group of Republicans on the Left, and was one of the 363 on the *Seize-Mai* (1877). If he refused to vote the expulsion of the princes in 1883, and resigned as deputy upon the enactment of the law, it was only owing to personal connexions with the family of Orleans. On the 17th of August 1883 he became under-secretary of state for war, and retained that position until the 7th of January 1885. From 1890 to 1892 he was vice-president of the chamber, then in 1893 president. On the 3rd of December he became prime-minister, holding the department of foreign affairs, resigned in May 1894, and was re-elected president of the chamber. On the 24th of June 1894, after the assassination of President Carnot, he was elected president of the republic by 451 votes against 195 for Henri Brisson and 97 for Charles Dupuy. His presidency lasted only six months. The resignation of the Dupuy ministry on the 14th of January 1895 was followed the next day by that of the president. Casimir-Périer explained his action by the fact that he found himself ignored by the ministers, who did not consult him before taking decisions, and did not keep him informed upon political events, especially in foreign affairs. From that time he definitely and absolutely abandoned politics, and devoted himself to business—especially mining. At the trial of Dreyfus at Rennes, Casimir-Périer's evidence, as opposed to that of General Mercier, was of great value to the cause of Dreyfus. He died on the 11th of March 1907.

**CASINO** (diminutive of *casa*, a house), the Italian name for a pleasure-house in a garden, which has been extended to a place of public amusement at pleasure resorts, in which concerts, theatrical performances and public balls are given, and which usually contains a *café-restaurant* and gaming saloons. "Casino" as an architectural term is still employed in France, and the subject is given in competitive programmes in the French schools of design. In the 18th century in England many Italian examples were built in the parks of country mansions, and Sir William Chambers in his treatise on civil architecture publishes plates of the casinos he had built at Marino, near Dublin, Wilton near Salisbury, and Birdshall, Yorkshire.

*Casino* or *Cassino* is also the name given to a game of cards of obscure origin, played with a full whist-pack. The object is to take as many cards as possible, particularly such as have special value. It may be played by two, three or four persons, partners sitting opposite one another. The player at the dealer's right is called the pony (*pone*), the one at his left the eldest hand. The dealer (selected by the cut of the lowest card) deals four cards to each player by twos and also, just before dealing to himself, four to the table, face upwards. The eldest hand begins the game by playing a card in one of three ways. Either he may take one of the exposed cards on the table by matching it with one from his own hand; or he may put one of his cards upon one of the table hand and call the sum of the pips (called *building*); or thirdly, failing to do either of these things, he must *trail*, *i.e.* lay a card face upwards on the table beside the exposed cards, and the player at his left then plays in his turn. When each player has played out all four of his cards the dealer deals four more all round, and the game proceeds until the pack is exhausted. The game either (1) ends at this juncture, the player having secured the most points winning; or (2) the side or player first securing 21 points wins; or (3) the points secured in a given number of deals may determine the winner. The points and their respective values are as follows:—*Big* (or *Great*) *Casino* (ten of diamonds), 2; *Little Casino* (deuce of spades), 1; *Cards* (greatest number), 3; *Spades* (greatest number), 1;  *Aces*, 1 each or 4 together; *Sweeps*, 1 each. Thus, without *sweeps*, the maximum points in one deal are 11. A sweep is a play that clears the table of all exposed cards. The game then proceeds by the next player placing a card on the table face upwards.

"Building," referred to above, is done as follows. Should a 3 lie exposed on the table, a player may place a 4 upon it, saying, "I build a 7," and, if it is not disturbed before his next turn, he may then take the two cards with another 7 from his hand. It follows that no combination may be built unless the builder hold the proper card in his hand. But a build may be increased. Thus, in the case cited above, another player may put a 2 upon the two cards which make 7 and say, "I build 9," in which case the original

builder loses control of the build unless he also holds a 9 in his hand or can himself increase the build again; for instance, adding an ace and calling 10. In the old way of playing the ace counted 1, the deuce 2, and so on as at whist, excepting that all court cards counted 10. But in the popular variation called *Royal Casino*, now almost universally played, the ace counts either 1 or 14, the king 13, the queen 12 and the knave 11. In this manner the opportunities for simple and increased building are greatly multiplied, resulting in a much livelier game.

If a player has made a build he must take it in on his next play, unless he can take some other card. He cannot have two builds on the table at the same time, nor increase another build if he already has one of his own. *Double Builds* cannot be increased, e.g. if a player combines a 3 and 4 lying on the table and places a 7 from his hand upon them, saying, "I build sevens" this build can be taken only with a 7, and cannot be built upon further. Of course in the case cited the builder must still have another 7 in his hand. In playing partners each may take in the other's build, or may build to a card that has been declared by his partner; e.g. if his partner has built an 8 that has been captured by an opponent, he may build another 8 with a card from his own hand to the 8 that he knows to be in his partner's hand, even though he has no 8 himself. In *building*, i.e. laying down a card without matching or building, one usually plays small cards, avoiding aces and 10's. Big and Little Casino have not yet been played) tens and deuces, as well as many cards one has reason to think will be of service to the enemy. High cards are usually played last, as they are stronger in taking combinations. Such rules are, however, quite general, each situation calling for special treatment. In the last round all cards remaining on the table become the property of the player taking the last trick. A good memory and keen powers of observation are essential in playing this game.

In *Twenty-One-Point Casino* nothing is scored until the end of the deal. A second or third deal is usually necessary before one side scores the requisite 21. In the final deal each side keeps a mental count of the points made, and as soon as 21 are scored the game is claimed and the points shown. But if, when added to those already scored in previous deals, they make more or less than 21, the claimant loses the game. In counting out cards count first, followed by spades, Big Casino, Little Casino, aces and sweeps, in that order.

*Spade Casino* is a variation in which the usual 11 points count as in the regular game, and, in addition, each spade counts 1, excepting the knave of spades, which counts 2, making 24 points in all. These are scored on a cribbage-board, each point being marked as it is made. The game is for 61 points, or once round the board and into the game-hole.

**CASINUM**, an ancient town of Italy, probably of Volscian origin. Varro states that the name was Sabine, and meant *forum vetus*, and also that the town itself was Samnite, but he is probably wrong. When it came under Roman supremacy is not known, but it probably received the citizenship in 188 B.C. It was the most south-easterly town in *Latium adjectum*, situated on the Via Latina about 40 m. N.W. of Capua. It appears occasionally in the history of the Hannibalic War. Varro possessed a villa near it, in which later on Mark Antony held his orgies. Towards the end of the republic it was a *praefectura*, and under the empire it appears as a colony (perhaps founded by the triumvirs), though in two (not local) inscriptions it is called *municipium*. Strabo speaks of it as an important town; Varro mentions the olive-oil of its district as especially good. The older, Volscian Casinum must have stood on the hill (1715 ft.) above the Roman town (148 ft.), where considerable remains of fortifications in Cyclopean masonry, of finely cut blocks of limestone, still exist. The site is now occupied by the Benedictine monastery of Monte Cassino (q.v.) founded by St. Benedict himself in 529. A number of Roman inscriptions from Casinum are preserved there. The wall which runs south-west and west starting from the west side of the monastery, for a total length of about 300 yds., is not so clearly traceable on the other side of the hill, though there is one fragment under the east side of the monastery; but it seems to have defended the summit and was perhaps the original acropolis. The Roman town lay at the foot of the mountain, close to the Via Latina. The amphitheatre, erected by Ummidia Quadrattilla (whose passion for actors is mentioned by Pliny, *Epist.* vii. 24, on the occasion of her death at the age of about eighty), is still existing: it is built of *opus reticulatum* and the five entrances are by arches of larger blocks of stone; it is approximately circular in plan. The external walls are 59 ft. high. The seats in the interior have disappeared. Above it on the hillside is a theatre of *opus reticulatum*, less well preserved. Close by is a building

converted into the Cappella del Crocifisso, originally perhaps a tomb in the Via Latina; it is a chamber in the form of a Greek cross, constructed of large masses of travertine, with a domed roof of the same material. On the opposite bank of the Rapido are the ruins called Monticelli, attributed to the villa of Varro, a part of which was frequently drawn by the architects of the 16th century (T. Ashby in *Papers of the British School at Rome*, ii. 19). The medieval town of S. Germano, which resumed the name Cassino in 1871, lies a little to the north. The cathedral was founded in the 8th century, but the present building was constructed in the 17th century. The church of S. Maria delle Cinque Torri contains twelve ancient marble columns; above the town is a picturesque medieval castle. (T. As.)

**CASIRI, MIGUEL** (1710-1791), a learned Maronite, was born at Tripoli (Syria) in 1710. Hestudied at Rome, where he lectured on Arabic, Syriac, Chaldee, philosophy and theology. In 1748 he went to Spain, and was employed in the royal library at Madrid. He was successively appointed a member of the Royal Academy of History, interpreter of oriental languages to the king, and joint-librarian at the Escorial. In 1763 he became principal librarian, a post which he appears to have held till his death in 1791. Casiri published a work entitled *Bibliotheca Arabico-Hispana Escorialensis* (2 vols., Madrid, 1760-1770). It is a catalogue of above 1800 Arabic MSS., which he found in the library of the Escorial; it also contains a number of quotations from Arabic works on history. The MSS. are classified according to subjects; the second volume gives an account of a large collection of geographical and historical MSS., which contain valuable information regarding the wars between the Moors and the Christians in Spain. Casiri's work is not yet obsolete, but a more scientific system is adopted in Hartwig Derenbourg's incomplete treatise, *Les Manuscrits arabes de l'Escorial* (Paris, 1884).

**CASKET**, a small box or coffer, commonly used for jewels, money, papers, or other objects of value. The etymology is doubtful. It is possibly a diminutive of "cask," a barrel for wine or other liquor. The Spanish *casco* meant also a skull, helmet, or rind of an onion, and is probably connected with *cascar*, to break open, Latin *quassare*, French *casser*, to break, shake. The French *casque*, *casquet*, of the same origin is only used of a helmet, and the sense of "small chest" is not found in languages other than English. Skeat suggests that the word is a corruption of French *cassette*, diminutive of *casse*, box, Latin *capsa*, from *capere*, to hold, contain, cf. English "case." History and literature are full of references to the often disconcerting contents of these famous receptacles. The "Casket Letters" (q.v.) are one of the mysteries of history. Harpagon's casket plays an important part in Molière's *L'Avare*; Bluebeard gives his too-curious wife the keys of his caskets filled with precious stones; the contents of Sainte-Croix's casket brought about the trial and condemnation of the marquise de Brinvilliers, the poisoner. This very ancient piece of furniture was no doubt derived from the chest, which was the original wardrobe. It was often an object of great value, covered with ivory, enamel, or stamped leather, enriched with precious metals, or encrusted with jewels. One which belonged to St. Louis and is preserved in the Louvre is covered with enamelled shields of arms and other decorations. In the 16th and 17th centuries secret hiding-places were sometimes in the thickness of the lid or in a false bottom. The word is now little used—the natural result of the desuetude of the object; but auctioneers occasionally announce that they will sell a "casket of jewels," and undertakers, especially in the United States, frequently use it as a grandiose synonym for "coffin."

**CASKET LETTERS**. This is the name generally given to eight letters, and a sequence of irregular sonnets, all described as originally in French, and said to have been addressed by Mary, queen of Scots, to the earl of Bothwell, between January and April 1566-1567. The nature of these documents—authentic, forged, or partly forged, partly genuine—has been the theme of much discussion. If authentic throughout, they afford perfect proof of Mary's complicity in the murder of her husband, Henry, Lord Darnley. The topic is so perplexing, and possibilities

are so delicately balanced, that inquirers may change their views, and modify or reverse their opinions, on the appearance of each fresh document that is brought to light; or even upon a new consideration of existing evidence. Controversy centres round a very long and singular undated epistle called "The Glasgow Letter" or "Letter II." If Mary wrote all of this, or even wrote some compromising parts of it, she was certainly guilty. But two questions remain to be settled—(1) did her accusers at one time possess another version of this letter which if it existed was beyond doubt a forgery? and (2) is not part of Letter II. a forged interpolation, based on another document, not by Mary?

The whole affair has been obscured and almost inextricably entangled, as we shall see, by the behaviour of Mary's accusers. Of these Maitland of Lethington was consenting to Darnley's murder; the earl of Morton had, at least, guilty foreknowledge; the regent Moray (Mary's natural brother) had "looked through his fingers" at the crime, and for months remained on intimate terms with the criminals. He also perjured himself when putting before Elizabeth's commission of inquiry at Westminster (December 1568) a copy of the confession of Hepburn of Bowton (Cotton MSS. British Museum. Caligula C.I. fol. 325). This is attested as a "true copy," but Moray, who had been present when Bowton was examined (December 8, 1567), knew that the copy presented at Westminster (December 1568) had been mutilated because the excised passages were damning to Lethington and the earl of Morton, accomplices in the crime of Darnley's murder, and accomplices of Moray in his prosecution of his sister. (See in Cambridge University Library, MS. Oo. 47, fol. 5 et seq. Compare the MS. copy of the confession in the British Museum, Cotton MSS. Caligula, C.I. fol. 325, printed in Anderson's *Collections*, vol. ii. pp. 183-188.)

If Moray the righteous could act thus, much more might the murderer Morton perjure himself in his avowment that there had been no tampering with the Casket Letters in his custody. We cannot, in short, believe Mary's accusers on their oaths. When they all went, in October-December 1568, to York and London to accuse their queen—and before that, in their proclamations—they contradicted themselves freely and frequently, they put in a list of dates which made Mary's authorship of Letter II. impossible; and they rang the changes on Scots translations of the alleged French originals, and on the French itself. For example, when Moray, after Mary was in Elizabeth's power (May 16, 1568), wished Elizabeth to have the matter tried, he in May-June 1568 sent John Wood to England with Scots translations of the letters. Wood was to ask, "if the French originals are found to tally with the Scots translations, will that be reckoned good evidence?" It was as easy to send copies of the French, and thus give no ground for the suspicion that the Scots letters were altered on the basis of information acquired between May and October 1568, and that the French versions were made to fit the new form of the Scots copies. Another source of confusion, now removed, was the later publication in France of the letters in French. This French did not correspond with French copies of some of the originals recently discovered in Cecil's MSS. and elsewhere. But that is no ground of suspicion, for the published French letters were not copies of the alleged originals, but translations of Latin translations of them, from the Scots (see T. F. Henderson, *The Casket Letters*, 1890). German historians have not made matters more clear by treating the Letters on the principle of "the higher criticism" of Homer and the Bible. They find that the documents are of composite origin, partly notes from Mary to Darnley, partly a diary of Mary's, and so on; all combined and edited by some one who played the part of the legendary editorial committee of Peisistratus (see HOMER), which compiled the *Iliad* and *Odyssey* out of fragmentary lays. From all these causes, and others, arise confusion and suspicion.

So much information unknown to older disputants such as Goodall, the elder Tytler, Chalmers, and Malcolm Laing, and in certain cases unknown even to Froude and Skelton, has accrued, that the question can now best be studied in *The Casket Letters*,

by T. F. Henderson (1889; second issue, 1890, being the more accurate); in *The Mystery of Mary Stuart*, by Andrew Lang (4th edition, 1904), and in Henderson's criticism of that book, in his *Mary, Queen of Scots* (1905) (Appendix A). The conclusion arrived at here is that of Henderson, but it is reached independently.

The history of the letters must be given in summary. Henderson, in *The Casket Letters* (1889), was the first to publish and use as evidence a document of which the existence was made known in the fifth report of the royal commission on historical manuscripts. It is a sworn statement of the earl of Morton, written in 1568. A silver casket (originally Mary's property, but then in the possession of Bothwell) was placed in his hands on the 20th of June, and was inspected by several nobles and gentlemen on the 21st of June 1567. Morton denies that the contents, the letters, sonnets, and some other papers, had been in any way tampered with. But if Moray could knowingly submit garbled evidence, Morton's oath is of no value if uncorroborated.

Mary was, on the 21st of June 1567, a prisoner in Loch Leven Castle. A messenger was at once sent from Edinburgh to London with a letter from Lethington and a verbal message. By the 12th of July, de Silva, the Spanish ambassador, reports on the authority of the French ambassador that du Croc, French envoy to Scotland, avers that Mary's Scottish enemies have autograph letters of hers proving her guilt, and himself possesses copies. Of these copies no more is heard, and they cannot be found. According to de Silva, Elizabeth said that she did not believe in the Letters, and that Lethington, who wrote to Cecil on the 21st of June, and sent a verbal message by the bearer, "had behaved badly in the matter,"—whether that of the letters, or in general. On what evidence she based that opinion, if she really held it, is unknown. In December 1567 the Scottish parliament was informed that the letters were signed by Mary (they are unsigned), but the phrase is not used in the subsequent act of parliament. The letters were exhibited and apparently were read, probably read aloud. Mary's party in September 1568 declared that they were garbled, and that the handwriting was not hers. In the end of July 1567 the earl of Moray, Mary's brother, passing through London from France, told de Silva, as de Silva reported to his government, that there was proof of Mary's guilt in a letter of three double sheets of paper signed by her.

According to Moray's version of the letter, Mary was to try to poison Darnley in a house on the way between Glasgow and Edinburgh where he and she were to stop. Clearly Lord Livingstone's house, Callendar, where they did rest on their journey, is intended. If this failed, Mary would put Darnley "in the house where the explosion was arranged for the night upon which one of the servants was to be married." No such arrangement had been made, as the confessions of the murderers, at which Moray was present, clearly prove. It may be said that de Silva means "the house in which the explosion was afterwards arranged." But the earl of Lennox, Darnley's father, understood Moray to mean that as early as January 21-22, 1567, the house of Kirk o' Field, where Darnley was slain, had already been mined. Moray's version of the letter made Mary tell Bothwell to poison or put away his wife. No such matters occur in Letter II., Moray spoke, he said, on the authority of "a man who had read the letter." A similar account of this letter is given in a document of Darnley's father, the earl of Lennox (Cambridge University Library MSS. Oo. 7. 47; f. 17 b.). Can we suppose that "the man who had read the letter" invented much of its contents, and told them to Moray, who told de Silva, and told Darnley's father, Lennox, then in or near London?

At this point comes in the evidence—unknown to Froude, Skelton, Hosack, and Henderson in his book *The Casket Letters*—of a number of documents, notes of information, and indictments of Mary, written for or by the earl of Lennox. These MSS are in the University Library of Cambridge, and were transcribed by Father Stevenson. His transcripts were brought to light by Father Pollen, S. J., who lent them, with his own notes on them,

to Andrew Lang for use in his book, *The Mystery of Mary Stuart* (1900-1904).

Not one of the Lennox documents is dated; all but one are endorsed in an English hand of the period. It may be conjectured that they were selected by Lennox from his papers, and lent by him to some one who was writing against Mary. Among them (Cambridge University MSS. Oo. 7. 47. fol. 17 b.) is a long indictment of Mary, in which Lennox describes a wicked letter of hers. As has been said, he closely follows Moray's version reported by de Silva in July 1567. Lennox also gives several stories of cruel words of Mary spoken to Darnley in the hearing of her servants.

Now, on the 11th of June 1568, Lennox was in the company of John Wood, a creature of Moray's, and Wood, as we saw, brought copies of the Scots renderings of the Letters into England in May-June 1568. It was argued by Andrew Lang that Wood was likely to show these letters to Lennox; and that as Lennox follows Moray's version of Mary's long and murderous letter, and does not follow Letter II., the murderous letter (a forgery) was then part of the dossier of Mary's accusers. Again, as Lennox's indictment of Mary (Cambridge Oo. 7. 47. fol. 17 b.) is rife in "reports and sayings of Mary's servants" about her cruel words to Darnley, and as Lennox had not these reports on the 11th of June 1568, for on that day he wrote to Scotland asking his friends to discover them and send them to him, the indictment (Oo. 7. 47) must have been composed long after the 11th of June. This must be so, for Lennox's letters of the 11th of June were intercepted by his foes, the Hamiltons, and were found in the Hamilton Muniment Room. Thus answers to his inquiries were delayed. (The letters of Lennox were published in *Miscellany of the Maitland Club*, vol. iv.)

Henderson, on the other side, believes that Wood "indubitably" showed to Lennox the Scots copies of the Casket Letters about the 11th of June 1568. But Lennox, he says, could not quote Letter II. in his indictment against Mary, and had to rest on Moray's version of July 1567, because Lennox's indictment was completed, and even laid before Elizabeth, as early as the 28th of May 1568. Henderson seeks to prove that this is so by quoting from Chalmers's *Mary Queen of Scots* (vol. ii. p. 280) the statement that Lennox and his wife on that day presented to Elizabeth a "Bill of Supplication"; and (though he submits that the indictment [Oo. 7. 47] is a draft for the Bill) he strengthens his case by heading the indictment, which he publishes, *Bill of Supplication*. The document, in fact, is unendorsed, and without a title, and there is not a word of "supplication" in it. It is a self-contradictory history of the relations between Mary and Darnley.

Henderson's contention therefore seems erroneous. Lennox could not begin to prepare an English indictment against Mary till she was in England and in Elizabeth's power. He could not hear of this fact—Mary's arrival in England (May 16, 1568)—before, say, the 19th of May; and between the 19th of May and the 28th of May he could not write for and receive from Scotland "the reports and sayings of her servants." He did not possess them on the 11th of June, when he asked for them; he did not get them at once, for his letters were intercepted; the indictment (Oo. 7. 47) is rich in them; therefore that paper is not the "Bill of Supplication" of the 28th of May.

Thus the question remains, why, if Wood about the 11th of June showed to Lennox Letter II. in Scots, did Lennox follow Moray's erroneous version of July 1567? Because in June 1568 that version, forged, was in the Scots collection of the Casket Letters? If so, there was time for Lennox to lend to the accusers certain notes which a retainer of his, Thomas Crawford of Jordan Hill, swore (December 9, 1568) that he had made for Lennox (about January 22, 1567) of secret conversations between Darnley and Mary. Lennox (June 11, 1568) asked Crawford for his reminiscences, not of Darnley's reports of his talks with Mary, but of Crawford's own interview with her as she entered Glasgow to visit Darnley, probably on the 21st of January 1567. It follows that Lennox possessed Crawford's written notes of the Darnley and Mary conversations. If he had not possessed

them on the 11th of June 1568, he must have asked Crawford for his reminiscences of these talks. But he did not ask.

Crawford's evidence was all-important, because it corroborated Mary's own account of her interviews with Darnley in Letter II. That part of the letter then, it is argued by many, is a forged interpolation based on Crawford's notes and memories. The force of this contention lies in the close verbal identities between Crawford's account of the Darnley-Mary interviews (see Crawford's Declaration of December 9, 1568, in Lang's *Mystery of Mary Stuart*, pp. 428-431; from *State Papers Scotland*, Elizabeth vol. xiii. No. 14. Record Office) and the corresponding passages in Letter II. (*Mystery of Mary Stuart*, pp. 396-398). The verbal identities can only be explained in one of the following ways. Either Letter II. is here based on Crawford; or Crawford has copied Letter II. by way of corroborating it (a fatal step, if the case came before a modern English court of justice); or Darnley's memory of his conversation with Mary was so fresh, when he dictated his recollection of it to Crawford on 21st-22nd January 1567, that he reported speeches in almost the very same words as Mary used in writing Letter II. Henderson prefers the hypothesis that Lennox had lost Crawford's notes; and that the identities are explained by the "remarkably good memories of Crawford and Mary, or by the more likely supposition that Crawford, before preparing his declaration for the conference" (at Westminster, December 1568) "refreshed his memory by the letter." (Letter II., *Mary Queen of Scots*, p. 650.)

Mary did not need a particularly good memory; if she wrote, she wrote unchecked her recollections of the day's talk. But no human memory of a conversation reported on the 22nd of January 1567, could be so nearly "word perfect" as Crawford's must have been two years later. If Crawford "refreshed his memory by the letter," he exposed himself, and the entire case, by copying whole passages, often with few verbal changes. If he had access to his original notes of the 21st and 22nd of January 1567, then he was safe—that is, if Darnley's memory of the conversations tallied so exactly with Mary's. Whether that could be, Darnley dictating while still hot from the exciting interchange of words which he meant to report, is a question for psychologists. Experiments made by a person who possesses a good memory seem to show that the thing is very possible, especially if Darnley revised Crawford's notes.

Thus the probabilities are delicately balanced. But if any one compares Crawford's whole declaration with Letter II. in Scots, he will find that Crawford has sources of information not yielded by Letter II.; while Letter II. abounds in matter spoken by Mary and Darnley which could not be borrowed by the hypothetical forger from Crawford's Declaration, for it does not contain the facts. These facts, again, in Letter II., are worthless to a forger, because they concern matters never alluded to in any of the records; never employed in any indictment (though Lennox's are copious in private talk between Darnley and Mary, "reports of her servants"), and totally useless for the purposes of the accusers. Here is one of several examples. Letter II. has, and Crawford has not, the statement that Darnley "showed me, amongst other talk, that he knew well enough that my brother had revealed to me what he (Darnley) had spoken at Stirling. Of this he (Darnley) denies half, and above all that he (the brother?) ever came to his (Darnley's) chamber."

Nothing is known about this matter. The Lennox papers are full of reports of bitter words that passed between Darnley and Mary at Stirling (December 1566), where Darnley was sulking apart while the festivities of the baptism of his son (later James VI.) were being held. But nothing is said in the Lennox papers of words spoken by Darnley to Mary's brother (probably Lord Robert of Holyrood) and revealed by Lord Robert to Mary. Lord Robert was the only friend of Darnley in Mary's entourage; and he even, according to the accusers, warned him of his danger in Kirk o' Field, to which they said that a Casket Letter (III.) referred. The reference is only to be seen by willing eyes.

Is it credible that a forger, using Crawford's Declaration, which is silent as to Mary's brother at Stirling, should have superfluously added what is not to any purpose? Could he have combined

with Crawford's matter the passage "he (Darnley) showed me almost all that is in name of the Bishop and Sutherland, and yet I have never touched a word of what you (Bothwell) showed me . . . and by complaining of the Bishop, I have drawn it all out of him."

Who but Mary herself could have written about this unknown affair of the Bishop, and what had the supposed forger to gain by inventing and adding these references to affairs unconnected with the case?

There remains what looks like absolute proof that, in essence, Crawford's Declaration and Letter II. are independent documents. We are not aware that this crucial point has been noticed by the earlier critics of the Letters. In Letter II. (paragraph 7, p. 398, in Lang's *Mystery of Mary Stuart*, 1901) Mary writes, "I asked why he (Darnley) would pass away in the English ship. He denies it, and swears thereunto; but he grants that he spoke unto the men." Here Crawford's declaration has, "She asked him why he would pass away in the English ship. He answered that he had spoken with the Englishman, but not of mind to go away with him. And, if he had, it had not been without cause, considering how he was used. For he had neither [means] to sustain himself nor his servants, and need not make further rehearsal thereof, seeing she knew it as well as he." (*Mystery of Mary Stuart*, p. 429.)

It may seem to the reader doubtful whether these complaints are words of Darnley's, or an indignant addition by his friend Crawford. But Mary, in Letter II., shows that the complaints and the self-defence are Darnley's own. It was in paragraph 7 that she wrote about the English ship; she did not then give Darnley's reonstrances, as Crawford does. But in paragraph 18 (*Mystery*, p. 406) Mary returns to the subject, and writes, "He (Darnley) spoke very bravely at the beginning, as the bearer will show you, upon the subject of the Englishmen, and of his departing; but in the end he returned to his humility."

Thus it is certain that Darnley had reported to Crawford his brave words and reproaches of Mary, which Crawford gives in the proper place. But Letter II. omits them in that place (paragraph 7); and only on her second day of writing, in paragraph 18, does Mary's mind recur to Darnley's first brave words—"he spoke very bravely at the beginning," about his wrongs, "but in the end he returned again to his humility."

Here is proof positive that Crawford does not copy Letter II., but gives Darnley's words as reported to him by Darnley—words that Darnley was proud of,—while Mary, returning on the second day of writing to the topic, does not quote Darnley's brave words, but merely contrasts his speaking "very bravely at the beginning" with his pitiful and craven later submission; "he has ever the tear in his eye," with what follows. (*Mystery*, paragraph 12, p. 402.)

When we add to these and other proofs the strange lists of memoranda in the middle of the pages of the letter, and the breach in internal chronology which was apparently caused by Mary's writing, on her second day, on the clean verso of a page on the other side of which she had written some lines during her first night in Glasgow; when we add the dramatic changes of her mood, and the heart breaking evidence of a remorse not stifled by lawless love, we seem compelled to believe that she wrote the whole of Letter II.; that none of it is forged.

In *The Mystery of Mary Stuart* the evidence for an early forged letter was presented with confidence; the interpolation of forgeries based on Crawford's declaration was more dubiously suggested. That position the writer now abandons. It may be asked why, after being with Wood on the 11th of June, did Lennox still rely on Moray's version of Mary's letter? The reply may be that the Scots versions were regarded as a great secret; that Lennox was a married man; and that though Lennox in June knew about Mary's letters, doubtless from Wood, or from common report (Bishop Jewell in a letter of August 1567 mentions that he had heard of them), yet Wood did not show to him the Scots copies. Lennox quotes Letter II. later, in an indictment to be read to the commission sitting at York (October 1568). But, on the other hand, as Lennox after meeting Wood wrote to

Crawford for his reminiscences of his own interview with Mary (January 21, 1567), and as these reminiscences were only useful as corroborative of Mary's account in Letter II., it seems that Wood had either shown Lennox the letters or had spoken of their contents. In that case, when Lennox later quotes Moray's version, not Letter II. itself, he is only acting with the self-contradictory stupidity which pervades his whole indictment (Oo. 7. 47. fol. 17 b.).

The letters are not known to have been seen by any man—they or the silver casket—after the death of the earl of Gowrie (who possessed them). In May 1584 Bowes, the English ambassador to Holyrood, had endeavoured to procure them for Elizabeth, "for the secrecy and benefit of the cause." Conceivably the letters fell into the hands of James VI. and were destroyed by his orders. (A. L.)

**CASLON**, the name of a famous family of English typefounders. William Caslon (1692-1766), the first of the name, was born at Cradley, Worcestershire, and in 1716 started business in London as an engraver of gun locks and barrels, and as a bookbinder's tool-cutter. Being thus brought into contact with printers, he was induced to fit up a type foundry, largely through the encouragement of William Bowyer. The distinction and legibility of his type secured him the patronage of the leading printers of the day in England and on the continent. The use of Caslon types, discontinued about the beginning of the 19th century, was revived about 1845 at the suggestion of Sir Henry Cole, and used for printing the *Diary of Lady Willoughby* (a pseudo-17th-century story) by the Chiswick Press. The headline on this page is "Caslon Old Face." He died on the 23rd of January 1766. His son, William Caslon (1720-1778), who had been partner with his father for some years, continued the business.

**CASPARI, KARL PAUL** (1814-1892), German Lutheran theologian and orientalist, was born of Jewish parents at Dessau, Anhalt, on the 8th of February 1814. He studied at Leipzig and Berlin, became a Christian in 1838, and in 1857 was appointed professor of theology at Christiania, having declined invitations to Rostock and Erlangen. He died at Christiania on the 11th of April 1892. Caspari is best known as the author of an Arabic grammar (*Grammatica Arabica*, 2 vols., 1844-1848; new edition, *Arabische Grammatik*, edited by A. Müller; 5th ed. 1887). He also wrote commentaries on the prophetic books of the Old Testament, dogmatic and historical works on baptism, and from 1857 helped to edit the *Theologisk Tidsskrift for den evangelisk-lutherske Kirke i Norge*. His writings include: *Beiträge zur Einleitung in Jesaja* (1848), and *Alle und neue Quellen zur Geschichte des Taufsymbols und der Glaubensregel* (1879).

**CASPIAN SEA** (anc. *Mare Caspium* or *Mare Hyrcanum*; Russian, *Kaspiyskoe More*, formerly *Hvalynskoe More*; Persian, *Darya-i-Khysr* or *Gurzem*; Tatar, *Ak-denghis*; the *Sikim* and *Jurjan* of the ancient Eastern geographers), an inland sea between Europe and Asia, extending from 36° 40' to 47° 20' N. lat., and from 46° 50' to 55° 10' E. long. Its length is 760 m. from N. to S., and its breadth 100 to 280 m., and its area reaches 160,330 sq. m., of which 865 sq. m. belong to its islands. It fills the deepest part of a vast depression, sometimes known as the Aralo-Caspian depression, once an inland sea, the Eurasian Mediterranean or Sarmatian Ocean. At the present time its surface lies 86 ft. below the level of the ocean, or 96.7 ft. according to the Aral-Caspian levelling<sup>1</sup> and 242.7 ft. below the level of the Aral.

*Hydrography and Shores*.—The hydrography of the Caspian Sea has been studied by von Baer, by N. Ivashintsev (1819-1871) in 1862-1870, by O. Grimm, N. I. Andrusov (1895), and by J. B. Spindler (1897), N. von Seidlitz and N. Knipovich (1904) since the last quoted date. Its basin is divided naturally into three sections—(1) A northern, forming in the east the Gulf of Mortvity Kultuk or Tsarevich Bay. This is the shallowest part, barely reaching a depth of 20 fathoms. It is being gradually

<sup>1</sup> By the triangulation of 1840 its level was found to be 84 ft. below the level of the Black Sea. The Caucasus triangulation of 1860-1870 gave 89 ft.

silted up by the sedimentary deposits brought down by the rivers Volga, Ural and Terek. The western shore, from the delta of the Volga to the mouth of the Kuma, a distance of 170 m., is gashed by thousands of narrow channels or lagoons, termed *limans*, from 12 to 30 m. in length, and separated in some cases by chains of hillocks, called *bugors*, in others by sandbanks. These channels are filled, sometimes with sea-water, sometimes with overflow water from the Volga and the Kuma. The coastline of the Gulf of Mortvyi Kultuk on the north-east is, on the other hand, formed by a range of low calcareous hills, constituting the rampart of the Ust-Urt plateau, which intervenes between the Caspian and the Sea of Aral. On the south this gulf is backed by the conjoined peninsulas of Busachi and Manghishlak, into which penetrates the long, narrow, curving bay or fjord of Kaidak or Kara-su. (2) South of the line joining the Bay of Kuma with the Manghishlak peninsula, in 44° 10' N. lat., the western shore is higher and the water deepens considerably, being over one-half of the area 50 fathoms, while the maximum depth (between 41° and 42° N. lat.) reaches 437 fathoms. This, the middle section of the Caspian, which extends as far as the Apsheron peninsula, receives the Terek and several smaller streams (e.g. Sulak, Samur), that drain the northern slopes of the Caucasus. At Derbent, just north of 42° lat., a spur of the Caucasus approaches so close to the sea as to leave room for only a narrow passage, the *Caspiae Pylae* or *Albaniae Portae*, which has been fortified for centuries. The eastern shore of this section of the sea is also formed by the Ust-Urt plateau, which rises 550 ft. to 750 ft. above the level of the Caspian; but in 42° N. lat. the Ust-Urt recedes from the Caspian and circles round the Gulf of Kara-boghaz or Kara-bugaz (also called Aji-darya and Kuli-darya). This subsidiary basin is separated from the Caspian by a narrow sandbar, pierced by a strait 1½ m. long and only 115 to 170 yds. wide, through which a current flows continuously into the gulf at the rate of 1½ to 5 m. an hour, the mean velocity at the surface being 3 m. an hour. To this there exists no compensating outflow current at a greater depth, as is usually the case in similar situations. The area of this lateral basin being about 7100 sq. m., and its depth but comparatively slight (3½ to 36 ft.), the evaporation is very appreciable (amounting to 3.2 ft. per annum), and sufficient, according to von Baer, to account for the perpetual inflow from the Caspian. South of the Kara-Boghaz Bay the coast rises again in another peninsula, formed by an extension of the Balkhan Mountains. This marks (40° N. lat.) the southern boundary of the middle section of the Caspian. This basin may be, on the whole, considered as a continuation of the synclinal depression of the Manych, which stretches along the northern foot of the Caucasus from the Sea of Azov. It is separated from (3), the southern and deepest section of the Caspian, by a submarine ridge (30 to 150 fathoms of water), which links the main range of the Caucasus on the west with the Kopet-dagh in the Transcaspian region on the east. This section of the sea washes on the south the base of the Elburz range in Persia, sweeping round from the mouth of the Kura, a little north of the Bay of Kizil-agach, to Astarabad at an average distance of 40 m. from the foot of the mountains. A little east of the Gulf of Enzeli, which resembles the Kara-boghaz, though on a much smaller scale, the Sefid-rud pours into the Caspian the drainage of the western end of the Elburz range, and several smaller streams bring down the precipitation that falls on the northern face of the same range farther to the east. Near its south-east corner the Caspian is entered by the Atrek, which drains the mountain ranges of the Turkoman (N.E.) frontier of Persia. Farther north, on the east coast, opposite to the Bay of Kizil-agach, comes the Balkhan or Krasnovodsk Bay. In the summer of 1894 a subterranean volcano was observed in this basin of the Caspian, in 38° 10' N. lat. and 52° 37' E. long. The depth in this section ranges from 300 to 500 fathoms, with a maximum of 602 fathoms.

*Drainage Area and Former Extent.*—The catchment area from which the Caspian is fed extends to a very much greater distance on the west and north than it does on the south and east. From

the former it is entered by the Volga, which is estimated to drain an area of 560,000 sq. m., the Ural 96,000 sq. m., the Terek 59,000 sq. m., the Sulak 7000 sq. m., the Samur 4250 sq. m.; as compared with these, there comes from the south and east the Kura and Aras, draining the south side of the Caucasus over 87,250 sq. m., and the Sefid-rud and the Atrek, both relatively short. Altogether it is estimated (by von Dingsledt) that the total discharge of all the rivers emptying into the Caspian amounts annually to a volume equal to 174.5 cub. m. Were there no evaporation, this would raise the surface of the sea 5½ ft. annually. In point of fact, however, the entire volume of fresh water poured into the Caspian is only just sufficient to compensate for the loss by evaporation. Indeed in recent times the level appears to have undergone several oscillations. From the researches of Philippov it appears that during the period 1851–1888 the level reached a maximum on three separate occasions, namely in 1868–1869, 1882 and 1885, while in 1853 and 1873 it stood at a minimum; the range of these oscillations did not, however, exceed 3 ft. 6½ in. The Russian expedition which investigated the Kara-boghaz in 1896 concluded that there is no permanent subsidence in the level of the sea. In addition to these periodical fluctuations, there are also seasonal oscillations, the level being lowest in January and highest in the summer.

The level of the Caspian, however, was formerly about the same as the existing level of the Black Sea, although now some 86 ft. below it. This is shown by the evidences of erosion on the face of the rocks which formed the original shore-line of its southern basin, those evidences existing at the height of 65 to 80 ft. above the present level. That a rapid subsidence did take place from the higher level is indicated by the fact that between it and the present level there is an absence of indications of erosive energy. There can be no real doubt that formerly the area of the Caspian was considerably greater than it is at the present time. Nearly one hundred and fifty years ago Pallas had his attention arrested by the existence of the salt lakes and dry saline deposits on the steppes to the east of the Caspian, and at great distances from its shores, and by the presence in the same localities of shells of the same marine fauna as that which now inhabits that sea, and he suggested the obvious explanation that those regions must formerly have been covered by the waters of the sea. And it is indeed the fact that large portions of the vast region comprised between the lower Volga, the Aral-Irtysh water-divide, the Dzungarian Ala-tau, and the outliers of the Tian-shan and Hindu-kush systems are actually covered with Aralo-Caspian deposits, nearly always a yellowish-grey clay, though occasionally they assume the character of a more or less compact sandstone of the same colour. These deposits attain their maximum thickness of 90 ft. east of the Caspian, and have in many parts been excavated and washed away by the rivers (which have frequently changed their beds) or been transported by the winds, which sweep with unmitigated violence across those wide unsheltered expanses. The typical fossils unearthed in these deposits are shells of species now living in both the Caspian and the Aral, though in the shallow parts of both seas only, namely (according to Ivan V. Mushketov [1850–1902]) *Cardium edule*, *Dreissena polymorpha*, *Neritina liurata*, *Adacna vitrea*, *Hydrobia stagnalis*, in the Kara-kum desert, and *Lithoglyphus caspius*, *Hydrobia stagnalis*; *Anodonta ponderosa* and the sponge *Melchionkia tuberculata*, in the Kizil-kum desert. The exact limits of the ancient Aralo-Caspian sea are not yet settled, except in the north-west, where the Ergeni Hills of Astrakhan constitute an unmistakable barrier. Northwards these marine deposits are known to exist 80 m. away from Lake Aral, though they do not cross the Aral-Irtysh water-divide, so that this sea will not probably have been at that time connected with the Arctic, as some have supposed. The eastern limits of these deposits lie about 100 m. from Lake Aral, though Severtsov maintained that they penetrate into the basin of Lake Balkash. Southwards they have been observed without a break for 160 m. from Lake Aral, namely in the Sary-kamysch depression (the surface of which lies below the level of the Caspian) and up

the Uzboi trench for 100 m. from the latter sea. How far they reach up the present courses of the Oxus (Amu-darya) and Jaxartes (Syr-darya) is not known. Hence, it is plain that in late Tertiary, and probably also in Post-Tertiary, times the Aralo-Caspian Sea covered a vast expanse of territory and embraced very large islands (e.g. Ust-Urt), which divided it into an eastern and a western portion, communicating by one or two narrow straits only, such as on the south the Sary-kamysh depression, and on the north the line of the lakes of Chumyshy and Asmantai. More than this, the Caspian was also, it is pretty certain, at the same epoch, and later, in direct communication with the Sea of Azov, no doubt by way of the Manych depression; for in the *limans* or lagoons of the Black Sea many faunal species exist which are not only identical with species that are found in the Caspian, but also many which, though not exactly identical, are closely allied. As examples of the former may be named—*Archaobdella*, *Cleissinia variabilis*, *Neritina liturata*, *Gmelina*, *Gammarus moeoticus*, *Pseudocuma pectinata*, *Paramysis Baeri*, *Mesomysis Kowalevskiy* and *M. intermedia*, *Limnomysis Benedeni* and *L. Brandii*, and species of the ichthyological fauna *Gobius*, *Clupea* and *Acipenser*; while as illustrating the latter class the Black Sea contains *Dreissena bugensis* (allied to *D. rostriformis* and *D. Grimmi*), *Cardium ponticum* (to *C. caspium*), *C. coloratum* (to *Monodacna edentula*), *Amphicleis antiqua* (to *A. Kowalevskiy*) and *Mythotrochus aovicus* (to *B. socialis*).

In the opinion of Russian geologists the separation of the Caspian from the great ocean must have taken place at a comparatively recent geological epoch. During the early Tertiary age it belonged to the Sarmatian Ocean, which reached from the middle Danube eastwards through Rumania, South Russia, and along both flanks of the Caucasus to the Aralo-Caspian region, and westwards had open communication with the great ocean, as indeed the ancient geographers Eratosthenes, Strabo and Pliny believed it still had in their day. This communication began to fail, or close up presumably in the Miocene period; and before the dawn of Pliocene times the Sarmatian Ocean was broken up or divided into sections, one of which was the Aralo-Caspian sea already discussed. During the subsequent Ice Age the Caspian flowed over the steppes that stretch away to the north, and was probably still connected with the Black Sea (itself as yet unconnected with the Mediterranean), while northwards it sent a narrow gulf or inlet far up the Volga valley, for Aralo-Caspian deposits have been observed along the lower Kama in 56° N. lat. Eastwards it penetrated up the Uzboi depression between the Great and Little Balkhan ranges, so that that depression, which is strewn (as mentioned above) with Post-Tertiary marine deposits, was not (as is sometimes supposed) an old bed of the Oxus, but a gulf of the Caspian. After the great ice cap had thawed and a period of general desiccation set in, the Caspian began to shrink in area, and simultaneously its connexions with the Black Sea and the Sea of Aral were severed.

**FAUNA.**—The fauna of this sea has been studied by Eichwald, Kowalevsky, Grimm, Dybowski, Kessler and Sars. At the present time it represents an intermingling of marine and freshwater forms. To the former belongs the herring (*Clupea*), and to the latter, species of *Cyprinus*, *Perca* and *Silurus*, also a lobster. Other marine forms are *Rhizopoda* (*Rotalia* and *Textularia*), the sponge *Amorphina*, the *Amphicleis* worm, the molluscs *Cardium edule* and other *Cardidae*, and some Amphipods (*Cumacea* and *Mysidae*), but they are forms which either tolerate variations in salinity or are especially characteristic of brackish waters. But there are many species inhabiting the waters of the Caspian which are not found elsewhere. These include Protozoa, three sponges, Vermes, twenty-five Molluscs, numerous Amphipods, fishes of the genera *Gobius*, *Benthophilus* and *Cobitis*, and one mammal (*Phoca caspia*). This last, together with some of the *Mysidae* and the species *Glyptomus entomon*, exhibits Arctic characteristics, which has suggested the idea of a geologically recent connexion between the Caspian and the Arctic, an idea of which no real proofs have been as yet discovered. The Knipovich expedition in 1904 found no traces of organic life below the depth of 220 fathoms except micro-organisms and a

single Oligochaete; but above that level there exist abundant evidences of rich pelagic life, more particularly from the surface down to a depth of 80 fathoms.

**Fisheries.**—No other inland sea is so richly stocked with fish as the Caspian, especially off the mouths of the large rivers, the Volga, Ural, Terek and Kura. The fish of greatest economic value are sturgeon (four species), which yield great quantities of caviare and isinglass, the herring, the salmon and the lobster. The annual catch of the entire sea is valued at an average of one million sterling. Some 50,000 persons are engaged in this industry off the mouth of the Volga alone. Seals are hunted in Krasnovodsk Bay.

**Salinity.**—The proportion of salt in the water of the Caspian, though varying in different parts and at different seasons, is generally much less than the proportion in oceanic water, and even less than the proportion in the water of the Black Sea. In fact the salinity of the Caspian is only three-eighths of that of the ocean. In the northern section, which receives the copious volumes brought down by the Volga, Ural and Terek, the salinity is so slight (only 0.0075% in the surface layers) that the water is quite drinkable, its specific gravity being not higher than 1.0016. In the middle section the salinity of the surface layers increases to 0.015%, though it is of course greater along the shores. The concentration of the saline ingredients proceeds with the greatest degree of intensity in the large bays on the east side of the sea, and more especially in that of Kara-boghaz, where it reaches 16.3% (Spindler expedition). The bottom of this almost isolated basin is covered for an area of 1,300 sq. m. with a deposit of Epsom salts (sulphate of magnesium), 7 ft. thick, amounting to an estimated total of 1,000,000 tons. While the proportion of common salt to sulphate of magnesium is as 11 to 1 in the water of the Black Sea and as 2 to 1 in the Caspian water generally, it is as 12.8 to 5.03 in the Kara-boghaz. The salinity of the surface water of the southern section of the Caspian averages 1.5%.

**Climate.**—The temperature of the air over the Caspian basin is remarkable for its wide range both geographically and seasonally. The January isotherm of 15° F. skirts its northern shore; that of 40° crosses its southern border. But the winter extremes go far below this range: during the prevalence of north-east winds the thermometer drops to -20°, or even lower, on the surrounding steppes, while on the Ust-Urt plateau a temperature of -30° is not uncommon. Again, the July isotherm of 75° crosses the middle section of the Caspian, nearly coinciding with the January isotherm of 25°, while that of 80° skirts the southern shore of the sea, nearly coinciding with the January curve of 40°, so that the mean annual range over the northern section of the sea is 60° and over the southern section 40°. The former section, which is too shallow to store up any large amount of heat during the summer, freezes for three or four months along the shores, effectually stopping navigation on the lower Volga, but out in the middle ice appears only when driven there by northerly winds.

The prevalent winds of the Caspian blow from the south-east, usually between October and March, and from the north and north-west, commonly between July and September. They sometimes continue for days together with great violence, rendering navigation dangerous and driving the sea-water up over the shores. They also, by heaping up the water at the one end of the sea or the other, raise the level temporarily and locally to the extent of 4 to 8 ft. The currents of the Caspian were investigated by the Knipovich expedition; it detected two of special prominence, a south-going current along the west shore and a north-going current along the east shore. As a consequence of this the temperature of the water is higher on the Asiatic than on the European side. The lowest temperature obtained was 35°·24 on the bottom in shallow water, the highest 70°·7 on the surface. But in March the temperature, as also the salinity, was tolerably uniform throughout all the layers of water. Another interesting fact ascertained by the same expedition is that the amount of oxygen contained in the water decreases rapidly with the depth: off Derbent in the middle section of the sea the amount diminished from 5.6 cc. per litre at a depth of 100 metres

(330 ft.) to 0.32 cc. per litre at a depth of 700 metres (say 2300 ft.). At the same spot samples of water drawn from the bottom were found to contain 0.3 cc. of sulphuretted hydrogen per litre. In the southern section of the sea the decrease is not so rapid. In this latter section Spindler ascertained in July 1897 that the temperature of the surface water 60 m. from Baku was 72.9°, but that below 10 fathoms it sank rapidly, and at 200 fathoms and below it was constant at 21.2°.

**Navigation.**—The development of the petroleum industry in the Apsheron peninsula (Baku) and the opening (1886) of the Transcasian railway have greatly increased the traffic across the Caspian Sea. A considerable quantity of raw cotton is brought from Ferghana by the latter route and shipped at Krasnovodak for the mills in the south and centre of Russia, as well as for countries farther west. And Russia draws her own supplies of petroleum, both for lighting and for use as liquid fuel, by the sea route from Baku. Other ports in addition to those just mentioned are Astrakhan, on the Volga; Petrovsk, Derbent and Lenkoran, on the west shore; Enzeli or Resht, and Astarabad, on the Persian coast; and Mikhailovsk, on the east coast. The Russians keep a small naval flotilla on the Caspian, all other nations being debarred from doing so by the treaty of Turkmanchai (1828).

At various times and by various persons, but more particularly by Peter the Great, the project has been mooted of cutting a canal between the Volga and the Don, and so establishing unrestricted water communication between the Caspian and the Black Sea; but so far none of these schemes has taken practical shape. In 1900 the Hydrotechnical Congress of Russia discussed the plan of constructing a canal to connect the Caspian more directly with the Black Sea by cutting an artificial waterway about 22 ft. deep and 180 ft. wide from Astrakhan to Taganrog on the Sea of Azov.

Bz.)

**CASS, LEWIS** (1782-1866), American general and statesman, was born at Exeter, New Hampshire, on the 9th of October 1782. He was educated at Phillips Exeter Academy, joined his father at Marietta, Ohio, about 1799, studied law there in the office of Return Jonathan Meigs (1765-1825), and was admitted to the bar at the age of twenty. Four years later he became a member of the Ohio legislature. During the War of 1812 he served under General William Hull, whose surrender at Detroit he strongly condemned, and under General W. H. Harrison, and rose from the rank of colonel of volunteers to be major-general of Ohio militia and finally to be a brigadier-general in the regular United States army. In 1813 he was appointed governor of the territory of Michigan, the area of which was much larger than that of the present state. This position gave him the chief control of Indian affairs for the territory, which was then occupied almost entirely by natives, there being only 6000 white settlers. During the eighteen years in which he held this post he rendered valuable services to the territory and to the nation; he extinguished the Indian title to large tracts of land, instituted surveys, constructed roads, and explored the lakes and sources of the Mississippi river. His relations with the British authorities in Canada after the War of 1812 were at times very trying, as these officials persisted in searching American vessels on the Great Lakes and in arousing the hostility of the Indians of the territory against the American government. To those experiences was largely due the antipathy

for Great Britain manifested by him in his later career. Upon the reorganization of President Jackson's cabinet in 1831 he became secretary of war, and held this office until 1836. It fell to him, therefore, to direct the conduct of the Black Hawk and Seminole wars. He sided with the president in his nullification controversy with South Carolina and in his removal of the Indians from Georgia, but not in his withdrawal of the government deposits from the United States Bank.

In 1836 General Cass was appointed minister to France, and became very popular with the French government and people. In 1842, when the Quintuple Treaty was negotiated by representatives of England, France, Prussia, Russia and Austria for the suppression of the slave trade by the exercise of the right of search, Cass attacked it in a pamphlet entitled "An Examination of the Questions now in Discussion between the American and British Government Concerning the Right of Search," and presented to the French government a formal memorial which was probably instrumental in preventing the ratification of the treaty by France. In this same year the Webster-Ashburton treaty between Great Britain and the United States was concluded, and, as England did not thereby relinquish her claim of the right to search American vessels, Cass, after having taken such a decided stand in this controversy, felt himself in an awkward position, and resigned his post. His attitude on this question made him very popular in America, and he was a strong, but unsuccessful, candidate for the Democratic nomination for the presidency in 1844. From 1845 to 1848 and from 1849 to 1857 he was a member of the United States Senate, and in 1846 was a leader of those demanding the "re-annexation" of all the Oregon country south of 54° 40' or war with England, and was one of the fourteen who voted against the ratification of the compromise with England at the 49th parallel. He loyally supported Polk's administration during the Mexican War, opposed the Wilmot Proviso, and advocated the Compromise Measures of 1850 and the Kansas-Nebraska Bill of 1854. In his famous "Nicholson letter" of December 1847 he made what was probably the earliest enunciation of the doctrine of "popular sovereignty," namely, that the people of the territories should decide for themselves whether or not they should have slavery.

In 1848 he received the Democratic nomination for the presidency, but owing to the defection of the so-called "Barnburners" (see FREE-SOIL PARTY) he did not receive the united support of his party, and was defeated by the Whig candidate, Zachary Taylor. His name was again prominent before the Democratic convention of 1852, which, however, finally nominated Franklin Pierce. On account of his eminently conservative attitude on all questions concerning slavery, General Cass has been accused of pandering to the southern Democrats in order to further his political aspirations. His ideas of popular sovereignty, however, were not inconsistent with the vigorous Democratic spirit of the west, of which he was a typical representative, and it is not clear that he believed that the application of this principle would result in the extension of slavery. As the west became more radically opposed to slavery after the troubles in Kansas, Cass was soon out of sympathy with his section, and when the Republicans secured control of the legislature in 1857 they refused to return him to the Senate. President Buchanan soon afterward made him secretary of state, and in this position he at last had the satisfaction of obtaining from the British government an acknowledgment of the correctness of the American attitude with regard to the right of search (or "visitation," as Great Britain euphemistically termed it). In December 1860 he retired from the cabinet when the president refused to take a firmer attitude against secession by reinforcing Fort Sumter, and he remained in retirement until his death at Detroit, Michigan, on the 17th of June 1866. He wrote for the *North American* and the *American Quarterly Reviews*, and published *Inquiries Concerning the History, Traditions and Languages of Indians Living Within the United States* (1823), and *France: Its King, Court and Government* (1840).

See W. T. Young, *Life and Public Services of General Lewis Cass* (Detroit, 1852); W. L. G. Smith, *Life and Times of Lewis Cass*

(New York, 1856). The best biography is by A. G. McLaughlin, *Lewis Cass* (revised edition, Boston, 1899), in the "American Statesmen" series.

**CASSABA**, a town of Asia Minor, in the sanjak of Manisa, 63 m. E. of Smyrna, with which it is connected by rail. Pop. estimated at 23,000, of which two-thirds are Mussulman; but the estimate is probably excessive. It has considerable local trade, and exports the products of the surrounding district. Cotton is the most important article, and there are ginning factories in the town; the silkworm is largely raised and exported; and the "melons of Cassaba" are sent not only to Smyrna but to Constantinople. There are fragments of marbles built into the houses, but the modern town does not seem to occupy any ancient site of importance.

**CASSAGNAC, BERNARD ADOLPHE GRANIER DE** (1806-1880), French journalist, was born at Avéron-Bergelle in the department of Gers on the 11th of August 1806. In 1832 he began his career as a Parisian journalist, contributing ardent defences of Romanticism and Conservatism to the *Revue de Paris*, the *Journal des Débats*, and to *La Presse*. Then he founded a political journal, *L'Époque* (1845-1848), in which his violent polemics in support of Guizot brought him notoriety and not a few duels. In 1851, in the *Constitutionnel*, he declared himself openly an imperialist; and in 1852 was elected as "official candidate" by the department of Gers. As journalist and deputy he actively supported an absolutist policy. He demanded the restoration of religion, opposed the laws in favour of the press, and was a member of the club of the rue de l'Arcade. In March 1868 he accused the Liberal deputies of having received money from the king of Prussia for opposing the emperor, and when called upon for proof, submitted only false or trivial documents. After the proclamation of the republic (4th of September 1870) he fled to Belgium. He returned to France for the elections of 1876, and was elected deputy. He continued to combat all the republican reforms, but with no advantage to his party. He died on the 31st of January 1880. In addition to his journalistic articles he published various historical works, now unimportant.

His son, **PAUL ADOLPHE MARIE PROSPER GRANIER DE CASSAGNAC** (1843-1904), while still young was associated with his father in both politics and journalism. In 1866 he became editor of the Conservative paper *Le Pays*, and figured in a long series of political duels. On the declaration of war in 1870 he volunteered for service and was taken prisoner at Sedan. On his return from prison in a fortress in Silesia he continued to defend the Bonapartist cause in *Le Pays*, against both Republicans and Royalists. Elected deputy for the department of Gers in 1876, he adopted in the chamber a policy of obstruction "to discredit the republican régime." In 1877 he openly encouraged MacMahon to attempt a Bonapartist *coup d'état*, but the marshal's refusal and the death of the prince imperial foiled his hopes. He now played but a secondary rôle in the chamber, and occupied himself mostly with the direction of the journal *L'Autorité*, which he had founded. He was not re-elected in 1902, and died in November 1904. His sons took over *L'Autorité* and the belligerent traditions of the family.

**CASSANA, NICCOLÒ** (1659-1714), often called NICOLETTO, Italian painter, was born at Venice, and became a disciple of his father, Giovanni Francesco Cassana, a Genoese, who had been taught the art of painting by Bernardino Strozzi ("il Prete Genovese"). Having painted portraits of the Florentine court, and also of some of the English nobility, Nicoletto was invited to England, and introduced to Queen Anne, who sat to him for her likeness, and conferred on him many marks of favour. He died in London in 1714, having given way to drinking in his later years. Cassana was a man of the most vehement temper, and would wallow on the ground if provoked with his work. One of his principal paintings is the "Conspiracy of Catiline," now in Florence.

**CASSANDER** (c. 350-297 B.C.), king of Macedonia, eldest son of Antipater, first appears at the court of Alexander at Babylon,

where he defended his father against the accusations of his enemies. Having been passed over by his father in favour of Polyperchon as his successor in the regency of Macedonia, Cassander allied himself with Ptolemy Soter and Antigonus, and declared war against the regent. Most of the Greek states went over to him, and Athens also surrendered. He further effected an alliance with Eurydice, the ambitious wife of King Philip Arrhidaeus of Macedon. Both she and her husband, however, together with Cassander's brother, Nicanor, were soon after slain by Olympias. Cassander at once marched against Olympias, and, having forced her to surrender in Pydna, put her to death (316). In 310 or 309 he also murdered Roxana and Alexander, the wife and son of Alexander the Great, whose natural son Heracles he bribed Polyperchon to poison. He had already connected himself with the royal family by marriage with Thessalonica, Alexander the Great's half-sister, and, having formed an alliance with Seleucus, Ptolemy and Lysimachus, against Antigonus, he became, on the defeat and death of Antigonus in 301, undisputed sovereign of Macedonia. He died of dropsy in 297. Cassander was a man of literary taste, but violent and ambitious. He restored Thebes after its destruction by Alexander the Great, transformed Therma into Thessalonica, and built the new city of Cassandria upon the ruins of Potidaea.

See Diod. Sic. xviii., xix., xx.; Plutarch, *Demetrius*, 18. 31. *Phocion*, 31; also MACEDONIAN EMPIRE.

**CASSANDER (OR CASSANT), GEORGE** (1513-1566), Flemish theologian, born at Pitthem near Bruges, went at an early age to Louvain and was teaching theology and literature in 1541 at Bruges and shortly afterwards at Ghent. About 1549 he removed to Cologne, where, after a profound study of the points of difference between the Catholic and reformed churches, he devoted himself to the project of reunion, thus anticipating the efforts of Leibnitz. In 1561 he published anonymously *De Officiis pii ac publicae tranquillitatis vere amantis viri in hoc dissidio religionis* (Basel), in which, while holding that no one, on account of abuses, has a right utterly to subvert the Church, he does not disguise his dislike of those who exaggerated the papal claims. He takes his standpoint on Scripture explained by tradition and the fathers of the first six centuries. At a time when controversy drowned the voice of reason, such a book pleased neither party; but as some of the German princes thought that he could heal the breach, the emperor Ferdinand asked him to publish his *Consultatio de Articulis Fidei inter Catholicos et Protestantos Controversis* (1565), in which, like Newman at a later date, he tried to put a Catholic interpretation upon Protestant formularies. While never attacking dogma, and even favouring the Roman church on the ground of authority, he criticizes the papal power and makes reflections on practices. The work, attacked violently by the Louvain theologians on one side, and by Calvin and Beza on the other, was put on the Roman Index in 1617. He died at Cologne on the 3rd of February 1566. The collected edition of his works was published in 1616 at Paris. (E. T. S.)

**CASSANDRA**, in Greek legend, daughter of Priam and Hecuba. She was beloved of Apollo, who promised to bestow on her the spirit of prophecy if she would comply with his desires. Cassandra accepted the proposal; but no sooner had she obtained the gift than she laughed at the tempter, and refused to fulfil her promise. Apollo revenged himself by ordaining that her predictions should be discredited (Apollodorus iii. 12. 5); and hence it was in vain that on the arrival of Helen she prophesied the ruin of Troy. On the capture of that city she was ravished by Ajax, the son of Oileus, in the temple of Minerva (Strabo vi. p. 264). In the distribution of the booty, Cassandra fell to the lot of Agamemnon; but again her foresight was useless, for he would not believe her prediction that he should perish in his own country. The prophecy was fulfilled, for both were slain through the intrigues of Clytemnestra (*Odyssey*, xi. 421 ff.). It is to be noticed that there is no mention in Homer of her prophetic gifts. Together with Apollo, she was worshipped under the name of Alexandra.

**CASSANO ALL' IONIO**, a town of Calabria, Italy, in the province of Cosenza; its railway station (6 m. S. of the town) is 37 m. N. by E. from the town of Cosenza, while it is 6 m. W. of Sibari, on the line between Metafonto and Reggio. Pop. 6842. It is very finely situated, 820 ft. above sea-level: the rock above it is crowned by a medieval castle commanding beautiful views: a tower is still pointed out as that from which the stone was thrown which killed Milo, but this rests on an erroneous identification of Cassano with the ancient Compaa (q.v.). There are warm sulphurous springs here which are used for baths.

**CASSAVA**, the name given to the farinaceous root of two species of Euphorbiaceae plants, the bitter cassava, *Manihot utilissima*, and the sweet cassava, *M. Aipi*; both highly important sources of food starches; Manihot is given as the native Brazilian name in Spanish writings of the 16th century. They are herbaceous or semi-shrubby perennials with very large fleshy, cylindrical, tapering roots as much as 3 ft. long and 6 to 9 in. in diameter, and filled with milky juice. The slender stems,

cleaned, sliced and dried; from such dried slices manioc or cassava meal, used for cassava cakes, &c., is prepared by rasping. The starch also is separated and used for food under the name of Brazilian arrowroot; and this, when agglomerated into pellets on hot plates, forms the tapioca (q.v.) of commerce. Cassava starch has a stellate hilum, which readily distinguishes it under the microscope from other starches.

**CASSEL**, a town of northern France in the department of Nord, 34 m. N.W. of Lille by rail. Pop. (1906) 1844. It stands on an isolated hill (515 ft.) from which portions of France, Belgium and England can be seen, with 32 towns and 100 villages, including St Omer, Dunkirk, Ypres and Ostend. The former hôtel de ville (1634), the hôtel de la Noble Cour, once the seat of the jurisdiction of maritime Flanders, now the town-hall, and the hôtel des ducs d'Halluin are the historic buildings of the town. Cassel has a communal college. Its industrial establishments include tanneries, oil-mills, salt refineries and breweries, and there is trade in cattle and butter.

The town, supposed to occupy the site of *Castellum Menapiorum*, was a Roman station, as numerous remains of the Gallo-Roman period attest, and an important centre of roads. It is frequently mentioned in the wars of the middle ages, and was the scene of important battles in 1071, when Robert, count of Flanders, vanquished his rival Arnulf; 1328, when Philip of Valois defeated the Flemish; and 1677, when William of Orange was defeated by Philip, duke of Orleans, brother of Louis XIV. General D. R. Vandamme (1770-1830) was born in the town.

**CASSEL**, or **KASSEL**, a city of Germany, capital of the former electorate of Hesse-Cassel, and, since its annexation by Prussia in 1866, capital of the province of Hesse-Nassau. Pop. (1885) 64,083; (1905) 120,446. It is pleasantly situated, in a hilly and well-wooded country, on both sides of the river Fulda, over which a stone bridge leads to the lower new town, 124 m. by rail N.N.E. from Frankfurt-on-Main. The river is navigable for barges, and railways connect the town with all parts of Germany. The streets of the old town are narrow and crooked, and contain many picturesque gabled houses, generally of the 17th century, but those of the upper and lower new town, and the three suburbs, are not surpassed by any in Germany. The principal streets are the Königs-strasse (5100 ft. long and 60 broad), the Schöne Aussicht, and the Stände-platz (180 ft. broad with four rows of linden trees). The large Friedrichs-platz is 1000 by 450 ft. in area. In it stands a marble statue of the landgrave Frederick II. There is a fine view from the open side. The former residence of the electors (*Residenzschloss*) fronts this square, as well as the Museum Fridericianum, with a *façade* of Roman-Ionic columns. The museum contains various valuable collections of curiosities, interesting mosaics, coins, casts, a library of 230,000 volumes, and valuable manuscripts. In the cabinet of curiosities there is a complete collection of clocks and watches from the earliest to the present time. Among these is the so-called Egg of Nuremberg, a watch made about 1500 by Peter Henlein. Among other public places and buildings worthy of notice are the Roman Catholic church, with a splendid interior; the Königs-platz, with a remarkable echo; the Karls-platz, with the statue of the landgrave Charles; and the Martins-platz, with a large church—St Martin—with twin towers, containing the burial-vaults of the Hessian princes. The gallery of paintings, housed in a handsome building erected in 1880 on the Schöne Aussicht, contains one of the finest small collections in Europe, especially rich in the works of Rembrandt, Frans Hals and Van Dyck.

The town contains numerous educational institutions, including a technical college, a school of painting, a celebrated classical school, which the emperor William II. attended, and a military academy. The descendants of the French refugees who founded the upper new town have a church and hospital of their own. There are three Roman Catholic churches, an English church, and two synagogues. Music is much cultivated, and there is an opera with a first-rate orchestra, of which Ludwig Spohr was at one time conductor. The opera-house or theatre was built

Cassava or Manioc (*Manihot utilissima*), less than half nat. size.

- 1, An inflorescence showing at a fruit which will presently separate into five one-seeded parts, about  $\frac{1}{2}$  nat. size.
- 2, Pistil of female flower.
- 3, Stamens and fleshy disc of male flower.
- 4, Seed with its appendage (strophiole or caruncle).

5 to 9 ft. high, bear large spreading long-stalked leaves, with the blade divided nearly to the base into three to seven long narrow segments. The plants are probably natives of South America, but the bitter cassava, which is the more important of the two in an economic sense, has been introduced into most tropical regions, and is extensively cultivated in west tropical Africa and the Malay Archipelago, from which, as well as from Brazil and other South American states, its starch in the form of tapioca is a staple article of export. The sap of the bitter cassava root contains hydrocyanic acid, and the root, being therefore highly poisonous, cannot be eaten in a fresh condition; while on the other hand the sweet cassava is perfectly innocuous, and is employed as a table vegetable. Exposure to heat dissipates the poisonous principle, and the concentrated juice is in that state used as the basis of cassareep and other sauces. From the bitter cassava roots many different food preparations are made in Brazil. The roots are preserved for use by being simply

by Jerome Napoleon, but in 1906 money was voted for a new building on the Auetor. A new Rathaus (town-hall) has been erected. There are also the Bose Museum, containing collections of pictures and antiquities of Hessian origin, museums of natural history and ethnography, an industrial exhibition hall, and an industrial art school. A handsome Gothic Lutheran church was erected in 1802-1807, a post office (Renaissance) in 1881, and new administrative offices and law courts in 1876-1880. The municipal (or Murhard) library, in the Hanau park, contains 118,000 volumes. The most noticeable of the modern public monuments are those to the emperor William I. (1898), to the musician Spohr (1883), and the Löwenbrunnen (1881). In the Karlsau, a favourite public promenade lying just below the Schöne Aussicht, are the Orangerie and the marble baths. Cassel is the headquarters of the XI. German army corps, and has a large garrison. It is a favourite residence for foreigners and retired officers and government officials. The industries embrace engine-building, the manufacture of railway carriages and plant, scientific instruments, porcelain, tobacco and cigars, lithography, jute-spinning, iron-founding, hewing and gardening.

On a slope of the Habichtswald Mountains, 3 m. W. of Cassel, and approached by an avenue, is the summer palace of Wilhelmshöhe, erected in 1787-1794. Napoleon III. resided here, as a prisoner of war, after the battle of Sedan. The surrounding gardens are adorned with fountains, cascades, lakes and grottos, the principal fountain sending up a jet of water 180 ft. high and 12 in. in diameter. Here also is an interesting building called the Löwenburg, erected in 1793-1796 in the style of a fortified castle, and containing among other things portraits of Tudors and Stuarts. The principal curiosity is the Karlsburg cascade, which is placed in a broad ravine, thickly wooded on both sides. A staircase of 900 steps leads to the top. On one of the landings is a huge rudely-carved stone figure of the giant Enceladus, and at the top is an octagon building called the Riessenschloss, surmounted by a colossal copper figure of the Farnese Hercules, 31 ft. high, whose club alone is sufficiently capacious to accommodate from eight to ten persons. In different parts of the park, and especially from the Octagon, charming views are obtained. The park was first formed by the landgrave Frederick II., the husband of Mary, daughter of George II. of England, and was finished by his successor the landgrave William, after whom it was named.

The earliest mention of Cassel is in 913, when it is referred to as Cassala. The town passed from the landgraves of Thuringia to the landgraves of Hesse in the 13th century, becoming one of the principal residences of the latter house in the 15th century. The burghers accepted the reformed doctrines in 1527. The fortifications of the town were restored by the landgrave Philip the Magnanimous and his son William IV. during the 16th century, and it was greatly improved by the landgrave Charles (1654-1730), who welcomed many Huguenots who founded the upper new town. In 1762 Cassel was captured by the Germans from the French; after this the fortifications were dismantled and New Cassel was laid out by the landgrave Frederick II. In 1807 it became the capital of the kingdom of Westphalia; in 1813 it was bombarded and captured by the Russian general Chernichev; in 1830, 1831 and 1848 it was the scene of violent commotions; from 1850 to 1851 it was occupied by the Prussians, the Bavarians and the Austrians; in 1866 it was occupied by the Prussians, and in 1867 was made the capital of the newly formed Prussian province of Hesse-Nassau.

See Piderit, *Geschichte der Haupt- und Residenzstadt Kassel* (Kassel, 1882); Fr. Müller, *Kassel seit 70 Jahren* (2 vols., 2nd ed., Kassel, 1893); and Hessler, *Die Residenzstadt Kassel und ihre Umgebung* (Kassel, 1902).

**CASSELL, JOHN** (1817-1866), British publisher, was born in Manchester on the 23rd of January 1817. His father was the landlord of a public-house, and John was apprenticed to a joiner. He was self-educated, gaining by his own efforts a considerable acquaintance with English literature and a knowledge of French. He came to London in 1836 to work at his trade, but his energies at this time were chiefly centred in the cause of temperance,

for which he was an active worker. In 1847 he established himself as a tea and coffee merchant, and soon after started a publishing business with the aim of supplying good literature to the working classes. From the offices of the firm, which became in 1859 Messrs. Cassell, Petter, Galpin & Co., were issued the *Popular Educator* (1852-1855), the *Technical Educator* (1870-1872), the *Magazine of Art* (1878-1903), *Cassell's Magazine* (from 1852), and numerous editions of standard works. A special feature of Cassell's popular books was the illustration. At the time of the Crimean War he procured from Paris the cuts used in *L'Illustration*, and by printing them in his *Family Paper* (begun in 1853) secured a large circulation for it. The firm was converted in 1883 into a limited liability company, under the name of Cassell & Company, Limited. John Cassell died in London on the 2nd of April 1865.

**CASSIA** (Lat. *cassia*, Gr. *καία*), the aromatic bark derived from *Cinnamomum cassia*. The greater part of the supply coming from China, it is sometimes termed Chinese cinnamon. The bark is much thicker than that of true cinnamon; the taste is more pungent and the flavour less delicate, though somewhat similar to that of cinnamon. The properties of cassia bark depend on the presence of a volatile oil—the oil of cassia, which is imported in a fairly pure state as an article of commerce from Canton. Cassia bark is in much more extensive demand on the continent of Europe than in Great Britain, being preferred to cinnamon by southern nations. The chief use of both the oil and bark is for flavouring liqueurs and chocolate, and in cooking generally. When ground as a spice it is difficult to distinguish cassia from cinnamon (*q.v.*), and it is a common practice to substitute the cheap common spice for the more valuable article. *Cassia Buds*, which have a pleasing cinnamon flavour, are believed to be the immature fruits of the tree which yields Chinese cinnamon. They are brought in considerable quantities from Canton, and used as a spice and in confectionery. *Cassia pulp*, used as a laxative, is obtained from the pods of *Cassia fistula*, or pudding pipe tree, a native of Africa which is cultivated in both the East and West Indies. Some confusion occasionally arises from the fact that *Cassia* is the generic name of an extensive genus of leguminous plants, which, in addition to various other medicinal products, is the source of the senna leaves which form an important article of materia medica.

**CASSIA, VIA**, an ancient high-road of Italy, leading from Rome through Etruria to Florentia (Florence); at the 11th mile the Via Clodia (see *CLODIA, VIA*) diverged north-north-west, while the Via Cassia ran to the east of the Lacus Sabatinus and then through the place now called Sette Vene, where a road, probably the Via Annia, branched off to Falerii, through Sutrium (where the Via Ciminea, running along the east edge of the Lacus Ciminius, diverged from it, to rejoin it at Aquae Passeris, north of the modern Viterbo<sup>1</sup>), Forum Cassii, Volsinii, Clusium and Arretium, its line being closely followed by the modern high-road from Rome to Florence. The date of its construction is uncertain: it cannot have been earlier than 187 B.C.<sup>2</sup> when the consul C. Flaminius constructed a road from Bononia to Arretium (which must have coincided with the portion of the later Via Cassia). It is not, it is true, mentioned by any ancient authorities before the time of Cicero, who in 45 B.C. speaks of the existence of three roads from Rome to Mutina, the Flaminia, the Aurelia and the Cassia. A milestone of A.D. 124 mentions repairs to the road made by Hadrian from the boundary of the territory of Clusium to Florence, a distance of 86 m.

See Ch. Hülsen in Pauly-Wissowa, *Realencyclopädie*, iii. 1669. (T. As.)

**CASSIANUS, JOANNES EREMITA**, or **JOANNES MASSILIENSIS** (?360-7435), a celebrated recluse, one of the first founders of monastic institutions in western Europe, was probably born in

<sup>1</sup> The Via Traiana Nova, or the (*riæ*) tres Traianæ, mentioned in inscriptions with the Cassia and Clodia as under the same *curator*, are not certainly identifiable.

<sup>2</sup> Having regard to the military importance of Arretium during the Punic wars, it is difficult to believe that no direct road existed to this point before 187 B.C.

Provence about 360, but he spent the early part of his life in the monastery of Bethlehem with his friend Germanus, and his affinities were always Eastern rather than Western. In company with Germanus he visited Egypt, and dwelt for several years among the ascetics of the desert near the banks of the Nile. In 403 he repaired to Constantinople, where he received ordination as deacon at the hands of Chrysostom. At Marseilles (after 410) he founded two religious societies—a convent for nuns, and the abbey of St Victor, which during his time is said to have contained 5000 inmates. In later times his regulations enjoyed a high reputation, and were adopted by the monks and nuns of Port Royal. He was eventually canonized; and a festival in his honour long continued to be celebrated at Marseilles on the 25th of July. Cassianus was one of the first and most prominent of the Semi-Pelagians; maintaining that while man is by nature sinful, he yet has some good remaining in him, and that, while the immediate gift of God's grace is necessary to salvation, conversion may also be begun by the exercise of man's will. He further asserted that God is always willing to bestow his grace on all who seek it, though, at the same time, it is true that he sometimes bestows it without its being sought. These views have been held by a very large part of the church from his time, and embrace much of the essence of Arminianism. The style of Cassianus is slovenly, and shows no literary polish, but its direct simplicity is far superior to the rhetorical affectations which disfigure most of the writings of that age. At the request of Castor, bishop of Apt, he wrote two monumental and influential treatises on the monastic life. The *De Institutione Coenobiorum* (twelve books) describes the dress, the food, the devotional exercises, the discipline and the special spiritual dangers of monastic life in the East (gluttony, unchastity, avarice, anger, gloom, apathy, vanity and pride). The *Collationes Patrum*, a series of dialogues with the pious fathers of Egypt, deal with the way in which these dangers (and others, e.g. demons) may be avoided or overcome. At the desire of Leo (then archdeacon of Rome) he wrote against Nestorius his *De Incarnatione Domini* in seven books.

EDITIONS.—Douay (1616) by Alardus Gazdus, with excellent notes; Migne's *Patrol. Lat.* vols. xlix. and l.; M. Petschensig in the *Vienna Corpus Script. Eccles. Lat.* (2 vols., 1886-1888). See A. Harnack, *History of Dogma*, v. 246 ff., 253 ff.; A. Hoch, *Die Lehre d. Joh. Cassian von Natur und Gnade* (Freiburg, 1895); W. Moeller, *History of the Chr. Church*, i. 368-370.

**CASSINI**, the name of an Italian family of astronomers, four generations of whom succeeded each other in official charge of the observatory at Paris.

GIOVANNI DOMENICO CASSINI (1625-1712), the first of these, was born at Perinaldo near Nice on the 8th of June 1625. Educated by the Jesuits at Genoa, he was nominated in 1650 professor of astronomy in the university of Bologna; he observed and wrote a treatise on the comet of 1652; was employed by the senate of Bologna as hydraulic engineer; and appointed by Pope Alexander VII. inspector of fortifications in 1657, and subsequently director of waterways in the papal states. His determinations of the rotation-periods of Jupiter, Mars and Venus in 1665-1667 enhanced his fame; and Louis XIV. applied for his services in 1669 at the stately observatory then in course of erection at Paris. The pope (Clement IX.) reluctantly assented, on the understanding that the appointment was to be temporary; but it proved to be irrevocable. Cassini was naturalized as a French subject in 1673, having begun work at the observatory in September 1671. Between 1671 and 1684 he discovered four Saturnian satellites, and in 1675 the division in Saturn's ring (see SATURN); made the earliest sustained observations of the zodiacal light, and published, in *Les Éléments de l'astronomie vérifiés* (1684), an account of Jean Richer's (1650-1696) geodetical operations in Cayenne. Certain oval curves which he proposed to substitute for Kepler's ellipses as the paths of the planets were named after him "Cassinians." He died at the Paris observatory on the 11th of September 1712.

A partial autobiography left by Giovanni Domenico Cassini was published by his great-grandson, Count Cassini, in his *Mémoires pour servir à l'histoire des sciences* (1810). See also C. Wolf, *Histoire*

*de l'observatoire de Paris* (1902); Max. Marie, *Histoire des sciences*, t. iv. p. 234; R. Wolf, *Geschichte der Astronomie*, p. 450, &c.

JACQUES CASSINI (1677-1756), son of Domenico Cassini, was born at the Paris observatory on the 8th of February 1677. Admitted at the age of seventeen to membership of the French Academy of Sciences, he was elected in 1696 a fellow of the Royal Society of London, and became *maître des comptes* in 1706. Having succeeded to his father's position at the observatory in 1712, he measured in 1713 the arc of the meridian from Dunkirk to Perpignan, and published the results in a volume entitled *De la grandeur et de la figure de la terre* (1720) (see GEODESY). He wrote besides *Éléments d'astronomie* (1740), and died on the 18th of April 1756 at Thury, near Clermont. The first tables of the satellites of Saturn were supplied by him in 1716.

See C. Wolf, *Histoire de l'observatoire de Paris*; Max. Marie, *Histoire des sciences*, vii. 214; R. Wolf, *Geschichte der Astronomie*, p. 451; J. C. Houzeau, *Bibl. astronomique*; J. Delambre, *Histoire de l'astronomie au XVIII<sup>e</sup> siècle*, pp. 250-275 (unfairly depreciatory); J. F. Montucla, *Hist. des mathématiques*, iv. 145, 248.

CÉSAR FRANÇOIS CASSINI, or CASSINI DE THURY (1714-1784), son of Jacques Cassini, was born at the observatory of Paris on the 17th of June 1714. He succeeded to his father's official employments, continued the hereditary surveying operations, and began in 1744 the construction of a great topographical map of France. The post of director of the Paris observatory was created for his benefit in 1771, when the establishment ceased to be a dependency of the Academy of Sciences. Cassini de Thury died at Thury on the 4th of September 1784. His chief works are:—*Méridienne de l'observatoire de Paris* (1744), *Description géométrique de la terre* (1775), and *Description géométrique de la France* (1784).

See C. Wolf, *Histoire de l'observatoire de Paris*, p. 287; Max. Marie, *Histoire des sciences*, viii. 158; J. Delambre, *Histoire de l'astronomie au XVIII<sup>e</sup> siècle*, pp. 275-309; R. Wolf, *Geschichte der Astronomie*, p. 451; J. J. de Lalande, *Bibliographie astronomique*.

JACQUES DOMINIQUE CASSINI, Count (1748-1845), son of César François Cassini, was born at the observatory of Paris on the 30th of June 1748. He succeeded in 1784 to the directorate of the observatory; but his plans for its restoration and re-equipment were wrecked in 1793 by the animosity of the National Assembly. His position having become intolerable, he resigned on the 6th of September, and was thrown into prison in 1794, but released after seven months. He then withdrew to Thury, where he died, aged ninety-seven, on the 18th of October 1845. He published in 1770 an account of a voyage to America in 1768, undertaken as the commissary of the Academy of Sciences with a view to testing Pierre Leroy's watches at sea. A memoir in which he described the operations superintended by him in 1787 for connecting the observatories of Paris and Greenwich by longitude-determinations appeared in 1791. He visited England for the purposes of the work, and saw William Herschel at Slough. He completed his father's map of France, which was published by the Academy of Sciences in 1793. It served as the basis for the *Atlas National* (1791), showing France in departments. Count Cassini's *Mémoires pour servir à l'histoire de l'observatoire de Paris* (1810) embodied portions of an extensive work, the prospectus of which he had submitted to the Academy of Sciences in 1774. The volume included his *Éloges* of several academicians, and the autobiography of his great-grandfather, the first Cassini:

See J. F. S. Devic, *Histoire de la vie et des travaux de J. D. Cassini* (1851); J. Delambre, *Histoire de l'astronomie au XVIII<sup>e</sup> siècle*, pp. 309-313; *Phil. Mag.* 3rd series, vol. xxviii. p. 412; C. Wolf, *Histoire de l'observatoire de Paris* (1902), p. 234 et passim. (A. M. C.)

**CASSIODORUS** (not *Cassiodorius*), the name of a Syrian family settled at Scyllacium (Squillace) in Bruttii, where it held an influential position in the 5th century A.D. Its most important member was FLAVIUS MAGNUS AURELIUS CASSIODORUS SENATOR (c. 490-585), historian, statesman, and monk. "Senator" (not a title) is the name used by himself in his official correspondence. His father held the offices of *comes privatarum* and *sacrorum largitionum* (controller of the emperor's private revenue and the public exchequer) under Odoacer, and subsequently

attached himself to Theodoric, by whom he was appointed *corrector* (governor) of Bruttii and Lucania, and *praefectus praetorio*. The son at an early age became *consiliarius* (legal assessor) to his father, and (probably in 507) *quaestor*, an official whose chief duty at that time consisted in acting as the mouth-piece of the ruler, and drafting his despatches. In 514 he was ordinary consul, and at a later date possibly *corrector* of his native province. At the death of Theodoric (526) he held the office of *magister officiorum* (chief of the civil service). Under Athalaric he was *praefectus praetorio*, a post which he retained till about 540, after the triumphal entry of Belisarius into Ravenna, when he retired from public life. With the object of providing for the transmission of divine and human knowledge to later ages, and of securing it against the tide of barbarism which threatened to sweep it away, he founded two monasteries—Vivarium and Castellum—in his ancestral domains at Squillace (others identify the two monasteries). The special duty which he enjoined upon the inmates was the acquisition of knowledge, both sacred and profane, the latter, however, being subordinated to the former. He also collected and emended valuable MSS., which his monks were instructed to copy, and superintended the translation of various Greek works into Latin. He further amused himself with making scientific toys, such as sun-dials and water-clocks. As he is stated to have written one of his treatises at the age of ninety-three, he must have lived till after 580. Whether he belonged to the Benedictine order is uncertain.

The writings of Cassiodorus evince great erudition, ingenuity and labour, but are disfigured by incorrectness and an affected artificiality, and his Latin partakes much of the corruptions of the age. His works are (1) historical and political, (2) theological and grammatical.

1. (a) *Variae*, the most important of all his writings, in twelve books, published in 537. They contain the decrees of Theodoric and his successors Amalasuinth, Theodahad and Witigis; the regulations of the chief officers of state; the edicts published by Cassiodorus himself when *praefectus praetorio*. It is the best source of our knowledge of the Ostrogothic kingdom in Italy (ed. T. Mommsen in *Monumenta Germaniae Historica: Auctores Antiquissimi*, xii., 1894; condensed English translation by T. Hodgkin, 1886).

(b) *Chronica*, written at the request of Theodoric's son-in-law Eutharic, during whose consulship (519) it was published. It is a dry and inaccurate compilation from various sources, unduly partial to the Goths (ed. T. Mommsen in *Mon. Germ. Hist.: Auct. Ant.* xi. pt. 1., 1893).

(c) *Fancyrics* on Gothic kings and queens (fragments ed. L. Traube in *Mon. Germ. Hist.: Auct. Ant.* xii.).

2. (a) *De Anima*, a discussion on the nature of the soul, at the conclusion of which the author deplors the quarrel between two such great peoples as the Goths and Romans. It seems to have been published with the last part of the *Variae*.

(b) *Institutiones divinarum et humanarum litterarum*, an encyclopaedia of sacred and profane literature for the monks, and a sketch of the seven liberal arts. It further contains instructions for using the library, and precepts for daily life.

(c) A commentary on the Psalms and short notes (*complexiones*) on the Pauline epistles, the Acts, and the Apocalypse.

(d) *De Orthographia*, a compilation made by the author in his ninety-third year from the works of twelve grammarians, ending with his contemporary Priscian (ed. H. Keil, *Grammatici Latini*, vii.).

The Latin translations of the *Antiquities* of Josephus and of the ecclesiastical histories of Theodoret, Sozomen and Socrates, under the title of *Historia Tripartita* (embracing the years 306-439), were carried out under his supervision.

Of his lost works the most important was the *Historia Gothorum*, written with the object of glorifying the Gothic royal house and proving that the Goths and Romans had long been connected by ties of friendship. It was published during the reign of Athalaric, and appears to have brought the history down to the death of Theodoric. His chief authority for Gothic history and legend was Ablavius (Ablavius). The work is only known to us in the meagre abridgment of Jordanes (ed. T. Mommsen, 1882).

COMPLETE WORKS.—*Éditio princeps*, by G. Fornerius (Paris, 1579); J. Gare (Rouen, 1679; Venice, 1729), reprinted in J. P. Migne, *Patrologia Latina*, lxi., lxx. On Cassiodorus generally, see *Anecdota Holderi*, excerpts from a treatise of Cassiodorus, edited by H. Usener (Bonn, 1877), which throws light on questions connected with his biography; T. Mommsen, preface to his edition of the *Variae*; monographs by A. Thorbecke (Heidelberg, 1867) and A. Fianz (Breslau, 1872); T. Hodgkin, *Italy and her Invaders*, iii. p. 280, iv. p. 348; A. Ebert, *Allgemeine Geschichte der Literatur des*

*Mittelalters*, i.; Teuffel-Schwabe, *Hist. of Roman Literature* (Eng. trans.), § 481; G. A. Simcox, *Hist. of Latin Literature* (1884); W. Ramsay in Smith's *Dictionary of Greek and Roman Biography*; J. B. Bury's edition of Gibbon's *Decline and Fall*, iv. 186, 322; R. W. Church in the *Church Quarterly Review*, x. (1880); J. E. Sandys in *Hist. of Classical Scholarship* (2nd ed., 1906); A. Olleris, *Cassiodore, conservateur des livres de l'antiquité latine* (Paris, 1891); G. Minasi, *M. A. Cassiodoro . . . ricerche storico-critiche* (Naples, 1895); and C. Cipolla in *Memoria della r. Accademia delle scienze di Torino* (2nd ser. xliii. pt. 2, 1893); L. M. Hartmann in *Paufl-Wisniewa's Realencyclopädie*, iii. pt. 2 (1899), with note on the musical section of Cassiodorus' *Institutiones* by C. von Jan.

**CASSIOPEIA**, in Greek mythology, the wife of Cepheus, and mother of Andromeda; in astronomy, a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.). Ptolemy catalogued 13 stars in this constellation, Tycho Brahe 46, and Hevelius 37. Its most interesting stars are:—*Nova Cassiopeiae*, a "new" star, which burst out with extraordinary brilliancy in 1572, when it was observed by Tycho Brahe, but gradually diminished in brightness, ultimately vanishing in about eighteen months; *a-Cassiopeiae* and *R-Cassiopeiae* are variable stars, the former irregular, the latter having a long period; *η-Cassiopeiae*, a binary star, having components of magnitudes 3½ and 7½; *ε-Cassiopeiae*, a double star, one being white and of magnitude 5, the other blue and of magnitude 7½.

**CASSITERIDES** (from the Gr. *κασσίτερος*, tin, i.e. "Tin-islands"), in ancient geography the name of islands regarded as being situated somewhere near the west coasts of Europe. Herodotus (430 B.C.) had dimly heard of them. Later writers, Posidonius, Diodorus, Strabo and others, call them smallish islands off (Strabo says, some way off) the north-west coast of Spain, which contained tin mines, or, as Strabo says, tin and lead mines—though a passage in Diodorus derives the name rather from their nearness to the tin districts of north-west Spain. While geographical knowledge of the west was still scanty and the secrets of the tin-trade were still successfully guarded by the seamen of Gades and others who dealt in the metal, the Greeks knew only that tin came to them by sea from the far west, and the idea of tin-producing islands easily arose. Later, when the west was better explored, it was found that tin actually came from two regions, north-west Spain and Cornwall. Neither of these could be called "small islands" or described as off the north-west coast of Spain, and so the Cassiterides were not identified with either by the Greek and Roman geographers. Instead, they became a third, ill-understood source of tin, conceived of as distinct from Spain of Britain. Modern writers have perpetuated the error that the Cassiterides were definite spots, and have made many attempts to identify them. Small islands off the coast of north-west Spain, the headlands of that same coast, the Scillies, Cornwall, the British Isles as a whole, have all in turn been suggested. But none suits the conditions. Neither the Spanish islands nor the Scillies contain tin, at least in serious quantities. Neither Britain nor Spain can be called "small islands off the north-west of Spain." It seems most probable, therefore, that the name Cassiterides represents the first vague knowledge of the Greeks that tin was found overseas somewhere in or off western Europe.

**AUTHORITIES**.—Herodotus iii. 115; Diodorus v. 21, 22, 38; Strabo ii. 5, iii. 2, 5, v. 11; Pliny, *Nat. Hist.* iv. 119, vii. 197, xxxiv. 156-158, are the chief references in ancient literature. T. R. Holmes, *Ancient Britain* (1907), appendix, identifies the Cassiterides with the British Isles. (F. J. H.)

**CASSITERITE** (from the Gr. *κασσίτερος*, tin), the mineralogical name for tin-stone, the common ore of tin. It consists of tin dioxide, or stannic oxide (SnO<sub>2</sub>), and crystallizes in the tetragonal system. The crystals are usually 4-sided or 8-sided prisms, striated vertically, and terminated by pyramids (fig. 1). Twins, with characteristic re-entrant angles, such as figs. 2 and 3, are common. Certain slender prismatic crystals, with an acute 8-sided pyramid, are known in Cornwall as "sparable tin," in allusion to their resemblance to sparable nails, whilst very slender crystals are termed needle-tin. Occasionally the mineral occurs in fibrous forms, which pass under the name of

"wood-tin," and these, though not unknown in the matrix, are generally found as rolled pebbles. By the disintegration of tin-bearing rocks and vein-stones, the cassiterite passes into the beds of streams as rolled fragments and grains, or even sand, and is then known as stream tin or alluvial tin. This detrital tin-ore was probably used as a source of the metal before the primitive miners had learnt to attack the solid tin-bearing rocks.

Pure cassiterite may be colourless, or white, as seen in certain specimens from the Malay Peninsula; but usually the mineral is brown or even black, the colour being referred to the presence of ferric oxide or other impurity. Occasionally the tin-stone is red. In microscopic sections the colour is often seen to be disposed in zones, following the contour of the crystal. A brown variety, with rather resinous lustre, is termed "rosin tin." The usual lustre of crystals of cassiterite is remarkably splendid, even adamantine. The mineral has a high refractive index, and strong bi-refringence. Certain transparent yellow and brown specimens, cut as gem-stones, exhibit considerable brilliancy.

FIG. 1.

FIG. 2.

FIG. 3.

The hardness of cassiterite is 6.5, so that it cannot be scratched with a knife, and is nearly as hard as quartz. Its specific gravity is about 7; and in consequence of this high density, the tin-stone is readily separated during the process of dressing, from all the associated minerals, except wolframite, which may, however, be removed by magnetic separators.

Cassiterite usually occurs as veins or impregnations in granitic rocks, and is especially associated with the quartz-mica rock called greisen. The usual associates of the tin-stone are quartz, tourmaline, apatite, topaz, beryl, fluorite, litha-mica, wolframite, chalcopyrite, &c. The presence of fluorine in many of these minerals has led to the opinion that the tin has been derived in many cases from an acid or granitic magma by the action of fluorine-bearing vapours, and that cassiterite may have been formed by the interaction of tin fluoride and water vapour. Cassiterite occurs as a pseudomorph after orthoclase feldspar in some of the altered granite of Cornwall, and it has occasionally been found as a cementing material in certain brecciated lodes.

Among the localities yielding cassiterite may be mentioned Cornwall, Saxony, Bohemia, Brittany, Galicia in Spain; the Malay peninsula, and the islands of Banca and Billiton; New South Wales, Queensland and Tasmania. Fine examples of wood-tin, occurring with topaz, are found in Durango in Mexico. Deposits of cassiterite under rather exceptional conditions are worked on a large scale in Bolivia; and it is notable that cassiterite is found in Liassic limestone near Campiglia Maritima in Tuscany. Cassiterite has been worked in the York region, Alaska. (F W R \*)

**CASSIUS**, the name of a distinguished ancient Roman family, originally patrician. Its most important members are the following.

1. **SPURIUS CASSIUS**, surnamed *Vecellinus* (*Vicellinus*, *Viscellinus*), Roman soldier and statesman, three times consul, and author of the first agrarian law. In his first consulate (502 B.C.) he defeated the Sabines; in his second (493) he renewed the league with the Latins, and dedicated the temple of Ceres

in the Circus, in his third (486) he made a treaty with the conquered Hernici. The account of his agrarian law is confused and contradictory; it is clear, however, that it was intended to benefit the needy plebeians (see *AGRARIAN LAWS*). As such it was violently opposed both by the patricians and by the wealthy plebeians. Cassius was condemned by the people as aiming at kingly power, and hurled from the Tarpeian rock. Another account says he was tried by the family council and put to death by his own father, who considered his proposal prejudicial to the patrician interest. According to Livy, his proposal to bestow a share of the land upon the Latins was regarded with great suspicion. According to Mommsen (*Römische Forschungen*, ii.), the whole story is an invention of a later age, founded upon the proposals of the Gracchi and M. Livius Drusus, to which period belongs the idea of sharing public land with the Latins.

See Livy ii. 33, 41; Dion Halic. v. 49, viii. 69-80; Cicero, *Pro Balbo*, 23 (53), *De Republica*, ii. 27 (49), 35 (60), Val. Max. v. 8. 2.

The following Cassii are all plebeians. It is suggested that the sons of Spurius Cassius either were expelled from, or voluntarily left, the patrician order, in consequence of their father's execution.

2. **GAIUS CASSIUS LONGINUS**, consul 73 B.C. With his colleague, Terentius Varro Lucullus, he passed a law (*lex Terentia Cassia*), the object of which was to give authority for the purchase of corn at the public expense, to be retailed at a fixed price at Rome. It is doubtful whether this Cassius (who is often called by the additional name Varus) is identical with the Varus who was proscribed by the triumvirs, and put to death at Minturnae (43). According to Orosius he was killed at the battle of Mutina.

See Cicero, *In Verrem*, iii. 70, 75, v. 21; Livy, *Epit.* 96; Appian, *Bell. Civ.* iv. 28; Orosius v. 24.

3. **GAIUS CASSIUS LONGINUS**, prime mover in the conspiracy against Julius Caesar. Little is known of his early life. In 53 B.C. he served in the Parthian campaign under M. Licinius Crassus, saved the remnants of the army after the defeat at Carrhae, and for two years successfully repelled the enemy. In 49 B.C. he became tribune of the plebs. The outbreak of the civil war saved him from being brought to trial for extortion in Syria. He at first sided with Pompey, and as commander of part of his fleet rendered considerable service in the Mediterranean. After Pharsalus he became reconciled to Caesar, who made him one of his legates. In 44 B.C. he became *praetor peregrinus* with the promise of the Syrian province for the ensuing year. The appointment of his junior, M. Junius Brutus, as *praetor urbanus* deeply offended him, and he was one of the busiest conspirators against Caesar, taking an active part in the actual assassination. He then left Italy for Syria, raised a considerable army, and defeated P. Cornelius Dolabella, to whom the province had been assigned by the senate. On the formation of the triumvirate, Brutus and he, with their combined armies, crossed the Hellespont, marched through Thrace, and camped near Philippi in Macedonia. Their intention was to starve out the enemy, but they were forced into an engagement. Brutus was successful against Octavian, but Cassius, defeated by M. Antonius (Mark Antony), gave up all for lost, and ordered his freedman to slay him. He was lamented by Brutus as "the last of the Romans," and buried at Thasos. A man of considerable ability, he was a good soldier, and took an interest in literature, but in politics he was actuated by vanity and ambition. His portrait in Shakespeare's *Julius Caesar*, though vivid, is scarcely historical.

See Plutarch, *Brutus*, passim, *Crassus*, 27, 29, *Caesar*, 62, 69; Dio Cassius xl. 28, xlii. 13, xlv. 14, xlvii. 20; Vell. Pat. ii. 46, 56, 58, 69, 70, 87; Cicero, *Philippics*, xi. 13, 14, *ad Att.* v. 21, xiv. 21, *ad Fam.* xi. 3, 15, 16; Appian, *Bell. Civ.* ii. 111, 113, iii. 2, 8, iv. 60-62, 87, 90, 111-113, 132; Caesar, *Bell. Civ.* iii. 101.

4. **QUINTUS CASSIUS LONGINUS**, the brother or cousin of the murderer of Caesar, quaestor of Pompey in Further Spain in 54 B.C. In 49, as tribune of the people, he strongly supported the cause of Caesar, by whom he was made governor of Further Spain. He treated the provincials with great cruelty, and his

appointment (48) to take the field against Juba, king of Numidia; gave him an excuse for fresh oppression. The result was an unsuccessful insurrection at Corduba. Cassius punished the leaders with merciless severity, and made the lot of the provincials harder than ever. At last some of his troops revolted under the quaestor M. Marcellus, who was proclaimed governor of the province. Cassius was surrounded by Marcellus in Ulia. Bogud, king of Mauretania, and M. Lepidus, proconsul of Hither Spain, to whom Cassius had applied for assistance, negotiated an arrangement with Marcellus whereby Cassius was to be allowed to go free with the legions that remained loyal to him. Cassius sent his troops into winter quarters, hastened on board ship at Malaca with his ill-gotten gains, but was wrecked in a storm at the mouth of the Iherus (Ebro). His tyrannical government of Spain had greatly injured the cause of Caesar.

See Dio Cassius xli. 15, 24, xlii. 15, 16, xliii. 29; Livy, *Epiit.* 111; Appian, *B.C.* ii. 33, 43; *Bellum Alexandrinum*, 48-64.

5. GAIUS CASSIUS LONGINUS (1st century A.D.), Roman jurist, consul in 30, proconsul of Asia 40-41, and governor of Syria under Claudius 45-50. On his return to Rome his wealth and high character secured him considerable influence. He was banished by Nero (65) to Sardinia, because among the images of his ancestors he had preserved that of the murderer of Caesar. He was recalled by Vespasian, and died at an advanced age. As he was consul in 30, he must have been born at the latest in the year 3 B.C. Cassius was a pupil of Masurius Sabinus, with whom he founded a legal school, the followers of which were called Cassiani. His chief work was the *Libri Juris Civilis* in ten books, which was used by the compilers of the *Digest* of Justinian.

See Tacitus, *Annals*, xvi. 7-9; Suetonius, *Nero*, 37; Dio Cassius lix. 29; Teuffel-Schwabe, *Hist. of Roman Literature*, § 298, 3.

CASSIUS, AVIDIUS (d. A.D. 175), Roman general, a Syrian by birth, lived during the reign of Marcus Aurelius. He especially distinguished himself during the Parthian War (A.D. 162-165), at the conclusion of which he was apparently appointed military governor of Asia, though the actual extent of his jurisdiction is doubtful. In 172 he was sent to Egypt, where he put down a dangerous rising of the Buccolici, the robber herdsmen of the delta of the Nile, after which he returned to Syria. In 175 the emperor Aurelius fell ill, and his wife Faustina, to secure her position in case of his death, offered her hand and the throne to the successful general. A rumour of Aurelius's death having reached Syria, Cassius, without waiting for confirmation, proclaimed himself emperor; when the report proved false, it was too late for him to draw back, and he accordingly prepared for war. The senate declared him a public enemy, although Aurelius even then expressed the hope that he might have the opportunity of pardoning him. Deploring the necessity for taking up arms against his trusted officer, Aurelius set out for the east. While in Illyria, he received the news that Cassius had been slain by his own officers. The murderers offered his head to Aurelius, who refused to admit them, and ordered its immediate burial.

See Dio Cassius lxxi. 2-4, 17, 22-28, 30, 31; Fronto, *Letters*, i. 6; Lives of Marcus Aurelius, Verus and Commodus in the *Scriptores Historiae Augustae*, and the special biography of Avidius Cassius in the same by Vulcacius Gallicanus. The various letters and documents in the last-named are generally considered spurious, and the portions of the narrative founded on them consequently untrustworthy. See also article in Pauly-Wissowa's *Realencyclopädie*, ii. pt. 2 (1896).

CASSIUS, GAIUS, Latin poet, general and politician, called Parmensis from his birthplace Parma, was one of the murderers of Julius Caesar, and after his death joined the party of Brutus and his namesake Cassius the conspirator. In 43 B.C. he was in command of the fleet on the coast of Asia, but after the battle of Philippi joined Sextus Pompeius in Sicily. When Pompeius, having been defeated in a naval engagement at Naulochus by the fleet of Octavian under Agrippa, fled to Asia, Cassius went over to Antony, and took part in the battle of Actium (31). He afterwards fled to Athens, where he was soon put to death by Octavian, whom he had offended by writing an abusive letter (Suetonius, *Augustus*, 4). Cassius is credited with satires, elegies, epigrams and tragedies. Some hexameters with the title *Cassii*

*Orpheus* are by Antonius Thyleusius, an Italian of the 17th century. Horace appears to have thought well of Cassius as a poet, for he asks Tibullus whether he intends to compete with the *opuscules* (probably the elegies) of Cassius (*Epistles*, l. 4. 3). The story in the Horace scholia, that L. Varius Rufus published his famous tragedy *Thyestes* from an MS. which he found amongst the papers of Cassius after his death, is due to a confusion of Cassius's murderer, Q. Attius Varius, with the tragedian (Appian, *B.C.* v. 2, 139; Cicero, *ad Fam.* xii. 13; Vell. Pat. ii. 87; Orosius, vi. 19; see also the diffuse treatise of A. Weichert, *De L. Varii d. Cassii Parmensis Vita et Carminibus*, 1836). Cassius Parmensis must not be confused with Cassius Etruscus (Horace, *Satires*, i. 10. 60), an improviser, who is said to have used enough paper to furnish his funeral pyre.

CASSIVELLAUNUS, or CASSIVELLAUNUS, a British chieftain, ruler of the country north of the Thames, who led the native tribes against Julius Caesar on his second expedition (54 B.C.) (see BRITAIN). After several indecisive engagements, Caesar took the camp of Cassivellaunus, who was obliged to make peace on condition of paying tribute and giving hostages. But these promises were not meant to be kept, and it appears certain that the tribute was never paid. According to Bede (*Hist. Eccles.* i. 2), the remains of Cassivellaunus's entrenchment were visible seven or eight centuries later.

See Caesar, *B.G.* v. 11-22; Dio Cassius xl. 2, 3; Orosius vi. 9. 6; Eutropius vi. 17; Polyaeus, *Strategemata*, viii. 23. For the etymology of the name (which is Celtic in origin, and appears later as Caswallon) see J. Rhye, *Celtic Britain*, pp. 289-290 (1904); C. I. Elton, *Origins of English History* (1890); and Stock's edition of Caesar, *De Bello Gallico* (1898).

CASSOCK (Fr. *casaque*, a military cloak), a long-sleeved, close-fitting robe worn by the clergy and others engaged in ecclesiastical functions. The name was originally specially applied to the dress worn by soldiers and horsemen, and later to the long garment worn in civil life by both men and women. As an ecclesiastical term the word "cassock" came into use somewhat late (as a translation of the old names of *subtanea*, *vestis talaris*, *toga talaris*, or *tunica talaris*), being mentioned in canon 74 of 1604; and it is in this sense alone that it now survives. The origin of the word has been the subject of much speculation. It is derived through the French from the Italian *casacca*, which Florio (*Q. Anno's New World of Words*, 1611) translates as "a frock, a horseman's cote, a long cote; also a habitation or dwelling," and it is usually held that this in turn is derived from *casa*, a house (cf. the derivation of "chastable," *q.v.*). This, however, though possible is uncertain. A Slav origin for the word has been suggested (Hatzfeld and Darmsteter, *Dic. gén. de la langue française*), and the Cossack horseman may have given to the West both the garment and the name. Or again, it may be derived from *casequin* (Ital. *casechino*), rather than vice versa, and this in turn from an Arabic *hasbyand* (Pers. *kashdyand*), a padded jerkin; the word *kasagdas* occurring in Mid. High Ger. for a riding-cloak, and *gasygaw* in O. Fr. for a padded jerkin (Lagarde in *Göt. gelehrte Anzeiger*, April 15, 1887, p. 238).

The cassock, though part of the canonical costume of the clergy, is not a liturgical vestment. It was originally the out-doors and domestic dress of lay-people as well as clergy, and its survival among the latter when the secular fashions had changed is merely the outcome of ecclesiastical conservatism. In mild weather it was the outer garment; in cold weather it was worn under the tabard or chimere (*q.v.*); sometimes in the middle ages the name "chimere" was given to it as well as to the sleeveless upper robe. In winter the cassock was often lined with furs varying in costliness with the rank of the wearer, and its colour also varied in the middle ages with his ecclesiastical or academic status. In the Roman Catholic Church the *subtanea* (Fr. *soutane*, Ital. *sottana*) must be worn by the clergy whenever they appear, both in ordinary life (except in Protestant countries) and under their vestments in church. It varies in colour with the wearer's rank: white for the pope, red (or black edged with red) for cardinals, purple for bishops, black for the lesser ranks; members of religious orders, however,

whatever their rank, wear the colour of their religious habit. In the Church of England the cassock, which with the gown is prescribed by the above-mentioned canon of 1604 as the canonical dress of the clergy, has been continuously, though not universally, worn by the clergy since the Reformation. It has long ceased, however, to be their every-day walking dress and is now usually only worn in church, at home, or more rarely by clergy within the precincts of their own parishes. The custom of wearing the cassock under the vestments is traceable in England to about the year 1400.

The old form of English cassock was a double-breasted robe fastened at the shoulder and probably girdled. The continental, single-breasted cassock, with a long row of small buttons from neck to hem, is said to have been first introduced into England by Bishop Harris of Llandaff (1729-1738). The shortened form of cassock which survives in the bishop's "apron" was formerly widely used also by the continental clergy. Its use was forbidden in Roman Catholic countries by Pope Pius IX., but it is still worn by Roman Catholic dignitaries as part of their out-of-door dress in certain Protestant countries.

See the *Report of the sub-committee of Convocation on the Ornaments of the Church and its Ministers* (London, 1908), and authorities there cited.

**CASSONE**, in furniture, the Italian name for a marriage coffer. The ancient and once almost universal European custom of providing a bride with a chest or coffer to contain the household linen, which often formed the major part of her dowry, produced in Italy a special type of chest of monumental size and artistic magnificence. The cassoni of the people, although always large in size, were simple as regards ornament; but those of the nobles and the well-to-do mercantile classes were usually imposing as regards size, and adorned with extreme richness. The cassone was almost invariably much longer than the English chest, and even at a relatively early period it assumed an artistic finish such as was never reached by the chests of northern Europe, except in the case of a few of the royal *corbeilles de mariage* made by such artists as Boulle for members of the house of France. Many of the earlier examples were carved in panels of geometrical tracery, but their characteristic ornament was either *intarsia* or *gesso*, or a mixture of the two. Bold and massive feet, usually shaped as claws, lioncels, or other animals are also exceedingly characteristic of cassoni, most of which are of massive and sarcophagus-like proportions with moulded lids, while many of them are adorned at their corners with figures sculptured in high relief. The scroll-work inlay is commonly simple and graceful, consisting of floral or geometrical motives, or arabesques. The examples coated with gilded *gesso* or hlazoned with paintings are, however, the most magnificent. They were often made of chestnut, and decorated with flowers and foliage in a relief which, low at first, became after the Renaissance very high and sharp. The panels of the painted cassoni frequently bore representations of scriptural and mythological subjects, or incidents derived from the legends of chivalry. Nor was heraldry forgotten, the arms of the family for which the chest was made being perhaps emblazoned upon the front. These chests rarely bear dates or initials, but it is often possible to determine their history from their armorial bearings.

**CASSOWARY** (*Casuarus*), a genus of struthious birds, only inferior in size to the emeu and ostrich, and, according to Sir R. Owen, approximating more closely than any other living birds to the extinct moas of New Zealand. The species are all characterized by short rudimentary wings, bearing four or five barbless shafts, a few inches long, and apparently useless for purposes of flight, of running, or of defence; and by loosely webbed feathers, short on the neck, but of great length on the rump and back, whence they descend over the body forming a thick hair-like covering. They possess stout limbs, with which they kick in front, and have the inner toe armed with a long powerful claw. The common cassowary (*Casuarus galeatus*) stands 5 ft. high, and has a horny, helmet-like protuberance on the crown of its head; the front of the neck is naked and provided with two brightly-coloured wattles. It is a native of the Island of Ceram,

where it is said to live in pairs, feeding on fruits and herbs, and occasionally on small animals. The mookuk, or Bennett's cassowary (*Casuarus Bennettsii*), is a shorter and more robust bird, approaching in the thickness of its legs to the moas. It differs further from the preceding species in having its head crowned with a horny plate instead of a helmet. It has only been found in New Britain, where the natives are said to regard it with some degree of veneration. When captured by them shortly after being hatched, and reared by the hand, it soon becomes tame and familiar; all the specimens which have reached Europe alive have been thus domesticated by the natives. The adult bird in the wild state is exceedingly shy and difficult of approach, and, owing to its great fleetness and strength, is rarely if ever caught. It eats voraciously, and, like the ostrich, will swallow whatever comes in its way. (See EMEU.)

**CAST** (from the verb meaning "to throw"; the word is Scand. in origin, cf. Dan. *kaste*, and Swed. *kasta*; "cast" in Middle Eng. took the place of the A.S. *weorpan*, cf. Ger. *werfen*), a throw, or that which is thrown, or that into which something is thrown. From these three meanings come the main uses of the word; for the throwing of dice, with the figurative sense of a chance or opportunity, as in "at the last cast"; for the throwing of a fisherman's line in fly-fishing; for hounds spreading out in search of a lost scent; or, with the further meaning of a twisted throw or turn, for a slight squint in the eye. "Cast" is applied to a measure of herrings or other fish, being the amount taken in two hands to be thrown into a vessel, and similarly to a potter's measure for a certain quantity of clay; in fishing, to the casting line of gut with fly attached; to the hard refuse thrown out of the crop of a bird of prey, and to the coils of earth thrown up by earth-worms. From the old method, in making calculations, of using counters, which were thus "thrown" up into a heap, is probably derived the meaning of "cast" for the "casting up" of figures in an account. Further, the word is found for a mould for the casting of metals, and more particularly for the copy of an original statue or relief taken from a mould; similarly, of fossils, for the mineral filling of the empty mould left by the organism. Special uses of the word are also found in the theatrical term for the assignment of particular parts to the actors and actresses in a play, and in the many figurative senses of a type or stamp, as of features or characters.

**CASTAGNO, ANDREA DEL** (1390-1457), Italian painter of the Florentine school, was born in 1390, probably at Castagno, in the district of Mugello, and died in August 1457. He imitated Masaccio and the naturalists of his time in boldness of attitude, but was deficient in grace and colouring. His name was for about four centuries hurdened with the heinous charge of murder, it was said that he treacherously assassinated his colleague, Domenico Veneziano, in order to monopolize the then recent secret of oil painting as practised in Flanders by the Van Eycks. This charge has, however, been proved to be an untruth; Domenico died four years after Andrea. The latter is commonly called "Andrea (or Andreino) degli Impiccati" (of the Hanged Men); this was in consequence of his being commissioned in 1435 to paint, in the Palazzo del Podestà in Florence, the fallen leaders of the Peruzzi and Albizzi—not (as currently said) the men of the Pazzi conspiracy, an event which did not occur until 1478, long after this painter's death. One of his principal works now extant (most of them have perished) is the equestrian figure of Nicola di Tolentino, in the cathedral of Florence.

**CASTALIA**, or **FONS CASTALII**, a celebrated fountain in Greece, now called the Fountain of St John, which rises in a chasm of Mount Parnassus, in the neighbourhood of Delphi. It was sacred to Apollo and the Muses, and its water was used in the religious purifications of the "Pythian Pilgrims." From its connexion with the Muses it is sometimes referred to by late Greek writers (e.g. Lucian, *Jup. Trag.* 30) and Latin poets (e.g. Ovid, *Am.* i. 15. 36) as a source of inspiration, and this has passed into a commonplace of modern literature. According to some authorities the nymph Castalia was the daughter of Achelous, according to others the water of the spring was derived from the Boeotian Cephissus.

**CASTANETS** (Fr. *castagnelles*, Ger. *Kastagnellen*, Span. *castañuelas*), instruments of percussion, introduced through the Moors by way of Spain into Europe from the East, used for marking the rhythm in dancing. Castanets, always used in pairs, one in each hand, consist of two pear or mussel-shaped bowls of hard wood, hinged together by a silk cord, the loop being passed over the thumb and first finger. The two halves are then struck against each other by the other fingers in single, double or triple beats, giving out series of hollow clicks of indefinite musical pitch. When intended for use in the orchestra the pair of castanets is mounted one at each end of a wooden stick about 8 in. long, which facilitates the playing. Castanets are also sometimes used in military bands and are then specially constructed. The two halves are kept open by a slight spring fixed to a frame attached to the hoop of a side drum, and the instrument is worked by the drummer with an ordinary drumstick. An instance of the use of castanets in opera occurs in the Habanera in *Carmen*. A quaint description of *castinalls* is given in Harleian MS. 2034 (f. 208) at the British Museum (before 1688) with a pencil sketch which tallies very well with the above. The MS. is by Randle Holme and forms part of the *Academy of Armoury*. Castanets (*κροτάλα*) were used by the ancient Greeks, and also by the Romans (Lat. *crotalum, crotalo*) to accompany the dances in the Dionysiac and Bacchanalian rites.

**CASTE** (through the Fr. from Span. and Port. *casta*, lineage, Lat. *castus*, pure). There are not many forms of social organization on a large scale to which the name "caste" has not been applied in a good or in a bad sense. Its Portuguese origin simply suggests the idea of family; but before the word came to be extensively used in modern European languages, it had been for some time identified with the Brahmanic division of Hindu society into classes. The corresponding Hindu word is *varna*, or colour, and the words *gati, kula, gotra, pravara* and *karana* are also used with different shades of meaning. Wherever, therefore, a writer has seen something which reminds him of any part of the extremely indeterminate notion, Indian caste, he has used the word, without regard to any particular age, race, locality or set of social institutions. Thus Palgrave<sup>1</sup> maintains that the colleges of operatives, which inscriptions prove to have existed in Britain during the Roman period, were practically castes, because by the Theodosian code the son was compelled to follow the father's employment, and marriage into a family involved adoption of the family employment. But these *collegia opificum* seem to be just the forerunners of the voluntary associations for the regulation of industry and trade, the frithgilds, and craft-gilds of later times, in which, no doubt, sons had great advantages as apprentices, but which admitted qualified strangers, and for which intermarriage was a matter of social feeling. The history of the formation of gilds shows, in fact, that they were really protests against the authoritative regulation of life from without and above. In the Saxon period, at any rate, there was nothing resembling caste in the strict sense. "The ceorl who had thriven so well as to have five hides of land rose to the rank of a thegn; his wergild became 1200 shillings; the value of his oath and the penalty of trespass against him increased in proportion; his descendants in the third generation became geseithcund. Nor was the character of the thriving defined; it might, so far as the terms of the custom went, be either purchase, or inheritance, or the receipt of royal bounty. The successful merchant might also thrive to thegn-right. The thegn himself might also rise to the rank, the estimation and status of an earl."<sup>2</sup> It has been said that early German history is, as regards this matter, in contrast with English, and that true castes are to be found in the military associations (*Genossenschaften*) which arose from the older class of Dienstmannen, and in which every member—page, squire or knight—must prove his knightly descent; the Bauernstand, or rural non-military population; the Bürgerstand, or merchant-class. The ministry of the Catholic Church in the West, was, however, never restricted

by blood relation. There is no doubt that at some time or other professions were in most countries hereditary. Thus Prescott<sup>3</sup> tells us that in Peru, notwithstanding the general rule that every man should make himself acquainted with the various arts, "there were certain individuals carefully trained to those occupations which minister to the wants of the more opulent classes. These occupations, like every other calling and office in Peru, always descended from father to son. The division of castes was in this particular as precise as that which existed in Hindustan or Egypt." Again, Zurita<sup>4</sup> says that in Mexico no one could carry on trade except by right of inheritance, or by public permission. The Fiji carpenters form a separate caste, and in the Tonga Islands all the trades, except tattoo-markers, barbers and club-carvers are hereditary,—the separate classes being named matabooles, moosas and tooas. Nothing is more natural than that a father should teach his son his handicraft, especially if there be no organized system of public instruction; it gives the father help at a cheap rate, it is the easiest introduction to life for the son, and the custom or reputation of the father as a craftsman is often the most important legacy he has to leave. The value of transmitted skill in the simple crafts was very great; and what was once universal in communities still survives in outlying portions of communities which have not been brought within the general market of exchange. But so long as this process remains natural, there can be no question of caste, which implies that the adoption of a new profession is not merely unusual, but wrong and punishable. Then, the word caste has been applied to sacred corporations. A family or a tribe is consecrated to the service of a particular altar, or all the altars of a particular god. Or a semi-sacred class, such as the Brehons or the Bards, is formed, and these, and perhaps some specially dignified professions, become hereditary, the others remaining free. Thus in Peru, the priests of the Sun at Cuzco transmitted their office to their sons; so did the Quipu-camayoc, or public registrars, and the *amanas* and *haranacs*, the learned men and singers.<sup>5</sup> In many countries political considerations, or distinctions of race, have prevented intermarriage between classes. Take, for example, the patricians and the plebeians at Rome, or the *Βραχωνάται, Αδύκιοι* or *πλεβαιοι*, and the *Ἐλευθροι* at Sparta. In Guatemala it was the law that if any noble married a plebeian woman he should be degraded to the caste of *macequal*, or plebeian, and be subject to the duties and services imposed on that class, and that the bulk of his estate should be sequestered to the king.<sup>6</sup> In Madagascar marriage is strictly forbidden between the four classes of Nobles, Hovas, Zarahovas and Andevos,—the lowest of whom, however, are apparently mere slaves. In a sense slavery might be called the lowest of castes, because in most of its forms it does permit some small customary rights to the slave. In a sense, too, the survival in European royalty of the idea of "equality of birth" (*Ebenbürtigkeit*) is that of a caste conception, and the marriage of one of the members of a European royal family with a person not of royal blood might be described as an infraction of caste rule.

Caste in India is a question of more than historical interest. It is the great obstacle to government in accordance with modern

<sup>1</sup> *History of Peru*, i. 143.

<sup>2</sup> *Rapport sur les différentes classes de chefs dans la nouvelle Espagne* (1840), p. 223.

<sup>3</sup> Something like this is to be found in the Russian notion of *chin*, or status according to official hierarchy of ranks, as modified by the custom of *myestnichestvo*, by which no one entering the public service could be placed beneath a person who had been subject to his father's orders. Hereditary nobility at one time belonged to every servant, military or civil, above a certain rank, and a family remaining out of office for two generations lost its rights of nobility; but in 1854 the privilege was confined to army colonels and state councillors of the 4th class. At one time, therefore, the *варьянские* knights, or special registers, superseded by Peter the Great's *бархатарыя* kniga, or Velvet Book, contained a complete code of social privilege and precedence. Peter's "tabel of rangkh" contained fourteen classes. The subject is treated in the 1600 articles of the ninth volume of the Russian Code *Свод Законов*. The Russian Nobility, though deprived of their exemptions from conscription, personal taxation and corporal punishment, still retain many advantages in the public service.

ideas, and to the work of native religious reformers as well as of Christian missionaries. By some writers caste has been regarded as the great safeguard of social tranquillity, and therefore as the indispensable condition of the progress in certain arts and industries which the Hindus have made. Others, such as James Mill, have denounced it as fatal to the principle of free competition and opposed to individual happiness. The latter view assumes a state of facts which was denied by Colebrooke, one of the highest authorities on Indian matters. Writing in 1798 he says,<sup>1</sup> after pointing out that any person unable to earn a subsistence by the exercise of his profession may follow the trade of a lower caste or even of a higher: "Daily observation shows even Brahmans exercising the menial profession of a Sudra. We are aware that every caste forms itself into clubs or lodges, consisting of the several individuals of that caste residing within a small distance, and that these clubs or lodges govern themselves by particular rules or customs or by-laws. But though some restrictions and limitations, not founded on religious prejudices, are found among their by-laws, it may be received as a general maxim that the occupation appointed for each tribe is entitled merely to a preference. Every profession, with few exceptions, is open to every description of persons; and the discouragement arising from religious prejudices is not greater than what exists in Great Britain from the effects of municipal and corporation laws. In Bengal the numbers of people actually willing to apply to any particular occupation are sufficient for the unlimited extension of any manufacture." This was corroborated by Elphinstone,<sup>2</sup> who states that, during a long experience of India, he never heard of a single case of degradation from caste; and it is illustrated by the experience of the Indian army, in which men of all castes unite.<sup>3</sup>

The ordinary notion of modern caste is that it involves certain restrictions on marriage, on profession, and on social intercourse, especially that implied in eating and drinking together. How far intermarriage is permitted, what are the effects of a marriage permitted but looked on as irregular, what are the penalties of a marriage forbidden, whether the rules protecting trades and occupations are in effect more than a kind of unionism grown inveterate through custom, by what means caste is lost, and in what circumstances it may be regained,—these are questions on which very little real or definite knowledge exists. Sir H. Risley regards the absolute prohibition of mixed marriages as now the essential and most prominent characteristic. It is very remarkable that the Vedas, on which the whole structure of Brahmanic faith and morals professes to rest, give no countenance to the later regulations of caste. The only passage bearing on the subject is in the Purusha Sukta, the 10th Hymn of the 10th Book of the R̥gveda Samhita. "When they divided man, how many did they make him? What was his mouth? what his arms? what are called his thighs and feet? The Brahmana was his mouth, the Raganya was made his arms, the Vaisya became his thighs, the Sudra was born from his feet." Martin Haug finds in this a subtle allegory that the Brahmans were teachers, the Kshatriyas the warriors of mankind. But this is opposed to the simple and direct language of the Vedic hymns, and to the fact that in the accounts of creation there the origin of many things besides classes of men is attributed in the same fanciful manner to parts of the divine person. It is in the Puranas and the Laws of Manu, neither of which claims direct inspiration, where they

<sup>2</sup> *History of India*.

<sup>3</sup> "The cruelties and cruelties of the caste system need not blind us to its other aspects. There is no doubt that it is the main cause of the fundamental stability and contentment by which Indian society has been braced up for centuries against the shocks of politics and the cataclysms of Nature. It provides every man with his place, his career, his occupation, his circle of friends. It makes him, at the outset, a member of a corporate body: it protects him through life from the canker of social jealousy and unfulfilled aspirations; it ensures him companionship and a sense of community with others in like case with himself. The caste organization is to the Hindu his club, his trade union, his benefit society, his philanthropic society. An Indian without caste, as things stand at present, is not quite easy to imagine." (Sidney Low, *Vision of India*, 1906, ch. xv. p. 263).

differ from the letter of the Veda, that the texts are to be found on which all that is objectionable in caste has been based. Even in the Vishnu Purana, however, the legend of caste speaks of the four classes as being at first "perfectly inclined to conduct springing from religious faith." It is not till after the whole human race has fallen into sin that separate social duties are assigned to the classes. The same hymn speaks of the evolution of qualities of Brahma. Sattva, or goodness, sprang from the mouth of Brahma; Rajas, or passion, came from his breast; Tamas, or darkness, from his thighs; others he created from his feet. For each one of these gunas, or primitive differences of quality, a thousand couples, male and female, have been created, to which the distinct heavens, or places of perfection of Prajapati, Indra, Maruts and Gandharvas are assigned. To the gunas are related the yugas, or ages: 1st, the Krita, or glorious age of truth and piety, in which apparently no distinctions, at least no grades of excellence were known; 2nd, the Treta, or period of knowledge; 3rd, the Dvapara, or period of sacrifice; 4th, the Kali, or period of darkness. Bunsen supposes there may be an historical element in the legend that Pururava, a great conqueror of the Treta age, founded caste. The yugas are hardly periods of historical chronology, but there is no doubt that the Vayu Purana assigns the definite origin of caste to the Treta period. "The perfect beings of the first age, some tranquil, some fiery, some active and some distressed, were again born in the Treta, as Brahmans, &c., governed by the good and bad actions performed in former births." The same hymn proceeds to explain that the first arrangement did not work well, and that a second was made, by which force, criminal justice and war were declared to be the business of the Kshatriyas; officiating at sacrifices, sacred study and the receipt of presents to belong to the Brahmans; traffic, cattle and agriculture to the Vaisyas; the mechanical arts and service to the Sudras. The Ramayana hymn suggests that in the four great periods the castes successively arrive at the state of *dharma* or righteousness. Thus, a Sudra cannot, even by the most rigorous self-mortification, become righteous in the period proper to the salvation of the Vaisyas. As the hymn speaks in the Dvapara age, it speaks of the salvation of Sudras as future, and not yet possible. Wholly in opposition to the story of a fourfold birth from Brahma is the legend that the castes sprang from Manu himself, who is removed by several generations of gods and demi-gods from Brahma. Then, again, the Santiparvan alleges that the world, at first entirely Brahmanic, was separated into castes merely by the evil works of man. Castehood consists in the exercise of certain virtues or vices. *Munis*, or persons born indiscriminately, frequently rise to the caste of Brahmans, and the offspring of Brahmans sink to a lower level. The serpent observes: "If a man is regarded by you as being a Brahman only in consequence of his conduct, then birth is vain, until action is shown." But this change of caste takes place only through a second birth, and not during the life which is spent in virtue. Another poetical conception of caste birth is expressed in the Harivamsa. The Brahmans were formed from an imperishable element (Akshara), the Kshatriyas from a perishable element (Kshara), the Vaisyas from alteration, and the Sudras from a modification of smoke.

The general result of the foregoing texts is that several contradictory accounts have been given of the origin of caste, and that these are for the most part unintelligible. Caste is described as a late episode in creation, and as born from different parts of different gods, from the mortal Manu, from abstract principles, and from non-entity. It is also described as coeval with creation, as existing in perfection during the Krita period, and subsequently falling into sin. It is also said that only Brahmans existed at first, the others only at later periods. Then the rationalistic theories of the Santiparvan upset the very foundation of caste, viz. hereditary transmission of the caste character.<sup>4</sup> It seems clear that when the Vedas were composed, many persons who were not Brahmans acted as priests, and saints, the "preceptors of gods," by their "austere fervour," rose from a lower rank to the dignity of Brahmanhood. Originally, indeed, access to the gods by prayer

<sup>4</sup> Muir's *Sanskrit Texts*, vol. i. (1868).

and sacrifice was open to all classes of the community. As the Brahmans grow in political importance, they make religion an exclusive and sacred business. We find them deciding questions of succession to the throne, and enforcing their decisions. While in the earlier literature there are several instances of Brahmans receiving instruction from the hands of Kshatriyas, in the Puranas and Manu deity is made to overtake Kshatriyas who are not submissive to the Brahmans; and in one case Visvamitra, the son of Gadhi, actually obtains Brahmanhood as a reward for his submission. It seems certain that many of the ancient myths were expressly manufactured by the Brahmans to show their superiority in birth and in the favour of Heaven to the Kshatriyas—a poetical effect which is sometimes spoiled by their claiming descent from their rivals. This brings us to a consideration of the theories which have been started to account for the appearance of Brahmanic caste, as it is stereotyped in the Laws of Manu. James Mill, who invariably underestimated the influence on history of "previous states of society," suggested that the original division must have been the work of some inspired individual, a legislator or a social reformer, who perceived the advantages which would result from a systematic division of labour. The subordination of castes he accounts for by the superstitious terror and the designing lust of power which have so frequently been invoked to explain the natural supremacy of the religious class. Because the ravages of war were dreaded most after the calamities sent by heaven, he finds that the military class properly occupy the second place. This arrangement he apparently contemplates as at no time either necessary or wholesome, and as finally destroyed by the selfish jealousies of caste, and by the degradations which the multiplication of trades made inevitable. Heeren<sup>1</sup> and Klaproth have contended that the division into castes is founded on an original diversity of race, and that the higher castes are possessed of superior beauty. The clear complexion and regular features of the Brahmans are said to distinguish them as completely from the Sudras as the Spanish Creoles were distinguished from the Peruvians. "The high forehead, stout build, and light copper colour of the Brahmans and other castes allied to them, appear in strong contrast with the somewhat low and wide heads, slight make, and dark bronze of the low castes" (Stevenson, quoted by Max Müller, *Chips*, ii. p. 327).<sup>2</sup> This explanation is, however, generally conjoined with that founded on the tradition of conquest by the higher castes. There is no doubt that the three castes of lighter colour (traivarnika), the white Brahmans, the red Kshatriyas, the yellow Vaisyas, are, at least in the early hymns and Brahmanas, spoken of as the Aryas, the Sanskrit-speaking conquerors, in contradistinction to the dark cloud of the Turanian aborigines Dasyus. In fact Arya, which means noble, is derived from *ārya*, which means householder, and was the original name of the largest caste, now called Vaisyas. The great Sanscrit scholar, Rudolf von Roth (1821-1895), in his *Brahma und die Brahmanen*<sup>3</sup> held that the Vedic people advanced from their home in the Punjab, drove the aborigines into the hills, and took possession of the country lying between the Ganges, the Jumna and the Vindhya range. "In this stage of complication and disturbance," he said, "power naturally fell into the hands of those who did not possess any direct authority," i.e. the domestic priests of the numerous tribal kings. The Sudras he regarded as a conquered race, perhaps a branch of the Aryan stock, which immigrated at an earlier period into India, perhaps an autochthonous

<sup>1</sup> *Ideen*, i. 610.

<sup>2</sup> The idea of a conquering white race is strangely repeated in the later history of India. The Rajputs and Brahmans are succeeded by the Mussulmans, the Turks, the Afghans. There was an aristocracy of colour under the Mogul dynasty. But under an Indian climate it could not last many generations. The Brahmans of southern India were as black as the lowest castes; the Chandals are said to be descended from Brahmans. According to Manu the Chandals must not dwell within town; his sole wealth must be dogs and asses; his clothes must consist of the mantles of deceased persons; his dishes must be broken pots. Surely this vituperative description must apply to an aboriginal race.

<sup>3</sup> *Zeitschrift der deutschen morgenländischen Gesellschaft*, Band i. (quoted by Muir, *ubi supra*).

Indian tribe. The latter hypothesis is opposed to the fact that, while the Sudra is debarred from sharing three important Vedic sacrifices, the Bhagasata Purana expressly permits him to sacrifice "without mantras," and imposes on him duties with reference to Brahmans and cows which one would not expect in the case of a nation strange in blood. But unless a previous subordination of castes among the conquering race be supposed, it seems difficult to see why the warrior-class, who having contributed most to the conquest must have been masters of the situation, should have consented to degradation below the class of Brahmans. The position of the Sudra certainly suggests conquest. But are there sound historical reasons for supposing that Brahmans and Sudras belonged to different nations, or that either class was confined to one nation? The hypothesis was held in a somewhat modified form by Meiners,<sup>4</sup> who supposed that instead of one conquest there may have been two successive immigrations,—the first immigrants being subdued by the second, and then forming an intermediate class between their conquerors and the aborigines; or, if there were no aborigines, the mixture of the two immigrant races would form an intermediate class. In the same way Talboys Wheeler<sup>5</sup> suggested that the Sudra may be the original conquerors of the race now represented by the Pariahs. Most of these explanations seem rather to describe the mode in which the existing institutions of caste might be transplanted from one land to another, from a motherland to its colonies, and altered by its new conditions. Military conquest, though it often introduces servitude, does not naturally lead to the elevation of the priesthood. It is unscientific to assume large historical events, or large ethnological facts, or the existence of some creator of social order.<sup>6</sup>

As Benjamin Constant<sup>7</sup> points out, caste rests on the religious idea of an indelible stain resting on certain men, and the social idea of certain functions being committed to certain classes. The idea of physical purity was largely developed under the Mosaic legislation; in fact the internal regulations of the Essenes (who were divided into four classes) resemble the frivolous prohibitions of Brahmanism. As the daily intercourse of men in trade and industry presents numberless occasions on which the stain of real or fancied impurity might be caught, the power of the religious class who define the rules of purity and the penalties of their violation becomes very great. Moreover, the Hindus are deeply religious, and therefore naturally prepared for Purohiti or priest-rule. They were also passionately attached to their national hymns, some of which had led them to victory, while others were associated with the benign influences of nature. Only the priest could chant or teach these hymns, and it was believed that the smallest mistake in pronunciation would draw down the anger of the gods. But however favourable the conditions of spiritual dominion might be, it seems to have been by no more natural process than hard fighting that the Brahmans finally asserted their supremacy. We are told that Parasurama, the great hero of the Brahmans, "cleared the earth three severer times of the Kshatriya caste, and filled with their blood the five large lakes of Samaut."<sup>8</sup> Wheeler thinks that the substitution of blood-sacrifices for offerings of parched grain, clarified butter and soma wine marks an adaptation by the Brahmans of the great military banquets to the purposes of political supremacy. It is not, therefore, till the Brahmanic period of Indian history, which ends with the coming of Sakya Muni, in 600 B.C., that we find the caste-definitions of Manu realized as facts. These are — "To Brahmans he (i.e. Brahma) assigned the duties of reading

<sup>4</sup> *De Origine Castarum* (Göttingen).

<sup>5</sup> *History of India*, vol. i. (1867-1871).

<sup>6</sup> For a characteristic appreciation of caste see Comte. *Cours de philosophie positive*, vi. c. 8. He regards the hereditary transmission of functions under the rule of a sacerdotal class as a necessary and universal stage of social progress, greatly modified by war and colonization. The morality of caste was, he contends, an improvement on what preceded; but its permanence was impossible, because "the political rule of intelligence is hostile to human progress." Theclusion of women and the preservation of industrial inventions were features of caste; and the higher priests were also magistrates, philosophers, artists, engineers, and physicians.

<sup>7</sup> *De la religion*, ii. 8.

the Vedas, of teaching, of sacrificing, of assisting others to sacrifice, of giving alms if they be rich, and if indigent of receiving gifts."<sup>1</sup> The duties of the Kshatriya are "to defend the people, to give alms, to sacrifice, to read the Veda, to shun the allurements of sensual gratification." The duties of a Vaisya are "to keep herds of cattle, to bestow largesses, to sacrifice, to read the scripture, to carry on trade, to lend at interest, and to cultivate land." These three castes (the twice born) wear the sacred thread. The one duty of a Sudra is "to serve the before-mentioned classes without depreciating their worth."<sup>2</sup> The Brahman is entitled by primogeniture to the whole universe; he may eat no flesh but that of victims; he has his peculiar clothes. He is bound to help military and commercial men in distress. He may seize the goods of a Sudra, and whatever the latter acquires by labour or succession beyond a certain amount. The Sudra is to serve the twice born; and even when emancipated cannot be anything but a Sudra. He may not learn the Vedas, and in sacrifice he must omit the sacred texts. A Sudra in distress may turn to a handicraft; and in the same circumstances a Vaisya may stoop to service. Whatever crime a Brahman might commit, his person and property were not to be injured; but whoever struck a Brahman with a blade of grass would become an inferior quadruped during twenty-one transmigrations. In the state the Brahman was above all the ministers; he was the raja's priest, exempt from taxation, the performer of public sacrifices, the expounder of Manu, and at one time the physician of bodies as well as of souls. He is more liable than less holy persons to pollution, and his ablutions are therefore more frequent. A Kshatriya who slandered a Brahman was to be fined 100 panas (a copper weight of 200 grains); a Vaisya was fined 200 panas; a Sudra was to be whipped. A Brahman slandering any of the lower castes pays 50, 25 or 12 panas. In ordinary salutations a Brahman is asked whether his devotion has prospered; a Kshatriya, whether he has suffered from his wounds; a Vaisya whether his health is secure; a Sudra whether he is in good health.<sup>3</sup> In administering oaths a Brahman is asked to swear by his veracity; a Kshatriya by his weapons, horse or elephant; a Vaisya by his kine, grain or goods; a Sudra by all the most frightful penalties of perjury. The Hindu mind is fertile in oaths; before the caste assembly the Dhurm, or caste custom, is sometimes appealed to, or the feet of Brahma, or some cow or god or sacred river, or the bel (the sacred creeper), or the roots of the turmeric plant. The castes are also distinguished by their modes of marriage. Those peculiar to Brahmans seem to be—1st, Brahma, when a daughter, clothed only with a single robe, is given to a man learned in the Veda whom her father has voluntarily invited and respectfully receives; 2nd, Devas or Daiva, when a daughter, in gay attire is given, when the sacrifice is already begun, to the officiating

<sup>1</sup> The great mass of the Brahmans were in reality mendicants, who lived on the festivals of birth, marriage, and death, and on the fines exacted for infractions of caste rule. Others had establishments called Muths, endowed with Jagir villages. There were two distinct orders of officiating priests—the Purohita, or family priest, who performed all the domestic rites, and probably gave advice in secular matters, and the Guru, who is the head of a religious sect, making tours of superintendence and exaction, and having the power to degrade from caste and to restore. In some cases the Guru is recognized as the Mehtra or officer of the caste assembly, from whom he receives Haks, or salary, and an exemption from house and stamp taxes, and service as beggar (Steele's *Law and Customs of Hindoo Castes within the Dekhan Provinces*, 1826; later edition, 1868). Expulsion from caste follows on a number of moral offences (e.g. assault, murder, &c.), as well as ceremonial offences (e.g. eating prohibited food, eating with persons of lower caste, abstaining from funeral rites, having connexion with a low-caste woman). Exclusion means that it is not allowed to eat with or enter the houses of the members of the caste, the offender being in theory not degraded but dead. For some heinous offences, i.e. against the express letter of the Shasters, no readmission is possible. But generally this depends on the ability of the out-caste to pay a fine, and to supply the caste with an expiatory feast of sweetmeats. He has also to go through the Sashtanyam, or prostration of eight members, and to drink the Panchakaryam, i.e. drink of the five products of the cow (*Description of People of India*, Abbé J. A. Dubois, Missionary in Mysore, Eng. Trans., London, 1817; edition by Pope, Madras, 1862).

<sup>2</sup> Manu, x. 88-90.

<sup>3</sup> Wheeler ii. 533.

priest. The primitive marriage forms of Rashassas or Rachasa, when a maiden is seized by force from home, while she weeps and calls for help, is said to be appropriate to Kshatriyas. To the two lower castes the ceremony of Asura is open, in which the bridegroom, having given as much wealth as he can afford to the father and paternal kinsman and to the damsel herself, takes her voluntarily as his bride. A Kshatriya woman on her marriage with a Brahman must hold an arrow in her hand; a Vaisya woman marrying one of the sacerdotal or military classes must hold a whip; a Sudra woman marrying one of the upper castes must hold the skirt of a mantle.

How little the system described by Manu applies to the existing castes of India may be seen in these facts—(1) that there is no artisan caste mentioned by Manu; (2) that eating with another caste, or eating food prepared by another caste, is not said by him to involve loss of caste, though these are now among the most frequent sources of degradation. The system must have been profoundly modified by the teaching of Buddha: "As the four rivers which fall into the Ganges lose their names as soon as they mingle their waters with the holy river, so all who believe in Buddha cease to be Brahmans, Kshatriyas, Vaisyas, and Sudras." After Buddha, Sudra dynasties ruled in many parts of India, and under the Mogul dynasty the Cayets, a race of Sudras, had almost a monopoly of public offices. But Buddha did not wish to abolish caste. Thus it is related that a Brahman Pundit who had embraced the doctrines of Buddha nevertheless found it necessary, when his king touched him, to wash from head to foot.<sup>4</sup> Alexander the Great found no castes in the Punjab, but Megasthenes had left an account of the ryots and tradesmen, the military order and the gymnosophists (including the Buddhist Germans) whom he found in the country of the Ganges.<sup>5</sup> From his use of the word gymnosophist it is probable that Megasthenes confounded the Brahmans with the hermits or fakirs; and this explains his statement that any Hindu might become a Brahman. Megasthenes spent some time at the court of Sandracottus (Chandragupta Maurya), a contemporary of Seleucus Nicator. All the later Greeks<sup>6</sup> follow his statement and concur in enumerating seven Indian castes—sophists, agriculturists, herdsmen, artisans, warriors, inspectors, councillors. On the revival of Brahmanism it was found that the second and third castes had disappeared, and that the field was now occupied by the Brahmans, the Sudras, and a host of mixed castes, sprung from the original twelve, Unulum and Prutilum, left-hand and right-hand, which were formed by the crossing of the four original castes. Manu himself gives a list of these impure castes, and the Ain-i-Akbari (1556-1605) makes the positive statement that there were then 500 tribes bearing the name of Kshatriya, while the real caste no longer existed. Most of these subdivisions are really trade-organizations, many of them living in village-communities, which trace descent from a pure caste. Thus in Bengal there are the Vaidya or Baidya, the physicians, who, Manu says, originated in the marriage of a Brahman father and a Vaisya mother.

As Colebrooke said, Brahmans and Sudras enter into all trades, but Brahmans (who are profoundly ignorant even of their own scriptures) have succeeded in maintaining their monopoly of Vedic learning, which really means a superficial acquaintance with the Puranas and Manu. Though they have succeeded in excluding others from sacred employment, only a portion of the caste are actually engaged in religious ceremonies, in sacred study, or even in religious begging. Many are privates in the army, many water-carriers, many domestic servants. And they have, like other castes, many subdivisions which prevent intimate association and intermarriage. The ideal Brahman is gone: the priest "with his hair and beard clipped, his passions subdued, his mantle white, his body pure, golden rings in his ear." But the hold which caste has on the Hindu minds may, perhaps, be most clearly seen in the history of the Christian missions and in comparatively recent times. The Jesuits Xavier and Fra dei

Nobli did everything but become Brahmans in order to convert the south of India—they put on a dress of cavy or yellow colour, they made frequent ablutions, they lived on vegetables and milk, they put on their foreheads the sandalwood paste used by the Brahmans—and Gregory XV. published a bull sanctioning caste regulations in the Christian churches of India. The Danish mission of Tranquebar, the German mission of the heroic Schwarz, whose headquarters were Tanjore, also permitted caste to be retained by their followers. Even the priests of Buddha, whose life was a protest against caste, re-erected the system in the island of Ceylon, where the *radis* or *radias* were reduced to much the same state as the Pariahs.<sup>1</sup> Protestant missions have made but little progress, even in recent years. The number of native converts to Christianity rose from 1,246,000 in 1872 to 2,664,000 in 1901; these figures, however, are by themselves rather misleading, for Christianity appears to have touched the higher classes in India not at all, only the out-castes.

It is still the general law that to constitute a good marriage the parties must belong to the same caste, hut to unconnected families. Undoubtedly, however, the three higher castes were always permitted to intermarry with the caste next below their own, the issue taking the lower caste or sometimes forming a new class. A Sudra need not marry a wife of the same caste or sect as himself. In 1871 it was decided by the judicial committee of the privy council that a marriage between a zemindar (landowner) of the Malavar class, a subdivision of the Sudra caste, with a woman of the Vellala class of Sudras is lawful. Generally also a woman may not marry beneath her own caste. The feeling is not so strong against a man marrying even in the lowest caste, for Manu permits the son of a Brahman and a Sudra mother to raise his family to the highest caste in the seventh generation. The illegitimacy resulting from an invalid marriage does not render incapable of caste; at least it does not so disqualify the lawful children of the bastard. On a forfeiture of caste by either spouse intercourse ceases between the spouses: if the out-caste be a sonless woman, she is accounted dead, and funeral rites are performed for her; if she have a son, he is bound to maintain her. It is remarkable that the professional concubinage of the dancing-girl does not involve degradation, if it be with a person of the same caste. This suggests that whatever may be the function of caste, it is not a safe guardian of public morality. The rules as to prohibited degrees in marriage used to be very strict, but they are now relaxed. An act of 1856 legalized re-marriage by widows in all the castes, with a conditional forfeiture of the deceased husband's estate, unless the husband has expressly sanctioned the second marriage. The later Indian Marriage Act was directed against the iniquitous child marriages; it requires a *minimum* age. In many ways the theoretical inferiority of the Sudra absolves him from the restraints which the letter of the law lays on the higher castes. Thus a Sudra may adopt a daughter's or sister's son, though this is contrary to the general rule that the adopter should be able to marry the mother of the adopted person. The rule requiring the person adopted to be of the same caste and *gotra* or family as the adopter is also dispensed with in the case of Sudras. In fact, it is only a married person whom a Sudra may not adopt. As regards inheritance the Sudra does not come off so well in competition with the other castes. "The sons of a Brahmana in the several tribes have four shares or three or two or one; the children of a Kshatriya have three portions or two or one; and those of a Vaisya take two parts or one." This refers to the case permitted by law, and not unknown in practice, of a Brahman having four wives of different castes, a Kshatriya three, and so on. But all sons of inferior caste are excluded from property coming by gift to the father; and a Sudra son is also excluded from land acquired by purchase. It must be recollected, however, that under an act of 1850, *loss* of caste no longer affects the capacity to inherit or to be adopted. In cases of succession *ab intestato* on failure of the preceptor, pupil, and fellow-student (heirs called by the Hindu law after relatives), a priest, or any Brahman, many succeed. Where a Sudra is the only son of a

<sup>1</sup> Irving, *Theory and Practice of Caste* (London, 1859).

Brahman, the Sapinda, or next of kin, would take two-thirds of the inheritance; where he is the only son of any other twice-born father, the Sapinda would take one-half. Possibly, the rule of equal division among sons of equal caste did not at first apply to Brahmans, who, as the eldest sons of God, would perhaps observe the custom of primogeniture among themselves. On the other hand it was laid down in the judicial committee in 1860, contrary to the collected opinions of the Pundits of the Sudder court, that, in default of lawful children, the illegitimate children of the Sudra caste inherit their putative father's estate, and, even if there be lawful children, are entitled to maintenance out of the estate. It had previously been decided by Sir Edward Ryan in 1857 that the illegitimate children of a Rajput, or of any other member of a superior caste, have no right of inheritance even under will, but a mere right to maintenance, provided the children are docile. It seems then that the Kshatriya and Vaisya castes, though in one sense non-existent, still control Hindu succession.

With regard to Persia the *Zend Avesta* speaks of a fourfold division of the ancient inhabitants of Iran into priests, warriors, agriculturists and artificers; and also of a sevenfold division corresponding to the seven *amshespands*, or servants of Ormuzd. This was no invention of Zoroaster, but a tradition from the golden age of Jemshid or Diemshid. The priestly caste of Magi was divided into Herbeds or disciples, Mobeds or masters, and Destur Mobeds or complete masters. The last-named were alone entitled to read the liturgies of Ormuzd; they alone predicted the future and carried the sacred *casti*, or girdle, *havan*, or cup, and *barsom*, or bunch of twigs. The *Zend word baresma* is supposed to be connected with Brahma, or sacred element, of which the symbol was a bunch of kusa grass, generally called *veda*. The Persian and Hindu religions are further connected by the ceremony called Homa in the one and Soma in the other. Haug, in his *Tract on the Origin of Brahmanism* (quoted by Muir, *ubi supra*), maintains that the division in the *Zend Avesta* of the followers of Ahura Mazda into Atharvas, Rathaesvas, and Vastrya was precisely equivalent to the three superior Indian castes. He also asserts that only the sons of priests (Atharvas) could become priests, a rule still in force among the Parsis. The Book of Daniel rather suggests that the Magi were an elective body; and as regards the secular classes there does not seem to be a trace of hereditary employment or religious subordination. There is a legend in the Dabistan of a great conqueror, Mahabad, who divided the Abyssinians into the usual four castes; and Strabo mentions a similar classification of the Iberians into kings, priests, soldiers, husbandmen and menials.

At one time it was the universal opinion that in Egypt there were at least two great castes, priests and warriors, the functions of which were transmitted from father to son, the minor professions grouped under the great castes being also subject to hereditary transmission. This opinion was held by Oufried Müller,<sup>2</sup> Meiners of Göttingen, and others. Doubts were first suggested by Rossellini, and after Champollion had deciphered the hieroglyphic inscriptions, J. J. Ampère<sup>3</sup> boldly announced that there were in Egypt no castes strictly so called; that in particular the professions of priest, soldier, judge, &c., were not hereditary; and that the division of Egyptian society was merely that which is generally found in certain stages of social growth between the liberal professions and the mechanical arts and trades. No difference of colour, or indeed of any feature, has been observed in the monumental pictures of the different Egyptian castes. From an inspection of numerous tombs, sarcophagi, and funeral stones, which frequently enumerate the names and professions of several kinsfolk of the deceased, Ampère concluded that sacerdotal and military functions were sometimes united in the same person, and might even be combined with civil functions; that intermarriage might certainly take place between the sacred and military orders; and that the members of the same natural family did frequently adopt the different occupations which had been supposed to be the exclusive property of the castes. The tombs of Beni Hassan show in a striking manner the

<sup>2</sup> *Manual of Archaeology*.

<sup>3</sup> *Revue des deux mondes*, 15th September 1848

Egyptian tendency to accumulate, rather than to separate, employments. Occasionally families were set apart for the worship of a particular divinity. An interesting "section" of Egyptian society is afforded by a granite monument preserved in the museum at Naples. Nine figures in bas-relief represent the deceased, his father, three brothers, a paternal uncle, and the father and two brothers of his wife. Another side contains the mother, wife, wife's mother and maternal aunts. The deceased is described as a military officer and superintendent of buildings; his elder brother as a priest and architect; his third brother as a provincial governor, and his father as a priest of Ammon. The family of the wife is exclusively sacerdotal. Egyptian caste, therefore, permitted two brothers to be of different castes, and one person to be of more castes than one, and of different castes from those to which his father or wife belonged. The lower employments, commerce, agriculture, even medicine, are never mentioned on the tomb. The absolute statements about caste in Egypt, circulated by such writers as Reynier and De Coguet, have, no doubt, been founded on passages in Herodotus (ii. 143, 164), who mentions seven classes, and makes war an hereditary profession; in Diodorus Siculus (i. 2-8), who mentions five classes and a hereditary priesthood; and in Plato, who, anxious to illustrate the principle of compulsory division of labour, on which his republic was based, speaks in the *Timæus* of a total separation of the six classes—priests, soldiers, husbandmen, artisans, hunters and shepherds. Heeren (ii. 594) does not hesitate to ascribe the formation of Egyptian caste to the meeting of different races. According to the chronology constructed by Bunsen the division into castes began in the period 10,000-9000, and was completed along with the introduction of animal worship and the improvement of writing under the third dynasty in the 6th or 7th century of the Old Empire. The Scholiast of Apollonius Rhodius, on the authority of Dicaearchus, in the Second Book of *Hellas*, mentions a king, Sesonchosis, who, about 3712 B.C., "enacted that no one should abandon his father's trade, for this he considered as leading to avarice." Bunsen conjectures that this may refer to Sesostoris, the lawgiver of Manetho's third or Memphite dynasty, the eighth from Menes, who introduced writing, building with hewn stone, and medicine; possibly, also, to Sesostri, who, Aristotle says (*Polit.* vii. 1), introduced caste to Crete. He further observes that in Egypt there was never a conquered indigenous race. There was one nation with one language and one religion; the public panegyrics embraced the whole people; every Egyptian was the child and friend of the gods. The kings were generally warriors, and latterly adopted into the sacerdotal caste. Intermarriage was the rule, except between the swineherds and all other classes. "Every shepherd is an abomination unto the Egyptians" (*Gen.* xlv. 34).

The comprehensive essay by Sir H. H. Risley in the introductory volume of the Indian Census Report for 1901 is the best recent account of caste in India. See also, besides the works mentioned in the text, Sir Denzil Ibbetson's *Report on the Punjab Census* (1881); W. Crooke, *Things Indian* (1905) and other books by this author on Indian religion and caste; Senart, *Les Castes dans l'Inde* (1896); Jopendra Nath Bhattacharya, *Hindu Castes and Sects* (1896). There is an interesting chapter on the subject in Sidney Low's *View of India* (1906). See also INDIA, INDIAN LAW, and HINDUISM.

**CASTEL, LOUIS BERTRAND** (1688-1757), French mathematician, was born at Montpellier on the 11th of November 1688, and entered the order of the Jesuits in 1703. Having studied literature, he afterwards devoted himself entirely to mathematics and natural philosophy. He wrote several scientific works, that which attracted most attention at the time being his *Optique des couleurs* (1740), or treatise on the melody of colours. He endeavoured to illustrate the subject by a *clavicé oculaire*, or ocular harpsichord; but the treatise and the illustration were quickly forgotten. He also wrote *Mathématique universelle* (1728) and *Traité de physique sur la pesanteur universelle des corps* (1724). He also published a critical account of the system of Sir Isaac Newton in French in 1743.

**CASTELAR Y RIPOLL, EMILIO** (1832-1899), Spanish statesman, was born at Cadix on the 8th of September 1832. At the age of seven he lost his father, who had taken an active part in

the progressist agitations during the reign of Ferdinand VII., and had passed several years as an exile in England. He attended a grammar-school at Sax. In 1848 he began to study law in Madrid, but soon elected to compete for admittance at the school of philosophy and letters, where he took the degree of doctor in 1853. He was an obscure republican student when the Spanish revolutionary movement of 1854 took place, and the young liberals and democrats of that epoch decided to hold a meeting in the largest theatre of the capital. On that occasion Castelar delivered his maiden speech, which at once placed him in the van of the advanced politicians of the reign of Queen Isabella. From that moment he took an active part in politics, radical journalism, literary and historical pursuits. Castelar was compromised in the first rising of June 1866, which was concerted by Marshal Prim, and crushed, after much bloodshed, in the streets by Marshals O'Donnell and Serrano. A court-martial condemned him *in contumaciam* to death by "garote vil," and he had to hide in the house of a friend until he escaped to France. There he lived two years until the successful revolution of 1868 allowed him to return and enter the Cortes for the first time—as deputy for Saragossa. At the same time he resumed the professorship of history at the Madrid university. Castelar soon became famous by his rhetorical speeches in the Constituent Cortes of 1869, where he led the republican minority in advocating a federal republic as the logical outcome of the recent revolution. He thus gave much trouble to men like Serrano, Topete and Prim, who had never harboured the idea of drifting into advanced democracy, and who had each his own scheme for re-establishing the monarchy with certain constitutional restrictions. Hence arose Castelar's constant and vigorous criticisms of the successive plans mooted to place a Hohenzollern, a Portuguese, the duke of Montpensier, Espartero and finally Amadeus of Savoy on the throne. He attacked with relentless vigour the short-lived monarchy of Amadeus, and contributed to its downfall.

The abdication of Amadeus led to the proclamation of the federal republic. The senate and congress, very largely composed of monarchists, permitted themselves to be dragged along into democracy by the republican minority headed by Salmeron, Figueras, Pi y Margall and Castelar. The short-lived federal republic from the 11th of February 1873 to the 3rd of January 1874 was the culminating point of the career of Castelar, and his conduct during those eleven months was much praised by the wiser portion of his fellow-countrymen, though it alienated from him the sympathies of the majority of his quondam friends in the republican ranks.

Before the revolution of 1868, Castelar had begun to dissent from the doctrines of the more advanced republicans, and particularly as to the means to be employed for their success. He abhorred bloodshed, he disliked mob rule, he did not approve of military *pronunciamientos*. His idea would have been a parliamentary republic on the American lines, with some traits of the Swiss constitution to keep in touch with the regionalist and provincialist inclinations of many parts of the peninsula. He would have placed at the head of his commonwealth a president and Cortes freely elected by the people, ruling the country in a liberal spirit and with due respect for conservative principles, religious traditions and national unity. Such a statesman was sure to clash with the doctrinaires, like Salmeron, who wanted to imitate French methods; with Pi y Margall, who wanted a federal republic after purely Spanish ideas of decentralization; and above all with the intransigent and gloomy fanatics who became the leaders of the cantonal insurrections at Cadiz, Seville, Valencia, Malaga and Cartagena in 1873.

At first Castelar did his best to work with the other republican members of the first government of the federal republic. He accepted the post of minister for foreign affairs. He even went so far as to side with his colleagues, when serious difficulties arose between the new government and the president of the Cortes, Señor Martos, who was backed by a very imposing commission composed of the most influential conservative members of the last parliament of the Savoyard king, which had

suspended its sittings shortly after proclaiming the federal republic. A sharp struggle was carried on for weeks between the executive and this commission, at first presided over by Martos, and, when he resigned, by Salmeron. In the background Marshal Serrano and many politicians and military men steadily advocated a *coup d'état* in order to avert the triumph of the republicans. The adversaries of the executive were prompted by the captain-general of Madrid, Pavia, who promised the co-operation of the garrison of the capital. The president, Salmeron, and Marshal Serrano himself lacked decision at the last moment, and lost time and many opportunities by which the republican ministers profited. The federal republicans became masters of the situation in the last fortnight of April 1873, and turned the tables on their adversaries by making a pacific bloodless *pronunciamiento*.

The battalions of the militia that had assembled in the bull-ring near Marshal Serrano's house to assist the anti-democratic movement were disarmed, and their leaders, the politicians and generals, were allowed to escape to France or Portugal. The Cortes were dissolved, and the federal and constituent Cortes of the republic convened, but they only sat during the summer of 1873, long enough to show their absolute incapacity, and to convince the executive that the safest policy was to suspend the session for several months.

This was the darkest period of the annals of the Spanish revolution of 1873-1874. Matters got to such a climax of disorder, disturbance and confusion, from the highest to the lowest strata of Spanish society, that the president of the executive, Figueras, deserted his post and fled the country. Pi y Margall and Salmeron, in successive attempts to govern, found no support in the really important and influential elements of Spanish society. Salmeron had even to appeal to such well-known reactionary generals as Pavia, Sanchez, Bregna and Moriones, to assume the command of the armies in the south and in the north of Spain. Fortunately these officers responded to the call of the executive. In less than five weeks a few thousand men properly handled sufficed to quell the cantonal risings in Cordoba, Sevilla, Cadiz and Malaga, and the whole of the south might have been soon pacified, if the federal republican ministers had not once more given way to the pressure of the majority of the Cortes, composed of "Intransigents" and radical republicans. The president, Salmeron, after showing much indecision, resigned, but not until he had recalled the general in command in Andalusia, Pavia. This resignation was not an unfortunate event for the country, as the federal Cortes not only made Castelar chief of the executive, though his partisans were in a minority in the Parliament, but they gave him much liberty to act, as they decided to suspend the sittings of the house until 2nd January 1874. This was the turning-point of the Spanish revolution, as from that day the tide set in towards the successive developments that led to the restoration of the Bourbons.

On becoming the ruler of Spain at the beginning of September 1873, Castelar at once devoted his attention to the reorganization of the army, whose numbers had dwindled down to about 70,000 men. This force, though aided by considerable bodies of local militia and volunteers in the northern and western provinces, was insufficient to cope with the 60,000 Carlists in arms, and with the still formidable nucleus of cantonalists around Alcoy and Cartagena. To supply the deficiencies Castelar called out more than 100,000 conscripts, who joined the colours in less than six weeks. He selected his generals without respect of politics, sending Moriones to the Basque provinces and Navarre at the head of 20,000 men, Martinez Campos to Catalonia with several thousand, and Lopez Dominguez, the nephew of Marshal Serrano, to begin the land blockade of the last stronghold of the cantonal insurgents, Cartagena, where the crews of Spain's only fleet had joined the revolt.

Castelar next turned his attention to the Church. He renewed direct relations with the Vatican, and at last induced Pope Pius IX. to approve his selection of two dignitaries to occupy vacant sees as well as his nominee for the vacant archbishopric of Valencia, a prelate who afterwards became archbishop of

Toledo, and remained to the end a close friend of Castelar. He put a stop to all persecutions of the Church and religious orders, and enforced respect of Church property. He attempted to restore some order in the treasury and administration of finance, with a view to obtain ways and means to cover the expense of the three civil wars, Carlist, cantonal and Cuban. The Cuban insurgents gave him much trouble and anxiety, the famous *Virginus* incident nearly leading to a rupture between Spain and the United States. Castelar sent out to Cuba all the reinforcements he could spare, and a new governor-general, Jovellar, whom he peremptorily instructed to crush the mutinous spirit of the Cuban militia, and not allow them to drag Spain into a conflict with the United States. Acting upon the instructions of Castelar, Jovellar gave up the filibuster vessels, and those of the crew and passengers who had not been summarily shot by General Burriel. Castelar always prided himself on having terminated this incident without too much damage to the prestige of Spain.

At the end of 1873 Castelar had reason to be satisfied with the results of his efforts, with the military operations in the peninsula, with the assistance he was getting from the middle classes and even from many of the political elements of the Spanish revolution that were not republican. On the other hand, on the eve of the meeting of the federal Cortes, he could indulge in no illusions as to what he had to expect from the bulk of the republicans, who openly dissented from his conservative and conciliatory policy, and announced that they would reverse it on the very day the Cortes met. Warnings came in plenty, and no less a personage than the man he had made captain-general of Madrid, General Pavia, suggested that, if a conflict arose between Castelar and the majority of the Cortes, not only the garrison of Madrid and its chief, but all the armies in the field and their generals, were disposed to stand by the president. Castelar knew too well what such offers meant in the classic land of *pronunciamientos*, and he refused so flatly that Pavia did not renew his advice. The sequel is soon told. The Cortes met on the 2nd of January 1874. The intransigent majority refused to listen to a last eloquent appeal that Castelar made to their patriotism and common sense, and they passed a vote of censure. Castelar resigned. The Cortes went on wrangling for a day and night until, at daybreak on the 3rd of January 1874, General Pavia forcibly ejected the deputies, closed and dissolved the Cortes, and called up Marshal Serrano to form a provisional government.

Castelar kept apart from active politics during the twelve months that Serrano acted as president of the republic. Another *pronunciamiento* finally put an end to it in the last week of December 1874, when Generals Campos at Sagunto, Jovellar at Valencia, Primo de Rivera at Madrid, and Laserna at Logroño, proclaimed Alphonso XII. king of Spain. Castelar then went into voluntary exile for fifteen months, at the end of which he was elected deputy for Barcelona. He sat in all subsequent parliaments, and just a month before his death he was elected as representative of Murcia. During that period he became even more estranged from the majority of the republicans. Bitter experience had shown him that their federal doctrines and revolutionary methods could lead to nothing in harmony with the aspirations of the majority of Spaniards. He elected, to use his own words, to defend and to seek the realization of the substance of the programme of the Spanish revolution of 1868 by evolution, and legal, pacific means. Hence the contrast between his attitude from 1876 to 1886, during the reign of Alphonso XII., when he stood in the front rank of the Opposition to defend the reforms of that revolution against Señor Canovas, and his attitude from 1886 to 1891. In this latter period Castelar acted as a sort of independent auxiliary of Sagasta and of the Liberal party. As soon as Castelar saw universal suffrage re-established he solemnly declared in the Cortes that his task was accomplished, his political mission at an end, and that he proposed to devote the remainder of his life to those literary, historical, philosophical, and economic studies which he had never neglected even in the busiest days of his political career. Indeed, it was his extraordinary activity and power of

assimilation in such directions that allowed him to keep his fellow-countrymen so well informed of what was going on in the outer world. His literary and journalistic labours occupied much of his time, and were his chief means of subsistence. He left unfinished a history of Europe in the 19th century. The most conspicuous of his earlier works were:—*A History of Civilization in the First Five Centuries of Christianity, Recollections of Italy, Life of Lord Byron, The History of the Republican Movement in Europe, The Redemption of Slaves, The Religious Revolution, Historical Essays on the Middle Ages, The Eastern Question, Fra Filippo Lippi, History of the Discovery of America*, and some historical novels. Castelar died near Murcia on the 25th of May 1890, at the age of 66. His funeral at Madrid was an imposing demonstration of the sympathy and respect of all classes and parties.

(A. E. H.)

**CASTELFRANCO NELL' EMILIA**, a town of Emilia, Italy, in the province of Bologna, 16 m. N.W. by rail from the town of Bologna. Pop. (1901) 3163 (town), 13,484 (commune). The churches contain some pictures by later Bolognese artists. Just outside the town is a massive fort erected by Urban VIII. in 1628, on the frontier of the province of Bologna, now used as a prison. Castelfranco either occupies or lies near the site of the ancient Forum Gallorum, a place on the Via Aemilia between Mutina and Bononia, where in 43 B.C. Octavian and Hirtius defeated Mark Antony.

**CASTELFRANCO VENETO**, a town and episcopal see of Venetia, Italy, in the province of Treviso, 16 m. W. by rail from the town of Treviso. Pop. (1901) 5220 (town), 12,551 (commune). The older part of the town is square, surrounded by mediæval walls and towers constructed by the people of Treviso in 1218 (see *CITTADELLA*). It was the birthplace of the painter Giorgio Barbarelli (II Giorgione, 1477–1512), and the cathedral contains one of his finest works, the Madonna with SS. Francis and Liberalis (1504), in the background of which the towers of the old town may be seen.

**CASTELL, EDMUND** (1606–1685), English orientalist, was born in 1606 at Tadlow, in Cambridgeshire. At the age of fifteen he entered Emmanuel College, Cambridge, but afterwards changed his residence to St John's, on account of the valuable library there. His great work was the compiling of his *Lexicon Heptaglotton Hebraicum, Chaldaicum, Syriacum, Samaritanum, Aethiopicum, Arabicum, et Persicum* (1669). Over this book he spent eighteen years, working (if we may accept his own statement) from sixteen to eighteen hours a day; he employed fourteen assistants, and by an expenditure of £12,000 brought himself to poverty, for his lexicon, though full of the most unusual learning, did not find purchasers. He was actually in prison in 1667 because he was unable to discharge his brother's debts, for which he had made himself liable. A volume of poems dedicated to the king brought him preferment. He was made prebendary of Canterbury and professor of Arabic at Cambridge. Before undertaking the *Lexicon Heptaglotton*, Castell had helped Dr Brian Walton in the preparation of his Polyglott Bible. His MSS. he bequeathed to the university of Cambridge. He died in 1685 at Higham Gobion, Bedfordshire, where he was rector.

The Syriac section of the *Lexicon* was issued separately at Göttingen in 1788 by J. D. Michaelis, who offers a tribute to Castell's learning and industry. Trier published the Hebrew section in 1790–1792.

**CASTELLANMARE DI STABIA** (anc. *Stabiae*), a seaport and episcopal see of Campania, Italy, in the province of Naples, 17 m. S.E. by rail from the town of Naples. Pop. (1901) town, 26,378; commune, 32,589. It lies in the south-east angle of the Bay of Naples, at the beginning of the peninsula of Sorrento, and owing to the sea and mineral water baths (12 different springs) and its attractive situation, with a splendid view of Vesuvius and fine woods on the hills behind, it is a favourite resort of foreigners in spring and autumn and of Neapolitans in summer. The castle from which it takes its name, on the hill to the south of the town, was built by the emperor Frederick II. There are three large churches of the late 18th century. There are a large royal dockyard and a small-arms factory;

there are also iron works, cotton, flour and macaroni mills. The value of imports (chiefly coal, wheat, scrap-iron and cheese) for 1904 was £1,239,048, and the value of exports (chiefly macaroni and green fruit) £769,100. There is also a sponge trade, but the former coral trade is depressed. The port was cleared by 420 vessels of 477,713 tonnage in 1905. An electric tramway along the coast road to Sorrento was opened in 1905.

**CASTELLESÌ, ADRIANO** (c. 1460?–c. 1521?), known also as CORNETO from his birthplace, Italian cardinal and writer, was sent by Innocent VIII. to reconcile James III. of Scotland with his subjects. While in England he was appointed (1503), by Henry VII., to the see of Hereford, and in the following year to the more lucrative diocese of Bath and Wells, but he never resided in either. Returning to Rome, he became secretary to Alexander VI. and was made by him cardinal (May 31, 1503). A man of doubtful reputation, Alexander's confidant and favourite, he paid the pope a large sum for his elevation. He bought a *vigna* in the Borgo near the Vatican, and thereon erected a sumptuous palace after designs by Bramante; and it was here, in the summer of 1503, that he entertained the pope and Cesare Borgia at a banquet that went on till nightfall despite the unhealthy season of the year, when ague in its most malignant form was rife. Of the three, Cardinal Adrian was the first to fall ill, the pope succumbing a week after. The story of the poisoning of the pope is to be relegated to the realm of fiction. Soon after the election of Leo X. the cardinal was implicated in the conspiracy of Cardinal Petrucci against the pope, and confessed his guilt; but, pardon being offered only on condition of the payment of 25,000 ducats, he fled from Rome and was subsequently deposed from the cardinalate. As early as 1504 he had presented his palace (now the Palazzo Giraud-Torlonia) to Henry VII. as a residence for the English ambassador to the Holy See; and on his flight Henry VIII., who had quarrelled with him, gave it to Cardinal Campeggio. Adrian first fled to Venice. Of his subsequent history nothing is known for certain. It is said that he was murdered by a servant when on his way to the conclave that elected Adrian VI. As a writer, he was one of the first to restore the Latin tongue to its pristine purity; and among his works are *De Vera Philosophia ex quatuor doctoribus ecclesiae* (Bologna, 1507), *De Sermone Latino* (Basel, 1513), and a poem, *De Venatione* (Venice, 1534).

See Polydore Vergil, *Anglicae historiae*, edited by H. Ellis (London, 1844); and A. Aubrey, *Histoire générale des cardinaux* (Paris, 1642). (E. T.N.)

**CASTELLI, IGNAZ FRANZ** (1781–1862), Austrian dramatist, was born at Vienna on the 6th of March 1781. He studied law at the university, and then entered the government service. During the Napoleonic invasions his patriotism inspired him to write stirring war songs, one of which, *Kriegslied für die österreichische Armee*, was printed by order of the archduke Charles and distributed in thousands. For this Castelli was proclaimed by Napoleon in the *Moniteur*, and had to seek refuge in Hungary. In 1815 he accompanied the allies into France as secretary to Count Cavriani, and, after his return to Vienna, resumed his official post in connexion with the estates of Lower Austria. In 1842 he retired to his property at Lilienfeld, where, surrounded by his notable collections of pictures and other art treasures, he for the rest of his life devoted himself to literature. Castelli's dramatic talent was characteristically Austrian; his plays were well constructed and effective and satirized unsparingly the foibles of the Viennese. But his wit was too local and ephemeral to appeal to any but his own generation, and if he is remembered at all to-day it is by his excellent *Gedichte in niederösterreichischer Mundart* (1828). He died at Lilienfeld on the 5th of February 1862.

Castelli's *Gesammelte Gedichte* appeared in 1835 in 6 vols.; a selection of his *Werke* in 1843 in 15 vols. (2nd ed., 1848), followed by 6 supplementary volumes in 1858. His autobiography, *Memoiren meines Lebens*, appeared in 1861–1862 in 4 vols.

**CASTELLO, BERNARDO** (1557–1629), Genoese portrait and historical painter, born at Alvaro near Genoa, was the intimate friend of Tasso, and took upon himself the task of designing the figures of the *Gerusalemme Liberata*, published in 1592;

some of these subjects were engraved by Agostino Caracci. Besides painting a number of works in Genoa, mostly in a rapid and superficial style, Castello was employed in Rome and in the court of the duke of Savoy.

**CASTELLO, GIOVANNI BATTISTA** (1500?–1560?), Italian historical painter, was born near Bergamo in 1500 or perhaps 1509, and is hence ordinarily termed Il Bergamasco. He belongs, however, to the school of Genoa, but does not appear to have had any family relationship with the other two painters named Castello, also noticed here. He was employed to decorate the Nunziata di Portoria in Genoa, the saloon of the Lanzi Palace at Gorlago, and the Pardo Palace in Spain. His best-known works are the "Martyrdom of St Sebastian," and the picture of "Christ as Judge of the World" on one of the vaultings of the Annunziata. He was an architect and sculptor as well as painter. In 1567 he was invited to Madrid by Philip II., and there he died, holding the office of architect of the royal palaces. The date of death (as of birth) is differently stated as 1569 or 1579.

**CASTELLO, VALERIO** (1625–1650), Italian painter, was the youngest son of Bernardo Castello (q.v.). He surpassed his father, and particularly excelled in painting battle-scenes. He painted the "Rape of the Sabines," now in the Palazzo Brignole, Genoa, and decorated the cupola of the church of the Annunziata in the same city. In these works he is regarded by his admirers as combining the fire of Tintoretto with the general style of Paolo Veronese.

**CASTELLO BRANCO, CAMILLO, VISCONDE DE CORREIA BORELHO** (1825–1890), Portuguese novelist, was born out of wedlock and lost his parents in infancy. He spent his early years in a village in Traz-os-Montes. He learnt to love poetry from Camoens and Bocage, while Mendes Pinto gave him a lust for adventure, but he dreamed more than he read, and grew up undisciplined and proud. He studied in Oporto and Coimbra with much irregularity, and since his disdain for the intrigues and miseries of politics in Portugal debarred him from the chance of a government post, he entered the career of letters to gain a livelihood. After a spell of journalistic work in Oporto and Lisbon he proceeded to the Episcopal seminary in the former city with a view of studying for the priesthood, and during this period wrote a number of religious works and translated Chateaubriand. He actually took minor orders, but his restless nature prevented him from following one course for long and he soon returned to the world, and henceforth kept up a feverish literary activity to the end. He was created a viscount in 1885 in recognition of his services to letters, and when his health finally broke down and he could no longer use his pen, parliament gave him a pension for life. When, having lost his sight, and suffering from chronic nervous disease, he died by his own hand in 1890, it was generally recognized that Portugal had lost the most national of her modern writers.

Apart from his plays and verses, Castello Branco's works may be divided into three sections. The first comprises his romances of the imagination, of which *Os mysterios de Lisboa*, in the style of Victor Hugo, is a fair example. The second includes his novels of manners, a style of which he was the creator and remained the chief exponent until the appearance of *O Crime de Padre Amaro* of Eça de Queiroz. In these he is partly idealist and partly realist, and describes to perfection the domestic and social life of Portugal in the early part of the 19th century. The third division embraces his writings in the domain of history, biography and literary criticism. Among these may be cited *Noites de Lamego*, *Cousas leves e pesadas*, *Covar em ruínas*, *Memorias do Bispo do Grão Para* and *Bohemia do Espirito*.

In all, his publications number about two hundred and sixty, belonging to many departments of letters, but he owes his great and lasting reputation to his romances. Notwithstanding the fact that his slender means obliged him to produce very rapidly to the order of publishers, who only paid him from £30 to £60 a book, he never lost his individuality under the pressure. Knowing the life of the people by experience and not from books, he was able to fix in his pages a succession of strongly

marked and national types, such as the *brasilero*, the old *fidalgo* of the north, and the Minho priest, while his lack of personal acquaintance with foreign countries and his relative ignorance of their literatures preserved him from the temptation, so dangerous to a Portuguese, of imitating the classical writers of the larger nations. Among the most notable of his romances are *O Romance de um Homem Rico*, his favourite, *Retrato de Ricardina*, *Amor de Perdição*, and the magnificent series entitled *Novelas do Minho*. Many of his novels are autobiographical, like *Onde está a felicidade*, *Memorias do Carcere* and *Vingança*. Castello Branco is an admirable story-teller, largely because he was a brilliant improvisatore, but he does not attempt character study. Nothing can exceed the richness of his vocabulary, and no other Portuguese author has shown so profound a knowledge of the popular language. Though nature had endowed him with the poetic temperament, his verses are mediocre, but his best plays are cast in bold lines and contain really dramatic situations, while his comedies are a triumph of the grotesque, with a mordant vein running through them that recalls Gil Vicente.

The collected works of Camillo Castello Branco are published by the Companhia Editora de Lisbon, and his most esteemed books have had several editions. The *Dicionario Bibliographico Portuguez*, vol. ix. p. 7 et seq., contains a lengthy but incomplete list of his publications. See *Romance do Romancista*, by A. Pimentel, a badly put together but informing biography; also a study on the novelist by J. Pereira de Saavedra in *A Geracao Nova* (Oporto, 1886); Dr Theophilus Braga, *As Modernas Ideias na literatura Portugueza* (Oporto, 1892); Padre Senna Freitas, *Perfil de Camillo Castello Branco* (S. Paulo, 1887); and Paulo Osorio, *Camillo, a sua vida, o seu genio, e sua obra* (Oporto, 1908). (E. Pa.)

**CASTELLÓN BRANCO**, an episcopal city and the capital of an administrative district formerly included in the province of Beira, Portugal; 1560 ft. above the sea, on the Abrantes-Guarda railway. Pop. (1900) 7288. Numerous Roman remains bear witness to the antiquity of Castello Branco, but its original name is unknown. The city is dominated by a ruined castle, and partly enclosed by ancient walls; its chief buildings are the cathedral and episcopal palace. Cloth is manufactured, and there is a flourishing local trade in cork, wine and olive oil. The administrative district of Castello Branco, which comprises the valleys of the Zezere, Ocreza and Ponsul, right-hand tributaries of the Tagus, coincides with the south-eastern part of Beira; pop. (1900) 216,608; area, 2582 sq. m.

**CASTELLÓN DE LA PLANA**, a maritime province of eastern Spain, formed in 1833 of districts formerly included in Valencia, and bounded on the N. by Teruel and Tarragona, E. by the Mediterranean Sea, S. by Valencia, and W. by Teruel. Pop. (1900) 310,828; area, 2495 sq. m. The surface of the province is almost everywhere mountainous, and flat only near the coast and along some of the river valleys. Even on the coast the Atalayas de Alcalá and the Desierto de las Palmas form two well-defined though not lofty ridges. The Mijares or Millares is the principal river, flowing east-south-east from the highlands of Teruel, between the Sierras of Espina and Espadan towards the south, and the peak called Peña Golosa (5945 ft.) towards the north, until it reaches the sea a little south of the capital, also called Castellón de la Plana. The Monlleo, a left-hand tributary of the Mijares; the Bergantes, which flows inland to join the Guadalope in Teruel; the Cenia, which divides Castellón from Tarragona; and a variety of lesser streams, render the province abundantly fertile. No considerable inlet breaks the regularity of the coast-line, and there is no first-class harbour. The climate is cold and variable in the hilly districts, temperate in winter and very warm in summer in the lowlands. Agriculture, fruit-growing, and especially the cultivation of the vine and olive, employ the majority of the peasantry; stock-farming and sea-fishing are also of importance. Lead, zinc, iron and other ores have been discovered in the province; but in 1901, out of 129 mining concessions registered, only two were worked, and their output, lead and zinc, was quite insignificant. The local industries are mainly connected with fish-curing, paper, porcelain, woollens, cotton, silk, esparto, brandy and oak. Wine, oranges and oil are exported to foreign countries and

other parts of Spain. The important Barcelona-Valencia railway skirts the coast, passing through the capital; and the Calatayud-Sagunto line crosses the southern extremity of the province. Elsewhere the roads, which are generally indifferent, form the sole means of communication. Castellón (29,904), Villarreal (16,068), the port of Burriana (12,962), and Peñíscola (3,142), a town of some historical interest, are described in separate articles. The other chief towns are Alcalá de Chisbert (6,993), Almazora (7076), Benicarló (7251), Maella (7335), Onda (6595), Segorbe (7045), Vall de Uxó (8643), Villafamés (6708) and Vinaroz (8625).

**CASTELLÓN DE LA PLANA**, the capital of the province described above, on the Barcelona-Valencia railway, 4 m. from the Mediterranean Sea. Pop. (1906) 29,904. The broad and fertile plain in which Castellón is built is watered artificially by a Moorish aqueduct, largely cut through the solid rock, and supplied by the estuary of the Mijares, 5 m. south-east. The town is partly encircled by ancient walls; and, although most of its public buildings are modern, it contains several convents of early foundation, a curious old bell-tower, 150 ft. high, and a parish church chiefly noteworthy for a painting in the interior by Francisco Ribalta, who was born here in the middle of the 16th century. Castellón has a brisk trade, its manufactures comprising porcelain, leather, silk, linen, brandy and cork goods. Its harbour, El Gráo de Castellón, about 4 m. east, is annually entered by some 200 small vessels. A light railway, which traverses the numerous and profitable orange plantations on the south-west, connects it with the towns of Almazora, Villarreal, Burriana and Onda. Under its Moorish rulers Castellón occupied a hill to the north of its present site; its removal to the plain by James I. of Aragon (1213-1276) gave the town its full name, "Castellón de the Plain."

**CASTELNAU, MICHEL DE, SEUR DE LA MAUVISSIÈRE** (c. 1520-1592), French soldier and diplomatist, ambassador to Queen Elizabeth, was born in Touraine about 1520. He was one of a large family of children, and his grandfather, Pierre de Castelnau, was equerry to Louis XII. Endowed with a clear and penetrating intellect and remarkable strength of memory, he received a careful education, to complete which he travelled in Italy and made a long stay at Rome. He then spent some time in Malta, afterwards entered the army, and made his first acquaintance with war in the campaigns of the French in Italy. His abilities and his courage won for him the friendship and protection of the cardinal of Lorraine, who took him into his service. In 1557 a command in the navy was given to him, and the cardinal proposed to get him knighted. This, however, he declined, and then rejoined the French army in Picardy. Various delicate missions requiring tact and discretion were entrusted to him by the constable de Montmorency, and these he discharged so satisfactorily that he was sent by the king, Henry II., to Scotland with despatches for Mary Stuart, then betrothed to the dauphin (afterwards Francis II.). From Scotland he passed into England, and treated with Queen Elizabeth respecting her claims on Calais (1559), a settlement of which was effected at the congress of Cateau-Cambrésis. He was next sent as ambassador to the princes of Germany, for the purpose of prevailing upon them to withdraw their favour from the Protestants. This embassy was followed by missions to Margaret of Parma, governess of the Netherlands, to Savoy, and then to Rome, to ascertain the views of Pope Paul IV. with regard to France. Paul having died just before his arrival, Castelnau used his influence in favour of the election of Pius IV. Returning to France, he once more entered the navy, and served under his former patron. It was his good fortune, at Nantes, to discover the earliest symptoms of the conspiracy of Amboise, which he immediately reported to the government.

After the death of Francis II. (December 1560) he accompanied the queen, Mary Stuart, to Scotland, and remained with her a year, during which time he made several journeys into England, and attempted to bring about a reconciliation between Mary and Queen Elizabeth. The wise and moderate counsels which he offered to the former were unheeded. In 1562, in

consequence of the civil war in France, he returned there. He was employed against the Protestants in Brittany, was taken prisoner in an engagement with them and sent to Havre, but was soon after exchanged. In the midst of the excited passions of his countrymen, Castelnau, who was a sincere Catholic, maintained a wise self-control and moderation, and by his counsels rendered valuable service to the government. He served at the siege of Rouen, distinguished himself at the battle of Dreux, took Tancarville, and contributed in 1563 to the recapture of Havre from the English.

During the next ten years Castelnau was employed in various important missions:—first to Queen Elizabeth, to negotiate a peace; next to the duke of Alba, the new governor of the Netherlands. On this occasion he discovered the project formed by the prince of Condé and Admiral Coligny to seize and carry off the royal family at Monceaux (1567). After the battle of St Denis he was again sent to Germany to solicit aid against the Protestants; and on his return he was rewarded for his services with the post of governor of Saint-Dizier, and a company of orderlies. At the head of his company he took part in the battles of Jarnac and Moncontour. In 1572 he was sent to England by Charles IX. to allay the excitement created by the massacre of St Bartholomew, and the same year he was sent to Germany and Switzerland. Two years later he was reappointed by Henry III. ambassador to Queen Elizabeth, and he remained at her court for ten years. During this period he used his influence to promote the marriage of the queen with the duke of Alençon, with a view especially to strengthen and maintain the alliance of the two countries. But Elizabeth made so many promises only to break them that at last he refused to accept them or communicate them to his government. On his return to France he found that his château of La Mauvissière had been destroyed in the civil war; and as he refused to recognize the authority of the League, the duke of Guise deprived him of the governorship of Saint-Dizier. He was thus brought almost to a state of destitution. But on the accession of Henry IV., the king, who knew his worth, and was confident that although he was a Catholic he might rely on his fidelity, gave him a command in the army, and entrusted him with various confidential missions.

Castelnau died at Joinville in 1592. His *Mémoires* rank very high among the original authorities for the period they cover, the eleven years between 1559 and 1570. They were written during his last embassy in England for the benefit of his son; and they possess the merits of clearness, veracity and impartiality. They were first printed in 1621; again, with additions by Le Laboureur, in 2 vols. folio, in 1659; and a third time, still further enlarged by Jean Godefroy, 3 vols. folio, in 1731. Castelnau translated into French the Latin work of Ramus, *On the Manners and Customs of the Ancient Gauls*. Various letters of his are preserved in the Cottonian and Harleian collections in the British Museum.

His grandson, JACQUES DE CASTELNAU (1620-1658), distinguished himself in the war against Austria and Spain during the ministries of Richelieu and Mazarin, and died marshal of France.

See Hubault, *Ambassade de Castelnau en Angleterre* (1856); *Relations politiques de la France . . . avec l'Écosse au seizième siècle*, edited by J. B. A. T. Teulet (1862); and De la Ferrière, *Les Projets de mariage d'Élisabeth* (1883).

**CASTELNAUDARY**, a town of south-western France, capital of an arrondissement in the department of Aude, 22 m. W.N.W. of Carcassonne, on the Southern railway between that city and Toulouse. Pop. (1906) 6650. It is finely situated on an elevation in the midst of a fertile and well-cultivated plain; and its commercial facilities are greatly increased by the Canal du Midi, which widens out, as it passes the town, into an extensive basin surrounded with wharves and warehouses for the timber used in the upkeep of the canal. The principal buildings are the law court, the hôtel de ville, and the church of St Michel, dating from the 14th century; none of these offers any feature of unusual interest. There are a number of flour-mills, as well as manufactories of earthenware, tiles and blankets; an extensive

trade is maintained in lime, gypsum, timber, grain, fruits, wine, wool, cattle and farm implements, and the building of canal boats forms an important industry. The public institutions include the sub-prefecture, tribunals of first instance and of commerce, a communal college and a farm school.

Castelnaudary probably represents the ancient town of *Sostomagus*, taken during the 5th century by the Visigoths, who, it is conjectured, rebuilt the town, calling it *Castrum Novum Ariarorum*, whence the present name. Early in the 13th century the town was the scene of several struggles during the war against the Albigenses, between Simon IV., count of Montfort, and Raymond VI., count of Toulouse, and their supporters. In 1229 it was deprived of its ramparts, and after these had been rebuilt, it was captured and burned by the Black Prince in 1355, but again rebuilt in 1366. In 1632 it was the scene of a cavalry engagement in which the rebel Henry II., duke of Montmorency, was defeated and captured by the royal troops.

**CASTELSARRASIN**, a town of south-western France, capital of an arrondissement in the department of Tarn-et-Garonne, 12 m. W. of Montauban on the Southern railway. Pop. (1906) town, 3189; commune, 7496. Castelsarrasin, situated on the left bank of the lateral canal of the Garonne and about a mile from the right bank of that river, is surrounded by promenades occupying the site of the old fortifications. Its chief building is the brick-built church of St Sauveur, which dates from the 13th century. The administrative buildings are modern. The town has a sub-prefecture, a tribunal of first instance, and a communal college. The principal industrial establishment is the metal-foundry of Sainte-Marguerite, where copper, tin and other metals are worked; there are also flour-mills, saw-mills and dye-works. Trade is in cattle, agricultural produce, wine, baskets and game.

The name Castelsarrasin appears in the 13th century, when the village of Villelongue was replaced by the present bastide. *Castrum Cerrucium*, *Castel-sur-Azine* (from the neighbouring stream, *Azine*) and *Castellum Sarracenum* are suggested derivations, no one of which can be adopted with certainty.

**CASTI, GIOVANNI BATTISTA** (1721-1803), Italian poet, was born of humble parents at Montefiascone, in the states of the church, in 1721. He rose to the dignity of canon in the cathedral of his native place, but gave up his chance of church preferment to satisfy his gay and restless spirit by visiting most of the capitals of Europe. In 1782, on the death of Metastasio, he was appointed *Poeta Cæsario*, or poet-laureate of Austria, in which capacity he applied himself with great success to the opera bouffe; but in 1796 he resigned this post, in order that he might not be hampered by political relations; and he spent the close of his life as a private gentleman at Paris, where he died in 1803. Casti is best known as the author of the *Novelle galanti*, and of *Gli Animali parlanti*, a poetical allegory, over which he spent eight years (1794-1802), and which, notwithstanding its tedious length, excited so much interest that it was translated into French, German and Spanish, and (very freely and with additions) into English, in W. S. Rose's *Court and Parliament of Beasts* (Lond., 1819). Written during the time of the Revolution in France, it was intended to exhibit the feelings and hopes of the people and the defects and absurdities of various political systems. The *Novelle Galanti* is a series of poetical tales, in the *ottava rima*—a metre largely used by Italian poets for that class of compositions. The sole merit of these poems consists in the harmony and purity of the style, and the liveliness and sarcastic power of many passages. They are, however, characterized by the grossest licentiousness; and there is no originality of plot—that, according to the custom of Italian novelists, being taken from classical mythology or other ancient legends. Among the other works of Casti is the *Poema Tartaro*, a mock-heroic satire on the court of Catherine II., with which he was personally acquainted.

**CASTIGLIONE, BALDASSARE** (1478-1529), Italian diplomatist and man of letters, was born at Casanatico near Mantua, and was educated at Milan under the famous professors Merula and Chalcondyles. In 1496 he entered the service of Lodovico Sforza, duke of Milan, returning to Mantua in 1500 when Lodovico was

carried prisoner into France. In 1504 he was attached to the court of Guidobaldo Malatesta, duke of Urbino, and in 1506 he was sent by that prince on a mission to Henry VII. of England, who had before conferred on Federigo Malatesta, "the Good Duke," the most famous mercenary of his age, the order of the Garter. Guidobaldo dying childless in 1508, the duchy of Urbino was given to Francesco Maria della Rovere, for whom Castiglione, envoy at the court of Leo X. (Medici), obtained the office of generalissimo of the Papal troops. Charged with the arrangement of the dispute between Clement VII. (Medici) and Charles V., Castiglione crossed, in 1524, into Spain, where he was received with highest honours, being afterwards naturalized, and made bishop of Avila. In 1527, however, Rome was seized and sacked by the Imperialists under Bourbon, and in July of the same year the surrender of the castle of Sant' Angelo placed Clement in their hands. Castiglione had been tricked by the emperor, but there were not wanting accusations of treachery against himself. He had, however, placed fidelity highest among the virtues of his ideal "courtier," and when he died at Toledo in 1529 it was said that he had died of grief and shame at the imputation. The emperor mourned him as "one of the world's best cavaliers." A portrait of him, now at the Louvre, was painted by Raphael, who disdained neither his opinion nor his advice.

Castiglione wrote little, but that little is of rare merit. His verses, in Latin and Italian, are elegant in the extreme; his letters (Padua, 1769-1771) are full of grace and finesse. But the book by which he is best remembered is the famous treatise, *Il Cortegiano*, written in 1514, published at Venice by Aldus in 1528, and translated into English by Thomas Hoby as early as 1561. This book, called by the Italians *Il Libro d'oro*, and remarkable for its easy force and undemonstrative elegance of style no less than for the nobility and manliness of its theories (see the edition by V. Cian, Florence, 1894), describes the Italian gentleman of the Renaissance under his brightest and fairest aspect, and gives a charming picture of the court of Guidobaldo da Montefeltre, duke of Urbino, "confessedly the purest and most elevated court in Italy." In the form of a discussion held in the duchess's drawing-room—with Elizabetta Gonzaga, Pietro Bembo, Bernardo Bibbiena, Giuliano de' Medici, Emilia Pia, and Ceretino the Unique among the speakers—the question, What constitutes a perfect courtier? is debated. With but few differences, the type determined on is the ideal gentleman of the present day.

See P. L. Ginguet, *Histoire littéraire de l'Italie*, vi., vii.; J. A. Symonds, *The Renaissance in Italy* (London, 1875); C. Harr, *Courts and Camps of the Italian Renaissance* (1908); Julia Cartwright, *B. Castiglione, the Perfect Courtier* (1908), with good bibliography.

**CASTIGLIONE, CARLO OTTAVIO**, COUNT (1784-1849), Italian philologist, was born at Milan of an ancient family. His principal work was done in connexion with the Arabic and other Oriental languages, but he also performed good service in several other departments. In 1819 he published *Monete cufiche del Museo di Milano*, and assisted Cardinal Mai in his *Uphilæ partium ineditarum in Ambrosianis palimpsestis repertarum editio*. A learned *Mémoire géographique et numismatique sur la partie orientale de la Barbarie appelée Afrika par les Arabes* appeared in 1826, and established his reputation. In 1829 he published by himself the Gothic version of the second epistle of Paul to the Corinthians; and this was followed by the Gothic version of the epistle to the Romans, the first epistle to the Corinthians, and the epistle to the Ephesians in 1834, by Galatians, Philippians, and 1 Thessalonians in 1835, and by 2 Thessalonians in 1839. He died at Genoa on the 10th of April 1849.

His *Life*, by Biondelli, appeared at Milan in 1856.

**CASTIGLIONE, GIOVANNI BENEDETTO** (1616-1670), called in Italy Il Grechetto, and in France Le Bénédette, Italian painter of the Genoese school, was born in Genoa, and studied for some time under Vandyck. He painted portraits, historical pieces and landscapes, but chiefly excelled in fairs, markets and rural scenes with animals. Noah and the animals entering the

**Ark** was a favourite subject of his. His paintings are to be found in Rome, Venice, Naples, Florence, and more especially Genoa and Mantua. He also executed a number of etchings, which are spirited, free and full of taste; "Diogenes searching for a Man" is one of the principal of these. The etchings are remarkable for light and shade, and have even earned for Castiglione the name of "a second Rembrandt." The *Presepio* (Nativity of Jesus) in the church of San Luca, Genoa, ranks among his most celebrated paintings, and the Louvre contains eight characteristic examples. In his closing years he lived in Mantua, painting for the court; here he received his name of "Grechetto," from the classic air of his pastorals, and here he died of gout in 1670. His brother Salvatore and his son Francesco excelled in the same subjects; and it is thought that many paintings which are ascribed to Benedetto are only copies after him, or perhaps originals by his son or brother.

**CASTIGLIONE DELLE STIVIERE**, a town of Lombardy, Italy, in the province of Mantua, 20 m. N.W. of Mantua by road. Pop. (1901) 4122 (town), 5940 (commune). It has an old castle, much altered and restored, especially by the Gonzaga family of Mantua in the 16th century. During the War of the Spanish Succession, the French under the duke of Vendôme occupied it; and during the siege of Mantua in 1706, the Austrians under Würmsér were defeated here by the French under Augereau, who was later created by Napoleon duke of Castiglione.

**CASTIGLIONE OLONA**, a town of Lombardy, Italy, in the province of Como, 27 m. N.E. of Milan by rail. Pop. (1901) 1806. The choir of the collegiate church, erected about 1428 by Cardinal Branda Castiglione, contains fine frescoes by Masolino of Florence: there are other works by the same master in the baptistery. The tomb of the cardinal (1443) is good. The church of S. Sepolcro, in the lower part of the town, has two large stone figures of saints on its façade (of the end of the 13th century) and, within, painted wooden figures and the tomb of Guido Castiglione (d. 1485) with fine sculptures of the school of Amadeo. The palace erected by Cardinal Castiglione has good terra-cotta decorations.

**CASTILE**, or **CASTILLE** (*Castilla*), an ancient kingdom of Spain, occupying the central districts of the Iberian Peninsula; and bounded on the N. by the Bay of Biscay, N.E. by the Basque Provinces and Navarre, E. by Aragon, S.E. by Valencia and Murcia, S. by Andalusia, W. by Estremadura and Leon, and N.W. by Asturias. Pop. (1900) 3,708,713; area, 55,307 sq. m. The name *Castile* is commonly said to be derived from the numerous frontier forts (*castillos*) erected in the middle ages as a defence against the Moors. The northern part of the kingdom, which was first freed from Moorish rule, is called Old Castile (*Castilla la Vieja*); the southern, acquired later, is called New Castile (*Castilla la Nueva*). These two divisions, with a third known as North Castile, now rank as military districts or captaincies-general; but the term "North Castile," which covers the northern extremity of Old Castile, is not generally used. In 1833 Old Castile was divided into the provinces of Ávila, Burgos, Logroño, Palencia, Santander, Segovia, Soria and Valladolid; while New Castile was similarly divided into Ciudad Real, Cuenca, Guadalajara, Madrid and Toledo. The modern progress of commerce, communications, &c. in these thirteen provinces is described in the separate articles upon each of them.

Castile extends for about 300 m. from north to south, and 160 m. from east to west. It consists of a vast central plateau, with an average altitude of about 2500 ft. This plateau has a natural frontier of high mountains on all sides, except on the borders of Leon and Murcia; it is also bisected by the Sierra de Guadarrama and Sierra de Grédos, which extend in a south-westerly direction across the central districts, and form the dividing line between Old and New Castile. Geographically it includes also the high plains of Leon, towards the north-west, and of Murcia on the south-east. The existing frontier is marked on the north by the Cantabrian Mountains (*q.v.*); on the east by the Sierra de la Demaña with its offshoots, and by the

Serranía de Cuenca; on the south by the Sierra Morena; and on the west by various minor ranges which link together the three more or less parallel chains of the Sierra de Grédos, Sierra de Guadalupe and Sierra Morena. Three great rivers, the Douro, which traverses Old Castile, with the Tagus and Guadiana, which respectively drain the central and southern regions of New Castile, flow westward into Portugal, and finally reach the Atlantic; while the Ebro, which rises in the north of the kingdom, skirts the north-eastern frontier on its way to the Mediterranean. These rivers are described under their own names.

The climate of Old Castile is healthy, but liable to severe cold and heat. Snow falls early and lies late in the mountains, and there is a heavy rainfall in the north-west. New Castile has a still more rigorous climate, for although the mean annual temperature is about 59° Fahr., the summer heat in the valleys is peculiarly oppressive, and the highlands are swept by scorching or icy gales, laden with dust. The rainfall rarely exceeds 10 in. in a year.

In both the Castiles the central plateau has a naturally fertile soil, for after rain a luxuriant vegetation appears; but drought is common, owing to the insufficient volume of the rivers, and the failure of the Spaniards to extend the fine system of irrigation which the Moors originated. Certain districts, indeed, in which a layer of heavy loam underlies the porous and friable surface, are able to retain the moisture which elsewhere is absorbed. Such land is found in Palencia, and in the Mesa de Ocaña, where it yields abundant crops; and many of the northern mountains are well wooded. But vast tracts of land are useless except as pasture for sheep, and even the sheep are driven by the severe winters to migrate yearly into Estremadura (*q.v.*). The normal Castilian landscape is an arid and sterile steppe, with scarcely a tree or spring of water; and many even of the villages afford no relief to the eye, for they are built of sunburnt unbaked bricks, which share the dusty brownish-grey tint of the soil. Especially characteristic is the great plain of La Mancha (*q.v.*).

The transformation of Castile from a small county in the north of what is now Old Castile into an independent monarchy, was one of the decisive events in the reconquest of Spain from the Moors. The successful resistance offered by Asturias to the invaders had been followed by the liberation of Galicia and Leon, when Ferdinand I. of Castile (1035-1065), by his marriage with Sancha, widow of the last king of Leon, was enabled to unite Leon and Castile in a single kingdom, with its capital at Burgos. New territories were annexed on the south, until, after the capture of Toledo in 1085, and the consequent formation of a New Castile, the kingdom comprised the whole of central Spain. Thenceforward its history is inseparable from that of the whole country; and it is therefore described in full, together with the language and literature of Castile, under SPAIN (*q.v.*).

Castilian, which is the literary language of Spain, and with certain differences, of Spanish America, is spoken in Old and New Castile, Aragon, Estremadura, and the greater part of Leon; in Andalusia it is subject to various modifications of accent and pronunciation. As there is little, if any, difference of racial origin, character and physical type, among the inhabitants of this region, except in Andalusia, and, to a less extent, in Estremadura, the Castilian is justly regarded as the typical Spaniard. Among the Castilian peasantry, where education and foreign influence have never penetrated deeply, the national character can best be studied. Its intense pride, its fatalistic indolence and ignorance, its honesty and its bigotry, tempered by a keen sense of humour, are well-known characteristics. Apart from the peasant class, Castilians have contributed more to the development of Spanish art and literature than the inhabitants of any other region except, perhaps, Andalusia, which claims to be regarded as supreme in architecture and painting. Of the two great Spanish universities, Alcalá de Henares belonged in all respects to Castile, and Salamanca rose to equality with Paris, Oxford or Bologna, under the purely Castilian influence of Alphonso X. (1252-1284).

For a general description of Castile and its inhabitants, antiquities, commerce, &c., see *Castilla la Nueva*, three illustrated volumes in

the series *España*, by J. M. Quadrado and V. de la Fuente (Barcelona, 1885-1886), and the *Guía del antiguo reino de Castilla*, by E. Valverde y Alvarez (Madrid, 1886), which deals with the provinces of Burgos, Santander, Logroño, Soria, Avila and Segovia. For the history, see in addition to the works cited under SPAIN (section *History*), *Cronicas de los reyes de Castilla*, by C. Rosell (Madrid, 1875-1877, 2 vols.); *Colección de las crónicas y memorias de los reyes de Castilla* (Madrid, 1779-1787, 7 vols.); and *Historia de las comunidades de Castilla* (Madrid, 1897).

**CASTILHO, ANTONIO FELICIANO DE** (1800-1875), Portuguese man of letters, was born at Lisbon. He lost his sight at the age of six, but the devotion of his brother Augusto, aided by a retentive memory, enabled him to go through his school and university course with success; and he acquired an almost complete mastery of the Latin language and literature. His first work of importance, the *Cartas de Echo e Narciso* (1821), belongs to the pseudo-classical school in which he had been brought up, but his romantic leanings became apparent in the *Primavera* (1822) and in *Amor e Melancholia* (1823), two volumes of honeyed and prolix bucolic poetry. In the poetic legends *A noite de Castello* (1836) and *Cuimes do bardo* (1838) Castilho appeared as a full-blown Romanticist. These books exhibit the defects and qualities of all his work, in which lack of ideas and of creative imagination and an atmosphere of artificiality are ill compensated for by a certain emotional charm, great purity of diction and melodious versification. Belonging to the didactic and descriptive school, Castilho saw nature as all sweetness, pleasure and beauty, and he lived in a dreamland of his imagination. A fulsome epic on the succession of King John VI. brought him an office of profit at Coimbra. On his return from a stay in Madeira, he founded the *Revista Universal Lisbonense*, in imitation of Herculano's *Panorama*, and his profound knowledge of the Portuguese classics served him well in the introduction and notes to a very useful publication, the *Livraria Classica Portuguesa* (1845-1847, 25 vols.), while two years later he established the "Society of the Friends of Letters and the Arts." A study on Camoens and treatises on metrifcation and mnemonics followed from his pen. His praiseworthy zeal for popular instruction led him to take up the study of pedagogy, and in 1850 he brought out his *Leitura Recpentina*, a method of reading which was named after him, and he became government commissary of the schools which were destined to put it into practice. Going to Brazil in 1854, he there wrote his famous "Letter to the Empress." Though Castilho's lack of strong individuality and his over-great respect for authority prevented him from achieving original work of real merit, yet his translations of Anacreon, Ovid and Virgil and the *Chase do Enigma*, explaining the romantic incidents that led to his first marriage with D. Maria de Baena, a niece of the satirical poet Tolentino, and a descendant of Antonio Ferreira, reveal him as a master of form and a purist in language. His versions of Goethe's *Faust* and Shakespeare's *Midsummer Night's Dream*, made without a knowledge of German and English, scarcely added to his reputation. When the Coimbra question arose in 1865, Garrett was dead and Herculano had ceased to write, leaving Castilho supreme, for the moment, in the realm of letters. But the youthful Anthero de Quental withstood his claim to direct the rising generation and attacked his superannuated leadership, and after a fierce war of pamphlets Castilho was dethroned. The rise of João de Deus reduced him to a secondary position in the Portuguese Parnassus, and when he died ten years later much of his former fame had preceded him to the tomb.

See also "Memorias de Castilho" in the *Instituto de Coimbra*: Innocencio da Silva in *Dicionario bibliographico Portuguez*, i. 130 and viii. 132; Latino Coelho's study in the *Revista contemporanea de Portugal e Brazil*, vols. i. and ii.; Dr Theophilo Braga, *Historia do Romantismo* (Lisbon, 1880).

**CASTILHO, CRISTÓBAL DE** (1490-1556), Spanish poet, was born at Ciudad Rodrigo in 1490. In 1518 he left Spain with Ferdinand of Austria, afterwards emperor, whose private secretary he eventually became. While residing at Vienna in 1528-1530 he wrote the *Historia de Piramo y Tisbe*, and dedicated it to Anna von Schumberg, with whom he had a platonic love-affair. He seems to have visited Venice, to have been

neglected by his patron, to have fallen ill in 1540, and to have passed his last years in poverty. He died on the 12th of June 1556, and was buried at Vienna. Castillejo's poems are interesting, not merely because of their intrinsic excellence, but also as being the most powerful protest against the metrical innovations imported from Italy by Boscan and Garcilaso de la Vega. He adheres to the native *quintillas* or to the *coplas de pie quebrado*, and only abandons these traditional forms when he indulges in caustic parody of the new school—as in the lines *Contra los que dejan los metros castellanos*. He excels by virtue of his charming simplicity and his ingenious wit, always keen, sometimes licentious, never brutal. The urbane gaiety of his occasional poems is delightfully spontaneous, and the cynical humour which informs the *Diálogo de las condiciones de las mujeres* and the *Diálogo de la vida de la corte* is impregnated with the Renaissance spirit. Castillejo is the Clément Marot of Spain. His plays are lost; the best text of his verses is that printed at Madrid in 1792.

**CASTILLO SOLÓRZANO, ALONSO DE** (1584?-1647?), Spanish novelist and playwright, is stated to have been baptized at Tordesillas near Valladolid on 1st October 1584. Nothing is known of his youth, and he is next heard of at Madrid in 1619 as a man of literary tastes. While in the service of the marquis de Villar, he issued his first work, *Donaires del Parnaso* (1624-1625), two volumes of humorous poems; his *Tardes entretenidas* (1625) and *Jornadas alegres* (1626) proved that he was a novelist by vocation. Shortly afterwards he joined the household of the marquis de los Vélez, viceroy of Valencia, and published in quick succession three clever picaresque novels: *La Niña de los embustes*, *Teresa de Mansanera* (1632), *Los Aventuras del Bachiller Trapaza* (1637), and a continuation entitled *La Garduña de Sevilla y Anzuelo de las bolsas* (1642). To these shrewd cynical stories he owes his reputation. He followed the marquis de los Vélez in his disastrous campaign in Catalonia, and accompanied him to Rome, where the defeated general was sent as ambassador. Castillo Solórzano's death occurred (probably at Palermo) before 1648, but the exact date is uncertain. His prolonged absence from Madrid prevented him from writing as copiously for the stage as he would otherwise have done; but he was popular as a playwright both at home and abroad. His *Marqués del Cigaral* and *El Mayorazgo figurón* are the sources respectively of Scarron's *Don Jophet d'Arménie* and *L'Heritier ridicule*. Among his numerous remaining works may be mentioned *Las Harpías en Madrid* (1633), *Fiestas del Jardín* (1634), *Los Alivios de Casandra* (1640) and the posthumous *Quinta de Loure* (1649); the witty observation of these books forms a singular contrast to the prim devotion of his *Sagrario de Valencia* (1635). His versatility and graceful style deserve the highest praise. (J. F.-K.)

**CASTLE** (Lat. *castellum*, a fort, diminutive of *castra*, a camp; Fr. *château* and *château*), a small self-contained fortress, usually of the middle ages, though the term is sometimes used of prehistoric earthworks (e.g. Hollingbury Castle, Maiden Castle), and sometimes of citadels (e.g. the castles of Badajoz and Burgos) and small detached *forts d'arrêt* in modern times. It is also often applied to the principal mansion of a prince or nobleman, and in France (as *château*) to any country seat, this use being a relic of the feudal age. Under its twofold aspect of a fortress and a residence, the medieval castle is inseparably connected with the subjects of fortification (see FORTIFICATION AND SIEGECRAFT) and architecture (q.v.). An account of Roman and pre-Roman castles in Britain will be found under BRITAIN.

The word "castle" (*castel*) was introduced into English shortly before the Norman Conquest to denote a type of fortress, then new to the country, brought in by the Norman knights whom Edward the Confessor had sent for to defend Herefordshire against the inroads of the Welsh. Richard's castle, of which the earthworks remain and which has given its name to a parish, was erected at this period on the border of Herefordshire and Shropshire by Richard Fitz Scrob. The essential feature of this type was a circular mound of earth surrounded by a dry ditch and flattened at the top. Around the crest of

its summit was placed a timber palisade. This moated mound was styled in French *motte* (latinized *mota*), a word still common in French place-names. It is clearly depicted at the time of the Conquest in the Bayeux tapestry, and was then familiar on the mainland of western Europe. A description of this earlier castle is given in the life of John, bishop of Terouanne (*Acta Sanctorum*, quoted by G. T. Clark, *Medieval Mil. Architecture*):—

"The rich and the noble of that region being much given to feuds and bloodshed, fortify themselves . . . and by these strongholds subdue their equals and oppress their inferiors. They heap up a mound as high as they are able, and dig round it as broad a ditch as they can. . . . Round the summit of the mound they construct a palisade of timber to act as a wall. . . . Inside the palisade they erect a house, or rather a citadel, which looks down on the whole neighbourhood." St John, bishop of Terouanne, died in 1130, and this castle of Merchem, built by "a lord of the town many years before" may be taken as typical of the practice of the 11th century. But in addition to the mound, the citadel of the fortress, there was usually appended to it a bailey or basecourt (and sometimes two) of semilunar or horseshoe shape, so that the mound stood *à cheval* on the line of the enceinte. The rapidity and ease with which it was possible to construct castles of this type made them characteristic of the Conquest period in England and of the Anglo-Norman settlements in Wales, Ireland and the Scottish lowlands. In later days a stone wall replaced the timber palisade and produced what is known as the shell-keep, the type met with in the extant castles of Berkeley, Alnwick and Windsor.

But the Normans introduced also two other types of castle. The one was adopted where they found a natural rock stronghold which only needed adaptation, as at Clifford, Ludlow, the Peak and Exeter, to produce a citadel; the other was a type wholly distinct, the high rectangular tower of masonry, of which the Tower of London is the best-known example, though that of Colchester was probably constructed in the 11th century also. But the latter type belongs rather to the more settled conditions of the 12th century when haste was not a necessity, and in the first half of which the fine extant keeps of Hedingham and Rochester were erected. These towers were originally surrounded by palisades, usually on earthen ramparts, which were replaced later by stone walls. The whole fortress thus formed was styled a castle, but sometimes more precisely "tower and castle," the former being the citadel, and the latter the walled enclosure, which preserved more strictly the meaning of the Roman *castellum*.

Reliance was placed by the engineers of that time simply and solely on the inherent strength of the structure, the walls of which defied the battering-ram, and could only be undermined at the cost of much time and labour, while the narrow apertures were constructed to exclude arrows or flaming brands.

At this stage the crusades, and the consequent opportunities afforded to western engineers of studying the solid fortresses of the Byzantine empire, revolutionized the art of castle-building, which henceforward follows recognized principles. Many castles were built in the Holy Land by the crusaders of the 12th century, and it has been shown (Oman, *Art of War: the Middle Ages*, p. 529) that the designers realized, first, that a

second line of defences should be built within the main enceinte, and a third line or keep inside the second line; and secondly, that a wall must be flanked by projecting towers. From the Byzan-

FIG. 2.—Vertical section of rectangular Norman Keep (Tower of London).

tine engineers, through the crusaders, we derive, therefore, the cardinal principle of the mutual defence of all the parts of a fortress. The *donjon* of western Europe was regarded as the

FIG. 3.—Berkeley Castle, late Norman Shell-Keep.

Indeed the keep, in several crusader castles, is no more than a tower, larger than the rest, built into the enceinte and serving with the rest for its flanking defence, while the fortress was made strongest on the most exposed front. The idea of the flanking towers (which were of a type very different from the slight projections of the shell-keep and rectangular tower) soon penetrated to Europe, and Alnwick Castle (1140-1150) shows the influence of the new system. But the finest of all castles of the middle ages was Richard Cœur de Lion's fortress of Château Gaillard (1197) on the Seine near Les Andelys. Here the innermost ward was protected by an elaborate system of strong appended defences, which included a strong

FIG. 4.—Krak-des-Chevaliers, Plan.

*l'été-de-pont* covering the Seine bridge (see Clark, i. 384, and Oman, p. 533). The castle stood upon high ground and consisted of three distinct enceintes or wards besides the keep, which was in this case merely a strong tower forming part of the innermost ward. The donjon was rarely defended *à outrance*, and it

gradually sank in importance as the outer "wards" grew stronger. Round instead of rectangular towers were now becoming usual, the finest examples of their employment as keeps being at Conisborough in England and at Coucy in France. Against

FIG. 5.—Krak-des-Chevaliers: View.

the relatively feeble siege artillery of the 13th century a well-built fortress was almost proof, but the mines and the battering ram of the attack were more formidable, and it was realized that corners in the stonework of the fortress were more vulnerable than a uniform curved surface. Château Gaillard fell to Philip Augustus in 1204 after a strenuous defence, and the success of the assailants was largely due to the wise and skilful employ-

FIG. 6.—Château Gaillard.

ment of mines. An angle of the noble keep of Rochester was undermined and brought down by John in 1215.

The next development was the extension of the principle of successive lines of defence to form what is called the "concentric" castle, in which each ward was placed wholly within another which enveloped it; places thus built on a flat side (e.g. Caerphilly Castle) became for the first time more formidable

than strongholds perched upon rocks and hills such as Château Gaillard, where the more exposed parts indeed possessed many successive lines of defence, but at other points, for want of room, it was impossible to build more than one or, at most, two walls. In these cases, the fall of the inner ward by surprise, escalade, *vive force*, or even by regular siege (as was sometimes feasible), entailed the fall of the whole castle.

The adoption of the concentric system precluded any such mischance, and thus, even though siege-engines improved during the 13th and 14th centuries, the defence, by the massive strength of the concentric castle in some cases, by natural inaccessibility of position in others, maintained itself superior to the attack during the latter middle ages. Its final fall was due to the introduction of gunpowder as a propellant. "In the 14th century the change begins, in the 15th it is fully developed, in the 16th the feudal fastness has become an anachronism."

The general adoption of cannon placed in the hands of the central power a force which ruined the baronial fortifications in a few days of firing. The possessors of cannon were usually private individuals of the middle classes, from whom the prince hired the *matériel* and the technical workmen. A typical case will be found in the history of Brandenburg and Prussia (Carlyle, *Frederick the Great*, bk. iii. ch. i.), the impregnable castle of Friesack, held by an intractable feudal noble, Dietrich von

FIG. 7.—Coucy: Plan.

FIG. 8.—Coucy: View.

Quitow, being reduced in two days by the elector Frederick I with "Heavy Peg" (*Faule Grete*) and other guns hired and borrowed (February 1414). The beginnings of orderly government in Brandenburg thus depended upon the guns, and the taking of Friesack is, in Carlyle's phrase, "a fact memorable to every Prussian man." In England, the earl of Warwick in 1469

reduced the strong fortress of Bamborough in a week, and in Germany, Franz von Sickingen's stronghold of Landstuhl, formerly impregnable on its heights, was ruined in one day by the artillery of Philip of Hesse (1523). Very heavy artillery was used for such work, of course, and against lighter natures, some castles and even fortified country-houses or castellated mansions managed to make a stout stand even as late as the Great Rebellion in England.

The castle thus ceases to be the fortress of small and ill-governing local magnates, and its later history is merged in that of modern fortification. But an interesting transitional type between the medieval stronghold and the modern fortress is found in the coast castles erected by Henry VIII., especially those at Deal, Sandown and Walmer (c. 1540), which played some part in the events of the 17th century, and of which Walmer Castle is still the official residence of the lord

 FIG. 9.—Beaumaris Castle: Plan.

warden of the Cinque Ports. Viollet-le-Duc, in his *Annals of a Fortress* (English trans.), gives a full and interesting account of the repeated renovations of the fortress on his imaginary site in the valley of the Doubs, the construction by Charles the Bold of artillery towers at the angles of the castle, the protection of the masonry by earthen outworks, boulevards and demi-boulevards, and, in the 17th century, the final service of the medieval walls and towers as a pure *enceinte de sûreté*. Here and there we find old castles serving as *forts d'arrêt* or block-houses in mountain passes and defiles, and in some few cases, as at Dover, they formed the nucleus of purely military places of arms, but normally the castle falls into ruins, becomes a peaceful mansion, or is merged in the fortifications of the town which has grown up around it. In the *Annals of a Fortress* the site of the feudal castle is occupied by the citadel of the walled town, for once again, with the development of the middle class and of commerce and industry, the art of the engineer came to be displayed chiefly in the fortification of cities. The baronial "castle" assumes *pari passu* the form of a mansion, retaining indeed for long some capacity for defence, but in the end losing all military characteristics save a few which survived as ornaments. Examples of such castellated mansions are seen in Wingfield Manor, Derbyshire, and Hurstmonceaux, Sussex, erected in the 15th century, and

From Clark's *Med. M.H. Arch.*  
 FIG. 10.—Beaumaris Castle: View.

nearly all older castles which survived were continually improved and altered to serve as residences. (C. F. A.)

*Influence of Castles in English History.*—Such strongholds as existed in England at the time of the Norman Conquest seem to have offered but little resistance to William the Norman, who, in order effectually to guard against invasions from without as well as to awe his newly-acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect

themselves from the resentment of the despoiled natives, built strongholds and castles on their estates, and these were multiplied so rapidly during the troubled reign of King Stephen that the "adulterine" (i.e. unauthorized) castles are said by one writer to have amounted to 1115.

In the first instance, when the interest of the king and of his barons was identical, the former had only retained in his hands the castles in the chief towns of the shires, which were entrusted to his sheriffs or constables. But the great feudal revolts under the Conqueror and his sons showed how formidable an obstacle to the rule of the king was the existence of such fortresses

From Oman's *History of the Art of War.*  
 FIG. 11.—Caerphilly Castle: Plan.

in private hands, while the people hated them from the first for the oppressions connected with their erection and maintenance. It was, therefore, the settled policy of the crown to strengthen the royal castles and increase their number, while jealously keeping in check those of the barons. But in the struggle between Stephen and the empress Maud for the crown, which became largely a war of sieges, the royal power was relaxed and there was an outburst of castle-building, without permission, by the barons. These in many cases acted as petty sovereigns, and such was their tyranny that the native chronicler describes the castles as "filled with devils and evil men." These excesses paved the way for the pacification at the close of the reign, when it was provided that all unauthorized castles constructed during its course should be destroyed. Henry II., in spite of his power, was warned by the great revolt against him that he must still rely on castles, and the massive keeps of Newcastles and of Dover date from this period.

Under his sons the importance of the chief castles was recognized as so great that the struggle for their control was in the forefront of every contest. When Richard made vast grants at his accession to his brother John, he was careful to reserve the possession of certain castles, and when John rose against the king's minister, Longchamps, in 1211, the custody of castles was the chief point of dispute throughout their negotiations, and Lincoln was besieged on the king's behalf, as were Tickhill, Windsor and Marlborough subsequently, while the siege of Nottingham had to

From Clark's *Med. M.H. Arch.*  
 FIG. 12.—Caerphilly Castle: View.

be completed by Richard himself on his arrival. To John, in turn, as king, the fall of Château Gaillard meant the loss of Rouen and of Normandy with it, and when he endeavoured to repudiate the newly-granted Great Charter, his first step was to prepare the royal castles against attack and make them his centres of resistance. The barons, who had begun their revolt by besieging that of Northampton, now assailed that of Oxford as well and

seized that of Rochester. The king recovered Rochester after a severe struggle and captured Tonbridge, but thenceforth there was a war of sieges between John with his mercenaries and Louis of France with his Frenchmen and the barons, which was specially notable for the great defence of Dover Castle by Hubert de Burgh against Louis. On the final triumph of the royal cause, after John's death, at the battle of Lincoln, the general pacification was accompanied by a fresh issue of the Great Charter in the autumn of 1217, in which the precedent of Stephen's reign was followed and a special clause inserted that all "adulterine" castles, namely those which had been constructed or rebuilt since the breaking out of war between John and the barons, should be immediately destroyed. And special stress was laid on this in the writs addressed to the sheriffs.

In 1223 Hubert de Burgh, as regent, demanded the surrender to the crown of all royal castles not in official custody, and though he succeeded in this, Falkes de Breauté, John's mercenary, burst into revolt next year, and it cost a great national effort and a siege of nearly two months to reduce Bedford Castle, which he had held. Towards the close of Henry's reign castles again asserted, in the Baron's War, their importance. The Provisions of Oxford included a list of the chief royal castles and of their appointed castellans with the oath that they were to take; but the alien favourites refused to make way for them till they were forcibly ejected. When war broke out it was Rochester Castle that successfully held Simon de Montfort at bay in 1264, and in Pevensey Castle that the fugitives from the rout of Lewes were able to defy his power. Finally, after his fall at Evesham, it was in Kenilworth Castle that the remnant of his followers made their last stand, holding out nearly five months against all the forces of the crown, till their provisions failed them at the close of 1266.

Thus for two centuries after the Norman Conquest castles had proved of primary consequence in English political struggles, revolts and warfare. And, although, when the country was again torn by civil strife, their military importance was of small account, the crown's historic jealousy of private fortification was still seen in the need to obtain the king's licence to "crenellate" (i.e. embattle) the country mansion.

**BIBLIOGRAPHY.**—G. T. Clark, *Medieval Military Architecture in England* (2 vols.), includes a few French castles and is the standard work on the subject, but inaccurate and superseded on some points by recent research; Professor Oman's *Art of War in the Middle Ages* is a wide survey of the subject, but follows Clark in some of his errors; Mackenzie, *The Castles of England* (1897), valuable for illustrations; Deville, *Histoire du Château-Gaillard* (1829) and *Château d'Argues* (1839); Viollet-le-Duc's *Essay on the Military Architecture of the Middle Ages* was translated by M. Macdormott in 1860. More recent studies will be found in J. H. Round's *Geoffrey de Mandeville* (1891); "English Castles" (*Quarterly Review*, July 1894); and "Castles of the Conquest" (*Archæologia*, lviii., 1902); St John Hope's "English Castles of the 10th and 11th Centuries" (*Archæol. Journal*, ix., 1902); Mrs Armitage's "Early Norman Castles of England" (*Eng. Hist. Review*, xix., 1904), and her papers in *Scot. Soc. Ant. Proc.* xxxiv., and *The Antiquary*, July, August, 1906; G. Neilson's "The Motes in Norman Scotland" (*Scottish Review*, lxiv., 1898); G. H. Orpen, "Motes and Norman Castles in Ireland" (*Eng. Hist. Review*, xxii., xxiii., 1906-1907). (J. H. R.)

**CASTLEBAR**, a market town and the county town of Co. Mayo, Ireland, in the west parliamentary division, on the river and near the lough of the same name, on the Manulla and Westport branch of the Midland Great Western railway. Pop. of urban district (1901) 3585. The county court buildings and other public offices occupy a square, and there is a pleasant mall shaded by fine trees. There are some breweries, and trade in linens and agricultural produce. The castle, which gives its name to the town, was a fortress of the De Burgh family; but the town itself was founded in the reign of James I., and received a charter from him in 1613. In 1641 the castle was held for the parliament by Sir Henry Bingham, but he was forced to surrender to Lord Mayo, and fell a victim, with all his garrison, to the fury and treachery of the besiegers. The massacre was afterwards avenged in 1653 by the execution of Sir Theobald Burke (by that time Lord Mayo), who had been in command along with his father at the siege. In 1798 the town was occupied for some

weeks by the French under General J. J. Humbert, who had defeated the English under Luke Hutchison in a conflict which is jocularly styled the "Castlebar Races." The town returned two members to the Irish parliament until the Union. Four miles N.E. of Castlebar is Turlough, with a round tower 70 ft. high and 57 ft. in circumference, and other remains.

**CASTLECONNELL**, a village of Co. Limerick, Ireland, on the left bank of the Shannon, 8 m. N.E. of Limerick on the Great Southern & Western railway. It possesses a spa which was once considerably frequented, but is famous as a centre for the salmon fishing on the lower Shannon. Castleconnell is so intimately connected with this sport that it has given its name to a favourite pattern of fly-rod, in which a movable splice takes the place of the usual metal joint. The beautiful rapids of Doonas (avoided by a canal) are in the neighbourhood, and the surrounding scenery is generally attractive. There are remains of a castle from which the town took its name, which was the seat of the kings of Thomond, and was blown up by General Ginkel at the time of the siege of Limerick (1690).

**CASTLE DONINGTON**, a town in the Loughborough parliamentary division of Leicestershire, England, 12½ m. N.N.W. from London, on the Trent Junction and Western branch of the Midland railway. Pop. (1901) 2514. It lies on the flank of the hills overlooking the Trent and Soar valleys. There are slight remains of the castle. The church of St Luke is a fine building of Early English and later date. Donington Park, a neighbouring mansion, was offered to refugees during the French Revolution in 1830, and Charles X. availed himself of this retreat. Hosiery, silk and baskets are manufactured. Castle Donington is 2½ m. west of Kegworth station on the Midland main line. Kegworth (pop. 2078), on the Soar, has a hosiery and knitting industry.

**CASTLE DOUGLAS**, a burgh of barony and police burgh of Kirkcudbrightshire, Scotland. Pop. (1901) 3018. It is situated on Carlingwark Loch, 10½ m. S.W. of Dumfries by the Glasgow & South-Western railway. Its auction marts for sheep and cattle sales are the largest in the south-west of Scotland; at an autumn sale as many as 15,000 sheep and 1400 cattle are disposed of in one day. The leading industries comprise the making of agricultural implements and mineral waters, besides tanning. The Macmillan Free Church perpetuates the memory of John Macmillan (d. 1753), the Cameronian, who helped to found the Reformed Presbyterian Church. He had been chaplain to Murray of Broughton, and afterwards became minister of Balmaghie, about 3½ m. N.W. of Castle Douglas. The town is the chief centre of business in East Galloway, and it is also resorted to in midsummer for its beautiful scenery and excellent fishing. Till 1765 it was only a village under the name of Causewayhead, but the discovery of marl in the lake brought it some prosperity, and it was purchased in 1792 by Sir William Douglas and called after him. Since then its progress has been continuous. Carlingwark Loch contains several islets, on one of which is a crannog, or ancient lake dwelling.

**CASTLEFORD**, an urban district in the Osgoldcross parliamentary division of the West Riding of Yorkshire, England, on the river Aire near its junction with the Calder, 9 m. S.E. of Leeds, on the North-Eastern and Lancashire & Yorkshire railways. Pop. (1901) 17,386. Large glass-bottle and earthenware-jar works, chemical works, and neighbouring collieries employ the inhabitants. Here was the Roman village or fort of *Logecium* or *Legolium*; and though visible remains are wanting, a number of relics have been discovered.

**CASTLE-GUARD**, an arrangement under the feudal system, by which the duty of finding knights to guard royal castles was imposed on certain baronies, and divided among their knight's fees. The greater barons provided for the guard of their castles by exacting a similar duty from their knights. In both cases the obligation was commuted very early for a fixed money payment, which, as "castle-guard rent" lasted on to modern times.

See J. H. Round, "Castle-Guard," in *Archæological Journal*, vol. lix., and "Castle-ward and Coinage," in *The Commune of London*. (J. H. R.)

**CASTLEMAINE**, a town of Talbot county, Victoria, Australia, 78 m. by rail N.N.W. of Melbourne. Pop. (1901) 5704. The gold-mines here were among the first discovered in the colony, and dredging for gold is carried on in Barker's and Forrest creeks, at the junction of which the town stands. Slate and flagstone are largely quarried in the district, which also produces wine and much fruit, especially apples. Castlemaine has a reputation as a health resort in cases of pulmonary complaints.

**CASTLE RISING**, a village of Norfolk, England, 4 m. by road N.E. of King's Lynn. The Norman castle for which it is famous stands on slightly elevated ground overlooking, to the west, the low marshy coast of the Wash. Its site is enclosed by artificial ramparts of earth and a dyke which is crossed by an ancient bridge. The keep is square and massive, and fairly perfect, and it is not difficult to reconstruct the arrangement of the rooms. In some parts, especially the entrance, the Norman carving is very rich. The foundations of a small chapel with apical eastern termination have been discovered outside the castle. The village of Castle Rising is the decayed remnant of a town of no little importance. Its church of St Laurence is late Norman, with much rich ornamentation; it shows traces of considerable alterations in the Early English period, but is an admirable example of the earlier style.

It is a matter of dispute whether Rising was or was not an early Saxon settlement; in Domesday Book the manor is given as having belonged to Archbishop Stigand, from whom it had passed to Odo of Bayeux, whose estates were confiscated in 1088. Granted to William de Albini, whose son built Rising Castle, it passed first to Robert de Montalt, and then by sale to Isabel, queen of England, in 1332, remaining in the possession of the crown until Henry VIII. exchanged it for other lands with the duke of Norfolk. In 1269 an inquisition found that the lord had the return of all writs. In 1275 Robert de Montalt died seized of the manor and vill with the assize of bread and ale. An inquisition of 1370, although it makes no mention of the borough, states that the lord has the rents of assizes, and perquisites of the courts with view of frank-pledge. A mayor is first mentioned in 1343, and a borough existed in the 15th century. A survey of 1589-1590 declared that Castle Rising was an ancient borough by prescription according to the grant made to Hugh de Albini by Henry III. In 1589-1590 the recorder was chosen by the lord of the manor. The mayor, the only member of the corporation, whose sole duty was the holding of the assize of bread and ale, was chosen by the burgesses and presented at the court leet for confirmation. Castle Rising became a parliamentary borough in 1558, but was disfranchised in 1832 and the corporation abolished in 1835, although a mayor was elected for special purposes until 1883. Having no manufactures, the trade of the town depended entirely on its fairs and markets; but these have been long obsolete.

**CASTLETON**, a village in the High Peak parliamentary division of Derbyshire, England, 17 m. W.S.W. of Sheffield, and 2 m. from Hope station on a branch of the Midland railway. Pop. (1901) 547. Lying itself at an elevation of about 600 ft., it is surrounded on the north, west and south by hills from 1400 to 1700 ft. in height, rising sharply, and in parts precipitously. The village is celebrated for its situation in the midst of the wild Peak country, for the caves and mines in the neighbourhood, and for the Castle of the Peak, the ruins of which are strongly placed on a cliff immediately above the village. The Peak Cavern or Devil's Hole, penetrating this cliff, is the most magnificent in Derbyshire. For many generations the entrance to this cave has served as a workshop, held free of rent, to families employed in rope and twine making. Speedwell Cavern is not far distant, at the entrance to the fine pass of Winnats, by which Castleton and the Vale of Hope are approached from the west. The beauties of this cavern, in which occurs the so-called bottomless pit, are in part readily accessible by boat, but the approach to the inner or Cliff cavern is so difficult that it has rarely been explored. Among several other caves it is known as the Blue John Mine, from the decorative fluorspar called "Blue John" which is obtained here. The church of St Edmund,

Castleton, retains a fine Norman chancel arch, and the vestry contains a valuable library. At Brough near Castleton was a Roman fort, established to hold in check the hillmen of the Peak. It was connected by roads with Buxton, Manchester and Rotherham. The Castle of the Peak, or Peveril Castle, is famous through Sir Walter Scott's novel *Peveril of the Peak*. Early earthworks, which, extending from below the castle in a semi-circle, enclosed the town, can still in great part be traced. Before the Conquest the site was held by Gernebern and Hundinc, and was granted by the Conqueror to William Peverell, by whom the castle was built. On the forfeiture of William Peverell, grandson of the first holder, it was granted by Henry II. to Prince John who, in 1204, made Hugh Nevill governor of the castle. In 1216 William Ferrers, earl of Derby, took it from the rebellious barons, and was made governor by Henry III., who in 1223 granted a charter for a weekly market at the town. In 1328 the castle was given to John of Gaunt on his marriage with Blanche of Lancaster, and thus became parcel of the duchy of Lancaster. The castle has often been used as a prison, and from its position was almost impregnable.

**CASTLETOWN** (Manx, *Bully Cashiel*), a town of the Isle of Man, 10 m. S.W. of Douglas, by the Isle of Man railway. Pop. (1901) 1975. It is picturesquely situated on both sides of a small harbour formed by the outflow of the Silver Burn into Castletown Bay. It was the legal capital of the island until 1862. In the centre of the town stands Castle Rushen, which is said to owe its foundation to the Danish chief, Guthred, in 947-960, though the existing building, which is remarkably well preserved, probably dates from the 14th century. Until the 18th century it was the residence of the lords of Man, and until 1891 served as a prison. The massive keep is square, and is surrounded by an outer wall, with towers and a moat. The council chamber and court-house were built in 1644. In the neighbourhood of the castle is the old House of Keys, where the members of the Manx parliament held their sessions until the removal of the seat of government to Douglas. A lofty Doric column commemorates Cornelius Smelt, lieutenant-governor of the island (d. 1832), near which there is a remarkable sun-dial with thirteen faces, dating from 1720. King William's College, situated a mile to the north-east of the town, was opened in 1833; but a complete restoration was rendered necessary by fire in 1844, and it was subsequently enlarged. It is the chief educational establishment in the island. At Hango Hill near the town William Christian, receiver-general, who had surrendered the castle, and with it the island, to the parliamentary forces in 1651, was executed in 1663 at the instance of the countess of Derby, who had undertaken to defend it for the king. A small shipping trade is maintained.

**CASTOR** and **POLLUX** (Gr. Πολυδῆμνος), in Greek and Roman mythology, the twin sons of Leda, and brothers of Helen and Clytemnestra. They were also known under the name of Dioscuri (Διόσκουροι, later Διδάσκουροι, children of Zeus), for, according to later tradition, they were the children of Zeus and Leda, whose love the god had won under the form of a swan. In some versions Leda is represented as having brought forth two eggs, from one of which were born Castor and Pollux, from the other Helen. In another account, Zeus is the father of Pollux and Helen, Tyndareus (king of Sparta) of Castor and Clytemnestra. In Homer, Castor, Pollux and Clytemnestra are said to be the children of Tyndareus and Leda, Helen the daughter of Leda by Zeus. The Dioscuri were specially revered among people of Dorian race, and were said to have reigned at Sparta, where also they were buried. They were also worshipped, especially in Athens, as lords and protectors (ἑταίροι, ἑταίρες). Sailors in a storm prayed to them (Horace, *Odes*, i. 3) and sacrificed a white lamb, whereupon they were wont to appear in the form of fire at the masthead (probably referring to the phenomenon of St Elmo's fire), and the storm ceased. Later, they were confounded with the Samothracian Cabeiri. In battle they appeared riding on white horses and gave victory to the side they favoured. They were the patrons of hospitality, and founded the sacred festival called Theoxenia.

They presided over public games, Castor especially as the horse-tamer, Pollux as the boxer; but both are represented as riding on horseback or driving in a chariot. In Sparta their ancient symbol was two parallel beams (*δῆκανα*), connected by cross-bars, which the Spartans took with them into the field (Plutarch, *De Fraternali Amore*, 1; Herodotus v. 75); later, they were represented by two amphorae with snakes twined round them. Their most important exploits were the invasion of Attica, to rescue their sister Helen from Theseus; their share in the hunting of the Calydonian boar (see MELEAGER) and the Argonautic expedition, and their battle with the sons of Aphaeus, brought about by a quarrel in regard to some cattle, in which Castor, the mortal (as the son of Tyndareus), fell by the hand of Idas. Pollux, finding him dead after the battle, implored Zeus to be allowed to die with him; this being impossible by reason of his immortality, Pollux was permitted to spend alternately one day among the gods, the other in Hades with his brother. According to another fable, the god marked his approval of their love by placing them together in the sky, as the Twins or the morning and evening star (Hyginus, *Poet. Astronom.* ii. 22). Like the Asvins of the *Veda*, the bringers of light in the morning sky, with whom they have been identified, the Dioscuri are represented as youthful horsemen, naked or wearing only a light clamys. Their characteristic attribute is a pointed egg-shaped cap, surmounted by a star.

Though their worship was perhaps most carefully observed among people of Dorian origin, Castor and Pollux were held in no small veneration at Rome. It was the popular belief in that city from an early period that the battle of Lake Regillus had been decided by their interposition (Dion. Halic. vi. 13). They had fought, it was said, armed and mounted, at the head of the legions of the commonwealth, and had afterwards carried the news of the victory with incredible speed to the city. The well in the Forum at which they alighted was pointed out, and near it rose their ancient temple, in which the senate often held its sittings. On the 15th of July, the supposed anniversary of the battle, a great festival with sumptuous sacrifices was celebrated in their honour, and a solemn parade of the Roman knights (*transvectio equitum*), who looked upon the Dioscuri as their patrons, took place. (Apollodorus iii. 10. 7, 11. 2; Homer, *Odyssey*, xi. 299; Hyginus, *Fab.* 77. 155; Pindar, *New.* x. 60, 80 and schol.; Diod. Sic. iv. 43; Plutarch, *Theseus*, 32, 33; Theocritus, *Idyll*, xxii.)

**CASTOR OIL**, the fixed oil obtained from the seeds of the castor oil plant or Palma Christi, *Ricinus communis*, belonging to the natural order Euphorbiaceae. The botanical name is from Lat. *ricinus*, a tick, from the form and markings of the seed. The plant is a native of tropical Africa, but it has been introduced, and is now cultivated in most tropical and in the warmer temperate countries. In size it varies from a shrubby plant to a tree of from 30 to 40 ft. in height according to the climate in which it grows, being arborescent in tropical latitudes. On account of its very large beautiful palmate-peltate leaves, which sometimes measure as much as 2 ft. in diameter, it is cultivated as an ornamental plant. In the south of England, with the habit of an annual, it ripens its seeds in favourable seasons; and it has been known to come to maturity as far north as Christiania in Norway. Plants are readily grown from seed, which should be sown singly in small pots and placed in heat early in March. The

young plants are kept under glass till early in June when they are hardened and put out. The fruit consists of a three-celled capsule, covered externally with soft yielding prickles, and each cell develops a single seed. The seeds of the different cultivated varieties, of which there are a great number, differ much in size and in external markings; but average seeds are of an oval laterally compressed form, with their longest diameter about four lines. They have a shining, marble-grey and brown, thick, leathery outer coat, within which is a thin dark-coloured brittle coat. A large distinct leafy embryo lies in the middle of a dense, oily tissue (endosperm). The seeds contain a toxic substance, which makes them actively poisonous; so much so that three have been known to kill an adult.

The oil is obtained from the seeds by two principal methods—expression and decoction—the latter process being largely used in India, where the oil, on account of its cheapness and abundance is extensively employed for illuminating as well as for other domestic and medicinal purposes. The oil exported from Calcutta to Europe is prepared by shelling and crushing the seeds between rollers. The crushed mass is then placed in hempen cloths and pressed in a screw or hydraulic press. The oil which exudes is mixed with water and heated till the water boils, and the mucilaginous matter in the oil separates as a scum. It is next strained, then bleached in the sunlight, and stored for exportation. A considerable quantity of castor oil of an excellent quality is also made in Italy; and in California the manufacture is conducted on an extensive scale. The following is an outline of the process adopted in a Californian factory. The seeds are submitted to a dry heat in a furnace for an hour or thereby, by which they are softened and prepared to part easily with their oil. They are then pressed in a large powerful screw-press, and the oily matter which flows out is caught, mixed with an equal proportion of water, and boiled to purify it from mucilaginous and albuminous matter. After boiling about an hour, it is allowed to cool, the water is drawn off, and the oil is transferred to zinc tanks or clarifiers capable of holding from 60 to 100 gallons. In these it stands about eight hours, bleaching in the sun, after which it is ready for storing. By this method 100 lb of good seeds yield about 5 gallons of pure oil.

Castor oil is a viscid liquid, almost colourless when pure, possessing only a slight odour, and a mild yet highly nauseous and disagreeable taste. Its specific gravity is .96, a little less than that of water, and it dissolves freely in alcohol, ether and glacial acetic acid. It contains palmitic and several other fatty acids, among which there is one—ricinoleic acid—peculiar to itself. This occurs in combination with glycerin, constituting the greater part of the bulk of the oil.

The active principle to which the oil owes its purgative properties has not been isolated. It is, indeed, probable that it is formed in the intestine, as a result of some decomposition as yet unknown. The dose is from a drachm to an ounce. The pharmacopoeial mixture is best avoided, being almost uniquely nauseous. By far the best way to administer the oil is in capsules. It acts in about five hours, affecting the entire length of the bowel, but not increasing the flow of bile except in very large doses. The mode of its action is unknown. The oil will purge when rubbed into the skin or injected *per rectum*. It is an invaluable drug in temporary constipation and whenever a mild action is essential, as in pregnancy. It is extremely useful for children and the aged, but must not be employed in cases of chronic constipation, which it only aggravates, whilst relieving the symptoms.

**CASTRÉN, MATTHIAS ALEXANDER** (1813–1853), Finnish ethnologist and philologist, was born at Tervola, in the parish of Kemi in Finland, on the 20th of November (December 2, 1813). His father, Christian Castrén, parish minister at Rovaniemi, died in 1825; and Matthias passed under the protection of his uncle, Mathias Castrén, the kindly and learned incumbent of Kemi. At the age of twelve he was sent to school at Uleåborg, and there he helped to maintain himself by teaching the younger children. On his removal to the Alexander University at Helsingfors in 1830, he first devoted himself to Greek and Hebrew

with the intention of entering the church; but his interest was soon excited by the language of his native country, and he even began before his course was completed to lay the foundations of a work on Finnish mythology. The necessity of personal explorations among the still unwritten languages of cognate tribes soon made itself evident; and in 1838 he joined a medical fellow-student, Dr. Ehrström, in a journey through Lapland. In the following year he travelled in Russian Karelia at the expense of the Literary Society of Finland; and in 1841 he undertook, in company with Dr. Elias Lönnrot, the great Finnish philologist, a third journey, which ultimately extended beyond the Ural as far as Obdorsk, and occupied a period of three years. Before starting on this last expedition he had published a translation into Swedish of the Finnish epic of *Kalevala*; and on his return he gave to the world his *Elementa grammaticæ Syrjœnæ* and *Elementa grammaticæ Tscherenissæ*, 1844. No sooner had he recovered from the illness which his last journey had occasioned than he set out, under the auspices of the Academy of St Petersburg and the Helsingfors University, on an exploration of the whole government of Siberia, which resulted in a vast addition to previous knowledge, but seriously affected the health of the adventurous investigator. The first-fruits of his collections were published at St Petersburg in 1849 in the form of a *Versuch einer ostjakischen Sprachlehre*. In 1850 he published a treatise *De officiis personalibus linguarum Alaicarum*, and was appointed professor at Helsingfors of the new chair of Finnish language and literature. The following year saw him raised to the rank of chancellor of the university; and he was busily engaged in what he regarded as his principal work, a Samoyedic grammar, when he died on the 7th of May 1853.

Five volumes of his collected works appeared from 1852 to 1858, containing respectively—(1) *Reseminnen från åren 1838-1844*; (2) *Reseberättelser och bref åren 1845-1849*; (3) *Föreläsningar i Finsk mytologi*; (4) *Etnologiska föreläsningar öfver Altaiska läken*; and (5) *Smärre afhandlingar och akademiska dissertationer*. A German translation was published by Anton Schiefner, who was also entrusted by the St Petersburg Academy with the editing of his manuscripts, which had been lent to the Helsingfors University and which were subsequently published.

**CASTRENSIS, PAULUS**, an Italian jurist of the 14th century. He studied under Baldus at Perugia, and was a fellow-pupil with Cardinal Zabarella. He was admitted to the degree of doctor of civil law in the university of Avignon, but it is uncertain when he first undertook the duties of a professor. A tradition, which has been handed down by Panzirolus, represents him as having taught law for a period of fifty-seven years. He was professor at Vienna in 1390, at Avignon in 1394, and at Padua in 1429; and, at different periods, at Florence, at Bologna and at Perugia. He was for some time the vicar-general of Cardinal Zabarella at Florence, and his eminence as a teacher of canon law may be inferred from the language of one of his pupils, who styles him "famosissimus juris utriusque monarcha." His most complete treatise is his readings on the *Digest*, and it appears from a passage in his readings on the *Digestum Velus* that he delivered them at a time when he had been actively engaged for forty-five years as a teacher of civil law. His death is generally assigned to 1436, but it appears from an entry in a MS. of the *Digestum Velus*, which is extant at Munich, made by the hand of one of his pupils who styles him "præceptor meus," that he died on the 20th of July 1441.

**CASTRES**, a town of south-western France, capital of an arrondissement in the department of Tarn, 29 m. S.S.E. of Albi on a branch line of the Southern railway. Pop. (1906) town, 19,864; commune, 28,272. Castres, the busiest and most populous town of its department, is intersected from north to south by the Agout; the river is fringed by old houses the upper stories of which project over its waters. Wide boulevards traverse the west of the town, which is also rendered attractive by numerous fountains fed by a fine aqueduct hewn in the rock. The church of St Benoît, once a cathedral, and the most important of the churches of Castres, dates only from the 17th and 18th centuries. The hôtel de ville, which contains a museum and the municipal library, occupies the former bishop's palace,

designed by Jules Mansart in the 17th century; the Romanesque tower beside it is the only survival of an old Benedictine abbey. The town possesses some old mansions of which the hôtel de Nayrac, of the Renaissance, is of most interest. Castres has a sub-prefecture, tribunals of first instance and of commerce, a board of trade-arbitrators, a chamber of commerce, a branch of the bank of France and two hospitals. There are also communal colleges for boys and girls, a school of artillery and school of draughtsmanship. The industrial establishments include manufactories of earthenware and porcelain and metal-foundries, and tanning, leather-dressing, turnery, the making of wooden shoes and furniture, the weaving of woollen and other fabrics, dyeing, and the manufacture of machinery, paper and parchment are carried on.

Castres grew up round a Benedictine abbey, which is believed to have been founded in the 7th century. It was a place of considerable importance as early as the 12th century, and ranked as the second town of the Albigenes. During the Albigenian crusade it surrendered of its own accord to Simon de Montfort; and in 1366 it was raised to a countyship by King John of France. On the confiscation of the possessions of the D Armagnac family, to which it had passed, it was bestowed by Louis XI. on Boffilo del Giudice, but the appointment led to so much disagreement that the countyship was united to the crown by Francis I. in 1519. In the wars of the latter part of the 16th century the inhabitants sided with the Protestant party, fortified the town, and established an independent republic. They were brought to terms, however, by Louis XIII., and forced to dismantle their fortifications; and the town was made the seat of the *chambre de l'édit*, or chamber for the investigation of the affairs of the Protestants, afterwards transferred to Castelnaudary (in 1679). The bishopric of Castres, which had been established by Pope John XXII. in 1317, was abolished at the Revolution.

**CASTRO, INEZ DE** (d. 1355), mistress, and perhaps wife, of Peter I. (Pedro), king of Portugal, called *Collo de Garza*, i.e. "Heron's Neck," was born in Spanish Galicia, in the earlier years of the 14th century. Tradition asserts that her father, Don Pedro Fernandez de Castro, and her mother, Dona Aldonça Soares de Villadares, a noble Portuguese lady, were unmarried, and that Inez and her two brothers were consequently of bastard birth. Educated at the semi-Oriental provincial court of Juan Manuel, duke of Peñafiel, Inez grew up side by side with Costança, the duke's daughter by a scion of the royal house of Aragon, and her own cousin. After refusing several crowned heads in marriage, Costança was at last persuaded to accept the hand of the infante Dom Pedro, son of Alphonso the Proud, king of Portugal. In 1341 the two girls left Peñafiel; Costança's marriage was celebrated in the same year, and the young infanta and her cousin went to reside at Lisbon, or at Coimbra, where Dom Pedro conceived that luckless and furious passion for Inez which has immortalized them.

The morality of the age was lax, and more especially so in Spain and Portugal; where the looseness of the marriage tie and the example of the Moors encouraged polygamy. Pedro's connexion *par amours* with Inez would of itself have aroused no opposition. He might even have married her, after the death of his wife in childbirth in 1345. According to his own assurance he did marry her in 1354. But by that time the rising power of the Castro family had created the most brutal hatred among their rivals, both in Spain and Portugal. Alvaro Gonzales, Pedro Coelho, and Diogo Lopes Pacheco persuaded the king, Alphonso, that his throne was in danger from an alliance between his son and the Castros, and with all the brutality of the age they urged the king to remove the danger by murdering the poor woman. The old king listened, refused, wavered and ended by yielding. He went in secret to the palace at Coimbra, where Inez and the infante resided, accompanied by his three familiars, and by others who agreed with them. The beauty and tears of Inez disarmed his resolution, and he turned to leave her; but the gentlemen about him had gone too far to recede. Inez was stabbed to death and was buried immediately in the church of Santa Clara.

The infante raised at once the flag of revolt against his father, and was only appeased by the concession of a large share in the government. The three murderers of Inez were sent out of the kingdom by Alphonso, who knew his son too well not to be aware that the vengeance would be tremendous as the crime. They took refuge in Castile. In 1357, however, Alphonso died, and the infante was crowned king of Portugal. Peter the Cruel, his nephew, reigned over Castile; and the murderers were given up as soon as required. Diogo Lopes escaped through the gratitude of a beggar to whom he had formerly done a kindness; but Coclho and Gonzales were executed, with horrible tortures, in the very presence of the king.

The story of the exhumation and coronation of the corpse of Inez has often been told. It is said that to the dead body, crowned and robed in royal raiment, and enthroned beside the king, the assembled nobles of Portugal paid homage as to their queen, swearing fealty on the withered hand of the corpse. The gravest doubts, however, exist as to the authenticity of this story; Fernão Lopes, the Portuguese Froissart, who is the great authority for the details of the death of Inez, with some of the actors in which he was acquainted, says nothing of the ghastly ceremony, though he tells at length the tale of the funeral honours that the king bestowed upon his wife. Inez was buried at Alcobaça with extraordinary magnificence, in a tomb of white marble, surmounted by her crowned statue; and near her sepulchre Pedro caused his own to be placed. The monument, after repeatedly resisting the violence of curiosity, was broken into in 1810 by the French soldiery; the statue was mutilated, and the yellow hair was cut from the broken skeleton, to be preserved in reliquaries and blown away by the wind. The children of Inez shared her habit of misfortune. From her brother, however, Alvaro Perez de Castro, the reigning house of Portugal directly descends.

See Fernão Lopes, *Chronica del Rey Dom Pedro* (1735); Camoens, *Os Lusíadas*; Antonio Ferreira's *Inez de Castro*,—the first regular tragedy of the Renaissance after the *Sofonisba* of Trissino; Luis Velez de Guevara, *Reinas despues de morir*, an admirable play; and Ferdinand Denis, *Chroniques chevaleresques de l'Espagne et du Portugal*.

**CASTRO, JOÃO DE** (1500–1548), called by Camoens *Castro Forte*, fourth viceroy of the Portuguese Indies, was the son of Alvaro de Castro, civil governor of Lisbon. A younger son, and destined therefore for the church, he became at an early age a brilliant humanist, and studied mathematics under Pedro Nunez, in company with the infante Dom Luis, son of Emanuel the First, with whom he contracted a life-long friendship. At eighteen he went to Tangier, where he was dubbed knight by Duarte de Menezes the governor, and there he remained several years. In 1535 he accompanied Dom Luis to the siege of Tunis, where he had the honour of refusing knighthood and reward at the hands of the great emperor Charles V. Returning to Lisbon, he received from the king the small commandship of São Paulo de Salvaterra in 1538. He was exceedingly poor, but his wife Lenor de Coutinho, a noble Portuguese lady, admired and appreciated her husband sufficiently to make light of their poverty. Soon after this he left for the Indies in company with his uncle Garcia de Noronha, and on his arrival at Goa enlisted among the *aventureiros*, "the bravest of the brave," told off for the relief of Diu. In 1540 he served on an expedition under Estevo da Gama, by whom his son, Alvaro de Castro, a child of thirteen, was knighted, out of compliment to him. Returning to Portugal, João de Castro was named commander of a fleet, in 1543, to clear the European seas of pirates; and in 1545 he was sent, with six sail, to the Indies, in the room of Martin de Sousa, who had been dismissed the viceroyalty. The next three years were the hardest and most brilliant, as they were the last, of his life—years of battle and struggle, of glory and sorrow, of suffering and triumph. Valiantly seconded by his sons (one of whom, Fernão, was killed before Diu) and by João Mascarenhas, João de Castro achieved such popularity by the overthrow of Mahmud, king of Gujarat, by the relief of Diu, and by the defeat of the great army of the Adil Khan, that he could contract a very large loan with the Goa merchants on

the simple security of his moustache. These great deeds were followed by the capture of Broach, by the complete subjugation of Malacca, and by the passage of Antonio Miconiz into Ceylon; and in 1547 the great captain was appointed viceroy by João III., who had at last accepted him without mistrust. He did not live long to fill this charge, expiring in the arms of his friend, St Francis Xavier, on the 6th of June 1548. He was buried at Goa, but his remains were afterwards exhumed and conveyed to Portugal, to be reinterred under a splendid monument in the convent of Bemfica.

See Jacinto Freire de Andrade, *Vida de D. João de Castro* (Lisbon, 1651), English translation by Sir Peter Wyche (1664); Diogo de Couto, *Decadas da Asia*, vi. *The Roteiros* or logbooks of Castro's voyages in the East (Lisbon 1833, 1843 and 1872) are of great interest.

**CASTROGIOVANNI** (Arab. *Kasr-Yani*, a corruption of *Castrum Ennae*), a town and episcopal see of the province of Caltanissetta, Sicily, 95 m. by rail S.E. of Palermo, and 56 m. W. of Catania, situated 2605 ft. above sea-level, almost in the centre of the island, and commanding a magnificent view of the interior. Pop. (1901) 25,826. Enna was one of the cities of the Sicels, and the statement of Stephanus Byzantinus that it was colonized by Syracuse in 664 B.C. is improbable. The question is discussed by E. Pais, *Atakia* (Pisa, 1891), 63. It does not appear in history before the time of Dionysius I. of Syracuse, who, after unsuccessful attempts, finally acquired possession of it by treachery about 397 B.C. Its natural position rendered it a fortress of great importance, and it is frequently mentioned in subsequent history. In 134–132 it was the headquarters of the slave revolt, and was only reduced by treachery. Cicero speaks of it as a place of some importance, but in imperial times it seems to have been of little account. In A.D. 837 the Saracens attempted to take it, but without success; and it was again only by treachery that they were able to take it in 859. In 1087 it fell into the hands of the Normans; and the existing remains of fortifications are entirely mediæval. There are indeed no remains of earlier days. The cathedral, founded in 1307, is of some interest. There are no remains of the famous temple of Demeter, from which Verres, as Cicero tells us, removed the bronze statue of the goddess. The lake of Pergusa, where Persephone, according to one of the myths, was carried off by Hades, lies 4 m. to the south. The myth itself must have had some local origin, but has had so much Greek detail grafted upon it that the very names of the earlier Sicel deities have been displaced.

**CASTRO URDIALES**, a seaport of northern Spain, in the province of Santander, situated on the bay of Biscay and at the head of a branch railway connected with the Bilbao-Santander line. Pop. (1870) about 3500; (1900) 14,191. Castro Urdiales is a modern town, although its castle and parish church date from the middle ages. It was destroyed by the French in 1813, but speedily rebuilt and fortified. Its rapid rise in population and prosperity dates from the increased development of iron-mining and railway communication which took place after 1879. Its chief industries are iron-mining, fishing, and the preservation of fish, especially sardines, in oil. Between 1884 and 1904 the exports of iron ore rose from 277,200 tons to 516,574 tons.

**CASTRO Y BELLVIS, GUILLÉN DE** (1569–1631), Spanish dramatist, was a Valencian by birth, and early enjoyed a reputation as a man of letters. In 1591 he became a member of a local literary academy called the *Nocturnos*. At one time a captain of the coast-guard, at another the protégé of Benavente, viceroy of Naples, who appointed him governor of Scigliano, patronized by Osuna and Olivares, Castro was nominated a knight of the order of Santiago in 1623. He settled at Madrid in 1626, and died there on the 28th of July 1631 in such poverty that his funeral expenses were defrayed by charity. He probably made the acquaintance of Lope de Vega at the festival (1620–1622) held to commemorate the beatification and canonization of St Isidore, the patron saint of Madrid. On the latter occasion Castro's *octavas* were awarded the first prize. Lope de Vega dedicated to him a celebrated play entitled *Las Almozas*

casuistry found no place, because there were no sacred books. "Among the Greeks writing never attained the consecration of religion. No system of doctrine and observance, no manuals containing authoritative rules of morality, were ever transmitted in documentary form. In conduct they shrank from formulae. Unvarying rules petrified action; the need of flexibility, of perpetual adjustment, was strongly felt" (Butcher, *The Greek Genius*, p. 182). For this reason their interest in ethical speculations was all the keener; their great thinkers were endlessly engaged in settling what the relation ought to be between duty and self-interest. Ought one to swallow up the other—and, if so, which should prevail? Or was it possible to patch up a compromise between them? The great Stoic philosophers took the austere line, and held that duty should always and everywhere be our only law. But it was one thing to enunciate such magnificent theories in a lecture, and quite another to apply them in the market-place. Casuistry came to the aid of average human nature—that is to say, pupils began to confront the master with hard cases taken from daily life. And more than one master was disposed to make large—even startlingly large—concessions to the exigencies of practice. This concrete side of moral philosophy came specially into evidence when Stoicism was transplanted to Rome. Cicero's *De Officiis* abounds in the kind of question afterwards so warmly discussed by Dr Johnson and his friends. Is it ever right to tell a lie? May a lawyer defend a client whom he knows to be guilty? In selling my goods, is it enough not to disguise their shortcomings, or ought I candidly to admit them? Seneca even made the discussion of such problems into a regular discipline, claiming that their concrete character gave an interest in morality to those who had no love for abstractions; while they prevented those who had from losing themselves in the clouds. And M. Thamin maintains that, if his heroes did not form great characters, at any rate they taught the Roman child to train its conscience. But, then, Cicero and Seneca took common-sense as their guide. They decided each problem on its merits, looking more to the spirit than to the letter, and often showing a practical sagacity worthy of Johnson himself. Quite in the great doctor's spirit is Cicero's counsel to his son, to hear what the philosophers had to say, but to decide for himself as a man of the world. Such advice could not be grateful to the philosophers themselves—then a definite professional class, not unlike the "spiritual directors" of a later Rome, who earned their bread by smoothing away the doubts of the scrupulous on all matters intellectual and moral. Their great weapon was their logic; and a logician, as Pascal says, must be very unfortunate or very stupid if he cannot manage to find exceptions to every conceivable rule. In their hands casuistry became the art of finding such exceptions. From the Greek sophists they borrowed ingenious ways of playing off one duty against another, or duty in general against self-interest—leaving the doubter in the alternative of neglecting the one and being a knave, or neglecting the other and being a fool. Or else they raised a subtle distinction between the act and the intention. To get drunk for the sake of the drink was the mark of a beast; but wine was a powerful stimulant to the brain, and to fuddle oneself in order to think great thoughts was worthy of a sage. No doubt these airy paradoxes were not always seriously taken; but it is significant that a common Roman proverb identified "philosophizing" (*philosophatur*) with thinking out some dirty trick.

Christianity swept the whole discussion on to a higher plane. All the stress now fell on the disposition, not on the outward act. The good deeds of a just man were a natural consequence of his justice; whereas a bad man was no whit the better, because he now and then deviated into doing right. Actions, in short, were of no account whatever, apart from the character that produced them. "All things are lawful unto me," said St Paul,

but all are not expedient." And St Augustine sums the whole matter up in the famous phrase: "Have charity, and do as thou wilt." Narrow-minded Christian consciences, however, could not stay long on this level; law was so very much more satisfying a guide than vague, elusive charity. And law in

plenty was forthcoming, so soon as the Church developed the discipline of public confessions followed by appropriate penances for each fault. At first the whole proceeding was informal and impulsive enough; but by the 7th century it had grown thoroughly stereotyped and formal. *Libri Poenitentiales* began to appear—detailed lists of all possible sins, with the forfeit to be exacted from each. As public penance finally decayed, and auricular confession took its place, these were superseded by the *Summae de Poenitentia*,—law-books in the strictest sense. These were huge digests of all that popes, councils, primitive fathers had decided on every kind of question pertaining to the confessional—what exactly is a sin, what kind of questions the priests must ask, under what conditions he could give absolution. As such, they were eagerly welcomed by the clergy; for a single magistrate, sitting in secret without appeal, necessarily grasps at whatever will lighten his burden of responsibility. Nor was their complexity a stumbling-block. The medieval mind was only too prone to look on morality as a highly technical art, quite as difficult as medicine or chancery law—a path where wayfaring men were certain to err, with no guide but their unsobered conscience. What could they possibly do but cling to their priest with a "blind and unexpressed faith"?

Against this state of things the Reformation was a violent protest. Catholicism increasingly took for granted that a man imperilled his soul by thinking for himself; Protestantism replied that he could certainly lose it, if he left his thinking to another. For it is to the individual conscience that God speaks; through the struggles of the individual conscience He builds up a strong and stable Christian character. "A man may be a heretic in the truth," says Milton in his *Areopagitica* (1644). "If he believes things only because his pastor says so, or the Assembly so determines, without knowing other reason, though his belief be true, yet the very truth he holds becomes his heresy. There is not any burden that some would not gladder post off to another than the charge and care of their religion. A wealthy man, addicted to his pleasures and his profits, finds religion to be a traffic so entangled, and of so many piddling accounts, that of all mysteries he cannot skill to keep a stock going upon that trade. What does he therefore but resolve to give over tending, and find himself some factor, to whose care and conduct he may commit the whole managing of his religious affairs—some divise of note and estimation that must be. To him he adheres, resigns the whole warehouse of his religion with all the locks and keys into his custody, and indeed makes the very person of that man his religion. So that a man may say his religion is now no more within himself, but is become a dividual moveable, which goes or comes near him, according as that good man frequents the house."

Twelve years after the *Areopagitica* appeared Pascal's *Provincial Letters* (1656-1657). These deal with the casuists of the Counter-Reformation in the spirit of Milton; laying especial stress on the artificiality of their methods and the laxity of their results. Not, of course, that they meant deliberate evil; Pascal expressly credits them with good intentions. But they were drawn, almost to a man, from Italy or Spain, the two countries least alive to the spirit of the Reformation; and most of them were Jesuits, the order that set out to be nothing Protestantism was, and everything that Protestantism was not. Hence they were resolutely opposed to any idea of reform; for to begin making changes in the Church's system would be a tacit admission that Luther had some show of reason on his side. On the other hand, they would certainly lose their hold on the laity, unless some kind of change were made; for many of the Church's rules were obsolete, and others far too severe to impose on the France of Montaigne or even the Spain of Cervantes. Thus caught between two fires the casuists developed a highly ingenious method, not unlike that of the Roman Stoics, for eviscerating the substance of a rule while leaving its shadow carefully intact. The next step was to force the confessors to accept their lax interpretation of the law; and this was accomplished by their famous theory of *probabilism*—first taught in Spain about 1580. This made it a grave sin in the priest to refuse absolution, whenever there

was some good reason for giving it even when there were other and better reasons for refusing it. This principle does not deserve all the abuse that has been lavished upon it. It secured uniformity in the confessional, and thereby protected the penitent from the caprices of individual priests; and by depriving these of responsibility, it forced the penitent back on himself. But the gain was more than counterbalanced by the evil. The less the Church could expect from its penitents, the more it was driven to trust to the miraculous efficiency of sacramental grace. Once get a sinner to confession, and the whole work was done. However bad his natural disposition, the magical words of absolution would make him a new man. As for most penitents, all they cared for was to scrape through by the skin of their teeth. Casuistry might insist that it only proposed to fix the minimum of a minimum, and beg them for their soul's sake to aim a little higher. Human nature seldom resists the charms of a fixed standard—least of all when it is applied by a live judge in a visible court. If the priest must be satisfied with little, why be at the trouble of offering more? For this reason, probabilism found vigorous opponents in Bossuet and other eminent divines; and various of its excesses were condemned by the popes during the latter half of the 17th century. After a long eclipse it was finally re-established, though in a very modified form, by Alfonso Liguori about the middle of the 18th century.

In Protestant countries casuistry shrank and dwindled, though works on the subject continued to be written both in Germany and England during the 17th century. The best known of the Anglican books is Jeremy Taylor's *Ductor Dubitantium* (1660). But the Protestant casuist never pretended to speak authoritatively; all he did was to give his reasons, and leave the decision to the conscience of his readers. "In all this discourse," says Bishop Sanderson, one of the best of the English writers, "I take it upon me not to write edicts, but to give my advice." Very soon, however, these relics of casuistry were swept away by the rising tide of common-sense. The 18th century loved to discuss hard cases of conscience, as a very cursory glance at Fielding's novels (1742-1751) or Boswell's *Life of Johnson* (1791) will show. But the age was incurably suspicious of attempts to deal with such difficulties on any kind of technical system. Pope was never tired of girding at

"Morality by her false guardians drawn,  
Chitane in furs, and casuistry in lawn";

while Fielding has embodied the popular conception of a casuist in Parson Thwackum and Philosopher Square, both of whom only take to argument when they want to reason themselves out of some obvious duty. Still more outspoken is the Savoyard vicar in the *Émile* (1762) of Jean Jacques Rousseau: "Whence do I get my rules of action? I find them in my heart. All I feel to be good is good; all I feel to be evil is evil. Conscience is the best of casuists; it is only when men wish to cheat it that they fly to logical quibbles." Extravagant as this sentiment sounds, it paved the way to better things. The great object of 17th-century moralists had been to find some general principle from which the whole of ethics could be deduced; common-sense, by turning its back on abstract principles of every kind, forced the philosophers to come down to the solid earth, and start by inquiring how the world does make up its mind in fact. During the last two centuries deduction has gone steadily out, and psychology come in. Ethics have become more distinctively a science, instead of an awkward hybrid between a science and an art; their business has been to investigate what moral conduct is, not to lay down the law as to what it ought to be. Hence they deliberately refuse to engage in casuistry of the old-fashioned sort. Further, it is increasingly felt that ethical judgments do not depend on reason alone, but involve every element in our character; and that the real problem of practical morality is to establish a harmonious balance between the intelligence and the feelings—to make a man's "I think this is right" correspond with his "I feel that it is so." Whether systematic training can do anything to make the attainment of this balance easier is a

question that has lately engaged the attention of many educational reformers; and whatever future casuistry may still have before it would seem to lie along the lines indicated by them.

There is an excellent study of the ancient casuists by M. Raymond Thamin, *Un Problème moral dans l'antiquité* (Paris, 1884). For the Roman Catholic casuists see Dollinger and Reusch, *Moralstreitigkeiten im siebenzehnten Jahrhundert* (2 vols., Nordlingen, 1889), and various articles ("Casuistik," "Ethik," "Moralssysteme," &c.) in Wetzer and Welte's *Kirchenlexicon* (Freiburg, 1880-1896). See also the editions of Pascal's *Provincial Letters*, by John de Soyres (with English notes, Cambridge, 1880), and A. Molinier (2 vols., Paris, 1891). The Anglican casuists are discussed in Whewell, *Lectures on Moral Philosophy* (London, 1862). For general reflections on the subject see the appendix to Jowett's edition of the Epistle to the Romans (London, 1855). Most modern text-books on ethics devote some attention to the matter—notably F. H. Bradley in his *Ethical Studies* (London, 1876). See also Hastings Rashdall, *Theory of Good and Evil* (2 vols., Oxford, 1907). (St. C.)

**CASUS BELLI**, the technical term for cases in which a state holds itself justified in making war, if a certain course to which it objects is persisted in. Interference with the full exercise of a nation's rights or independence, an affront to its dignity, an unredressed injury, are instances of *casus belli*. Most of the new compulsory treaties of arbitration entered into by Great Britain and other states exclude from their application cases affecting the "vital interests" or "national honour" of the contracting states. These may therefore be considered as a sort of definition of *casus belli* in so far as the high contracting parties to them are concerned.

**CAT**,<sup>1</sup> properly the name of the well-known domesticated feline animal usually termed by naturalists *Felis domestica*, but in a wider sense employed to denote all the more typical members of the family *Felidae*. According to the *New English Dictionary*, although the origin of the word "cat" is unknown, yet the name is found in various languages as far back as they can be traced. In old Western Germanic it occurs, for instance, so early as from A.D. 400 to 450; in old High German it is *chazzo* or *calero*, and in Middle German *kaltaro*. Both in Gaelic and in old French it is *cat*, although sometimes taking the form of *chater* in the latter; the Gaelic designation of the European wild cat being *cat siabhaich*. In Welsh and Cornish the name is *calh*. If Martial's *catos* refer to this animal, the earliest Latin use of the name dates from the 1st century of our era. In the work of Palladius on agriculture, dating from about the year A.D. 350, reference is made to an animal called *calus* or *caltus*, as being useful in

<sup>1</sup> The word "cat" is applied to various objects, in all cases an application of the name of the animal. In mediæval siegecraft the "cat" (Med. Lat. *chaltus* or *galtus*, *chalta* or *gatta*, in Fr. *chat* or *châcheiteil*) was a movable pent-house used to protect besiegers when approaching a wall or gateway, for the purpose of sapping, mining or direct attack, or to cover a ram or other battering-engine. The word is also sometimes applied to a heavy timber fitted with iron spikes or projections to be thrown down upon besiegers, and to the large work known as a "cavalier." "Cat" or "cat-head," in nautical usage, is the projecting beam on the bows of a ship used to clear the anchor from the sides of the vessel when weighed. The stock of the anchor rests on the cat-head when hung outside the ship. The name is also used of a type of a vessel, now obsolete, and formerly used in the coal and timber trade on the north-east coast of England; it had a deep waist and narrow stem; it is still applied to a small rig of sailing boats, with a single mast stepped far forward, with a fore and aft sail. Among other objects also known by the name of "cat" is the small piece of wood pointed at either end used in the game of tip-cat, and the instrument of punishment, generally known as the "cat o' nine tails." This consists of a handle of wood or rope, about 18 in. long, with nine knotted cords or thongs. The multiplication of thongs for purposes of flogging is found in the old Roman *flagellum*, a scourge, which had sometimes three thongs with bone or bronze knots fastened to them. The "cat" was the regular instrument with which floggings were performed in the British army and navy. Since the abolition of flogging in the services, the use of the cat is now restricted to certain classes of offenders in military prisons (Army Act 1881, § 133). In the English criminal law, where corporal punishment is ordered by the court for certain criminal offences, the "cat" is used only where the prisoner is over sixteen years of age. It may not be used except when actually ordered in the sentence, and must be of a pattern approved by a secretary of state. Further floggings are inflicted with the "cat" upon convicted prisoners for breaches of discipline in prison. They must be ordered by the visitors of the prison and confirmed by the home secretary.

granaries for catching mice. This usage, coupled with the existence of a distinct term in Gaelic for the wild species, leaves little doubt that the word "cat" properly denotes only the domesticated species. This is confirmed by the employment in Byzantine Greek of the term *káttos* or *kárra* to designate domesticated cats brought from Egypt. It should be added that the *αἴλουρος* of the Greeks, frequently translated by the older writers as "cat," really refers to the marten-cat, which appears to have been partially domesticated by the ancients and employed for mousing.

As regards the origin of the domesticated cats of western Europe, it is well known that the ancient Egyptians were in the habit of domesticating (at least in some degree) the Egyptian race of the African wild cat (*Felis ocreata maniculata*), and also of embalming its remains, of which vast numbers have been found in tombs at Beni Hasan and elsewhere in Egypt. These Egyptian cats are generally believed by naturalists to have had a large share in the parentage of the European breeds, which have, however, in many cases been crossed to a greater or less extent with the European wild cat (*F. catus*).

One of the features by which the Egyptian differs from the European wild cat is the longer and less bushy tail; and it has been very generally considered that the same feature is characteristic of European domesticated cats. According, however, to Dr E. Hamilton, "the measurement of a number of tails of the [European] wild cat and of the domestic cat gives a range between 11 in. and 14½ in., the longer length being quite as often found in the wild cats as in the domestic. The bushy appearance depends entirely on the length of the fur, and accords with the thick fur of the rest of the body of the wild cat, while in the domestic race the fur both on the body and tail is thinner and softer."

Probably those domesticated cats with unusually short and bushy tails may have a larger share of European wild-cat blood; while, conversely, such wild cats as show long tails may have a cross of domesticated blood.

More importance was attached by Dr A. Nehring of Berlin (*SB. Ges. Naturfor.*, Berlin, 1887) to the colour of the soles of the hind-feet as a means of determining the relationship of the domesticated cat of Europe. According to his observations, in the Egyptian wild cat the pads of the toes are wholly black, while the black extends back either continuously or in long stripes as far as the calcaneum or heel-bone. In the European wild cat, on the other hand, the black is limited to a small round spot on the pads, while the colour of the hair as far back as the heel-bone is yellowish or yellowish-grey. Since in all domesticated cats retaining the colouring of the wild species the soles of the hind-feet correspond in this particular with the Egyptian rather than with the European wild cat, the presumption is in favour of their descent from the former rather than from the latter.

Later, Dr Nehring (*op. cit.* 1889) came to the conclusion that the domesticated cat has a dual parentage, one stock coming from south-eastern Asia and the other from north-eastern Africa; in other words, from a domesticated Chinese cat (itself derived from a wild Chinese species) on the one hand, and from the Egyptian cat on the other. The ordinary domesticated cats of Europe are, however, mainly of African origin, although they have largely crossed, especially in Germany (and probably also in Great Britain), with the wild cat. The same author was likewise of opinion that the domestication or taming of various species of wild cats took place chiefly among nationalities of stationary or non-nomadic habits who occupied themselves with agricultural pursuits, since it would be of vital importance that their stores of grain should be adequately protected from the depredations of rats and mice.

The foregoing opinion as to the dual parentage of our domesticated cats receives support from observations made many years ago by E. Blyth, which have recently been endorsed and amplified by R. I. Pocock (*Proc. Zool. Soc. London*, 1907). According to these observations, two distinct types of so-called tabby cats are recognizable. In the one the pattern consists of narrow vertical stripes, and in the other of longitudinal or obliquely longitudinal

stripes, which, on the sides of the body, tend to assume a spiral or sub-circular arrangement characteristic of the blotched tabby. This latter type appears to be the true "tabby"; since that word denotes a pattern like that of watered silk. One or other of these types is to be found in cats of almost all breeds, whether Persian, short-haired or Manx; and there appear to be no intermediate stages between them. Cats of the striped type are no doubt descended from the European and North African wild cats; but the origin of cats exhibiting the blotched pattern appears to be unknown. As it was to a cat of the latter kind that Linnæus gave the name of *Felis catus*, Pocock urges that this title is not available for the European wild cat, which he would call *Felis sylvestris*. Without accepting this proposed change in nomenclature, which is liable to lead to confusion without any compensating advantage, it may be suggested that the blotched tabby type represents Dr Nehring's presumed Chinese element in the cat's parentage, and that the missing wild stock may be one of the numerous phases of the leopard-cat (*F. bengalensis*), in some of which an incipient spiral arrangement of the markings may be noticed on the shoulder.

As to the introduction of domesticated cats into Europe, the opinion is very generally held that tame cats from Egypt were imported at a relatively early date into Etruria by Phœnician traders; and there is decisive evidence that these animals were established in Italy long before the Christian era. The progeny of these cats, more or less crossed with the indigenous species, thence gradually spread over Europe, to become mingled at some period, according to Dr Nehring's hypothesis, with an Asiatic stock. The earliest written record of the introduction of domesticated cats into Great Britain dates from about A.D. 936, when Hywel Dda, prince of South Wales, enacted a law for their protection. "The Romans," writes Dr Hamilton, "were probably the original introducers of this cat, and as the final evacuation of Britain by that nation took place under the emperor Valentinian about A.D. 436, the period of its introduction may certainly be dated some 500 years previous to the Welsh chronicle and even much earlier." It is added that the remains of cats from Roman villas at Silchester and Dursley are probably referable to the domesticated breed.

Before proceeding to notice some of the different types of domesticated cats, a few lines may be devoted to the wild European species, *F. catus*. Beyond stating that in colour it conforms very closely to the striped phase of domesticated tabby, it will be unnecessary to describe the species. Its geographical range was formerly very extensive, and included Great Britain, France, the Netherlands, Switzerland, Germany, Bohemia, Hungary, Poland, Transylvania, Galicia, the Caucasus as far as the Caspian, southern Russia, Italy, Spain, Greece, Rumania, Bulgaria, Servia, and portions of central and northern Asia. "At the present time," observes Dr Hamilton, "the wild cat has become almost extinct in many of the above districts. Examples may perhaps occasionally still be found in the uninhabited forests of Hungary and Transylvania, and occasionally in Spain and Greece, as well as in the Caucasus and in some of the Swiss cantons, but the original race has in most countries interbred with the domestic cat wherever the latter has penetrated." In Great Britain wild cats survive only in some of the Scottish forests, and even there it is difficult to decide whether pure-bred specimens are extant. Remains of the wild cat occur in English caverns; while from those of Ireland (where the wild species has apparently been unknown during the historic period) have been obtained jaws and teeth which it has been suggested are referable to the Egyptian rather than to the European wild cat. Such a determination is, however, extremely hazardous, even if it be admitted that the remains of cats from the rock-fissures of Gibraltar pertain to *Felis ocreata*.

The favourite haunts of the wild cat are mountain forests where masses or rocks or cliffs are interspersed with trees, the crevices in these rocks or the hollow trunks of trees affording sites for the wild cat's lair, where its young are produced and reared. In the Spanish plains, however, the young are often produced in nests built in trees, or among tall bamboos in

case-brakes. "To fight like a wild cat" is proverbial, and wild cats are described as some of the most ferocious and untamable of all animals. How far this untamable character lends support to the view of the origin of our domesticated breeds has not yet been determined. Hares, rabbits, field-mice, water-rats, rats, squirrels, moles, game-birds, pigeons, and small birds, form the chief food of the wild cat.

Apart from the above-mentioned division of the striped members of both groups into two types according to the pattern of their markings, the domesticated cats of western Europe are divided into a short-haired and a long-haired group. Of these, the former is the one which bears the closest relationship to the wild cats of Africa and of Europe, the latter being an importation from the East. The striped (as distinct from the blotched) short-haired tabby is probably the one most nearly allied to the wild ancestors, the stripes being, however, to a great extent due to the European wild cat. In one direction the tabby shows a tendency to melanism which culminates in complete blackness; while in the other direction there is an equally marked tendency to albinism; grey cats, which may be regarded as tabbies whose stripes have disappeared, forming the connecting link between the tabby and the white cat. A mixture of the melanistic with the albinistic type will of course give rise to parti-coloured cats. A third colour-phase, the "erythristic" or red, is represented by the sandy cat, the female of which takes the form of the "tortoise-shell," characterized, curiously enough, by the colour being a blend of black, white, and sandy. The so-called orange tabby is one phase of the erythristic type.

As to long-haired cats, there appear originally to have been two closely-allied strains, the Angora and the Persian, of which the former has been altogether replaced in western Europe by the latter. That these long-haired cats have an ancestry, to some extent at any rate distinct from the ordinary short-haired breeds, is practically certain, and it has been suggested that they are derived from the "manul" cat, or Pallas's cat (*Felis mosul*), of the deserts of central Asia, which is a long-haired and bushy-tailed species with comparatively slight striping. The fact that in tabby Persians the body-markings are never so strong as in the short-haired breeds is in some degree confirmatory of this, as suggesting descent from a nearly whole-coloured type. At the present day, however, Persians exhibit nearly all the colour and pattern types of the short-haired breeds, the "orange Persian" representing the erythristic phase.

Turning to the tailless or so-called Manx cats, in which the tail should be represented merely by a tuft of hair without any remnant of bone, it seems that the strain is to be met with in many parts of Russia, and there is a very general opinion that it originally came from Japan or some other far eastern country. Throughout Japan, China, Siam, and the Malay countries, normal long-tailed cats are indeed seldom seen. Instead of these are cats with more or less abbreviated tails, showing in greater or less degree a decided kink or bend near the tip. In other cases the tail is of the short curling type of that of a bulldog; sometimes it starts quite straight, but divides in a fork-like manner near the tip; and in yet other instances it is altogether wanting, as in the typical Manx cats. These kink-tailed or tailless cats are moreover smaller in size than the ordinary short-tailed breeds, with rather longer hair, whose texture approaches that of rabbit-fur, and a cry said to be like that of the jungle-cat (*F. chaus*) of India and Africa, and more dog-like habits. Unless the jungle-cat, which is a nearly whole-coloured species, can claim the position, the ancestry of these Manx-Malay cats is still unknown. Kink-tailed cats, it should be added, are also known from Madagascar.

Among the domesticated cats of India a spotted type of colouring, with a more or less decided tendency for the spots to coalesce into stripes, is very noticeable; and it is probable that these cats are derived from the spotted Indian desert-cat (*F. ornata*), with a certain amount of crossing from other species. The so-called *F. lorquata* of India is probably based on cats of

this type which have reverted to the wild state. Other Indian cats with a tawny or fulvous type of colouring are probably the more or less modified descendants of the jungle-cat. From the same stock may be derived the Abyssinian breed, in which the ears are relatively large and occasionally tipped with long hairs (thus recalling the tufted ears of the jungle-cat). The colour is typically reddish-brown, each individual hair being "ticked" like that of a wild rabbit, whence the popular name of "bunny cat." Another African breed is the Mombasa cat, in which the hair is reported to be unusually short and stiff.

By far the most remarkable of all the Old World domesticated breeds is, however, the royal Siamese cat, which almost certainly has an origin quite distinct from that of the ordinary European breeds; this being rendered evident not only by the peculiar type of colouring, but likewise by the cry, which is quite unmistakable. Siamese cats may have the tail either straight or kinked, but whether the latter feature belongs of right to the breed, or has been acquired by crossing with the ordinary black and tabby kink-tailed cats of the country, is not known. In the royal Siamese breed the head is rather long and pointed, the body also elongated with relatively slender limbs, the coat glossy and close, the eyes blue, and the general colour some shade of cream or pink, with the face, ears, feet, under-parts, and tail chocolate or seal-brown. There is however a wholly chocolate-coloured strain in which the eyes are yellow. The most remarkable feature about the breed is that the young are white. "The kittens," observes a lady writer, "are born absolutely white, and in about a week a faint pencilling comes round the ears, and gradually all the points come. At four or five months they are lovely, as generally they retain their baby whiteness, which contrasts well with their almost black ears, deep-brown markings, and blue eyes." In constitution these cats are extremely delicate. The blue eyes and the white coat of the kitten indicate that the Siamese breed is a semi-albino, which when adult tends towards melanism, such a combination of characters being apparently unknown in any other animal. If the frequent presence of a kink in the tail be an inherent feature, the breed is evidently related to the other kink-tailed Malay cats which, as already stated, have a cry differing from that of European cats. Should this be so, then if the ordinary Malay cats are the descendants of the jungle-cat, we shall have to assign the same ancestry to the Siamese breed.

Although definite information on this point is required, it seems probable that the southern part of North America and South America possessed certain native domesticated breeds of cats previous to the European conquest of the country; and if this be so, it will be obvious that these breeds must be derived from indigenous wild species. One of these breeds is the Paraguay cat, which when adult weighs only about three pounds, and is not more than a quarter the size of an ordinary cat. The body is elongated, and the hair, especially on the tail, short, shiny and close. This small size and elongated form suggest origin from the jaguarondi (*F. jaguarondi*), a chestnut-coloured wild species; but information appears to be lacking with regard to the colouring of the domesticated breed. Another South American breed is said to be free from the hideous "caterwauling" of the ordinary cat. In old days New Mexico was the home of a breed of hairless cats, said to have been kept by the ancient Aztecs, but now well-nigh if not completely extinct. Although entirely naked in summer, these cats developed in winter a slight growth of hair on the back and the ridge of the tail.

LITERATURE.—St George Mivart, *The Cat* (London, 1881); R. Lydekker, "Cats," in *Allen's Naturalists' Library* (1888); F. Hamilton, *The Wild Cat of Europe* (London, 1896); Frances Simpson, *The Book of the Cat* (London, 1903). (R. L.)\*

CATABOLISM, or KATABOLISM (Gr. *κατά*, down, *βολή*, a throw), the biological term for the reverse of anabolism, namely the breaking down of complex into simpler substances, destructive metabolism (see *PHYSIOLOGY*).

CATACLYSM (Gr. *κατακλυσμός*, a deluge), a great flood or deluge (*q.v.*). The term is used in geology to denote an

overwhelming catastrophe which has produced sudden changes in the earth's surface; and also, figuratively, of any great and violent change which sweeps away the existing social or political order.

**CATACOMB**, a subterranean excavation for the interment of the dead or burial-vault. In this sense the word "catacomb" has gained universal acceptance, and has found a place in most modern languages. The original term, *calacumbas*, however, had no connexion with sepulture, but was simply the name of a particular locality in the environs of Rome. It was derived from the Greek *καρά* and *κλύσις*, "a hollow," and had reference to the natural configuration of the ground. In the district that bore this designation, lying close to the Appian Way, the basilica of San Sebastiano was erected, and the extensive burial-vaults beneath that church—in which, according to tradition, the bodies of the apostles St Peter and St Paul rested for a year and seven months previous to their removal to the basilicas which bear their names—were, in very early times, called from its *coemeterium ad calacumbas*, or *calacumbas* alone. From the celebrity of this cemetery as an object of pilgrimage its name became extensively known, and in entire forgetfulness of the origin of the word, *calacumbas* came to be regarded as a generic appellation for all burial-places of the same kind. This extension of the term to Christian burial-vaults generally dates from the 9th century, and obtained gradual currency through the Christian world. The original designation of these places of sepulture is *crypta* or *coemeterium*.

The largest number of Christian catacombs belong to the 3rd and the early part of the 4th centuries. The custom of subterranean interment gradually died out, and entirely ceased with the sack of Rome by Alaric, A.D. 410. "The end of the catacomb graves," writes Mommsen (*Coni. Rev.*, May 1871), "is intimately connected with the end of the powerful city itself. . . . Poverty took the place of wealth, . . . the traditions of the Christian tomb-architects sank into utter insignificance, and the expanse of the wasted Campagna now offered room enough to bury the few bodies, without having to descend as once far down below the surface of the earth." The earliest account of the catacombs, that of St Jerome narrating his visits to them when a schoolboy at Rome, about A.D. 354, shows that interment in them was even then rare if it had not been altogether discontinued; and the poet Prudentius's description of the tomb of the Christian martyr Hippolytus, and the cemetery in which it stood, leads us to the same conclusion. With the latter part of the 4th century a new epoch in the history of the catacombs arose—that of religious reverence. In the time of Pope Damasus, A.D. 366–384, the catacombs had begun to be regarded with special devotion, and had become the resort of large bands of pilgrims, for whose guidance catalogues of the chief burial-places and the holy men buried in them were drawn up. Some of these lists are still extant.<sup>1</sup> Pope Damasus himself displayed great zeal in adapting the catacombs to their new purpose, restoring the works of art on the walls, and renewing the epitaphs over the graves of the martyrs. In this latter work he employed an engraver named Furius Philocalus, the exquisite beauty of whose characters enables the smallest fragment of his work to be recognized at a glance. This gave rise to extensive alterations in their construction and decoration, which has much lessened their value as authentic memorials of the religious art of the 2nd and 3rd centuries. Subsequent popes manifested equal ardour, with the same damaging results, in the repair and adornment of the catacombs, and many of the paintings covering their walls, which have been assigned to the period of their original construction, are really the work of these later times. The catacombs

shared in the devastation of Rome by the Goths under Vitiges in the 6th century and by the Lombards at a later period; and partly through the spoliation of these barbarian invaders, partly through the neglect of those who should have been their guardians, they sank into such a state of decay and pollution that, as the only means of preserving the holy remains they enshrined from further desecration, Pope Paul I., in the latter part of the 8th century, and Pope Paschal, at the beginning of the 9th, entered upon the work of the translation of the relics, which was vigorously carried on by successive pontiffs until the crypts were almost entirely despoiled of their dead. The relics having been removed, the visits of pilgrims naturally ceased, and by degrees the very existence of those wonderful subterranean cemeteries was forgotten. Six centuries elapsed before the accidental discovery of a sepulchral chamber by some labourers digging for *pozzolana* earth (May 31, 1578) revealed to the amazed inhabitants of Rome "the existence," to quote a contemporary record, "of other cities concealed beneath their own suburbs." Baronius, the ecclesiastical historian, was one of the first to visit the new discovery, and his *Annals* in more than one place evidence his just appreciation of its importance. The true "Columbus of this subterranean world," as he has been aptly designated, was the indefatigable Antonio Bosio (d. 1629), who devoted his life to the personal investigation of the catacombs, the results of which were given to the world in 1632 in a huge folio, entitled *Roma sotterranea*, profusely illustrated with rude hut faithful plans and engravings. This was republished in a Latin translation with considerable alterations and omissions by Paolo Aringhi in 1651; and a century after its first appearance the plates were reproduced by Giovanni Bottari in 1737, and illustrated with great care and learning. Some additional discoveries were described by Marc Antonio Boldetti in his *Osservazioni*, published in 1720; but, writing in the interests of the Roman Church with an apologetic, not a scientific object, truth was made to bend to polemics, and little addition to our knowledge of the catacombs is to be gained from his otherwise important work. The French historian of art, Seroux d'Agincourt, 1825, by his copious illustrations, greatly facilitated the study of the architecture of the catacombs and the works of art contained in them. The works of Raoul Rochette display a comprehensive knowledge of the whole subject, extensive reading, and a thorough acquaintance with early Christian art so far as it could be gathered from books, but he was not an original investigator. The great pioneer in the path of independent research, which, with the intelligent use of documentary and historical evidence, has led to so vast an increase in our acquaintance with the Roman Catacombs, was Padre Marchi of the Society of Jesus. His work, *Monumenti delle arti cristiane primitive*, is the first in which the strange misconception, received with unquestioning faith by earlier writers, that the catacombs were exhausted sand-pits adapted by the Christians to the purpose of interment, was dispelled, and the true history of their formation demonstrated. Marchi's line of investigation was followed by the Commendatore De Rossi, and his brother Michele, the former of whom was Marchi's fellow-labourer during the latter part of his explorations; and it is to them that we owe the most exhaustive scientific examination of the whole subject. The Catacombs of Rome are the most extensive with which we are acquainted, and, as might be expected in the centre of the Christian world, are in many respects the most remarkable. No others have been so thoroughly examined and illustrated. These may, therefore, be most appropriately selected for description as typical examples.

Our description of the Roman Catacombs cannot be more appropriately introduced than by St Jerome's account of his visits to them in his youth, already referred to, which, after the lapse of above fifteen centuries, presents a Catacombs of Rome. most accurate picture of these wonderful subterranean labyrinths. "When I was a boy," he writes, "receiving my education in Rome, I and my schoolfellows used, on Sundays, to make the circuit of the sepulchres of the apostles and martyrs. Many a time did we go down into the catacombs. These are

<sup>1</sup> The most important of these lists are the two Itineraries belonging to the first half of the 7th century, in the Salzburg library. One still earlier, but less complete, appears in the *Notitia Urbis Romae*, under the title *Index Coemeteriorum*. Another Itinerary, preserved at Einsiedeln, printed by Mabillon, dates from the latter half of the same century. That found in the works of William of Malmesbury (Hardy's ed. vol. ii. pp. 539-544) appears to be copied from it, or both may be from the same source. De Rossi gives a comparative table of these Itineraries and other similar lists.

excavated deep in the earth, and contain, on either hand as you enter, the bodies of the dead hurried in the wall. It is all so dark there that the language of the prophet (Ps. lv. 15) seems to be fulfilled, 'Let them go down quick into hell.' Only occasionally is light let in to mitigate the horror of the gloom, and then not so much through a window as through a hole. You take each step with caution, as, surrounded by deep night, you recall the words of Virgil—

"Horror ubique animos, simul ipsa silentia terret."<sup>1</sup>

In complete agreement with Jerome's vivid picture the visitor to the Roman Catacombs finds himself in a vast labyrinth of narrow galleries, usually from 3 to 4 ft. in width, interspersed with small chambers, all excavated at successive levels, in the

they reach seven storeys), and communicate with one another by stairs cut out of the living rock. Light and air are introduced by means of vertical shafts (*luminaria*) running up to the outer air, and often serving for several storeys. The drawing (fig. 3) from Northcote gives a very correct idea of these galleries, with the tiers of graves pierced in the walls. The doorways which are seen interrupting the lines of graves are those of the family sepulchral chambers, or *cubicula*, of which we shall speak more particularly hereafter.

The graves, or *loculi*, as they are commonly designated, were, in the Christian cemeteries, with only a few exceptions (Padre Marchi produces some from the cemetery of St Ciriaca, *Monum. primitiv.* tav. xiv. xliii. xliv.), parallel with the length of the

strata of volcanic rock subjacent to the city and its environs, and constructed originally for the interment of the Christian dead. The galleries are not the way of access to the cemeteries, but are themselves the cemeteries, the dead being buried in long low horizontal recesses, excavated in the vertical walls of the passages, rising tier above tier like the berths in a ship, from a few inches above the floor to the springing of the arched ceiling, to the number of five, six or even sometimes twelve ranges. These galleries are not arranged on any definite plan, but, as will be seen from the plan (fig. 1), they intersect one another at different angles, producing an intricate network which it is almost impossible to reduce to any system. They generally run in straight lines, and as a rule preserve the same level. The different storeys of galleries lie one below the other (fig. 2) to the number of four or five (in one part of the cemetery of St Calixtus

<sup>1</sup> Hieron., *Comment. in Eszech.* lib. xx. c. 40. The translation is Dean Burgon's.

gallery. In the pagan cemeteries, on the other hand, the sepulchral recess as a rule entered the rock like an oven at right angles to the corridor, the body being introduced endways. The plan adopted by the Christians saved labour, economized space, and consulted reverence in the deposition of the corpse. These *loculi* were usually constructed for a single body only. Some, however, were formed to contain two, three, or four, or even more corpses. Such recesses were known respectively as *bisomi*, *trisomi*, *quadrisomi*, &c., terms which often appear in the sepulchral inscriptions. After the introduction of the body the *loculi* were closed with the greatest care, either with slabs of marble the whole length of the aperture, or with huge tiles, three being generally employed, cemented together with great exactness so as to prevent the escape of the products of decomposition (fig. 4). Where any epitaph was set up—an immense number are destitute of any inscription at all—it is always painted or engraved on these slabs or tiles. In the earlier interments the

epitaph is usually daubed on the slab in red or black paint. In later examples it is incised in the marbles, the letters being rendered clearer by being coloured with vermilion. The enclosing slab very often bears one or more Christian symbols, such as the

FIG. 2.—Section of Galleries at different levels. (From Seroux d'Agincourt.)

dove, the anchor, the olive-branch, or the monogram of Christ (figs. 5, 6). The palm branch, which is also of frequent occurrence, is not an indisputable mark of the last resting-place of a martyr, being found in connexion with epitaphs of persons dying natural deaths, or those prepared by persons in their lifetime, as well as in those of little children, and even of pagans. Another frequent concomitant of these catacomb interments, a small glass vessel containing traces of the sediment of a red fluid, embedded in the cement of the *loculus* (fig. 7), has no better claim. The red matter proves to be the remains of wine, not of blood; and the conclusion of the ablest archaeologists is that

FIG. 3.—View of a Gallery.

the vessels were placed where they are found, after the eucharistic celebration or *agape* on the day of the funeral or its anniversary, and contained remains of the consecrated elements as a kind of religious charm. Not a few of the slabs, it is discovered, have done double duty, bearing a pagan inscription on one side and a Christian one on the other. These are known as *opisthographs*. The bodies were interred wrapped in linen

cloths, or swathed in bands, and were frequently preserved by embalming. In the case of poorer interments the destruction of the body was, on the contrary, often accelerated by the use of quicklime.

Interment in the wall-recess or *loculus*, though infinitely the most common, was not the only mode employed in the catacombs.

FIG. 4.—Loculi. (From de Rossi.)

Other forms of very frequent recurrence are the *table-tomb* and *arched tomb*, or *arcosolium*. From the annexed woodcuts it will be seen that these only differ in the form of the surmounting recess. In each case the arched tomb was formed by an oblong chest, either hollowed out of the rock, or built of masonry, and closed with a horizontal slab. But in the table-tomb (fig. 8) the recess above, essential for the introduction of the corpse, is square, while in the *arcosolium* (fig. 9), a form of later date, it is semicircular. Sarcophagi are also found in the catacombs, but are

FIGS. 5 and 6.—Loculi. (From de Rossi.)

of rare occurrence. They chiefly occur in the earlier cemeteries, and the costliness of their construction confined their use to the wealthiest classes—e.g. in the cemetery of St. Domitilla, herself a member of the imperial house. Another unfrequent mode of interment was in graves like those of modern times, dug in the floor of the galleries (Marchi, *u.s.*, tav. xxi. xxvi.). Table-tombs and *arcosolia* are by no means rare in the corridors of the catacombs, but they belong more generally to the *cubicula*, or family vaults, of which we now proceed to speak.

These *cubicula* are small apartments, seldom more than 12 ft. square, usually rectangular, though sometimes circular or

FIG. 7.—Glass Bottles. (From Bosio.)

polygonal, opening out of the main corridors. They are not unfrequently ranged regularly along the sides of the galleries, the doors of entrance, as may be seen in a previous illustration (fig. 3), following one another in an orderly succession as the bedchamber doors in the passage of a modern house. The roof is sometimes

flat, but is more usually vaulted, and sometimes rises into a cupola. Both the roof and the walls are almost universally coated with stucco and covered with fresco paintings—in the earlier works merely decorative, in the later always symbolical or historical. Each side of the cubiculum, except that of the entrance, usually contains a recessed tomb, either a table-tomb or an arcosolia. That facing the entrance was the place of greatest honour, where in many instances the remains of a martyr were deposited, whose tomb, according to primitive usage, served as an altar for the celebration of the eucharist. This was sometimes, as in the Papal crypt of St Calixtus

was celebrated the funeral-feast on the day of burial and on its anniversary, as well as the eucharist, which was the invariable accompaniment of funerals in the primitive church (Bingham,

FIG. 8.—Table-tomb.

(fig. 10), protected from irreverence by lattice work (*transennae*) of marble. The cubiculum was originally designed for the reception of a very limited number of dead. But the natural desire to be buried near one's relatives caused new tombs to be cut in the walls, above and around and behind the original tombs, the walls being thus completely honeycombed with *loculi*, sometimes as many as seventy, utterly regardless of the paintings originally depicted on the walls. Another motive for multiplying the number of graves operated when the cubiculum contained the remains of any noted saint or martyr. The Christian antiquary has cause continually to lament the destruction of works of art due to this craving. One of the most perfect examples of early Christian pictorial decoration, the so-called "Dispute with the Doctors," in the catacomb of Calixtus, the "antique style of beauty" of which is noticed by Kugler, has thus suffered irreparable mutilation, the whole of the lower part of the picture having been destroyed by the excavation of a fresh grave-recess (Bottari, vol. ii. tav. 15). The plates of De Rossi, Perret, and, indeed, all illustrations of the catacombs, exhibit frequent examples of the same destructive superstition. The illustrations (figs. 11 and 12), taken from De Rossi's great work, representing two of the cubicula in the cemetery of St Calixtus, show the general arrangement of the *loculi* and the

*Orig. Ecd. bk. xxiii. c. iii. 12*). The funeral-banquet descended to the Christian church from pagan times, and was too often profaned by heathen licence. St Augustine, in several passages, inveighs against those who thus by "gluttony and insobriety buried themselves over the buried," and "made themselves

FIG. 9.—Arcosolia. (From Bosio.)

character of the frescoes which ornament the walls and roof. These paintings, it will be seen, are simply decorative, of the same style as the wall-paintings of the baths, and those of Pompeii.

Each *cubiculum* was usually the burying-place of some one family, all the members of which were interred in it, just as in the chantry-chapels connected with medieval churches. In them

FIG. 11.—Cubiculum in Cemetery of St Calixtus. (From de Rossi.)

drunk in the chapels of the martyrs, placing their excesses to the score of religious reverence for the dead" (August., *De Mor. Ecd. Cathol.* c. 34; *Contr. Faust.* lih. xx. c. 21; *Confess.* lih. vi. c. 2). Some curious frescoes representing these funeral-feasts, found in the *cubicula* which were the scene of them, are

reproduced by Bosio (pp. 355, 391) and others. A romantic air has been thrown over these burial chapels by the notion that they were the places of worship used by the Christians in times of

FIG. 12.—Cubiculum in the Cemetery of St. Calixtus. (From de Rossi.)

persecution. This to a certain extent is doubtless true, as in the case of the chapel of Santa Priscilla, where the altar or stone coffin of a martyr remains, with a small platform behind it for the priest or bishop to stand upon. But that they can have been so used to any large extent is rendered impossible by their limited dimensions, as none of them could hold more than fifty or sixty persons. In some of the catacombs, however, there are larger halls and connected suites of chapels which may possibly have been constructed for the purpose of congregational worship during the dark periods when the public exercise of the Christian religion was made penal. The most remarkable of these is in the cemetery of Sant' Agnese (see plan, fig. 13). It consists of five rectangular compartments, three on one side of the corridor

FIG. 13.—Plan of a supposed Church, Catacomb of Sant' Agnese. (From Marchi.)

and two on the other, connected by a passage intersecting the gallery at right angles. Two of the five compartments are supposed to have been assigned to male, and two to female worshippers, the fifth, at the extremity of the whole, being reserved for the altar and its ministers. In the centre of the end-wall stands a stone chair (fig. 14), considered to have been the episcopal cathedra, with a bench for the clergy on each side. There is no trace of an altar, which may, Marchi thinks, have been portable. The walls of the compartments are occupied by arched sepulchral recesses, above and below which are tiers of ordinary graves or *loculi*. The arrangements are certainly such as indicate a congregational purpose, but the extreme narrowness

of the suite, and still more of the passage which connects the two divisions, must have rendered it difficult for any but a small number to take any intelligent part in the services at the same time. Although the idea of the use of the catacombs for religious worship may have been pressed too far, there can be no doubt that the sacred rites of the church were celebrated within them. We have already spoken of the eucharistic celebrations of which the *cubicula* were the scene; and still existing baptisteries prove that the other sacrament was also administered there. The most remarkable of these baptisteries is that in the catacomb of San Pontianus (fig. 15). Ten steps lead down to a basin of sufficient depth for immersion, supplied

FIG. 14.—Bishop's Chair. Catacomb of Sant' Agnese.

by a spring. Some of the subterranean chambers contain armed seats and benches cut out of the tufa rock. These are supposed by Marchi and others to indicate schoolrooms, where the catechumens were instructed by the bishop or presbyters. But this theory wants verification. It is impossible not to be struck with the remarkable analogy between these rock-hewn chairs and those discovered in the Etruscan tombs, of the purpose of which no satisfactory explanation has been given.

Very exaggerated statements have been made as to the employment of the catacombs as dwelling-places by the Christians in times of persecution. We have, however, sufficient evidence that they were used as places of refuge from the fury of the heathen, in which the believers—especially the bishops and clergy, who would naturally be the first objects of attack—might secrete themselves until the storm had blown over. This was a purpose for which they were

FIG. 15.—Baptistry of San Pontianus. (From Perret.)

admirably adapted both by the intricacy of their labyrinthine passages, in which any one not possessing the clue would be inevitably lost, and the numerous small chambers and hiding-places at different levels which might be passed unperceived in the dark by the pursuers. As a rule also the catacombs had

more than one entrance, and frequently communicated with an *arenaria* or sand-quarry; so that while one entrance was carefully watched, the pursued might escape in a totally different direction by another. But, to quote J. H. Parker, "the catacombs were never intended, nor fit for, dwelling-places, and the stories of persons living in them for months are probably fabulous. According to modern physicians it is impossible to live many days in the caves of *pozzolana* in which many of the catacombs are excavated." Equally exaggerated are the statements as to the linear and lateral extent of the catacombs, and their intercommunication with one another. Without resorting to this exaggeration, Mommsen can speak with perfect truth of the "enormous space occupied by the burial vaults of Christian Rome, not surpassed even by the *cloacae* or sewers of Republican Rome," but the data are too vague to warrant any attempt to define their dimensions. Marchi has estimated the united length of the galleries at from 800 to 900 m., and the number of interments at between 6,000,000 and 7,000,000; Martigny's estimate is 587 m.; and Northcote's, lower still, at "not less than 350 m." The idea of general intercommunication is negated by the fact that the chief cemeteries are separated by low ground or valleys, where any subterranean galleries would be at once filled with water.

It now remains to speak of the history of these subterranean burial-places, together with the reasons for, and mode of, their construction. From the period of the rediscovery of the catacombs in the 16th century till comparatively recent times a gigantic fallacy prevailed, repeated by writer after writer, identifying the Christian burial-places with disused sand-pits. It was accepted as an unquestionable fact by every one who undertook to describe the catacombs, that the Christians of Rome, finding in the labyrinthine mazes of the exhausted *arenariae*, which abounded in the environs of the city, whence the sand used in building had been extracted, a suitable place for the interment of their martyred brethren, where also the sacred rites accompanying the interment might be celebrated without fear of interruption, took possession of them and used them as cemeteries. It only needed a comparison of the theory with the visible facts to refute it at once, but nearly three centuries elapsed before the independence of the *arenariae* and the catacombs was established. The discovery of this independence is due to Marchi. Starting with the firmest belief in the old traditional view, his own researches by degrees opened his eyes to the truth, now universally recognized, that the catacombs were exclusively the work of the Christians, and were constructed for the interment of the dead. It is true that a catacomb is often connected with the earlier sand-quarry, and starts from it as a commencement, but the two are excavated in different strata, suitable to their respective purposes, and their plan and construction are so completely unlike as to render any confusion between them impossible.

The igneous formation of which the greater part of the Roman Campagna is, in its superior portion, composed, contains three strata known under the common name of *tufa*—the "stony," "granular," and "sandy" tufa,—the last being commonly known as *pozzolana*.<sup>1</sup> The *pozzolana* is the material required for building purposes, for admixture with mortar; and the sandpits are naturally excavated in the stratum which supplies it. The stony tufa (*tufa litoide*) is quarried as building-stone. The granular tufa is useless for either purpose, containing too much earth to be employed in making mortar, and being far too soft to be used as stone for building. Yet it is in this stratum, and in this alone, that the catacombs are constructed; their engineers avoiding with equal care the solid stone of the *tufa litoide* and the friable *pozzolana*, and selecting the stratum of medium hardness, which enabled them to form the vertical walls of their galleries, and to excavate the *loculi* and *cubicula* without severe labour and also without fear of their falling in. The annexed illustration (fig. 16) from Marchi's work, when compared with that of the catacomb of Sant' Agnese already given, presents

to the eye the contrast between the wide winding irregular passages of the sand-pit, calculated for the admission of a horse and cart, and the narrow rectilinear accurately-defined galleries of the catacomb. The distinction between the two is also plainly exhibited when for some local or private reasons an ancient *arenaria* has been transformed into a cemetery. The modifications required to strengthen the crumbling walls to support the roof and to facilitate the excavation of *loculi*, involved so much labour that, as a rule, after a few attempts, the idea of utilizing an old quarry for burial purposes was abandoned.

Another equally erroneous idea was that these vast burial-places of the early Christians remained entirely concealed from the eyes of their pagan neighbours, and were constructed not only without the permission of the municipal authorities but without their cognizance. Nothing can be farther from the truth. Such an idea is justly stigmatized by Mommsen as ridiculous, and reflecting a discredit as unfounded as it is unjust on the imperial police of the capital. That such vast excavations should have been made without attracting attention, and that such an immense number of corpses could have been carried to burial in perfect secrecy is utterly impossible. Nor was there any reason why secrecy should have been desired. The decent burial of the dead was a matter especially provided for by the Roman laws. No particular mode was prescribed. Interment was just as legal

as cremation, and had, in fact, been universally practised by the Romans until the later days of the republic.<sup>2</sup> The bodies of the Scipios and Nasos were buried in still existing catacombs; and if the Christians preferred to adopt that which Minucius Felix calls

FIG. 16.—Arenaria beneath the Cemetery of Calixtus.

"the better, and more ancient custom of inhumation" (*Octavius*, c. 2), there was absolutely nothing, to quote the words of Northcote (*Roma sotterrana*, pp. 56, 61), "either in their social or religious position to interfere with their freedom of action. The law left them entire liberty, . . . and the faithful did but use their liberty in the way that suited them best, burying their dead according to a fashion to which many of them had been long accustomed, and which enabled them at the same time to follow in death the example of him who was also their model in life." Interment in rock-hewn tombs, "as the manner of the Jews is to bury," had been practised in Rome by the Jewish settlers for a considerable period anterior to the rise of the Christian Church. A Jewish catacomb, now lost, was discovered and described by Bosio (*Rom. soll.* p. 141), and others are still accessible. They are to be distinguished from Christian catacombs only by the character of their decorations, the absence of Christian symbols and the language of their inscriptions. There would, therefore, be nothing extraordinary in the fact that a community, always identified in the popular heathen mind with the Jewish faith, should adopt the mode of interment belonging to that religion. Nor have we the slightest trace of any official interference with Christian burials, such as would render secrecy necessary or desirable. Their funerals were as much under the protection of the law, which not only invested the tomb itself with a sacred character, but included in its protection the area in which it stood, and the *cella memoriae* or chapel connected with it, as those of their heathen fellow-citizens, while the same shield would be thrown over the burial-club, which, as we learn from Tertullian

<sup>1</sup> In Rome the three strata are known to geologists as *tufa litoide*, *tufa granolare* and *pozzolana*.

<sup>2</sup> Cicero is our authority for the burial of Marius, and for Sulla's being the first member of the gens Cornelia whose dead body was burnt (*De Legg.* ii. 22).

(*Apolo.* c. 39), were common among the early Christians, as over those existing among the heathen population of Rome.

We may then completely dismiss the notion of there being any studied secrecy in connexion with the early Christian cemeteries, and proceed to inquire into the mode of their formation.

*Mode of formation.*

Almost without exception, they had their origin in small burial areas, the property of private persons or of families, gradually ramifying and receiving additions of one subterranean storey after another as each was required for interments. The first step would be the acquisition of a plot of ground either by gift or purchase for the formation of a tomb. Christians were not beyond the pale of the law, and their faith presented no hindrance to the property being secured to them in perpetuity. To adapt the ground for its purpose as a cemetery, a gallery was run all round the area in the tufa rock at a convenient depth below the surface, reached by staircases at the corners. In the upright walls of these galleries *loculi* were cut as needed to receive the dead. When these first four galleries were full others were mined on the same level at right angles to them, thus gradually converting the whole area into a net-work of corridors. If a family vault was required, or a burial chapel for a martyr or person of distinction, a small square room was excavated by the side of the gallery and communicating with it. When the original area had been mined in this way as far as was consistent with stability, a second storey of galleries was begun at a lower level, reached by a new staircase. This was succeeded by a third, or a fourth, and sometimes even by a fifth. When adjacent burial areas belonged to members of the same Christian confraternity, or by gift or purchase fell into the same hands, communications were opened between the respective cemeteries, which thus spread laterally, and gradually acquired that enormous extent which, "even when their fabulous dimensions are reduced to their right measure, form an immense work."<sup>1</sup> This could only be executed by a large and powerful Christian community unimpeded by legal enactments or police regulations, "a living witness of its immense development corresponding to the importance of the capital." But although, as we have said, in ordinary times there was no necessity for secrecy, yet when the peace of the Church was broken by the fierce and often protracted persecutions of the heathen emperors, it became essential to adopt precautions to conceal the entrance to the cemeteries, which became the temporary hiding-places of the Christian fugitives, and to baffle the search of their pursuers. To these stormy periods we may safely assign the alterations which may be traced in the staircases, which are sometimes abruptly cut off, leaving a gap requiring a ladder, and the formation of secret passages communicating with the *arenariæ*, and through them with the open country.

When the storms of persecution ceased and Christianity had become the imperial faith, the evil fruits of prosperity were not slow to appear. Cemetery interment became a regular trade in the hands of the *fossores*, or grave-diggers, who appear to have established a kind of property in the catacombs, and whose greed of gain led to that destruction of the religious paintings with which the walls were decorated, for the quarrying of fresh *loculi*, to which we have already alluded. Monumental epitaphs record the purchase of a grave from the *fossores*, in many cases during the lifetime of the individual, not unfrequently stating the price. A very curious fresco, found in the cemetery of Calixtus, preserved by the engravings of the earlier investigators (Bottari, tom. ii. p. 126, tav. 99), represents a "fossor" with his lamp in his hand and his pick over his shoulder, and his tools lying about him. Above is the inscription, "Diogenes Fossor in Pace depositus."

It is unnecessary to enter on any detailed description of the frescoes which cover the walls and ceilings of the burial-chapels in the richest abundance. It must suffice to say that the earliest examples are only to be distinguished from the mural decorations employed by their pagan contemporaries (as seen at Pompeii and

<sup>1</sup> Mommsen's chosen example of an ancient burial-chamber, extending itself into a catacomb, or gathering subterranean additions round it (till a catacomb was established, is that of the cemetery of St. Domicilla, traditionally identified with a granddaughter of Vespasian, and the catacomb of Santi Nereo ed Achilleo on the Appian and Ardeatine way.

elsewhere) by the absence of all that was immoral or idolatrous, and that it was only very slowly and timidly that any distinctly religious representations were introduced. These were at first purely symbolical, meaningless to any but a Christian eye, such as the Vine, the Good Shepherd, the Sheep, the Fisherman, the Fish, &c. Even the personages of ancient mythology were pressed into the service of early Christian art, and Orpheus, taming the wild beasts with his lyre, symbolized the peaceful sway of Christ; and Ulysses, deaf to the Siren's song, represented the Believer triumphing over the allurements of sensual pleasure. The person of Christ appeared but rarely, and then commonly simply as the chief personage in an historical picture. The events depicted from the life of Christ are but few, and always conform rigidly to the same traditional type. The most frequent are the miracle at Cana, the multiplication of the loaves and fishes, the paralytic carrying his bed, the healing of the woman with the issue of blood, the raising of Lazarus,

- In the centre, the Good Shepherd.

Zacchæus, and the triumphal entry into Jerusalem. The Crucifixion, and subjects from the Passion, are never represented. The cycle of Old Testament subjects is equally limited. The most common are the history of Jonah as a type of the Resurrection, the Fall, Noah receiving the dove with the olive branch, Abraham's sacrifice of Isaac, Moses taking off his shoes, David with the sling, Daniel in the lions' den, and the Three Children in the fiery furnace. The mode of representation is always conventional, the treatment of the subject no less than its choice being dictated by an authority to which the artist was compelled to bow. All the more valuable of these paintings have been produced in J. H. Parker's series of photographs taken in the catacombs with the magnesium light.<sup>2</sup> Wilpert's great work, in which these frescoes are reproduced in colours, now enables the student even better to distinguish the styles of different centuries and follow the course of artistic development or decay.

Beyond Rome and its suburbs the most remarkable Christian catacombs are those in the vicinity of Naples, described by Pelliccia (*De Christ. Ecd. Polii*, vol. iv. Dissert. 5), and in separate treatises by Belleman and Schultze. Plans of them are also given by Agincourt in his great work on Christian art. These

<sup>2</sup> Parker's invaluable series of Roman photographs may be seen at the library of the Victoria and Albert museum, at the Ashmolean museum and the Bodleian library, Oxford.

catacombs differ materially from those of Rome. They were certainly originally stone-quarries, and the hardness of the rock has made the construction practicable of wide, lofty corridors and spacious halls, very unlike the narrow galleries and contracted chambers in the Roman cemeteries. The mode of interment, however, is the same as that practised in Rome, and the *loculi* and *arcosolia* differ by little in the two. The walls and ceilings are covered

Catacombs of Naples.

FIG. 18.—Fresco Ceiling. (From Bosio.)

The subjects, beginning at the bottom and going to the right, are—

 (3) The three children in the furnace.

with fresco paintings of different dates, in some cases lying one over the other. This catacomb contains an unquestionable example of a church, divided into a nave and chancel, with a rude stone altar and bishop's seat behind it.

At Syracuse also there are very extensive catacombs known as "the Grottos of St John." They are also figured by Agincourt, and described by Denon (*Voyage en Sicile et Malte*) and Führer. There is an entire underground city with several storeys of larger and smaller streets, squares and cross ways, cut out of the rock; at the intersection of the cross ways

FIG. 19.—Plan of the Catacombs of St John, Syracuse.

are immense circular halls of a bottle shape, like a glass-house furnace, lighted by air shafts. The galleries are generally very narrow, furnished on each side with arched tombs, and communicating with family sepulchral-chambers closed originally

by locked doors, the marks of the hinges and staples being still visible. The walls are in many places coated with stucco adorned with frescoes, including palms, doves, labara and other Christian symbols. The ground-plans (figs. 19, 20), from Agincourt, of the catacomb and of one of the circular halls, show how widely this cemetery differs in arrangement from the Roman catacombs. The frequency of blind passages and of circular chambers will be noticed, as well as the very large number of bodies in the cruciform recesses, apparently amounting in one instance to nineteen. Agincourt remarks that this cemetery "gives an idea of a work executed with design and leisure, and with means very different from those at command in producing the catacombs of Rome."

FIG. 20.—Plan of Circular Hall, Catacombs of St John, Syracuse. (From Agincourt.)

Denon also describes catacombs at Malta near the ancient capital of the island. The passages were all cut in a close-grained stone, and are very narrow, with arched ceilings, running very irregularly, and ramifying in all directions. The greater part of the tombs stand on either side of the galleries in square recesses (like the table-tombs of the Roman catacombs), and are rudely fashioned to imitate sarcophagi. The interments are not nearly so numerous as in other catacombs, nor are there any vestiges of painting, sculpture or inscriptions. At Taormina in Sicily is a Saracenic catacomb, also figured by Agincourt. The main corridor is 12 ft. wide, having three or more ranges of *loculi* on either side, running longitudinally into the rock, each originally closed by a stone bearing an inscription.

Passing to Egypt, a small Christian catacomb at Alexandria is described and figured by de Rossi.<sup>1</sup> The *loculi* here also are set endways to the passage. The walls are abundantly decorated with paintings, one of a liturgical character. But the most extensive catacombs at Alexandria are those of Egypto-Greek origin, from the largest of which, according to Strabo (lib. xvii. p. 795), the quarter where it is placed had the name of the Necropolis. The plan, it will be seen, is remarkable for its regularity (figs. 21, 22). Here, too, the graves run endways into the rock. Other catacombs in the vicinity of the same city are described by Pocock and other travellers, and are figured by Agincourt.

FIG. 21.—Plan of Catacomb at Alexandria. (From Agincourt.)

Subterranean cemeteries of the general character of those described are very frequent in all southern and eastern countries.

A vast necropolis is in the environs of Saida, the ancient Sidon, is described in Renan's *Mission en Phénicie*, and figured in Thobois's plates. It consists of a series of apartments approached by staircases,

<sup>1</sup> *Bulletino di archaeologia cristiana*, November 1864, August 1865. See also *Autorities*, below.

the sides pierced with sepulchral recesses running lengthwise into the rock.

The rock-hewn tombs of Etruria scarcely come under the category of catacombs, in the usual sense, being rather independent family burial-places, grouped together in a necropolis. They are, however, far too remarkable to be altogether passed over. These sepulchres are usually hollowed out of the face of low cliffs on the side of a hill. They often rise tier above tier, and are sometimes all on the same level "facing each other as in streets, and branching off laterally into smaller lanes or alleys"; and

Rock-tombs of Etruria.

FIG. 23.—Plan of a Tomb at Cervetri. (From Dennis.)

occasionally forming "a spacious square or piazza surrounded by tombs instead of houses" (Dennis, *Cities and Cemeteries of Etruria*, ii. 31). The construction of the tombs commonly keeps up the same analogy between the cities of the living and those of the dead. Their plan is for the most part that of a house, with a door of entrance and passage leading into a central chamber or *atrium*, with others of smaller size opening from it, each having a stone-hewn bench or *triclinium* on three of its sides, on which the dead, frequently a pair of corpses side by side, were laid as if at a banquet. These benches are often hewn in the form of couches with pillows at one end, and the legs carved in relief. The ceilings have the representation of beams and rafters cut in the rock. In some instances arm-chairs, carved out of the living rock, stand between the doors of the chambers, and the walls above are decorated with the semblance of suspended shields. The walls are often covered with paintings in a very simple archaic style, in red and black. As a typical example of the Etruscan tombs we give the plan and section (figs. 23, 24) of the *Grotta della Sedda* at Cervetri from Dennis (pp. 32, 35). The tombs in some instances form subterranean groups more analogous to the general idea of a catacomb. Of this nature is the very remarkable cemetery at Poggio Gaiella, near Chiusi, the ancient Clusium, of a portion of the principal storey of which the woodcut (fig. 25) is a plan. The most remarkable of these sepulchral chambers is a large circular hall about 25 ft. in diameter, supported by a huge cylindrical pillar

FIG. 24.—Section of the Tomb of the Seats and Shields, Cervetri. (From Dennis.)

hewn from the rock. Opening out of this and the other chambers, and connecting them together, are a series of low winding passages or *cuniculi*, just large enough for a man to creep through on all fours. No plausible suggestion has been offered as to the purpose of these mysterious burrows, which cannot fail to remind us of the labyrinth which, according to Varro's description as quoted by Pliny (*Hist. Nat.* lib. xxxvi. c. 10, § 4), was the distinguishing mark of Porsena's tomb, and which have led some adventurous archaeologists to identify this sepulchre with that of the great king of Etruria (Dennis, *u.s.*, pp. 393 ff.). (E. V.; O. M. D.)

*Modern Discoveries.*—In 1873 was discovered, near the cemetery of St Domitilla, the semi-subterranean basilica of *Sann Nereo ed Achilleo*, 100 ft. by 60 ft. This is now covered with a roof, and the fallen columns have been raised up. The lower

FIG. 25.—Plan of a portion of the principal storey in the Poggio Gaiella. (From Dennis.)

part of a pillar, which once supported a baldachino over the *anacostium*, still preserves the name *ACHILLEUS*, and beneath it a bas-relief of the martyr, with his hands bound, receiving his death-blow from the executioner. The base of a similar column has only feet in the same attitude, and probably bore the name *NYXIS*. In a grave in the apse was found a large fragment of an inscription, composed by Pope Damasus, but set up by his successor Stricius, which, from the note-book of a Salzburg pilgrim of the 8th century, can be completed thus:—

Militiae nomen dederant saevum  
Officium pariter spectantes iussu  
Praeceptis pulsante metu servi  
Mira fides rerum subito posue  
Conversi fugiunt ducis impia castr  
Projiciunt clypeos faleras tel  
Confessi gaudent Christi portar  
Credite per Damasum possit quid

Nereus (see Rom. xvi. 15) and Achilleus, said to have been baptized by St Peter, refused to do the bidding of Domitian as praetorians, and entering the service of Flavia Domitilla, suffered martyrdom with their mistress Petronilla, of the Aurelian family closely connected with the Flavii, and the spiritual daughter of St Peter, who was buried in a sarcophagus with the inscription:—

AVRELIAE · PETRONILLAE · FIL · DIVLICISSIMAE

This is now in St Peter's, but was probably originally behind the apse of this basilica, for there is a fresco of her in an arcosolium, with a matron named Veneranda. The original entrance to the cemetery leads directly into a spacious corridor with no *loculi*, but recesses for sarcophagi, and decorations of the classical style of the 2nd century. From this a wide staircase leads directly down to a chamber, discovered in March 1881, of a very early date. Within an arcosolium is a tablet set up by "Aurelius Ampliatius and his son Gordian, to Aurelia Bonifatia, his incomparable wife, a woman of true chastity, who lived 35 years, 2 months, 4 days, and 2 hours." The letters are of the 2nd century; but above the arcosolium was found a stone with great letters, 5 or 6 in. high: "AMPLIATI, the tomb of Ampliatius." Now Ampliatius is a servile name: how comes it to be set up with such distinction in the sepulchre of the Flavii? Romans xvi. 8 supplies the answer: "Salute Ampliatius, most

beloved to me in the Lord." De Rossi thinks the identification well grounded (*Bullettino*, 1881, p. 74). Epitaphs of members of the Flavian family have been found here, and others stating that they are put up "EX INDULGENTIA FLAVIAE DOMITILLAE VESPASIANI NEPTIS." So that De Rossi did not hesitate to complete an inscription on a broken stone thus:—

De Rossi began his excavations in the cemetery of Santa Priscilla in 1851, but for thirty years nothing but what had been described by Bosio came to light. In 1880 he unearthed a portion near the Cappella Greca, and found galleries that had not been touched since they were filled in during the Diocletian persecution. The *loculi* were intact and the epitaphs still in their places, so that "they form a kind of museum, in which the development, the formulae, and the symbolic figures of Christian epigraphy, from its origin to the end of the 3rd or 4th century, can be notified and contemplated, not in artificial specimens as in the Lateran, but in the genuine and living reality of their original condition." (*Bullett.*, 1884, p. 68). Many of the names mentioned in St Paul's Epistles are found here: Phoebe, Prisca, Aquilus, Felix Ampliatus, Epenetus, Olympias, Onesimus, Philemon, Asyncritus, Lucius, Julia, Caius, Timotheus, Tychicus, Crescens, Urbanus, Hermogenes, Tryphaena and Trypho(sa) on the same stone. Petrus, a very rare name in the catacombs, is found here several times, both in Greek and in Latin. The neighbouring *Coemeterium Ostrianum* was anciently known as "Fons S. Petri," "ubi Petrus baptizavit," "ubi Petrus prius sed." This cemetery derives its name from Priscilla, mother of Pudens, who is said to have given hospitality to St Peter the Apostle. We are reminded of St Paul, and of his friends Aquila and Prisca, by a monument erected by an imperial freedman who was PRAEPOSITVS TABERNACVLORVM—chief tentmaker. In 1888 a corridor was discovered which had at one time been isolated from the rest of the cemetery. It had no *loculi*, but recesses in the wall to receive sarcophagi. At the end of the corridor there was a large chamber, 23 ft. by 13 ft., once lined with marble and the ceiling covered with mosaic, a few fragments of which still remain. The only tomb here was a sarcophagus, of which the broken front bears the letters which show it to have been the epitaph of one of the Acilian family:—

ACILIO GLABRIONI FILIO

In the vicinity are fragments of the epitaphs of Manius Acilius and Priscilla, of Quintus Acilius and Caia Acilia in Greek, another Greek inscription "Acilius Rufinus mayest thou live in God." After careful examination of the nine Acillii, who were consuls, De Rossi concludes that this was the resting-place of that Acilius Glabrio, consul with Trajan, A.D. 91, who in the year of his consulate was compelled by Domitian to fight with beasts in the arena, and then banished and put to death in 95. The question of his Christianity seems settled by the discovery of the sepulchre of these Christian Acillii. From this crypt a staircase led up to the basilica in which Pope Silvester was buried, and the whole plan of which was laid bare by De Rossi. The tomb of St Silvester could be identified, and that of Pope Siricius "at his feet," as the pilgrim noted (*Bullett.*, 1890, pp. 106-119).

Just before De Rossi's death, Mgr. Wilpert discovered in the Cappella Greca a painting of the "Fractio Panis" or eucharistic feast, which he cleansed from the dust with which it had been covered. The picture of the Blessed Virgin and Child, which De Rossi ascribed to the 2nd, if not to the 1st century, has received an unexpected proof of its antiquity. In 1890 the floor of the gallery in which it stands was excavated, and another floor was found to be 6 ft. below its supposed level. The *loculi* in this lower portion were intact, with inscriptions of the 2nd century still in their places, proving that the niche in which that picture was painted must have been considerably older than the lowering of

the floor. A flight of iron steps enables the visitor now to examine this venerable specimen of early Christian art.

After the death of De Rossi, one of his pupils, H. Stevenson, since dead, discovered in 1896 a small subterranean basilica in the catacomb of Santi Pietro e Marcellino on the Via Labicana, with pious acclamations on the plaster similar to those in the Papal crypt in St Calixtus. Near the well-known subterranean chapel in the *Coemeterium Ostrianum* was discovered by Mgr. Crostarosa, in 1877, another chapel, in which Signor Armellini found traces of St Emerentiana, foster-sister of St Agnes. Near this a whole region of galleries has been brought to light with *loculi* intact.

Explorations conducted in the cemetery of Domitilla in 1897-1898 brought to light a fine double crypt with frescoes representing Christ seated between six male and female saints; also an inscription relating to a new saint (Eulalius) in a cubiculum of the 3rd century. In 1899-1900 were discovered two opposite cubicula in the catacomb of Santi Pietro e Marcellino. These were unknown to Bosio, and are both covered with frescoes, the vault being in one case decorated with the scene which represents Christ seated among the apostles and pronouncing sentence upon the defunct. An inscription discovered in 1900 on the site of the ancient cemetery of St Ciriaca, and dating from A.D. 405, states that one Euryalus bought a site *ad mensam beati martyris Laurentii* from a certain *fossor* whose name has been erased. This is interesting as an example of what was known as *memoriae damnatio* or the blotting out of a name on account of some dishonourable action. From the end of the 4th to the first half of the 5th century, the *fossores* had the privilege of selling sites, which frequently led to grave abuses. In 1901-1902 excavations in the cemetery of Santa Priscilla, near the Cappella Greca, revealed a polygonal chamber. This may have originally been the *nymphaeum* of the great villa of the Acilii Glabrones, the *hypogaeum* of which was discovered by De Rossi near this spot in 1888. It may have been used as a burial-place for martyrs, and Professor Marucchi is inclined to see in it the sepulchral chapel of Pope Marcellinus, who died in A.D. 304 during the persecutions of Diocletian. In 1902, in that part of the Via Ardeatina which passes between the cemeteries of Calixtus and Domitilla, was discovered a crypt with frescoes and the sanctuary of a martyr: it is thought that this, rather than a neighbouring crypt brought to light in 1897, may prove to be the sepulchral crypt of SS. Marcus and Marcellianus. In a cubiculum leading out of a gallery in the vicinity there was also discovered an interesting impression in plaster of an inscription of the mother of Pope Damasus, beginning:

HIC DAMASI MATER POSUIT LAVRENTIA MEMBRA).

In the same year building operations in the Via di Sant' Onofrio revealed the presence of catacombs beneath the foundations: examination of the *loculi* showed that no martyrs or illustrious persons were buried here.

In 1903 a new cemetery with frescoes came to light on the Via Latina, considered by Marucchi to have belonged to a heretical sect. In the same year the Jewish cemetery on the Via Portuense, known to Bosio but since forgotten, was rediscovered. The subterranean basilica of SS. Felix and Adauctus, discovered by Boldetti and afterwards choked up with ruins, was cleared again: the crypt, begun by Damasus and enlarged by Siricius, contains frescoes of the 6th-7th centuries.

A good plan of the catacombs at Albano (at the 15th milestone of the Appian way), discovered by Boldetti and described by De Rossi, has been published by Marucchi (*Nuovo Bullettino di archeologia cristiana*, 1902, pp. 89 ff.). In 1904 a small subterranean cemetery was discovered at Anagnina. Catacombs have also been recently discovered on the site of Hadrumetum near Sousse in Tunisia. (\* W. R. B.; O. M. D.)

AUTHORITIES.—The classical work on the catacombs of Rome is G. B. De Rossi's *Roma sotterranea*, on which most of the accounts in other languages than Italian have been based. The fine volume by Mgr. Wilpert, *Le Pitture delle catacombe romane* (Rome, 1903), in which all the important frescoes are reproduced in colours, is to be regarded as an addition to the *Roma sotterranea*. All new

discoveries made by the active *Commissione di archeologia sacra* are chronicled with as little delay as possible in the *Nuovo Bulletino de archeologia cristiana* published in Rome.

The most recent accounts of the catacombs are to be found in the following books:—Armelini, *Gli Antichi Cimiteri cristiani di Roma e d'Italia* (Rome, 1893); O. Marucchi, *Le Catacombe romane* (Rome, 1903; also translated into French), *Manuale di epigrafia cristiana* (Milan, 1904); M. Besnier, *Les Catacombes de Rome* (Paris, 1909).

Among the older works are: Bosio, *Roma sotterranea*, Severano's edition (1632), and Aringhi's edition (1651); Boldetti, *Osservazioni sopra i cimiteri dei santi martiri* (Rome, 1730); Bottari, *Sculture e pitture sacre, &c.* (Rome, 1737-1754); Seroux-Agincourt, *Histoire de l'art par les monuments* (Paris, 1823; German ed., 1840); G. Marchi, *Monumenti delle arti cristiane primitive* (Rome, 1844); Raoul Rochette, *Tableaux des catacombes de Rome* (2nd ed., Paris, 1854); Perret, *Les Catacombes de Rome* (Paris, 1855)—a sumptuous folio work, but not always accurate, Roller, *Les Catacombes de Rome* (Paris, 1881); V. Schultze, *Die Katakomben* (Leipzig, 1882).

Works written in English are: Northcote and Brownlow, *Roma sotterranea* (London, 1866; based upon De Rossi); Wharton Marriott, *The Testimony of the Catacombs* (London, 1870); J. H. Parker, *The Archaeology of Rome: the Catacombs*; Smith and Cheetham, *Dictionary of Christian Antiquities*, s.v. "Catacombs"; R. Lanciani, *Pagan and Christian Rome* (London, 1892); W. Lowry, *Christian Art and Archaeology*, ch. ii. (London, 1901; a useful introduction to the subject); H. Gee, "The Church in the Catacombs," in W. Lefroy's *Lectures in Ecclesiastical History* (1896); Th. Mommsen, in the *Contemporary Review*, May 1871.

Accounts of the catacombs will also be found in the encyclopaedias and manuals published under the following names: Martigny, Pératé, F. X. Kraus (*Realencyclopädie und Geschichte der christlichen Kunst*), Reusens, V. Schultze and C. M. Kauffmann, and in the large new *Dictionnaire d'archéologie chrétienne et liturgie*, published at Paris under the editorship of Dom F. Cabrol.

The catacombs at Naples are described in C. F. Bellermann, *Über die ältesten christlichen Begräbnisstätten und besonders die Katakomben zu Neapel* (Hamburg, 1839); Armelini, as above, and V. Schultze, *Die Katakomben von San Gennaro dei Poveri zu Neapel* (Jena, 1877).

For the catacombs in Malta, A. A. Caruana, *Ancient Pagan Tombs and Christian Cemeteries in the Islands of Malta* (Malta, 1898), and A. Mayr, "Die altchristlichen Begräbnisstätten auf Malta," in *Römische Quartalschrift*, vol. xv. pp. 216 and 352 (Rome, 1901), may be consulted.

The fullest account of the Sicilian catacombs is given by J. Führer, *Forschungen zur Sicilia sotterranea* (Munich, 1897); and D. C. Barrecca, *Le Catacombe di San Giovanni in Siracusa* (Siracusa, 1906).

A catacomb of the 5th century, discovered at Kertch in South Russia, is described by J. Kulakovsky in *Materials for Russian Archaeology* (St Petersburg, 1896; a publication of the Russian Imperial Archaeological Commission), but it is written in Russian, as also is the account by V. Latyshev, in *Vizantiskii Vremennik*, vol. vi. pp. 337 ff. (St Petersburg, 1899).

The catacombs at Hadrumetum (Sousse) are described by A. F. Leynard, *Les Catacombes d'Hadrumète, deuxième campagne de fouilles* (1904-1905). See also *Revue Tunisienne* (1905), p. 250.

For the catacombs of Alexandria, Neroutos Bey, *L'Ancienne Alexandria*, may be consulted in addition to De Rossi's article mentioned in the text. (O. M. D.)

**CATAPALQUE** (a word of unknown origin, occurring in various forms in many European languages, meaning a funeral scaffold or temporary stage), a movable structure of wood sometimes richly decorated, erected temporarily at funeral ceremonies in a church to receive the coffin or effigy of the deceased; also an open hearse or funeral car.

**CATALANI, ANGELICA** (1780-1849), Italian opera-singer, daughter of a tradesman at Sinigaglia, was educated at the convent of Santa Lucia at Gubbio, where her magnificent soprano voice, of extraordinary compass and purity, soon became famous. In 1795 she made her début on the stage at Venice, and from that moment every impresario in Europe was anxious to engage her. For nearly thirty years she sang at all the great houses, receiving very large fees; her first appearance in London being at the King's theatre in 1806. She remained in England, a prima donna without a serious rival, for seven years. Then she was given the management of the opera in Paris, but this resulted in financial failure, owing to the incapacity and extravagance of her husband, Captain Valabrègue, whom she married in 1806. But her continental tours continued to be enormously successful, until she retired in 1828. She settled at Florence in 1830, where she founded a free singing school for girls; and her charity and kindness were unbounded. She died of cholera in Paris on the 12th of June 1849.

**CATALEPSY** (from Gr. *κατάληψις*, a seizure), a term applied to a nervous affection characterized by the sudden suspension of sensation and volition, accompanied with a peculiar rigidity of the whole or of certain muscles of the body. The subjects of catalepsy are in most instances females of highly nervous temperament. The exciting cause of an attack is usually mental emotion operating either suddenly, as in the case of a fright, or more gradually in the way of prolonged depression. The symptoms presented vary in different cases, and even in the same individual in different attacks. Sometimes the typical features of the disease are exhibited in a state of complete insensibility, together with a statue-like appearance of the body which will retain any attitude it may be made to assume during the continuance of the attack. In this condition the whole organic and vital functions appear to be reduced to the lowest possible limit consistent with life, and to such a degree as to simulate actual death. At other times considerable mental excitement will accompany the cataleptic symptoms, and the patient will sing or utter passionate exclamations during the fit, being all the while quite unconscious. The attack may be of short duration, passing off within a few minutes. It may, however, last for many hours, and in some rare instances persist for several days; and it is conceivable that in such cases the appearances presented might be mistaken for real death, as is alleged to have occasionally happened. Catalepsy belongs to the class of functional nervous disorders (see *MUSCLE AND NERVE: Pathology*) in which morbid physical and psychological conditions are mixed up. Although it is said to occur in persons in perfect health, careful inquiry will usually reveal some departure from the normal state, as is shown by the greater number of the recorded cases. More particularly is this true of females, in whom some form of menstrual derangement is generally found to have preceded the cataleptic affection. Catalepsy is sometimes associated with epilepsy and with grave forms of mental disease. In ordinary cases, however, the mental phenomena bear close resemblance to those witnessed in hysteria. In many of the subjects of catalepsy there appears to be a remarkable weakness of the will, whereby the tendency to lapse into the cataleptic state is not resisted but rather in some measure encouraged, and attacks may thus be induced by the most trivial circumstances.

**CATALOGUE** (a Fr. adaptation of the Gr. *κατάλογος*, a register, from *κατά*, to enrol or pick out), a list or enumeration, generally in alphabetical order, of persons, things, &c., and particularly of the contents of a museum or library. A *catalogue raisonné* is such a list classified according to subjects or on some other basis, with short explanations and notes. (See also articles *BIBLIOGRAPHY* and *BIBLIOLOGY*, and *LIBRARIES*.)

**CATALONIA** (*Cataluña*), a captaincy-general, and formerly a province of Spain, formerly also a principality of the crown of Aragon; bounded on the N. by the Pyrenees, W. by Aragon, S. by Valencia, and E. by the Mediterranean Sea. Pop. (1900) 1,966,382; area, 12,427 sq. m. The triangular territory of Catalonia forms the north-eastern corner of the Iberian Peninsula. A full account of the physical features, and of the modern development of commerce, communications, &c., in this area is given in the articles on the four provinces Barcelona, Gerona, Lérida and Tarragona, into which Catalonia was divided in 1833.

The coast, which is partly sandy, partly rocky, extends about 240 m.; its chief harbours are those of the capital, Barcelona, of Mataró, of Rosas and of Tarragona. The surface is much broken by spurs of the Pyrenees, the direction of which is generally south. Running south-west to north-east, and united on the north with one of the offsets of the Pyrenees, is the range of the Sierra Llena, which bisects Catalonia, and forms its central watershed. The principal rivers are the Ter, the Llobregat, and the Ebro (*q.v.*), which all run into the Mediterranean. None of them is navigable. The climate, in spite of frequent mists and rains, sudden changes of temperature, and occasional great mid-day heat, is healthy and favourable to vegetation. The dwarf-palm, orange, lime, and olive grow in the warmer tracts; and on the higher grounds the thorn-apple, pomegranate, myrtle, esparto and heaths flourish. There is much woodland.

but meadows and pastures are rare. Maize, millet, rye, flax, liquorice and fruits of all sorts—especially nuts, almonds, oranges, figs, walnuts and chestnuts—are produced. Wheat sufficient for one-fourth of the population is grown, and the vine is extensively cultivated. Few cattle, but numbers of sheep, goats and swine are reared. Game is plentiful, and the fisheries on the coast are excellent. The wines are for the most part rough and strong, though some are very good, especially when matured. They are much used to adulterate those of Oporto, or, after undergoing the blending operation termed *compage*, are passed off as Bordeaux wines in France. The best of them, *priorato*, is chiefly known in England, under the disguise of second or third-rate port; it was much used in the military hospitals of America during the Civil War.

The Catalonians are a frugal, sharp-witted, and industrious people, having much national pride, and a strong revolutionary spirit. They are distinct in origin from the other inhabitants of Spain, from whom they differ in their dialect and costume. In their great energy and their love of enterprise they resemble the Basques. Irrigation, careful husbandry and railroad communications have much developed the resources of their country, in themselves excellent; and there are many manufacturing towns and industrial establishments.

Catalonia was one of the first of the Roman possessions in Spain, and formed the north-eastern portion of Hispania *Tarraconensis*. About 470 it was occupied by the Alans and Goths. It was conquered by the Moors in 712, but these invaders were in turn dispossessed by the Spaniards and the troops of Charlemagne in 788. Catalonia was subsequently ruled by French counts, who soon, however, made themselves independent of France. By the marriage of Count Raymond Berenger IV. of Barcelona with Petronilla of Aragon, Catalonia became annexed to Aragon; but this union was frequently severed. In 1640, when Philip IV. attempted to deprive Catalonia of its rights and privileges, it gave itself up to Louis XIII. of France. It was restored to Spain in 1659, and was once more occupied by the French from 1694 to 1697. Under Philip V. Catalonia, in 1714, was deprived of its cortes and liberties. From 1808 to 1813 it was held by France. It was the scene of civil war in 1823, and of important revolutionary operations in the Carlist wars.

The history and literature of Catalonia have been closely studied, and in many cases the results of research are published in the Catalan language. See *Cataluña, sus monumentos y artes, su naturaleza e historia* (2 vols. of the illustrated series *España*), by P. Piñerfer, F. B. Margall, and A. A. Pijoan (Barcelona, 1884); *Historia de Cataluña*, by V. Balaguer (11 vols., Madrid, 1886, &c.); *Historia de Cataluña*, by A. Bori y Fontestá (Barcelona, 1898); *Orígenes históricos de Cataluña*, by J. Balari y Jovany (Barcelona, 1899); *Colección dels monografías de Catalunya*, by J. Reig y Vilardell (Barcelona, 1899); *Historia del derecho en Catalonia, Mallorca y Valencia*, by B. Oliver (Madrid, 1876-1880); and *Antigua marina catalana*, by F. de Bofarull y Sans (Barcelona, 1898). The *Revista catalana* (Catalan Review), published at Barcelona from 1889, contains many valuable papers on local affairs. See also SPAIN: sections *Languages, Literature and History*, and BARCELONA.

**CATALPA**, in botany, a genus belonging to the family *Bignoniaceae* and containing about ten species in America and eastern Asia. The best known is *Catalpa bignonioides*, a native of the eastern United States which is often cultivated in parks and gardens. It is a stately tree with large heart-shaped pointed leaves and panicles of white bell-shaped flowers streaked with yellow and brown purple.

**CATALYSIS** (from the Gr. *κατά*, down, and *λύω*, to loosen), in chemistry, the name given to chemical actions brought about by a substance, termed the "catalyst," which is recovered unchanged after the action. The term was introduced by Berzelius, who first studied such reactions. It is convenient to divide catalytic actions into two groups:—(1) when the catalyst first combines with one of the reaction components to form a compound which immediately reacts with the other components, the catalyst being simultaneously liberated, and free to react with more of the undecomposed first component; and (2), when the catalyst apparently reacts by mere contact. The theory of catalysis is treated under CHEMICAL ACTION; in this article mention will be made of some of the more interesting examples.

A familiar instance of a catalytic action is witnessed when a mixture of potassium chlorate and manganese dioxide is heated to 350°, oxygen being steadily liberated, and the manganese dioxide being unchanged at the end of the reaction. The action may be explained as follows:—part of the chlorate reacts with the manganese dioxide to form potassium permanganate, chlorine and oxygen, the chlorine subsequently reacting with the permanganate to produce manganese dioxide, potassium chloride and oxygen, thus

This explanation is supported by the facts that traces of chlorine are present in the gas, and the pink permanganate can be recognized when little dioxide is used. Other oxides bring about the same decomposition at temperatures below that at which the chlorate yields oxygen when heated alone; but since such substances as kaolin, platinum black and some other finely powdered compounds exercise the same effect, it follows that the explanation given above is not quite general. Another example is Deacon's process for the manufacture of chlorine by passing hydrochloric acid gas mixed with air over heated bricks which had been previously impregnated with a copper sulphate solution. The nitrous gases employed in the ordinary chamber process of manufacturing sulphuric acid also act catalytically. Mention may be made of the part played by water vapour in conditioning many chemical reactions. Thus sodium will not react with dry chlorine or dry oxygen; carbon, sulphur and phosphorus will not burn in perfectly dry oxygen, neither does nitric oxide give red fumes of the peroxide. In organic chemistry many catalytic actions are met with. In the class of reaction known as "condensations," it may be found that the course of the reaction is largely dependent upon the nature of some substance which acts catalytically. One of the most important is the Friedel and Craft's reaction, in which an aromatic compound combines with an alkyl haloid in the presence of aluminium, zinc or ferric chloride. It seems in this, as in other cases, that addition compounds are first formed which subsequently react with the re-formation of the catalyst. The formation of benzoin from benzaldehyde in the presence of potassium cyanide is another example; this action has been investigated by G. Bredig and Stern (*Zeit. Elektrochem.*, 1904, 10, p. 582).

The second class of catalytic actions, viz. those occasioned by the presence of a metal or some other substance which undergoes no change, is of especial interest, and has received much attention. The accelerating influence of a clean platinum plate on the rate of combination of hydrogen and oxygen was studied by Faraday. He found that with the pure gases the velocity of reaction increased until the mixture exploded. The presence of minute quantities of carbon monoxide, carbon disulphide, sulphuretted hydrogen and hydrochloric acid inhibited the action; in the case of the first two gases, there is no alteration of the platinum surface, since the plate brings about combination when removed to an atmosphere of pure hydrogen and oxygen; with the last two gases, however, the surface is altered, since the plate will not occasion the combination when placed in the pure gases. M. Bodenstein (*Zeit. phys. Chem.*, 1904, 46, p. 725) showed that combination occurs with measurable velocity at ordinary temperatures in the presence of compact platinum. More energetic combination is observed if the metal be finely divided, as, for instance, by immersing asbestos fibres in a solution of platinum chloride and strongly heating. The "spongy" platinum so formed brings about the combination of ammonia and oxygen to form water and nitric acid, of nitric oxide and hydrogen to form ammonia (see German Patent, 1905, 157,287), and of sulphur dioxide and oxygen to form sulphur trioxide. The last reaction, which receives commercial application in the contact process of sulphuric acid manufacture, was studied by M. Bodenstein and W. Pohl (*Zeit. Elektrochem.*, 1905, 11, p. 373), who found that the equilibrium followed the law of mass-action (see also F. W. Küster, *Zeit. anorg. Chem.*, 1904, 42, p. 453; R. Lucas, *Zeit. Elektrochem.*, 1905, 11, p. 457). Other metals, such as nickel, iron, &c., can also react as catalysts.

The use of finely divided nickel (obtained by reducing the oxide in a current of pure hydrogen at a temperature of  $350^{\circ}$ ) has been carefully studied by P. Sabatier and J. B. Senderens; a summary of their results is given in the *Ann. Chim. Phys.*, 1905 (viii.) 4, pp. 319-488. Of special interest is the condensation of acetylene. If this gas mixed with hydrogen be passed over the reduced nickel in the cold, the temperature may rise to as high as  $150^{\circ}$ , the acetylene disappearing and becoming replaced by a substance like petroleum. If the nickel be maintained at  $200^{\circ}$ , and the gases circulated for twenty-eight hours, a product, condensable to a yellow liquid having a beautiful fluorescence and boiling at  $45^{\circ}$ , is obtained. This substance closely resembles ordinary Pennsylvanian petroleum. If acetylene be passed alone over nickel heated to  $200^{\circ}$ - $300^{\circ}$ , a mixture, boiling at  $60^{\circ}$ - $70^{\circ}$  and having a green colour by diffused and a red by transmitted light, was obtained. This substance closely resembles Caucasian petroleum. The decomposition of carbon monoxide according to the reaction  $2CO \rightleftharpoons C + CO_2$  is purely catalytic in the presence of nickel and cobalt, and also in the presence of iron, so long as the amount of carbon dioxide present does not exceed a certain amount (R. Schenck and W. Heller, *Ber.*, 1905, 38, pp. 2132, 2139). It is of interest that finely divided aluminium and magnesium decompose methane, ethane, and ethylene into carbon and hydrogen in the same way as nickel. Charcoal at  $350^{\circ}$  also reacts catalytically; for example, Senderens found that ethyl alcohol was decomposed by animal charcoal into methane, ethylene, hydrogen, carbon monoxide and a little carbon dioxide, and propyl alcohol gave propylene, ethane, carbon monoxide and hydrogen, while G. Lemoine obtained from ethyl alcohol and wood charcoal a mixture of acetaldehyde and hydrogen.

**CATAMARAN** (a Tamil word, from *catla*, to tie, and *maram* wood), a surf-boat or raft used by the natives of Madras and along the Coromandel Coast in India. It is usually made of three tree trunks lashed together, the centre trunk being the largest and longest, and having one end bent upward to form a kind of prow. Catamarans of a larger size are in use in the West Indies and South America. The name is also given to two boats lashed together. Apparently through an erroneous connexion with cat, the name has been applied to a noisy scolding woman.

**CATAMARCA**, an Andean province of the Argentine Republic, lying W. of Santiago del Estero and Tucuman and extending to the Chilean frontier, with Los Andes and Salta on the N., Cordoba on the S.E., and Rioja on the S. Pop. (1895) 90,161; (1904, estimate) 103,082; area, 47,531 sq. m. The surface of the province is extremely broken, the Andes forming its western boundary, and the Aconquija, Ancaste, Ambato, Gulampaja and other ranges traversing it from north to south. It is composed very largely of high plateaus with a general slope southward broken by a few fertile valleys. The greater part of the province is arid and barren, being sheltered from the moist, eastern winds by the high mountain barriers of Aconquija and Ancaste. The rivers are small, and some of them are lost in the barren, sandy wastes. Others, especially in the foothills of the high sierras, are utilized to irrigate the fertile valleys. The climate of some of the low, sheltered valleys is extremely hot and unhealthy, but on the open plateaus it is peculiarly dry and bracing and is probably beneficial in the treatment of pulmonary diseases. The mineral resources of the province include gold, silver, copper, lead, nickel, iron, coal and malachite, but of these only copper and silver are mined, and these chiefly in the Andalgalá district. Salt deposits also exist, but are worked only to a limited extent. Cereals, alfalfa and fruit are grown. Large numbers of cattle, fattened in the alfalfa fields of Pucará, Tinogasta and Copacabana, are driven into northern Chile across the San Francisco pass (13,124 ft. above sea level) and mules are bred for the Bolivian market. Wine of an excellent quality is produced and exported. Tanning leather is another industry of the province, some of the trees growing in the Catamarca forests being rich in tannin. Catamarca is traversed by the Northern Central railway between Cordoba and the city of Catamarca, its capital, which passes around the southern extremity of the Sierra de Ancaste and makes a long detour to Chumicha, near the Rioja

frontier. The more important towns, after Catamarca, the capital, are Andalgalá and Tinogasta with populations (estimated, 1904) of 5000 to 6000 each. Belén is the oldest Spanish settlement in the province and was founded in 1550, being called Barco at first. The population is largely mixed with Indian blood.

**CATAMARCA** (*San Fernando de Catamarca*), capital of the above province on the Rio del Valle de Catamarca, 230 m. (318 m. by rail) N.N.W. of Cordoba. Pop. (1895) 7397; (1905, estimate) 8000, with a large percentage of mestizos. Catamarca is connected by railways with Rioja and Patquia and with Cordoba. The city stands in a narrow, picturesque valley at the foot of the Sierra de Ambato, 1772 ft. above sea level. The valley is highly fertile, partially wooded, and produces fruit in abundance, wine and some cereals. In the city are flour mills and tanneries, and among its exports are leather, fruit, wine, flour, and a curious embroidery for which the women of Catamarca have long been famous. There is a fine church, 220 by 90 ft., and a national college occupies the old Merced convent. The alameda is one of the prettiest in the Argentine Republic, having a reservoir of two acres surrounded by shrubbery and walks. Catamarca was founded in 1685 by Fernando de Mendoza because the town of Chacra, the former provincial capital, a few miles north of Catamarca, had been found unhealthy and subject to inundations. Previous to the selection of Chacra as the provincial capital, the seat of government was at San Juan de Londres, founded in 1558 and named after the capital of England by order of Philip II. in honour of his marriage with Queen Mary. The arid surroundings of Londres led to its partial abandonment and it is now a mere village. Cholla, a suburb of Catamarca, is inhabited wholly by Calchaqui Indians, a remnant of the original inhabitants of this region.

**CATANIA** (*Gr. Katané*, *Rom. Catina*<sup>1</sup>), a city and episcopal see of Sicily, the chief town of the province of Catania, on the east coast, 59 m. by rail S. of Messina, and 151 m. by rail S.E. of Palermo (102 m. direct). Pop. (1881) 100,417; (1905) 157,722. The principal buildings are handsome, and the main streets, meeting in the Piazza del Duomo, are fine. The cathedral of S. Agatha, containing the relics of the saint, retains its three original Norman apses (1091), but is otherwise a large baroque edifice. The monument of Don Ferrando d'Acunza, a Spanish viceroy of Sicily, is a fine early Renaissance work (1494). In the west portion of the town is the huge Benedictine abbey of S. Nicola (now suppressed), the buildings of which occupy an area of about 21 acres and contain the museum, a library, observatory, &c. The church, dating, like the rest of the buildings, from 1693-1735, is the largest in Sicily, and the organ, built in 1760 by Donato del Piano, with 72 stops and 2016 pipes, is very fine. The university, founded in 1444, has regained some of its former importance. To the south near the harbour is the massive Castell' Ursino, erected in 1232 by Frederick II. Remains of several ancient buildings exist, belonging in the main to the Roman period. The theatre, covered by a stream of lava, and built partly of small rectangular blocks of the same material, though in the main of concrete, has been superimposed upon the Greek building, some foundations of which, in calcareous stone, of which the seats are also made, still exist. It is 106 yds in diameter, and is estimated to have accommodated 7000 spectators. Close to it are the remains of the so-called Odeum, of similar plan to the theatre but without a stage, and to the north is the church of S. Maria Rotonda, originally a Roman domed structure, perhaps part of a bath. To the north, in the Piazza Stesicoro, is the amphitheatre, a considerable portion of which has been uncovered, including the two corridors which ran round the whole building and gave access to the seats, while a part of the arcades of the exterior has been excavated and left open; the pillars are made of blocks of lava, and the arches of brick. The external diameters of the amphitheatre are 410 and 348 ft., while the corresponding diameters of the arena are 233 and 167 ft. It is thus the third largest Roman amphitheatre known, being surpassed only by that at Verona and the Colosseum. Remains

<sup>1</sup> This is the form vouched for by the inscriptions.

of many other Roman buildings also exist beneath the modern town, among the best preserved of which may be noted the public baths (*Thermae Achilense*) under the cathedral, and those under the church of S. Maria dell' Indirizzo. The number of baths is remarkable, and gives some idea of the luxury of the place in Roman times. Their excellent preservation is accounted for by their burial under the lava. The majority were excavated by Prince Ignazio Biscari (1719-1786), who formed an important private collection of antiquities. Of the ancient city walls no authenticated remains exist.

Catania has a considerable export trade in sulphur, pumice stone, asphalt, oranges and lemons, almonds, filberts, cereals, wine (the total production of wine in the province amounted to 28,600,000 gallons in 1905) and oil. The total value of exports in 1905 was £1,647,075, and of imports £1,326,055, the latter including notably coal, almost entirely from the United Kingdom, and wheat, from Russian ports. The harbour is a good one, and has been considerably enlarged since 1872; £128,000 was voted in 1905 towards the completion of the harbour works by the Italian government. Sulphide of carbon is produced here; and there are large dyeworks, and a factory for making bed-stuffing from seaweed.

The ancient Catina was founded in 730 B.C. by colonists from Naxos, perhaps on the site of an earlier Sicel settlement—the name is entirely non-Greek, and may be derived from *κάρων*, which in the Sicel language, as *catinum* in Latin, meant a basin, and would thus be descriptive of the situation of the town. Charondas, a citizen of Catina, is famous as its lawgiver, but his date and his birthplace are alike uncertain; the fragments preserved of his laws show that they belong to a somewhat primitive period. The poet Stesichorus of Himera died here. Very little is heard of Catina in history until 476 B.C., when Hiero I. removed its inhabitants to Leontini, reoccupied it with 5000 Syracusans and 5000 Peloponnesians, and changed its name to Aetna. In 461 B.C., however, with the help of Ducetius and the Syracusans, the former inhabitants recovered possession of their city and revived the old name. Catina was, however, an ally of Athens during the Syracusan expedition (415-413 B.C.), and served as the Athenian base of operations in the early part of the war. In 403 B.C. it was taken by Dionysius of Syracuse, who plundered the city, sold the inhabitants into slavery and replaced them with Campanian mercenaries. In the First Punic War it was one of the first cities of Sicily to be taken by the Romans (263 B.C.). Marcellus constructed a gymnasium here out of the booty of Syracuse. In 123 B.C. there was an eruption of Etna so violent that the title on the territory of Catina payable to Rome was remitted for ten years. It appears to have been a flourishing city in the 1st century B.C., but to have suffered from the ravages of Sextus Pompeius. It became a Roman *colonia* under Augustus, and it is from this period that the fertile plain, hitherto called the plain of Leontini, begins to be called the plain of Catina. It seems to have been at this time the most important city in the island, to judge from the language of Strabo and the number of inscriptions found there. In A.D. 251 a lava stream threatened the town and entered the amphitheatre, which in the time of Theodorici had fallen into ruins, as is clear from the fact that he permitted the use of its fallen stones to build the city wall. It was recovered by Belisarius in 535, sacked by the Saracens in 902 and taken by the Normans. The latter founded the cathedral; but the town was almost entirely destroyed by earthquake in 1170, and devastated by Henry VI. in 1107. It became the usual residence of the Aragonese viceroys of the 13th and 14th centuries. In 1669 an eruption of Etna partly filled up the harbour, but spared the town, which was, however, almost entirely destroyed by the earthquake of 1693. Since that catastrophe it has been rebuilt, and has not further suffered from its proximity to Etna.

See A. Holm, *Das alte Catania* (Lübeck, 1873).

(T. As.)

**CATANZARO**, a town and episcopal see of Calabria, Italy, capital of the province of Catanzaro, 1125 ft. above sea-level. Pop. (1901) 22,799 (town); 32,005 (commune). The station for the town (Catanzaro Sala) is situated on a branch line connecting

the two main lines along the east and west coasts of Calabria, 6 m. N. by W. of Catanzaro Marina on the east coast, and 20 m. E. of S. Eufemia Biforcazione, on the west coast line. The town enjoys a comparatively cool climate in summer, and commands fine views. Numerous wealthy families reside here, and the town has a trade in olive-oil, silk and velvet. The castle, built by Robert Guiscard, has been modernized, and so has the cathedral. The see was founded in 1121. The provincial museum contains antiquities and especially coins from the ancient cities of Magna Græcia, and a few pictures.

**CATAPHYLL** (Gr. *κατά*, down, *φύλλον*, leaf), a botanical term for the early leaf-forms produced in the lower part of a shoot, such as bud-scales, or scales on underground stems.

**CATAPULT** (Lat. *catapulta*, Gr. *καταπέλτης*), a generic name for warlike engines of the cross-bow type used by the ancients. Although engines of war appear on Assyrian remains, and are mentioned in 2 Chronicles xxvi. 15, it appears that Greek armies, even of the 5th century, did not possess them, and the first record of a large siege train in classical literature is of the year 399 B.C., when Dionysius I. of Syracuse, contemplating an expedition against Carthage, provided himself with engines. From Sicily siege engines found their way some years later into Greece; they were used by Philip of Macedonia at the siege of Byzantium in 340, and thereafter, as a natural consequence of the regularizing or professionalizing of armies, artillery, as we may call it, came into prominence and called into existence technical corps to work it.

The war engines of the Romans, during the republic and early principate, are of the same type as those of Alexander's successors in Greece. They are usually classed as (a) catapults and (b) ballistæ (*βυβόδοι*). The former were smaller and were used with arrows for what is now called direct fire (*i.e.* at low angles of elevation); the latter were large siege engines discharging heavy bolts or stones at a high angle of elevation, like the modern howitzer. They were, of course, principally siege engines, but the smaller natures of catapult appear in field warfare from time to time, and eventually, during the early principate, they are found as part of the regulation equipment of infantry units. Both were constructed on the same principle.

The essential parts of the catapult (see illustration) were the frame, the propelling gear, the trough (corresponding to the modern barrel) and the pedestal. The frame consisted of two horizontal beams forming top and bottom sills, and four strong upright bars mortised into them. The three open spaces or compartments, resembling narrow windows, between these four uprights carried the propelling and laying gear. The propelling gear occupied the two outer "windows." In each a thick skein of cord or sinews was fastened to the top and bottom sills and tightly twisted. Two stiff wooden arms were inserted in the two skeins, and a specially strong bowstring joined the tips of these arms. In the middle compartment was the hinged fore-end of the trough, which was at right angles to the frame and at the back of it. The trough could be laid for elevation by a movable prop, the upper end of which was hinged to the trough, while the lower ran up and down a sort of trail fastened to the pedestal. The whole equipment was laid for "line" by turning the frame, and with it the trough, prop and trail by a pivot in the head of the pedestal. Sliding up and down in the trough was a block, fitted with a trigger mechanism, through which passed the middle of the bowstring. The pedestal was a strong and solid upright resting upon, and strutted to, a framework on the ground; its upper end, as mentioned above, took the pivot of the frame and the head of the trail.

On coming into action the machine was laid for direction and elevation. The block and with it the bowstring was next forced back against the resistance of the twisted skeins to the rear end of the trough, this being effected by a windlass attachment. The trigger being then pressed or struck with a hammer, the bowstring was released from the block, the stiff arms were violently brought back to the frame by the untwisting of the skeins, and the arrow was propelled through the centre "window" with great velocity. A small machine of the type described weighed about 85 lb, and sent a "three-span" (26-in.) arrow weighing  $\frac{1}{2}$  lb at an effective man-killing velocity somewhat over 400 yds.

The ballista was considerably larger and more expensive than this. In Scipio's siege train, at the attack of New Carthage (Livy xxvi. 47. 5), the number of the ballistae was only one-sixth that of the catapults. In the ballista the rear end of the trough (which projected in front of the frame) always rested upon the ground, or rather was fixed to the framework of the pedestal—which was a heavy trestle construction—and the trough was thus restricted to the angle of elevation, giving the maximum range (45°). Even so the range was not appreciably greater than that of a catapult, and in the case of the largest ballistae (ninety-pounder) it was much less. These enormous engines, which, once in position, could not be laid on any fresh target, were used for propelling beams and stones rather than for shooting arrows, that is, more for the destruction of material than for man-killing effect. The skeins that supplied the motive force of all these engines were made of the sinews of animals, twisted raw hide, horsehair rope, and, in at least one celebrated case, of women's hair. In 146 B.C., the authorities of Carthage having surrendered their engines to the Romans in the vain hope of staying their advance, new ones were hurriedly constructed, and the women and virgins of the city cut off their hair to supply the needed skeins.

The modern implement known as a "catapult" is formed by a forked stick, to the forks of which are attached the ends of a piece of elastic. To the middle of this elastic a pocket is fitted to contain a bullet or small stone. In use the forked stick is held in the left hand and the pocket drawn back with the right. Aim is taken and, the pocket being released, the missile flies through the fork of the stick. Though classed as a toy, this weapon can do considerable execution among birds, &c., when skilfully used. The name of "catapult" has also been given to a bowling machine which is used for cricket practice.

**CATARACT** (from the Lat. form *cataracta* of the Gr. *καταρρακτης*, a floodgate, or waterfall, properly something which rushes down), a downpour of water, a waterfall. The earliest use in English is of a floodgate or porticulus, and this survives in the name of a disease of the eye (see *EYE: Eye Diseases*), in which the crystalline lens becomes opaque, and forms an apparent grating over the eye. The term is also used of a device to regulate the strokes in certain types of steam-engine.

**CATARGIU** (or **CATARGI**), **LASCAR** (1823-1899), Rumanian statesman, was born in Moldavia in November 1823. He belonged to an ancient Walachian family, one of whose members had been banished in the 17th century by Prince Matthew Bassaraba, and had settled in Moldavia. Under Prince Gregory Ghica (1849-1856), Catargiu rose to be prefect of police at Jassy. In 1857 he became a member of the *Divan ad hoc* of Moldavia, a commission elected in accordance with the treaty of Paris (1856) to vote on the proposed union of Moldavia and Walachia. His strongly conservative views, especially on agrarian reform, induced the Conservatives to support him as a candidate for the throne in 1859. During the reign of Prince Cuza (1859-1866), Catargiu was one of the Opposition leaders, and received much assistance from his kinsman, Barbu Catargiu (b. 1807), a noted journalist and politician, who was assassinated at Bucharest on the 20th of June 1862. On the accession of Prince Charles in May 1866, Lascar Catargiu became president of the council, or prime minister; but, finding himself unable to co-operate with his Liberal colleagues, I. C. Bratianu and C. A. Rosetti, he resigned in July. After eight more ministerial changes, culminating in the anti-dynastic agitation of 1870-

1871, Catargiu formed, for the first time in Rumanian history, a stable Conservative cabinet, which lasted until 1876. His policy, which averted revolution and revived the popularity of the crown, was regarded as unpatriotic and reactionary by the Liberals, who resumed office in 1876; and a proposal to impeach the whole Catargiu cabinet was only withdrawn in 1878. Catargiu remained in opposition until 1880, when he formed another cabinet, taking the portfolio of the Interior; but this administration fell after seven months. In the Florescu ministry of March 1891 he occupied the same position, and in December he again became president of the council, retaining office until 1895. During this period he was responsible for several useful reforms, chiefly financial and commercial. He died suddenly at Bucharest on the 11th of April 1899.

**CATARRH** (from the Gr. *καταρρῆν*, to flow down), a term principally employed to describe a state of irritation of the mucous membrane of the respiratory passages, or what is called in popular language a "cold." It is the result of infection by a micro-organism in one or more of various predisposing conditions, damp, chill, fatigue, &c. The complaint usually begins as a nasal catarrh or *coryza* (Gr. *κόρυς*, head), with a feeling of weight about the forehead and some degree of difficulty in breathing through the nose, increased on lying down. Fits of sneezing accompanied with a profuse watery discharge from the nostrils and eyes soon follow, while the sense of smell and to some extent that of taste become considerably impaired. There is usually present some amount of sore throat and of bronchial irritation, causing hoarseness and cough. Sometimes the vocal apparatus becomes so much inflamed (laryngeal catarrh) that temporary loss of voice results. There is always more or less feverishness and discomfort, and frequently an extreme sensitiveness to cold. After two or three days the symptoms begin to abate, the discharge from the nostrils and chest becoming thicker and of purulent character, and producing when dislodged considerable relief to the breathing. On the other hand the catarrh may assume a more severe aspect and pass into some form of pulmonary inflammation (see *BRONCHITIS*) or *influenza* (q.v.).

When the symptoms are first felt it is well to take a good purge, and to encourage free perspiration by a hot bath, some diaphoretic drug, as spirits of nitrous ether, being taken before retiring to bed. Some of the older school of physicians still pin their faith to a dose of Dover's powder. When the cold manifests itself by aches and pains in back and limbs, aspirin taken three or four times in the first twenty-four hours will often act like magic. Locally a snuff made of menthol 1 part, ammonium chloride 3 parts and boric acid 2 parts will relieve the discomfort of the nose. Also, remembering the microbic origin of the disease, gargling and nasal syringing should be repeated at intervals. As soon as the attack shows signs of subsiding, a good tonic and, still better, a change of air are very helpful.

The term catarrh is used in medical nomenclature in a wider sense to describe a state of irritation of any mucous surface in the body, which is accompanied with an abnormal discharge of its natural secretion, hence the terms gastric catarrh, intestinal catarrh, &c.

See also *RESPIRATORY SYSTEM: Pathology, and DIGESTIVE ORGANS, Pathology of*.

**CATARRHINE APE**, the term used to describe those apes which have the nostrils approximated, the aperture pointing downward, and the intervening septum narrow; distinguishing features of both the lower "doglike" apes (*Cynomorpha*) and the higher "manlike" apes (*Anthropomorpha*). The Catarrhini are restricted entirely to the Old World, and include the gorilla, the chimpanzee and orang-utan.

**CATASTROPHE** (Gr. *καταστροφή*, from *καταστρέφειν*, to overturn), a term of the ancient Greek drama for the change in the plot which leads up to the conclusion. The word is thus used of any sudden change, particularly of a violent or disastrous nature, and in geology of a cataclysm or great convulsion of the earth's surface.

**CATAUXI**, a numerous cannibal tribe of South American Indians of the Purus river district, Brazil. They are a fine warlike race, with remarkably clear complexions and handsome features; round wrists and ankles they wear rings of twisted hair. They cultivate mandioc, and make pottery and bark canoes.

**CATAWBAS** (from the Choctaw for "divided"), a tribe of North American Indians of Siouan stock; formerly the dominant people of South Carolina. Some of their divisions extended into North Carolina. They are now almost extinct, but were at one time able to send nearly 3000 "braves" into battle. In the American War of Independence they furnished a valuable contingent to the South Carolina troops. They then occupied a number of small towns on the Catawba river, but they afterwards leased their land and removed to the territory of the Cherokees, with whom they had been formerly at war. There, however, they did not long remain, but returned to a reservation in their original district. Their affinities have not been very clearly made out, and by Albert Gallatin they were grouped with the Cherokees, Choctaws, Muskogeans and Natchez. A vocabulary of sixty of their words was published by Horatio Hale in vol. ii. of the *Transactions of the American Ethnological Society* in 1848; and a much fuller list—about 300—collected by Oscar M. Lieber, the geologist, in 1856, made its appearance in vol. ii. of *Collections of the South Carolina Historical Society*, 1858. Of the one hundred Catawbas still said to be surviving, few, if any, can claim to be full-blooded. They are in the Catawba Reservation in York county, South Carolina. The name is familiar in connexion with the white American wine, the praises of which have been sung by Longfellow. The grape from which the wine is obtained was first discovered about 1801, near the banks of the Catawba river, and named by Major Adlum in 1808, but it is now cultivated extensively in Illinois, Ohio and New York, and especially on the shores of Lake Erie.

See also *Handbook of American Indians* (Washington, 1907).

**CATCH THE TEN**, sometimes called *Scotch Whist*, a game played with a pack of 36 cards, from ace, king, queen to six in each suit, the ace being highest both in play and cutting. In trumps, however, the knave ranks highest. Any number from two to eight may play. If an even number, partners are cut for; if odd, each plays for himself. An odd number of players sit as they like; four players sit as at whist; six playing in two sides sit so that no two partners shall be next each other; six playing three sides sit so that two opponents shall divide each pair; eight are arranged in alternate pairs. After cutting, the cards are dealt according to the number of players. The last card is turned up for the trump. When five or seven play, the six of spades is usually omitted; when eight play, the four sixes are thrown out. The eldest hand leads any card he chooses and all must follow suit if able, the penalty for a revoke being the loss of the game. The tricks are not kept separate but gathered in by one player for his side. At the end of the deal there are six hands of six cards on the table. The players first play out the first two hands, next the second two and finally the last two, the trump card remaining on the table until the first four hands are played out. The game is 41 points, the object of the play being to win the cards which have a special value. These are, with their values: knave of trumps 11, ace of trumps 4, king of trumps 3, queen of trumps 2, ten of trumps 10. All other cards have no counting value. As the ten can be taken by any other honour the object is to "catch the ten."

**CATECHISM** (from Gr. *κατήχησις*, teach by word of mouth), a compendium of instruction (particularly of religious instruction) arranged in the form of questions and answers. The custom of catechizing, common to all civilized antiquity, was followed in the schools of Judaism and in the Early Church, where it helped to preserve the Gospel narrative (see **CATECHUMEN**).

The catechism as we know it is intended primarily for children and uneducated persons. Its aim is to instruct, and it differs from a creed or confession in not being in the first instance an act of worship or a public profession of belief. The first regular catechisms seem to have grown out of the usual oral teaching

of catechumens, and to have been compiled in the 8th and 9th centuries. Among them the work of Notker Labeo and of Kero, both monks of St Gall, and that of Otfrid of Weissenburg in Alsace deserve mention. But it is not until the first stirrings of revolt against the hierarchy, which preceded the Reformation, that they became at all widespread or numerous. The Waldenses of Savoy and France, the *Brethren* (small communities of evangelical dissenters from the medieval faith) of Germany, and the *Unitas Fratrum* of Bohemia all used the same catechism (one that was first printed in 1498, and which continued to be published till 1530) for the instruction of their children. It was based on St Augustine's *Enchiridion*, and considers (a) Faith, i.e. the Creed, (b) Hope, i.e. the Lord's Prayer, and (c) Love, i.e. the Decalogue.

The age of the Reformation gave a great stimulus to the production of catechisms. This was but natural at a time when the invention of printing had thrown the Bible open to all, and carried the war of religious opinion from the schools into the streets. The adherents of the "old" and the "new" religions alike had to justify their views to the unlearned as well as to the learned, and to give in simple formulas their reasons for the faith that was in them. Moreover, in the universal unrest and overthrowing of all authority, Christianity itself was in danger of perishing, not only as the result of the cultured paganism of the Renaissance, but also through the brutish ignorance of the common folk, deprived now of their traditional religious restraints. To the urgency of this peril the reformers were fully alive; and they sought its remedy in education. "Let the people be taught," said Luther, "let schools be opened for the poor, let the truth reach them in simple words in their own mother tongue, and they will believe."

*Catechisms of the Chief Religious Communions.*—(a) *Evangelical (Lutheran and Reformed)*.—It was the ignorance of the peasantry, as revealed by the horrors of the Peasants' War of 1524-25, and his pastoral visitation of the electorate of Saxony 1525-1527, that drew the above exclamation from Luther, and impelled him to produce his two famous catechisms (1529). In 1520 he had brought out a primer of religion dealing briefly with the Decalogue, the Creed and the Lord's Prayer; and Justus Jonas, Johannes Agricola and other leaders had done something of the same kind. Now all these efforts were superseded by Luther's *Smaller Catechism* meant for the people themselves and especially for children, and by his *Larger Catechism* intended for clergy and schoolmasters. These works, which did much to mould the character of the German people, were set among the doctrinal standards of the Lutheran Church and powerfully influenced other compilations. The *Smaller Catechism*, with the Augsburg Confession, was made the Rule of Faith in Denmark in 1537.

In this same year (1537) John Calvin at Geneva published his catechism for children. It was called *Instruction and Confession of Faith for the Use of the Church of Geneva* (a reprint edited by A. Rilliet and T. Dufour was published in 1878), and explained the Decalogue, the Apostles' Creed, the Lord's Prayer and the Sacraments. Though it was meant, as he said, to give expression to a simple piety rather than to exhibit a profound knowledge of religious truth, it was the work of a man who knew little of the child mind, and, though it served as an admirable and transparent epitome of his famous *Institutes*, it was too long and too minute for the instruction of children. Calvin came to see this, and in 1542, after his experience in Strassburg, drafted a new one which was much more suitable for teaching purposes, though, judged by modern standards, still far beyond the theological range of childhood. It was used at the Sunday noon instruction of children, on which Calvin laid much stress, and was adopted and similarly used by the Reformed Church of Scotland. The Reformed churches of the Palatinate, on the other hand, used the Heidelberg Catechism (1562-1563), "sweet-spirited, experiential, clear, moderate and happily-phrased," mainly the work of two of Calvin's younger disciples, Kaspar Olevianus and Zacharias Ursinus. The Heidelberg Catechism, set forth by order of the elector, is perhaps the most widely accepted symbol of the Calvinistic faith, and is noteworthy for its

emphasis on the less controversial aspects of the Genevan theology. As revised by the synod of Dort in 1619, this catechism became the standard of most of the Reformed churches of central Europe, and in time of the Dutch and German Reformed churches of America. Other compilations were those of Oecolampadius (Basel, 1526), Leo Juda (Zürich, 1534), and Bullinger (Zürich, 1555). In France, after Calvin's day, the Reformed church used, besides Calvin's book the catechisms of Louis Capell (1619), and Charles Dreilincourt (1642), and at the present time Bonnefon's *Nouveau Catechisme élémentaire* (14th ed., 1900) seems most in favour. In Scotland both Calvin's Geneva Catechism and then the Heidelberg Catechism were translated by order of the General Assembly and annotated. In 1592 these were superseded by that of John Craig, for a time the colleague of John Knox at the High Church, Edinburgh.

Since 1648 the standard Presbyterian catechisms have been those compiled by the Westminster Assembly, presented to parliament in 1647, and then authorized by the General Assembly of the Church of Scotland (July 1648) and by the Scottish parliament (January 1649). The Larger Catechism is "for such as have made some proficiency in the knowledge of the Christian religion," but is too detailed and minute for memorizing, and has never received anything like the reception accorded to the Shorter Catechism, which is "for such as are of weaker capacity." The work was done by a committee presided over first by Herbert Palmer, master of Queens', Cambridge, and then by Anthony Tuckney, master of Emmanuel. The scriptural proof texts were added at the request of the English parliament. In his negotiations with the parliament in 1648 Charles I. offered to license the printing of the catechism, but, as the negotiations were broken off, this was not done. The Shorter Catechism, after a brief introduction on the end, rule and essence of religion, is divided into two parts:—I. The doctrines we are to believe (1) concerning the nature of God, (2) concerning the decrees of God and their execution—(a) in creation and providence, (b) in the covenant of works, (c) in the covenant of grace; II. The duties we are to perform (1) in regard to the moral law, (2) in regard to the gospel—(a) inward duties, i.e. faith and repentance, (b) outward duties as to the Word, the sacraments and prayer. It has 107 questions and answers, while that of the Anglican Church has but 24, grouping as it does the ten commandments and also the petitions of the Lord's Prayer, instead of dealing with them singly. Though the Shorter Catechism, closely associated as this has been from the first with Scottish public elementary education, has had very great influence in forming and training the character of Presbyterians in Scotland, America and the British colonies, it is, like most other catechisms drawn up by dogmatic theologians, more admirable as an epitome of a particular body of divinity than as an instruction for the young and the unlearned. Its use is now generally preceded by something more adapted to the child-mind, and this is true also in other communions and in the case of other catechisms.

(b) *Roman Catholic*.—There was no universal catechism published by the Latin Church before the council of Trent, but several provincial councils, e.g. in Germany and Scotland (where Archbishop Hamilton's catechism appeared in 1552 and was ordered to be read in church by the parish priest), moved in self-defence along the lines already adopted by the reformers. The council of Trent in 1563 resolved on an authoritative work which was finally carried through by two small papal commissions, and issued in 1566 by Pius V. (Eng. trans. by Donovan, Dublin, 1829). Being uncatechetical in form and addressed to the clergy rather than to the people, it missed its intention, and was superseded by others of less exalted origin, especially by those of the Jesuit Peter Canisius, whose *Somma Doctrinae et Institutionis Christianae* (1554) and its shorter form (1556) were already in the field. The catechisms of Bellarmine (1603) and Bossuet (1687) had considerable vogue, and a summary of the former known as *Schema de Parvo* was sanctioned by the Vatican council of 1870. But the Roman Catholic Church as a whole has never had any one official catechism, each bishop being allowed to settle the matter for his own diocese. In England

the Roman Catholic bishops have agreed on the use of what is known as "The Penny Catechism," which is very lucid and well constructed.

(c) *Orthodox Eastern Church*.—Peter Mogilas, metropolitan of Kiev, drew up in 1643 the *Orthodox Confession of the Catholic and Apostolic Eastern Church*. This bulwark against the encroachments of the Jesuits and the Reformed Church was standardized by the synod of Jerusalem in 1672. A smaller catechism was drawn up by order of Peter the Great in 1723. The catechisms of Levshin Platon (1762) and V. D. Philaret (1839), each in his day metropolitan of Moscow, are bulky compilations which cannot be memorized, though there is a short introductory catechism prefaced to Philaret's volume (Eng. trans. in Blackmore's *Doctrine of the Russian Church*, 1845). These works are not to any extent in the hands of the people, but are used by the Russian clergy and schoolmasters as guides in giving instruction. The Coptic and Armenian churches also have what H. Bonar describes as "mere pretences at catechisms."

(d) *Anglican*.—The catechism of the Church of England is included in the Book of Common Prayer between the Orders for Baptism and Confirmation. It has two parts: (i.) the baptismal covenant, the Creed, the Decalogue and the Lord's Prayer, drawn up probably by Cranmer<sup>1</sup> and Ridley in the time of Edward VI., and variously modified between then (1549) and 1661; (ii.) the meaning of the two sacraments, written on the suggestion of James I. at the Hampton Court Conference in 1604 by John Overall, then dean of St. Paul's, and afterwards bishop successively of Coventry and Lichfield and of Norwich. This supplement to what had become known as the Shorter Catechism established its use as against the longer one, *King Edward VIth's Catechism*, which had been drawn up in 1553 by John Ponet or Poynt, bishop of Winchester, and then revised and enlarged in 1570 by Alexander Nowell, Overall's predecessor as dean of St. Paul's. The Anglican catechism with occasional modification, especially in the sacramental section, is used not only in the Church of England but in the Episcopal churches of Ireland, Scotland, the British dominions and the United States of America. By the rubric of the Prayer Book and by the 59th canon of 1603 the clergy are enjoined to teach the catechism in church on Sundays and holidays after the second lesson at Evening Prayer. This custom, long fallen into disuse, has largely been revived during recent years, the children going to church for a special afternoon service of which catechizing is the chief feature. Compared with the thoroughness of most other catechisms this one seems very scanty, but it has a better chance of being memorized, and its very simplicity has given it a firm hold on the inner life and conscience of devout members of the Anglican communion throughout the world.

(e) *Other Communions*.—Almost every section of the church, e.g. the Wesleyan Methodist, has its catechism or catechisms, but in addition to those already enumerated only a few need be mentioned. The Socinians embodied their tenets in the larger and smaller works drawn up by Fausto Sozzini and Schmalz, and published at Rakow in Poland in 1605;<sup>2</sup> modern Unitarians have modern catechisms. The Quakers or Friends possess a kind of catechism said to have been written by George Fox in 1660, in which father and son are respectively questioner and answerer, and an interesting work by Robert Barclay, in which texts of Scripture form the replies. Congregationalists for some time used Isaac Watts's *Catechisms for Children and Youth* (1730), since superseded by the manuals of J. H. Stowell, J. H. Riddette and others. In 1898 the National Council of the Evangelical Free Churches in England and Wales published

<sup>1</sup> Cranmer had published a separate and larger catechism on the basis of the work of Justus Jonas in 1548: note also Allen's *Catechisme. A Christen Instruccion of the Principall Pointes of Christis Religion* (1551).

<sup>2</sup> A Latin edition in 1609 was dedicated to James I. of England. The British Houses of Parliament passed a resolution ordering all copies of it to be publicly burned, and again in 1652 when another edition appeared. An English translation, probably by John Bode, was printed in Amsterdam and widely circulated.

an *Evangelical Free Church Catechism*, the work of a committee (convened by Rev. Hugh Price Hughes) comprising Congregationalists, Baptists, Methodists (Wesleyan, Primitive and others), and Presbyterians, and thus representing directly or indirectly the beliefs of sixty or seventy millions of avowed Christians in all parts of the world, a striking example of inter-denominational unity. More remarkable still in some respects is *The School Catechism*, issued in 1907 by a conference of members of the Reformed churches in Scotland, which met on the invitation of the Church of Scotland. In its compilation representatives of the Episcopal Church in Scotland co-operated, and the book though "not designed to supersede the distinctive catechisms officially recognized by the several churches for the instruction of their own children," certainly "commends itself as suitable for use in schools where children of various churches are taught together."

Catechisms have a strong family likeness. In the main they are expositions of the Creed, the Lord's Prayer and the Decalogue, and thus follow a tradition that has come down from the days when Cyril of Jerusalem delivered his catechetical Lectures. Even when (as in the Shorter Westminster Catechism and the School Catechism) the Creed is simply printed as an appendix, or where (as in the Free Church Catechism) it is not mentioned at all, its substance is dealt with. The order in which these three main themes are treated is by no means constant. The Heidelberg and Westminster Catechisms are of a more logical and independent character. The former is based on the Epistle to the Romans, and deals with the religious life as (1) Repentance, (2) Faith, (3) Love. Under these heads it discusses respectively the sin and misery of men, the redemption wrought by Christ (here are included the Creed and the Sacraments), and the grateful service of the new life (the Decalogue).

It may be noted that Sir Oliver Lodge has adopted the catechetical form in his book, *The Substance of Faith Allied with Science* (1907), which is described as "a catechism for parents and teachers."

**CATECHU**, or CUTCH (Malay, *kachu*), an extract obtained from several plants, its chief sources being the wood of two species of acacia (*A. catechu* and *A. suma*), both natives of India. This extract is known as pale catechu. A similar extract, known in pharmacy as black catechu (*Catechu pallidum*), and in general commerce as gambir, or *terra japonica*, is produced from the leaves of *Uncaria gambir* and *U. acida*, cinchonaceous plants growing in the East Indian Archipelago. A third product to which the name catechu is also applied, is obtained from the fruits of the areca or betel palm, *Areca catechu*.

Ordinary black catechu is usually imported in three different forms. The first and best quality, known as Pegu catechu, is obtained in blocks externally covered with large leaves; the second and less pure variety is in masses, which have been moulded in sand; and the third consists of large cubes packed in coarse bags. The wood of the two species of *Acacia* yielding catechu is taken for the manufacture when the trees have attained a diameter of about 1 ft. The bark is stripped off and used for tanning, and the trunk is split up into small fragments, which are covered with water and boiled. When the extract has become sufficiently thick it is cast into the forms in which the catechu is found in commerce. Catechu so prepared is a dark brown, or, in mass, almost black, substance, brittle, and having generally a shining lustre. It is astringent, with a sweetish taste. In cold water it disintegrates, and in boiling water, alcohol, acetic acid and strong caustic alkali it is completely dissolved. Chemically it consists of a mixture of a peculiar variety of tannin termed catechu-tannic acid with catechin or catebuic acid, and a brown substance due to the alteration of both these principles. Catechu-tannic acid is an amorphous body soluble in cold water, while catechin occurs in minute, white, silky, needle-shaped crystals, which do not dissolve in cold water. A very minute proportion of quercetin, a principle yielded by quercitron bark, has been obtained from catechu.

Gambir, which is similar in chemical composition to ordinary

catechu, occurs in commerce in the form of cubes of about an inch in size, with a pale brown or yellow colour, and an even earthy fracture. For the preparation of this extract the plants above mentioned are stripped of their leaves and young twigs, and these are boiled down in shallow pans. The juice is strained off, evaporated, and when sufficiently concentrated is cast into shallow boxes, where, as it hardens and dries, it is cut into small cubes.

Gambir and catechu are extensively employed in dyeing and tanning. For dyeing they have been in use in India from the most remote period, but it was only during the 19th century that they were placed on the list of European dyeing substances. Catechu is fixed by oxidation of the colouring principle, catechin, on the cloth after dyeing or printing; and treated thus it yields a variety of durable tints of drabs, browns and olives with different mordants (see DYEING). The principal consumption of catechu occurs in the preparation of fibrous substances exposed to water, such as fishing-lines and nets, and for colouring stout canvas used for covering boxes and portmanteaus under the name of tanned canvas. Black catechu is official in most pharmacopoeias except that of Great Britain, in which pale catechu is the official drug. The actions and uses of the two are similar, but black catechu is the more powerful. The dose is from five to twenty grains. The *pulvis catechu compositus* contains catechu and kino, and may be given in doses twice as large as those named. The drug has the actions and uses of tannic acid, but owing to the relative insolubility of catechu-tannic acid, it is more valuable than ordinary tannic acid in diarrhoea, dysentery and intestinal hæmorrhage.

**CATECHUMEN** (Lat. *catechumenus*, Gr. *κατηχόμενος*, instructed, from *κατὰ*, to teach orally), an ecclesiastical term applied to those receiving instruction in the principles of the Christian religion with a view to baptism. As soon as Christianity became a missionary religion, it was found necessary to make arrangements for giving instruction to new converts. At the beginning the Apostles themselves seem to have undertaken this duty, and the instruction was apparently given after baptism, for in Acts ii. 41, 42, we are told that "they that gladly received the word were baptized . . . and they continued stedfastly in the Apostles' teaching." There are two instances in the New Testament where reference is made to individual instruction in this technical sense. Luke (i. 4) in dedicating the third Gospel to Theophilus tells him that his aim in writing the book was "that thou mightest have certainty in the things in which thou has been instructed" (*κατηχήθης*), and we are told that Apollo was instructed (*κατηχήμενος*) "in the way of the Lord" (Acts xviii. 25).

With the development of Christianity the instruction became more definite and formal. It is probable that the duty of instructing converts was assigned to "the teachers," who are ranked by Paul immediately after the Apostles and prophets (1 Cor. xii. 28), and occupied an important position in the Christian ministry. In the *Didache*, or Teaching of the Apostles, we have an excellent illustration of the teaching which was given to candidates for baptism in early times. There can be little doubt that the *Didache* was used as a manual for catechumens for several centuries. Athanasius (*Festal Epistles*, 39), for instance, says that "it was appointed by the Fathers to be read by those who are just recently coming to us, and wish to be instructed in the word of godliness" (*κατηχίσθαι τὸν τῆς εὐσεβείας λόγον*). The instruction prescribed by the *Didache* is very largely ethical, and stands in striking contrast to the more elaborate doctrinal teaching which came into vogue in later days. The *Shepherd of Hermas* too is another book which seems to have been used for the purpose of catechesis, for Eusebius says that it "was deemed most necessary for those who have need of elementary instruction" (*Eccles. Hist.* iii. 3-6).

With the rise of the theological controversy and the growth of heresy catechetical instruction became of vital importance to the Church, and much greater importance was attached to it. After the middle of the 4th century it was regarded as essential that the candidate for baptism should not only be acquainted

with the spiritual truths and ethical demands which form the basis of practical Christianity, but should also be trained in theology and the interpretation of the creeds. Two books have been preserved which throw a striking light upon the transformation which had taken place in the conception of catechesis; (1) the Catechetical Lectures of Cyril of Jerusalem; (2) the *De rudibus Catechizandis* of Augustine. Cyril's Lectures may be termed the *Pearson on the Creed* of the 4th century. He takes each article separately, discusses it clause by clause, explains the meaning of each word, and justifies each statement from Scripture. Augustine's treatise was written at the request of a catechist, named Deogratias, who had asked him for advice. After replying to the question of Deogratias, and giving sundry counsels as to the best method of interesting catechumens, Augustine concludes by giving a model catechetical lecture, in which he covers the whole of biblical history, beginning from the opening chapters of Genesis, and laying particular stress on the doctrinal parts of Scripture. Cyril and Augustine differ, as we should expect, in the doctrines which they select for emphasis, but they both agree in requiring a knowledge of sound doctrine on the part of the candidates.

In spite of the numerous references to catechumens in Patristic literature, our knowledge of the details of the system is often very deficient, and upon some points there is considerable diversity of opinion amongst experts. The following are the most important questions which come under consideration.

1. *The Classification of Catechumens.*—Bingham and many of the older writers held that there were four classes of catechumens, representing different stages in the process of instruction: (a) "The inquirers" whose interest in Christianity had been sufficiently aroused to make them desire further information, and who received private and individual instruction from the teachers before they were admitted into the second class. (b) "The hearers" (*audientes*), who were admitted into the Church for the purpose of listening to sermons and exhortations. (c) The *prostrati* or *genu flectentes*, who were allowed also to take part in the prayers. (d) The *electi* or *competentes*, who had completed the period of probation and were deemed ready to receive baptism. Modern scholars, however, for the most part, deny that there is sufficient basis to justify this elaborate classification, and think that its advocates have confused the catechumenate with the system of penance. The evidence does not seem to warrant more than two classes, (a) the *audientes*, who were in the initial stages of their training, (b) the *competentes*, who were qualified for baptism.

2. *The Relation of Catechumens to the Church.*—Catechumens were allowed of course to attend church services, but at a certain point were dismissed with the words "Ite catechumeni, missa est." The moment at which the dismissal took place cannot be exactly determined, and it is not clear whether the catechumens were allowed to remain for a portion of the Communion service, and if so, whether as spectators or as partial participants. A passage in Augustine seems to imply that in some way they shared in the Sacrament, "that which they (the catechumens) receive, though it be not the Body of Christ, is yet an holy thing and more holy than the common food which sustains us, because it is a Sacrament" (*De peccatorum meritis*, ii. 42). The explanation of these words has occasioned considerable controversy. Many scholars hold (and this certainly seems the most natural interpretation) that consecrated bread was taken from the Eucharist and given to the catechumens. Bingham, however, maintains that the reference is not to the consecrated bread, but to salt, which was given to them as a symbol "that they might learn to purge and cleanse their souls from sin."

3. *The Duration of the Training.*—Various statements with regard to the duration of the catechumenal training are found in ecclesiastical authorities. The Apostolical Constitutions, for instance, fix it at three years;<sup>1</sup> the synod of Elvira at two.<sup>2</sup> The references in the Fathers, however, imply that for practical purposes it was limited to the forty days of Lent. Very probably, however, the forty days of actual instruction were preceded by a period of probation.

4. *The Relation between the Catechumenate and Baptism.*—Catechetical instruction was designed as a preliminary to baptism. There were two directions, however, in which this purpose was enlarged: (a) We have no reason to suppose that when infant baptism was introduced, those who had been baptized in infancy were excluded from the catechetical training, or that instruction was deemed unnecessary in their case, though as a matter of fact we have no definite reference to their admission. The custom of postponing baptism, which was very general in the 4th and 5th centuries, probably made such cases more rare than is generally supposed, and so accounts for the absence of any allusion to them

in connexion with the catechumenate. (b) We have no reason to suppose that the instruction given in the famous catechetical schools of Alexandria and Carthage was restricted to candidates for baptism. There is no doubt that "catechetical" is used in a much wider sense when applied to the lectures of Origen than when used of the addresses of Cyril of Jerusalem. The "instruction" of Origen was given to all classes of Christians, and not merely to those who were in the initial stages.

5. *Characteristics of the Catechumenal Training.*—Besides instruction there were some other important features connected with the catechumenate. (a) The duty of *confession* was impressed on the candidates. (b) The ceremony of *exorcism* was often performed in order to free the catechumen from evil spirits. (c) At a certain point in the training the creed and the doctrine of the Sacraments were delivered to the candidates by the bishop with much impressive ceremonial. This teaching constituted the "holy secret" or "mystery" (*disciplina arcani*) of Christianity, and could only be imparted to those who were qualified to receive it. The acquisition of this arcanum was regarded as the most essential element in the catechetical discipline, and marked off its possessors from the rest of the world. There can be little doubt that this conception of the "Holy Secret" came into the Church originally from the Greek mysteries, and that much of the ceremonial connected with the catechumenate and baptism was derived from the same source.

*AUTHORITIES.*—Cyril, *Catecheses*; Gregory of Nyssa, *Oratio Catechetica*; Chrysostom, *Catecheses ad illuminandos*; Augustine, *De rudibus Catechizandis*; Mayer, *Geschichte des Katechumenats . . . in den ersten sechs Jahrhunderten* (1868); S. Cheetham, *The Mysteries, Pagan and Christian*. (H. T. A.)

**CATEGORY** (Gr. *κατηγορία*, "accusation"), a term used both in ordinary language and in philosophy with the general significance of "class" or "group." In popular language it is used for any large group of similar things, and still more generally as a mere synonym for the word "class." The word was introduced into philosophy as a technical term by Aristotle, who, however, several times used it in its original sense of "accusation." He also used the verb *κατηγορεῖν*, to accuse, in the specific logical sense, to predicate; *τὸ κατηγοροῦν* becomes the predicate; and *κατηγορεῖν πρότερον* may be translated as affirmative proposition. But though the word thus received a new signification from Aristotle, it is not on that account certain that the thing it was taken to signify was equally a novelty in philosophy. In fact we find in the records of Oriental and early Greek thought something corresponding to the Aristotelian classification.

Our knowledge of Hindu philosophy, and of the relations in which it may have stood to Greek speculation, scarcely enables us to give decisive answers to various questions that naturally arise on observation of their many resemblances (see *Philosophy*, an article by Richard Garbe in *Monist*, iv. 176-193). Yet the similarity between the two is so striking that, if not historically connected, they must at least be regarded as expressions of similar philosophic needs. The Hindu classification to which we specially refer is that of Kanada, who lays down six categories, or classes of existence, a seventh being generally added by the commentators. The term employed is *Padārtha*, meaning "signification of a word." This is in entire harmony with the Aristotelian doctrine, the categories of which may with truth be described as significations of simple terms, *τὰ κατὰ μέρη τὰ ἐννοητὰ ὑποκείμενα*. The six categories of Kanada are Substance, Quality, Action, Genus, Individuality, and Concretion or Co-inherence. To these is added Non-Existence, Privation or Negation. *Substance* is the permanent substance in which *Qualities* exist. *Action*, belonging to or inhering in substances, is that which produces change. *Genus* belongs to substance, qualities and actions; there are higher and lower genera. *Individuality*, found only in substance, is that by which a thing is self-existent and marked off from others. *Concretion* or Co-inherence denotes inseparable or necessary connection, such as that between substance and quality. Under these six classes, *ἕξις καὶ ἕξις*, Kanada then proceeds to range the facts of the universe.<sup>1</sup>

Within Greek philosophy itself there were foreshadowings of the Aristotelian doctrine, but nothing so important as to warrant the conclusion that Aristotle was directly influenced by it. Doubtless the One and Many, Being and Non-Being, of the Eleatic dialectic, with their subordinate appositions, may be called categories, but they are not so in the Aristotelian sense and have little or nothing in common with the later system. Their

<sup>1</sup> For details of this and other Hindu systems see H. T. Colebrook, *Miscellaneous Essays* (1837; new ed. E. B. Cecil, 1873); H. H. Wilson, *Essays and Lectures on the Religions of the Hindus* (1861-1862); Monier Williams, *Indian Wisdom* (4th ed., 1893); A. E. Gough, "A Vaisheshika-Sūtras (Benares, 1873), and *Philosophy of the Upanishads* (London, 1882, 1891); Max Müller, *Sanskrit Literature*, and particularly his appendix to Thomson's *Laws of Thought*.

<sup>1</sup> *Apost. Constil.* viii. 2.

<sup>2</sup> Canon 42.

starting-point and results are wholly diverse. Nor does it appear necessary to do more than mention the Pythagorean table of principles, the number of which is supposed to have given rise to the decuple arrangement adopted by Aristotle. The two classifications have nothing in common; no term in the one list appears in the other; and there is absolutely nothing in the Pythagorean principles which could have led to the theory of the categories.<sup>1</sup>

One naturally turns to Plato when endeavouring to discover the genesis of any Aristotelian doctrine, and undoubtedly there are in the Platonic writings many detached discussions in which the matter of the categories is touched upon. Special

terms also are anticipated at various times, e.g. *νοῦς* in the *Theaetetus*, *νοῦσις* and *νόησις* in the *Gorgias*, and *νόσις* in the *Sophist*.<sup>2</sup> But there does not seem to be anything in Plato in which one could say gave occasion directly and of itself to the Aristotelian doctrine; and even when we take a more comprehensive view of the Platonic system and inquire what in it corresponds to the widest definition of categories, say as ultimate elements of thought and existence, we receive no very definite answer. The Platonic dialectic never worked out into system, and only in two dialogues do we get anything like a list of ultimate or root-notions. In the *Sophist*, Being, Rest and Motion (*τὸ ἐκ ἀπὸ καὶ ἐναντίον καὶ κίνησις*) are laid down as *πρώτα καὶ γενέα*.<sup>3</sup> To these are subsequently added the Same and the Other (*αὐτὸ καὶ ἕτερον*), and out of the consideration of all five some light is cast upon the obscure notion of Non-Being (*τὸ μὴ ὄν*). In the same dialogue (262 seq.) is found the important distinction of *ἁπλοῦς* and *μίμη*, noun and verb. The *Philebus* presents us with a totally distinct classification into four elements—the Infinite, the Finite, the Mixture or Unity of both and the Cause of this unity (*τὸ ἄπειρον, τὸ ὁριστόν, τὸ ἄμικτόν, ἡ αἰτία*). It is at once apparent that, however these classifications are related to one another and to the Platonic system, they lie in a different field from that occupied by the Aristotelian categories, and can hardly be said to have anything in common with them.

The Aristotelian doctrine is most distinctly formulated in the short treatise *Κατηγορίαι*, which generally occupies the first place among the books of the *Organon*. The authenticity of the treatise was doubted in early times by some of the commentators, and the doubts have been revived by such scholars as L. Spengel and Carl Prantl. On the other hand, C. A. Brandis, H. Bonitz, and Ed. Zeller are of opinion that the tract is substantially Aristotle's. The matter is hardly one that can be decided either *pro* or *con* with anything like certainty; but this is of little-moment, for the doctrine of the categories, even of the *ten* categories, does not stand or fall with only one portion of Aristotle's works.

It is surprising that there should yet be so much uncertainty as to the real significance of the categories, and that we should be in nearly complete ignorance as to the process of thought by which Aristotle was led to the doctrine. On both points it is difficult to extract from the matter before us anything approaching a satisfactory solution. The terms employed to denote the categories have been scrutinized with the utmost care, but they give little help. The most important—*τὸ ὄν* or *τὸ ὄντως*, *τὸ ὄντως ὄν* or *τὸ ὄντως ὄντως*, *τὸ ὄντως ὄντως ὄντως*, *τὸ ὄντως ὄντως ὄντως ὄντως*, or *τὸ ὄντως ὄντως ὄντως ὄντως ὄντως*—only indicate that the categories are general classes into which Being as such may be divided, that they are *ἁπλοῦς γενέα*. The expressions *τὸ ὄντως ὄντως ὄντως ὄντως ὄντως* and *ὄντως ὄντως ὄντως ὄντως ὄντως*, which are used frequently, seem to lead to another and somewhat different view. *κατηγορία* being taken to mean that which is predicated, *τὸ ὄντως ὄντως ὄντως ὄντως ὄντως* would signify the most general classes of predicates, the framework into the divisions of which all predicates must come. To this interpretation there are objections. The categories must be carefully distinguished from predicables; in the scholastic phraseology the former refer to *first intentions*, the latter to *second intentions*, i.e. the one denote real, the other logical connexion. Further, the categories cannot without careful explanation be defined as predicates; they are this and something more. The most important category, *ὄντως*, in one of its aspects cannot be predicated at all.

In the *Κατηγορίαι* Aristotle prefixes to his enumeration a grammatico-logical disquisition on homonyms and synonyms, and on the elements of the proposition, i.e. subject and predicate. He draws attention to the fact that things are spoken of either in the connexion known as the proposition, e.g. "a man runs," or apart from such connexion, e.g. "man" and "runs." He then proceeds, "Of things spoken of apart from their connexion in a proposition (*ἄνευ κατὰ πρόθεσιν ἐπισημοῦ λέγουμένων*), each signifies either Substance (*ὄντως*), or Quantity (*ποσότης*), or Quality (*ποιότης*), or Relation (*σπότης*), or Where (i.e. Place, *τοῦ*), or When (i.e. Time, *πότε*), or Position (*εἰσθεῖα*), or Possession (*ἔχειν*), or Action (*ποιεῖν*), or Passion (*πάσχειν*), *ὄντως*, the first category, is subdivided into *σπότης ὄντως* or primary substance, which is defined to be *τὸ ὄντως ὄντως*, the singular thing in which properties inhere, and to which predicates are attached, and *σπότης*

*ὄντως*, genera or species which can be predicated of primary substances, and are therefore *ὄντως* only in a secondary sense. Nevertheless, they too, after a certain fashion, signify the singular thing, *τὸ ὄντως ὄντως* (*K.* p. 3 b 12, 13). It is this doctrine of *σπότης ὄντως* that has raised doubts with regard to the authenticity of the *Κατηγορίαι*. But the tenfold classification, which has also been captiously objected to, is given in an acknowledged writing of Aristotle's (see *Topica*, i. 9, p. 103 h 20).<sup>4</sup> At the same time it is at least remarkable that in two places where the enumeration seems intended to be complete (*Met.* p. 1017 a 25; *An. Pos.* i. 22, p. 83 a 21), only eight are mentioned, *ἔχειν* and *εἰσθεῖα* being omitted. In other passages<sup>5</sup> six, five, four, and three are given, frequently with some addition, such as *καὶ αἰτία* &c. It is also to be observed that, despite of this wavering, distinct intimations are given by Aristotle that he regarded his list as complete, and he uses phrases which would seem to indicate that the division had been exhaustively carried out. He admits certainly that some predicates which come under one category might be referred to another, but he declines to deduce all from one highest class, or to recognize any relation of subordination among the several classes.

The full import of the categories will never be adequately reached from the point of view taken up in the *Κατηγορίαι*, which bears all the marks of an early and preliminary study. For true understanding we must turn to the *Metaphysics*, where the doctrine is handled at large. The discussion of Being in that work starts with a distinction that at once gives us a clue. *τὸ ὄντως ὄντως* is spoken of in many ways; of these four are classified—*τὸ ὄντως ὄντως ὄντως ὄντως*, *τὸ ὄντως ὄντως ὄντως ὄντως*, *τὸ ὄντως ὄντως ὄντως ὄντως*, and *τὸ ὄντως ὄντως ὄντως ὄντως*. It is evident from this that the categories can be regarded neither as purely logical nor as purely metaphysical elements. They indicate the general forms or ways in which Being can be predicated; they are determinations of Being regarded as an object of thought, and consequently as matter of speech. It becomes apparent also why the analysis of the categories starts from the singular thing, for it is the primary form under which all that is becomes object of knowledge, and the other categories modify or qualify this real individual. *Πάντα δὲ τὰ γινόμενα ἐπὶ τὸ ὄντως ὄντως ὄντως ὄντως ὄντως*. . . . The categories, therefore, are not logical forms, but real predicates; they are the general modes in which Being may be expressed. The definite thing, that which comes forward in the process from potentiality to full actuality, can only appear and be spoken of under forms of individuality, quality, quantity and so on. The nine later categories all denote entity in a certain imperfect fashion.

The categories then are not to be regarded as heads of predicates, the framework into which predicates can be thrown. They are real determinations of Being—*allgemeine Bestimmungen*, as Hegel calls them. They are not *summa genera* of existences, still less are they to be explained as a classification of namable things in general. The objections Mill has taken to the list are entirely irrelevant, and would only have significance if the categories were really—what they are not—an exhaustive division of concrete existences. Grote's view (*Aristotle*, i. 108) that Aristotle drew up his list by examining various popular propositions, and throwing the different predicates into genera, "according as they stood in different logical relation to the subject," has no foundation. The relation of the predicate category to the subject is not entirely a logical one; it is a relation of real existence, and wants the essential marks of the propositional form. The logical relations of *τὸ ὄντως ὄντως* are provided for otherwise than by the categories.

Aristotle has given no intimation of the course of thought by which he was led to his tenfold arrangement, and it seems hopeless to discover it. Trendelenburg in various essays has worked out the idea that the root of the matter is to be found in grammatical considerations, that the categories originated from investigations into grammatical functions, and that a correspondence will be found to obtain between categories and parts of speech. Thus, Substance corresponds to noun substantive, Quantity and Quality to the adjective, Relation partly to the comparative degree and perhaps to the preposition, When and Where to the adverbs of time and place, Action to the active, Passion to the passive of the verb, Position (*εἰσθεῖα*) to the intransitive verb, *ἔχειν* to the peculiar Greek perfect. That there should be a very close correspondence between the categories and grammatical elements is by no means surprising; that the one were deduced from the other is both philosophically and historically improbable. Reference to the detailed criticisms of Trendelenburg by Ritter, Bonitz, and Zeller will be sufficient.

Aristotle has also left us in doubt on another point. Why should there be only *ten* categories? and why should these be the ten? Kant and Hegel, it is well known, signalize as the great defect in the Aristotelian categories the want of a principle, and yet some of Aristotle's expressions would warrant the inference that he had a principle, and that he thought his arrangement exhaustive. The leading idea of all later attempts at reduction to unity of principle,

<sup>1</sup> The supposed origin of that theory in the treatise *πρὸς τοὺς ἰατροὺς*, ascribed to Archytas (q.v.), has been proved to be an error. The treatise itself dates in all probability from the Neo-Pythagorean schools of the 2nd century A.D.

<sup>2</sup> Prantl, *Ges. der Logik*, i. 74-75; F. A. Trendelenburg, *Kate-goriklehre*, 209. n.

<sup>3</sup> *Soph.* 254 D.

<sup>4</sup> Against this passage even Prantl can raise no objection of any moment; see *Ges. der Logik*, i. 206. n.

<sup>5</sup> See Bonitz, *Index Aristotelicus*, s.v., and Prantl, *Ges. der Logik*, i. 207.

the division into substance and accident, was undoubtedly not overlooked by Aristotle, and Fr. Brentano<sup>1</sup> has collected with great diligence passages which indicate how the complete list might have been deduced from this primary distinction. His tabular arrangements (pp. 175, 177) are particularly deserving of attention. The results, however, are hardly beyond the reach of doubt.

There was no fundamental change in the doctrine of the categories from the time of Aristotle to that of Kant, and only two proposed reclassifications are of such importance as to require notice. The Stoics adopted a fivefold arrangement of highest classes, *γενεσθαι*. *τὸ εἶναι* or *τὸ ὄν*, Being, or somewhat in general, was subdivided into *βραχυτέρα* or subjects, *πρῶτα* or qualities in general, which give definiteness to the blank subject, *πρῶτα ἕκαστα*, modes which further determine the subject, and *πρῶτα τὴν πρῶτα ἕκαστα*, definite relative modes. These categories are so related that each involves the existence of one higher than itself, thus cannot be a *πρῶτα τὴν πρῶτα ἕκαστα* which does not rest upon or imply a *πρῶτα ἕκαστα*, but *πρῶτα ἕκαστα* is impossible without *πρῶτα*, which only exists in *βραχυτέρα*, a form or phase of *τὸ ὄν*.<sup>2</sup>

Plotinus, after a lengthy criticism of Aristotle's categories, sets out a twofold list. *τὸ εἶναι*, *αἰσθητὰ*, *εὐκατά*, *καθόλου*, *ἐκείνη* are the primitive categories (*πρῶτα γέννη*) of the intelligible sphere. *ὁρατά*, *πρῶτα τὴν πρῶτα ἕκαστα*, *αἰσθητὰ* are the categories of the sensible world. The return to the Platonic classification will not escape notice.

Modern philosophy, neglecting altogether the dry and tasteless treatment of the Aristotelian doctrine by scholastic writers, gave a new, a wider and deeper meaning to the categories.

**Modern philosophy.** They now appear as ultimate or root notions, the metaphysical or thought elements, which give coherence and consistency to the material of knowledge, the necessary and universal relations which obtain among the particulars of experience. There was thus to some extent a return to Platonism, but in reality, as might easily be shown, the new interpretation was, with due allowance for difference in point of view, in strict harmony with the true doctrine of Aristotle. The modern theory dates in particular from the time of Kant, who may be said to have reintroduced the term into philosophy. Naturally there are some anticipations in earlier thinkers. The Substance, Attribute and Mode of Cartesianism can hardly be classed among the categories; nor does Leibnitz's chance suggestion of a fivefold arrangement into Substance, Quantity, Quality, Action and Passion, and Relations, demand any particular notice. Locke, too, has a classification into Substances, Modes and Relations, but in it he has manifestly no intention of drawing up a table of categories. What in his system corresponds most nearly to the modern view of these elements is the division of kinds of real predication. In all judgments of knowledge we predicate either (1) Identity or Diversity, (2) Relation, (3) Co-existence, or necessary connexion, or (4) Real existence. From this the transition was easy to Hume's important classification of *philosophical relations* into those of Resemblance, Identity, Time and Place, Quantity or Number, Quality, Contrariety, Cause and Effect.

These attempts at an exhaustive distribution of the necessary relations of all objects of knowledge indicate the direction taken by modern thought, before it received its complete expression from Kant.

The doctrine of the categories is the very kernel of the Kantian system, and, through it, of later German philosophy. To explain it fully would be to write the history of that philosophy.

**Kant.** The categories are called by Kant Root-notions of the Understanding (*Stammbegriffe des Verstandes*), and are briefly the specific forms of the a priori or formal element in rational cognition. It is this distinction of matter and form in knowledge that marks off the Kantian from the Aristotelian doctrine. To Kant knowledge was only possible as the synthesis of the material or a posteriori with the formal or a priori. The material to which a priori forms of the understanding were applied was the sensuous content of the pure intuitions, Time and Space. This content could not be known by sense, but only by intellectual function. But the understanding in the process of knowledge makes use of the universal form of synthesis, the judgment; intellectual function is essentially of the nature of judgment or the reduction of a manifold to unity through a conception. The specific or type forms of such function will, therefore, be expressed in judgments; and a complete classification of the forms of judgments is the key by which one may hope to discover the system of categories. Such a list of judgments Kant thought he found in ordinary logic, and from it he drew up his well-known scheme of the twelve categories. These forms are the determinations of all objects of experience, for it is only through them that the manifold of sense can be reduced to the unity of consciousness, and thereby constituted experience. They are a priori conditions, subjective in one sense, but objective as being universal, necessary and constitutive of experience.

The table of logical judgments with corresponding categories is as follows:—

Judgments.		Categories.
Universal . . . . .	I. Of Quantity	Unity.
Particular . . . . .		Plurality.
Singular . . . . .		Totality.
Affirmative . . . . .	II. Of Quality	Reality.
Negative . . . . .		Negation.
Infinite . . . . .		Limitation.
Categorical . . . . .	III. Of Relation	Inherence and Subsistence (Substance and Accident).
Hypothetical . . . . .		Causality and Dependence (Cause and Effect).
Disjunctive . . . . .		Community (Reciprocity).
Problematical . . . . .	IV. Of Modality	Possibility and Impossibility.
Assertoric . . . . .		Existence and Non-Existence.
Apodictic . . . . .		Necessity and Contingency.

Kant, it is well known, criticizes Aristotle severely for having drawn up his categories without a principle, and claims to have disclosed the only possible method by which an exhaustive classification might be obtained. What he criticized in Aristotle is brought against his own procedure by the later German thinkers, particularly Fichte and Hegel. And in point of fact it cannot be denied that Kant has allowed too much completeness to the ordinary logical distribution of propositions; he has given no proof that in these forms are contained all species of synthesis, and in consequence he has failed to show that in the categories, or pure conceptions, are contained all the modes of a priori synthesis. Further, his principle has so far the unity he claimed for it, the unity of a single function, but the specific forms in which such unity manifests itself are not themselves accounted for by this principle. Kant himself hints more than once at the possibility of a completely rational system of the categories, at an evolution from one single movement of thought, and in his *Remarks on the Table of the Categories* gave a pregnant hint as to the method to be employed. From any complete realization of this suggestion Kant, however, was precluded by one portion of his theory. The categories, although the necessary conditions under which alone an object of experience can be thrown, are merely forms of the mind's own activity; they apply only to sensuous and consequently subjective material. Outside of and beyond them lies the thing-in-itself, which to Kant represented the ultimately real. This subjectivism was a distinct hiatus in the Kantian system, and against it principally Fichte and Hegel directed criticism. It was manifest that at the root of the whole system of categories there lay the synthesizing unity of self-consciousness, and it was upon this unity that Fichte fixed as giving the possibility of a more complete and rigorous deduction of the pure notions of the understanding. Without the act of the Ego, whereby it is self-conscious, there could be no knowledge, and this primitive act or function must be, he saw, the *positio* or affirmation of itself by the Ego. The first principle then must be that the Ego posits itself as the Ego, that Ego=Ego, a principle which is unconditioned both in form and matter, and therefore capable of standing absolutely first, of being the *primo* in a system. Metaphysically regarded this act of self-position yields the categories of Reality. But, so far as matter is concerned, there cannot be affirmation without negation, *omnis determinatio est negatio*. The determination of the Ego presupposes or involves the Non-Ego. The form of the proposition in which this second act takes to itself expression, the Ego is not = Not-Ego, is unconditioned, not derivable from the first. It is the absolute antithesis to the primitive thesis. The category of Negation is the result of this second act. From these two propositions, involving absolutely opposed and mutually destructive elements, there results a third which reconciles both in a higher synthesis. The notion in this third is determination or limitation; the Ego and Non-Ego limit, and are opposed to one another. From these three positions Fichte proceeds to evolve the categories by a series of thesis, antithesis and synthesis.

In thus seizing upon the unity of self-consciousness as the origin for systematic development, Fichte has clearly taken a step in advance of, and yet in strict harmony with, the Kantian doctrine. For, after all that can be said as to the demonstrated character of formal logic, Kant's procedure was empirical, and only after the list of categories had been drawn out, did he bring forward into prominence what gave them coherence and reality. The peculiar method of Fichte, also, was nothing but a consistent application of Kant's own Remark on the Table of the Categories. Fichte's doctrine, however, is open to some of the objections advanced against Kant. His method is too abstract and external, and wants the unity of a single principle. The first two of his fundamental propositions stand isolated from one another, not to be resolved into a primitive unity. With him, too, the whole stands yet on the plane of subjectivity. He speaks, indeed, of the universal Ego as distinct from the empirical self-consciousness; but the universal does not rise with him to concrete spirit. Nevertheless the *Wissenschaftslehre* contains the only real advance in the treatment of the categories from the time of Kant to that of Hegel.<sup>3</sup> This of

<sup>2</sup> For detailed examination of the Stoic categories, see Prantl, *Ges. d. Logik*, i. 428 sqq.; Zeller, *Ph. d. Griech.* iii. 1. 82. sqq.; Trendelenburg, *Kateg.* p. 217.

<sup>3</sup> It does not seem necessary to do more than refer to the slight alterations made on Kant's Table of Categories by J. G. von Herder (in the *Metakritik*), by Solomon Maimon (in the *Propädeutik an einer*

course, does not imply that there were not certain elements in Schelling, particularly in the *Transcendental Idealism*, that are of value in the transition to the later system; but on the whole it is only in Hegel that the whole matter of the Kantian categories has been assimilated and carried to a higher stage. The Hegelian philosophy, in brief, is a system of the categories; and, as it is not intended here to expound that philosophy, it is impossible to give more than a few general and quite external observations as to the Hegelian mode of viewing these elements of thought. With Kant, as has been seen, the categories were still subjective, not as being forms of the individual subject, but as having over against them the world of *noumena* to which they were inapplicable. Self-consciousness, which was, even with Kant, the *nodus* or kernel whence the categories sprang, was nothing but a logical centre,—the reality was concealed. There was thus a dualism, to overcome which is the first step in the Hegelian system. The principle, if there is to be one, must be universally applicable, all-comprehensive. Self-consciousness is precisely the principle wanted; it is a unity, an identity containing in itself a multiplicity. The universal in absolute self-consciousness is just pure thinking, which in systematic evolution is the categories; the particular is the natural or multiform, the external as such; the concrete of both is spirit, or self-consciousness come to itself. The same law that obtains among the categories is found adequate to an explanation of the external thing which had so sadly troubled Kant. The categories themselves are moments of the universal of thought, type forms, or definite aspects which thought assumes; determinations, *Bestimmungen*, as Hegel most frequently calls them. They evolve by the same law that was found to be the essence of ultimate reality—i.e. of self-consciousness. The complete system is pure thought, the *Universal par excellence*.

After the Hegelian there can hardly be said to have been a philosophical treatment of the categories in Germany which is not more or less a criticism of that system. It does not seem necessary to mention the unimportant modifications introduced by Kuno Fischer, J. E. Erdmann, or others belonging to the school. In the strongly-opposed philosophy of J. F. Herbart the categories can hardly be said to hold a prominent place. They are, with him, the most general notions which are psychologically formed, and he classifies them as follows:—(1) Thing, either as product of thought or as given in experience; (2) Property, either qualitative or quantitative; (3) Relation; (4) The Negated. Along with these he posits as categories of inner process—(1) Sensation, (2) Cognition, (3) Will, (4) Action. Joh. Fr. L. George (1811-1873),<sup>1</sup> who in the main follows Schleiermacher, draws out a table of categories which shows, in some points, traces of Herbartian influence. His arrangement by *enades*, or series of nine, is fanciful, and wanting in inner principle.

The most imposing of more recent attempts at a reconstruction of the categories is that of F. A. Trendelenburg. To him the first principle, or primitive reality, is Motion, which is both real as external movement, and ideal as inner construction. The necessary conditions of Motion are Time and Space, which are both subjective and objective. From this point onwards are developed the mathematical (point, line, &c.) and real (causality, substance, quantity, quality, &c.) categories which appear as involved in the notion of motion. Matter cannot be regarded as a product of motion; it is the condition of motion, we must think something moved. All these categories, "under the presupposition of motion as the first energy of thought, are ideal and subjective relations; as also, under the presupposition of motion as the first energy of Being, real and objective relations."<sup>2</sup> A serious difficulty presents itself in the next category, that of End (*Zweck*), which can easily be thought for inner activity, but can hardly be reconciled with real motion. Trendelenburg solves the difficulty only empirically, by pointing to the insufficiency of the merely mechanical to account for the organic. The consideration of Modality effects the transition to the forms of logical thought. On the whole, Trendelenburg's unique fact of motion seems rather a blunder. There is much more involved than he is willing to allow, and motion *per se* is by no means adequate to self-consciousness. His theory has found little favour.

Hermann Ulrici works out a system of the categories from a psychological or logical point of view. To him the fundamental fact of philosophy is the distinguishing activity (*unterscheidende Thätigkeit*) of thought. Thought is only possible by distinction, difference. The fixed points in the relations of objects upon which this activity turns are the categories, which may be called the forms or laws of thought. They are the aspects of things, notions under which things must be brought, in order to become

known (*Theoria des Denkens*), by J. F. Fries in the *Neue Kritik der Vernunft*, or by Schopenhauer, who desired to reduce all the categories to one—that of Causality. We should require a new philosophical vocabulary even to translate the extraordinary compounds in which K. C. F. Krause expounds his theory of the categories. Notices of the changes introduced by Antonio Rosmini-Serbati, and of Vincenzo Gioberti's remarkable theory, will be found in Ragnisco's work referred to below.

<sup>1</sup> *System der Metaphysik* (1844).

<sup>2</sup> *Logische Untersuchungen*, l. 376-377.

objects of thought. They are thus the most general predicates or heads of predicates. The categories cannot be completely gathered from experience, nor can they be evolved a priori; but, by attending to the general relations of thought and its purely indefinite matter, and examining what we must predicate in order to know Being, we may attain to a satisfactory list. Such a list is given in great detail in the *System der Logik* (1852), and in briefer, preciser form in the *Compendium der Logik* (2nd ed., 1872); it is in many points well deserving of attention.

The definition of the categories by the able French logician Charles Bernard Renouvier in some respects resembles that of Ulrici. To him the primitive fact is Relation, of which all the categories are but forms. "The categories," he says, "are the primary and irrefutable laws of knowledge, the fundamental relations which determine its form and regulate its movements." His table and his criticism of the Kantian theory are both of interest. The criticism of Kant's categories by Cousin and his own attempted classification are of no importance. Of little more value is the elaborate table drawn out by Sir W. Hamilton.<sup>4</sup> The generalized category of the *Conditioned* has but little meaning, and the subordinate categories evolve themselves by no principle, but are arranged after a formal and quite arbitrary manner. They are never brought into connexion with thought itself, nor could they be shown to spring from its nature and relations. J. S. Mill presented, "as a substitute for the abortive classification of Existences, termed the categories of Aristotle," the following as an enumeration of all nameable things:—(1) Feelings, or states of consciousness; (2) The minds which experience these feelings; (3) Bodies, or external objects which excite certain of those feelings; (4) Successions and co-existences, likenesses and unlikenesses, between feelings or states of consciousness.<sup>5</sup> This classification proceeds on a quite peculiar view of the categories, and is here presented only for the sake of completeness.

By modern psychologists the subject has been closely investigated. Professor G. F. Stout (*Manual of Psychology*, vol. ii, pp. 312 foll.) defines categories as "forms of cognitive consciousness, universal principles or relations presupposed either in all cognition or in all cognition of a certain kind." He then treats External (or Physical) Reality, Space, Time, Causality and "Thinghood" from the standpoint of the perceptual consciousness; showing in what sense the categories of causality, substance and the rest exist in the sphere of perception. As contrasted with the idealational, the perceptual consciousness is concerned with practice. Perception tells the child of things as separate entities, not in their ultimate relations as parts of a coherent whole. G. T. Ladd (*Psychology Descriptive and Explanatory*, ch. xxl., on "Space, Time and Causality") defines the categories from the psychological standpoint as "the most highly abstract conceptions which the mind frames by reflection upon its own most general modes of behaviour. They are our own notions resulting from co-operation of imagination and judgment, concerning the ultimate and unanalyzable forms of our own existence and development." In other words, the categories are highly abstract, have no content, and are realized as a kind of thinking which has for its-object all the other mental processes.

**CATENARY** (from Lat. *catena*, a chain), in mathematics, the curve assumed by a uniform chain or string hanging freely between two supports. It was investigated by Galileo, who erroneously determined it to be a parabola; Jungius detected Galileo's error, but the true form was not discovered until 1691, when James Bernoulli published it as a problem in the *Acta Eruditorum*. Bernoulli also considered the cases when (1) the chain was of variable density, (2) extensible, (3) acted upon at each point by a force directed to a fixed centre. These curves attracted much attention and were discussed by John Bernoulli, Leibnitz, Huygens, David Gregory and others.

Modern  
psychology.

The mechanical properties of the curves are treated in the article MECHANICS, where various forms are illustrated. The simple catenary is shown in the figure. The cartesian equation referred to the axis

and directrix is  $y=c \cosh(x/c)$  or  $y=c \frac{e^{x/c} + e^{-x/c}}{2}$ ; other forms are  $y=c \sinh(x/c)$  and  $y^2=c^2+s^2$ ,  $s$  being the arc measured from the vertex; the intrinsic equation is  $s=c \tan \psi$ . The radius of curvature and normal are each equal to  $c \sec^2 \psi$ .

The surface formed by revolving the catenary about its directrix is named the *alysseide*. It is a minimal surface, i.e. the catenary solves the problem: to find a curve joining two given points, which when revolved about a line co-planar with the points traces a surface of minimum area (see VARIATIONS, CALCULUS OF).

The involute of the catenary is called the *tractory*, *tractrix* or *antifriction curve*; it has a cusp at the vertex of the catenary, and is asymptotic to the directrix. The cartesian equation is

$$x = \sqrt{(c^2 - y^2)} + c \log \left\{ \frac{c - \sqrt{(c^2 - y^2)}}{c + \sqrt{(c^2 - y^2)}} \right\},$$

and the curve has the geometrical property that the length of its tangent is constant. It is named the tractory, since a weight placed on the ground and drawn along by means of a flexible string by a person travelling in a straight line, the weight not being in this line, describes the curve in question. It is named the antifriction curve, since a pivot and step having the form of the surface generated by revolving the curve about its vertical axis wear away equally (see MECHANICS: Applied).

**CATERAN** (from the Gaelic *ceathairne*, a collective word meaning "peasantry"), the band of fighting men of a Highland clan; hence the term is applied to the Highland, and later to any, marauders or cattle-lifters.

**CATERHAM**, an urban district in the Wimbledon parliamentary division of Surrey, England, 20 m. S. of London by the South-Eastern & Chatham railway. Pop. (1901) 9486. It lies in a healthy, hilly district, and has grown in modern times from a village into a large residential town. There are large barracks in the neighbourhood, and the Metropolitan lunatic asylum is close to the town.

**CATERPILLAR**, the popular name of the larva of various insects, particularly of butterflies and moths (see LEPIDOPTERA, HEXAPODA, METAMORPHOSIS). The word appears first in the form *caterpyl* (*Promptorium Parvulorum*, about the middle of the 15th century). This may be the original form, with the addition of *-ar* or *-er*; if so, it represents the O. Fr. *chatepelose* or *chatepelouse*, i.e. "hairy-cat" (*chat*, cat, and *pelouse*, hairy, Lat. *pilosus*), a name applied to the hairy caterpillar, and also according to Cotgrave to a weevil. The use of "cat" in this connexion is paralleled by the Swiss name for a caterpillar, *teufelskate*, and the popular English name for the blossom of the willow, "catkin," somewhat resembling a caterpillar (cf. "palmer"); the modern French is *chenille*, Latin *canicula*, a little dog. The termination of the word seems to have been early connected with "pillar," a robber, plunderer from the destructive habits of the larva, cf. Joel i. 4—"That which the palmer-worm hath left, hath the locust eaten." The spelling "caterpillar," a 17th century corruption, has been the usual form since Johnson.

**CATESBY, ROBERT** (1573-1605), English conspirator, son of Sir William Catesby of Lapworth in Warwickshire, a prominent recusant who was a descendant of Sir William Catesby; speaker of the House of Commons in 1484, executed by Henry VII. after the battle of Bosworth, was born in 1573, and entered Gloucester Hall (now Worcester College), Oxford, in 1586. He possessed a considerable estate, and was said to be wild and extravagant in his youth. In 1596 he was one of those arrested on suspicion during an illness of Queen Elizabeth. In 1601 he took part in the rebellion of Essex, was wounded in the fight and imprisoned, but finally pardoned on the payment of an enormous fine, to obtain which he was forced to sell a portion of his property. In 1602 he despatched Thomas Winter and the Jesuit Tesimond alias Greenway to Spain to induce Philip III. to organize an

invasion of England, and in 1603, after James's accession, he was named as an accomplice in the "Bye Plot." Catesby was a man of great beauty of person, "above 2 yards high," says Father Gerard, "and though slender, yet as well-proportioned to his height as any man one should see." He possessed a clear head and unflinching courage, and with a strong determination and fascinating manner mastered the minds of his associates and overpowered all opposition. He was, however, headstrong, wilful and imprudent, fit for action, but incapable of due deliberation, and entirely wanting in foresight. Exasperated by his personal misfortunes and at the repressive measures under which his co-religionists were suffering, and blinded by a religious zeal which amounted to fanaticism, he was now to be the chief instigator of the famous Gunpowder Plot, which must in any event have brought disaster upon the Roman Catholic cause. The idea of some great stroke seems to have first entered his mind in May 1603. About the middle of January 1604 he imparted his scheme of blowing up the Parliament House to his cousin Thomas Winter, subsequently taking in Guy Fawkes and several other conspirators and overcoming all fears and scruples. But it was his determination, from which he would not be shaken, not to allow warning to be given to the Roman Catholic peers that was the actual cause of the failure of the plot. A fatal mistake had been made in imparting the secret to Francis Tresham (q.v.), in order to secure his financial assistance; and there is scarcely any doubt that he was the author of the celebrated letter to his brother-in-law, Lord Monteagle, which betrayed the conspiracy to the government, on the 26th of October. On receiving the news of the letter on the 28th, Catesby exhibited extraordinary coolness and fortitude, and refused to abandon the attempt, hoping that the government might despise the warning and still neglect precautions; and his confidence was strengthened by Fawkes's report that nothing in the cellar had been touched or tampered with. On the 2nd of November his resolution was shaken by Tresham's renewed entreaties that he would flee, and his positive assurance that Salisbury knew everything. On the evening of the 3rd, however, he was again, through Percy's insistence, persuaded to stand firm and hazard the great stroke. The rest of the story is told in the article GUNPOWDER PLOT. Here it need only be said that Catesby, after the discovery of the conspiracy, fled with his fellow-plotters, taking refuge ultimately at Holbeche in Staffordshire, where on the night of the 8th of November he was overtaken and killed. He had married Catherine, daughter of Thomas Leigh of Stoneleigh, Warwickshire, and left one son, Robert, who inherited that part of the family estate which had been settled on Catesby's mother and was untouched by the attainer, and who is said to have married a daughter of Thomas Percy.

**CAT-FISH**, the name usually applied to the fishes of the family *Siluridae*, in allusion to the long barbels or feelers about the mouth, which have been compared to the whiskers of a cat. The *Siluridae* are a large and varied group, mostly inhabitants of fresh waters; some of them by their singular form and armature are suggestive of the Devonian mailed fishes, and were placed at one time in their vicinity by L. Agassiz. Even such authorities as T. H. Huxley and E. D. Cope were inclined to ascribe ganoid affinities to the *Siluridae*; but this view has gradually lost ground, and most modern ichthyologists, if not all, have adopted the conclusions of M. Sagemehl, who has placed the *Siluridae* near the carps and Characins in the group Ostariophysii. The Silurids and Cyprinids may be regarded as two parallel series derived from some common stock which cannot have been very different from the existing Characins. In spite of the archaic appearance of some of its members, the family *Siluridae* does not appear to extend far back in time, its oldest known representative being the *Buchlandium diluvii* of the Lower Eocene (London Clay) of Sheppey. A great number of forms were placed by Cuvier and his successors in the family *Siluridae*, which has since been broken up by T. Gill and other American authors into several families, united under the name of Nemato-gnathi. A middle course appears the more reasonable to the

present writer, who has divided the *Siluridae* of Cuvier into three families, with the following definitions:—

*Siluridae*—ribs attached to strong parapophyses; operculum well developed.

*Loricariidae*—ribs sessile; parapophyses absent; operculum more or less developed.

*Aspredinidae*—ribs sessile; strong parapophyses; operculum absent.

These three families may be defined among the Ostariophysi by having the parietal bones fused with the supraoccipital, no symplectic, the body naked or with bony scutes, the mouth usually toothed, with barbels, and usually an adipose dorsal fin.

The *Siluridae* embrace more than one thousand species, spread over the fresh waters of all parts of the world, but mostly from between the tropics. They are absent from western Europe and north-west Africa, and from North America west of the Rocky Mountains, but this deficiency has been made good by now, the introduction of *Amiurus nebulosus* and allied species in various parts of continental Europe and California having proved a success. Only a few forms are marine (*Plotosus*, *Arius*, *Galeichthys*).

The species which has given the name to the whole family is the "Wels" of the Germans, *Silurus glanis*, the largest European fresh-water fish, inhabiting the greater part of Europe from the Rhine eastwards and north of the Alps. Its head is large and broad, its mouth wide, furnished with six barbels, of which those

FIG. 1.—The "Wels" (*Silurus glanis*).

of the upper jaw are very long. Both jaws and the palate are armed with broad bands of small closely-set teeth, which give the bones a rasp-like appearance. The eyes are exceedingly small. The short body terminates in a long, compressed, muscular tail, and the whole fish is covered with a smooth, scaleless, slippery skin. Specimens of 4 and 5 ft. in length, and of 50 to 80 lb in weight, are of common occurrence, and the fish grows to 10 ft., with a weight of 400 lb, in the Danube. Its food consists chiefly of other bottom-feeding fishes, and in inland countries it is considered one of the better class of food fishes. Stories about children having been found in the stomach of very large individuals are probably inventions. An allied species (*S. aristotelis*) is found in Greece.

The *Clarias* and *Heterobranchius* of Africa and south-eastern Asia have an elongate, more or less eel-shaped body, with long dorsal and anal fins, and are known to be able to live a long time out of water, being provided with an accessory dendritic breathing organ situated above the gills. Some species live in burrows during the dry season, crawling about at night in search of food. The common Nile species, the "Harmoot" (*Clarias lasera*), occurs abundantly in the Lake of Galilee and was included in, if not chiefly aimed at, by the Mosaic law which forbade the Jews to eat scaleless fishes, a prohibition which has been extended to eels in spite of the obvious presence of minute scales in the latter.

The *Saccobranchius* of India and Ceylon, a genus more nearly related to *Silurus*, have also an accessory organ for breathing atmospheric air. It consists of a long sac behind the gill-cavity, extending far back on each side of the body under the muscles.

In the majority of the *Siluridae*, called by A. Günther the *Proteropterae*, a section extremely numerous in species, and represented throughout the tropics, the dorsal fin consists of a

short-rayed and an adipose portion, the former belonging to the abdominal vertebral column; the anal is always much shorter than the tail. The gill-membranes are not confluent with the skin of the isthmus; they have a free posterior margin. When a nasal barbel is present, it belongs to the posterior nostril. This section includes among many others the genus *Bogrus*, of which the bayad (*B. bayad*) and docmac (*B. docmac*) frequently come under the notice of travellers on the Nile; they grow to a length of 5 ft. and are eaten.

Of the "cat-fishes" of North America (*Amiurus*), locally called "bull-heads" or "horned-pouts," with eight barbels, some twenty species are known. Some of them are valued as food, especially one which is abundant in the ponds of New England, and capable of easy introduction into other localities (*A. nebulosus*). Others which inhabit the great lakes (*A. nigriconis*) and the Mississippi (*A. ponderosus*) often exceed the weight of 100 lb. *Platylooma* and *Pimelodus* people the rivers and lakes of tropical America, and many of them are conspicuous in this fauna by the ornamentation of their body, by long spatulate snouts, and by their great size.

The genus *Arius* is composed of a great number of species and has the widest distribution of all Silurids, being represented in almost all tropical countries which are drained by large rivers. Most of the species live in salt water. They possess six barbels, and their head is extensively ossaceous on its upper surface; their dorsal and pectoral spines are generally developed into powerful weapons. *Bogarius*, one of the largest Silurids of the rivers of India and Java, exceeding a length of 6 ft., differs from *Arius* in having eight barbels and the head covered with skin.

R. Semon has made observations in Queensland on the habits of *Arius australis*, which builds nests in the sandy bed of the Burnett river. These nests consist of circular basin-like excavations about 20 in. in diameter, at the bottom of which the eggs are laid and covered over by several layers of large stones. In the marine and estuarine species of *Arius*, *Galeichthys* and *Osteogobius*, the male, more rarely the female, carries the eggs in the mouth and pharynx; these eggs, few in number, are remarkably large, measuring as much as 17 or 18 millimetres in diameter in *Arius commersonii*, a fish 3 or 4 ft. in length.

The common North American *Amiurus nebulosus* also takes care of its eggs, which are deposited beneath protecting objects at the bottom of the water, failing which both parents join in excavating a sort of nest in the mud. The male watches over the eggs, and later leads the young in great schools near the shore, seemingly caring for them as the hen for her chickens.

In the *Siluridae Stenobranchiae* of Günther the dorsal fin consists of an adipose portion and a short-rayed fin which belongs to the abdominal vertebral column, and, like the adipose fin, may be sometimes absent. The gill-membranes are confluent with the skin of the isthmus. The Silurids belonging to this section are either South American or African. Among the former we notice specially the genus *Doras*, which is distinguished by having a series of bony scutes along the middle of the side. The narrow-

FIG. 2.—*Syndontis ziphias*.

ness of their gill-openings appears to have developed in them a habit which has excited the attention of all naturalists who have visited the countries bordering upon the Atlantic rivers of tropical America, viz. the habit of travelling during seasons of drought from a piece of water about to dry up to ponds of greater capacity. These journeys are occasionally of such a length that the fish have to travel all night; they are so numerous

that the Indians fill many baskets of them. J. Hancock supposes that the fish carry a small supply of water with them in their gill-cavity, which they can easily retain by closing their branchial apertures. The same naturalist adds that they make regular nests, in which they cover up their eggs with care and defend them—male and female uniting in this parental duty until the eggs are hatched. *Synodontis* is an African genus and common in the Nile, where the various species are known by the name of "Shal." They frequently occur among the representations of animals left by the ancient Egyptians. The upper part of their

FIG. 3.—*Malopterus electricus*.

head is protected by strong osseous scutes, and both the dorsal and pectoral fins are armed with powerful spines. Their mouth is small, surrounded by six barbels, which are more or less fringed with a membrane or with branched tentacles.

The curious fact of some species of *Synodontis* having the lower parts darker than the upper, some being whitish above and blackish beneath, appears to be connected with their habit of swimming in a reversed position, the belly turned upwards. This habit, known to the ancient Egyptians, who have frequently represented them in that attitude, has been described by E. Geoffroy, who says they nearly constantly swim on their back, moving quite freely forwards and sideways; but if alarmed, they revert to the normal position to escape more rapidly.

The electric cat- or sheath-fishes (*Malopterus*) have been referred to the same section. Externally they are at once recognized by the absence of a rayed dorsal fin, of which only a rudiment remains as a small interneural spine concealed below the skin. The entire fish is covered with soft, villous skin, an osseous defensive armour having become unnecessary in consequence of the development of a powerful electric apparatus, the strength of which, however, is exceeded by that of the electric eel and the large species of *Torpedo*.

The electric organ of *Malopterus* differs essentially from that of other fishes provided with such batteries, being part of the tegumentary system instead of being derived from the muscles. It consists of rhomboidal cells of a fine gelatinous substance immediately under the skin. It is put into action by a single ganglionic cell at the anterior extremity of the spinal cord. Contrary to what takes place in other electric fishes, the current proceeds from the head to the tail.

The electric cat-fish, which grows to a length of 3 ft. in the Congo, has a wide distribution in Africa, extending from the Nile to the Zambezi and from the Senegal to the Congo. It was well known to the ancient Egyptians, who have depicted it in their mural paintings and elsewhere, and an account of its electric properties was given by an Arab physician of the 12th century; then as now the fish was known under the suggestive name of *Raad* or *Raash*, which means "thunder."

Günther's *Siluridae Branchiocolae* comprise the smallest and least developed members of the family; they are referred to two genera only from South America, *Stegophilus* and *Vandellia*, the smallest of which does not exceed the length of 2 in. Their body is soft, narrow, cylindrical and elongate; the dorsal and anal fins short; the vent far behind the middle of the length of the body; gill-membranes confluent with the skin of the isthmus. Each maxillary is provided with a small barbel; and the gill-covers are armed with short stiff spines. Their small size notwithstanding, these Silurids are well known to the Brazilians, who

accuse them of entering and ascending the urethra of persons while bathing, causing inflammation and sometimes death. Some certainly live parasitically in the gill-cavity of large Silurids, and F. Silvestri has observed *Stegophilus insidiosus* to suck the blood in the gills of *Platystoma coruscans*, a Silurid growing to a length of 6 ft.

The mailed cat-fish of the South American genus *Callichthys*

FIG. 4.—*Callichthys armatus*, from the upper Amazons. (Natural size.)

builds regular nests of grass on leaves, sometimes placed in a hole scooped out in the bank, in which they cover their eggs and defend them, male and female sharing in this parental duty. In the allied *Corydoras* a lengthy courtship takes place, followed by an embrace, during which the female receives the seminal fluid in a sort of pouch formed by the folded membranes of her ventral fins, immediately after, five or six eggs are produced and received in the pouch, to be afterwards carefully placed in a secluded spot. This operation is repeated many times, until the total number of eggs, about 250, have been deposited. In accordance with these pairing habits, the pectoral spines of the male, which are used in amplexation, are larger and stronger than those of the female. These fish are monogamous, and both parents remain by the side of the nest, furiously attacking any assailant.

The allied family *Loricariidae*

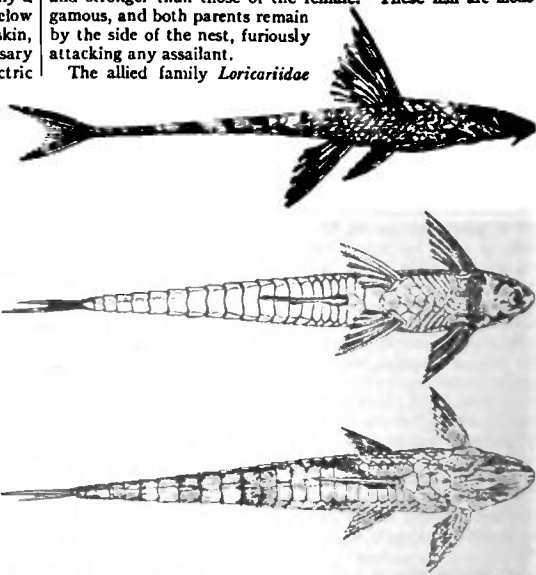

FIG. 5.—*Loricaria lanceolata*, from the upper Amazons. (Natural size.)

is entirely confined to the fresh waters of Central and South America. C. T. Regan, who has recently published an elaborate monograph of them, recognizes 189 species, referred to 17 genera. Many of them are completely mailed; but all have in common a short-rayed dorsal fin, with the

ventrals below or rarely in front of it. Their gill-openings are reduced to a short slit. The first group of this section comprises alpine forms of the Andes, without any armature, and with a very broad and pendent lower lip. They have been referred to several genera (*Stylogenes*, *Arges*, *Brontes*, *Astroblepus*), but are collectively called "prefañillas" by the natives, who state that they live in subterranean craters within the bowels of the volcanoes of the Andes, and are ejected with streams of mud and water during eruptions. These fishes may, however, be found in surface waters at all times, and their appearance in great quantities in the low country during volcanic

FIG. 6.—Abdomen of *Aspredo batrachus*, with the ova attached; at a the ova are removed, to show the spongy structure of the skin, and the processes filling the interspaces between the ova. (Natural size.)

eruptions can be accounted for by numbers being killed by the sulphuretted gases which escape during an eruption and by their being swept down with the torrents of water issuing from the volcano. The lowland forms have their body encased in large scutes, either rough, scale-like, and arranged in four or five series (*Chaetostomus*), or polished, forming broad rings round the slender and depressed tail (*Loricaria*, fig. 5). They are mostly of small size.

In certain of the mailed genera the secondary sexual differences may be very pronounced, and have given rise to many nominal species. The shape of the snout may differ according to the sex, and its margin may be beset with tentacles in the male, whilst it frequently happens that the head of the latter is margined with spines or bristles which are either absent or considerably shorter in the female.

The *Aspredinidae*, which are also closely related to the *Siluridae*, are

represented by four genera and eighteen species from South America. *Aspredo batrachus* (fig. 6), of the Guianas, the largest form, reaching to about a foot in length, deserves notice from the manner in which the female carries her eggs attached to the belly and paired fins, in a single layer, each egg being connected with the skin by a cup-shaped pedunculate base supplied with blood-vessels and coated with a layer of epithelium, the formation of which is still unexplained. (C. A. B.)

**CATGUT**, the name applied to cord of great toughness and tenacity prepared from the intestines of sheep, or occasionally from those of the horse, mule and ass. Those of the cat are not employed, and therefore it is supposed that the word is properly *kitgul*, *kit* meaning "fiddle," and that the present form has arisen through confusion with *kit*=cat. The substance is used for the strings of harps and violins, as well as other stringed musical instruments, for hanging the weights of clocks, for bow-strings, and for suturing wounds in surgery. To prepare it the intestines are cleaned, freed from fat, and steeped for some time in water, after which their external membrane is scraped off with a blunt knife. They are then steeped for some time in an alkaline ley, smoothed and equalized by drawing out, subjected to the antiseptic action of the fumes of burning sulphur, if necessary dyed, sorted into sizes, and twisted together into cords of various numbers of strands according to their uses. The best strings for musical instruments are imported from Italy ("Roman strings"); and it is found that lean and ill-fed animals yield the toughest gut.

**CATHA**, the *khat* of the Arabs, a shrub widely distributed and much cultivated in Arabia and tropical Africa from Abyssinia to the Cape. The dried leaves are used for the preparation of a kind of tea and also as tobacco. The plant is a member of the natural order *Celastraceae*, a family of shrubs and trees found in temperate and tropical climates and represented in Britain by the spindle-tree (*Euonymus europaeus*).

**CATHARS** (**CATHARI** or **CATHARISTS**), a widespread heretical sect of the middle ages. They were the débris of an early Christianity, scattered in the 10th to 14th centuries over East and West, having their analogues in the Mahomedan world as well. In the East they were called Bogomils (*g.v.*) and Paulicians; in the West, Patarenes, Tixerands (*i.e.* Weavers), Bulgars, Concorrcii, Albanenses, Albigeois, &c.; in both, Cathars and Manicheans. This article relates to the Western Cathars, as they appear (1) in the Cathar Ritual written in Provençal and preserved in a 13th-century MS. in Lyons, published by Clédat, Paris, 1888; (2) in Bernard Gui's *Practica inquisitionis haereticae pravitatis*, edited by Canon C. Douais, Paris, 1886; and (3) in the *procès verbal* of the inquisitors' reports. Some were downright dualists, and believed that there are two gods or principles, one of good and the other of evil, both eternal; but as a rule they subordinated the evil to the good. All were universalists in so far as they believed in the ultimate salvation of all men.<sup>1</sup>

Their tenets were as follows.—The evil god, Satan, who inspired the malevolent parts of the Old Testament, is god and lord of this world, of the things that are seen and are temporal, and especially of the outward man which is decaying, of the earthen vessel, of the body of death, of the flesh which takes us captive under the law of sin and desire. This world is the only true purgatory and hell, being the antithesis of the world eternal, of the inward man renewed day by day, of Christ's peace and kingdom which are not of this world. Men are the result of a primal war in heaven, when hosts of angels incited by Satan or Lucifer to revolt were driven out, and were imprisoned in terrestrial bodies created for them by the adversary. But there are also celestial bodies, bodies spiritual and not natural. These the angel souls left behind in heaven, and they are buildings from God, houses not made with hands, tunics eternal.

<sup>1</sup> A certain Peter (*Doc. Doct.*, 22, p. 98) declared that could he but get hold of the false and perfidious God of the Catholics who created a thousand men in order to save a single one and damn all the rest, he would break him to pieces and tear him asunder with his nails and spit in his face.

Imprisoned in the garment of flesh, burdened with its sin, souls long to be clothed upon with the habitations they left in heaven. So long as they are at home in the body, they are absent from the Lord. They would fain be at home with the Lord, and absent from the body, for which there is no place in heaven since flesh and blood cannot inherit the kingdom of God, nor corruption inherit incorruption. There is no resurrection of the flesh. The true resurrection is the spiritual baptism bequeathed by Christ to the *boni homines*. How shall man escape from his prison-house of flesh, and undo the effects of his fall? For mere death brings no liberation, unless a man is become a new creation, a new Adam, as Christ was; unless he has received the gift of the spirit and become a vehicle of the Paraclete. If a man dies unreconciled to God through Christ, he must pass through another cycle of imprisonment in flesh; perhaps in a human, but with equal likelihood in an animal's body. For when after death the powers of the air throng around and persecute, the soul flees into the first lodging of clay that it finds.<sup>1</sup> Christ was a life-giving spirit, and the *boni homines*, that "good men," as the Cathars called themselves, are his ambassadors. They alone have kept the spiritual baptism with fire which Christ instituted, and which has no connexion with the water baptism of John; for the latter was an unregenerate soul, who failed to recognize the Christ, a Jew whose mode of baptism with water belongs to the fleeting outward world and is opposed to the kingdom of God. It would be interesting to trace Bardesanes and the Syriac Hymn of the Soul in all this.

The Cathars fell into two classes, corresponding to the Baptized and the Catechumens of the early church, namely, the Perfect, who had been "consoled," *i. e.* had received the gift of the Paraclete; and the *credentes* or Believers. The Perfect formed the ordained priesthood, were women no less than men, and controlled the church; they received from the Believers unquestioning obedience, and as vessels of election in whom the Holy Spirit already dwelt, they were adored by the faithful, who were taught to prostrate themselves before them whenever they asked for their prayers. For none but the Consoled had received into their hearts the spirit of God's Son, which cries "Abba, Father." They alone were become adopted sons, and so able to use the Lord's Prayer, which begins, "Our Father, which art in heaven." The Perfect alone knew God and could address him in this prayer, the only one they used in their ceremonies. The mere *credens* could at best invoke the living saint, and ask him to pray for him.

All adherents of the sect seem to have kept three Lents in the year, as also to have fasted Mondays, Wednesdays and Fridays of each week; in these fasts a diet of bread and water was usual. But a *credens* under probation for initiation, which lasted at least one and often several years, fasted always. The life of a Perfect was so hard, and, thanks to the inquisitors, so fraught with danger, that most Believers deferred the rite until the death-bed, as in the early centuries many believers deferred baptism. The rule imposed complete chastity. A husband at initiation left his wife, committing her "to God and the gospel"; a wife her husband. A male Perfect could not lay his hand on a woman without incurring penance of a three-days' fast. All begetting of children is evil, for Adam's chambering with Eve was the forbidden fruit. It is good for a man not to touch a woman; a man's relations with his own wife are merely a means of fornication, and marriage and concubinage are indistinguishable as against the kingdom of God, in which there is no marrying or giving in marriage. Those only have been redeemed from earth who were virgins, undefiled with women. The passages of the New Testament which seem to connive at the married relation were interpreted by the Cathars as spoken in regard of Christ and the church. The Perfect must also leave his father and mother, and his children, for a man's foes are they of his own household. The family must be sacri-

ficed to the divine kinship. He that loveth father or mother more than Christ is not worthy of him, nor he that loveth more his son or daughter. The Perfect takes up his cross and follows after Christ.

Next he must abstain from all flesh diet except fish. He may not even eat cheese or eggs or milk, for they, like meat, are produced *per viam generationis seu coitus*. Everything that is sexually begotten is impure. Fish were supposed to be born in the water without sexual connexion, and on the basis of this old physiological fallacy the Cathars equally with the Catholic framed their rule of fasting. And there was yet another reason why the Perfect should not eat animals, for a human soul might be doing time in its body. Nor might a Perfect or one in course of probation kill anything, for the Mosaic commandment applies to all life. He might not lie nor take an oath, for the precept "Swear not at all" was, like the rest of the gospel, taken seriously. This was the chief of their "anarchist doctrines."<sup>2</sup>

The Cathar rites, which remain to us in a manual of the sect, "recall," says the Abbé Guiraud, no too favourable a witness, "those of the primitive church with a truth and precision the more striking the nearer we go back to the apostolic age." The medieval inquisitor saw in them an aping of the rites of the Catholic church as he knew them; but they were really, says the same authority, "archaeological vestiges (*i. e.* survivals) of the primitive Christian liturgy. In the bosom of medieval society they were the last witness to a state of things that the regular development of Catholic cult had amplified and modified. They resemble the erratic blocks which lost amid alien soils recall, where we find them, the geological conditions of earlier ages. This being so, it is of the deepest interest to study the Cathar cult, since through its rites we can get a glimpse of those of the primitive church, about which want of documents leaves us too often in the dark."

The central Cathar rite was *consolamentum*, or baptism with spirit and fire. The spirit received was the Paraclete derived from God and sent by Christ, who said, "The Father is greater than I." Of a consubstantial Trinity the Cathars naturally had never heard. Infant baptism they rejected because it was unscriptural, and because all baptism with water was an appanage of the Jewish demiurge Jehovah, and as such expressly rejected by Christ.

The *consolamentum* removes original sin, undoes the sad effects of the primal fall, clothes upon us our habitation which is from heaven, restores to us the lost tunic of immortality. A Consoled is an angel walking in the flesh, whom the thin screen of death alone separates from Christ and the beatific vision. The rite was appointed by Christ, and has been handed down from generation to generation by the *boni homines*.

The long probation called "abstinence" which led up to it is a survival of the primitive catechumenate with its scrutinies. The prostrations of the *credens* before the Perfect were in their manner and import identical with the prostrations of the catechumen before the exorcist. We find the same custom in the Celtic church of St Columba. Just as at the third scrutiny the early catechumen passed a last examination in the Gospels, Creed and Lord's Prayer, so after their year of abstinence the *credens* receives creed and prayer; the allocation with which the elder "handed on" this prayer is preserved, and of it the Abbé Guiraud remarks that, if it were not in a Cathar ritual, one might believe it to be of Catholic origin. It is so Christian in tone, he quaintly remarks elsewhere, that an inquisitor might have used it quite as well as a heretic. In it the Perfect addresses the postulant, as in the corresponding Armenian rite, by the name of Peter; and explains to him from Scripture the indwelling of the spirit in the Perfect, and his adoption as a son by God. The Lord's Prayer is then repeated by the postulant after the elder, who explains it clause by clause; the words *passi*

<sup>1</sup> Here we have a doctrine of metempsychosis which seems of Indian origin (see ASCETICISM). But Julius Caesar (*de B.G.* vi. 13) attests this belief among the ancient Druids of Gaul.

<sup>2</sup> The Abbé Guiraud remarks that in refusing to take oaths the Cathars "contraried the social principles on which the constitutions of all states repose," and congratulates himself that society is not yet so thoroughly "laicized" as to have given up oaths in the most important acts of social life.

*supersticialis* being interpreted not of the material but of the spiritual bread, which consists of the Words of Life.

There followed the Renunciation, primitive enough in form, but the postulant solemnly renounced, not Satan and his works and pomp, but the harlot church of the persecutors, whose prayers were more deadly than desirable. He renounced the cross which its priests had signed on him with their chrism, their sham baptisms and other magical rites. Next followed the spiritual baptism itself, consisting of imposition of hands, and holding of the Gospel on the postulant's head. The elder begins a fresh allocution by citing Matt. xxviii. 19, Mark xvi. 15, 16, John iii. 3 (where the Cathars' text most originally have omitted in v. 5 the words "of water and," since their presence contradicts their argument). Acts ix. 17, 18, viii. 14-17, are then cited; also John xx. 21-23, Matt. xvi. 18, 19, Matt. xviii. 18-20, for the Perfect one receives in this rite power to bind and loose. The Perfect's vocation is then defined: he must not commit adultery nor homicide, nor lie, nor swear any oath, nor pick and steal, nor do unto another that which he would not have done unto himself. He shall pardon his wrongdoers, love his enemies, pray for them that calumniate and accuse him, offer the other cheek to the smiter, give up his mantle to him that takes his tunic, neither judge nor condemn. Asked if he will fulfil each of these, the postulant answers: "I have this will and determination. Pray God for me that he give me his strength."

The next episode of the rite exactly reproduces the Roman *confiteor* as it stood in the 2nd century; "the postulant says: '*Parcite nobis*. For all the sins I have committed, in word or thought or deed, I come for pardon to God and to the church and to you all.' And the Christians shall say: 'By God and by us and by the church may they be pardoned thee, and we pray God that he pardon you them.'"

There follows the act of "consoling." The elder takes the Gospel off the white cloth, where it has lain all through the ceremony, and places it on the postulant's head, and the other good men present place their right hands on his head; they shall say the *parcias* (spare), and thrice the "Let us adore the Father and Son and Holy Spirit," and then pray thus: "Holy Father, welcome thy servant in thy justice and send upon him thy grace and thy boly spirit." Then they repeat the "Let us adore," the Lord's Prayer, and read the Gospel (John i. 1-17).

This was the vital part of the whole rite. The *credens* is now a Perfect one. He is girt with the sacred thread round his naked body under the breasts. Where the fear of the persecutor was absent he was also clad in a black gown. The Perfect ones present give him the kiss of peace, and the rite is over. This part of the rite answers partly to the Catholic confirmation of a baptized person, partly to the ordination of a pope of Rome or Alexandria. The latter in being ordained had the Gospel laid on their heads, and the same feature occurs in old Gallican and Coptic rites of ordaining a bishop.

Thus the Cathar ritual, like that of the Armenian dissenters (see PAULICIANS), reflects an age when priestly ordination was not yet differentiated from confirmation. "Is it not curious," says the Abbé Guiraud, "to remark that the essential rite of the *consolamentum* is in effect nothing but the most ancient form of Christian ordination?"

The Cathar Eucharist was equally primitive, and is thus described by a contemporary writer in a 13th-century MS. of the Milan Library:—"The Benediction of bread is thus performed by the Cathars. They all, men and women, go up to a table, and standing up say the 'Our Father.'<sup>1</sup> And he who is prior among them, at the close of the Lord's Prayer, shall take bold of the bread and say: 'Thanks be to the God of our Jesus Christ. May the Spirit be with us all.' And after that he breaks and distributes to all. And such bread is called bread blessed, although no one believes that out of it is made the body of Christ.

<sup>1</sup> Cf. S. Gregorij *Ep. ix. 12* (26): "Mos apostolorum fuit ut ad ipsum solommodo orationem oblationis hostiam consecrarent." ("The custom of the apostles was to use no other prayer but the Lord's in consecrating the host of the offering.")

The Albanenses, however, deny that it can be blessed or sanctified, because it is corporeal" (i.e. material).

As Tertullian relates of his contemporaries in the 2nd century, so the Cathars would reserve part of their bread of blessing and keep it for years, eating of it occasionally though only after saying the *Benedicite*. The Perfect kept it wrapped up in a bag of pure white cloth, tied round the neck,<sup>2</sup> and sent it long distances to regions which through persecution they could not enter. On the death-bed it could even, like the Catholic *Visaticum*, take the place of the rite of *Consolamentum*, if this could not be performed. Once a month this solemn rite of breaking bread was held, the *credentes* assisting. The service was called *apparellamentum*, because a table was covered with a white cloth and the Gospel laid on it. The Perfect were adored, and the kiss of peace was passed round.

The influence of Catharism on the Catholic church was enormous. To counteract its celibacy was finally imposed on the clergy, and the great mendicant orders evolved; while the constant polemic of the Cathar teachers against the cruelty, rapacity and irascibility of the Jewish tribal god led the church to prohibit the circulation of the Old Testament among laymen. The sacrament of "extreme unction" was also evolved by way of competing with the death-bed *consolamentum*.

CATHAY, the name by which China (*q.v.*) was known to medieval Europe and is still occasionally referred to in poetry, as in Tennyson's "Better fifty years of Europe than a cycle of Cathay." It is derived from Khitai, or Khitat, the name which was properly that of the kingdom established by the Khitán conquerors in the northern provinces of China about A.D. 907, which after the fall of this dynasty in 1125 remained attached to their former territory, and was subsequently applied by the nations of Central Asia to the whole of China. Thus "Kitai" is still the Russian name for China. The name penetrated to Europe in the 13th century with the fame of the conquests of Jenghiz Khan. After the discovery of southern China by European navigators Cathay was erroneously believed to be a country to the north of China, and it was the desire to reach it that sent the English adventurers of the 16th century in search of the north-east passage.

CATHCART, SIR GEORGE (1794-1854), English soldier, third son of the 1st Earl Cathcart, was born in London on the 12th of May 1794. He was educated at Eton and Edinburgh University. In 1810 he entered the army, and two years later accompanied his father to Russia as aide-de-camp. With him he joined the Russian headquarters in March 1813; and he was present at all the great battles of that year in Germany, and of the following year in France, and also at the taking of Paris. The fruits of his careful observation and critical study of these operations appeared in the *Commentaries* on the war in Russia and Germany 1812-1813, a plain soldier-like history, which he published in 1850. After the peace of 1814 he accompanied his father to the congress of Vienna. He was present at Quatre Bras and at Waterloo, as an aide-de-camp to the duke of Wellington, and remained on the staff till the army of occupation quitted France.

<sup>1</sup> Cf. Duchesne, *Origines*, ed. 1898, p. 177.

Reappointed almost immediately, he accompanied the duke to the congresses of Aix-la-Chapelle and Verona, and in 1826 to Prussia. Promoted lieutenant-colonel in 1826, he was placed on half-pay in 1834. He was recalled to active service in 1838, and sent as commander of the King's Dragoon Guards to Canada, where he played an important part in suppressing the rebellion and pacifying the country. In 1844 he returned to England, and two years later was appointed deputy-lieutenant of the Tower, a post which he held up to the time of his promotion to major-general in 1851. In March 1852 he succeeded Sir Harry Smith as governor and commander-in-chief at the Cape, and brought the Kaffir war, then in progress, to a successful conclusion. He promulgated the first constitution of Cape Colony, and conducted operations against the Basuto. Cathcart was made a K.C.B. and received the thanks of both Houses for his services (1853). In December 1853 he was made adjutant-general of the army, but never entered upon his duties, being sent out to the Crimean War as soon as he arrived in England. He was even given a dormant commission entitling him to the chief command in case of accident to Lord Raglan, and the highest hopes were fixed on him as a scientific and experienced soldier. But these hopes were not to be fulfilled; for he fell at the battle of Inkerman (November 5, 1854). His remains, with those of other officers, were buried on Cathcart's Hill. Sir George Cathcart married in 1824 Lady Georgiana Greville, who survived him, and by whom he had a family.

**CATHCART, WILLIAM SCHAW CATHCART, 1ST EARL** (1755-1843), English soldier and diplomatist, was born at Peterham on the 17th of September 1755, and educated at Eton. In 1771 he went to St Petersburg, where his father, Charles, 9th Baron Cathcart (1721-1776), a general in the army, was ambassador. From 1773 to 1777 he studied law, but after succeeding to the barony in 1776 he obtained a commission in the cavalry. Proceeding to America in 1777, he had before the close of his first campaign twice won promotion on the field of battle. In 1778 he further distinguished himself in outpost work, and at the battle of Monmouth he commanded an irregular corps, the "British Legion," with conspicuous success; for a time also he acted as quartermaster-general to the forces in America. He returned home in 1780, and in February 1781 was made captain and lieutenant-colonel in the Coldstream Guards. He was elected a representative peer for Scotland in 1788, and in 1792 he became colonel of the 20th foot. He served with distinction in the campaigns in the Low Countries, 1793-1795, in the course of which he was promoted major-general; and in 1801 he was made a lieutenant-general, having in the meanwhile received the appointments of vice-admiral of Scotland (1795), privy councillor (1798), and colonel of the 2nd Life Guards (1797). From 1803 to 1805 Lord Cathcart was commander-in-chief in Ireland, and in the latter year he was sent by Pitt in command of the British expedition to Hanover (see NAPOLEONIC CAMPAIGNS). After the recall of this expedition Cathcart commanded the forces in Scotland until 1807, when he was placed in charge of the expedition to Copenhagen, which surrendered to him on the 6th of September. Four weeks later he was created Viscount Cathcart of Cathcart and Baron Greenock of Greenock in the peerage of the United Kingdom, resuming the Scottish command on his return from the front. On the 1st of January 1812 he was promoted to the full rank of general, and a few months later he proceeded to Russia as ambassador and military commissioner. In the latter capacity he served with the headquarters of the allies throughout the War of Liberation (1812-1814); his success in the delicate and difficult task of maintaining harmony and devotion to the common cause amongst the generals of many nationalities was recognized after the war by his elevation to the earldom (July 1814). He then went to St Petersburg, and continued to hold the post of ambassador until 1820, when he returned to England. He died at his estate near Glasgow on the 16th of June 1843.

His son, **CHARLES MURRAY CATHCART**, 2nd earl (1783-1899), succeeded to the title in 1843. He entered the 2nd Life Guards in 1800, and saw active service under Sir James Craig in the Mediterranean, 1805-1806. In 1807 he became by courtesy Lord Greenock. He took part in the Walcheren expedition of 1809 as a major, and as a lieutenant-colonel served at Barossa, Salamanca and Vittoria. He had already gained staff experience, and he now served under Graham in Holland, 1814, as quartermaster-general. He was present at Waterloo, and for his services received the C.B. and several foreign orders. During the peace he became deeply interested in scientific pursuits, and a new mineral discovered by him in 1841 was named Greenockite. His later military services included the chief command in Canada during a period of grave unrest (1846-1849). He retired from active service in 1859, becoming a full general just before his death. The title passed to his son and grandson as 3rd and 4th earls.

**CATHCART**, a parish situated partly in Renfrewshire and partly in Lanarkshire, Scotland. The Renfrewshire portion has the larger area (2387 acres), but the smaller population (7373), the area of the Lanarkshire portion being 745 acres and the population (1901) 20,983. The industries include paper-making, dyeing and sandstone quarrying, but limestone and coal have also been worked. The parish includes the town of Cathcart (pop. 4808), and the villages of Old and New Cathcart, but much of it, though outside the city boundaries, is practically contiguous with some of the southern suburbs of Glasgow, with which there is communication by electric tram and the Caledonian railway's circular line. The White Cart flows through the parish. In the 12th century Cathcart became a barony of the Cathcarts, who derived the title of their lordship (1460) and earldom (1814) from it. On the Queen's Knowe, a hillock near the ruins of Cathcart Castle, a memorial marks the spot where Queen Mary watched the progress of the battle of Langside (1568), the site of which lies within the parish.

**CATHEDRAL**, more correctly "cathedral church" (*ecclesia cathedralis*), the church which contains the official "seat" or throne of a bishop—*cathedra*, one of the Latin names for this, giving us the adjective "cathedral." The adjective has gradually, for brevity of speech, assumed the character of a substantive, but though an instance of this (strictly incorrect) use of the word as a substantive has been found as far back as 1587, it became common only at the end of the 18th, or first half of the 19th, century. One of the earliest instances of the term *ecclesia cathedralis* is said to occur in the acts of the council of Tarragona in 516. Another name for a cathedral church is *ecclesia mater*, indicating that it is the mother church. As being the one important church, it was also known as *ecclesia major*. This is the formal expression used by Archbishop Walter Gray of York (1216-1255), and it is preserved in modern times by the name of "*La Majewne*," by which the old cathedral church of Marseilles is popularly known. Again, as the chief house of God, the cathedral church was the *Domus Dei*, and from this name the German *Domkirche*, or *Dom*, is derived, as also the Swedish *Domkyrka*, and the Italian *Duomo*.

*History and Organisation.*—It was early decreed that the *cathedra* of a bishop was not to be placed in the church of a village, but only in that of a city. There was no difficulty as to this on the continent of Europe, where towns were numerous, and where the cities were the natural centres from which Christianity was diffused among the people who inhabited the surrounding districts. In the British islands, however, the case was different; towns were few, and owing to other causes, instead of exercising jurisdiction over definite areas or districts, many of the bishops were bishops of tribes or peoples, as the bishops of the south Saxons, the west Saxons, the Somersetas and others. The *cathedra* of such a bishop was often migratory, and was at times placed in one church, and then another, and sometimes in the church of a village. In 1075 a council was held in London, under the presidency of Archbishop Lanfranc, which, reciting the decrees of the council of Sardica held in 347 and that of Laodicea held in 360 on this matter, ordered the

bishop of the south Saxons to remove his see from Selsey to Chichester; the Wilts and Dorset bishop to remove his *cathedra* from Sherborne to Old Sarum, and the Mercian bishop, whose *cathedra* was then at Lichfield, to transfer it to Chester. Traces of the tribal and migratory system may still be noted in the designations of the Irish see of Meath (where the result has been that there is now no cathedral church) and Ossory, the cathedral church of which is at Kilkenny. Some of the Scottish sees were also migratory.

By the canon law the bishop is regarded as the pastor of the cathedral church, the *parochia* of which is his diocese. In view of this, canonists speak of the cathedral church as the one church of the diocese, and all others are deemed chapels in their relation to it.

Occasionally two churches jointly share the distinction of containing the bishop's *cathedra*. In such cases they are said to be con-cathedral in relation to each other. Instances of this occurred in England before the Reformation in the dioceses of Bath and Wells, and of Coventry and Lichfield. Hence the double titles of those dioceses. In Ireland an example occurs at Dublin, where Christ Church and St Patrick's are jointly the cathedral churches of that diocese. In France the bishop of Couserans (a see suppressed at the Revolution) had two con-cathedral churches at St Lizier, and the bishop of Sisteron (a see also suppressed) had a second throne in the church of Forcalquier which is still called "La Con-cathédrale." Other instances might be named. In the case of York the collegiate churches of Beverley, Ripon and Southwell were almost in the same position, but although the archbishop had a stall in each he had no diocesan *cathedra* in them, and the chapters were not united with that of the metropolitan church in the direct government of the diocese, or the election of the archbishop, nor had they those other rights which were held to denote the cathedral character of a church.

Cathedral churches are reckoned as of different degrees of dignity: (1) the simple cathedral church of a diocesan bishop, (2) the metropolitan church to which the other diocesan cathedral churches of a province are suffragan, (3) the primatial church under which are ranged metropolitan churches and their provinces, (4) patriarchal churches to which primatial, metropolitan, and simple cathedral churches alike owe allegiance. The title of "primate" was occasionally conferred on metropolitans of sees of great dignity or importance, such as Canterbury, York, Rouen, &c., whose cathedral churches remained simply metropolitan. Lyons, where the cathedral church is still known as "La Primatiale," and Lund in Sweden, may be cited as instances of churches which were really primatial. Lyons had the archbishops of Sens and Paris and their provincial dioceses subject to it till the Revolution, and Lund had the archbishop of Upsala and his province subject to it. As with the title of primate, so also that of "patriarch" has been conferred on sees such as Venice and Lisbon, the cathedral churches of which are patriarchal in name alone. The cathedral church of St John Lateran, the cathedral church of the pope as bishop of Rome and patriarch of the West, alone in western Europe possesses potentially a patriarchal character. Its formal designation is "*Patriarchalis Basilica, Sacrosancta Romana Cathedralis Ecclesia Lateranensis.*"

The removal of a bishop's *cathedra* from a church deprives that church of its cathedral dignity, although often the name clings in common speech, as for example at Antwerp, which was deprived of its bishop at the French Revolution.

The history of the body of clergy attached to the cathedral church is obscure, and as in each case local considerations affected its development, all that can be attempted is to give a general outline of the main features which were more or less common to all. Originally the bishop and cathedral clergy formed a kind of religious community, which, in no true sense a monastery, was nevertheless often called a *monasterium*. The word had not the restricted meaning which it afterwards acquired. Hence the apparent anomaly that churches like York and Lincoln, which never had any monks attached to them, have

inherited the name of minster or monastery. In these early communities the clergy often lived apart in their own dwellings, and were not infrequently married. In the 8th century, however, Chrodegang, bishop of Metz (743-766), compiled a code of rules for the clergy of the cathedral churches, which, though widely accepted in Germany and other parts of the continent, gained little acceptance in England. According to Chrodegang's rule the cathedral clergy were to live under a common roof, occupy a common dormitory and submit to the authority of a special officer. The rule of Chrodegang was, in fact, a modification of the Benedictine rule. Gisa, a native of Lorraine, who was bishop of Wells from 1061 to 1088, introduced it into England, and imposed its observance on the clergy of his cathedral church, but it was not followed for long there, or elsewhere in England.

During the two centuries, roughly bounded by the years 900 and 1100, the cathedral clergy became more definitely organized, and were also divided into two classes. One was that of a monastic establishment of some recognized order of monks, very often that of the Benedictines, while the other class was that of a college of clergy, living in the world, and bound by no vows, except those of their ordination, but governed by a code of statutes or canons. Hence the name of "canon" given to them. In this way arose the distinction between the monastic and secular cathedral churches. In England the monastic cathedral churches were Bath, Canterbury, Carlisle, Coventry, Durham, Ely, Norwich, Rochester, Winchester and Worcester, all of them Benedictine except Carlisle, which was a church of Augustinians. The secular churches were Chichester, Exeter, Hereford, Lichfield, Lincoln, St Paul's (London), Salisbury, Wells, York, and the four Welsh cathedral churches. In Ireland all were secular except Christ Church, Dublin (Augustinian), and Down (Benedictine), and none, even in their earliest days, were ever, it is believed, churches of recognized orders of monks, except the two named. In Scotland St Andrew's was Augustinian, Elgin (or Moray), Glasgow and Aberdeen were always secular, and ordered on the models of Lincoln and Salisbury. Brechin had a community of Culdees till 1372, when a secular chapter was constituted. The cathedral church of Galloway, at Whithorn, of English foundation, was a church of Praemonstratensians. In Germany, as in England, many of the cathedral churches were monastic. In Denmark all seem to have been Benedictine at first, except Børglum, which was Praemonstratensian till the Reformation. The others were changed to churches of secular canons. In Sweden, Upsala was originally Benedictine, but was secularized about 1250, and it was ordered that each of the cathedral churches of Sweden should have a chapter of at least fifteen secular canons. In France monastic chapters were very common, but nearly all the monastic cathedral churches there had been changed to churches of secular canons before the 17th century. One of the latest to be so changed was that of Seez, in Normandy, which was Augustinian till 1547, when Pope Paul III. dispensed the members from their vows, and constituted them a chapter of secular canons. The chapter of Seenez was monastic till 1647, and others perhaps even later, but the majority were secularized about the time of the Reformation.

In the case of monastic cathedral churches there were no dignitaries, the internal government was that of the order to which the chapter belonged, and all the members kept perpetual residence. The reverse of this was the case with the secular chapters; the dignities of provost, dean, precentor, chancellor, treasurer, &c., soon came into being, for the regulation and good order of the church and its services, while the non-residence of the canons, rather than their perpetual residence, became the rule, and led to their duties being performed by a body of "vicars," who officiated for them at the services of the church.

Ahoad, the earliest head of a secular church seems to have been the provost (*praepositus, Probst, &c.*), who was charged, not only with the internal regulation of the church, and oversight of the members of the chapter and control of the services, but was also the steward or seneschal of the lands and possessions of the church. The latter often mainly engaged his attention,

to the neglect of his domestic and ecclesiastical duties, and complaints were soon raised that the provost was too much mixed in worldly affairs, and was too frequently absent from his spiritual duties. This led, in many cases, to the institution of a new officer called the "dean," who had charge of that portion of the provost's duties which related to the internal discipline of the chapter and the services of the church. In some cases the office of provost was abolished, but in others it was continued, the provost, who was also occasionally archdeacon as well, remaining head of the chapter. This arrangement was most commonly followed in Germany. In England the provost was almost unknown. Bishop Gisa introduced a provost as head of the chapter of Wells, but the office was afterwards subordinated to the other dignities, and the provost became simply the steward of certain of the prebendal lands. The provost of the collegiate church of Beverley was the most notable instance of such an officer in England, but at Beverley he was an external officer with no authority in the government of the church, no stall in the choir and no vote in chapter. The provost of Eton, introduced by Henry VI., occupied a position most nearly approaching that of a foreign cathedral provost. In Germany and in Scandinavia, and in a few of the cathedral churches in the south of France, the provost was the ordinary head of the cathedral chapter, but the office was not common elsewhere. As regards France, of one hundred and thirty-six cathedral churches existing at the Revolution, thirty-eight only, and those either on the borders of Germany or in the extreme south, had a provost as the head of the chapter. In others the provost existed as a subordinate officer. There were two provosts at Autun, and Lyons and Chartres had four each, all as subordinate officers.

The normal constitution of the chapter of a secular cathedral church comprised four dignitaries (there might be more), in addition to the canons. The dean (*decanus*) seems to have derived his designation from the Benedictine dean who had ten monks under his charge. The dean, as already noted, came into existence to supply the place of the provost in the internal management of the church and chapter. In England the dean was the head of all the secular cathedral churches, and was originally elected by the chapter and confirmed in office by the bishop. He is president of the chapter, and in church has charge of the due performance of the services, taking specified portions of them by statute on the principal festivals. He sits in the chief stall in the choir, which is usually the first on the right hand on entering the choir at the west. Next to the dean (as a rule) is the precentor (*primicerius, cantor, &c.*), whose special duty is that of regulating the musical portion of the services. He presides in the dean's absence, and occupies the corresponding stall on the left side, although there are exceptions to this rule, where, as at St Paul's, the archdeacon of the cathedral city ranks second and occupies what is usually the precentor's stall. The third dignitary is the chancellor (*scholasticus, eodite, capiscol, magistral, &c.*), who must not be confounded with the chancellor of the diocese. The chancellor of the cathedral church is charged with the oversight of its schools, ought to read divinity lectures, and superintend the lectures in the choir and correct slovenly readers. He is often the secretary and librarian of the chapter. In the absence of the dean and precentor he is president of the chapter. The easternmost stall, on the dean's side of the choir, is usually assigned to him. The fourth dignitary is the treasurer (*custos, sacrista, chefcier*). He is guardian of the fabric, and of all the furniture and ornaments of the church, and his duty was to provide bread and wine for the eucharist, and candles and incense, and he regulated such matters as the ringing of the bells. The treasurer's stall is opposite to that of the chancellor. These four dignitaries, occupying the four corner stalls in the choir, are called in many of the statutes the "*quatuor majores personae*" of the church. In many cathedral churches there were additional dignitaries, as the praetor, subdean, vice-chancellor, succentor-canonorum, and others, who came into existence to supply the places of the other absent dignitaries, for non-residence was the fatal blot of the secular churches, and in this they contrasted very badly with the

monastic churches, where all the members were in continuous residence. Besides the dignitaries there were the ordinary canons, each of whom, as a rule, held a separate prebend or endowment, besides receiving his share of the common funds of the church. For the most part the canons also speedily became non-resident, and this led to the distinction of residential and non-residential canons, till in most churches the number of resident canons became definitely limited in number, and the non-residential canons, who no longer shared in the common funds, became generally known as prebendaries only, although by their non-residence they did not forfeit their position as canons, and retained their votes in chapter like the others. This system of non-residence led also to the institution of vicars choral, each canon having his own vicar, who sat in his stall in his absence, and when the canon was present, in the stall immediately below, on the second form. The vicars had no place or vote in chapter, and, though irremovable except for offences, were the servants of their absent canons whose stalls they occupied, and whose duties they performed. Abroad they were often called demi-prebendaries, and they formed the *bas chœur* of the French churches. As time went on the vicars were themselves often incorporated as a kind of lesser chapter, or college, under the supervision of the dean and chapter.

There was no distinction between the monastic cathedral chapters and those of the secular canons, in their relation to the bishop or diocese. In both cases the chapter was the bishop's *consilium* which he was bound to consult on all important matters and without doing so he could not act. Thus, a judicial decision of a bishop needed the confirmation of the chapter before it could be enforced. He could not change the service books, or "use" of the church or diocese, without capitular consent, and there are many episcopal acts, such as the appointment of a diocesan chancellor, or vicar general, which still need confirmation by the chapter, but the older theory of the chapter as the bishop's council in ruling the diocese has become a thing of the past, not in England only, but on the continent also. In its corporate capacity the chapter takes charge *sede vacante* of a diocese. In England, however (except as regards Salisbury and Durham), this custom has never obtained, the two archbishops having, from time immemorial, taken charge of the vacant dioceses in their respective provinces. When, however, either of the sees of Canterbury or York is vacant, the chapters of those churches take charge, not only of the diocese, but of the province as well, and incidentally, therefore, of any of the dioceses of the province which may be vacant at the same time.

All the English monastic cathedral chapters were dissolved by Henry VIII., and, except Bath and Coventry, were refounded by him as churches of secular chapters, with a dean as the head, and a certain number of canons ranging from twelve at Canterbury and Durham to four at Carlisle, and with certain subordinate officers as minor canons, gossellers, epistolers, &c. The precentorship in these churches of the "New Foundation," as they are called, is not, as in the secular churches of the "Old Foundation," a dignity, but is merely an office held by one of the minor canons.

English cathedral churches, at the present day, may be classed under four heads: (1) the old secular cathedral churches of the "Old Foundation," enumerated in the earlier part of this article; (2) the churches of the "New Foundation" of Henry VIII., which are the monastic churches already specified, with the exception of Bath and Coventry; (3) the cathedral churches of hishoprics founded by Henry VIII., viz. Bristol, Chester, Gloucester, Oxford and Peterborough (the constitution of the chapters of which corresponds to those of the New Foundation); (4) modern cathedral churches of sees founded since 1856, viz. (a) Manchester, Ripon and Southwell, formerly collegiate churches of secular canons; (b) St Albans and Southwark, originally monastic churches; (c) Truro, Newcastle and Wakefield, formerly parish churches, (d) Birmingham and Liverpool, originally district churches. The ruined cathedral church of the diocese of Sodor (*i.e.* the Southern Isles) and Man, at Peel in the latter island, appears never to have had a chapter of clergy attached to it.

**Architecture.**—From the architectural point of view there is no special treatment as regards dimensions or style for a cathedral other than that required for a church or abbey, as there are cases when the former are comparatively small buildings (like the old cathedral at Athens), and some parish churches and abbeys are larger than many cathedrals. In recent times, indeed, some English abbeys or minsters, such as those of Ripon, Manchester,

FIG. 1.—Plan of Canterbury Cathedral.

St Albans and Southwell, partly on account of their dimensions, have been raised to the rank of cathedrals, in consequence of the demand for additional sees; others, such as those of Bristol, Gloucester, Oxford, Chester and Peterborough, became cathedrals only on the dissolution of the monasteries by Henry VIII.

Under the headings **NAVE, AISLE, CHOIR, APSE, CHEVET, and LADY-CHAPEL**, the principal arrangements of the plan of a cathedral are dealt with, and its architectural features, such as **TOWER and SPIRE, PORCH, TRIFORIUM, CLERESTORY and VAULT**, are separately defined; while in the article **ARCHITECTURE** the evolution of the various styles in England, France, Germany, Italy and Spain, is set forth. It is only necessary here to deal with the development of the eastern end of English and foreign cathedrals, as it was in those that the greatest changes from the middle of the 11th century to the close of the 16th century took place.

The earliest extended development of the eastern end of the cathedral is that which was first set out in Edward the Confessor's church at Westminster, probably borrowed from the ancient church of St Martin at Tours; in this church, dating probably from the 10th century, two new elements are found, (1) the carrying of the choir aisle round a circular apse so as to provide a processional aisle round the eastern end of the church, and (2) five apsidal chapels, constituting the germ of the chevets, which transformed the eastern terminations of the French cathedrals in the 12th and 13th centuries. It is only within recent times that the foundations of the early church at Tours with its choir aisle and chapels have been traced under the existing church.

In Edward the Confessor's church (1050) there were probably only three chapels and a processional aisle; in the next example at Gloucester (1089) were also three chapels, two of which, on the north and south sides of the aisle, still remain; the same is found in Canterbury (1096-1107) and Norwich (1089-1119), the eastern chapel in all three cases having been taken down to make way for the Lady-chapel in Gloucester and Norwich, and for the Trinity chapel in Canterbury cathedral (fig. 1). The semicircular aisle is said to have existed in the Anglo-Norman cathedral of Winchester, but the eastern end being square, two chapels were arranged filling the north and south ends, and an apsidal chapel projecting beyond the east wall. This semicircular processional aisle with chevets chapels was the favourite type of plan in the Anglo-Norman cathedrals, and was followed up to about the middle of the 12th century, when the English builders in some cases returned to the square east end instead of the semicircular apsidal termination. The earliest example of this exists in Ramsey Abbey (c. 1130), where the processional

FIG. 2.—Plan of Salisbury Cathedral.

path crosses behind the presbytery, there being eastern apsidal chapels in the axis of the presbytery aisle and a central rectangular chapel beyond. A similar arrangement is found in Hereford cathedral, and exists in Winchester, Salisbury (fig. 2), Durham, St Albans, Exeter, Ely, Wells and Peterborough, except that in all those cases (except Wells) the eastern chapels are square ended; in Wells cathedral the most eastern chapel (the Lady-chapel) has a polygonal termination; in Durham (fig. 3), the eastern chapels are all in one line, constituting the chapel of the nine altars, which was probably borrowed from the eastern end of Fountains Abbey. It should be noted that in some of the above the original design has been transformed in rebuilding; thus in St Albans, Durham, York and Exeter cathedrals, there was no eastern ambulatory but three parallel apses, in some cases rectangular externally. In Southwell, Rochester, Ely and Chester, there was no processional path or ambulatory round the east end; in Carlisle no eastern chapels; and in Oxford only one central apse. In Ely cathedral (fig. 4) the great central tower built by the first Norman abbot (1082-1094) fell down in 1321, carrying with it portions of the adjoining bays of the nave, transept and choir; instead of attempting to rebuild the tower.

Alan of Walsingham conceived the idea of obtaining a much larger area in the centre of the cathedral, and instead of rebuilding the piers of the tower he took as the base of his design a central octagonal space, the width of which was equal to that of nave and aisles, with wide arches to nave, transepts and choir, and smaller arches across the octagonal sides; from shafts in the eight pier angles, ribs in wood project forward and carry a smaller octagon on which the lantern rests. Internally the effect of this central octagon is of great beauty and originality, and it is the only instance of such a feature in English Gothic architecture. (See ARCHITECTURE, Plate VIII., fig. 82.)

The earliest example of the chevet is probably to be found in the church of St Martin at Tours; this was followed by others

From Rickman's *Styles of Architecture*.

FIG. 3.—Plan of Durham Cathedral.

at Tournus, Clermont-Ferrand, Auxerre, Chartres, Le Mans and other churches built during the great church-building period of the 11th century. In the still greater movement in the 12th century, when the episcopacy, supported by the emancipated communes, undertook the erection of cathedrals of greater dimensions and the reconstruction of others, in some cases they utilized the old foundations, as in Chartres (fig. 5), Coutances and Auxerre cathedrals, while in others (as at Le Mans) they extended the eastern termination, much in the same way as in many of the early examples in England, with this important difference, that when the apsidal east end was given up (about the middle of the 12th century) in favour of the square east end in England, the French, on the other hand, developed it by doubling the choir aisles and adding to the number of extra chapels; thus in Canterbury, Norwich and Gloucester, there were only three apsidal chapels in the chevet, whereas in Noyon (1150), Soissons (1190), Reims (1212), Tours, Sees, Bayeux (1230), Clermont (1275), Senlis, Limoges, Albi and Narbonne cathedrals there were five; in Amiens, Le Mans and Beauvais, there were seven apsidal chapels, and in Chartres cathedral nine. Double aisles round the choir, of which there

are no examples in England, are found in the cathedrals of Paris, Bourges and Le Mans; the cathedral of Sens (fig. 6) (1144-1168) possesses one feature which is almost unique, viz. the coupled columns of the alternate bays of nave and choir and of the apse; and these were introduced into the chapel of the Trinity in Canterbury cathedral, probably from the designs of William of Sens, by his successor William the Englishman. The square east end found no favour in France—Laon, Poitiers and Dol being the only cathedral examples; and of the triapsal arrangement, viz. with apses in the axes of the choir aisle and a central apse, the only example is that of the cathedral of Autun. The immense development given to the eastern limb of the French

FIG. 4.—Plan of Ely Cathedral.

cathedrals was sometimes obtained at the expense of the nave, so that, notwithstanding the much greater dimensions compared with English examples, in the latter the naves are much longer and consist of more bays than those in France.

In one of the French cathedrals, Bourges, there is no transept; on the other hand there are many examples in which this part of the church is emphasized by having aisles on each side, as at Laon, Soissons, Chartres, Reims, Amiens, Rouen and Clermont cathedrals. Transept aisles in England are found in Ely, York, Wells and Winchester cathedrals, in the last being carried round the south and north ends of the transept; aisles on the

FIG. 5.—Plan of Chartres Cathedral.

east side of the transept only, in some cases probably for

additional altars, exist in Durham, Salisbury, Lichfield, Peterborough and Ripon cathedrals; and on the north side only in Hereford cathedral. In Rouen cathedral, east of the transept aisles, there are apsidal chapels, which with the three chapels in the chevet make up the usual number. The cathedral of Poitiers has been referred to as an example of a square east end, but a sort of compromise has been made by the provision of three segmental apses, and there are no windows in the east front; the most remarkable divergence from the usual design is found here in the absence of any triforium or clerestory, owing to the fact that the vault of the aisles is nearly as high as that of the nave, so that it constitutes an example of what in Germany (where there are many) are called *Hallen Kirchen*; the light being obtained through the aisle windows only gives a gloomy effect to the nave. Another departure from the usual plan is that found in Albi cathedral (1350), in which there are no aisles, their place being taken by chapels between the buttresses which were required to resist the thrust of the nave vault, the widest in France. The cathedral is built in brick and externally has the appearance of a fortress. In the cathedrals of the south-west of France, where the naves are covered with a series of domes—as at Cahors, Angoulême and St Front de Périgueux—

FIG. 6.—Plan of Sens Cathedral.

FIG. 7.—Plan of Angoulême Cathedral.

the immense piers required to carry them made it necessary to dispense with aisles. The cathedral of Angoulême (fig. 7) consists of a nave covered with three domes, a transept of great length with lofty towers over the north and south ends, and an apsidal choir with four chevet chapels. In St Front de Périgueux (1150), based on St Mark's at Venice, the plan consists of nave, transept and choir, all of equal dimensions, each of them, as well as the crossing, vaulted over with a dome, while originally there was a simple apsidal choir.

Returning now to the great cathedrals in the north of France, we give an illustration (fig. 8) of Amiens cathedral (from Viollet le Duc's *Dictionnaire raisonné*) which shows the disposition of a cathedral, with its nave-arches, triforium, clerestory windows and vault, the flying buttresses which were required to carry the thrust of the vault to the outer buttresses which flanked the aisle walls, and the lofty pinnacles which surmounted them. In this case there was no triforium gallery, owing to the greater height given to the aisles. In Notre Dame at Paris the triforium was nearly as high as the aisles; in large towns this feature gave increased accommodation for the congregation, especially on the occasion of great fêtes, and it is found in Noyon, Laon, Senlis and Soissons cathedrals, built in the latter part of the 12th century; later it was omitted, and a narrow passage in the thickness of the wall only represented the triforium; at a still later period the aisles were covered with a stone

pavement of slight fall so as to allow of loftier clerestory windows.

The cathedrals in Spain follow on the same lines as those in France. The cathedral of Santiago de Compostela is virtually a copy of St Sermin at Toulouse, consisting of nave and aisles, transepts and aisles, and a choir with chevet of five chapels; at Leon there is a chevet with five apsidal chapels, and at Toledo an east end with double aisles round the apse with originally seven small apsidal chapels, two of them rebuilt at a very late period. At Leon, Barcelona and Toledo the processional passage round the apse with apsidal chapels recalls the French disposition, there being a double aisle around the latter, but in Leon and Toledo cathedrals the east end is masked externally by other buildings, so that the beauty

FIG. 8.—Perspective of Amiens Cathedral.

of the chevet is entirely lost. At Avila and Salamanca (old cathedral) the triapsal arrangement is adopted, and the same is found in the German cathedrals, with one important exception, the cathedral of Cologne, which was based on that of Amiens, the comparative height of the former, however, being so exaggerated that scale has been lost, and externally it has the appearance of an overgrown monster.

Under the headings VAULT, FLYING BUTTRESS, PINNACLE, CLERESTORY and TRIFORIUM, definitions are given of these chief components of a cathedral or church; but as their design varies materially in almost every example, without a very large number of drawings it would be impossible to treat them more in detail. The perspective view, taken from Viollet le Duc's dictionary, of the interior of the nave of Amiens cathedral illustrates the principal features, viz. the vault (in this case quadripartite, with flying buttresses and pinnacle), the triforium (in this case limited to a narrow passage in the thickness of the wall), and the nave-arches, with the side aisles, beneath the windows of which is the decorative arcade. (R. P. S.)

**CATHELINEAU, JACQUES** (1759-1793), French Vendean chieftain during the Revolution, was born at Tin-en-Manges, in the country now forming the department of Maine-et-Loire. He became well known in the country of Anjou, over which he travelled as a pedlar and dealer in contraband goods. His physical strength and his great piety gave him considerable ascendancy over the peasants, who surnamed him "the saint of Anjou." In the first years of the Revolution, Cathelineau listened to the exhortations of Catholic priests and royalist *émigrés*, and joined the insurrection provoked by them against the revolutionary government. Collecting a band of peasants and smugglers, he took the château of Gallais, where he captured a cannon, christened by the Vendéans the "Missionary"; he then took the towns of Chemillé, Cholet, Vihiers and Chalonnnes (March 1793). His companions committed atrocities which brought upon them terrible reprisals on the part of the

Republicans. Meanwhile Cathelineau's troops increased, and he combined with the other Vendean chiefs, such as N. Stofflet and Gigot d'Elbée, taking the towns of Beaupréau, Fontenay and Saumur. The first successes of the Vendéens were due to the fact that the Republicans had not expected an insurrection. When the resistance to the insurgents became more serious, differences arose among their leaders. To avoid these rivalries, it is thought that Cathelineau was named generalissimo of the rebels, though his authority over the undisciplined troops was not increased by the new office. In 1793 all the Royalist forces tried to capture Nantes. Cathelineau entered the town in spite of the resistance of General J. B. C. Canclaux, but he was killed, and the Vendean army broke up. Numerous relatives of Cathelineau also perished in the war of La Vendée. His grandson, Henri de Cathelineau, figured in the war of 1870 between France and Germany (see also VENDÉE; CHOUANS).

See C. Port. *Vie de J. Cathelineau* (1882): "La Légende de Cathelineau" in the review *La Révolution française*, vol. xxiv.; *Les Origines de la Vendée* (Paris, 1888, 2 vols.); *Dictionnaire historique de Maine-et-Loire*; Crétineau-Joly. *Histoire de la Vendée militaire*; Th. Muret, *Vie populaire de Cathelineau* (1845). (R. A. \*)

**CATHERINE, SAINT.** The Roman hagiology contains the record of six saints of this name. 1. **ST CATHERINE OF ALEXANDRIA**, Virgin and Martyr, whose day of commemoration recurs on the 25th of November, and in some places on the 5th of March. 2. **ST CATHERINE OF SWEDEN**, a daughter of St Bridget, who died abbess of Watzen in March 1381, and is commemorated on the 22nd of that month. 3. **ST CATHERINE OF SIENA**, 1347-1380, whose festal day is observed on the 30th of April. 4. **ST CATHERINE OF BOLOGNA**, 1413-1463, a visionary, abbess of the convent of the Poor Clares in Bologna, canonized by Pope Benedict XIII., and commemorated throughout the Franciscan order on the 9th of March. 5. **ST CATHERINE OF GENOA**,<sup>1</sup> who belonged to the noble family of Fieschi, was born about 1447, spent her life and her means in succouring and attending on the sick, especially in the time of the plague which ravaged Genoa in 1497 and 1501, died in that city in 1510, was beatified by Clement V. in 1675 and canonized by Clement XII. in 1737; her name was placed in the calendar on the 22nd of July by Benedict XIV. 6. **ST CATHERINE DE' RICCI**, of Florence, daughter of a wealthy merchant prince, was born in 1522, became a nun in the convent of the Dominicans at Prato in 1536, and died in 1589. She was famous during her life-time for the weekly ecstasy of the Passion, during which in a trance she experienced the sufferings of the Holy Virgin contemplating the Passion of her Son. She was canonized in 1746 by Benedict XIV., who fixed her festal day on the 13th of February. In Celtic and English martyrologies (November 25) there is also commemorated St Catherine Audley (c. 1400), a recluse of Ledbury, Hereford, who was reputed for piety and clairvoyance.

Of two of these saints, St Catherine of Alexandria, the St Catherine *par excellence*, and St Catherine of Siena, something more must be said. Of the former history has little or nothing to tell. The Maronite scholar, Joseph Simon Assemani (1687-1768), first identified her with the royal and wealthy lady of Alexandria (Eusebius, *Hist. Eccl.* viii. 14) who, for refusing the solicitations of the emperor Maximinus, was deprived of her property and banished. But Rufinus (*Hist. Eccl.* viii. 17) called this lady Dorothea, and the old Catherine legend, as recorded in the Roman martyrology and by Simeon Metaphrastes, has quite other features. According to it Catherine was the daughter of King Konetos, eighteen years old, beautiful and wise. During the persecution under Maximinus she sought an interview with the emperor, upbraided him for his cruelties, and adjured him to give up the worship of false gods. The angry tyrant, unable to refute her arguments himself, sent for pagan scholars to argue with her, but they were discomfited. Catherine was then scourged and cast into prison, and the empress was sent to reason with her; but the dauntless virgin converted not only the empress but the Roman

general and his soldiers who had accompanied her. Maximinus now ordered her to be broken on the wheel; but the wheel was shattered by her touch. The headsman's axe proved more fatal, and the martyr's body was borne by angels to Mount Sinai, where Justinian I. built the famous monastery in her honour. Another development of the legend is that in which, having rejected many offers of marriage, she was taken to heaven in vision and betrothed to Christ by the Virgin Mary.

Of all these marvellous incidents very little, by the universal admission of Catholic scholars, has survived the test of modern criticism. That St Catherine actually existed there is, indeed, no evidence to disprove; and it is possible that some of the elements in her legend are due to confusion with the story of Hypatia (*q.v.*), the neo-platonic philosopher of Alexandria, who was done to death by a Christian mob. To the men of the middle ages, in any case, St Catherine was very real; she was ranked with the fourteen most helpful saints in heaven, and was the constant theme of preachers and of poets. Her festival was celebrated in many places with the utmost splendour, and in certain dioceses in France was a holy day of obligation as late as the beginning of the 17th century. Numberless chapels were dedicated to her, and in nearly all churches her statue was set up, the saint being represented with a wheel, her instrument of torture, and sometimes with a crown and a book. The wheel being her symbol she was the patron saint of wheelwrights and mechanics; as the confounder of heathen sophistry she was invoked by theologians, apologists, preachers and philosophers, and was chosen as the patron saint of the university of Paris; as the most holy and illustrious of Christian virgins she became the tutelary saint of nuns and virgins generally. So late as the 16th century, Bossuet delivered a panegyric upon her, and it was the action of Dom Deforis, the Benedictine editor of his works, in criticizing the accuracy of the data on which this was based, that first discredited the legend. The saint's feast was removed from the Breviary at Paris about this time, and the devotion to St Catherine has since lost its earlier popularity. See Leon Clugnet's article in the *Catholic Encyclopædia*, vol. iiii. (London, 1908).

St Catherine of Siena was the youngest of the twenty-five children of Giacomo di Benincasa, a dyer, and was born, with a twin-sister who did not survive her birth, on the 25th of March 1347. A highly sensitive and imaginative child, she very early began to practise asceticism and see visions, and at the age of seven solemnly dedicated her virginity to Christ. She was attracted by what she had heard of the desert anchorites, and in 1363-1364, after much struggle, persuaded her parents to allow her to take the habit of the Dominican tertiaries. For a while she led at home the life of a recluse, speaking only to her confessor, and spending all her time in devotion and spiritual ecstasy. Her innate humanity and sound sense, however, led her gradually to return to her place in the family circle, and she began also to seek out and help the poor and the sick. In 1368 her father died, and she assumed the care of her mother Lapa. During the following years she became known to an increasingly wide circle, especially as a peacemaker, and entered into correspondence with many friends. Her peculiarities excited suspicion, and charges seem to have been brought against her by some of the Dominicans to answer which she went to Florence in 1374, soon returning to Siena to tend the plague-stricken. Here first she met the Dominican friar, Raimondo of Capua, her confessor and biographer.

The year 1375 found Catherine entering on a wider stage. At the invitation of Piero Gambacorti, the ruler of the republic of Pisa, she visited that city and there endeavoured to arouse enthusiasm for the proposed crusade, urging princes and presidents, commanders and private citizens alike to join in "the holy passage." To this task was added that of trying to keep Pisa and Lucca from joining the Tuscan League against the pope. It was at Pisa, in the church of Santa Cristina, on the fourth Sunday in Lent (April 1), while rapt in ecstasy after the communion, that Catherine's greatest traditional glory befell her, viz. the *stigmata* or impression on her hands, feet and heart, of the wounds corresponding with those received by Christ at his

<sup>1</sup> See the study in Baron Fr. von Hügel's *Mystical Element in Religion* (1909).

crucifixion. The marks, however, were at her prayer not made visible. There is no need to doubt the reality of Catherine's exaltation, but it should be remembered that she and her circle were Dominicans, and that the stigmata of St Francis of Assisi were considered the crowning glory of the saint, and hitherto the exclusive boast of the Franciscans. The tendency observable in many of the austerities and miracles attributed to St Catherine to outstrip those of other saints, particularly Francis, is especially remarkable in this marvel of the stigmata, and so acute became the rivalry between the two orders that Pope Sixtus IV., himself a Franciscan, issued a decree asserting that St Francis had an exclusive monopoly of this particular wonder, and making it a censurable offence to represent St Catherine receiving the stigmata.

In the year 1376, the 29th of Catherine's life, Gregory XI. was living and holding the papal court at Avignon. He was the last of seven French popes in succession who had done so, and had perpetuated for seventy-three years what ecclesiastical writers are fond of terming "the Babylonian captivity of the church." To put an end to this absenteeism, and to bring back the papacy to Italy was the cherished and anxious wish of all good Italians, and especially of all Italian churchmen. Petrarch had urgently pressed Urban V., Gregory's immediate predecessor, to accomplish the desired change; and Dante had at an earlier date laboured to bring about the same object. But these and all the other influences which Italy had striven to bring to bear on the popes had hitherto failed to induce them to return. In these circumstances Catherine determined to try her powers of persuasion and argument, attempting first by correspondence to reconcile Gregory and the Florentines, who had been placed under an interdict, and then going in person as the representative of the latter to Avignon, where she arrived on the 18th of June. Gregory empowered her to treat for peace, but the Florentine ambassadors were first tardy and then faithless. Nothing daunted, Catherine herself besought Gregory, who, indeed, was himself so minded, to return, and he did so, in September (taking the sea route from Marseilles to Genoa), though perhaps intending only to make a temporary stay in Italy. Catherine went home by land and stayed for a month in Genoa with Madonna Orietta Scotti, a noble lady of that city, at whose house Gregory had a long colloquy with her, which encouraged him to push on to Rome. To this year, 1376, belongs the admission to Catherine's circle of disciples of Stefano di Corrado Maconi, a Siennese noble distinguished by a character full of charm and purity, and her healing of the bitter feud between his family and the Tolomei. Another family quarrel, that of the Salimbeni at Rocca D'Orcia, was ended by her intervention in 1377. This year also she turned the castle of Belcaro, which had been given to her, into a monastery.

Meanwhile the returned pope was not having an easy time. Besides perpetuating the strife with his enemies he was alienating his friends, and finding it increasingly difficult to pay his mercenaries. He vented his anger upon Catherine, who reproved him for minding temporal rather than spiritual things, but in the beginning of 1378 sent her on an embassy to Florence and especially to the Guelph party. While she was urging the citizens to make peace with the pope there came the news of his death. During the troubles that ensued in Florence Catherine nearly lost her life in a popular tumult, and sorely regretted not winning her heart's desire, "the red rose of martyrdom." Peace was signed with the new pope, Urban VI., and Catherine, having thus accomplished her second great political task, went home again to Siena. Thence on the outbreak of the schism Urban summoned her to Rome, whither, somewhat reluctantly, she journeyed with her now large spiritual family in November. Once arrived she gave herself heartily to Urban's cause, and wore her slender powers out in restraining his impatient temper, quieting the revolt of the people of Rome, and trying to win for Urban the support of Europe. After prolonged and continual suffering she died on the 29th of April 1380.

Catherine of Siena lived on not only in her writings but in her disciples. During her short course she gathered round her a devoted

company of men and women trained to labour for the reformation of the individual, the church and the state. Her death naturally broke up the fellowship, but its members did not cease their activity and kept up what mutual correspondence was possible. Among them were Fra Raimondo, who became master-general of the Dominicans, William Flete, an ascetically-minded Englishman from Cambridge, Stefano Maconi, who joined the Carthusians and ultimately became prior-general, and the two secretaries, Neri di Landocico and Francesco Malavolti. The last of her band, Tommaso Caffarini, died in 1434, but the work was taken up, though in other shape, by Savonarola, between Francis of Assisi and whom Catherine forms the connecting link.

Catherine's works consist of (1) a treatise occupying a closely-printed quarto volume, which Fra Raimondo describes as "a dialogue between a soul, which asked four questions of the Lord, and the same Lord, who made answer and gave instruction in many most useful truths," (2) letters, and (3) prayers. The dialogue is entitled, *The Book of Divine Doctrine, given in person by God the Father, speaking to the mind of the most glorious and holy virgin Catherine of Siena, and written down as she dictated it in the vulgar tongue, she being the while entranced, and actually hearing what God spoke in her.* The work is declared to have been dictated by the saint in her father's house in Siena, a little before she went to Rome, and to have been completed on the 13th of October 1378. The book opens with a passage on the essence of mysticism, the union of the soul with God in love, and the bulk of it is a compendium of the spiritual teachings scattered throughout her letters. There is more monologue than dialogue. The book has a significant place in the history of Italian literature. "In a language which is singularly poor in mystical works it stands with the *Divina Commedia* as one of the two supreme attempts to express the eternal in the symbolism of a day, to paint the union of the soul with the supra-sensible while still imprisoned in the flesh." The prayers (twenty-six in all) are mostly mystical outpourings repeating the aspirations found in her other writings. Of more interest are the letters, nearly four hundred in number, and addressed to kings, popes, cardinals, bishops, conventual bodies, political corporations, and private individuals. Their historical importance, their spiritual vigour and fragrance, and their literary value combine to put their author almost on a level with Petrarch as a 14th century letter-writer. Her language is the purest Tuscan of the golden age of the Italian vernacular, and with spontaneous eloquence she passes to and fro between spiritual counsel, domestic advice and political guidance.

**AUTHORITIES.**—The sources for the personal life of Catherine of Siena are (1) the *Vita* or *Legenda*, Fra Raimondo's biography written 1384-1395, first published in Latin at Cologne, 1553, and widely translated; (2) the *Processus*, a collection of testimonies and letters by those of her followers who survived in 1411, and had to justify the reverence paid to the memory of one yet uncanonized; (3) the *Supplementum* to Raimondo's *Vita*, compiled by Tommaso Caffarini in 1414; (4) the *Legenda abbreviata*, Caffarini's summary of the *Vita*, translated into beautiful Italian by Stefano Maconi; (5) the *Letters*, of which the standard edition is that of Girolamo Gigli (2 vols., Siena, 1713, Lucca, 1721). A selection of these has been published in English by V. D. Scudder (London, 1905). A complete bibliography is given in E. G. Gardner's *Saint Catherine of Siena* (London, 1907), a monumental study dealing with the religion, history and literature of the 14th century in Italy as they centre "in the work and personality of one of the most wonderful women that have ever lived."

**CATHERINE I. (1683-1727)**, empress of Russia. The true character and origin of this enigmatical woman were, until quite recently, among the most obscure problems of Russian history. It now appears that she came of a Lithuanian stock, and was one of the four children of a small Catholic yeoman, Samuel Skovronsky; but her father died of the plague while she was still a babe, the family scattered, and little Martha was adopted by Pastor Glück, the Protestant superintendent of the Marienburg district. Frau Glück finally rid herself of the girl by marrying her to a Swedish dragoon called Johan. A few months later, the Swedes were compelled by the Russians to evacuate Marienburg, and Martha became one of the prisoners of war of Marshal Sheremetev, who sold her to Prince Meshikov, at whose house, in the German suburb of Moscow, Peter the Great first beheld and made love to her in his own peculiar fashion. After the birth of their first daughter Catherine, Peter made no secret of their relations. He had found, at last, the woman he wanted, and she soon became so indispensable to him that it was a torment to be without her. The situation was regulated by the reception of Martha into the Orthodox Church, when she was rechristened under the name of Catherine Alekseyevna, the tsarevich Alexis being her godfather, by the bestowal upon her of the title *Gesudaryniya* or *souverain* (1710),

and, finally (1711), by her public marriage to the tsar, who divorced the tsaritsa Eudoxia to make room for her. Henceforth the new tsaritsa was her husband's inseparable companion. She was with him during the campaign of the Pruth, and Peter always attributed the successful issue of that disastrous war to the courage and sang-froid of his consort. She was with him, too, during his earlier Caspian campaigns, and was obliged on this occasion to shear off her beautiful hair and wear a close-fitting fur cap to protect her from the rays of the sun.

By the ukaz of 1722 Catherine was proclaimed Peter's successor, to the exclusion of the grand-duke Peter, the only son of the tsarevich Alexius, and on the 7th of May 1724 was solemnly crowned empress-consort in the Uspensky cathedral at Moscow, on which occasion she wore a crown studded with no fewer than 2564 precious stones, surmounted by a ruby, as large as a pigeon's egg, supporting a cross of brilliants. Within a few months of this culminating triumph, she was threatened with utter ruin by the discovery of a supposed *liaison* with her gentleman of the bedchamber, William Mons, a handsome and unscrupulous upstart, and the brother of a former mistress of Peter. A dangerously familiar but perfectly innocent flirtation is, however, the worst that can fairly be alleged against Catherine on this occasion. So Peter also seemed to have thought, for though Mons was decapitated and his severed head, preserved in spirits, was placed in the apartments of the empress, she did not lose Peter's favour, attended him during his last illness, and closed his eyes when he expired (February 28, 1725). She was at once raised to the throne by the party of progress, as represented by Prince Menshikov and Count Tolstoy, whose interests and perils were identical with those of the empress, before the reactionary party had time to organize opposition, her great popularity with the army powerfully contributing to her success. The arch-bishops of the Russian church, Theodosius, archbishop of Novgorod, and Theophanes, archbishop of Pskov, were also on her side for very much the same reason, both of them being unpopular innovators who felt that, at this crisis, they must stand or fall with Tolstoy and Menshikov.

The great administrative innovation of Catherine's reign was the establishment of the *Verkhnoy Tainy Sovet*, or supreme privy council, by way of strengthening the executive, by concentrating affairs in the hands of a few persons, mainly of the party of Reform (*Ukaz* of February 26, 1726). As to the foreign policy of Catherine I. (principally directed by the astute Andrei Osterman), if purely pacific and extremely cautious, it was, nevertheless, dignified, consistent and independent. Russia, by the mere force of circumstances, now found herself opposed to England, chiefly because Catherine protected Charles Frederick, duke of Holstein, and George I. found that the Schleswig-Holstein question might be reopened to the detriment of his Hanoverian possessions. Things came to such a pass that, in the spring of 1726, an English squadron was sent to the Baltic and cast anchor before Revel. The empress vigorously protested, and the fleet was withdrawn, but on the 6th of August Catherine acceded to the anti-English Austro-Spanish league. Catherine died on the 16th of May 1727. Though quite illiterate, she was an uncommonly shrewd and sensible woman, and her imperturbable good nature under exceptionally difficult circumstances, testifies equally to the soundness of her head and the goodness of her heart.

(R. N. B.)

**CATHERINE II.** (1720-1796), empress of Russia, was the daughter of Christian Augustus, prince of Anhalt-Zerbst, and his wife, Johanna Elizabeth of Holstein-Gottorp. The exact date and place of her birth have been disputed, but there appears to be no reason to doubt that she was right in saying that she was born at Stettin on the 2nd of May 1729. Her father, who succeeded to the principality of Anhalt-Zerbst in 1746 and died in 1747, was a general in the Prussian service, and, at the time of her birth, was military commandant at Stettin. Her baptismal name was Sophia Augusta Frederica. In accordance

with the custom then prevailing in German princely families, she was educated chiefly by French governesses and tutors. In 1744 she was taken to Russia, to be affianced to the grand-duke Peter, the nephew of the empress Elizabeth (q.v.), and her recognized heir. The princess of Anhalt-Zerbst was the daughter of Christian Albert, bishop of Lubeck, younger brother of Frederick IV., duke of Holstein-Gottorp, Peter's paternal grandfather. The choice of her daughter as wife of the future tsar was the result of not a little diplomatic management in which Frederick the Great took an active part, the object being to strengthen the friendship between Prussia and Russia, to weaken the influence of Austria and to ruin the chancellor Bestuzhev, on whom Elizabeth relied, and who was a known partisan of the Austrian alliance. The diplomatic intrigue failed, largely through the flighty intervention of the princess of Anhalt-Zerbst, a clever but very injudicious woman. But Elizabeth took a strong liking to the daughter, and the marriage was finally decided on. The girl had spared no effort to ingratiate herself, not only with the empress, but with the grand-duke and the Russian people. She applied herself to learning the language with such zeal that she rose at night and walked about her bedroom barefoot repeating her lessons. The result was a severe attack of congestion of the lungs in March 1744. During the worst period of her illness she completed her conquest of the good-will of the Russians by declining the religious services of a Protestant pastor, and sending for Simon Todorskiy, the orthodox priest who had been appointed to instruct her in the Greek form of Christianity. When she wrote her memoirs she represented herself as having made up her mind when she came to Russia to do whatever had to be done, and to profess to believe whatever she was required to believe, in order to be qualified to wear the crown. The consistency of her character throughout life makes it highly probable that even at the age of fifteen she was mature enough to adopt this worldly-wise line of conduct. Her father, who was a convinced Lutheran, was strongly opposed to his daughter's conversion, and supplied her with books of controversy to protect her Protestantism. She read them, and she listened to Todorskiy, and to other advisers who told her that the Russian crown was well worth a mass, or that the differences between the Greek and Lutheran churches were mere matters of form. On the 28th of June 1744 she was received into the Orthodox Church at Moscow, and was renamed Catherine Alexeyevna. On the following day she was formally betrothed, and was married to the archduke on the 21st of August 1745 at St Petersburg.

At that time Catherine was essentially what she was to remain till her death fifty-one years later. It was her boast that she was as "frank and original as any Englishman." If she meant that she had a compact character, she was right. She had decided on her line in life and she followed it whole-heartedly. It was her determination to become a Russian in order that she might the better rule in Russia, and she succeeded. She acquired a full command of all the resources of the language, and a no less complete understanding of the nature of the Russian people. It is true that she remained quite impervious to religious influences. The circumstances of her conversion may have helped to render her indifferent to religion, but their influence need not be exaggerated. Her irreligion was shared by multitudes of contemporaries who had never been called upon to renounce one form of Christianity and profess belief in another in order to gain a crown. Her mere actions were, like those of other and humbler people, dictated by the conditions in which she lived. The first and the most important of them was beyond all question the misery of her married life. Her husband was a wretched creature. Nature had made him mean, the smallpox had made him hideous, and his degraded habits made him loathsome. And Peter had all the sentiments of the worst kind of small German prince of the time. He had the conviction that his princeliness entitled him to disregard decency and the feelings of others. He planned brutal practical jokes, in which blows had always a share. His most manly taste did not rise above the kind of military interest which has been defined as "corporal's

mania," the passion for uniforms, pipeclay, buttons, the "tricks of parade and the froth of discipline." He detested the Russians, and surrounded himself with Holsteiners. For ten years the marriage was barren, and the only reason for supposing that the future tsar Paul (*q.v.*), who was born on the 2nd of October 1754, was the son of Peter, is the strong similarity of their characters. Living in the grossly animal court of the empress Elizabeth, bound to a husband whom she could not but despise and detest, surrounded by suitors, and entirely uninfluenced by religion, Catherine became and remained perfectly immoral in her sexual relations to men. The scandalous chronicle of her life was the commonplace of all Europe. Her male favourites were as openly paraded as the female favourites of King Louis XV. It may be said once and for all that her most trusted agents while she was still grand-duchess, and her chief ministers when she became empress, were also her lovers, and were known to be so.

For some time after the marriage, the young couple were controlled by the empress Elizabeth, who appointed court officials to keep a watch on their conduct; but before long these custodians themselves had become the agents of Catherine's pleasures and ambition. After the birth of Paul she began to take an active part in political intrigues. Her abilities forced even her husband to rely on her judgment. When in difficulty he ran to her and flattered her with the name of Madame La Ressource—Madame Quick Wit—which did not prevent him from insulting and even kicking her when the immediate need of her help was over. In 1758 he endeavoured to turn the empress Elizabeth against her, and for a time Catherine was in danger. She faced the peril boldly, and reconquered her influence over the sovereign, but from this time she must have realized that when the empress was dead she would have to defend herself against her husband. That Peter both hated and dreaded her was notorious. The empress Elizabeth died on the 5th of January 1762. The grand duke succeeded without opposition as Peter III. His behaviour to his wife continued to be brutal and menacing, and he went on as before offending the national sentiment of the Russian people. In July he committed the insane error of retiring with his Holsteiners to Oranienbaum, leaving his wife at St Petersburg. On the 13th and 14th of that month a "pronunciamento" of the regiments of the guard removed him from the throne and made Catherine empress. The history of this revolt is still obscure. It has naturally been said that she organized the mutiny from the first, and some plausibility is conferred on this belief by the fact that the guards were manipulated by the four Orlov brothers. The eldest, Gregory, was her recognized chief lover, and he was associated with his brother Alexis in the office of favourite. On the other hand, there does not appear to have been any need for organization. The hatred felt for Peter III was spontaneous, and Catherine had no need to do more than let it be known that she was prepared to profit by her husband's downfall. Peter, who behaved with abject cowardice, was sent to a country house at Ropcha, where he died on the 15th or 18th of July of official "apoplexy." The truth is not known, and Frederick the Great at least professed long afterwards to believe that Catherine had no immediate share in the murder. She had no need to speak. Common-sense must have shown the leaders of the revolt that they would never be safe while Peter lived, and they had insults to avenge.

The mere fact that Catherine II., a small German princess without hereditary claim to the throne, ruled Russia from 1762 to 1796 amid the loyalty of the great mass of the people, and the respect and admiration of her neighbours, is sufficient proof of the force of her character. Her title to be considered a great reforming ruler is by no means equally clear. Voltaire and the encyclopaedists with whom she corresponded, and on whom she conferred gifts and pensions, repaid her by the grossest flattery, while doing their best to profit by her generosity. They made her a reputation for "philosophy," and showed the sincerity of their own love of freedom by finding excuses for the partition of Poland. There is a very great difference between Catherine II. as she appears in the panegyrics of the encyclopaedists and Catherine as she appears in her correspondence and in her acts.

Her foreign admirers amused her, and were useful in spreading her reputation. The money they cost her was a small sum in comparison to the £12,000,000 she lavished on her long series of lovers, who began with Soltykov and Stanislaus Poniatowski (*q.v.*) before she came to the throne, and ended with the youthful Platon Zubov, who was tenant of the post at her death. She spent money freely on purchasing works of art and curios. Yet she confessed with her usual candour that she had no taste for painting, sculpture or music. Her supposed love of literature does not appear to have amounted to more than a lively curiosity, which could be satisfied by dipping into a great number of books. She had a passion for writing, and produced not only a mass of letters written in French, but pamphlets and plays, comic and serious, in French and Russian. One on the history of Oleg, the more or less legendary Varangian, who was guardian to the son of Kurik, was described by her as an "imitation of Shakespeare." The scheme is not unlike that of a "chronicle play." Her letters are full of vivacity, of colour, and at times of insight and wit, but she never learnt to write either French or German correctly. The letters to Voltaire attributed to her are not hers, and were probably composed for her by Andrei Shuvalov. The philosophers and encyclopaedists who, by the mouth of Diderot, complimented Catherine on being superior to such female affectations as modesty and chastity, flattered her to some extent even here. She enforced outward decency in her household, was herself temperate in eating and drinking, and was by no means tolerant of disorderly behaviour on the part of the ladies of her court. They flattered her much more when they dwelt on her philanthropy and her large share of the enlightenment of the age. She was kind to her servants, and was very fond of young children. She was rarely angry with people who merely contradicted her or failed to perform their service in her household. But she could order the use of the knout and of mutilation as freely as the most barbarous of her predecessors when she thought the authority of the state was at stake, and she did employ them readily to suppress all opinions of a heterodox kind, whether in matters of religion or of politics, after the beginning of the French Revolution. Her renowned toleration stopped short of allowing the dissenters to build chapels, and her passion for legislative reform grew cold when she found that she must begin by the emancipation of the serfs. There were exceptions even to her personal kindness to those about her. She dropped her German relations. She kept a son born to her shortly before the palace revolution of 1762, whose paternity could not be attributed to Peter, at a distance, though she provided for him. He was brought up in a private station under the name of Bobrinski. She was a harsh mother to her son Paul. It seems highly probable that she intended to exclude him from the succession, and to leave the crown to her eldest grandson Alexander, afterwards the emperor Alexander I. Her harshness to Paul was probably as much due to political distrust as to what she saw of his character. Whatever else Catherine may have been she was emphatically a sovereign and a politician who was in the last resort guided by the reason of state. She was resolved not to allow her authority to be disputed by her son, or shared by him.

As a ruler, Catherine professed a great contempt for system, which she said she had been taught to despise by her master Voltaire. She declared that in politics a capable ruler must be guided by "circumstances, conjectures and conjunctions." Her conduct was on the surface very unstable. In a moment of candour she confessed that she was a great *commenceuse*—that she had a mania for beginning innumerable enterprises which she never pursued. This, however, is chiefly true of her internal administration, and even there it should be qualified. Many of her beginnings were carried on by others and were not barren. Her foreign policy was as consistent as it could be considering the forces she had to contend against. It was steadily aimed to secure the greatness and the safety of Russia. There can be no question that she loved her adopted country sincerely, and had an affection for her people, and an opinion of their great qualities which she did not hesitate to express in hyperbolic terms. Her zeal for the reputation of the Russians

was almost comically shown by the immense trouble she took to compile an answer to the *Voyage en Sibirie* of the French astronomer Chappe d'Aueroche. The book is in three big quartos, and Catherine's answer—which was never finished—is still larger. Chappe d'Aueroche had discovered that Siberia was not a paradise, and had observed that the Russians were dirty in their habits, and that masters whipped their servants, male and female. Her patriotism was less innocently shown by her conquests. Yet it may be doubted whether any capable ruler of Russia could have abstained from aggressions at the expense of the rights of the Saxon family in Courland, of Poland, and of Turkey (see *RUSSIA: History*). It does seem now to be clearly proved that the partition of Poland was not suggested by her, as has been frequently asserted. Catherine would have preferred to control the country through a vassal sovereign of the type of Stanislaus Poniatowski, the old lover whose election she secured in 1763. Poland was incapable of maintaining its independence at the time of the first partition (1772), and the division of the unhappy country was forced on by Austria and Prussia. In the case of the second partition in 1793, she did show herself to be very unscrupulous. Her opposition to the reform of the Polish government was plainly due to a wish to preserve an excuse for further spoliation, but her conduct was less cruel and base than that of Prussia.

Catherine had adhered to her husband's policy of a Prussian alliance. While Frederick the Great lived she was impressed by his ability. But the Prussian alliance became hateful to her, and her later correspondence with Grimm overflows with contempt of his successor Frederick William II., who is always spoken of by her as "Brother Gu." Her exasperation with the affectations of the Prussian king was unquestionably increased by her discovery that he would not be induced to apply himself to a crusade against the French Revolution, which by employing all his forces would have left Russia free to annex the whole of what remained of Poland. But at least she did not enter into a solemn engagement to defend the Poles who were engaged in reforming their constitution, and then throw them over in order to share in the plunder of their country.

Catherine's Turkish policy was at first marked by a certain grandiosity. When the Turks declared war in 1768 in order to support Poland, which they looked upon as a necessary buffer state, she retaliated by the great Greek scheme. For a time it was a pet idea with her to revive the Greek empire, and to plant the cross, with the double-headed Russian eagle, at Constantinople. She formed a corps of Greek cadets, caused her younger grandson to be christened Constantine, and began the policy of presenting Russia to the Christian subjects of the Porte as their deliverer. In pursuit of this heroic enterprise, which excited the loud admiration of Voltaire, she sent a fleet under Alexis Orlov into the Mediterranean in 1770. Orlov tempted the Greeks of the Morea to take up arms, and then left them in the lurch. When Catherine found herself opposed by the policy of France and England, and threatened by the jealousy of Prussia and Austria, she dropped the Greek design, observing to Voltaire that the descendants of the Spartans were much degenerated. The introduction into the treaty of Kuchuk-Kainarji of 1774 of a clause by which the Porte guaranteed the rights of its Christian subjects, and of another giving Russia the right to interfere on behalf of a new Russian church in Constantinople, advertised the claim of the tsars to be the natural protectors of the Orthodox in the Ottoman dominions; but when she took up arms again in 1788 in alliance with Joseph II. (q.v.), it was to make a mere war of conquest and partition. The Turkish wars show the weak side of Catherine as a ruler. Though she had mounted the throne by a military revolt and entered on great schemes of conquest, she never took an intelligent interest in her army. She neglected it in peace, allowed it to be shamefully administered in war, and could never be made to understand that it was not in her power to improvise generals out of her favourites. It is to her credit that she saw the capacity of Suvarov, yet she never had as much confidence in him as she had in Potemkin, who may have been a man of genius, but was certainly no general. She

took care never to have to deal with a disciplined opponent, except the Swedes, who beat her, but who were very few.

It was the misfortune of Catherine that she lived too long. She disgraced herself by living with her last lover, Zubov, when she was a woman of sixty-seven, trusting him with power and lavishing public money on him. The outbreak of the French Revolution stripped off the varnish of philosophy and philanthropy which she had assumed in earlier years. She had always entertained a quiet contempt for the French writers whom she flattered and pensioned, and who served her as an advertising agency in the west. When the result of their teaching was seen in Paris, good-natured contempt was turned to hatred. She then became a persecutor in her own dominions of the very ideas she had encouraged in former years. She scolded and preached a crusade, without, however, departing from the steady pursuit of her own interests in Poland, while endeavouring with transparent cunning to push Austria and Prussia into an invasion of France with all their forces. Her health began to break down, and it appears to be nearly certain that towards the end she suffered from hysteria of a shameful kind. It is plain that her intellect had begun to fail just before her death, for she allowed the reigning favourite, Platon Zubov, to persuade her to despatch his brother Valerian, with the rank of field marshal and an army of 20,000 men, on a crack-brained scheme to invade India by way of Persia and Tibet. The refusal of the king of Sweden to marry into her family unless the bride would become a Lutheran is said to have thrown her into a convulsion of rage which hastened her death. On the 9th of November 1796, she was seized by a fit of apoplexy, and died on the evening of the 10th.

All other accounts of Catherine II. have been superseded by Waliszewski's two volumes, *The Roman d'une impératrice* (Paris, 1893) and *Around d'un Trône: Catherine II., ses collaborateurs, ses amis, ses favoris* (Paris, 1894). The original sources for the history of her policy and her character are to be found in the publications of the Imperial Russian Historical Society, vols. I.-cix. (St Petersburg), begun in 1867; her private and official correspondence will be found in vols. I., II., IV., V., VI., VII., VIII., IX., X., XIII., XIV., XV., XVII., XX., XXIII., XXXIII., XXXVI., XLII., XLIII., XLV., XLVI., XLVII., XLVIII., LXXVII., LXXXVII., XCIV., XCVII., CXXV., CXXVIII.

**CATHERINE DE' MEDICI** (1519-1589), queen of France, the wife of one of the French king and the mother of three, was born at Florence in 1519. She was a daughter of Lorenzo II. de' Medici and a French princess, Madeleine de la Tour d'Auvergne. Having lost both her parents at an early age, Catherine was sent to a convent to be educated; and she was only fourteen when she was married (1533) at Marseilles to the duke of Orleans, afterwards Henry II. It was her uncle, Pope Clement VII., who arranged the marriage with Francis I. Francis, still engaged in his lifelong task of making head against Charles V., was only too glad of the opportunity to strengthen his influence in the Italian peninsula, while Clement, ever needful of help against his too powerful protector, was equally ready to hold out a bait. During the reign of Francis, Catherine exercised no influence in France. She was young, a foreigner, a member of a state that had almost no weight in the great world of politics, had not given any proof of great ability, and was thrown into the shade by more important persons. For ten years after her marriage she had no children. In consequence, a divorce began to be talked of at court; and it seemed not impossible that Francis, alarmed at the possible extinction of the royal house, might listen to such a proposal. But Catherine had the happiness of bringing him grandchildren ere he died. During the reign of her husband, too (1547-1559), Catherine lived a quiet and passive, but observant life. Henry being completely under the influence of his mistress, Diane de Poitiers, she had little authority. In 1552, when the king left the kingdom for the campaign of Metz, she was nominated regent, but with very limited powers. This continued even after the accession of her son Francis II. Francis was under the spell of Mary Stuart, and she, little disposed to meddle with politics on her own account, was managed by her uncles, the cardinal of Lorraine and the duke of Guise. The queen-mother, however, soon grew weary of the domination of the Guises, and entered upon a course of secret opposition. On the 1st of April 1560 she placed in the

chancellorship Michel de l'Hôpital (q.v.), who advocated the policy of conciliation.

On the death of Francis (5th of December 1560), Catherine became regent during the minority of her second son, Charles IX., and now found before her a career worthy of the most soaring ambition. She was then forty-one years old, but, although she was the mother of nine children, she was still very vigorous and active. She retained her influence for more than twenty years in the troubled period of the wars of religion. At first she listened to the moderate counsels of l'Hôpital in so far as to avoid siding definitely with either party, but her character and the habits of policy to which she had been accustomed, rendered her incapable of any noble aim. She had only one virtue, and that was her zeal for the interests of her children, especially of her favourite third son, the duke of Anjou. Like so many of the Italians of that time, who were almost destitute of a moral sense, she looked upon statesmanship in particular as a career in which finesse, lying and assassination were the most admirable, because the most effective weapons. By habit a Catholic, but above all things fond of power, she was determined to prevent the Protestants from getting the upper hand, and almost equally resolved not to allow them to be utterly crushed, in order to use them as a counterpoise to the Guises. This trimming policy met with little success: rage and suspicion so possessed men's minds, that she could no longer control the opposing parties, and one civil war followed another to the end of her life. In 1567, after the "Enterprise of Meaux," she dismissed l'Hôpital and joined the Catholic party. But, having failed to crush the Protestant rebellion by arms, she resumed in 1570 the policy of peace and negotiation. She conceived the project of marrying her favourite son, the duke of Anjou, to Queen Elizabeth of England, and her daughter Margaret to Henry of Navarre. To this end she became reconciled with the Protestants, and allowed Coligny to return to court and to re-enter the council. Of this step she quickly repented. Charles IX. conceived a great affection for the admiral and showed signs of taking up an independent attitude. Catherine, thinking her influence menaced, sought to regain it, first by the murder of Coligny, and, when that had failed, by the massacre of St Bartholomew (q.v.). The whole of the responsibility for this crime, therefore, rests with Catherine; unlike the populace, she had not even the excuse of fanaticism. This responsibility, however, weighed but lightly on her; while her son was overwhelmed with remorse, she calmly enjoyed her short-lived triumph. After the death of Charles in 1574, and the succession of Anjou under the name of Henry III., Catherine pursued her old policy of compromise and concessions; but as her influence is lost in that of her son, it is unnecessary to dwell upon it. She died on the 5th of January 1589, a short time before the assassination of Henry, and the consequent extinction of the House of Valois. In her taste for art and her love of magnificence and luxury, Catherine was a true Medici; her banquets at Fontainebleau in 1564 were famous for their sumptuousness. In architecture especially she was well versed, and Philibert de l'Orme relates that she discussed with him the plan and decoration of her palace of the Tuileries. Catherine's policy provoked a crowd of pamphlets, the most celebrated being the *Discours merueilleux de la vie, actions et deportemens de la reine Catherine de Médicis*, in which Henri Estienne undoubtedly collaborated.

Baschet, 1866); H. Bouchot, *Catherine de Médicis* (Paris, 1899). For a more complete bibliography see Ernest Lavisse, *Histoire de France* (vol. v., by H. Lecomte, and vol. vi., by J. H. Mariéjol, 1902-1905). See also Miss E. Sichel's books, *Catherine de' Medici and the French Reformation* (1905), and *The Later Years of Catherine de' Medici* (1908).

**CATHERINE OF ARAGON** (1485-1536), queen of Henry VIII. of England, daughter of Ferdinand and Isabella of Spain, was born on the 15th or 16th of December 1485. She left Spain in 1501 to marry Arthur, prince of Wales, eldest son of King Henry VII., and landed at Plymouth on the 2nd of October. The wed-

ding took place on the 14th of November in London, and soon afterwards Catherine accompanied her youthful husband to Wales, where, in his sixteenth year, the prince died on the 2nd of April 1502. On the 25th of June 1503, she was formally betrothed to the king's second son, Henry, now prince of Wales, and a papal dispensation for the alliance was obtained. The marriage, however, did not take place during the lifetime of Henry VII. Ferdinand endeavoured to cheat the English king of the marriage portion agreed upon, and Henry made use of the presence of the unmarried princess in England to extort new conditions, and especially to secure the marriage of his daughter Mary to the archduke Charles, grandson of Ferdinand, and afterwards Charles V. Catherine was thus from the first the unhappy victim of state politics. Writing to Ferdinand on the 9th of March 1509, she describes the state of poverty to which she was reduced, and declares the king's unkindness impossible to be borne any longer.<sup>1</sup> On the old king's death, however, a brighter prospect opened, for Henry VIII. decided immediately on marrying her, the wedding taking place on the 11th of June and the coronation on the 24th. Catherine now enjoyed a few years of married happiness; Henry showed himself an affectionate husband, and the alliance with Ferdinand was maintained against France. She was not without some influence in state affairs. During Henry's invasion of France in 1513 she was made regent; she showed great zeal and ardour in the preparations for the Scottish expedition, and was riding towards the north to put herself at the head of the troops when the victory of Flodden Field ended the campaign. The following year an affectionate meeting took place between the king and queen at Richmond on the return of the former. Ferdinand's treachery, however, in making a treaty with France roused Henry's wrath, and his angry reproaches fell upon his unfortunate wife; but she took occasion in 1520, during the visit of her nephew Charles V. to England, to urge the policy of gaining his alliance rather than that of France. Immediately on his departure, on the 31st of May 1520, she accompanied the king to France, on the celebrated visit to Francis I., called from its splendour the Field of the Cloth of Gold, but in 1522 war was declared against France and the emperor again welcomed to England. In 1521 she is represented by Shakespeare as pleading for the unfortunate duke of Buckingham.

These early years of happiness and of useful influence and activity had, however, been gradually giving way to gloom and disappointment. Between January 1510 and November 1518 Catherine gave birth to six children (including two princes), who were all stillborn or died in infancy except Mary, born in 1516, and rumour did not fail to ascribe this series of disasters to the curse pronounced in Deuteronomy on incestuous unions. In 1526 the condition of Catherine's health made it highly improbable that she would have more children. No woman had ever reigned in England, alone and in her own right, and to avoid a fresh dispute concerning the succession, and the revival of the civil war, a male heir to the throne was a pressing necessity. The act of marriage, which depended for its validity on the decision of the ecclesiastical courts, had, on account of the numerous dissolutions and dispensations granted, not then attained the security since assured to it by the secular law. For obtaining dissolutions of royal marriages the facilities were especially great. Pope Clement VII. himself permitted such a dissolution in the case of Henry's own sister Margaret, in 1528, proposed later as a solution of the problem that Henry should be allowed two wives,<sup>2</sup> and looked not unfavourably, with the same aim, on the project for marrying the duke of Richmond to Mary, a brother to a sister.<sup>3</sup> In Henry's case also the irregularity of a union, which is still generally reprobated and forbidden in Christendom, and which it was very doubtful that the pope had the power to legalize, provided a moral justification for a dissolution which in other cases did not exist. It was not therefore the immorality of the plea which obstructed the papal decree in

<sup>1</sup> *Cal. of State Pap., England and Spain*, i. 469.

<sup>2</sup> *Lettres and Papers*, iv. 6627, 6705, and app. 261.

<sup>3</sup> *Id.* iv. 5072.

Henry's favour, but the unlucky imprisonment at this time of Clement VII. at the hands of Charles V., Catherine's nephew, which obliged the pope, placed thus "between the hammer and the anvil," to pursue a policy of delay and hesitation. Nor was the immorality of Henry's own character the primary cause of the project of divorce. Had this been so, a succession of mistresses would have served as well as a series of single wives. The real occasion was the king's desire for a male heir. But, however clear this may be, the injustice done to Catherine was no less cruel and real. Rumours, probably then unfounded, of an intended divorce had been heard abroad as early as 1524. But the creation in 1525 of the king's illegitimate son Henry, as duke of Richmond—the title borne by his grandfather Henry VII—and the precedence granted to him over all the peers as well as the princess Mary, together with the special honour paid at this time by the king to his own half-sister Mary, were the first real indications of the king's thoughts. In 1526, and perhaps earlier, Wolsey had been making tentative inquiries at Rome on the subject. In May 1527 a collusive and secret suit was begun before the cardinal, who, as legate, summoned the king to defend himself from the charge of cohabitation with his brother's wife; but these proceedings were dropped. On the 22nd of June Henry informed Catherine that they had been living in mortal sin and must separate. During Wolsey's absence in July at Paris, where he had been commissioned to discuss vaguely the divorce and Henry's marriage with Renée, daughter of Louis XII., Anne Boleyn is first heard of in connexion with the king, his affection for her having, however, begun probably as early as 1523, and the cardinal on his return found her openly installed at the court. In October 1528 the pope issued a commission to Cardinal Campeggio and Wolsey to try the cause in England, and bound himself not to revoke the case to Rome, confirming his promise by a secret decretal commission which, however, was destroyed by Campeggio. But the trial was a sham. Campeggio was forbidden to pronounce sentence without further reference to Rome, and was instructed to create delays, the pope assuring Charles V. at the same time that the case should be ultimately revoked to Rome.<sup>1</sup>

The object of all parties was now to persuade Catherine to enter a nunnery and thus relieve them of further embarrassment. While Henry's envoys were encouraged at Rome in believing that he might then make another marriage, Henry himself gave Catherine assurances that no other union would be contemplated in her lifetime. But Catherine with courage and dignity held fast to her rights, demanded a proper trial, and appealed not only to the bull of dispensation, the validity of which was said to be vitiated by certain irregularities, but to a brief granted for the alliance by Pope Julius II. Henry declared the latter to be a forgery, and endeavoured unsuccessfully to procure a declaration of its falsity from the pope. The court of the legates accordingly opened on the 31st of May 1529, the queen appearing before it on the 18th of June for the purpose of denying its jurisdiction. On the 21st both Henry and Catherine presented themselves before the tribunal, when the queen threw herself at Henry's feet and appealed for the last time to his sense of honour, recalling her own virtue and helplessness. Henry replied with kindness, showing that her wish for the revocation of the cause to Rome was unreasonable in view of the paramount influence then exercised by Charles V. on the pope. Catherine nevertheless persisted in making appeal to Rome, and then withdrew. After her departure Henry, according to Cavendish, Wolsey's biographer, praised her virtues to the court. "She is, my lords, as true, as obedient, as conformable a wife as I could in my phantasy wish or desire. She hath all the virtues and qualities that ought to be in a woman of her dignity or in any other of baser estate." On her refusal to return, her plea was overruled and she was adjudged contumacious, while the sittings of the court continued in her absence. Subsequently the legates paid her a private visit of advice, but were unable to move her from her resolution. Finally, however, in July 1529, the case was, according to her wish, and as the result of the treaty of Barcelona

<sup>1</sup> *Cal. of State Pap., England and Spain*, iii. pt. ii. 779.

and the pope's complete surrender to Charles V., revoked by the pope to Rome: a momentous act, which decided Henry's future attitude, and occasioned the downfall of the whole papal authority in England. On the 7th of March 1530 Pope Clement issued a brief forbidding Henry to make a second marriage, and ordering the restitution of Catherine to her rights till the cause was determined; while at the same time he professed to the French ambassador, the bishop of Tarbes, his pleasure should the marriage with Anne Boleyn have been already made, if only it were not by his authority.<sup>2</sup> The same year Henry obtained opinions favourable to the divorce from the English, French and most of the Italian universities, but unfavourable answers from Germany, while a large number of English peers and ecclesiastics, including Wolsey and Archbishop Warham, joined in a memorial to the pope in support of Henry's cause.

Meanwhile, Catherine, while the great question remained unsolved, was still treated by Henry as his queen, and accompanied him in his visits in the provinces and in his hunting expeditions. On the 31st of May 1531 she was visited by thirty privy councillors, who urged the trial of the case in England, but they met only with a firm refusal. On the 14th of July Henry left his wife at Windsor, removing himself to Woodstock, and never saw her again. In August she was ordered to reside at the Moor in Hertfordshire, and at the same time separated from the princess Mary, who was taken to Richmond. In October she again received a deputation of privy councillors, and again refused to withdraw the case from Rome. In 1532 she sent the king a gold cup as a new year's gift, which the latter returned, and she was forbidden to hold any communication with him. Alone and helpless in confronting Henry's absolute power, her cause found champions and sympathizers among the people, among the court preachers, and in the House of Commons, while Bishop Fisher had openly taken her part in the legatine trial. Subsequently Catherine was removed to Bishops Hatfield, while Henry and Anne Boleyn visited Francis I. Their marriage, anticipating any sentence of the nullity of the union with Catherine, took place after their return about the 25th of January 1533, in consequence of Anne's pregnancy. On the 10th of May Cranmer, for whose consecration as archbishop of Canterbury Henry had obtained bulls from Rome, opened his court, and declared on the 23rd the nullity of Catherine's marriage and the validity of Anne's. On the 10th of August the king caused proclamation to be made forbidding her the style of queen; but Catherine refused resolutely to yield the title for that of princess-dowager. Not long afterwards she was removed to Buckden in Huntingdonshire. Here her household was considerably reduced, and she found herself hemmed in by spies, and in fact a prisoner. In July she had refused Henry the loan of a certain rich cloth, which had done service at the baptism of her children, for the use of Anne Boleyn's expected infant; and on the birth of Elizabeth and the refusal of Mary to give up the title of princess, the latter's household was entirely dismissed and she herself reduced to the position of attendant in Elizabeth's retinue. A project for removing Catherine from Buckden to Somersham, an unhealthy solitude in the isle of Ely, with a still narrower maintenance, was only prevented by her own determined resistance. The attempt in November to incriminate the queen in connexion with Elizabeth Barton failed. She passed her life now in religious devotions, taking strict precautions against the possibility of being poisoned. On the 23rd of March 1534 the pope pronounced her marriage valid, but by this time England had thrown off the papal jurisdiction, the parliament had transferred Catherine's jointure to Anne Boleyn, and the decree had no effect on Catherine's fortunes. She refused to swear to the new act of succession, which declared her marriage null and Anne's infant the heir to the throne, and soon afterwards she was removed to Kimbolton, where she was well treated. On the 21st of May she was visited by the archbishop of York and Tunstall, bishop of Durham, who threatened her with death if she persisted in her refusal, but only succeeded in confirming her resolution. She was kept in strict seclusion, separated from Mary

<sup>2</sup> *Cal. of State Pap., Foreign and Dom.*, iv. 629a.

and from all outside communications, and in December 1535 her health gave way, her death taking place on the 8th of January 1536, not without suspicions of poison, which, however, may be dismissed. She was buried by the king's order in Peterborough cathedral. Before her death she dictated a last letter to Henry, according to Polydore Vergil, expressing her forgiveness, begging his good offices for Mary, and concluding with the astounding assurance—"I vow that mine eyes desire you above all things." The king himself affected no sorrow at her death, and thanked God there was now no fear of war.

Catherine is described as "rather ugly than otherwise; of low stature and rather stout; very good and very religious; speaks Spanish, French, Flemish, English; more beloved by the islanders than any queen that has ever reigned." She was a woman of considerable education and culture, her scholarship and knowledge of the Bible being noted by Erasmus, who dedicated to her his book on *Christian Matrimony* in 1526. She endured her bitter and undeserved misfortunes with extraordinary courage and resolution, and at the same time with great womanly forbearance, of which a striking instance was the compassion shown by her for the fallen Wolsey.

Gairdner, and those on Henry VIII. and Wolsey, where the case is summed up very adversely to Henry, and *The Divorce of Catherine of Aragon*, by J. A. Froude (1891), where it is regarded from the contrary aspect: *Henry VIII.*, by A. F. Pollard (1905); *Cambridge Mod. History* (1903), ii. 416 et seq. and bibliographies, p. 789; *The Wives of Henry VIII.*, by M. Hume (1905). (P. C. Y.)

**CATHERINE OF BRAGANZA** (1638-1705), queen consort of Charles II. of England, daughter of John IV. of Portugal, and of Louisa de Gusman, daughter of the duke of Medina Sidonia, was born on the 15/25 of November 1638 at Villia Viçosa. She was early regarded as a useful medium for contracting an alliance with England, more necessary than ever to Portugal after the treaty of the Pyrenees in 1659 whereby Portugal was ostensibly abandoned by France. Negotiations for the marriage began during the reign of Charles I., were renewed immediately after the Restoration, and on the 23rd of June, in spite of Spanish opposition, the marriage contract was signed, England securing Tangier and Bombay, with trading privileges in Brazil and the East Indies, religious and commercial freedom in Portugal and two million Portuguese crowns (about £300,000); while Portugal obtained military and naval support against Spain and liberty of worship for Catherine. She reached England on the 13th of May 1662, but was not visited by Charles at Portsmouth till the 20th. The next day the marriage was solemnized twice, according to the Roman Catholic and Anglican usages. Catherine possessed several good qualities, but had been brought up in a conventual seclusion and was scarcely a wife Charles would have chosen for himself. Her personal charms were not potent enough to wean Charles away from the society of his mistresses, and in a few weeks after her arrival she became aware of her painful and humiliating position as the wife of the selfish and licentious king. On the first presentation to her of Lady Castlemaine, Charles's mistress *en titre*, whom he insisted on making lady of her bedchamber, she fainted away. She withdrew from the king's society and in spite of Clarendon's attempts to moderate her resentment, declared she would return to Portugal rather than consent to a base compliance. To overcome her resistance nearly the whole of her Portuguese retinue was dismissed. She was helpless, and the violence of her grief and anger soon changed to passive resistance, and then to a complete forbearance and complaisance which gained the king's regard and favour. In the midst of Charles's debauched and licentious court, she lived neglected and retired, often deprived of her due allowance, having no ambitions and taking no part in English politics, but keeping up rather her interest in her native country.

As the prospect diminished of her bearing children to Charles, several schemes were set on foot for procuring a divorce on various pretexts. As a Roman Catholic and near to the king's person Catherine was the special object of attack by the inventors of the Popish Plot. In 1678 the murder of Sir Edmund Berry Godfrey was ascribed to her servants, and Titus Oates accused

her of a design to poison the king. These charges, of which the absurdity was soon shown by cross-examination, nevertheless placed the queen for some time in great danger. On the 28th of November Oates accused her of high treason, and the Commons passed an address for her removal and that of all the Roman Catholics from Whitehall. A series of fresh depositions were sent in against her, and in June 1679 it was decided that she must stand her trial; but she was protected by the king, who in this instance showed unusual chivalry and earned her gratitude. On the 17th of November Shaftesbury moved in the House of Lords for a divorce to enable the king to marry a Protestant and have legitimate issue; but he received little support, and the bill was opposed by Charles, who continued to show his wife "extraordinary affection." During the winter the calumnies against the queen were revived by Fitzharris, who, however, before his execution in 1681 confessed to their falsity; and after the revival of the king's influence subsequent to the Oxford parliament, the queen's position was no more assailed.

During Charles's last illness in 1685 she showed great anxiety for his reconciliation with the Romish Church, and it was probably effected largely through her influence. She exhibited great grief at his death. She afterwards resided at Somerset House and at Hammersmith, where she had privately founded a convent. She interceded with great generosity, but ineffectually, for Monmouth the same year. On the 10th of June 1688 she was present at the birth of the prince of Wales and gave evidence before the council in favour of the genuineness of the child. She was still in England at the Revolution, having delayed her return to Portugal to prosecute a lawsuit against the second earl of Clarendon, formerly her chamberlain. She maintained at first good terms with William and Mary; but the practice of her religion aroused jealousies, while her establishment at Somerset House was said to be the home of cabals against the government; and in 1691 she settled for a short time at Euston. She left England finally with a train of one hundred persons in March 1692, travelling through France and arriving at Lisbon on the 20th of January 1693. She took up her residence at the palace of Bemposta, built by herself, near Lisbon. In 1703 she supported the Methuen Treaty, which cemented still further the alliance between Portugal and England, and in 1704 she was appointed regent of Portugal during the illness of her brother King Pedro II., her administration being distinguished by several successes gained over the Spaniards. She died on the 31st of December 1705, bequeathing her great wealth, the result of long hoarding, after the payment of divers charitable legacies, to King Pedro; and was buried with great ceremony and splendour at Belem.

See L. C. Davidson, *Catherine of Braganza* (1908).

**CATHERINE OF VALOIS** (1401-1437), queen of Henry V. of England, daughter of Charles VI. of France by his wife Isabel of Bavaria, was born in Paris on the 27th of October 1401. The lunacy of her father and the depravity of her mother were serious drawbacks to Catherine, and her only education was obtained in a convent at Poissy. About 1408 a marriage was suggested between the princess and Henry, prince of Wales, afterwards Henry V., who renewed this proposal after he became king in March 1413. In addition to the hand of Catherine, however, the English king asked for a large dowry both in money and lands, and when these demands were rejected war broke out. Once or twice during short intervals of peace the marriage project was revived, and was favoured by Queen Isabel. When peace was eventually made at Troyes in May 1420 Henry and Catherine were betrothed, and the marriage took place at Troyes on the 2nd of June 1420. Having crossed to England with Henry, the queen was crowned in Westminster Abbey on the 23rd of February 1421, and in the following December gave birth to a son, afterwards King Henry VI. She joined Henry in France in May 1422, returning to England after his death in the succeeding August. Catherine's name soon began to be coupled with that of Owen Tudor, a Welsh gentleman, and in 1428 Humphrey, duke of Gloucester, secured the passing of an act to prevent her from marrying without the

consent of the king and council. It appears, however, that by this time Catherine and Tudor were already married. They lived in obscurity till 1436, when Tudor was imprisoned, and Catherine retired to Bermondsey Abbey, where she died on the 3rd of January 1437. Her body was buried in the Lady chapel of Westminster Abbey, and when the chapel was pulled down during the reign of Henry VII., was placed in Henry V.'s tomb. It lay afterwards under the Villiers monument, and in 1878 was re-buried in Henry V.'s chantry. By Tudor Catherine had three sons and a daughter. Her eldest son by this marriage, Edmund, was created earl of Richmond in 1452, and was the father of Henry VII.

See Agnes Strickland, *Lives of the Queens of England*, vol. iii. (London, 1877).

**CATHETUS** (Gr. *κἀθετος*, a perpendicular line), in architecture the eye of the volute, so termed because its position is determined, in an Ionic or voluted capital, by a line let down from the point in which the volute generates.

**CATHOLIC** (Gr. *καθολικός*, general, universal), a designation adopted in the 2nd century by the Christian Church to indicate Christendom as a whole, in contrast with individual churches. With this idea went the notions that Christianity had been diffused throughout the whole earth by the apostles, and that only what was found everywhere throughout the church could be true. The term thus in time became full of dogmatic and political meaning, connoting, when applied to the church, a universal authoritative and orthodox society, as opposed to Gnostic and other "sects" (cf. the famous canon of Vincent of Lerins A.D. 434; *quod ubique, quod semper, quod ab omnibus creditum est*). The term "Catholic" does not occur in the old Roman symbol; but Professor Loofs includes it in his reconstruction, based on typical phrases in common use at the time of the ante-Nicene creeds of the East. In the original form of the Nicene creed itself it does not occur; but in the creed of Jerusalem (348), an amplification of the Nicene symbol, we find "one Holy Catholic Church," and in the revision by Cyril of Alexandria (362) "Catholic and Apostolic Church" (see CREEDS). Thus, though the word "Catholic" was late in finding its way into the formal symbols of the church, it is clear that it had long been in use in the original sense defined above. It must be borne in mind, however, that the designation "Catholic" was equally claimed by all the warring parties within the church at various times; thus, the followers of Arius and Athanasius alike called themselves Catholics, and it was only the ultimate victory of the latter that has reserved for them in history the name of Catholic, and branded the former as Arian.

With the gradual development and stereotyping of the creed it was inevitable that the term "Catholic" should come to imply a more narrowly defined orthodoxy. In the Eastern churches, indeed, the conception of the church as the guardian of "the faith once delivered to the saints" soon overshadowed that of interpretation and development by catholic consent, and, though they have throughout claimed the title of Catholic, their chief glory is that conveyed in the name of the Holy Orthodox Church. In the West, meanwhile, the growth of the power of the papacy had tended more and more to the interpretation of the word "catholic" as implying communion with, and obedience to, the see of Rome (see PAPACY); the churches of the East, no less than the heretical sects of the West, by repudiating this allegiance, had ceased to be Catholic. This identification of "Catholic" with "Roman" was accentuated by the progress of the Reformation. The Reformers themselves, indeed, like other dissidents and reformers before them, did not necessarily repudiate the name of Catholic; they believed, in fact, in catholicism, i.e. the universal sanction of their beliefs, as firmly as did the adherents of "the old religion"; they included the Catholic creeds, definitions formulated by the universal church, in their service books; they too appealed, as the fathers of Basel and Constance had done, from the papal monarchy to the great ecclesiastical republic. The Church of England at least, emphasizing her own essential catholicity, retained in her translations of the ancient symbols the word

"catholic" instead of replacing it by "universal." But the appeal to the verbally inspired Bible was stronger than that to a church hopelessly divided; the Bible, and not the consent of the universal church, became the touchstone of the reformed orthodoxy; in the nomenclature of the time, "evangelical" arose in contradistinction to "Catholic," while, in popular parlance, the "protest" of the Reformers against the "corruptions of Rome" led to the invention of the term "Protestant," which, though nowhere assumed in the official titles of the older reformed churches, was early used as a generic term to include them all.

"Catholic" and "Catholicism" thus again changed and narrowed their meaning; they became, by universal usage, identified definitely with "Romanist" and the creed and obedience of Rome. Even in England, where the church retained most strongly the Catholic tradition, this distinction of "Protestant" and "Catholic" was clearly maintained, at least till the "Catholic revival" in the Church of England of the 19th century. On the continent of Europe the equivalent words (e.g. Ger. *Katholik*, *Katholizismus*; Fr. *catholique*, *catholicisme*) are even more definitely associated with Rome; they have lost the sense which they still convey to a considerable school of Anglicans. The dissident "Catholic" churches are forced to qualify their titles: they are "Old Catholics" (*Alt-Katholiken*) or "German Catholics" (*Deutsch-Katholiken*). The Church of Rome alone, officially and in popular parlance, is "the Catholic Church" (*katholische Kirche*, *église catholique*), a title which she proudly claims as exclusively her own, by divine right, by the sanction of immemorial tradition, and by reason of her perpetual protest against the idea of a "national" churches, consecrated by the Reformation (see CHURCH HISTORY, and ROMAN CATHOLIC CHURCH). The additional qualification of "Roman" she tolerates, since it proclaims her doctrine of the see of Rome as the keystone of Catholicism; but to herself she is "the Catholic Church," and her members are "Catholics."

Yet to concede this claim and surrender without qualification the word "Catholic" to a connotation which is at best only universal in theory, is to beg several very weighty questions. The doctrine of the Catholic Church, i.e. the essential unity and interdependence of "all God's faithful people scattered throughout the world," is common to all sections of Christians. The creed is one; it is the interpretation that differs. In a somewhat narrower sense, too, the Church of England at least has never repudiated the conception of the Catholic Church as a divinely instituted organization for the safe-guarding and proclamation of the Christian revelation. She deliberately retained the Catholic creeds, the Catholic ministry and the appeal to Catholic antiquity (see ENGLAND, CHURCH OF). A large section of her members, accordingly, laying stress on this side of her tradition, prefer to call themselves "Catholics." But, though the invention of the terms "Roman Catholic" and "Roman Catholicism" early implied the retention by the English Church of her Catholic claim, her members were never, after the Reformation, called Catholics; even the Caroline divines of the 17th century, for all their "popish practices," styled themselves Protestants, though they would have professed their adherence to "the Catholic faith" and their belief in "the Holy Catholic Church."

Clearly, then, the exact meaning of the term varies according to those who use it and those to whom it is applied. To the Romanist "Catholic" means "Roman Catholic"; to the high Anglican it means whatever is common to the three "historic" branches into which he conceives the church to be divided—Roman, Anglican and Orthodox; to the Protestant pure and simple it means either what it does to the Romanist; or, in expansive moments, simply what is "universal" to all Christians. In a yet broader sense it is used adjectivally of mere wideness or universality of view, as when we speak of a man as "of catholic sympathies" or "catholic in his tastes."

The name of *Catholic Epistles* is given to those letters (two of Peter, three of John, one of James, one of Jude) incorporated in the New Testament which (except 2 and 3 John) are not, like

those of St Paul, addressed to particular individuals or churches, but to a larger and more indefinite circle of readers. (See BIBLE: *New Testament, Canon.*)

The title of *Catholicus* (καθολικός) seems to have been used under the Roman empire, though rarely, as the Greek equivalent of *consularis* and *praefectus*. Thus Eusebius (*Hist. eccl.* viii. 23) speaks of the catholicus of Africa (καθολικὸν τῆς Ἀφρικῆς). As an ecclesiastical title it was used to imply, not universal (ecumenical), but a great and widespread jurisdiction. Thus the bishop of the important see of Seleucia (Bagdad), though subordinate to the patriarch of Antioch, had the title of Catholicus and power to consecrate even archbishops; and on the division of the see there were two *Catholicis* under the patriarch of Antioch. In Ethiopia, too, there were *Catholicis* with less extensive powers, subject to the patriarch of Alexandria. The title now survives, however, only as that of the head of the Armenian Church (*q.v.*). A bishop's cathedral church is, however, in Greek the *Catholicon*.

An isolated use of the word "catholic" as a secular legal term survives in Scots law, a *catholic creditor* is one whose debt is secured over several or over all of the subjects belonging to the debtor.

**CATHOLIC APOSTOLIC CHURCH, THE**, a religious community often called "Irvingites," though neither actually founded nor anticipated by Edward Irving (*q.v.*) Irving's relation to this community was, according to its members, somewhat similar to that of John the Baptist to the early Christian Church, *i.e.* he was the forerunner and prophet of the coming dispensation, not the founder of a new sect; and indeed the only connexion which Irving seems to have had with the existing organization of the Catholic Apostolic body was in "fostering spiritual persons who had been driven out of other congregations for the exercise of their spiritual gifts." Shortly after Irving's trial and deposition (1831), certain persons were, at some meetings held for prayer, designated as "called to be apostles of the Lord" by certain others claiming prophetic gifts. In the year 1835, six months after Irving's death, six others were similarly designated as "called" to complete the number of the "twelve," who were then formally "separated," by the pastors of the local congregations to which they belonged, to their higher office in the universal church on the 14th of July 1835. This separation is understood by the community not as "in any sense being a schism or separation from the one Catholic Church, but a separation to a special work of blessing and intercession on behalf of it." The twelve were afterwards guided to ordain others—twelve prophets, twelve evangelists, and twelve pastors, "sharing equally with them the one Catholic Episcopate," and also seven deacons for administering the temporal affairs of the church catholic. The apostles were the channels of the Holy Ghost and the mysteries of God, and the authoritative interpreters of "prophetic utterance"; their teaching was brought home to the people by the "evangelists." The function of the prophets was to explain scripture and exhort to boldness, that of the "pastors" is explained by their title. The central episcopacy of forty-eight was regarded as "indicated by prophecy," being foreshown in the forty-eight boards of the Mosaic tabernacle. For ecclesiastical purposes the church universal is under their charge in twelve tribes; for Christendom is considered to be divided into twelve portions or tribes, each tribe being under the special charge of an apostle and his co-ministers, and the seat of the Apostolic College being at Albury, near Guildford. This is an ideal outline which has never been fulfilled. There has never been a "central episcopacy" of forty-eight. The "apostles" alone always held the supreme authority, though, as their number dwindled, "coadjutors" were appointed to assist the survivors, and to exercise the functions of the "apostolate." The last "apostle" died on the 3rd of February 1901.

For the service of the church a comprehensive book of liturgies and offices was provided by the "apostles." It dates from 1842 and is based on the Anglican, Roman and Greek liturgies. Lights, incense, vestments, holy water, chrism, and other

adjuncts of worship are in constant use. The ceremonial in its completeness may be seen in the church in Gordon Square, London, and elsewhere. The daily worship consists of "matins" with "proposition" (or exposition) of the sacrament at 6 A.M., prayers at 9 A.M. and 3 P.M., and "vespers" with "proposition" at 5 P.M. On all Sundays and holy days there is a "solemn celebration of the eucharist" at the high altar; on Sundays this is at 10 A.M. On other days "low celebrations" are held in the side-chapels, which with the chancel in all churches correctly built after apostolic directions are separated or marked off from the nave by open screens with gates. The community has always laid great stress on symbolism, and in the eucharist, while rejecting both transubstantiation and consubstantiation, holds strongly to a real (mystical) presence. It emphasizes also the "phenomena" of Christian experience and deems miracle and mystery to be of the essence of a spirit-filled church.

Each congregation is presided over by its "angel" or bishop (who ranks as angel-pastor in the Universal Church); under him are four-and-twenty priests, divided into the four ministries of "elders, prophets, evangelists and pastors," and with these are the deacons, seven of whom regulate the temporal affairs of the church—besides whom there are also "sub-deacons, acolytes, singers, and door-keepers." The understanding is that each elder, with his co-presbyters and deacons, shall have charge of 500 adult communicants in his district, but this has been but partially carried into practice. This is the full constitution of each particular church or congregation as founded by the "restored apostles," each local church thus "reflecting in its government the government of the church catholic by the angel or high priest Jesus Christ, and His forty-eight presbyters in their fourfold ministry (in which apostles and elders always rank first), and under these the deacons of the church catholic." The priesthood is supported by tithes; it being deemed a duty on the part of all members of the church who receive yearly incomes to offer a tithe of their increase every week, besides the free-will offering for the support of the place of worship, and for the relief of distress. Each local church sends "a tithe of its tithes" to the "Temple," by which the ministers of the Universal Church are supported and its administrative expenses defrayed; by these offerings, too, the needs of poorer churches are supplied. It claims to have among its clergy many of the Roman, Anglican and other churches, the orders of those ordained by Greek, Roman and Anglican bishops being recognized by it with the simple confirmation of an "apostolic act." The community has not changed recently in general constitution or doctrine. It does not publish statistics, and its growth during late years is said to have been more marked in the United States and in certain European countries, such as Germany, than in Great Britain. There are nine congregations enumerated in *The Religious Life of London* (1904).

For further details of doctrines, ritual, &c., see R. N. Bosworth, *Restoration of Apostles and Prophets, Readings on the Liturgy, The Church and Tabernacle, and The Purpose of God in Creation and Redemption* (5th ed., 1888); G. Miller, *History and Doctrines of Irvingism* (1878).

**CATILINE** [LUCIUS SERGIUS CATILINA] (c. 108–62 B.C.), a member of an ancient but impoverished patrician family of Rome, the prime mover in the conspiracy known by his name. He appears in history first as a supporter of Sulla, and during the proscription he was conspicuous for his greed and cruelty. He slew his inoffensive brother-in-law with his own hand, and tortured and mutilated the much-loved Marius Gratidianus. He was believed to have made away with his wife and his son to win the profligate and wealthy Aurelia Orestilla; it was even suspected that he had been guilty of an intrigue with the Vestal Fahlia. In 77 he was quaestor, in 68 praetor, and in 67–66 governor of Africa. His extortions and subsequent impeachment by P. Clodius Pulcher having disqualified him as a candidate for the consulship, he formed a conspiracy, in which he was joined by young men of all classes, even Crassus and Caesar, according to rumour, being implicated. The new consuls were to be murdered on the 1st of January; but the plot—the

execution of which was deferred till the 5th of February—failed in consequence of the impatience of Catiline, who gave the signal too hastily. Soon after, Catiline, having bribed both judges and accuser, was acquitted in the trial for extortion. His scheme was forthwith immensely widened. The city was to be fired, and those who opposed the revolution were to be slain; all debts were to be cancelled; and there was to be a proscription of all the wealthy citizens. Among the conspirators were many men of the first rank and influence. Arms and money were collected, soldiers were enlisted, and the assistance of the slaves was sought. But Catiline's hopes were again disappointed; once more he failed to obtain the consulship (64); and, moreover, it soon became apparent that one of the new consuls, Cicero, was mysteriously able to thwart all the schemes of the conspirators. He was, in fact, informed of every detail, through Fulvia, the mistress of Curius, one of the plotters, who was himself soon persuaded to turn informer. The other consul, C. Antonius, in whom Catiline hoped to find a supporter, was won over and got out of the way by Cicero, who resigned the province of Macedonia in his favour. Before the next *comitia consularia* assembled, the orator had given so impressive a warning of the danger which was impending, that Catiline was once more rejected (63), and the consuls were invested with absolute authority. Catiline now resolved upon open war; preparations were set on foot throughout Italy, especially in Etruria, where the standard of revolt was raised by the centurion C. Manlius (or Mallius), one of Sulla's veterans. A plan to murder Cicero in his own house on the morning of the 7th of November was frustrated. On the next day Cicero attacked Catiline so vigorously in the senate (in his first Catilinarian oration) that he fled to his army in Etruria. Next day Cicero awoke the terror of the people by a second oration delivered in the forum, in consequence of which Catiline and Manlius were declared public enemies, and the consul Antonius was despatched with an army against them. Meanwhile the imprudence of the conspirators in Rome brought about their own destruction. Some deputies from the Allobroges, who had been sent to Rome to obtain redress for certain grievances, were approached by P. Lentulus Sura, the chief of the conspirators, who endeavoured to induce them to join him. After considerable hesitation, the deputies decided to turn informers. The plot was betrayed to Cicero, at whose instigation documentary evidence was obtained, implicating Lentulus and others. They were arrested, proved guilty, and on the 5th of December condemned to death and strangled in the underground dungeon on the slope of the Capitol. This act, which was opposed by Julius Caesar and advocated by Cato Uticensis (and, indirectly, by Cicero), was afterwards vigorously attacked as a violation of the constitution, on the ground that the senate had no power of life and death over a Roman citizen. Thus a heavy blow was dealt to the cause of Catiline, who, in the beginning of 62, saw his legions, only partially armed and diminished by desertion, shut in between those of Metellus Celer and C. Antonius. Near Pistoria he hazarded battle with the forces of the latter, but was completely defeated in a desperate encounter. He himself, fighting with the utmost bravery, rushed into the ranks of the enemy and met his death.

Such was the conspiracy of Catiline and the character of its author, as we find them in the speeches of Cicero, and the histories of Sallust and Dio Cassius (see also Plutarch, *Cicero*; Vell. Pat. ii. 35; Florus iv. 1; Appian, *B.C.* ii. 6; Eutropius vi. 15). It must not be forgotten, however, that our authorities were all members of the aristocratic party. Some of the incidents given as facts by Dio Cassius are manifest absurdities; and Cicero paid more regard to the effect than to the truthfulness of an accusation. We find him at one time admitting that Catiline had almost persuaded him of his honesty and merit, and even seeking a political union with him; at another, when his alliance had been rejected and an election was at hand, declaiming against him as a murderer and a profligate. Lastly, though Sallust's vivid narrative is consistent throughout, it is obvious that he cherished very bitter feelings against the democratic party. Nevertheless, we cannot regard Catiline as an honest

enemy of the oligarchy, or as a disinterested champion of the provincials. It is held by some historians that there was at the time on the part of many of the Roman nobles a determination to raise themselves to power, despite the opposition of the senate; others with greater probability maintain that Catiline's object was simply the cancelling of the huge debts which he and his friends had accumulated. Catiline, by his bravery, his military talents, his vigorous resolution, and his wonderful power over men, was eminently qualified as a revolutionary leader. He is the subject of tragedies by Ben Jonson and P. Crébillon, and of the *Rome savée* of Voltaire.

**CATINAT, NICOLAS** (1637-1712), marshal of France, entered the Gardes Françaises at an early age and distinguished himself at the siege of Lille in 1667. He became a brigadier ten years later, *maréchal de camp* in 1680, and lieutenant-general 1688. He served with great credit in the campaigns of 1676-1678 in Flanders, was employed against the Vaudois in 1686, and after taking part in the siege of Philippsburg at the opening of the War of the League of Augsburg, he was appointed to command the French troops in the south-eastern theatre of war. In 1690 he conquered Savoy, and in 1691 Nice; the battle of Staffarda, won by him over the duke of Savoy in 1690, and that of Marsaglia in 1693, were amongst the greatest victories of the time. In 1696 Catinat forced the duke to make an alliance with France. He had in 1693 been made a marshal of France. At the beginning of the war of the Spanish Succession, Catinat was placed in charge of operations in Italy, but he was much hampered by the orders of the French court and the weakness of the forces for their task. He suffered a reverse at Carpi (1701) and was soon afterwards superseded by Villeroi, to whom he acted as second-in-command during the campaign of Chiari. He died at St Gratien in 1712. His memoirs were published in 1819.

See E. de Broglie, *Catinat, 1637-1712* (Paris, 1902).

**CATLIN, GEORGE** (1796-1872), American ethnologist, was born at Wilkes-Barre, Pennsylvania, in 1796. He was educated as a lawyer and practised in Philadelphia for two years; but art was his favourite pursuit, and forsaking the law he established himself at New York as a portrait painter. In 1832, realizing that the American Indians were dying out, he resolved to rescue their types and customs from oblivion. With this object he spent many years among the Indians in North and South America. He lived with them, acquired their languages, and studied very thoroughly their habits, customs and mode of life, making copious notes and many studies for paintings. In 1840 he came to Europe with his collection of paintings, most of which are now in the National Museum, Washington, as the Catlin Gallery; and in the following year he published the *Manners, Customs and Condition of the North American Indians* in two volumes, illustrated with 300 engravings. This was followed in 1844 by *The North American Portfolio*, containing 25 plates of hunting scenes and amusements in the Rocky Mountains and the prairies of America, and in 1848 by *Eight Years' Travels and Residence in Europe*. In 1861 he published a curious little volume, in "manograph," entitled *The Breath of Life*, on the advantage of keeping one's mouth habitually closed, especially during sleep; and in 1868, *Last Rambles amongst the Indians of the Rocky Mountains and the Andes*. He died in Jersey City, New Jersey, on the 22nd of December 1872.

**CATO, DIONYSIUS**, the supposed author of the *Dionysii Catonis Disticha de Moribus ad Filium*. The name usually given is simply Cato, an indication of the wise character of the maxims inculcated, but Dionysius is added on the authority of a MS. declared by Scaliger to be of great antiquity. This MS. also contains Priscian's translation of the *Periegesis* of the geographer Dionysius Periegetes; this has probably led to the *Disticha* also being attributed to him. In the middle ages the author on the *Disticha* was supposed to be Cato the Elder, who wrote a *Carmen de Moribus*, but extracts from this in Aulus Gellius show that it was in prose. Nothing is really known of the author or date of the *Disticha*; it can only be assigned to the 3rd or 4th century A.D. It is a small collection of moral apophthegms, each consisting of two hexameters, in four books. They are monotheistic in character, not specially Christian. The diction and metre are fairly good. The book had a great reputation in the middle ages, and was translated into many languages; it is frequently referred to by Chaucer, and in 1483 a translation was issued from Carton's press at Westminster.

Editions by F. Hauthal (1869), with full account of MSS. and early editions, and G. Némethy (1895), with critical notes: see also F. Zarncke, *Der deutsche Cato* (1852), a history of middle age German translations; J. Nehab, *Der altenglische Cato* (1879); E. Bischoff, *Prolegomena zum sogenannten Dionysius Cato* (1893), in which the name is discussed; F. Plessis, *Poésie latine* (1909), 663; for medieval translations and editions see Teufel. *Hist. of Roman Lit.* § 398, 3.

**CATO, MARCUS PORCIUS** (234-149 B.C.), Roman statesman, surnamed "The Censor," *Sapiens, Priscus, or Major* (the Elder), to distinguish him from Cato of Utica, was born at Tusculum. He came of an ancient plebeian family, noted for some military services, but not ennobled by the discharge of the higher civil offices. He was bred, after the manner of his Latin forefathers, to agriculture, to which he devoted himself when not engaged in military service. But, having attracted the notice of L. Valerius Flaccus, he was brought to Rome, and became successively quaestor (204), aedile (199), praetor (198), and consul (195) with his old patron. During his term of office he vainly opposed the repeal of the *lex Oppia*, passed during the Second Punic War to restrict luxury and extravagance on the part of women. Meanwhile he served in Africa, and took part in the crowning campaign of Zama (202). He held a command in Sardinia, where he first showed his strict public morality, and again in Spain, which he reduced to subjection with great cruelty, and gained thereby the honour of a triumph (194). In the year 191 he acted as military tribune in the war against Antiochus III. of Syria, and played an important part in the battle of Thermopylae, which finally delivered Greece from the encroachments of the East. His reputation as a soldier was now established; henceforth he preferred to serve the state at home, scrutinizing the conduct of the candidates for public honours and of generals in the field. If he was not personally engaged in the prosecution of the Scipios (Africanus and Asiaticus) for corruption, it was his spirit that animated the attack upon them. Even Africanus, who refused to reply to the charge, saying only, "Romans, this is the day on which I conquered Hannibal," and was absolved by acclamation, found it necessary to retire self-banished to his villa at Liternum. Cato's enmity dated from the African campaign when he quarrelled with Scipio for his lavish distribution of the spoil amongst the troops, and his general luxury and extravagance.

Cato had, however, a more serious task to perform in opposing the spread of the new Hellenic culture which threatened to destroy the rugged simplicity of the conventional Roman type. He conceived it to be his special mission to resist this invasion. It was in the discharge of the censorship that this determination was most strongly exhibited, and hence that he derived the title (the Censor) by which he is most generally distinguished. He revised with unsparing severity the lists of senators and knights, ejecting from either order the men whom he judged unworthy of it, either on moral grounds or from their want of the prescribed means. The expulsion of L. Quinctius Flaminius for wanton cruelty was an example of his rigid justice. His regulations against luxury were very stringent. He imposed a heavy tax

upon dress and personal adornment, especially of women, and upon young slaves purchased as favourites. In 181 he supported the *lex Orchia* (according to others, he first opposed its introduction, and subsequently its repeal), which prescribed a limit to the number of guests at an entertainment, and in 169 the *lex Voconia*, one of the provisions of which was intended to check the accumulation of an undue proportion of wealth in the hands of women. Amongst other things he repaired the aqueducts, cleansed the sewers, prevented private persons drawing off public water for their own use, ordered the demolition of houses which encroached on the public way, and built the first basilica in the forum near the curia. He raised the amount paid by the publican for the right of farming the taxes, and at the same time diminished the contract prices for the construction of public works.

From the date of his censorship (184) to his death in 149, Cato held no public office, but continued to distinguish himself in the senate as the persistent opponent of the new ideas. He was struck with horror, along with many other Romans of the graver stamp, at the licence of the Bacchanalian mysteries, which he attributed to the fatal influence of Greek manners; and he vehemently urged the dismissal of the philosophers (Carneades, Diogenes and Critolaus), who came as ambassadors from Athens, on account of the dangerous nature of the views expressed by them. He had a horror of physicians, who were chiefly Greeks. He procured the release of Polybius, the historian, and his fellow-prisoners, contemptuously asking whether the senate had nothing more important to do than discuss whether a few Greeks should die at Rome or in their own land. It was not till his eightieth year that he made his first acquaintance with Greek literature. Almost his last public act was to urge his countrymen to the Third Punic War and the destruction of Carthage. In 157 he was one of the deputies sent to Carthage to arbitrate between the Carthaginians and Massinissa, king of Numidia. The mission was unsuccessful and the commissioners returned home. But Cato was so struck by the evidences of Carthaginian prosperity that he was convinced that the security of Rome depended on the annihilation of Carthage. From this time, in season and out of season, he kept repeating the cry: "Delenda est Carthago."

To Cato the individual life was a continual discipline, and public life was the discipline of the many. He regarded the individual householder as the germ of the family, the family as the germ of the state. By strict economy of time he accomplished an immense amount of work; he exacted similar application from his dependents, and proved himself a hard husband, a strict father, a severe and cruel master. There was little difference apparently, in the esteem in which he held his wife and his slaves; his pride alone induced him to take a warmer interest in his sons. To the Romans themselves there was little in this behaviour which seemed worthy of censure; it was respected rather as a traditional example of the old Roman manners. In the remarkable passage (xxxix. 40) in which Livy describes the character of Cato, there is no word of blame for the rigid discipline of his household.

Cato perhaps deserves even more notice as a literary man than as a statesman or a soldier. He was the first Latin prose writer of any importance, and the first author of a history of Rome in Latin. His treatise on agriculture (*De Agricultura* or *De Re Rustica*) is the only work by him that has been preserved; it is not agreed whether the work we possess is the original or a later revision. It contains a miscellaneous collection of rules of good husbandry, conveying much curious information on the domestic habits of the Romans of his age. His most important work, *Origines*, in seven books, related the history of Rome from its earliest foundations to his own day. It was so called from the second and third books, which described the rise of the different Italian towns. His speeches, of which as many as 150 were collected, were principally directed against the young free-thinking and loose-principled nobles of the day. He also wrote a set of maxims for the use of his son (*Præcepta ad Filium*), and some rules for everyday life in verse (*Carmen de Moribus*). The collection of proverbs in hexameter verse,

extant under the name of Cato, probably belongs to the 4th century A.D. (See CATO, DIONYSIUS.)

**AUTHORITIES.**—There are lives of Cato by Cornelius Nepos, Plutarch and Aurelius Victor, and many particulars of his career and character are to be gathered from Livy and Cicero. See also F. D. Gerlach, *Marcus Porcius Cato der Censor* (Basel, 1869); G. Kurth, *Caton l'ancien* (Bruges, 1872); J. Cortese, *De M. Porcii Catonis vita, operibus, et lingua* (Turin, 1883); F. Marcucci, *Studio critico sulle Opere di Catone il Maggiore* (1902). The best edition of the *De Agricultura* is by H. Keil (1884-1891), of the fragments of the *Origines* by H. Peter (1883) in *Historicum Romanorum Fragmenta*, of the fragments generally by H. Jordan (1860); see also J. Wordsworth, *Fragments and Specimens of Early Latin* (1874); M. Schanz, *Geschichte der römischen Literatur* (1898); article in Smith's *Dictionary of Greek and Roman Biography*; Mommsen, *Hist. of Rome* (Eng. trans.), bk. iii. ch. xi and xiv.; Warde Fowler, *Social Life at Rome* (1909).

**CATO, MARCUS PORCIUS** (95-46 B.C.), Roman philosopher, called *Uticensis* to distinguish him from his great-grandfather, "the Censor." On the death of his parents he was brought up in the house of his uncle, M. Livius Drusus. After fighting with distinction in the ranks against Spartacus (72 B.C.), he became a military tribune (67), and served a campaign in Macedonia, but he never had any enthusiasm for the military profession. On his return he became quaestor, and showed so much zeal and integrity in the management of the public accounts that he obtained a provincial appointment in Asia, where he strengthened his reputation. Though filled with disgust at the corruption of the public men with whom he came in contact, he saw much to admire in the discipline which Lucullus had enforced in his own eastern command, and he supported his claims to a triumph, while he opposed the inordinate pretensions of Pompey. When the favour of the nobles gained him the tribuneship, he exerted himself unsuccessfully to convict L. Licinius Murena (2), one of their chief men, of bribery. Cicero, who defended Murena, was glad to have Cato's aid when he urged the execution of the Catilinarian conspirators. Cato's vote on this matter drew upon him the bitter resentment of Julius Caesar, who did his utmost to save them.

Cato had now become a great power in the state. Though possessed of little wealth and no family influence, his unflinching resolution in the cause of the ancient free state rendered him a valuable instrument in the hands of the nobles. He vainly opposed Caesar's candidature for the consulship in 59, and his attempt, in conjunction with Bibulus, to prevent the passing of Caesar's proposed agrarian law for distributing lands amongst the Asiatic veterans, proved unsuccessful. Nevertheless, although his efforts were ineffectual, he was still an obstacle of sufficient importance for the triumvirs to desire to get rid of him. At the instigation of Caesar he was sent to Cyprus (58) with a mission to depose its king, Ptolemy (brother of Ptolemy Auletes), and annex the island. On his return two years later he continued to struggle against the combined powers of the triumvirs in the city, and became involved in scenes of violence and riot. He succeeded in obtaining the praetorship in 54, and strenuously exerted himself in the hopeless and thankless task of suppressing bribery, in which all parties were equally interested. He failed to attain the consulship, and had made up his mind to retire from the arena of civic ambition when the civil war broke out in 49. Feeling that the sole chance for the free state lay in conceding an actual supremacy to Pompey, whom he had formerly vigorously opposed, he did not scruple to support the unjust measures of the nobles against Caesar. At the outset of the war he was entrusted with the defence of Sicily, but finding it impossible to resist the superior forces of C. Scribonius Curio, who had landed on the island, he joined Pompey at Dyrrhachium. When his chief followed Caesar to Thessaly he was left behind in charge of the camp, and thus was not present at the battle of Pharsalus. After the battle, when Pompey abandoned his party, he separated himself from the main body of the republicans, and conducted a small remnant of their forces into Africa. After his famous march through the Libyan deserts, he shut himself up in Utica, and even after the decisive defeat at Thapsus (46), in spite of

the wishes of his followers, he determined to keep the gates closed till he had sent off his adherents by sea. While the embarkation was in progress he continued calm and dignified; when the last of the transports had left the port he cheerfully dismissed his attendants, and soon afterwards stabbed himself.

He had been reading, we are told, in his last moments Plato's dialogue on the immortality of the soul, but his own philosophy had taught him to act upon a narrow sense of immediate duty without regard to the future. He conceived that he was placed in the world to play an active part, and when disabled from carrying out his principles, to retire gravely from it. He had lived for the free state, and it now seemed his duty to perish with it. In politics he was a typical doctrinaire, abhorring compromise and obstinately blind to the fact that his national ideal was a hopeless anachronism. From the circumstances of his life and of his death, he has come to be regarded as one of the most distinguished of Roman philosophers, but he composed no works, and bequeathed to posterity no other instruction than that of his example. The only composition by him which we possess is a letter to Cicero (*Ad Fam.* xv. 5), a polite refusal of the orator's request that he would endeavour to procure him the honour of a triumph. The school of the Stoics, which took a leading part in the history of Rome under the earlier emperors, looked to him as its saint and patron. It continued to wage war against the empire, hardly less openly than Cato himself had done, for two centuries, till at last it became actually seated on the imperial throne in the person of Marcus Aurelius. Immediately after his death Cato's character became the subject of discussion; Cicero's panegyric *Cato* was answered by Caesar in his *Anticato*. Brutus, dissatisfied with Cicero's work, produced another on the same subject; in Lucan *Cato* is represented as a model of virtue and disinterestedness.

See *Life* by Plutarch, and compare Addison's tragedy. Modern biographies by H. Wartmann (Zürich, 1859), and F. D. Gerlach (Basel, 1866); C. W. Oman, *Seven Roman Statesmen of the Late Republic, Cato ...* (1902); Mommsen, *Hist. of Rome* (Eng. trans.), bk. v. ch. v.; article in Smith's *Dictionary of Classical Biography*; Gaston Boissier, *Cicero and his Friends* (Eng. trans., 1897), esp. pp. 277 foll.; Warde Fowler, *Social Life at Rome* (1909).

**CATO, PUBLIUS VALERIUS**, Roman poet and grammarian, was born about 100 B.C. He is of importance as the leader of the "new" school of poetry (*poetae novi, νεώτεροι*, as Cicero calls them). Its followers rejected the national epic and drama in favour of the artificial mythological epics and elegies of the Alexandrian school, and preferred Euphron of Chalcis to Ennius. Learning, that is, a knowledge of Greek literature and myths, and strict adherence to metrical rules were regarded by them as indispensable to the poet. The *στίχονα* were also determined opponents of Pompey and Caesar. The great influence of Cato is attested by the lines:—

"Cato grammaticus, Latina Siren,  
Qui solus legit ac facit poetas."

Our information regarding his life is derived from Suetonius (*De Grammaticis*, 11). He was a native of Cisalpine Gaul, and lost his property during the Sullan disturbances before he had attained his majority. He lived to a great age, and during the latter part of his life was in very reduced circumstances. He was at one time possessed of considerable wealth, and owned a villa at Tusculum which he was obliged to hand over to his creditors. In addition to grammatical treatises, Cato wrote a number of poems, the best-known of which were the *Lydia* and *Diana*. In the *Indignatio* (perhaps a short poem) he defended himself against the accusation that he was of servile birth. It is probable that he is the Cato mentioned as a critic of Lucilius in the lines by an unknown author prefixed to Horace, *Satires*, i. 10.

Among the minor poems attributed to Virgil is one called *Dirae* (or rather two, *Dirae* and *Lydia*). The *Dirae* consists of imprecations against the estate of which the writer has been deprived, and where he is obliged to leave his beloved Lydia; in the *Lydia*, on the other hand, the estate is regarded with envy as the possessor of his charmer. Joseph Justus Scaliger was the first to attribute the poem (divided into two by R. Jacobs) to Valerius Cato, on the ground

"Cato, the grammarian, the Latin siren, who alone reads aloud the works and makes the reputation of poets."

that he had lost an estate and had written a *Lydia*. The question has been much discussed; the balance of opinion is in favour of the *Drow* being assigned to the beginning of the Augustan age, although so distinguished a critic as O. Ribbeck supports the claims of *Cato* to the authorship. The best edition of these poems is by A. F. Nibbe (1847), with exhaustive commentary and excursuses; a clear account of the question will be found in M. Schanz's *Geschichte der römischen Litteratur*; for the "new" school of poetry see Mommsen, *Hist. of Rome*, bk. v. ch. xii.; F. Fleissig, *Poësie latine* (1909), 188.

**CATS, JACOB** (1577-1660), Dutch poet and humorist, was born at Brouwershaven in Zealand on the 10th of November 1577. Having lost his mother at an early age, and being adopted with his three brothers by an uncle, Cats was sent to school at Zierikzee. He then studied law at Leiden and at Orleans, and, returning to Holland, he settled at the Hague, where he began to practise as an advocate. His pleading in defence of a wretched creature accused of witchcraft brought him many clients and some reputation. He had a serious love affair about this time, which was hroken off on the very eve of marriage by his catching a tertian fever which defied all attempts at cure for some two years. For medical advice and change of air Cats went to England, where he consulted the highest authorities in vain. He returned to Zealand to die, but was cured mysteriously by a strolling quack. He married in 1602 a lady of some property, Elaabeth von Valkenburg, and thenceforward lived at Grypskerke in Zealand, where he devoted himself to farming and poetry. His best works are: *Emblemata or Minnebeelden with Maegdenplicht* (1618); *Spiegel van den ouden en nieuwen Tijd* (1632); *Houwelyck* . . . (1625); *Selstrijt* (1620); *Ouderdom, Buiem leven* . . . en *Hofgedachten of Sorgvliet* (1664); and *Gedachten of slapelooze nachten* (1661). In 1621, on the expiration of the twelve years' truce with Spain, the breaking of the dykes drove him from his farm. He was made pensionary (stipendiary magistrate) of Middelburg; and two years afterwards of Dort. In 1627 Cats came to England on a mission to Charles I., who made him a knight. In 1636 he was made grand pensionary of Holland, and in 1648 keeper of the great seal; in 1651 he resigned his offices, but in 1657 he was sent a second time to England on what proved to be an unsuccessful mission to Cromwell. In the seclusion of his villa of Sorgvliet (Fly-oom-Care), near the Hague, he lived from this time till his death, occupied in the composition of his autobiography (*Eighty-two Years of My Life*, first printed at Leiden in 1734) and of his poems. He died on the 12th of September 1660, and was buried by torchlight, and with great ceremony, in the Klooster-Kerk at the Hague. He is still spoken of as "Father Cats" by his countrymen.

Cats was contemporary with Hooft and Vondel and other distinguished Dutch writers in the golden age of Dutch literature, but his Orangist and Calvinistic opinions separated him from the liberal school of Amsterdam poets. He was, however, intimate with Constantijn Huygens, whose political opinions were more nearly in agreement with his own. For an estimate of his poetry see **DUTCH LITERATURE**. Hardly known outside of Holland, among his own people for nearly two centuries he enjoyed an enormous popularity. His diffuseness and the antiquated character of his matter and diction, have, however, come to be regarded as difficulties in the way of study, and he is more renowned than read. A statue to him was erected at Brouwershaven in 1829.

See Jacob Cats, *Complete Works* (1790-1800, 19 vols.), later editions by van Vloten (Zwolle, 1858-1866; and at Schiedam, 1866-1870); Pigott, *Moral Emblems, with Aphorisms, &c.*, from *Jacob Cats* (1860); and P. C. Witsen Geijsbek, *Het Leven en de Verdiensten van Jacob Cats* (1829). Southey has a very complimentary reference to Cats in his "Epistle to Allan Cunningham."

**CATS-EYE**, a name given to several distinct minerals, their common characteristic being that when cut with a convex surface they display a luminous band, like that seen by reflection in the eye of a cat. (1) Precious cat's-eye, oriental cat's-eye or chrysoberyl cat's-eye. This, the rarest of all, is a chatoyant variety of chrysoberyl (*q.v.*), showing in the finest stones a very sharply defined line of light. One of the grandest known specimens was in the Hope collection of precious stones, exhibited for many years at the Victoria and Albert Museum. (2) Quartz cat's-eye. This

is the common form of cat's-eye, in which the effect is due to the inclusion of parallel fibres of asbestos. Like the chrysoberyl, it is obtained chiefly from Ceylon, but though coming from the East it is often called "occidental cat's-eye"—a term intended simply to distinguish it from the finer or "oriental" stone. It is readily distinguished by its inferior density, its specific gravity being only 2.65, whilst that of oriental cat's-eye is as high as 3.7. A greenish fibrous quartz, cut as cat's-eye, occurs at Hof and some other localities in Bavaria. (3) Crocidolite cat's-eye, a beautiful golden brown mineral, with silky fibres, found in Griqualand West, and much used in recent years as an ornamental stone, sometimes under the name of "South African cat's-eye." It consists of fibrous quartz, coloured with oxide of iron, and results from the alteration of crocidolite (*q.v.*). It is often distinguished as "tiger's-eye" (or more commonly "tiger-eye"), whilst a blue variety, less altered, is known as "hawk's-eye." By the action of hydrochloric acid the colour of tiger's-eye may to a large extent be removed, and a greyish cat's-eye obtained. (4) Corundum cat's-eye. In some asteriated corundum (see **ASTERIA**) the star is imperfect and may be reduced to a luminous zone, producing an indistinct cat's-eye effect. According to the colour of the corundum the stone is known as sapphire cat's-eye, ruby cat's-eye, topaz cat's-eye, &c. (F. W. R.)

**CATSKILL**, a village and the county-seat of Greene county, New York, U.S.A., on the W. bank of the Hudson river, 33 m. S. of Albany. Pop. (1890) 4920; (1900) 5484; of whom 657 were foreign-born; (1910) 5296. It is served by the West Shore railway, by several lines of river steamboats, and by the Catskill Mountain railway, connecting it with the popular summer resorts in the Catskill mountains. A ferry connects with Catskill station (Greendale) on the east side of the Hudson. The village is in a farming country, and manufactures woollen goods and bricks, but it is best known as a summer resort, and as the principal gateway to the beautiful Catskill Mountain region. The *Recorder*, a weekly newspaper, was established here in 1792 as the *Packet*. The first settler on the present site of Catskill was Derrick Teunis van Vechten, who built a house here in 1680. The village was not incorporated until 1806.

See J. D. Pinckney, *Reminiscences of Catskill* (Catskill, 1868).

**CATSKILL** (formerly **KAATSKILL**) **MOUNTAINS**, a group of moderate elevation pertaining to the Alleghany Plateau, and not properly included in the Appalachian system of North America because they lack the internal structures and the general parallelism of topographic features which characterize the Appalachian ranges. The group contains many summits above 3000 ft. elevation and half a dozen approaching 4000, Slide Mountain (4205 ft.), and Hunter Mountain (4025 ft.), being the only ones exceeding that figure. The bottom lands along the creeks which drain the mountains, together with rolling uplands rising to elevations of from 1500 to 2000 ft., are under cultivation, the mountain slopes being forested or devoted to grazing. The pure and cool atmosphere attracts summer visitors, for whose accommodation many hotels have been built, some of which have become celebrated. Stoney Clove and Kaaterskill Clove are picturesque gorges, the former being traversed by a railway, and the latter containing three cascades having a total fall of about 300 ft. The growing need of New York City for an increased water-supply has driven her engineers to the Catskills, where several great reservoirs have been projected to supplement those of the Croton watershed.

**CATTANEO, CARLO** (1801-1860), Italian philosopher and patriot. A republican in his convictions, during his youth he had taken part in the Carbonarist movement in Lombardy. He devoted himself to the study of philosophy, hoping to regenerate the Italian people by withdrawing them from romanticism and rhetoric, and turning their attention to the positive sciences. He expounded his ideas in a review founded by him at Milan in 1837, called *Il Politecnico*. But when the revolution of 1848 broke out he threw himself heart and soul into the fray, and became one of the leading spirits of the insurrection against the Austrians, known as the Five Days of Milan (March 18-22, 1848). Together with Terzaghi, Cernuschi and Clerici he formed a

council of war which, having its headquarters at Casa Taverna, directed the operations of the insurgents. He was second to none in self-sacrificing energy and heroic resolution. When on the 18th of March Field Marshal Radetzky, feeling that the position of the Austrian garrison was untenable, sounded the rebels as to their terms, some of the leaders were inclined to agree to an armistice which would give time for the Piedmontese troops to arrive (Piedmont had just declared war), but Cattaneo insisted on the complete evacuation of Lombardy. Again on the 21st, Radetzky tried to obtain an armistice, and Durini and Borromeo were ready to grant it, for it would have enabled them to reorganize the defences and replenish the supplies of food and ammunition, which could only last another day. But Cattaneo replied: "The enemy having furnished us with munitions thus far, will continue to furnish them. Twenty-four hours of victuals and twenty-four hours of hunger will be many more hours than we shall need. This evening, if the plans we have just arranged should succeed, the line of the bastions will be broken. At any rate, even though we should lack bread, it is better to die of hunger than on the gallows." On the expulsion of the Austrians the question arose as to the future government of Milan and Italy. Cattaneo was an uncompromising republican and a federalist; so violent was his dislike of the Piedmontese monarchy that when he heard that King Charles Albert had been defeated by the Austrians, and that Radetzky was marching back to reoccupy Milan, he exclaimed: "Good news, the Piedmontese have been beaten. Now we shall be our own masters; we shall fight a people's war, we shall chase the Austrians out of Italy, and set up a Federal Republic." When the Austrians returned Cattaneo had to flee, and took refuge at Lugano, where he gave lessons, wrote his *Storia della Rivoluzione del 1848*, the *Archivio triennale delle cose d' Italia* (3 vols., 1850-1855), and then early in 1860 he started the *Politecnico* once more. He bitterly attacked Cavour for his unitarian views, and for the cession of Nice and Savoy. In 1860 Garibaldi summoned him to Naples to take part in the government of the Neapolitan provinces, but he would not agree to the union with Piedmont without local autonomy. After the union of Italy he was frequently asked to stand for parliament, but always refused because he could not conscientiously take the oath of allegiance to the monarchy. In 1868 the pressure of friends overcame his resistance, and he agreed to stand, but at the last moment he drew back, still unable to take the oath, and returned to Lugano, where he died in 1869. As a writer Cattaneo was learned and brilliant, but far too bitter a partisan to be judicious, owing to his narrowly republican views; his ideas on local autonomy were perhaps wise, but, at a moment when unity was the first essential, inopportune.

Zanoni *Carlo Cattaneo nella vita e nelle opere* (Rome, 1898); see also his own *Opere edite ed inedite* (7 vols., Florence, 1881-1892), *Scritti politici ed epistolari* (3 vols., Florence, 1892-1901), *Scritti storici, letterari* (Milan, 1898, &c.).

**CATTARO** (Serbo-Croatian *Kotor*), the chief town of an administrative district in Dalmatia, Austria. Pop. (1900) of town, 3021; of commune, 5418. Cattaro occupies a narrow ledge between the Montenegrin Mountains and the Bocche di Cattaro, a winding and beautiful inlet of the Adriatic Sea. This inlet expands into five broad gulfs, united by narrower channels, and forms one of the finest natural harbours in Europe. Teodo, on the outermost gulf, is a small naval port. Cattaro is strongly fortified, and about 3000 troops are stationed in its neighbourhood. On the seaward side, the defensive works include Castelnuovo (*Erceg Novi*), which guards the main entrance to the Bocche. On the landward side, the long walls running from the town to the castle of San Giovanni, far above, form a striking feature in the landscape; and the heights of the Krivoscie or Crevoscia (*Krivostije*), a group of barren mountains between Montenegro, Herzegovina and the sea, are crowned by small forts. Cattaro is divided almost equally between the Roman Catholic and Orthodox creeds. It is the seat of a Roman Catholic bishop, with a small cathedral, a collegiate church and several convents.

The transit trade with Montenegro is impeded by high tariffs on both sides of the frontier. Foreign visitors to Montenegro usually land at Cattaro, which is connected by steamer with Trieste and by road with Cettigne. The railway from Ragusa terminates at Zelenika, near Castelnuovo.

There are many interesting places on the shores of the Bocche. Castelnuovo is a picturesque town, with a dismantled 14th-century citadel, which has, at various times, been occupied by Bosnians, Turks, Venetians, Spaniards, Russians, French, English and Austrians. The orthodox convent of St Sava, standing amid beautiful gardens, was founded in the 16th century, and contains many fine specimens of 17th-century silversmiths' work. There is a Benedictine monastery on a small island opposite to Perasto (*Perast*), 8 m. east of Castelnuovo. Perasto itself was for a time an independent state in the 14th century. Rhizon, the modern hamlet of Risano, close by, was a thriving "Illyrian" city as early as 220 B.C., and gave its name to the Bocche, then known as *Rhisonicus Sinus*. Rhizon submitted to Rome in 168 B.C., and about the same time Ascrivium, or Ascrivium, the modern Cattaro, is first mentioned as a neighbouring city. Justinian built a fortress above Ascrivium in A.D. 535, after expelling the Goths, and a second town probably grew up on the heights round it, for Constantine Porphyrogenitus, in the 10th century, alludes to "Lower Cattaro" (*τὸ κάτω Δεκάρεπα*). The city was plundered by the Saracens in 840, and by the Bulgarians in 1102. In the next year it was ceded to Serbia by the Bulgarian tsar Samuel, but revolted, in alliance with Ragusa, and only submitted in 1184, as a protected state, preserving intact its republican institutions, and its right to conclude treaties and engage in war. It was already an episcopal see, and, in the 13th century, Dominican and Franciscan monasteries were established to check the spread of Bogomilism. In the 14th century the commerce of Cattaro rivalled that of Ragusa, and provoked the jealousy of Venice. The downfall of Serbia in 1389 left the city without a guardian, and, after being seized and abandoned by Venice and Hungary in turn, it passed under Venetian rule in 1420. It was besieged by the Turks in 1538 and 1657, visited by plague in 1572, and nearly destroyed by earthquakes in 1563 and 1667. By the treaty of Campo-Formio in 1797 it passed to Austria; but in 1805, by the treaty of Pressburg, it was assigned to Italy, and was united in 1810 with the French empire. In 1814 it was restored to Austria by the congress of Vienna. The attempt to enforce compulsory military service, made and abandoned in 1869, but finally successful in 1881, led to two short-lived revolts among the Krivoscians, during which Cattaro was the Austrian headquarters.

See G. Gekich (Gelčić), *Memorie storiche sulle Bocche di Cattaro* (Zara, 1880).

**CATTEGAT**, or **KATTEGAT** (Scand. "cat's-throat"), a strait forming part of the connexion between the Baltic and the North Seas. It lies north and south between Sweden and Denmark, and connects north with the Skagerrack and south through the Sound, the Great Belt and the Little Belt with the Baltic Sea. Its length is about 150 m. and its extreme breadth about 90 m.

**CATTERMOLE, GEORGE** (1800-1868), English painter, chiefly in water-colours, was born at Dickleburgh, near Diss, Norfolk, in August 1800. At the age of sixteen he began working as an architectural and topographical draughtsman; afterwards he contributed designs to be engraved in the annuals then so popular; thence he progressed into water-colour painting, becoming an associate of the Water-Colour Society in 1822, and a full member in 1833. In 1850 he withdrew from active connexion with this society, and took to painting in oil. His most fertile period was between 1833 and 1850. At the Paris exhibition of 1855 he received one of the five first-class gold medals awarded to British painters. He also enjoyed professional honours in Amsterdam and in Belgium. He died on the 24th of July 1868. Among his leading works are "The Murder of the Bishop of Liège" (15th century), "The Armourer relating the Story of the Sword," "The Assassination of the Regent Murray by Hamilton of Bothwellhaugh," and (in oil) "A Terrible Secret."

He was largely employed by publishers, illustrating the *Waverley Novels* and the *Historical Annual* of his brother the Rev. Richard Cattermole (his scenes from the wars of Cavaliers and Roundheads in this series are among his best engraved works), and many other volumes besides. Cattermole was a painter of no inconsiderable gifts, and of great facility in picturesque resource; he was defective in solidity of form and texture, and in realism or richness of colour. He excelled in rendering scenes of chivalry, of medievalism, and generally of the romantic aspects of the past.

**CATTLE** (Norman Fr. *catel*, from Late Lat. *capitale*, wealth or property, a word applied in the feudal system to movable property and particularly to live stock, and surviving in its wider meaning as "chattel" or "chattle"), a general term for the cows and oxen of agricultural use. For the zoological account, see BOVIDÆ, and the subordinate articles there referred to; for details concerning dairy-farming, see DAIRY.

Oxen appear to have been among the earliest of domesticated animals, as they undoubtedly were among the most important agents in the growth of early civilization. They are mentioned in the oldest written records of the Hebrew and Hindu peoples, and are figured on Egyptian monuments raised over 3000 years a.c.; while remains of domesticated specimens have been found in Swiss lake-dwellings along with the stone implements and other relics of Neolithic man. In infant communities a man's wealth was measured by the number and size of his herds—Abraham, it is said, was rich in cattle—and oxen for a long period formed, as they still do among many savage or semi-savage tribes, the favourite medium of exchange between individuals and communities. After the introduction of a metal coinage into ancient Greece, this method of exchange was commemorated by stamping the image of an ox on the new money; while the connexion between cattle and coin as symbols of wealth has left its mark on the languages of Europe, as is seen in the Latin word *pecunia* and the English "pecuniary," derived from *pecus*, cattle. The value attached to cattle in ancient times is further shown by the Bull figuring among the signs of the zodiac; in its worship by the ancient Egyptians under the title of Apis; in the veneration which has always been paid to it by the Hindus, according to whose sacred legends it was the first animal created by the three divinities directed by the supreme Deity to furnish the earth with animated beings; and in the important part it played in Greek and Roman mythology. The Hindus were not allowed to shed the blood of the ox, and the Egyptians could only do so in sacrificing to their gods. Both Hindus and Jews were forbidden to muzzle it when treading out the corn; to destroy it wantonly was a crime among the Romans, punishable with exile.

**Breeds.**—There exist in Britain four interesting remnants of what were at one time numerous enclosed herds of ancient forest cattle, with black or red points, in parks at Chillingham, Cadzow, Vaynol (near Bangor, North Wales) and Chartley. A few of the last have been removed to Woburn. Other representatives of old stock are—a resuscitated white Welsh breed with black points, derived from white specimens born of black Welsh cows; several herds of a white polled breed with black points; a herd of the ancient Polled Suffolk Dun, an excellent milking breed; a White Belted Galloway and a White Belted Welsh breed; the old Gloucester breed at Badminton, with a white rump, tail and underline, related to the now extinct Glamorgan breed; the Shetland breed; and a few herds of Dutch cattle preserved for their superior milking powers.

The prominent breeds of cattle in the British Isles<sup>1</sup> comprise the Shorthorn, Lincolnshire Red Shorthorn, Hereford, Devon, South Devon, Sussex, Welsh, Longhorn, Red Polled, Aberdeen-Angus, Galloway, West Highland, Ayrshire, Jersey, Guernsey, Kerry and Dexter.

The Shorthorn, Lincolnshire Red Shorthorn, Hereford, Devon, South Devon, Sussex, Longhorn and Red Polled breeds are native to England; the Aberdeen-Angus, Galloway, Highland

and Ayrshire breeds to Scotland; and the Kerry and Dexter breeds to Ireland. The Jersey and Guernsey breeds—often spoken of as Channel Islands cattle—belong to the respective islands whose names they bear, and great care is taken to keep them isolated from each other. The term Alderney is obsolete, the cattle of Alderney being mainly a type of the Guernsey breed.

Among breeds well known in the United States<sup>2</sup> and not mentioned above, the more important are the Holsteins, large black and white cattle highly valued for their abundant milk production, and the Dutch Belted breed, black with a broad white band round the body, also good milkers.

The *Shorthorn*<sup>3</sup> is the most widely distributed of all the breeds of cattle both at home and abroad. No census of breeds has ever been taken in the United Kingdom, but such an enumeration would show the Shorthorn far to exceed in numbers any other breed, whilst the great majority of cross-bred cattle contain Shorthorn blood. During the last quarter of the 18th century the brothers Charles Colling (1751-1836) and Robert Colling (1749-1820), by careful selection and breeding, improved the cattle of the Teeswater district in the county of Durham. If the Shorthorn did not originate thus, it is indisputable that the efforts of the Collings<sup>4</sup> had a profound influence upon the fortunes of the breed. It is still termed the Durham breed in most parts of the world except the land of its hirth, and the geographical name is far preferable, for the term "shorthorn" is applicable to a number of other breeds. Other skilled breeders turned their attention to the Shorthorns and established famous strains, the descendants of which can still be traced. By Thomas Booth, of Killerby and Warlaby in Yorkshire (1777), the "Booth" strains of Shorthorns were originated; by Thomas Bates, of Kirklevington in Yorkshire, the "Bates" families<sup>5</sup> (1800).

The Shorthorn is sometimes spoken of as the ubiquitous breed, its striking characteristic being the ease with which it adapts itself to varying conditions of soil, climate and management. It is also called the "red, white and roan." The roan colour is very popular, and dark red has its supporters, as in the case of the *Lincolnshire Red Shorthorns*; white is not in favour, especially abroad. The Shorthorn breed is more noted for its beef-making than for its milk-yielding properties, although the non-pedigree milking Shorthorn of the north of England is an excellent cow with dual-purpose qualifications of the first order. An effort is being made to restore milking qualities to certain strains of pedigree blood.

The culmination of what may be termed the Booth and Bates period was in the year 1875, when the sales took place of Lord Dunmore's and William Torr's herds, which realized extraordinary prices. In that black year of farming, 1879, prices were declining, and they continued to do so till within the last few years of the close of the 19th century, when there set in a gradual revival, stimulated largely by the commercial prosperity of the country. The result of extremely high prices when line-bred animals were in fashion was a tendency to breed from all kinds of animals that were of the same tribe, without selection. A deterioration set in, which was aggravated by the overlooking of the milking properties. Shorthorn breeders came to see that change of blood was necessary. Meanwhile, for many years breeders in Aberdeenshire had been holding annual sales of young bulls and heifers from their herds. The late Amos Cruickshank began his annual sales in the 'forties, and the late W. T. Talbot-Crosbie had annual sales from his Shorthorn herd in the south-west of Ireland for a number of years. Many Aberdeen farmers emigrated to Canada, and bought Shorthorn calves in their native county to take with them. The Cruickshanks held their bull sales at that time, and many of their animals were bought by the small breeders in Canada. This continued until 1875, when the Cruickshanks had so much private demand that they discontinued their public sales. Subsequently, when Cruickshank sold his herd privately

to James Nelson & Sons for exportation, the animals could not all be shipped, and W. Duthie, of Collynie, Aberdeenshire, bought some of the older cows, whilst J. Deane Willis, of Bapton Monar, Wilts, bought the yearling heifers. Duthie thereupon resumed the sales that the Cruickshanks had relinquished, his averages being £30 in 1892, about £50 in 1893-1894, and £80 in 1895. These prices advanced through English breeders requiring a little change of blood, and also through the increasing tendency to exhibit animals of great substance, or rather to feed animals for show. The success of this movement strengthened the demand, whilst an inquiry for his line of blood arose in the United States and Canada. A faithful contemporary history of the Shorthorn breed is to be found in *Thornton's Circular*, published quarterly since 1868; see also J. Sinclair, *History of Shorthorn Cattle* (1907); R. Bruce, *Fifty Years among Shorthorns* (1907); A. H. Sanders, *Shorthorn Cattle* (Chicago, 1901).

The *Lincolnshire Red Shorthorns* are the best dual-purpose cattle—for milk and meat—that possess a pedigree record, in the United Kingdom, and their uniform cherry red colour has brought them into high favour in tropical countries for crossing with the native breeds.

The *Hereford* breed is maintained chiefly in Herefordshire and the adjoining counties. Whilst a full red is the general colour of the body, the Herefords are distinguished by their white face, white chest and abdomen, and white mane. The legs up to the knee or hock are also often white. As a protection against the sun in a hot climate dark spots on the eyelids or round the orbits are valuable. The horns are moderately long. Herefords, though they rear their own calves, have acquired but little fame as dairy cattle. They are very hardy, and produce beef of excellent quality. Being docile, they fatten easily and readily, and as graziers' beasts they are in high favour.

When the Bates' Shorthorn huddle burst in America about 1877, the Hereford gradually replaced the Shorthorn of the western ranches, and it is now the most numerous ranch animal in the United States and Canada. The bulls beat the bulls of all other breeds in "rustling" capacity.

In America the ranch-bred Herefords have got too small in the boae in recent years, and Shorthorns, chiefly of the Scottish type, are being introduced to increase their size by crossing. In the "feed lot" a well-bred Hereford steer feeds more quickly than either a Shorthorn or an Aberdeen-Angus.

In Queensland, Hereford cattle bred from the "Lord Wilton" strain by Robert Christison of Lammermoor have for years been triumphant as beef-producers in competition with the Shorthorn. When these are quartered in the ordinary butchers' fashion, the hind-quarters outweigh the fore-quarters, which is a reversal of the prevailing rule.

*North Devons*.—The "Rubies of the West," as they are termed from their hue, are reared chiefly in Devon and Somerset. The colour is a whole red, its depth or richness varying with the individual, and in summer becoming mottled with darker spots. The Devons stand somewhat low; they are neat and compact, and possess admirable symmetry. Although a smaller breed than the Shorthorn or the Hereford, they weigh better than either. The horns of the female are somewhat slender, and often curve neatly upwards. Being fine-limbed, active animals, they are well adapted for grazing the poor pastures of their native hills, and they turn their food to the best account, yielding excellent beef. They have not yet attained much celebrity as milch kine, for, though their milk is of first-class quality, with a few notable exceptions, its quantity is small. Latterly, however, the milking qualities have received more attention from breeders, whose object is to qualify the Devon as a dual-purpose breed.

The *South Devon* or *South Hams* cattle are almost restricted to that southern part of the county of Devon known as the Hams, whence they are also called "Hammers." With a somewhat ungainly head, lemon-yellow hair, yellow skin, and large but hardly handsome udder, the South Devon breed more resembles the Guernsey, with which it is supposed to be connected, than the trim-built cattle of the hills of North Devon. The cows are large, heavy milkers, and produce excellent butter. They

are rarely seen outside their locality except when they appear in the showyards.

The *Sussex* breed resembles the North Devon in many respects, but it is bigger, less refined in appearance, less graceful in outline, and of a deeper brown-chestnut colour than the "dainty Devon," as the latter may well be called when compared with them. As a hardy race, capable of thriving on poor rough pastures, the Sussex are highly valued in their native districts, where they were rapidly improved before the end of the 19th century. They are essentially a beef-producing breed, the cows having little reputation as milkers. By stall-feeding they can be ripened for the butcher at an early age. Sussex cattle are said to "die well," that is, to yield a large proportion of meat in the best parts of the carcase.

In the *Welsh* breed of cattle black is the prevailing colour, and the horns are fairly long. They do not mature very rapidly, but some of them grow eventually into great ponderous beasts, and their beef is of prime quality. The cows often possess considerable reputation as milkers. As graziers' beasts Welsh cattle are well known in the midland counties of England, where, under the name of "Welsh runts," large herds of bullocks are fattened on the pastures or "topped up" in the yards in winter.

All the remaining strains of Welsh cattle were recognized as one breed in 1904, when the Welsh Black Cattle Society united into one register the Herd Books of North and South Wales.

The *Longhorn* or "Dishley" breed of cattle is one of the most interesting historically. It was with Longhorns that Robert Bakewell, of Dishley, Leicestershire (1726-1795), showed his remarkable skill as an improver of cattle in the middle of the 18th century.<sup>1</sup> At one period Longhorns spread widely over England and Ireland, but, as the Shorthorns extended their domain, the Longhorns made way for them. They are big, rather clumsy animals, with long drooping horns, which are very objectionable in these days of cattle transport by rail and sea. They are slow in coming to maturity, but are very hardy. The bullocks feed up to heavy weights, and the cows are fair milkers. No lover of cattle can view these quaint creatures without a feeling of satisfaction that the efforts made to resuscitate a breed which has many useful qualities to commend it have been successful, and that the extinction which threatened it in the 'eighties of last century is no longer imminent. In 1907 there were twenty-two Longhorn herds containing about four hundred registered cattle located mainly in the English midlands and Man.

The *Red Poll* breed, though old, has only come into prominence within recent years. They were known as the East Anglian Polls, and later as the Norfolk and Suffolk Polled cattle, being confined chiefly to these two counties. They are symmetrically built, of medium size, and of uniformly red colour. They have a tuft of hair on the poll. As dairy cattle, they are noted for the length of the period during which they continue in milk. Not less are they valued as beef-producers, and, as they are hardy and docile, they fatten readily and mature fairly early. Hence, like the Lincolnshire Red Shorthorn, they may claim to be a dual-purpose breed. As beef cattle they are always seen to advantage at the Norwich Christmas cattle show, held annually in November.

The *Aberdeen-Angus*, a polled, black breed, the cows of which are often termed "Doddies," belongs to Aberdeenshire and adjacent parts of Scotland, but many herds are maintained in England and some in Ireland. The steers and heifers fed for the butcher attain great weight, make first-class show beasts, and yield beef of excellent quality. The cross between the Shorthorn and the Aberdeen-Angus is a favourite in the meat markets and at fat-stock competitions.

The *Galloways* are named from the district, Kirkcudbright and Wigtonshire, in the south-west of Scotland, to which they are native. Like the Aberdeen-Angus cattle, they are hornless, and normally of a black colour. But, with a thicker hide and shaggy hair, suited to a wet climate, they have a coarser appearance than the Aberdeen-Angus, the product of a less humid region, though

The comparative sizes of the animals are indicated by the scale of 6 centimeters of the photographs.

it approaches the latter in size. Galloways yield superior beef, but mature less rapidly than the Aberdeen-Angus. They make admirable beasts for the grazier, and the cross between the Galloway and the white Shorthorn bull, known as a "Blue Grey," is much sought after by the grazier and the butcher.

The *West Highland* or *Kyloe* breed are perhaps the most hardy and picturesque of British cattle. Their home is amidst the wild romantic scenery of the Highlands and the Western Isles of Scotland, though Highland bullocks with long, spreading curved horns may be seen in English parks. They have not made much progress towards early maturity, but their slowly ripened beef is of the choicest quality. The colour of their thick shaggy hair varies from white and light dun to tawny yellow of many shades, and black.

The *Ayrshires* are the dairy breed of Scotland, where they have considerably overstepped the limits of the humid western county whence they take their name. They are usually of a white and brown colour, the patches being well defined. The neat, shapely, upstanding horns are characteristic. The Ayrshires are under medium size and move gracefully, and the females display the wedge-shape typical of dairy cows. They are a hardy breed, and, even from poor pastures, give good yields of milk, especially useful for cheese-making purposes. The milking powers of the breed are being improved under a system of milk-testing and records supported by the Highland and Agricultural Society.

The *Jerseys* are graceful, deer-like cattle, whose home is in the island of Jersey, where, by means of stringent regulations against the importation of cattle, the breed has been kept pure for many generations. As its milk is especially rich in fat (so rich that it requires to be diluted with a little water before it can be safely fed to calves), the Jersey has attained a wide reputation as a butter-producing breed. It is a great favourite in England, where many pure-bred herds exist. The colours most preferred are "whole" fawns of many shades. The light silver-grey, which was in high repute in England in the early seventies of the 19th century, is out of favour. Browns and brindles are rarely seen. The grey zone surrounding the black muzzle gives the appearance designated "mealy-mouthed." The horns are short, and generally artificially curved inwards; the bones are fine. The best milch cows have a yellowish circle round the eye, and the skin at the extremity of the tail is of a deep yellow, almost orange colour. The cows are gentle and docile when reared in close contact with human beings, but the bulls, despite their small size, are often fierce.

*Guernsey* cattle are native to the islands of Guernsey, Alderney, Sark and Herm. They are kept pure by importation restrictions. Herds of pure-bred Guernseys also exist in the Isle of Wight and in various counties of England and Scotland. They have not the refined and elegant appearance of the Jerseys, which, however, they exceed in size. They are usually of a rich yellowish-brown colour, patched with white, in some cases their colour almost meriting the appellation of "orange and lemon." The yellow colour inside the ears is a point always looked for by judges. The cows, large-bellied and narrow in front, are truly wedge-shaped, the greatly developed udder adding to the expanse of the hinder part of the body. They yield an abundance of milk, rich in fat, and are excellent butter-producers. The horns are yellow at the base, curved, and not coarse. The nose is flesh-coloured and free from black markings.

The *Canadian* breed, black with a narrow brown stripe down the back and a light ring round the muzzle, are descended from old Brittany cattle imported into Canada by French settlers three hundred years ago, and are in consequence related to the Channel Islands cattle. They are remarkably hardy and good milkers, and it is claimed they produce butter fat at 2 c. a lb less cost than any other breed.

The *Kerry* is a breed of small black cattle belonging to the south-west of Ireland, whence they have spread into many parts, not only of their native land, but of England as well. Although they are able to subsist on the roughest and scantiest of fare, and are exceedingly hardy, the cows are, nevertheless, excellent milkers, and have acquired celebrity as a dairy breed. The

colour is black, but the cows sometimes have a little white on the udder. The horns are white, with black tips, and are turned upwards. The Kerry is active and graceful, long and lithe in body, and light-limbed. On the rich pastures of England it has increased considerably in size.

The *Dexter* breed is reputed to take its name from one Dexter, agent of Maude, Lord Hawarden, who is credited with having established it by selection and breeding from the best mountain types of the Kerry. Until recently it was called the Dexter-Kerry. It is smaller and more compact than the Kerry, shorter in the leg, and intoned before and behind. Whilst valuable as a beef-making animal, it is equally noted for its milk-producing capacity. Black is the usual colour, but red is also recognized, with, in either case, a little white. When of a red colour, the appearance of the animal has been aptly compared to that of a grand Shorthorn viewed through the wrong end of a telescope. The Kerry and the Dexter are readily distinguishable. The Kerry has a gay, light, deer-like head and horn, light limbs and thin skin. The Dexter has coarser limbs, a square body, flat back, thick shoulder, short neck, and head and horn set on low.

A herd of *Dexter-Shorthorns* was founded by Major Barton at Straffan, Ireland, in 1860, in which prominent characteristics of the two breeds have been permanently blended so that they breed true to type.

As milk-producers, and therefore as dairy cattle, certain strains of the Shorthorn (registered as well as non-pedigree), the Lincolnshire Red Shorthorn, South Devon, Longhorn, Red Polled, Ayrshire, Jersey, Guernsey, Kerry and Dexter breeds have acquired eminence. Such breeds as the Shorthorn, Lincolnshire Red Shorthorn, South Devon, Welsh, Red Polled and Dexter are claimed as useful beef-makers as well as milk-producers, and are classified as dual-purpose animals. The others belong to the beef-producers. As regards colour, red is characteristic of the Lincolnshire Shorthorn, the Hereford, Devon, Sussex and Red Polled. Black is the dominating colour of the Welsh, Aberdeen-Angus, Galloway, Kerry and Dexter. A yellowish hue is seen in the West Highland, Guernsey and South Devon breeds. Various shades of fawn colour are usual in Jersey cattle and also appear among Highlanders. The Herefords, though with red bodies, have white faces, manes, and dewlaps, whilst white prevails to a greater or less extent in the Shorthorn, Longhorn and Ayrshire breeds. The Shorthorn breed is exceedingly variable in colour; pure-bred specimens may be red, or white, or roan, or may be marked with two or more of these colours, the roan resulting from a blending of the white and red. Black is not seen in a pure-bred Shorthorn. The biggest and heaviest cattle come from the beef-making breeds, and are often cross-bred. Very large or heavy beasts, if pure-bred, usually belong to one or other of the Shorthorn, Hereford, Sussex, Welsh, West Highland, Aberdeen-Angus and Galloway breeds. The Devon, Red Polled and Guernsey are medium-sized cattle; the Ayrshires are smaller, although relatively the bullocks grow larger than bulls or cows. The Jerseys are small, graceful cattle, but the smaller type of Keries, the Dexters and the Shetlanders furnish the smallest cattle of the British Isles.

See generally the *Herd Books* of the various breed societies. (W. Fr.; R. W.)

**Rearing and Feeding.**<sup>1</sup>—A calf at birth scales from one-twelfth to one-fourteenth the weight of the dam. A sucking calf of one of the large breeds should gain 3 lb per day for the first month, 2.5 lb for the second, and 2 lb during the later calf period. Colostrum, or first-day milk after calving, contains more than five times the albuminoid compounds found in average cows' milk. In the course of three or four days it gradually becomes normal in composition, although the peculiar flavour remains a few days longer. Nature has specially prepared it for the young

<sup>1</sup> See E. Wolff, *Farm Foods*, by H. H. Cousins (1895); A. D. Hall, *Rothamsted Experiments* (1905); R. Warington, *Chemistry of the Farm* (15th ed., 1902); W. A. Henry, *Feeds and Feeding* (1907); H. W. Mumford, *Beef Production* (1907); H. P. Armsby, *Animal Nutrition* (2nd ed., 1906); T. Shaw, *Animal Breeding* (1903); R. Wallace, *Farm Live Stock of Great Britain* (4th ed., 1907).

calf with extremely nourishing and also laxative properties, and it is of practically no value for any other purpose. Normal cows' milk has an albuminoid ratio slightly narrower than 1:4-colostrum 1:1.71. [The ratio is arrived at by adding to the percentage of milk-sugar, possessing about the food equivalent of starch, the fat multiplied by 2.268, and dividing by the total albuminoids—all digestible.]

Common nutrient ratios for older animals are stated in the following table of food standards by Dr Emil Wolff:—

	Food Consumed per Day.					
	Dry.			Digestible.		
	Live Weight.	Organic Matter.	Albu-minoid.	Fats.	Carbo-hydrates.	Albu-minoid Ratio.
	lb	lb	lb	lb	lb	lb
Calves, growing, 2 to 3 months	150	3.3	0.6	0.30	2.1	1:4.7
Young cattle " 3 to 6 "	300	7.0	1.0	0.30	4.1	1:5.5
" " 6 to 12 "	500	12.0	1.2	0.30	6.8	1:6
" " 12 to 18 "	700	16.8	1.4	0.28	9.1	1:7
" " 18 to 24 "	850	20.4	1.4	0.26	10.3	1:8
Oxen in complete rest . . . . .	1000	27.5	0.7	0.15	8.0	1:12

" " 2nd period . . . . .	1000	26.0	3.0	0.70	14.8	1:5.5
" " 3rd period . . . . .	1000	25.0	2.7	0.60	14.8	1:6
Milch cows " " " " " " " " " " " "	1000	24.0	2.5	0.40	12.5	1:5.4

Digestible albuminoid nitrogen is the scarcest and consequently the costliest ingredient in food-stuffs, but, since the introduction of vegetable proteid made by Mitchell's process from the castor bean, an easy and inexpensive means of balancing cattle food ratios is available. By this means the manurial value of the excrement is increased. The calculations necessary in arriving at a ratio are simplified by the employment of Jeffers's calculator (Plainsboro, N. J.).

There are three common methods of rearing calves. (1) The calf sucks its mother or foster-mother. This is the natural method and the best for the show-yard and for early fattening purposes; but it is the most expensive, and the calves, if not handled, grow up wild and dangerous. Store stock may be also raised by putting two calves to one cow and weaning at three months old; a second pair in turn yielding place to a single calf. (2) Full milk from the cow at about 90° F. is given alone until the latter part of the milk period; then the calf is trained to eat supplementary foods to preserve the calf-fat after weaning. A large calf at first receives daily three quarts of milk at three meals. The amount is increased to 2 gallons by the end of the fourth week, and to 2½ gallons at 3 months, when gradual weaning begins. Linseed cake meal is specially suitable for such calves. (3) The calf receives full milk from the mother for one to two weeks, or better, for three to four weeks; then it is slowly transferred to fortified separated milk or milk substitutes. Cod-liver oil, 2 oz. daily, is a good substitute for butter fat. In America cotton-seed oil, ½ oz. to the quart of milk, or an equivalent of oleomargarine heated to 110° F. and churned with separated milk, has produced a live-weight-increase of 2 lb daily. Linseed simmered to a jelly and added to separated milk gives good results. Moderate amounts are easily digested. Oatmeal or maize meal containing 10% of linseed meal does well, later, at less cost. Milk substitutes and calf meals require close attention in preparation, and would not fetch the prices they do if feeders possessed the technical knowledge necessary to select and mix common foods. Ground cake or linseed meal is, after a time, better given dry than cooked, being then better masticated and not so liable to produce indigestion.

Grass or fine hay in racks is provided when the calf can chew the cud. As cattle get older, live-weight-increase grows less. Smithfield weights<sup>1</sup> show that a good bullock up to a year old will increase 2 lb daily, a two-year-old 1½ lb, and a three-year-old a little over 1½ lb.

Cattle feeding on a farm consume crude produce that is inconvenient to market, and make farmyard manure; but there is frequently no profit left. To secure the balance on the right

side the inlaid price per live cwt. requires to be 5s. less than the sale price—say 32s. per cwt. for lean cattle, and 37s. per cwt. for the animal when sold fat and capable of producing 60% of dressed beef. The ordinary animal yields only about 57%. A well-bred fattening bullock begins with 2 lb of cake and meal per day, increasing to 8 lb at the end of five months (6 lb on an average), and receives ¼ cwt. of roots and 12 lb of straw; at an average cost of about 4s. 3d. per imperial stone or 50s. per cwt. of dressed carcase. Heifers feed faster than bullocks, and

age tells on the rate at which an animal will mature: a three-year-old will develop into prime beef more quickly and easily than a two-year-old. It is difficult to produce "baby beef" at a profit, and it can only be done with picked animals of the best flesh-producing breeds, which cannot be bought at a price per cwt. below the finished sale price, for animals producing baby beef must from start to finish (under two years old) be at all times fit to go to the fat market. It is true that a very young animal can give a better account of food than an older one, but this advantage is counterbalanced by the tendency to grow rather than to fatten. (See also AGRICULTURE.)

In cold and stormy districts cattle thrive best in covered courts, but in a mild climate they do equally well in open yards with shelter-sheds. The more air they get the less liable they are to tuberculosis—example Lincolnshire and the drier south-eastern counties. The ideal method of house-feeding cattle is singly in boxes 10 ft. square, where they are undisturbed, and where the best manure is made because it is not washed by rain.

On the finest British grazing lands two lots of cattle are fed in one season. The first is finished early in July, having without artificial feeding, laid on eight to nine stones of beef. The second lot requires three or four pounds of undecorticated cotton cake each towards the end of September and in October when grass begins to fail. (R. W.)

CATULLUS, GAIUS VALERIUS (78-54 B.C.), the greatest lyric poet of Rome. As regards his names and the dates of his birth and death, the most important external witness is that of Jerome, in the continuation of the Eusebian *Chronicle*, under the year 87 B.C., "Gaius Valerius Catullus, scriptor lyricus Veronae nascitur," and under 57 B.C., "Catullus xxx. aetatis anno Romae moritur." There is no controversy as to the gentile name, *Valerius*. Suetonius, in his *Life of Julius Caesar* (ch. 73), mentions the poet by the names "Valerium Catullum." Other persons who had the *cognomen* Catullus belonged to the Valerian gens, e.g. M. Valerius Catullus Messalinus, a *delator* in the reign of Domitian, mentioned in the fourth satire of Juvenal (l. 113):—"Et cum mortifero prudens Veiento Catullo."

Inscriptions show, further, that *Valerius* was a common name in the native province of Catullus, and belonged to other inhabitants of Verona besides the poet and his family (Schwabe, *Quaestiones Catullianae*, p. 27). Scholars have been divided in opinion as to whether his *praenomen* was *Gaius* or *Quintus*, and in the best MSS. the volume is called simply *Catulli Veronensis liber*. For *Gaius* we have the undoubted testimony, not only of Jerome, which rests on the much earlier authority of Suetonius, but also that of Apuleius. In support of *Quintus* a passage was quoted from the *Natural History* of Pliny (xxxvii. 6, 81). But the *praenomen* Q. is omitted in the best MSS., and in other passages of the same author the poet is spoken of as "Catullus Veronensis." The mistake may have arisen from confusion with Q. Catulus, the colleague of Marius in the Cimbric War, himself also the author of lyrical poems. Allusions in the poems show that the date of his death given by Jerome (57 B.C.) is wrong, and that Catullus survived the second consulship of Pompey (55 B.C.) (cf. lv. 6, cxiii. 2), and was present in August of the

<sup>1</sup> E. J. Powell, *History of the Smithfield Club from 1798 to 1900* (1902).

following year at the prosecution of Vatinius by Licinius Calvus (cf. liii.). The allusion in lii. 3—

"Per consulatum peierat Vatinius."

does not prove that Catullus must have lived to see the consulship bestowed on Vatinius in the end of 47 B.C. but only that Vatinius, after being praetor in 55 B.C., was in the habit of boasting of the certainty of his attaining the consulship, as Cleopatra was in the habit of confirming her most solemn declarations by appealing to her hope of one day administering justice in the Capitol (cf. Haupt, "Quaestiones Catullianae," *Oppuscula*, vol. i. 1875). There is then nothing to prove that Catullus lived beyond the month of August 54 B.C. Some of the poems (as xxxvii. and lii.) may have been written during his last illness. If he died in 54 B.C. or early in 53 B.C., Catullus must either have been born later than 87 B.C., or have lived to a greater age than thirty. Catullus is described by Ovid as "hedera Iuvenalia cinctus Tempora" (*Amor.* iii. g. 61),—a description somewhat more suitable to a man who dies in his thirtieth year than to one who dies three or four years later. Further, the age at which a man dies is more likely to be accurately remembered than the particular date either of his death or of his birth, and the common practice of recording the age of the deceased in sepulchral inscriptions must have rendered a mistake about this less likely to occur. It seems, therefore, on the whole, most likely that Jerome's words "xxx. aetatis anno" are correct, and that Catullus was born in 84 B.C.

The statement that he was born at Verona is confirmed by passages in Ovid and Martial. Pliny the elder, who was born at Como, speaks of Catullus in the preface to his *Natural History*, as his "countryman" (*conterraneus*), and the poet speaks of Verona as his home, or at least his temporary residence, in more than one place. His occasional residence in his native place is further attested by the statement of Suetonius (*Julius Caesar*, 73), that "Julius Caesar accepted the poet's apology for his scurrilous verses upon him, invited him to dine with him on the same day, and continued his intimacy with his father as before." As this incident could only have happened during the time that Julius Caesar was pro-consul, the scene of it must have been in the Cisalpine province, and at the house of the poet's father, in or near Verona. The verses apologized for were those contained in poems xxix. and lvii., the former of which must have been written after Caesar's invasion of Britain, so that this interview probably took place in the winter of 55-54 B.C. The fact that his father was the host of the great pro-consul, and lived on terms of intimacy with him, justifies the inference, that he was, in wealth and rank, one of the principal men of the province. The only other important statement concerning the poet's life which rests on external authority is that of Apuleius, that the real name of the Lesbia of the poems was Clodia. Another, which concerns the reputation which he enjoyed after his death, is given in the *Life of Atticus* by Cornelius Nepos (12. 4). It is to the effect that he regarded Lucretius and Catullus as the two greatest poets of his own time.

The poems of Catullus consist of 116 pieces, varying in length from 2 to 408 lines, the great mass of them being, however, short pieces, written in lyric, iambic or elegiac metre. The arrangement cannot be the poet's; it is neither chronological nor in accordance with the character of the topics. The shorter poems, lyric or iambic, are placed first, next the longer epithalamia, (most being written in hexameters) amongst which the *Attis* is inserted and then those written in the elegiac metre. But, though no chronological order is observed, yet internal evidence enables us to determine the occasions on which many of the poems were written, and the order in which they followed one another. They give a very vivid image of various phases of the poet's life, and of the strong feelings with which persons and things affected him. They throw much light also on the social life of Rome and of the provincial towns of Italy in the years preceding the outbreak of the second civil war. In this respect they may be compared with the letters of Cicero.

The poems extend over a period of seven or eight years, from 61 or 62 till 54 B.C. Among the earliest are those which record

the various stages of the author's passion for Lesbia. It is in connexion with this passion that he is generally mentioned, or alluded to, by the later Roman poets, such as Propertius, Ovid, Juvenal and Martial. Her real name, as we learn from Apuleius, was Clodia. The admiration of Catullus for Sappho, the Lesbian poetess, which is clearly indicated by the imitation of her language in his fifty-first and sixty-second poems, affords an obvious explanation of the Greek name which he gave to his Roman mistress. Clodia was the notorious sister of Publius Clodius Pulcher, and in the year 56 she charged M. Caelius Rufus, after tiring of him, as she had of Catullus, with an attempt to poison her. It was in defence of Rufus that Cicero described the spell she exercised over young men, in language which might have been applied to her previous relations with the youthful poet, as well as those with the youthful orator and politician.

Poems concerning Lesbia occur among both the earliest and the latest of those contained in the series. They record the various stages of passion through which Catullus passed, from absolute devotion and a secure sense of returned affection, through the various conditions of distrust and jealousy, attempts at renunciation, and short-lived "amoribus integrationes," through the "odi et amo" state, and the later state of savage indignation against both Lesbia and his rivals, and especially against Caelius Rufus, till he finally attains, not without much suffering and loss, the last state of scornful indifference. Among the earliest of the poems connected with Lesbia, and among those written in the happiest vein, are li. and iii., and v. and vii. The 8th, "Miser Catulle, desinas ineptire," perhaps the most beautiful of them all, expresses the first awakening of the poet to a sense of her unworthiness, before the gentler have given place to the fiercer feelings of his nature. His final renunciation is sent in a poem written after his return from the East, with a union of imaginative and scornful power, to his two butts, Furius and Aurelius (xi., "Furi et Aureli, comites Catulli"), who, to judge by the way Catullus writes of them, appear to have been hangers-on upon him, who repaid the pecuniary and other favours they received by giving him grounds for jealousy, and making imputations on his character (cf. xv., xvi., xviii., xxiii.).

The intrigue of Caelius Rufus with Lesbia began in 59 or 58 B.C. It was probably in the earlier stages of this liaison that the 68th poem was written, from which it appears that Catullus, at the time living at Verona, and grieving for the recent death of his brother in the Troad, had heard of Lesbia's infidelity, and, in consideration of her previous faithlessness in his favour, was not inclined to resent it very warmly. Two other poems in the series express the grief which Catullus felt for the death of his brother,—one, the 65th, addressed to the orator Hortensius, who is there, as in some of Cicero's letters, called Hortalus or Ortalus, and sent to him along with the *Coma Berenices* (lxvi.), a translation of a famous elegy of Callimachus. The other poem referring to this event (ci.) must have been composed some years later, probably in 56 B.C., when Catullus visited his brother's tomb in the Troad, on his return from Bithynia. Between 59 and 57 B.C. most of the lampoons on Lesbia and her numerous lovers must have been written (e.g. xxxvii., xxxix., &c.). Some, too, of the poems expressive of his more tender feelings to her, such as viii. and lxxvii. belong also to these years; and among the poems written either during this period or perhaps in the early and happier years of his liaison, some of the most charming of his shorter pieces, expressing the affection for his young friends Verannius and Fabullus (ix., xii., xiii.), may be included.

In the year 57 the routine of his life was for a short time broken by his accompanying the propraetor C. Memmius, the friend to whom Lucretius dedicates his great poem, as one of his staff, to the province of Bithynia. His object was probably to better his fortunes by this absence from Rome, as humorous complaints of poverty and debt (xiii., xxvi.) show that his ordinary means were insufficient for his mode of life. He frankly acknowledges the disappointment of these hopes, and still more frankly his disgust with his chief (x., xxviii.). Some of the most charming and perfect among the shorter poems express the delight with which the poet changed the dulness and sultry climate of the

province for the freedom and keen enjoyment of his voyage home in his yacht, built for him at Amastris on the Euxine, and for the beauty and peace of his villa on the shores of Lake Benacus, which welcomed him home "wearied with foreign travel." To this period and to his first return to Rome after his visit to his native district belong the poems xlv., ci., iv., xxxi. and x., all showing by their freshness of feeling and vivid truth of expression the gain which the poet's nature derived from his temporary escape from the passions, distractions and animosities of Roman society. Two poems, written in a very genial and joyous spirit, and addressed to his younger friend Licinius Calvus (xiv. and l.), who is ranked as second only to himself among the lyrical poets of the age, and whose youthful promise pointed him out as likely to become one of the greatest of Roman orators, may, indeed, with most probability be assigned to these later years (xiv.). From the expression "Odissem te odio Vatiniiano," in the third line of xiv., it may be inferred that the poem was written not earlier than December (the "Saturnalia") of the year 56 B.C., as it was early in that year, as we learn from a letter of Cicero to his brother Quintus (ii. 4. 1), that Calvus first announced his intention of prosecuting Vatinius. The short poem numbered liii. would be written in August 54 B.C. The poems which have left the greatest stain on the fame of Catullus—those "referta contumeliis Caesaris," the licentious abuse of Mamurra, and probably some of those personal scurrilities addressed to women as well as men, or too frank confessions, which posterity would willingly have let die, may well have been written in the last years of his life, under the influence of the bitterness and recklessness induced by his experience. It cannot be determined with certainty whether the longer and more artistic pieces, which occupy the middle of the volume—the *Epithalamium* in celebration of the marriage of Manlius Torquatus, the 62nd poem, written in imitation of the *Epithalamia* of Sappho, "Vesper adest: iuvenes, consurgite"; the *Attis*, and the Epic Idyll representing the marriage festival of Peleus and Thetis—belong to the earlier or the later period of the poet's career. If the person addressed in the first part of the 68th is the Manlius of the *Epithalamium*, and the lines from 3 to 8—

"Naufragum ut eiectum . . . pervigilat,"

refer to the death of Vinia, it would follow that the first *Epithalamium* was written some time before that poem, and thus belongs to the earlier time. While the translations of Sappho,—

"Ille mi par esse deo videtur,"

and of Callimachus (lxvi.),—

"Omnia qui magni dispexit lumina mundi,"

belong to the earlier period, the *Attis* and the *Peleus and Thetis*; although perhaps suggested by the treatment of the same or similar subjects in Greek authors, are executed with such power and originality as declare them to be products of the most vigorous stage in the development of the poet's genius. That his genius came soon to maturity is a reason for hesitation in assigning any particular time between 62 and 54 B.C. for the composition of the *Attis* and of that part of the *Epithalamium* ("Peliaco quondam prognatae vertice pinus") which deals with the main subject of the poem. But the criticism of Munro in his edition of Lucretius, which shows similarities of expression that cannot be mere casual coincidences, between the Ariadne-episode in the *Epithalamium* of Catullus (from line 52 to 266) and the poem of Lucretius, leaves little doubt that that portion at least of the poem was written after the publication of the *De rerum natura*, in the winter of 55-54 B.C.

No ancient author has left a more vivid impression of himself on his writings than Catullus. Coming to Rome in early youth from a distant province, not at that time included within the limits of Italy, he lived as an equal with the men of his time of most intellectual activity and refinement, as well as of highest social and political eminence. Among those to whom his poems are addressed, or who are mentioned in them, we find the names of Hortensius, Cicero, Cornelius Nepos, Licinius Calvus, Helvius Cinna and Asinius Pollio, then only a youth (xii. 8). Catullus brought into this circle the genius of a great poet, the social

vivacity of a vigorous nature, the simplicity and sincerity of an unambitious, and the warmth of an affectionate disposition. He betrays all the sensitiveness of the poetic temperament, but it is never the sensitiveness of vanity, for he is characterized by the modesty rather than the self-confidence which accompanies genius, but the sensitiveness of a heart which gives and expects more sympathy and loyalty in friendship than the world either wants or cares to give in return. He shows also in some of his lighter pieces the fastidiousness of a refined taste, intolerant of all boorishness, pedantry, affectation and sordid ways of life. The passionate intensity of his temperament displays itself with similar strength in the outpourings of his animosity as of his love and affection. It was, unfortunately, the fashion of the time to employ in the expression of these animosities a licence of speech and of imputation which it is difficult for men living under different social conditions to understand, still more difficult to tolerate. Munro has examined the 20th poem—

"Quis hoc potest videre, quis potest pati,"

the longest and most important of the lampoons on Caesar and Mamurra, and shown with much learning and acuteness the motives and intention of Catullus in writing them. Had Julius Caesar really believed, as Suetonius, writing two hundred years afterwards, says he did, that "an eternal stigma had been cast upon him by the verses concerning Mamurra," we should scarcely apply the word magnanimity to his condonation of the offence. But these verses survive as a memorial not of any scandal affecting Julius Caesar which could possibly have been believed by his contemporaries, but of the licence of speech which was then indulged in, of the jealousy with which the younger members of the Roman aristocracy, who a little later fought on the side of Pompey, at that time regarded the ascendancy both of the "father-in-law and the son-in-law," and the social elevation of some of their instruments, and also, to a certain extent, of the deterioration which the frank and generous nature of Catullus underwent from the passions which wasted, and the faithlessness which marred his life.

The great age of Latin poetry extends from about the year 60 B.C. till the death of Ovid in 17 A.D. There are three marked divisions in this period, each with a distinct character of its own: the first represented by Lucretius and Catullus, the second by Virgil and Horace, the last by Ovid. Force and sincerity are the great characteristics of the first period, maturity of art of the second, facility of the last. The educating influence of Greek art on the Roman mind was first fully experienced in the Ciceronian age, and none of his contemporaries was so susceptible of that influence as Catullus. With the susceptibility to art he combined a large share of the vigorous and genial qualities of the Italian race. Like most of his younger contemporaries, he studied in the school of the Alexandrine poets, with whom the favourite subjects of art were the passion of love, and stories from the Greek mythology, which admitted of being treated in a spirit similar to that in which they celebrated their own experiences. It was under this influence that Catullus wrote the *Coma Berenices*, the 68th poem, which, after the manner of the Alexandrines, interweaves the old tale of Proteus and Laodamia with the personal experiences of the poet himself, and the *Epithalamium* of Peleus and Thetis, which combines two pictures from the Greek mythology, one of the secure happiness of marriage, the other of the passionate despair of love betrayed. In this last poem Catullus displays a power of creative pictorial imagination far transcending that displayed in any of the extant poetry of Alexandria. We have no means of determining what suggested the subject of the *Attis* to Catullus, whether the previous treatment of the subject by some Greek writer, some survival of the myth which he found still existing during his residence among the "Phrygii Campi," or the growth of various forms of Eastern superstition and fanaticism, at Rome, in the last age of the Republic. Whatever may have been its origin, it is the finest specimen we possess, in either Greek or Latin literature, of that kind of short poem more common in modern than ancient times, in which some situation or passion entirely alien to the writer, and to his own age, is realized with dramatic intensity.

But the genius of Catullus is, perhaps, even happier in the direct expression of personal feeling than in artistic creation, or the reproduction of tales and situations from mythology. The warmth, intensity and sincerity of his own nature are the sources of the inspiration in these poems. The most elaborate and one of the finest of them is the *Epithalamium* in honour of the marriage of a member of the old house of Manlius Torquatus with Vivia Aurunculeia, written in the glyconic in combination with the pherecratean metre. To this metre Catullus imparts a peculiar lightness and grace by making the trochee, instead of the spondee as in Horace's glyconics and pherecrateans, the first foot in the line. His elegiac metre is constructed with less smoothness and regularity than that of Ovid and Tibullus or even of Propertius, but as employed by him it gives a true echo to the serious and plaintive feelings of some of his poems, while it adapts itself, as it did later in the hands of Martial, to the epigrammatic terseness of his invective. But the perfection of the art of Catullus is seen in his employment of those metres which he adapted to the Latin tongue from the earlier poets of Greece, the pure iambic trimeter, as in iv.—

"Phaenelus ille quem videtis hospites,"

the spondee iambic, employed in viii. and xxxi.—

Paeninsularum, Sirmio, insularumque,"

and the phaeacian hendecasyllabic, a slight modification of the Supplic line, which is his favourite metre for the expression of his more joyful moods, and of his lighter satiric vein. The Latin language never flowed with such ease, freshness and purity as in these poems. Their perfection consists in the entire absence of all appearance of effort or reflection, and in the fullness of life and feeling, which gives a lasting interest and charm to the most trivial incident of the passing hour. In reference to these poems Munro has said with truth and force: "A generation had yet to pass before the heroic attained to its perfection; while he (Catullus) had already produced glyconics, phaeacians and iambs, each 'one entire and perfect chrysolite,' 'cunningest patterns' of excellence, such as Latium never saw before or after,—Alcaeus, Sappho, and the rest then and only then having met their match."

The work of Catullus has not come down to us intact, as is shown by lacunae and quotations in ancient writers which cannot now be found in his poems. Out of the MSS. only three have claims to intrinsic importance. The oldest and best appears to be the Bodeleian (Canon. 30). But little inferior is the *Sangermanensis* (Par. 14137). Of the third, the *Romanus*, we shall be better able to judge when its discoverer, Prof. W. G. Hale, has published his collation. None of these MSS. are older than the 14th century. One poem, 62, is, however, preserved in a MS. of the 9th century (the *Thuanicus*, Par. 8071). Prof. R. Ellis's discovery of the Bodeleian MS. and E. Baehrens's recognition of its value opened a new chapter in the history of the text. Ellis's contributions comprise an indispensable commentary (ed. 2, 1899), an elaborate critical edition (ed. 2, 1878) and an English translation (1871) in the metres of the original. The text in the Oxford series, published in 1905, is inferior to those specified below. Baehrens's edition, 2 volumes (text 1876, the second edition by K. P. Schulze in a misnomer and Latin commentary 1885) is still of value. Amongst other editions with critical or explanatory notes or both may be mentioned those of A. Ricce (1884), L. Schwabe (1886, with *index verborum*), B. Schmidt (1887), J. P. Postgate (1889, text differing little from that in the new *Corpus Poetarum*), E. Benoist and E. Thomas, with French translation by Rostaud (2 vols., 1882-1890), S. G. Owen (1893, *an edition de luxe*), W. T. Merrill (1893, Boston, U.S.A., with succinct English notes), A. Palmer (1896, one of the best of this scholar's works); M. Haupt's text of the three poets Catullus, Tibullus and Propertius, edited by J. Vahlen, reached its sixth edition in 1904. Of the numerous contributions to the textual and literary criticism of the poems may be named the papers in M. Haupt's *Opuscula*, L. Schwabe's *Quaestiones Catullianae* (1862), B. Schmidt's *Prolegomena*, H. A. J. Munro's *Criticisms and Elucidations of Catullus* (1878; second edition by J. D. Duff, 1905). Translations into English verse by J. Cranstoun (1867), Sir T. Martin (1861, 1876), R. Ellis (above); a recent version in prose with the Latin text by F. W. Cornish (1904). For further information see Teuffel's *History of Roman Literature* (tr. by Warre), § 214, or the more recent accounts by M. Schanz, *Geschichte der römischen Literatur*, I. §§ 102-106, and Frédéric Plessis, *La Poésie latine* (1909), pp. 143-173. (W. Y. S.; X.)

CATULLUS, the name of a distinguished family of ancient Rome of the gens Lutatia. The following are its most important members.

1. GAIVS LVTATIVS CATVLVS, Roman commander during the First Punic War, consul 242 B.C. He was sent with a fleet of 200 ships to Sicilian waters, and almost without opposition occupied the harbours of Lilybaeum and Drepanum. A hurriedly equipped fleet sent out from Carthage under Hanno was intercepted by the praetor Publius Valerius Falto and totally defeated (battle of the Aegates Islands, March 10; 241). Catullus, who had been wounded at Drepanum, took no part in the operations, but on his return to Rome was accorded the honour of a triumph, which against his will he shared with Valerius. (See PUNIC WARS: First, *ad fin.*)

2. QVINTVS LVTATIVS CATVLVS, Roman general and consul with Marius in 102 B.C. In the war against the Cimbri and Teutones he was sent to defend the passage of the Alps but found himself compelled to retreat over the Po, his troops having been reduced to a state of panic (see MARIUS, GAIVS). In 101 the Cimbri were defeated on the Raudine plain, near Vercellae, by the united armies of Catullus and Marius. The chief honour being ascribed to Marius, Catullus became his bitter opponent. He sided with Sulla in the civil war, was included in the proscription list of 87, and when Marius declined to pardon him, committed suicide. He was distinguished as an orator, poet and prose writer, and was well versed in Greek literature. He is said to have written the history of his consulship and the Cimbrian War after the manner of Xenophon; two epigrams by him have been preserved, one on Roscius the celebrated actor (Cicero, *De Nat. Deorum*, i. 28), the other of an erotic character, imitated from Callimachus (Gellius xix. 9). He was a man of great wealth, which he spent in beautifying Rome. Two buildings were known as "Monumenta Catuli"; the temple of *Fortuna huiusce diei*, to commemorate the day of Vercellae, and the *Porticus Catuli*, built from the sale of the Cimbrian spoils.

See Plutarch, *Marius, Sulla*; Appian, *B.C.* i. 74; Vell. Pat. ii. 21; Florus iii. 21; Val. Max. vi. 3, ix. 13; Cicero, *De Oratore*, iii. 3, *Brutus*, 35.

3. QVINTVS LVTATIVS CATVLVS (c. 120-61 B.C.), sometimes called Capitolinus, son of the above, consul in 102. He inherited his father's hatred of Marius, and was a consistent though moderate supporter of the aristocracy. In 78 he was consul with Marcus Aemilius Lepidus, who after the death of Sulla proposed the overthrow of his constitution, the re-establishment of the distribution of grain, the recall of the banished, and other democratic measures. Catullus vigorously opposed this, and a temporary compromise was effected. But Lepidus, having levied troops in his province of Transalpine Gaul, returned to Rome at the head of an army. Catullus defeated him at the Mulvian bridge and near Cosa in Etruria, and Lepidus made his escape to Sardinia, where he died soon afterwards. In 67 and 66 Catullus unsuccessfully opposed, as prejudicial to constitutional freedom, the Gabinian and Manilian laws, which conferred special powers upon Pompey (q.v.). He consistently opposed Caesar, whom he endeavoured to implicate in the Catilinarian conspiracy. Caesar, in return, accused him of embezzling public money during the reconstruction of the temple on the Capitol, and proposed to obliterate his name from the inscription and deprive him of the office of commissioner for its restoration. Catullus's supporters rallied round him, and Caesar dropped the charge. Catullus was the last *princeps senatus* of republican times; he held the office of censor also, but soon resigned, being unable to agree with his colleague Licinius Crassus. Although not a man of great abilities, Catullus exercised considerable influence through his political consistency and his undoubted solicitude for the welfare of the state.

See Sallust, *Catullina*, 35. 49; Dio Cassius xxxvi. 13; Plutarch, *Crassus*; Suetonius, *Caesar*, 15.

CAVB, or KAUB, a town of Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, 28 m. N.W. from Wiesbaden, on the railway from Frankfurt-on-Main to Cologne. Pop. 2200. It has a Roman Catholic and an Evangelical church, and a statue of Blücher. The trade mainly consists of the wines of the district. On a crag above the town stands the

imposing ruin of Gutenfels, and facing it, on a rock in the middle of the Rhine, the small castle Pfalz, or Pfalzgrafenstein, where, according to legend, the Palatine countesses awaited their confinement, but which in reality served as a toll-gate for merchandise on the Rhine.

Caub, first mentioned in the year 983, originally belonged to the lords of Falkenstein, passed in 1277 to the Rhenish Palatinate, and attained civic rights in 1374. Here Blücher crossed the Rhine with the Prussian and Russian armies, on New Year's night 1813-1814, in pursuit of the French.

**CAUCA**, a large coast department of Colombia, South America, lying between the departments of Bolivar, Antioquia, Caldas and Tolima on the E., and the Pacific Ocean and Panama on the W., and extending from the Caribbean Sea S. to the department of Nariño. Pop. (1905, estimate) 400,000; area 26,930 sq. m. Although Cauca was deprived of extensive territories on the upper Cauquetá and Putumayo, and of a large area bordering on Ecuador in the territorial redistribution of 1905, it remained the largest department of the republic. The Western Cordillera, traversing nearly its whole length from south to north, and the Central Cordillera, forming a part of its eastern frontier, give a very mountainous character to the region. It includes, besides, the fertile and healthful valley of the upper Cauca, the hot, low valley of the Atrato, and a long coastal plain on the Pacific. The region is rich in mines and valuable forests, but its inhabitants have made very little progress in agriculture because there are not adequate transportation facilities. The capital of the department is Popayán at its southern extremity, with an estimated population in 1905 of 10,000, other important towns are Cali (16,000), Buga, Cartago and Buenaventura.

**CAUCASIA**, or **CAUCASUS**, a governor-generalship of Russia, occupying the isthmus between the Black Sea and the Sea of Azov on the west and the Caspian Sea on the east, as well as portions of the Armenian highlands. Its northern boundary is the Kuma-Manych depression, a succession of narrow, half-desiccated lakes and river-beds, only temporarily filled with water and connecting the Manych, a tributary of the Don, with the Kuma, which flows into the Caspian. This depression is supposed to be a relic of the former post-Pliocene connexion between the Black Sea and the Caspian, and is accepted by most geographers as the natural frontier between Europe and Asia, while others make the dividing-line coincide with the principal water-parting of the Caucasus mountain system. The southern boundary of Caucasia is in part coincident with the river Aras (Araxes), in part purely conventional and political. It was shifted several times during the 19th century, but now runs from a point on the Black Sea, some 20 m. south of Batumi, in a south-easterly and easterly direction to Mt. Ararat, and thence along the Aras to within 30 m. of its confluence with the Kura, where it once more turns south-east, and eventually strikes the Caspian at Astara (30° 35' N.). This large territory, covering an area of 180,843 sq. m., and having in 1897 9,248,695 inhabitants (51 per sq. m.), may be divided into four natural zones or sections:—(i.) the plains north of the Caucasus mountains, comprising the administrative division of Northern Caucasia; (ii.) the Caucasus range and the highlands of Daghestan; (iii.) the valleys of the Rion and the Kura, between the Caucasus range and the highlands of Armenia; and (iv.) the highlands of Armenia.

(i.) The *plains of Northern Caucasia*, which include most of the provinces of Kuban and Terek and of the government of Stavropol, slope gently downwards from the foot of the Caucasus range towards the Kuma-Manych depression. It is only in their centre that they reach altitudes of as much as 2000-2500 ft. e.g. in the Stavropol "plateau," which stretches northwards, separating the tributaries of the Kuban from those of the Terek and the Kuma. Towards the foothills of the Caucasus they are clothed with thick forests, while in the west they merge into the steppes of south Russia or end in marshy ground, choked with reeds and rushes, in the delta of the Kuban. In the north and east they give place, as the Manych and the coasts of the Caspian are approached, to arid, sandy, stony steppes. The soil of these plains is generally very fertile and they support a population of nearly 2,800,000 Russians, composed of Cossacks and peasant immigrants, settled chiefly along the rivers and grouped in large, wealthy villages. They carry on agriculture—

wheat-growing on a large scale—with the aid of modern agricultural machines, and breed cattle and horses. Vines are extensively cultivated on the low levels, and a variety of domestic trades are prosecuted in the villages. The higher parts of the plains, which are deeply trenched by the upper tributaries of the rivers, are inhabited by various Caucasian races—Kabardians and Cherkeses (Circassians) in the west, Ossetes in the middle, and several tribal elements from Daghestan, described under the general name of Chechens, in the east, while nomadic Nogai Tatars and Turkomans occupy the steppes.

(ii.) The *Caucasus range* runs from north-west to south-east from the Strait of Kerch to the Caspian Sea for a length of 900 m., with a varying breadth of 30 to 140 m., and covers a surface of 12,000 sq. m. The orographical characteristics of the Caucasus are described in detail under that heading.

(iii.) The combined *valleys of the Rion and the Kura*, which intervene between the Caucasus and the Armenian highlands, and stretch their axes north-west and south-east respectively, embrace the most populous and most fertile parts of Caucasia. They correspond roughly with the governments of Kutais, Tiflis, Elisavetpol and Baku, and have a population of nearly 3,650,000. The two valleys are separated by the low ridge of the Sarām or Meskes mountains.

Spurs from the Caucasus and from the Armenian highlands fill up the broad latitudinal depression between them. Above (i.e. west of) Tiflis these spurs so far intrude into the valley that it is reduced to a narrow strip in breadth. But below that city it suddenly widens out, and the width gradually increases through the stretch of 350 m. to the Caspian, until in the Mugan steppe along that sea it measures 100 m. in width. The snow-clad peaks of the main Caucasus, descending by short, steep slopes, fringe the valley on the north, while an arid escarpment, having the characteristics of a border ridge, of the Armenian highlands, fronts it on the south. The floor of the valley slopes gently eastwards, from 1200 ft. at Tiflis to 900 ft. in the middle, and to 85 ft. below normal sea-level beside the Caspian. But the uniformity of the slope is interrupted by a plateau (2000-3000 ft. in altitude) along the southern foothills of the east central Caucasus, in the region known as Kakhetia, drained by the Alazan, a left-hand tributary of the Kura. The deep, short gorges and glets which seam the southern slopes of the Caucasus are inhabited by Ossetes, Tushes, Pshavs and Khevsurs in the west, and by various tribes of Lezgians in the east. In these high and stony valleys every available patch of ground is utilized for the cultivation of barley, even up to altitudes of 7000 and 8000 ft. above the level of the sea; but cattle-breeding is the principal resource of the mountaineers, whose little communities are often separated from one another by passes, few of which are lower than 10,000 ft. The steppes along the bottom of the principal valley are for the most part too dry to be cultivated without irrigation. It is only in Kakhetia, where numerous mountain streams supply the fields and gardens of the plateau of Alazan, that wheat, millet and maize are grown, and orchards, vineyards and mulberry plantations are possible. Lower down the valley cattle-breeding is the chief source of wealth, while in the small towns and villages of the former Georgian kingdom various petty trades, exhibiting a high development of artistic taste and technical skill, are widely diffused. The slopes of the Armenian highlands are clothed with fine forests, and the vine is grown at their base, while on the wide-stretching steppes the Turko-Tatar pasturage cattle, horses and sheep. The lower part of the Kura valley assumes the character of a dry steppe, the rainfall not reaching 24 in. annually at Baku, and it is still less in the Mugan steppe, though quite abundant in the adjacent region of Lenkoran. The vegetation of the steppe is on the whole scanty. Trees are generally absent, except for thickets of poplars, dwarf oaks and tamarisks along the course of the Kura, the delta of which is smothered under a jungle of reeds and rushes. The Mugan steppe is, however, in spite of its dryness, a more fertile region in virtue of the irrigation practised; but the Kura has excavated its bed too deeply to admit of that being done along its course. The Lenkoran district, sometimes called Talysh, on the western side of the Kizil-Agach bay, is blessed with a rich vegetation, a fertile soil, and a moist climate.

The inhabitants of the Kura valley consist principally of Iranian Tates and Talyshes, of Armenians and Lezgians, with Russians, Jews and Arabs. This conjoint valley of the Rion-Kura was in remote antiquity the site of several Greek colonial settlements, later the seat of successive kingdoms of the Georgians, and for centuries it has formed a bulwark against hostile invasions from the south and east. It is still inhabited chiefly by Georgian tribes—Gurians, Imeretians, Mingrelians, Svanetians—in the basin of the Rion, and by Georgians intermingled with Armenians in the valley of the Kura, while the steppes that stretch away from the lower course of the latter river are ranged over by Turko-Tatars. Mingrelians and Imeretians (valley of Rion) are the gardeners of Caucasia, but the high valleys of Svanetia, farther north on the south slopes of the Caucasus mountains, are wild and difficult of access. In the cultivated parts the land is so exceedingly fertile and productive that it sells for almost fabulous prices, and its value is still further enhanced by the discovery of manganese and copper mines in the basin of the Rion, and of the almost inexhaustible supplies of naphtha and petroleum at Baku in the Apscheron peninsula. The principal products of the soil are mentioned lower down, while the general

character of the vegetation is indicated under CAUCASUS: *Western Caucasus*. In the basin of the Rion, in that of the Chorokh (which runs off the Pontic highlands into the Black Sea south of Batum), and on the Black Sea littoral from Batum northwards to Sukhum-kaleh, and beyond, the climate is extremely hot and the rainfall heavy (see under *Climate* below). It is in this valley that the principal towns (except Vladikavkaz at the north foot of the Caucasus) of Caucasus are situated, namely, Baku (179,133 inhabitants in 1900), Tiflis (160,645 in 1897), Kutais (32,492), and the two Black Sea ports of Batum (28,512) and Poti (7666).

(iv.) The highlands of Armenia are sometimes designated the Minor Caucasus, Little Caucasus and Anti-Caucasus. But to use such terms for what is not only an independent, but also an older, orographical formation than the Caucasus tends to perpetuate confusion in geographical nomenclature. The Armenian highlands, which run generally parallel to the Caucasus, though at much lower elevations (5000-6000 ft.), are a plateau region, sometimes quite flat, sometimes gently undulating, clothed with luxuriant meadows and mostly cultivable. From its rise double or triple ranges connected by cross-ridges and spined with outer spurs. These double and triple ranges, which have a general elevation of 8500-10,000 ft., stretch from the south-east angle of the Black Sea, 400 m. south-eastwards to the Kara-dagh and Salavat mountains in north Persia, and the latter link them on to the Elburz mountains that skirt the southern end of the Caspian Sea. Various names are given to the different parts of the constituent ranges, or, perhaps more correctly, elongated groups of mountains. The Ajari, Akhali-sikh and Meskes or Trialety groups in the west are succeeded farther east by the Somkhet, Murguz, Ganji and Karabakh sections, forming the southern rim of the Kura basin, while parallel with them, but farther south, run the Mokry, Mishkan, Akmangan and Paltanin ranges, marking the northern edge of the Aras drainage area. These two sets of parallel ranges are linked together transversely by the cross-ridges of Bezobdal, Pambak, Shah-dagh and Gok-cha. From this last branches off the highest range in the entire series, namely, the Zangezur, which soars up to 10,000 ft. above the left bank of the Aras. From it again there shoot away at right angles, one on each side, the ranges of the Dar-alagöz and Bergushet. These highlands exhibit very considerable evidences of volcanic activity both in remote geological periods and also since the Tertiary epoch. Large areas are overlain with trachyte, basalt, obsidian, tuff and pumice. The most conspicuous features of the entire region, Mount Ararat (16,930 ft.) and Mount Ağdöz (13,440 ft.), are both solid masses of trachyte; and both rise above the limits of perpetual snow. Extinct volcanoes are numerous in several of the ranges, e.g. Akmangan, Mokry, Karabakh and Egrî-dagh (see below). It is in this region of the Armenian highlands that the largest lakes of Caucasus are situated, namely, the Gok-cha or Sevanga (540 sq. m. in area) at an altitude of 6340 ft., the Chaldîr-göl (33 sq. m.) at 6520 ft., and several smaller ones, such as the göls of Khozapin, Khopchalu, Arpa, Toporavan and Tabiztakhur, all situated between 6500 and 7000 ft. above sea-level. The principal water-divide in this highland region is, however, the range of Egrî-dagh (Ararat), which just south of 42° S. forms for 100 m. the boundary between Russian and Turkish Armenia, having Ararat at its eastern extremity and the extinct volcano of Kess-dagh (11,260 ft.) at its western. Its importance lies in the fact that it divides the streams which flow into the Black Sea and Caspian from those which make their way into the Persian Gulf. The Egrî-dagh possesses a sharply defined crest, ranges at a general elevation of 8000 ft., is bare of timber, scantily supplied with water, and rugged and deeply fissured.

The transverse water-parting between the Black Sea and the Caspian begins on the south side of the main range of the Caucasus, at Mount Zikara (12,560 ft.), a little south-west of Kasbek, and runs south-west along the sinuous crests of the Racha, Suram and Meskes (3000-5000 ft.), Vakhân (10,000-11,000 ft.), Arzyan (7000-10,000 ft.), and its continuation the Soganluk, thus linking the Caucasus ranges with those of the Armenian highlands. This line of heights separates the basins of the Chorokh and the Rion (Black Sea) from those of the Aras and the Kura (Caspian Sea). North of the Caucasus ranges the water-divide between these two seas descends from Mount Elburz along the Sadyrlar Mountains (11,000 ft.), and finally sinks into the Stavropol "plateau" (1600 ft.). But the main axis of the transverse upheavals would appear to be continued in a north-eastern direction in the Andi and other parallel ranges of Daghestan, as stated under CAUCASUS.

The population in this region consists principally of Armenians, Tatars, Turks, Kurds, Ossetes, Greeks, with Persians, Tates and a few Russians (see particulars below).

*Climate*.—Owing in part to the great differences in altitude in different regions of Caucasus and in part to the directions in which the mountain ranges run, and consequently the quarters towards which their slopes face, the climate varies very greatly according to locality. Generally speaking, it may be characterized as a climate of extremes on the Armenian highlands, in the Kura valley and in northern Caucasus, and as maritime and genial in Lenkoran, on the Black Sea coastlands, and in the

valley of the Rion. The greatest recorded range of temperature is at Erivan (altitude 3230 ft.), namely, of 64° between a January average of 14.9° and an August average of 78.8° F. At Sukhum-kaleh, on the Black Sea, the corresponding range is only 27.3° between a January average of 48.8° and an August average of 76.1°. The highest mean temperatures for the whole year are those of Lenkoran (60.3°) and of Sukhum-kaleh and Poti (about 58°), and the lowest at Ardahan (5840 ft.), in the province of Kars, namely, 37.9°, and at Gudaur (7245 ft.), a few miles south of Kasbek, namely, 38.6°. The following table gives particulars of temperature averages at a few typical places:—

Place.	Altitude.	Annual Mean.	January Mean.	July Mean.
Stavropol	2030	47.0°	24.0°	70.0°
Vladikavkaz	2345	47.3°	23.4°	68.0°
Gudaur	7245	38.6°	20.3°	57.2°
Baku on Caspian		58.0°	38.0°	80.0°
Tiflis	1490	55.0°	32.0°	76.5°
Batum on Black Sea		59.0°	42.0°	75.0°
Sochi on Black Sea		56.3°	40.3°	76.1°
Lenkoran on Caspian		60.3°	39.0°	80.6°
Erivan	3170	51.0°	15.0°	75.0°

In respect of precipitation the entire region of Caucasus may be divided into two strikingly contrasted regions, a wet and a dry. To the former belong the Black Sea littoral, where the rainfall averages 59 to 93 in. annually, and the valleys that open upon it or are exposed to winds blowing off it, in which the rainfall varies, however, from 20 in. (Abbas-tuman, Borzhom) to 60 (Kutais). In Lenkoran also the rainfall averages 40 to 50 in. in the year. Between 16 and 40 in. fall as a rule at the northern foot of the Caucasus (Mozdok, Pyatigorsk) and in the Kura valley (Tiflis, Novo-bayazet). On the Armenian highlands and on the steppes north of Pyatigorsk the rainfall is less than 12 in. annually, and even in some places less than 8 in., e.g. at the foot of Ararat. Most rain falls at Batum and at Lenkoran in the autumn, in northern Caucasus and in Transcaucasia in spring and summer, but in the vicinity of the Sea of Azov in winter.

*Flora and Fauna*.—Plant-life, in such a mountainous country as Caucasus, being intimately dependent upon aspect and altitude, is treated under CAUCASUS. The wild animals of Caucasus are for the most part the same as those which frequent the mountainous parts of central Europe, though there is also an irruption of Asiatic forms, e.g. the tiger (in Lenkoran only), panther, hyaena and jackal. The more important of the carnivores which haunt the forests, valleys and mountain slopes are the bear (*Ursus arctos*), wolf, lynx, wild cat and fox (*Vulpes melanotus*). The wild boar occurs around Borzhom. The aurochs (*Bos urus*) appears to exist still in the forests of the western Caucasus. Of interest for sportsmen, as well as serving as prey for the carnivores, are red deer, goats (*Capra pallasi* and *C. aegagrus*), chamois, roebuck, mouflon (*Ovis musimon*), argali or Asiatic wild sheep (*O. Ammon*), another species of sheep in *O. gmelini*, and follow deer (*Capreolus pigargus*) in northern Caucasus only. Rodents are numerous, the mouse (*Mus sylvaticus*) is very destructive, and beavers are met with in places. The birds of prey are the same as those of central Europe, and include the sea eagle, alpine vulture (*Gyps fulvus*), buzzard, kites (*Gypaëtus barbatus* and *Milvus aler*), hawks (e.g. *Asitur nisus*), goshawk (*A. palumbarius*), fish-hawk (*Pandion haliaëtus*) and owls. Among the smaller birds may be enumerated finches, the siskin, bullfinch, pipit, titmouse, wagtail, lark, fine-crested wren, hedge-sparrow, corn-wren, nut-hatch, starling, swallow; martin, swift, thrush, butcher bird, shrike, dipper, yellow-hammer, ortolan and a warbler (*Accentor alpinus*). The game birds consist of grouse, blackcock, moorhen, quail and partridge. The pheasant derives its name from the ancient name (*Phasis*) of the Rion.

In the seas and rivers about 190 species of fishes have been enumerated. Of these, 115 species are Mediterranean, 30 are common to the Caspian Sea, and the remaining species are peculiar to the Black Sea. The most useful economically are several species of sturgeon and of herring, trout, barbel, chubb, bream, ray, sea-dace,

carp, anchovy. Insects abound, especially Coleoptera. Flies, lice, gaddies and mosquitoes are the worst of the insect plagues. There are several snakes, including the viper (*Pelias berus*).

**Ethnology.**—The population of Caucasia is increasing rapidly. In 1897 it numbered 9,291,090, of whom 4,886,230 were males and 4,404,867 were females. The most densely-peopled provinces were Kutais and Tiflis, each with 80 inhabitants to the square mile; the thinnest the Black Sea government (20½ per sq. m.), Terek (31), and Kars (39). Of the total population 3,725,543 lived in northern Caucasia and 5,564,547 in Transcaucasia (including Daghestan). In the latter territorial division there exists a great disproportion between the sexes, namely, to every 100 males only 86 females; indeed in the Black Sea government there are only 65.5 females to every 100 males. Ethnologically the population belongs to a great variety of races. The older authorities asserted that these numbered as many as 150, or even 300; the more recent researches of Baron P. V. Uslar, F. Anton von Schiefner, Zagursky, and others have greatly reduced this number; but even then there are not less than fifty represented.

According to the languages spoken the populations of Caucasia admit of being classified as follows,<sup>1</sup> according to Senator N. Troitsky, president of the Russian Census Committee for 1897.

ARYANS	4,901,412		
Slavs		3,183,870	
Great Russians			1,829,793

<sup>1</sup> Premier Recensement général de la population de l'empire de Russie, ed. N. Troitsky (St. Petersburg, 1905, 2 vols.), in Russian and French. Although the Ingushes speak a Chechen dialect, they have recently been proved to be, anthropologically, quite a distinct race.

**Religion.**—Most of the Russians and the Georgians belong to the Orthodox Greek Church (over 4,000,000 in all); but considerable numbers (estimated at nearly 122,000, though in reality probably a good many more) are Nonconformists of different denominations. The Georgian Lazes are, however, Mussulmans. The Armenians are Christians, mostly of the national Gregorian Church (979,566), though 34,000 are Roman Catholics. The Caucasian races (except the Gregorians), together with the Turks and Tatars, are Mussulmans of the Sunnite sect (2,021,300), and the Iranian races mostly Mussulmans of the Shiite sect (884,100). The Kalmucks and other Mongolic tribes are Lamaists (20,300), and some of the Kurds profess the peculiar tenets of the Yezidis.

**Industries.**—The principal occupation of the settled inhabitants is agriculture and of the nomadic the breeding of live stock, including camels. The cultivation of the soil is, however, attended in many parts with great difficulties owing to the scanty rainfall and the very primitive implements still in use, and in the valley of the Kura heavy losses are frequently incurred from depredateurs by locusts. But where irrigation is employed the yield of crops is excellent. Rye and wheat are the most important crops harvested in northern Caucasia, but oats, barley and maize are also cultivated, whereas in Transcaucasia the principal crops are maize, rice tobacco and cotton. The rice is grown chiefly in the valley of the Kura and in Lenkoran; the tobacco in the Rion valley and on the Black Sea coastlands, also to some extent in Kuban; and the cotton in the eastern provinces. Various kinds of fodder crops are grown in Transcaucasia, such as hay, rye-grass and lucerne. It is estimated that nearly 54,000 acres are under vineyards in northern Caucasia and some 278,000 acres in Transcaucasia, the aggregate yield of wine being 30 million gallons annually. The best wine grows in Kakhetia, a district lying north-east and east of Tiflis; this district alone yields nearly 8 million gallons annually. Large numbers of mulberry trees are planted for rearing silkworms, especially in Kutais, Erivan, Elisavetpol (Nukha) and Baku (Shemakha); the groves occupy nearly 150,000 acres, and the winding of the silk gives employment to large numbers of the population. Melons and water-melons are also important objects of cultivation. Sunflowers are very extensively grown for oil in the government of Kuban and elsewhere, and also some flax. Liquorice is an article of export. Many varieties of fruit are grown, especially good being the apricots, peaches, walnuts and hazel nuts. A limited area (not more than 1150 acres) of the Black Sea coast between Sukhum-kaleh and Batum is planted with the tea-shrub, which succeeds very well. In the same district bamboos, ramie-fibre and attar (otto) of roses are cultivated.

The mining industry is growing rapidly in importance in spite of costly and deficient means of communication, want of capital, and lack of general initiative. So far the principal developments of the industry have been in the governments of Kutais, Batum, Elisavetpol and Kuban. Copper ore is extracted above the Murgul river (some 30 m. south of Batum), at Akhtala south of Tiflis, and at Kedabek in Elisavetpol; manganese to a considerably greater extent (over 400,000 tons annually) at Chiatufi in the Kvirila valley in Kutais. Steam coal of good quality is reported to exist about 30 m. inland from the open roadstead of Ochemchiri in Kutais, but it is not mined. About 50,000 tons of coal of very poor quality are, however, extracted annually, and the same quantity of salt in the Armenian highlands and in Kuban. Small quantities of quicksilver, sulphur and iron are obtained. But all these are insignificant in comparison with the mineral oil industry of Baku, which in normal times yields annually between ten and eleven million tons of crude oil (naphtha). A good deal of this is transported by gravitation from Baku to Batum on the Black Sea by means of a pipe laid overland. The refined oil is exported as kerosene or petroleum, the heavier refuse (mazut) is used as fuel. Naphtha is also obtained, though in much smaller quantities, in Terek and Kuban, in Tiflis and Daghestan. Numerous mineral springs (chalybeate and sulphurous) exist both north and south of the Caucasus ranges, e.g. at Pyatigorsk.

Zhelezanovodsk, Essentuki, and Kislovodsk in Terek, and at Tiflis, Abastuman and Borzhom in the government of Tiflis.

*Manufacturing industry* is confined to a few articles and commodities, such as cement, tea, tin cans (for oil), cotton goods, oil refineries, tobacco factories, flour-mills, silk-winding mills (especially at Shusha and Jebraïl in the south of Elisavetpol), distilleries and breweries. On the other hand, the domestic industries are extensively carried on and exhibit a high degree of technical skill and artistic taste. Carpets (especially at Shusha), silk, cotton and woollen goods, felts and fur cloaks are made, and small arms in Daghestan and at Tiflis, Nukha and Sukhum-kaleh; silversmiths' work at Tiflis, Akhaltsikh and Kutais; pottery at Elisavetpol and Shusha; leather shoe-making at Alexandropol, Nukha, Elisavetpol, Shusha and Tiflis; saddlery at Sukhum-kaleh and Ochemchiri on the Black Sea and at Temir-khan-shura in Daghestan; and copper work at Derbent and Alexandropol. But industries of every description were most seriously crippled by the spirit of turbulence and disorder which manifested itself throughout Transcaucasia in the years 1904-1906, accentuated as they were further by the outbreak of the long-rooted racial enmities between the Armenians and the Tatars, especially at Baku in 1905.

*Commerce.*—The exports through the Black Sea ports of Batum, Poti and Novo-rossiysk average in value a little over £10,000,000 annually, though showing a tendency to increase slightly. By far the most important commodity is petroleum, fully one-half of the total value. In addition large quantities are shipped at Baku direct for the Volga and the Transcasian port of Krasnovodsk. The export that comes next in value is silk, and after it may be named wheat, barley, manganese ore, maize, wool, oilcake, carpets, rye, oats, liquorice and timber. The import trade reaches nothing like the same value, and what there is is confined almost entirely to Batum. The annual average value may be put at not quite £2,000,000, machinery and tin-plate being a long way the most important items. There is further a small transit trade through Transcaucasia from Persia to the value of less than half a million sterling annually, and chiefly in carpets, cocoons and silk, wool, rice and boxwood; and further a sea-borne trade between Persia and Caucasian ports (Baku and Petrovsk) to the value of over ½ millions sterling in all. The very extensive internal trade with Russia can only be mentioned.

*Railways.*—The principal approach to Caucasia from Russia by rail is the line that runs from Rostov-on-Don to Vladikavkaz at the foot of the central Caucasus range. Thence, or rather from the junction of Beslan, 14 m. north of Vladikavkaz, the main line proceeds east of Petrovsk on the Caspian, and from Petrovsk skirts the shore southwards as far as Baku, the distance from Vladikavkaz to Baku being 414 m. This railway, together with the driving roads over the Caucasus mountains via the Mamison pass (the Ossetic military road) and the Darial pass (the Georgian military road), and the route across the Black Sea to Poti or Batum are the chief means of communication between southern Russia and Transcaucasia. Baku and Batum (also Poti) are connected by another main line, 560 m. long, which traverses the valleys of the Kura and the Rion, south of the Caucasus. From Tiflis, nearly midway on this last line, a railway proceeds south as far as Erivan (234 m.), with a branch to Kars (48 m.). The Erivan line is being continued into Persia, namely, to Tabriz via Julfa on the Aras.

*History.*—To the ancient Greeks Caucasia, and the mighty range which dominates it, were a region of mystery and romance. It was there that they placed the scene of the sufferings of Prometheus (*vide* Aeschylus, *Prometheus Vinculus*), and there, in the land of Colchis, which corresponds to the valley of the Rion, that they sent the Argonauts to fetch the golden fleece. Outside the domain of myth, the earliest connexion of the Greeks with that part of the world would appear to have been through the maritime colonies, such as Dioscurias, which the Milesians founded on the Black Sea coast in the 7th century B.C. For more than two thousand years the most powerful state in Caucasia was that

of Georgia (*q.v.*), the authentic history of which begins with its submission to Alexander the Great in 323 B.C. The southern portion of Transcaucasia fell during the 1st century B.C. under the sway of Armenia, and with that country passed under the dominion of Rome, and so eventually of the Eastern empire. During the 3rd century A.D. Georgia and Armenia were invaded and in great part occupied by the Khazars, and then for more than a thousand years the mountain fastnesses of this borderland between Europe and Asia were the refuge, or the resting-place, of successive waves of migration, as people after people and tribe after tribe was compelled to give way to the pressure of stronger races harassing them in the rear. The Huns, for instance, and the Avars appeared in the 6th century, and the Mongols in the 13th. In the 10th century bands of Varangians or Russified Scandinavians sailed out of the Volga and coasted along the Caspian until they had doubled the Apsheiron peninsula, when they landed and captured Barda, the chief town of Caucasian Albania.

But, apart from Georgia, historical interest in Caucasia centres in the long and persistent attempts which the Russians made to conquer it, and the heroic, though unavailing, resistance offered by the mountain races, more especially the Circassian and Lesghian tribes. Russian aggression began somewhat early in the 18th century, when Peter the Great, establishing his base at Astrakhan on the Volga, and using the Caspian for bringing up supplies and munitions of war, captured Derbent from the Persians in 1722, and Baku in the following year. But these conquests, with others made at the expense of Persia, were restored to the latter power after Peter's death, a dozen years later. At that period the Georgians were divided into various petty principalities, the chief of which were Imeretia and Georgia (Kharthlia), owing at times a more or less shadowy allegiance to the sultan of the Ottoman Turks at Constantinople. In 1770, during the course of a war between Russia and Turkey, the Russians crossed over the Caucasus and assisted the Imeretians to resist the Turks, and from the time of the ensuing peace of Kuchuk-kainarji the Georgian principalities looked to their powerful northern neighbour as their protector against the southern aggressors the Turks. In 1783 George XIII., prince of Georgia and Mingrelia, formally put himself under the suzerainty of Russia, and after his death Georgia was converted (1801) into a Russian province. The same fate overtook Imeretia nine years later. Meanwhile the Russians had also subdued the Ossetes (1802) and the Lesghian tribes (1803) of the middle Caucasus. By the peace of Gulistan in 1813 Persia ceded to Russia several districts in eastern Caucasia, from Lenkoran northwards to Derbent. Nevertheless the mountain tribes who inhabited the higher parts of the Caucasus were still independent, and their subjugation cost Russia a sustained effort of thirty years, during the course of which her military commanders were more than once brought almost to the point of despair by the tenacity, the devotion and the adroitness and daring which the mountaineers displayed in a harassing guerilla warfare. The animating spirit of their resistance was Shamyl (Samuel), a chief and priest of the Lesghians, who, a Mahomedan, proclaimed a "holy war" against the "infidel" aggressors. At first the Russians were able to continue their policy of conquest and annexation without serious check. After acquiring the northern edge of the Armenian plateau, partly from Persia in 1828 and partly from Turkey in 1829, Russia crushed a rising which had broken out in the Caspian coast districts of Daghestan on the north of the Caucasus. This took place during the years 1831-1832. The next seven years were occupied with the subjugation of the Abkhasians along the Black Sea coast, and of other Circassian tribes in the west. Meanwhile Shamyl had roused the Lesghian tribes farther east and begun his twenty years' struggle for freedom, a struggle which called forth the sympathy and admiration of nearly the whole of Europe. More than once he escaped, in a manner that seemed little short of marvellous, out of the hands of the Russians when they held him closely invested in some mountain fastness, as at Himry in 1831, at Akhulgo in 1839, and again at the same stronghold in 1849.

The general who at last broke the back of the long opposition of the prophet-chief of the Lesghians was Prince Baryatinsky, who after three years of strenuous warfare succeeded in capturing Shamy's stronghold of Weden, and then in surrounding that chieftain himself on the inaccessible rocky platform of Gunib in the heart of Daghestan. There the hitherto indomitable champion of Caucasian independence was forced to surrender to the Russians on the 6th of September 1859. Nevertheless the spirit of resistance in these stubborn mountaineers was not finally broken until 1864, when the Russians eventually stifled all opposition in the difficult valleys and glens of the western Caucasus. But this was followed, during the next fourteen years, by the wholesale emigration of thousands upon thousands of Circassians, who sought an asylum in Turkish territory, leaving their native region almost uninhabited and desolate, a condition from which it has not recovered even at the present day. During the Russo-Turkish War of 1877-78 the self-exiled Circassians and other Caucasian mountaineers, supported by a force of 14,000 Turks, made a determined attempt to wrest their native glens from the power of Russia; but, after suffering a severe defeat at the hands of General Alkhozov, the Turks withdrew, and were accompanied by some 30,000 Abkhassians, who settled in Asia Minor. A few months later the Lesghians in Daghestan, who had risen in revolt, were defeated and their country once more reduced to obedience. By the ensuing peace of Adrianople, Russia still further enlarged her Transcaucasian territories by the acquisition of the districts of Kars, Batum and Ardahan. After a peaceful period of a quarter of a century the Armenian subjects of Russia in Transcaucasia were filled with bitterness and discontent by the confiscation of the properties of their national (Gregorian) church by the Russian treasury. Nor were their feelings more than half allayed by the arrangement which made their ecclesiastics salaried officers of the Russian state. This ferment of unrest, which was provoked in the years 1903-1904, was exacerbated in the winters that followed by the renewed outbreak of the century-long racial feud between the Tatars and the Armenians at Baku and other places. In fact, nearly the whole of the region between the Caucasus and the Perso-Turkish frontier on the south, from the Caspian Sea on the one side to the Black Sea on the other, was embroiled in a civil war of the most sanguinary and ruthless character, the inveterate racial animosities of the combatants being in both cases inflamed by religious fanaticism. Complete anarchy prevailed at the worst centres of disorder, as Baku and Batum, the imperial authorities being more powerless to preserve even the semblance of order than they were in the interior of Russia. Many of the oil wells at Baku were burned, and massacres took place at that town, at Shusha, at Erivan, at Tiflis, at Batum, at Jebraïl and at other places. An end was put to these disorders only by the mutual agreement of the two contestants, alike horrified and exhausted by the fierce outburst of passion, in September 1905.

(J. T. B.)

**CAUCASUS**, a mountain range of Asia, wholly within the Russian empire, stretching north-west to south-east from the Strait of Kerch (between the Black Sea and Sea of Azov) to the Caspian Sea, over a length of 900 m., with a breadth varying from 30 to 140 m. In its general character and conformation the Caucasus presents a closer analogy with the Pyrenees than with the Alps. Its general uniformity of direction, its comparatively narrow width, and its well-defined limits towards both south and north are all features which it has in common with the former. The range of the Caucasus, like that of the Pyrenees, maintains for considerable distances a high average elevation, and is not cleft by deep trenches, forming natural passes across the range, such as are common in the Alps. In both ranges, too, some of the highest summits stand on spurs of the main range, not on the main range itself; as Mont Perdu and Maladetta lie south of the main backbone of the Pyrenees, so Mount Elbruz and Kasbek, Dykh-tau, Koshtan-tau, Janga-tau and Shkara—all amongst the loftiest peaks of the Caucasus—stand on a subsidiary range north of the principal range or on spurs connecting the two. On the other hand, it is interesting to compare the arrangement of the drainage waters of the Caucasus with those of the Alps. In

both orographical systems the principal rivers start nearly all together from a central nucleus, and in both cases they radiate to opposite quarters of the compass; but whereas in the Alps the Rhone and the Rhine, flowing south-west and north-east respectively, follow longitudinal valleys, and the Aar and the Ticino, flowing north-west and south-east respectively, follow transverse valleys, in the Caucasus the streams which flow south-west and north-east, namely, the headwaters of the Rion and the Terek, travel along transverse valleys, and those of the Kura and the Kuban, flowing south-east and north-west respectively, traverse longitudinal valleys. For purposes of description it is convenient to consider the range in four sections, a western, a middle with two subsections, and an eastern.

1. **WESTERN CAUCASUS.** This section, extending from the Strait of Kerch to Mount Elbruz in  $42^{\circ} 40'$  E., is over 430 m. long, and runs parallel to the north-east coast of the Black Sea and at only a short distance from it. Between the main range and the sea there intervene at least two parallel ranges separated by deep glens, and behind it a third subsidiary parallel range, likewise separated by a deep trough-like valley, and known as the Bokovoi Khrebet. All these ranges are shorn through transversely by numerous glens and gorges, and, the rainfall being heavy and the exposure favourable, they are densely clothed with vegetation. Many of the spurs or broken segments of ranges thus formed abut steeply upon the Black Sea, so that this littoral region is on the whole very rugged and not readily accessible, especially as the general elevations are considerable. The seaward flanking ranges run up to 4000 ft. and more, and in many places shoot out cliffs which overhang the coast some 2000-3000 ft. sheer, while the main range gradually ascends to 10,000-12,000 ft. as it advances eastwards, the principal peaks being Fisht (8040 ft.), Oshten (9210 ft.), Shuguz (10,640 ft.), and Psysh (12,425 ft.). And whereas the main range is built up of hard eruptive or crystalline rocks, the subsidiary chains are composed of softer (Cretaceous and Tertiary) laminated formations, which easily become disintegrated and dislocated. The snow-line runs here at about 9000 ft. on the loftiest summits, and east of Oshten the crest of the main range is capped with perpetual snow and carries many hanging glaciers, while larger glaciers creep down the principal valleys. The passes lie at relatively great altitudes and are few in number, so that although the northern versants of the various ranges all have a tolerably gentle slope, communication between the Black Sea and the valley of the Kuban, and the low steppe country beyond, is the reverse of easy. The more important passes, proceeding from west to east, are Pshekh (5435 ft.) west of Oshten, and Shelib (6060 ft.) east of Oshten, Pseashka (6880 ft.) east of Shuguz, Sanchar (7990 ft.) west of Psysh; and between the last-named mountain and Elbruz, facilitating communication between Sukhum-Kaleh (and the coast as far as Poti) and the upper valley of the Kuban, are the passes of Marukh (11,500 ft.), Klukhor (9450 ft.) and Nakhar (9615 ft.).

**Flora.**—The southern exposure of this littoral region, the shelter afforded against the bitter winds of the north by the lofty Caucasian range, and the copious rainfall all combine to foster a luxuriant and abundant vegetation. The most distinguishing feature of the flora of this region is the predominance of arborescent growths; forests cover in fact 56% of the area, and are not only dense but laced together with climbing and twining plants. The commonest species of trees are such as grow in central Europe, namely, ash, fir, pine, beech, acacia, maple, birch, box, chestnut, laurel, holm-oak, poplar, elm, lime, yew, elder, willow, oak. The common box is especially prevalent, but the preponderating species are *Coniferae*, including the Caucasian species *Pinus halepensis* and *P. insignis*. The commonest firs are *Abies nordmannia* and *A. orientalis*. There are two native oaks, *Quercus ponticus* and *Q. sessiliflora*. A great variety of shrubs grow on these slopes of the western Caucasus, chiefly the following species, several of which are indigenous—*Rhododendron ponticum*, *Asalca pontica*, *Aristotelia maqui*, *Agave*

*americana*, *Cephalaria talarica*, *Coloneaster pyraeantha*, *Citrus aurantium*, *Diospyros ebenum*, *Ficus carica*, *Illicium anisatum*, *Ligustrum caucasicum*, *Punica granatum*, *Philadelphus coronarius*, *Pyrus salicifolia*, *Rhus cotinus* and six species of *Viburnum*. Aquatic plants thrive excellently and occur in great variety. The following purely Caucasian species also grow on the coast—five species of seawort, three of saxifrage, *Aster caucasicus*, *Dioscorea caucasicus*, *Echinops raddeanus*, *Hedera colchica*, *Helleborus caucasicus* and *Peucedanum caucasicum*. Here too are found many of the more beautiful open-air flowering plants of a shrubby character, e.g. magnolia, azalea, camellia, begonia and paulownia. Among the cultivated trees and shrubs the most valuable economically are the vine, peach, pomegranate, fig, olive (up to 1500 ft. above sea-level), chestnut, apricot, apple, pear, plum, cherry, melon, tea (on the coast between Sukhum-Kaleh and Batum), maize (yielding the staple food of the inhabitants), wheat (up to 6000 ft.), potatoes, peas, currants, cotton, rice, colza and tobacco. Before the Russian conquest the native inhabitants of this region were Kabardians, Circassians (Adigheh) and Ahkhasians, also a Circassian race. But half a million of these people being Mahomedans, and refusing to submit to the yoke of Christian Russia, emigrated into Turkish territory

between 1864 and 1878, and the country where they had lived remained for the most part unoccupied until after the beginning of the 20th century. Then, however, the Russian government held out inducements to settlers, and these have been responded to by Russians, Greeks, Armenians and Rumanians, but the process of re-peopling the long deserted territory is slow and difficult. The coast-line is remarkably regular, there being no deep bays and few seaports. The best accommodation that these latter afford consists of more or less open roadsteads, e.g. Novo-rossiysk, Gelenjik, Anapa, Sukhum-Kaleh, Poti and Batum. Along the coast a string of summer bathing resorts is springing up similar to those that dot the south-east coast of the Crimea. The most promising of these little seaside places are Anapa, Gelenjik and Gagy.

2. MIDDLE CAUCASUS: (a) *Western Half*.—This sub-section, with a length of 200 m., reaches from Mount Elbruz to Kasbek and the Pass of Darial. It contains the loftiest summits of the entire range, fully a dozen exceeding Mont Blanc in altitude (see table below).

In addition to the peaks enumerated in the table, the following also exist between Elbruz and Kasbek all exceeding 13,000 ft. in altitude: Dong-osenghi, 14,265 ft.; Kurmychi, 13,310 ft.; Ullukara-tau, 14,070 ft.; Jailyk, 17,780 ft.; Sarikol-bashi, 13,965 ft.; Dumala-tau, 14,950 ft.; Sagan-tau, 14,730 ft.; Tiutiun-bashi, 14,500 ft.; Nuamkuam, 13,975 ft.; Zurungal, 13,915 ft.; Mala-tau, 14,950 ft.; Tiutiun-tau, 15,115 ft.; Khrumkol-tau, 14,653 ft.; Babis-khokh, 14,600 ft.; Gulchi, 14,680 ft.; Doppak, 14,240 ft.; Nakhshbita-khokh, 14,405 ft.; Shakhkhokh, 14,335 ft.; Mishirghi-tau (W. peak), 16,410 ft.; Fytnergyn-tau, 13,790 ft.; Gezeh-tau, 14,140 ft.; and Kalfber, 14,460 ft.

List of Peaks in the west central Caucasus, with their altitudes, names and dates of mountaineers who have climbed them.

Name of Peak.	Altitude in Feet.	By whom ascended.	Date.

1 Formerly the Koshtan-tau.

2 Formerly the Dykh-tau.

The crest of the main range runs continuously at an altitude exceeding 10,000 ft., but even it is surpassed in elevation by the secondary range to the north, the Bokovoi Khrebet. These two ranges are connected by more than half a dozen short transverse spurs or necks, inclosing as many cirques or high cauldron glens. Besides the Bokovoi Khrebet several other short subsidiary ranges branch off from the main range at acute angles, lifting up high montane glens between them; for instance, the two ranges in Svanetia, which divide, the one the river (glen) Ingur from the river (glen) Tskhenis-Tskhali, and the other the river (glen) Tskhenis-Tskhali from the rivers (glens) Lechkhum and Racha. Down all these glens glacier streams descend, until they find an opportunity to pierce through the flanking ranges, which they do in deep and picturesque gorges, and then race down the northern slopes of the mountains to enter the Terek or the Kubañ, or down the southern versant to join the Rion or the Kura. Amongst all these high glens there is a remarkable absence of lakes and waterfalls; nor are there down in the lower valleys at the foot of the mountains, as one would naturally expect in a region so extensively glaciated, any sheets of water corresponding to the Swiss lakes. In this section of the Caucasus the loftiest peaks do not

as a rule rise on the main range, but in many cases on the short spurs that link it with the Bokovoi Khrebet and other subsidiary ranges.

"The central chain of the Caucasus," writes Mr Douglas W. Freshfield,<sup>1</sup> "consists of a number of short parallel or curved horse-shoe ridges, crowned with rocky peaks and enclosing basins filled by the *masses* of great glaciers. . . . On either side of the main chain the same succession is repeated, with one important difference. On the north the schists come first, sometimes rising into peaks and ridges in a state of ruin . . . but more often worn to rolling downs; then the limestone range—writing-desk mountains that turn their steep fronts to the central snows; lastly low Cretaceous foothills, that sink softly into the steppe. But on the south side the crystalline rocks are succeeded by a broad belt of slates, as in the age of which the evidence is at present conflicting and the opinion of geologists divided. East of Adai-khokh, by what seems a strange freak of nature, the granitic [main] range is rent over and over again to its base by gorges, the watershed being transferred to the parallel chain of clay slates. . . . which has followed it from the Black Sea, attaining on its way the height of 13,400 ft. in the Laila, and limiting the great parallel basins of the Rion, Ingur and Skenia Shali [=Tskhenia-Tskhali]. . . ." "At the base of the central core of the chain spread (to the north) broad, smooth, grassy downs, the pastures of the Turk and the Ossete. . . . Their ridges attain to 9000 to 10,000 ft. They are composed of friable crystalline schists. . . . Beyond these schists rises a broken wall of limestone, cleft to the base by gorges, through which flow the mountain torrents, and capped by pale precipitous battlements, which face the central chain at a height of 11,000 to 12,000 ft. Beyond, again, lies a broad furrow, or 'longitudinal fold,' as geologists call it, parallel to the ridges, and then rises the last elevation, a belt of low calcareous hills, on which, here and there among the waves of beech forest, purple or blue with distance, a white cliff retains its local colour and shines like a patch of fresh snow. Beyond, once more beyond, spreads the Scythian steppe, not the dead level of Lombardy, but an expanse of long low modulations, which would be reckoned hills in our home counties, seemed by long shining ribbons, which mark the courses of the tributaries of the Terek. . . . Southwards too, immediately under the snows, we find 'crystalline schists,' smooth grassy heights, separated by shallow trenches, which form the lesser undulations of the three basins, the *drei Langenochthäler Imeritiens* of Dr Radde. These basins or 'longitudinal folds' are enclosed on the south by the long high ridge of dark slates, which extends parallel to the crystalline [main] chain from the neighbourhood of Sukhum-Kale to the Krestovaya Gora [pass of Darial]. Behind this slate crest spreads a confused multitude of hills, Jurassic and Cretaceous in their formation. . . . Their outer edge, distant some 90 to 400 m. from the snows, is marked by a limestone belt, lower and less continuous than that on the north, which frames the gorges of the Rion, and rises in the Kuamili (6352 ft.) and Nakarala (4774 ft.) near Kutais, its best known elevations."<sup>2</sup> It may be added that south of the central watershed, the strata, both Mesozoic and Palaeozoic, are compressed, crumpled, faulted and frequently overfolded, with their apices pointing to the south.

**Glaciers.**—As a rule the snow-line runs at 9500 to 10,000 ft. on the northern face and 1000 ft. higher on the southern face. It is estimated that there are in all over nine hundred glaciers in this section of the range, and although they often rival those of the Alps in size, they do not descend generally to such low altitudes as the latter. The best known are the Bezengi or Ullu, between Dykh-tau and Janga-tau, 10½ m. long, covering an area of 31 sq. m., and descending to 6535 ft. above sea-level; Leksyt, situated south of Adyr-su-bashi, 7½ m. long, 19 sq. m. in area, and creeping down to as low as 5600 ft., this being the lowest point to which any glacier descends on the south side of the range; Tseyra or Zea, descending 6 m. from the Adai-khokh to an altitude of 6730 ft.; Karagom, from the same mountain, 9½ m. long, 14 sq. m. in area and reaching down to 5790 ft., the lowest on the north side; Dyevdorak or Devdorak, from Kasbek, 2½ m. long, its lower end at 7530 ft.; Khaldeh or Geresho 4½ m. long, from Shkara and Janga-tau; Tuyber from Tetnuld, 6½ m. long, area 21 sq. m., and reaching down to 6565 ft.; Tsanner or Zanner, the same length and the same area, but stopping short 240 ft. higher, likewise given off by Tetnuld; while between that peak, Adish and Gestola originates the Adish or Lardkhat glacier, 5 m. long and terminating at 7450 ft. The total area covered by glaciers in the central Caucasus is estimated at 625 to 650 sq. m., the longest being the Maliev on Kasbek, 36 m. long; but according to the investigations of M. Rossikov several

of the largest glaciers are shrinking or retreating, the Tseyra at the rate of something like 40-45 ft. per annum.

**Passes.**—It is in this section that the entire mountain system is narrowest, and here it is that (apart from the "gate" at Derbent close beside the Caspian) the principal means of communication exist between north and south, between the steppes of southern Russia and the highlands of Armenia and Asia Minor. These means of communication are the passes of Darial and Mamison. Over the former, which lies immediately east of Kasbek; runs the Georgian military road (made 1811-1864) from Vladikavkaz to Tiflis, cutting through the mountains by a gorge (8 m. long) of singular beauty, shut in by precipitous mountain walls nearly 6000 ft. high, and so narrow that there is only just room for the carriage-road and the brawling river Terek side by side. The pass by which this road crosses the main range, farther south, is known as the Krestovaya Gora (Mountain of the Cross) and lies 7805 ft. above sea-level. The Mamison Pass, over which runs the Ossetic military road (made passable for vehicles in 1889) from the Terek (below Vladikavkaz) to Kutais in the valley of the Rion, skirting the eastern foot of the Adai-khokh, lies at an altitude of 9270 ft. and is situated a little south of the main range. Scarce any of the remaining passes in this west-central region are better than mountain paths; horses can traverse the best of them only during a few weeks in the height of summer. They mostly range at altitudes of 9000-12,500 ft., and between the pass of Nakhar in the west and that of Mamison in the east there is not a single pass below 10,000 ft. The best known in this section are the three Baksan passes of Chiper (10,800 and 10,720 ft.), Bassa (9950 ft.) and Donguz-oruz (10,490 ft.), south of Elbruz; those of Becho (11,070 ft.), Akh-su (12,465 ft.), Bak (10,220 ft.), Adyr-su (12,305 ft.) and Bezengi (10,000 ft.), between Elbruz and Dykh-tau; and those of Shari-vizk (11,560 ft.), Edena, Pasis-mta or Godivizk (11,270 ft.), Shtulu-vizk (10,860 ft.), Fytnargyn (11,130 ft.), between Dykh-tau and Adai-khokh; the Bakh-fandak (9570 ft.), between Adai-khokh and Kasbek; and the two Karaul passes (11,680 and 11,270 ft.) and Gurdzi-vizk (10,970 ft.), connecting the valley of the Uruk with that of the Rion. The most frequented pass in Svanetia is that of Latpari (9260 ft.), situated in the first of the southern subsidiary ranges mentioned above, and thus connecting the valley of the Ingur with the valley of the Tskhenia-Tskhali.

**Flora.**—In this section of the range again the southern slopes are clothed with vegetation of remarkable luxuriance and richness, more especially in the region of Svanetia (42°-43° E). Not only are the plants bigger than they grow in the Alps, but the blossoms are more abundant. Here again forests of *Coniferae* predominate, especially on the northern and eastern slopes; and the other distinguishing features of the flora are gigantic male ferns (*Aspidium filix-mas*), *Paris incompleta* (a member of the Trilliaceae), *Usnea* or tree-moss, box, holly (*Ilex aquifolium*), *Lilium monadelphum* and many of the familiar herbaceous plants which flower in English gardens, though here they grow to an altogether extraordinary size—"monksheads," *Cephalaria*, *Mulgedia* and groundseels, among which men on horseback might play at hide and seek without stooping" (E. Levier). Other prominent species are *Campanula*, *Pyrethrum*, aconite, *Cephaelis*, speedwell, *Alchemilla sericea*, *Centaurea macrocephala*, *Primula grandis* and a species of primrose. And the great height (13,000 ft.) at which the flowering plants blossom is not less remarkable than the great beauty and abundance of the flowers. Species which grow on both the northern and the southern slopes ascend 2000 ft. higher on the latter than on the former. Walnut grows up to an altitude of 5400 ft., the vine and mulberry up to 3250 ft., the lime and ash to 4000 ft. The forests extend to the upper end of the limestone gorges. Above that the crystalline schists are bare of tree vegetation. The upper limit of arborescent vegetation is considered to run at 7000-7500 ft., of shrubs such as rhododendrons at 8500 ft., and of pasture-lands up to 9000 ft. The principal cultivated varieties of plants in this section are wheat, rye, oats, barley, beans, millet and tobacco.

3. MIDDLE CAUCASUS: (b) Eastern Part.—In this sub-section, which stretches from Kasbek and the Darial gorge eastwards to

<sup>1</sup> *Exploration of the Caucasus* (2nd ed., 1902), i. 30-31.

<sup>2</sup> *Op. cit.* i. 35-36.

the Baba-dagh in  $48^{\circ} 25' E.$ , a distance of 230 m., the Caucasus attains its greatest breadth. For the whole of that distance the main range keeps at an average elevation of 10,000 ft., though the peaks in many instances tower up 2000 to nearly 5000 ft. higher, the altitudes increasing towards the east. As the main range approaches the Caspian its granite core gradually disappears, giving place to Palaeozoic schists, which spread down both the northern and the southern slopes. The glaciers too decrease in the same proportion both in magnitude and in extent. Here the principal peaks, again found for the most part on the spurs and subsidiary ranges, are the Tsmiakom-khokh (13,570 ft.), Shan-tau (14,530 ft.), Kidenais-magali (13,840 ft.), Zilga-khokh (12,645 ft.), Zikari (12,565 ft.), Choukhi (12,110 ft.), Jul'ti-dagh (12,430 ft.), Alakhun-dagh (12,600 ft.) and Maghi-dagh (12,445 ft.). On the main range itself stand Borbalo (10,175 ft.), Great Shavi-kildeh (12,325 ft.), Murov (11,110 ft.), Ansal (11,740 ft.), Ginor-roso (11,120 ft.), while farther east come Trfan-dagh (13,765 ft.) and Bazaryuz or Kichen (14,727 ft.). In the same direction, but again outside the main range, lie Shah-dagh (13,955 ft.), Shal'bu'z (13,675 ft.) and Malkamud (12,750 ft.).

But the most noteworthy feature of this section is the broad highland region of *Daghestan*, which flanks the main range on the north, and sinks down both eastwards to the Black Sea and northwards to the valley of the Terek. On the north-west this rugged highland region is well defined by the distinctive transverse ridge of Andi, which to the east of Kasbek strikes off from the Caucasus range almost at right angles. The rest of the *Daghestan* region consists of a series of roughly parallel folds, of Jurassic or Cretaceous age, ranging in altitudes from 7500 up to 12,500 ft., separated from one another by deep gorge-like river gleans which cut it up into a number of arid, treeless plateaus which have something of the appearance of independent ranges, or rather elongated tablelands of a mountainous character. The most prominent of these tablelands is Bash-lam, which stretches east and west between the Chanti Argun and the Andian Koisu, both tributaries of the Terek. Upon it rise the conspicuous peaks of Tebulos-mta (14,775 ft.), Tugo-mta (13,795 ft.), Komito-tavi or Kachu (14,010 ft.), Donos-mta (13,560 ft.), Diklos-mta (13,740 ft.), Kvalos-mta or Kolos-mta (13,080 ft.), Motshekh-tsferi (13,140 ft.) and Galavanas-tsferi (13,260 ft.). Farther east come the Bogos tableland, stretching from south-south-west to east-north-east between the Andian Koisu and the Avarian Koisu and rising to over 13,400 ft. in several peaks, e.g. Antshovala (13,440 ft.), Botshokh-me'r (13,515 ft.), Kosara-ku (13,420 ft.) and Addala-shuoghol-me'r (13,580 ft.); and the Dyulty tableland, reaching 12,400 ft. between the Kara Koisu and the Kazikumukh Koisu. On some of these peaks again there is a considerable amount of glaciation, more particularly on the slopes of Diklos-mta, where the glaciers descend to 7700 ft. on the north side and to 8350 ft. on the south side. In this section of the Caucasus the passes run somewhat lower than those between Elbruz and Kasbek, though still at appreciable heights, fully equal to those that lead up from the Black Sea to the valley of the Kubañ in the western section of the range. The best known are the Krestovaya Gora (7805 ft.) on the Georgian military road, south of Darial; Kodor (9300 ft.) and Satskheni, leading up from Telav in the upper valley of the Alazan; and Gudur (10,120 ft.) and Salavat (9280 ft.), carrying the Akhty military road from the valley of the Samur up past the Shah-dagh and the Bazar-dyusi to the valley of the Alazan.

The flora of this section bears a general resemblance to that farther west. Ample details will be found in Dr G. Radde's (1831-1903) monographs on *Daghestan*, quoted at the end of the present article.

4. THE EASTERN SECTION of the Caucasus gradually dies away east of Baba-dagh (11,930 ft.) towards the Caspian, terminating finally in the peninsula of Apsheron. It is, however, continued under the waters of the Caspian, as stated in the article on that sea, and reappears on its eastern side in the Kopet-dagh, which skirts the north-east frontier of Persia. In this section of the Caucasus no peak exceeds 9000 ft. in altitude

and the crest of the main range retains no snow. The most frequented pass, that of Alty-agach, necessitates a climb of not more than 4355 ft.

*Slopes of Range.*—Between the northern and the southern sides of the range there is quite as great a difference in climate, productions and scenery as there is between the Swiss and the Italian sides of the Alps. In the south-western valleys and on the south-western slopes of the Caucasus, where a heavy rainfall is combined with a warm temperature, magnificent forests clothe the mountain-sides and dip their skirts into the waters of the Black Sea. There not only the littoral from (say) Sukhum-Kaleh to Batum but the inland parts of the basin of the Rion will bear comparison with any of the provinces of Italy in point of fertility, and in richness and variety of products. But farther inland, upon proceeding eastwards towards Tiflis, a great change becomes noticeable on the other side of the transverse ridge of the Suram or Meskes mountains. Arid upland plains and parched hillsides take the place of the rich verdure and luxuriant arborescent growth of Imeretia, Svanetia and Mingrelia, the districts which occupy the valleys of the Ingur and Rion and the tributaries of the latter. A very similar change likewise becomes noticeable in the higher regions of the Caucasus Mountains upon proceeding north of the pass of Mamison, which separates the head-waters of the Rion from those of the Ardon, an important tributary of the Terek. The valleys of the two streams last mentioned, and of others that flow in the same direction, are almost wholly destitute of trees, but where the bare rock does not prevail, the mountain slopes are carpeted with grass. Freshfield's description of the valley of the Terek above Kasbek will apply pretty generally to all the valleys that descend on that face of the range: "treeless valleys, bold rocks, slopes of forbidding steepness (even to eyes accustomed to those of the Alps), and stonebuilt villages, scarcely distinguishable from the neighbouring crags." But, austere and unattractive though these valleys are, the same epithets cannot be applied to the deep gorges by which in most cases the streams make their escape through the northern subsidiary range. These defiles are declared to be superior in grandeur to anything of the kind in the Alps. That of Darial (the Terek) is fairly well known, but those of the Cherek and the Uruk, farther west, are stated to be still more magnificent. And not only do the snow-clad ranges and the ice-panopied peaks which tower up above them surpass the loftiest summits of the Alps in altitude; they also in many cases excel them in boldness and picturesqueness of outline, and equal the most difficult of them in steepness and relative inaccessibility.

*Hydrography.*—Nearly all the larger rivers of Caucasia have their sources in the central parts of the Caucasus range. The short, steep, torrential streams of Mdzimta, Pzou, Bzyb and Kodor drain the country west of Elbruz. The Ingur, Tskhenis-Tskhali, Rion and its tributaries (e.g. the Kvirtla) are longer, but also in part torrential; they drain the great glacier region between Elbruz and Kasbek. The Rion is the *Phasis* of the ancients and flows through the classic land of Colchis, associated with the legends of Medea and the Argonauts. The Lyakhva and Aragva, tributaries of the Kura, carry off the waters of the main range south of Kasbek, and other tributaries, such as the Yora and the Alazan, collect the surplus drainage of the main Caucasus range farther east. The other large river of this region, the Aras, has its sources, not in the Caucasus range, but on the Armenian highlands a long way south-west of Ararat. The rivers which go down from the central Caucasus northwards have considerably longer courses than those on the south side of the range, partly as a consequence of the gentler versant and partly also because of the great distances to which the steppes extend across which they make their way to the sea. The most important of these are the Kubañ and the Terek; but it is the latter that picks up most of the streams which have their sources among the central glaciers, e.g. the Malka, Bakhsan, Chegem, Cherek, Uruk, Ardon, all confined to deep narrow gleans until they quit the mountains. The Kuma, which alone pursues an independent course through the steppes, farther north than the

Terek, has its sources, not in the main ranges of the Caucasus, but in an outlying group of mountains near Pyatigorsk, the highest summit of which, Besh-tau, does not exceed 4600 ft. But its waters become absorbed in the sands of the desert steppes before they reach the Caspian. Of the streams that carve into chequers the elevated plateau or highland region of Daghestan four are known by the common name of the Koisu, being distinguished *inter se* as the Andian Koisu, the Avarian Koisu, the Kara Koisu and the Kazikumukh Koisu, which all unite to form the Sulak. The only other stream deserving of mention in this province is the Samur. Both rivers discharge their waters into the Caspian, as also does the Zungail, a small stream which drains the eastern extremity of the Caucasus range in the government of Baku.

**Volcanic Evidences.**—Ancient, but now extinct, volcanic upheavals are pretty common at the intersections of the main range with the transverse ranges; of these the most noteworthy are Elbruz and Kasbek. The town of Shemakha, near the eastern end of the system, was the scene of volcanic outbreaks as late as 1859, 1872 and 1902; while in the adjacent peninsula of Apsheron mud volcanoes exist in large numbers. All along the northern foot of the system hot mineral springs gush out at various places, such as Pyatigorsk, Zhelesnovodsk, Essentuki and Kislovodsk; and the series is continued along the north-eastern foot of the highlands of Daghestan, e.g. Isti-su, Eskindery, Akhta. In this connexion it may also be mentioned that similar evidences of volcanic activity characterize the northern border of the Armenian highlands on the southern side of the Rion-Kura depression, in the mountains of Ararat, Alagöz, Akmangan, Samsar, Godoreby, Great and Little Abull, and in the mineral springs of Borzhom, Abbas-tuman, Slepztov, Mikhailovsk and Tiflis. (J T BE, P. A. K)

**Geology.**—The general structure of the Caucasus is comparatively simple. The strata are folded so as to form a fan. In the centre of the fan lies a band of crystalline rocks which disappears towards the east. Beneath it, on both sides, plunge the strongly folded Palaeozoic and Jurassic schists. On the northern flank the folded beds are followed by a zone of Jurassic and Cretaceous beds which rapidly assume a gentle inclination towards the plain. On the south the corresponding zone is affected by numerous secondary folds which involve the Sarmatian or Upper Miocene deposits. In the eastern part of the chain the structure is somewhat modified. The crystalline band is lost. The northern Mesozoic zone is very much broader, and is thrown into simple folds like those of the Jura. The southern Mesozoic zone is absent, and the Palaeozoic zone sinks abruptly in a series of faulted steps to the plain of the Kura, beneath which no doubt the continuation of the Mesozoic zone is concealed.

The geological sequence begins with the granite and schists of the central zone, which form a band extending from Fisht on the west to a point some distance beyond Kasbek on the east. Then follow the Palaeozoic schists and slates. Fossils are extremely rare in these beds; *Bulhotrephis* has long been known, and doubtful traces of *Calamites* and ferns have been found, but it was not until 1897 that undoubted Palaeozoic fossils were obtained. They appear to indicate a Devonian age. Upon the Palaeozoic beds rest a series of Mesozoic deposits, beginning with the Lias and ending with the Upper Cretaceous. Whether the series is continuous or not is a matter of controversy. F. Loewinson-Leasing states that there is a more or less marked discordance between the Lias and the Upper Jurassic and between the latter and the Cretaceous. E. Fournier

north are nearly horizontal but on the south are in part included in the folds—the Eocene and Miocene being folded, while the latter beds, though sometimes elevated, are not affected by the folding. The final folding of the chain undoubtedly occurred at the close of the Miocene period. That there were earlier periods of folding is almost equally certain, but there is considerable difference of opinion as to their dates. The difference in character of the Jurassic beds on the two sides of the chain appears to indicate that a ridge existed

in that period. The last phase in the history of the Caucasus was marked by the growth of the great volcanoes of Elbruz and Kasbek, which stand upon the old rocks of the central zone, and by the outflow of sheets of lava upon the sides of the chain. The cones themselves are composed largely of acid andesites, but many of the lavas are augite andesites and basalts. There seem to have been two periods of eruption, and as some of the lavas have flowed over Quaternary gravels, the latest outbursts must have been of very recent date.

Near the northern foot of the Caucasus, especially in the neighbourhood of the hot mineral springs of Pyatigorsk, a group of hills of igneous rocks rises above the plain. They are laccolites of trachytic rock, and raised the Tertiary beds above them in the form of blisters. Subsequent denudation has removed the sedimentary covering and exposed the igneous core. (P. LA.)

**BIBLIOGRAPHY.**—Of the older works the following are still useful: A. von Haxthausen, *Transkaukasus* (2 vols., Leipzig, 1856); A. Petzholdt, *Der Kaukasus* (2 vols., Leipzig, 1866–1867); M. G. von Thielmann, *Travels in the Caucasus* (Eng. trans., 2 vols., London, 1875); F. C. Grove, *The Frosty Caucasus* (London, 1875); G. Radde, *Reisen im mingrelischen Hochgebirge* (Tiflis, 1866) and *Vier Vorträge über den Kaukasus* (Gotha, 1874); E. Favre, *Recherches géologiques dans la partie centrale de la chaîne du Caucase* (Geneva, 1873); Batevich, Simonovich and others, *Mat. dlya geologii Kavkaza* (Tiflis, 1873 seq.); O. Schneider, *Naturwissenschaftliche Beiträge zur Kenntnis der Kaukasusländer* (Dresden, 1879); and J. Bryce, *Transcaucasia* (London, 1878). The more important amongst the more recent books are D. W. Freshfield, *Exploration of the Caucasus* (2nd ed., 1902, 2 vols., London); A. F. Mummery, *My Climb in the Alps and Caucasus* (London, 1895); H. Abich, *Geologische Forschungen in den kaukasischen Ländern* (3 vols., Vienna, 1878–1887); *Aus kaukasischen Ländern* (2 vols., Vienna, 1896); and "Vergleichende Grundzüge des Kaukasus wie der armenischen und nordpersischen Gebirge," in *Mém. Acad. Sc. St-Petersb.* (ser. 6.

asserts that there exists a very strongly marked unconformity at the base of the Thithonian, and other writers have expressed other views. In general the Upper Jurassic beds are much more calcareous on the north flank of the chain than they are on the south. The Mesozoic beds are followed by the Tertiary deposits, which on the

Chantre, *Recherches anthropologiques dans le Caucase* (4 vols., Lyons and Paris, 1885-1887); C. von Hahn, *Aus dem Kaukasus* (Leipzig, 1802), *Kaukasische Reisen und Studien* (Leipzig, 1896), and *Bilder aus dem Kaukasus* (Leipzig,

1900); V. Sella and D. Vallino, *Nel Caucaso Centrale* (Turin, 1890); K. Koch, *Der Kaukasus* (Berlin, 1882); C. Philippus Woolley, *Savage Svanetia* (2 vols., London, 1883); E. Levier, *A travers le Caucase* (Paris, ed. 1905), especially valuable for botany; G. Merzbacher, *Aus den Hochregionen des Kaukasus* (2 vols., Leipzig, 1901); A. Fischer, *Zwei Kaukasische Expeditionen* (Berne, 1891); E. Fournier, *Description géologique du Caucase central* (Marseilles, 1896); G. Radde, *Reisen an der persisch-russischen Grenze. Talytsch und seine Bewohner* (Leipzig, 1886), *Karabagh* (Gotha, 1890), and *Aus den daghestanischen Hochalpen* (Gotha, 1887); and Count J. Zichy, *Voyages au Caucase* (2 vols., Budapest, 1897). F. Loewinson-Leasing has an account of the geology of the district along the military road from Vladikavkaz to Tiflis in the *Guide des Excursions du VII<sup>e</sup> Congrès géol. internat.* (St. Petersburg, 1897). N. Y. Dinnik writes on the fauna in *Bull. Soc. Impériale des Naturalistes de Moscou* (1901); J. Mourier on the folk-tales in *Contes et légendes du Caucase* (1888); and on modern history G. Baumgarten, *Sechzig Jahre des kaukasischen Krieges* (Leipzig, 1867). But a very great amount of most valuable information about the Caucasus is preserved in articles in encyclopaedias and scientific periodicals, especially the *Isvestia* and *Zapiski* of the Russian and Caucasian geographical societies, in P. P. Semenov's *Geographical Dictionary* (in Russian, 5 vols., St. Petersburg, 1863-1884), and in the *Russkij encyklopedicheskiy slovar* (1894), and in the *Kavkazskij kalender* (annually at Tiflis). See also G. Radde and E. Koenig, "Der Nordfuss des Daghestan und das vorlagernde Tiefland bis zur Kuma" (Ergänzungsheft No. 117 to *Petermanns Mitteilungen*), and "Das Ostufer des Pontus und seine kulturelle Entwicklung im Verlaufe der letzten 30 Jahre" (Ergänzungsheft No. 112 of the same); by V. Dingelstedt in *Scot. Geog. Mag.*—"Geography of the Caucasus" (July 1899); "The Caucasian Highlands" (June 1895); "The Hydrography of the Caucasus" (June 1899); "The Riviera of Russia" (June 1904), "The Small Trades of the Caucasus" (March 1892); and "Caucasian Idioms" (June 1888). The best map is that of the Russian General Staff on the scale of 1 : 210,000 (ed. 1895-1901). (J. T. B.; P. A. K.)

**CAUCHOIS-LEMAIRE, LOUIS FRANÇOIS AUGUSTE** (1789-1861), French journalist, was born in Paris on the 28th of August 1789. Towards the end of the First Empire he was proprietor of the *Journal de la littérature et des arts*, which he transformed at the Restoration into a political journal of Liberal tendencies, the *Nain jaune*, in which Louis XVIII. himself had little satirical articles secretly inserted. After the return from Elba the *Nain jaune* became Bonapartist and fell into discredit. It was suppressed at the second Restoration. Cauchois-Lemaire then threw himself impetuously into the Liberal agitation, and had to take refuge in Brussels in 1816, and in the following year at the Hague, whence he was expelled for publishing an *Appel à l'opinion publique et aux États Généraux en faveur des patriotes français*. Returning to France in 1819, he resumed the struggle against the ultra-royalist party with such temerity that he was condemned to one year's imprisonment in 1821 and fifteen months' imprisonment in 1827. After the revolution of July 1830 he refused a pension of 6000 francs offered to him by King Louis Philippe, on the ground that he wished to retain his independence even in his relations with a government which he had helped to establish. He made a bitter attack upon the Périer ministry in his journal *Bon sens*; and in 1836 was one of the founders of a new opposition journal, the *Siccle*. He soon, however, abandoned journalism for history and, having no private means, in 1840 accepted the post of head of a department in the Royal Archives. Of a *Histoire de la Révolution de Juillet*, which he then undertook, he published only the first volume (1842), which contains a historical summary of the Restoration and a preliminary sketch of the democratic movement. He died in Paris on the 9th of August 1861.

**CAUCHON, PIERRE** (d. 1442), French bishop, was born near Reims in the latter half of the 14th century. We find him rector of the university of Paris in October 1397. In 1413 he joined the Burgundian faction, and was exiled by the parliament of Paris. But on the triumph of his party this decree was annulled, and Philip the Good, duke of Burgundy, gave him a canonry at Beauvais, sent him to the council of Constance, procured him the post of *maître des requêtes* in 1418, and finally in 1420 had him made bishop of Beauvais. But the people were hostile to him, and he was driven from his bishopric in 1420; whereupon he attached himself to the English court, and in 1431 endeavoured to procure the surrender of Reims to the English, so that Henry VI. might be crowned there. In this he

failed, and Henry was crowned in Paris on the 17th of December 1431 by Henry Beaufort, cardinal bishop of Winchester, assisted by the bishops of Beauvais and Noyon. On the 24th of May 1430, Joan of Arc having been taken prisoner at Compiègne, within the limits of his diocese, Cauchon acted as her accuser, and demanded the right of judging her. Joan was taken to Rouen, whither Cauchon followed her, having been driven from Beauvais. He conducted the trial with marked partiality and malevolence, condemned the maid to imprisonment for life, and then, under pressure from the populace and the English, had recourse to fresh perfidies, declared Joan a relapsed heretic, excommunicated her, and handed her over to the secular arm on the 30th of May 1431. As, in consequence of this, it was impossible for him to return to his own diocese, he obtained the bishopric of Lisieux in 1432 by favour of the king of England. He assisted at the council of Basel in 1435, and died suddenly on the 18th of December 1442. Excommunicated posthumously by Pope Calixtus IV., his body was exhumed and thrown in the common sewer.

See Cerf, "Pierre Cauchon de Sommièvre, chanoine de Reims et de Beauvais, évêque de Beauvais et de Lisieux, son origine, ses dignités, sa mort et sa sépulture," in the *Transactions of the Academy of Reims* (1896-1898).

**CAUCHY, AUGUSTIN LOUIS, BARON** (1789-1857), French mathematician, was born at Paris on the 21st of August 1789, and died at Sceaux (Seine) on the 23rd of May 1857. Having received his early education from his father Louis François Cauchy (1760-1848), who held several minor public appointments and counted Lagrange and Laplace among his friends, Cauchy entered École Centrale du Panthéon in 1802, and proceeded to the École Polytechnique in 1805, and to the École des Ponts et Chaussées in 1807. Having adopted the profession of an engineer, he left Paris for Cherbourg in 1810, but returned in 1813 on account of his health, whereupon Lagrange and Laplace persuaded him to renounce engineering and to devote himself to mathematics. He obtained an appointment at the École Polytechnique, which, however, he relinquished in 1830 on the accession of Louis Philippe, finding it impossible to take the necessary oaths. A short sojourn at Freiburg in Switzerland was followed by his appointment in 1831 to the newly-created chair of mathematical physics at the university of Turin. In 1833 the deposed king Charles X. summoned him to be tutor to his grandson, the duke of Bordeaux, an appointment which enabled Cauchy to travel and thereby become acquainted with the favourable impression which his investigations had made. Charles created him a baron in return for his services. Returning to Paris in 1838, he refused a proffered chair at the Collège de France, but in 1848, the oath having been suspended, he resumed his post at the École Polytechnique, and when the oath was reinstated after the *coup d'état* of 1851, Cauchy and Arago were exempted from it. A profound mathematician, Cauchy exercised by his perspicuous and rigorous methods a great influence over his contemporaries and successors. His writings cover the entire range of mathematics and mathematical physics. Cauchy had two brothers: ALEXANDRE LAURENT (1792-1857), who became a president of a division of the court of appeal in 1847, and a judge of the court of cassation in 1849; and EUGÈNE FRANÇOIS (1802-1877), a publicist who also wrote several mathematical works.

The genius of Cauchy was promised in his simple solution of the problem of Apollonius, i.e. to describe a circle touching three given circles, which he discovered in 1805, his generalization of Euler's theorem on polyhedra in 1811, and in several other elegant problems. More important is his memoir on wave-propagation which obtained the *Grand Prix* of the Institut in 1816. His greatest contributions to mathematical science are enveloped in the rigorous methods which he introduced. These are mainly embodied in his three great treatises, *Cours d'analyse de l'École Polytechnique* (1821); *Le Calcul infinitésimal* (1823); *Leçons sur les applications du calcul infinitésimal à la géométrie* (1823-1828), and also in his courses of mechanics (for the École Polytechnique), higher algebra (for the Faculté des Sciences), and of mathematical physics (for the Collège de France). His treatises and contributions to scientific journals (to the number of 789) contain investigations on the theory of series (where he developed with perspicuous skill the notion of convergency), on the theory of numbers and complex quantities, the theory of groups and

substitutions, the theory of functions, differential equations and determinants. He clarified the principles of the calculus by developing them with the aid of limits and continuity, and was the first to prove Taylor's theorem rigorously, establishing his well-known form of the remainder. In mechanics, he made many researches, substituting the notion of the continuity of geometrical displacements for the principle of the continuity of matter. In optics, he developed the wave theory, and his name is associated with the simple dispersion formula. In elasticity, he originated the theory of stress, and his results are nearly as valuable as those of S. D. Poisson. His collected works, *Cŕuvres complètes d'Augustin Cauchy*, have been published in 27 volumes.

See C. A. Valson, *Le Baron Augustin Cauchy: sa vie et ses travaux* (Paris, 1868).

**CAUCUS**, a political term used in America of a special form of party meeting, and in Great Britain of a system of party organization. The word originated in Boston, Massachusetts, in the early part of the 18th century, when it was used as the name of a political club, the "Caucus" or "Caucas" club. Here public matters were discussed, and arrangements made for local elections and the choosing of candidates for offices. The first mention of the club in contemporary documents occurs in the diary of John Adams in 1763, but William Gordon (*History of the Independence of the United States of America*, 1788) speaks of the Caucus as having been in existence some fifty years before the time of writing (1774), and describes the methods used for securing the election of the candidates the club had selected. The derivation of the word has been much disputed. It was early connected with "caulkers," and it was supposed referred to meetings of the caulkers in the dockyard at Boston in 1770, to protest against the action of the British troops, or with a contemptuous allusion to the lower class of workmen frequenting the club. This is, however, a mere guess, and does not agree with the earlier date at which the club is known to have existed, nor with the accounts given of it. That it was a fanciful classical name for a convivial club, derived from the late Greek *καυκος*, a cup, is far-fetched, and the most plausible origin is an Algonquin word *kaw-kaw-was*, meaning to talk. Indian words and names have been popular in America as titles for societies and clubs; cf. "Tammany" (see *Notes and Queries*, sixth series, vols. xi. and xii.). In the United States "caucus" is used strictly of a meeting either of party managers or of party voters. Such might be a "nominating caucus," either for nominating candidates for office or for selecting delegates for a nominating convention. The caucus of the party in Congress nominated the candidates for the offices of president and vice-president from 1800 till 1824, when the convention system was adopted, and the place of the local "nominating caucus" is taken by the "primaries" and conventions. The word is used in America of the meetings of a party in Congress and other legislative bodies and elsewhere which decide matters of policy and plan campaigns. "Caucus" came first into use in Great Britain in 1878. The Liberal Association of Birmingham (see **LIBERAL PARTY**) was organized by Mr Joseph Chamberlain and Mr F. Schnadhorst on strict disciplinary lines, more particularly with a view to election management and the control of voters on the principle of "vote as you are told." This managing body of the association, known locally as the "Six Hundred," became the model for other Liberal associations throughout the country, and the Federation of Liberal Associations was organized on the same plan. It was to this supposed imitation of the American political "machine" that Lord Beaconsfield gave the name "caucus," and the name came to be used, not in the American sense of a meeting, but of a closely disciplined system of party organization, chiefly used as a stock term of abuse applied by opponents to each other's party machinery.

**CAUDEBEC-EN-CAUX**, a town of France, in the department of Seine-Inférieure, 27 m. W.N.W. of Rouen by the Ouest-État railway. Pop. (1906) 2141. It is situated on the right bank of the Seine, the tidal wave of which (*mascaret*) can be well seen at this point. The chief interest of the town lies in its church, a building of the 15th and the early 16th centuries. Round its top run balustrades formed of Gothic letters, which read as part of the Magnificat. Its west portal, the decoration of the spire of the tower, and its stained glass are among the features which

make it one of the finest churches of the Rouen diocese. The town also possesses several old houses. Its industries include tanning and leather-carrying, and there is trade in grain. The port has a small trade in coal, live-stock and farm produce.

**CAUDINE FORKS** (*Furculæ Caudinæ*), a pass in Samnium, famous for the disaster which befell the Roman army in the second Samnite War (321 B.C.). Livy (ix. 2) describes it as formed by two narrow wooded gorges, between which lay a plain, grassy and well-watered, but entirely enclosed by mountains. Through this plain the road (later the Via Appia) led. The Romans, marching from Calatia to the relief of Luceria, entered the valley unopposed, but found the exit blocked by the enemy; on marching back they saw that the entrance and the hills surrounding the plain were also occupied, and there was no way of escape. The plain which lies west of Caudium (Montesarchio) seems, despite the older views, to be the only possible site for such a disaster to an army of as many as 40,000 men; and there is no doubt that the Romans wished to leave it by the defile on the east, through which later ran the Via Appia to Beneventum. The existence of three ancient bridges on the line of the modern road renders it impossible to suppose that its course can be essentially different from that of the ancient, though Hülsen makes the two diverge considerably after passing Montesarchio. There are, however, two possible entrances—one on the north by Moiano, and one on the west by Arpaia; the former seems to answer better to Livy's description (*via alia per caravum rupem*), while the latter is the shortest route, having been, later on, followed by the Via Appia, and bore the name *Furculæ Caudinæ* in the middle ages.

See C. Hülsen in Pauly-Wissowa, *Realencyclopädie*, iii. (1802).

(T. AS.)

**CAUDLE** (through the O. Fr. *caudal*, from the Med. Lat. *caudellum*, a diminutive of *caudam*, a warm drink, from *caudus*, hot), a drink of warm gruel, mixed with spice and wine, formerly given to women in childbed.

**CAUL** (from O. Eng. *callo*, Fr. *cale*, a cap), a close-fitting woman's cap, especially one made of network worn in the 16th and 17th centuries; hence the membranous covering to the heart or brain, the *omentum*, or the similar covering to the intestines, and particularly, a portion of the *amnion*, which is sometimes found remaining round the head of a child after birth. To this, called in Scotland "sely how," holy or lucky hood, many superstitions have been attached; it was looked on as a sign of good luck, and when preserved, was kept as a protection against drowning.

**CAULAINCOURT, ARMAND AUGUSTIN LOUIS, MARQUIS DE** (1773-1827), French general and diplomatist, was born of a noble family. He early entered the army, did not emigrate in the revolution, but was deprived of his grade as captain in 1793 and served in the ranks. In 1795, through the protection of L. Hoche, he became captain again, was colonel in the Army of the Rhine in 1799-1800, and after the peace of Lunéville (1801) was sent to St Petersburg to negotiate an understanding between Russia and France. On his return he was named aide-de-camp of the First Consul. He was employed to seize some agents of the English government in Baden in 1804, which led to the accusation that he was concerned in the arrest of the duc d'Enghien, an accusation against which he never ceased to protest. After the establishment of the empire he received various honours and the title of duke of Vicenza (1808). Napoleon sent him in 1807 as ambassador to St Petersburg, where Caulaincourt tried to maintain the alliance of Tilsit, and although Napoleon's ambition made the task a difficult one, Caulaincourt succeeded in it for some years. In 1811 he strongly advised Napoleon to renounce his proposed expedition to Russia. During the war he accompanied the emperor, and was one of those whom Napoleon took along with him when he suddenly abandoned his army in Poland to return to Paris (December 1812). During the last years of the empire, Caulaincourt was charged with all the diplomatic negotiations. He signed the armistice of Pleswitz, June 1813, represented France at the congress of Prague, in August 1813, at the congress of Chatillon, in February 1814, and concluded the

treaty of Fontainebleau on the 10th of April 1814. During the first Restoration, Caulaincourt lived in obscure retirement. When Napoleon returned from Elba, he became minister of foreign affairs, and tried to persuade Europe of the emperor's peaceful intentions. After the second Restoration, Caulaincourt's name was on the list of those proscribed, but it was erased on the personal intervention of Alexander I. with Louis XVIII.

Caulaincourt's memoirs appeared under the title *Souvenirs du duc de Vicence* in 1837-1840. See A. Vandal, *Napoléon et Alexandre* (Paris, 1891-1895); Tatischeff, *Alexandre I<sup>er</sup> et Napoléon* (Paris, 1892); H. Houssaye, 1814 (*Paris*, 1888), and 1815 (*Napoleon*, 1893).

**CAULICULUS** (from Lat. *caulis*, a stalk), in architecture, the stalks (eight in number) with two leaves from which rise the helices or spiral scrolls of the Corinthian capital to support the abacus.

**CAULON** (Gr. *Καυλωνία*), a town of the district of the Bruttii, Italy, on the east coast. Its exact site is uncertain (though the name has been given to a modern village), and depends on the identification of the river Sagras. It was the southernmost of the Achaean colonies, founded either by Croton or direct from Greece itself. In the 7th century it was allied with Croton and Sybaris, and its coins, which go back to 550 B.C., prove its importance. It took the side of Athens in the Peloponnesian War. In 388 B.C. it was destroyed by Dionysius, but soon afterwards restored. It was captured during the invasion of Pyrrhus by Campanian troops. Strabo speaks of it as deserted in his time. The erection of the lighthouse at Capo Stilo, on the site of one of the mediaeval guard towers of the coast, led to the discovery of a wall of Greek origin, and close by of a number of terra-cottas, belonging perhaps to a temple erected in honour of the deities of the sea. Other remains were found at Fontanelle, 2½ m. away, including the fragment of a capital of an archaic Greek temple (P. Orsi in *Notizie degli Scavi*, 1891, 61). These buildings may be connected with the Caulon or a village dependent on it. (T. As.)

**CAUSATION** or **CAUSALITY** (Lat. *causa*, derived perhaps from the root *cas-*, as in *caveo*, and meaning something taken care of; corresponding to Gr. *αλτρία*), a philosophical term for the operation of causes and for the mental conception of cause as operative throughout the universe. The word "cause" is correlative to "effect." Thus when one thing B is regarded as taking place in consequence of the action of another thing A, then A is said to be the cause of B, and B the effect of A. The philosophical problems connected with causation are both metaphysical and psychological. The metaphysical problem is part of the whole theory of existence. If everything is to be regarded as causally related with simultaneous and prior things or actions, it follows logically that the investigation of existence must, by hypothesis, be a regress to infinity, i.e. that we cannot conceive a beginning to existence. This explanation has led to the postulate of a First Cause, the nature of which is variously explained. The empirical school sees no difficulty in assuming a single event; but such a theory seems to deny the validity of the original hypothesis. Theologians assert a divine origin in the form of a personal self-existent creator, while some metaphysical schools, preferring an impersonal First Cause, substitute the doctrine of the Absolute (*q.v.*). All the explanations are alike in this respect, that at a certain point they pass from the sphere of the senses, the physical world, to a metaphysical sphere in which the data and the intellectual operation of cognizing them are of a totally different quality. For example, the causal connexion between drunkenness and alcohol is not of the same observable character as that which is inferred between the infinite First Cause and the whole domain of sense-given phenomena.

A second metaphysical problem connected with causation arises when we consider the nature of necessity. It is generally assumed when two things are spoken of as cause and effect that their relation is a necessary one, or, in other words, that given the cause the effect must follow. The arguments connected with this problem belong to psychological discussions of causation. It is sufficient here to state that, in so far as causation is regarded as necessary connexion, it can form no part of a purely empirical theory of existence. The senses can say only that in all observed

cases B has followed A, and this does not establish necessary connexion. The idea of causation is a purely intellectual (*a priori*) one.

The psychological problems connected with causation refer (1) to the origin of the conception in our minds; (2) to the validity of the conception. As regards the origin of the conception modern psychological analysis does not carry us beyond the doctrine of Locke contained in his chapter on "Power" (*Essay*, bk. ii. ch. 21), wherein he shows that the idea of power is got from the knowledge of our own activity. "Bodies by their causes," he says, "do not afford us so clear and distinct an idea of active power as we have from reflection on the operation of our minds." Putting Locke's doctrine into modern language, we may say that a man has the conception of cause primarily because he himself is a cause. The conception thus obtained we "project," that is, transfer to external objects, so far as we may find it useful to do so. Thus it is by a sort of analogy that we say that the sun is the "cause" of daylight. The rival theory to Locke's is that of Hume (*Treatise*, bk. i.), who derives the conception from the unaided operation of custom. When one object, A, has been noticed frequently to precede another object, B, an association between A and B is generated; and by virtue of this association, according to Hume, we say that A is the cause of B. The weakness of this account is that many invariable successions, such as day and night, do not make us regard the earlier members of the successions as causing the later; while in numberless cases we assert a causal connexion between two objects from a single experience of them.

We may proceed now to consider the validity of the conception of causation, which has been attacked from two sides. From the side of absolute idealism it is argued that the conception of cause, as involving a transition in time, cannot be ultimately valid, since the time-relation is not ultimately real. Upon this view (ably stated in Professor Bosanquet's *Logic*, bk. i. ch. 6) the more we know of causes and effects the less relevant becomes the time-relation and the nearer does the conception of cause and effect approach to another conception which is truly valid, the conception of ground and consequence. This means that, viewed from the standpoint of science, a draught of alcohol causes intoxication in no other sense than the triangularity of a triangle causes the interior angles to be equal to two right angles. This argument ceases to have cogency so soon as we deny its fundamental proposition that the time-relation is not ultimately real, but is irrelevant from the standpoint of science. This is a sheer assertion, contrary to all ordinary experience, which we have as much right to deny as the absolute idealists to affirm. It is only plausible to those who are committed to the Hegelian view of reality as consisting of a static system of universals, a view which has long been discredited in Germany, its native land, and is fast losing ground in England. Against the Hegelians we must maintain that the common distinction between "ground" and "cause" is perfectly justifiable. Whereas "ground" is an appropriate term for the relations within a static, simultaneous system, "cause" is appropriate to the relations within a dynamic, successive system.

From the other side the validity of causation has been attacked in the interests of the naturalism of the mechanical sciences. J. S. Mill argues that, scientifically, the cause of anything is the total assemblage of the conditions that precede its appearance, and that we have no right to give the name of cause to one of them exclusively of the others. The answer to this is that Mill fails to recognize that cause is a conception which we find useful in our dealings with nature, and that whatever conceptions we find useful we are justified in using. Among the conditions of an event there are always one or two that stand in specially close relation to it from our point of view; e.g. the draught of alcoholic liquor is more closely related to the man's drunkenness than is the attraction of the earth's gravity, though that also must co-operate in producing the effect. Such closely related conditions we find it convenient to single out by a term which expresses their analogy to the cause of causes, human volition.

These are the questions respecting causation which are matters of present controversy; there are in addition many other points which belong to the controversies of the past. Among the most important are Aristotle's classification of causes into material, formal, efficient and final, set forth in his *Physics* and elsewhere, and known as his doctrine of the Four Causes; Geulincx's Occasional Causes, meant as a solution of certain difficulties in the cosmology of Descartes; Leibnitz's law of Sufficient Reason; and Kant's explanation of cause and effect as an a priori category of the understanding, intended as an answer to Hume's scepticism, but very much less effective than the line of explanation suggested by Locke.

The following is a list of the various technical terms connected with causation which have been distinguished by logicians and psychologists.

The four Aristotelian causes are: (1) *Material cause* ( $\delta\upsilon\nu$ ), the material out of which a thing is made; the material cause of a house is the bricks and mortar of which it is composed. (2) *Formal cause* ( $\epsilon\iota\delta\omicron\varsigma$ ,  $\lambda\omicron\gamma\omicron\varsigma$ ,  $\tau\omicron$   $\tau\acute{\iota}$   $\eta\upsilon$   $\epsilon\iota\lambda\alpha\iota$ ), the general external appearance, shape, form of a thing; the formal cause of a triangle is its triangularity. (3) *Efficient cause* ( $\alpha\rho\chi\eta$   $\tau\eta\varsigma$   $\kappa\alpha\iota\tau\eta\omicron\upsilon\varsigma$ ), the alcohol which makes a man drunk, the pistol-bullet which kills. This is the cause as generally understood in modern usage. (4) *Final cause* ( $\rho\acute{\epsilon}\lambda\omicron\varsigma$ ,  $\tau\omicron$   $\omicron\upsilon$   $\beta\upsilon\lambda\alpha$ ), the object for which an act is done or a thing produced; the final cause of a commercial man's enterprise is to make his livelihood (see TELEOLOGY). This last cause was rejected by Bacon, Descartes and Spinoza, and indeed in ordinary usage the cause of an action in relation to its effect is the desire for, and expectation of, that effect on the part of the agent, not the effect itself. The *Proximate cause* of a phenomenon is the immediate or superficial as opposed to the *Remote* or *Primary cause*. Plurality of Causes is the much criticized doctrine of J. S. Mill that a fact may be the uniform consequent of several different antecedents. *Causa essendi* means the cause whereby a change is what it is, as opposed to the *causa cognoscendi*, the cause of our knowledge of the event; the two causes evidently need not be the same. An object is called *causa immanens* when it produces its changes by its own activity; a *causa transiens* produces changes in some other object. *Causa sui* is a term applied to God by Spinoza to denote that he is dependent on nothing and has no need of any external thing for his existence. *Vera causa* is a term used by Newton in his *Principia*, where he says, "No more causes of natural things are to be admitted than such as are both true and sufficient to explain the phenomena of those things"; *verae causae* must be such as we have good inductive grounds to believe do exist in nature, and do perform a part in phenomena analogous to those we would render an account of.

**CAUSEWAY**, a path on a raised dam or mound across marshes or low-lying ground; the word is also used of old paved highways, such as the Roman military roads. "Causey" is still used dialectically in England for a paved or cobbled footpath. The word is properly "causey-way," from *causae*, a mound or dam, which is derived, through the Norman-French *causie* (cf. modern *chaussée*), from the late Latin *via calciata*, a road stamped firm with the feet (*calcare*, to tread).

**CAUSSES** (from Lat. *calx* through local Fr. *caous*, meaning "lime"), the name given to the table-lands lying to the south of the central plateau of France and sloping westward from the Cévennes. They form parts of the departments of Lozère, Aveyron, Gard, Hérault, Lot and Tarn-et-Garonne. They are of limestone formation, dry, sterile and treeless. These characteristics are most marked in the east of the region, where the Causse de Sauveterre, the Causse Méjan, the Causse Noir and the Larzac flank the Cévennes. Here the Causse Méjan, the most deserted and arid of all, reaches an altitude of nearly 4200 ft. Towards the west the lesser causses of Rouergue and Quercy attain respectively 2050 ft. and 1470 ft. Once an uninterrupted table-land, the causses are now isolated from one another by deep rifts through which run the Tarn, the Dourbie, the Jonte and other rivers. The summits are destitute of running water, since the rain as it falls either sinks through the permeable

surface soil or runs into the fissures and chasms, some of great depth, which are peculiar to the region. The inhabitants (*Causseards*) of the higher causses cultivate hollows in the ground which are protected from the violent winds, and the scanty herbage permits of the raising of sheep, from the milk of which Roquefort cheeses are made. In the west, where the rigours of the weather are less severe, agriculture is more easily carried on.

**CAUSSIN DE PERCEVAL, ARMAND-PIERRE** (1795-1871), French orientalist, was born in Paris on the 13th of January 1795. His father, Jean Jacques Antoine Caussin de Perceval (1759-1835), was professor of Arabic in the Collège de France. In 1814 he went to Constantinople as a student interpreter, and afterwards travelled in Asiatic Turkey, spending a year with the Maronites in the Lebanon, and finally becoming dragoman at Aleppo. Returning to Paris, he became professor of vulgar Arabic in the school of living Oriental languages in 1821, and also professor of Arabic in the Collège de France in 1833. In 1849 he was elected to the Academy of Inscriptions. He died at Paris during the siege on the 5th of January 1871.

Caussin de Perceval published (1828) a useful *Grammaire arabe vulgaire*, which passed through several editions (4th ed., 1858), and edited and enlarged Elie Bocthor's *Dictionnaire français-arabe* (2 vols., 1828; 3rd ed., 1864); but his great reputation rests almost entirely on one book, the *Essai sur l'histoire des Arabes avant l'Islamisme, pendant l'époque de Mahomet* (3 vols., 1847-1849), in which the native traditions as to the early history of the Arabs, down to the death of Mahomet and the complete subjection of all the tribes to Islam, are brought together with wonderful industry and set forth with much learning and lucidity. One of the principal MS. sources used is the great *Kiubb al-Aghani* (Book of Songs) of Abu Faraj, which has since been published (20 vols., Boullak, 1868) in Egypt; but no publication of texts can deprive the *Essai*, which is now very rare, of its value as a trustworthy guide through a tangled mass of tradition.

**CAUSTIC** (Gr.  $\kappa\alpha\upsilon\sigma\tau\iota\kappa\omicron\varsigma$ , burning), that which burns. In surgery, the term is given to substances used to destroy living tissues and so inhibit the action of organic poisons, as in bites, malignant disease and gangrenous processes. Such substances are silver nitrate (lunar caustic), the caustic alkalis (potassium and sodium hydrates), zinc chloride, an acid solution of mercuric nitrate, and pure carbolic acid. In mathematics, the "caustic surfaces" of a given surface are the envelopes of the normals to the surface, or the loci of its centres of principal curvature.

In optics, the term *caustic* is given to the envelope of luminous rays after reflection or refraction; in the first case the envelope is termed a catacaustic, in the second a diacaustic. Catacaustics are to be observed as bright curves when light is allowed to fall upon a polished riband of steel, such as a watch-spring, placed on a table, and by varying the form of the spring and moving the source of light, a variety of patterns may be obtained. The investigation of caustics, being based on the assumption of the rectilinear propagation of light, and the validity of the experimental laws of reflection and refraction, is essentially of a geometrical nature, and as such it attracted the attention of the mathematicians of the 17th and succeeding centuries, more notably John Bernoulli, G. F. de l'Hôpital, E. W. Tschirnhausen and Louis Carré.

The simplest case of a caustic curve is when the reflecting surface is a circle, and the luminous rays emanate from a point on the circumference. If in fig. 1 AQP be the reflecting circle having C as centre, P the luminous point, and PQ any incident ray, and we join CQ it follows, by the law of the equality of the angles of incidence and reflection, that the reflected ray QR is such that the angles RQC and CQP are equal: to determine the caustic, it is necessary to determine the envelope of this line. This may be readily accomplished geometrically or analytically, and it will be found that the envelope is a cardioid (*q.v.*), i.e. an epicycloid in which the radii of the fixed and rolling circles are equal. When the rays are parallel, the reflecting surface

<sup>1</sup> Elie Bocthor (1784-1821) was a French orientalist of Coptic origin. He was the author of a *Traité des conjugaisons* written in Arabic, and left his Dictionary in MS.

remains circular, the question can be similarly treated, and it is found that the caustic is an epicycloid in which the radius of the fixed circle is twice that of the rolling circle (fig. 2). The geometrical method is also applicable when it is required to determine the caustic

FIG. 1.

FIG. 2.

FIG. 3.

after any number of reflections at a spherical surface of rays, which are either parallel or diverge from a point on the circumference. In both cases the curves are epicycloids; in the first case the radii of the rolling and the fixed circles are  $a(2n-1)/n$  and  $a/2n$ , and in the second,  $a/(2n+1)$  and  $a/(2n+1)$ , where  $a$  is the radius of the mirror and  $n$  the number of reflections.

The Cartesian equation to the caustic produced by reflection at a circle of rays diverging from any point was obtained by Joseph Louis Lagrange; it may be expressed in the form

$$\{(4c^2 - a^2)(x^2 + y^2) - 2a^2cx - a^2c^2\}^2 = 27a^2c^2y^2(x^2 + y^2 - c^2)^2,$$

where  $a$  is the radius of the reflecting circle, and  $c$  the distance of the luminous point from the centre of the circle. The polar form is  $\{(u+p) \cos \theta\}^2 + \{(u-p) \sin \theta\}^2 = (2k)^2$ , where  $p$  and  $k$  are the reciprocals of  $c$  and  $a$ , and  $u$  the reciprocal of the radius vector of any point on the caustic. When  $c=a$  or  $c=\infty$  the curve reduces to the cardioid or the two cusped epicycloid previously discussed. Other

FIG. 4.

FIG. 5.

forms are shown in figs. 3, 4, 5, 6. These curves were traced by the Rev. Hammet Holditch (*Quart. Jour. Math.* vol. i.).

Secondary caustics are orthotomic curves having the reflected or refracted rays as normals, and consequently the proper caustic curve, being the envelope of the normals, is their evolute. It is usually the case that the secondary caustic is easier to determine than the caustic, and hence, when determined, it affords a ready means for deducing the primary caustic. It may be shown by geometrical considerations that the secondary caustic is a curve similar to the first positive pedal of the reflecting curve, of twice the linear dimensions, with respect to the luminous point. For a circle, when the rays emanate from any point, the secondary caustic is a limaçon, and hence the primary caustic is the evolute of this curve.

The simplest instance of a caustic by refraction (or diacaustic) is when luminous rays issuing from a point are refracted at a straight line. It may be shown geometrically that the secondary caustic, if the second medium be less refractive than the first, is an ellipse having the luminous point for a focus, and its centre at the foot of the perpendicular from the luminous point to the refracting line. The evolute of this ellipse is the caustic required. If the second medium be more highly refractive than the first, the secondary caustic is a hyperbola having the same focus and centre as before, and the caustic is the evolute of this curve. When the refracting curve is a circle and the rays emanate from any point, the locus of the secondary caustic is a Cartesian oval, and the evolute of this curve is the required diacaustic. These curves appear to have been first discussed by Gergonne. For the caustic by refraction of parallel rays at a circle reference should be made to the memoirs by Arthur Cayley.

FIG. 6.

REFERENCES.—Arthur Cayley's "Memoirs on Caustics" in the *Phil. Trans.* for 1857, vol. 147, and 1867, vol. 157, are especially to be consulted. Reference may also be made to R. S. Heath's *Geometrical Optics* and R. A. Herman's *Geometrical Optics* (1900).

**CAUTERETS**, a watering-place of south-western France in the department of Hautes-Pyrénées, 20 m. S. by W. of Lourdes by rail. Pop. (1906) 1030. It lies in the beautiful valley of the Gave de Cauterets; and is well known for its copious thermal

springs. They are chiefly characterized by the presence of sulphur and silicate of soda, and are used in the treatment of diseases of the respiratory organs, rheumatism, skin diseases and many other maladies. Their temperature varies between 75° and 137° F. The springs number twenty-four, and there are nine bathing establishments. Caüterets is a centre for excursions, the Monné (8935 ft.), the Cabaleros (7655 ft.), the Pic de Chaharrou (9550 ft.), the Vignemale (10,820 ft.), and other summits being in its neighbourhood.

**CAUTIN**, a province of southern Chile, bounded N. by Arauco, Malleco and Bio-Bio, E. by Argentina, S. by Valdivia, and W. by the Pacific. Its area is officially estimated at 5832 sq. m. Cautin lies within the temperate agricultural and forest region of the south, and produces wheat, cattle, lumber, tan-bark and fruit. The state central railway from Santiago to Puerto Montt crosses the province from north to south, and the Cautin, or Imperial, and Tolten rivers (the latter forming its southern boundary) cross from east to west, both affording excellent transportation facilities. The province once formed part of the territory occupied by the Araucanian Indians, and its present political existence dates from 1887. Its population (1905) was 96,139, of whom a large percentage were European immigrants, principally Germans. The capital is Temuco, on the Rio Cautin; pop. (1895) 7078. The principal towns besides Temuco are Lautaro (3130) and Nueva Imperial (2179), both of historic interest because they were fortified Spanish outposts in the long struggle with the Araucanians.

**CAUTLEY**, SIR PROBY THOMAS (1802-1871), English engineer and palaeontologist, was born in Suffolk in 1802. After some years' service in the Bengal artillery, which he joined in 1819, he was engaged on the reconstruction of the Doab canal, of which, after it was opened, he had charge for twelve years (1831-1843). In 1840 he reported on the proposed Ganges canal, for the irrigation of the country between the rivers Ganges, Hindan and Jumna, which was his most important work. This project was sanctioned in 1841, but the work was not begun till 1843, and even then Cautley found himself hampered in its execution by the opposition of Lord Ellenborough. From 1845 to 1848 he was absent in England owing to ill-health, and on his return to India he was appointed director of canals in the North-Western Provinces. After the Ganges canal was opened in 1854 he went back to England, where he was made K. C. B., and from 1858 to 1868 he occupied a seat on the council of India. He died at Sydenham, near London, on the 25th of January 1871. In 1860 he published a full account of the making of the Ganges canal, and he also contributed numerous memoirs, some written in collaboration with Dr Hugh Falconer, to the *Proceedings* of the Bengal Asiatic Society and the Geological Society of London on the geology and fossil remains of the Sivalik Hills.

**CAUVERY**, or KAVERI, a river of southern India. Rising in Coorg, high up amid the Western Ghats, in 12° 25' N. lat. and 75° 34' E. long., it flows with a general south-eastern direction across the plateau of Mysore, and finally pours itself into the Bay of Bengal through two principal mouths in Tanjore district. Its total length is 472 m., the estimated area of its basin 27,700 sq. m. The course of the river in Coorg is very tortuous. Its bed is generally rocky; its banks are high and covered with luxuriant vegetation. On entering Mysore it passes through a narrow gorge, but presently widens to an average breadth of 300 to 400 yds. Its bed continues rocky, so as to forbid all navigation; but its banks are here bordered with a rich strip of cultivation. In its course through Mysore the channel is interrupted by twelve anicuts or dams for the purpose of irrigation. From the most important of these, known as the Madakkatte, an artificial channel is led to a distance of 72 m., irrigating an area of 10,000 acres, and ultimately bringing a water-supply into the town of Mysore. In Mysore state the Cauvery forms the two islands of Seringapatam and Sivasamudram, which vie in sanctity with the island of Seringam lower down in Trichinopoly district. Around the island of Sivasamudram are the celebrated falls of the Cauvery, unrivalled for romantic beauty. The river here branches into two channels, each of which makes a descent of about 200 m.

in a succession of rapids and broken cascades. After entering the Madras presidency, the Cauvery forms the boundary between the Coimbatore and Salem districts, until it strikes into Trichinopoly district. Sweeping past the historic rock of Trichinopoly, it breaks at the island of Seringam into two channels, which enclose between them the delta of Tanjore, the garden of southern India. The northern channel is called the Coleroon (Kolidam); the other preserves the name of Cauvery. On the seaward face of its delta are the open roadsteads of Negapatam and French Karikal. The only navigation on any portion of its course is carried on in boats of basket-work. It is in the delta that the real value of the river for irrigation becomes conspicuous. This is the largest delta system, and the most profitable of all the works in India. The most ancient irrigation work is a massive dam of unhewn stone, 1080 ft. long, and from 40 to 60 ft. broad, across the stream of the Cauvery proper, which is supposed to date back to the 4th century, is still in excellent repair, and has supplied a model to British engineers. The area of the ancient system was 669,000 acres, the modern about 1,000,000 acres. The chief modern work is the anicut across the Coleroon, 2250 ft. long, constructed by Sir Arthur Cotton between 1836 and 1838. The Cauvery Falls have been utilized for an electric installation, which supplies power to the Kolar gold-mines and light to the city of Mysore.

The Cauvery is known to devout Hindus as Dakshini Ganga, or the Ganges of the south, and the whole of its course is holy ground. According to the legend there was once born upon earth a girl named Vishnumaya or Lopamudra, the daughter of Brahma; but her divine father permitted her to be regarded as the child of a mortal, called Kavera-muni. In order to obtain beatitude for her adoptive father, she resolved to become a river whose waters should purify from all sin. Hence it is that even the holy Ganges resorts underground once in the year to the source of the Cauvery, to purge herself from the pollution contracted from the crowd of sinners who have bathed in her waters.

**CAVA DEI TIRRENI**, a town and episcopal see of Campania, Italy, in the province of Salerno, 6 m. N.W. by rail from the town of Salerno. Pop. (1901) town, 7611; commune, 23,415. It lies fairly high in a richly cultivated valley, surrounded by wooded hills, and is a favourite resort of foreigners in spring and autumn, and of the Neapolitans in summer. A mile to the south-west is the village of Corpo di Cava (1970 ft.), with the Benedictine abbey of La Trinità della Cava, founded in 1025 by St. Alferius. The church and the greater part of the buildings were entirely modernized in 1796. The old Gothic cloisters are preserved. The church contains a fine organ and several ancient sarcophagi. The archives, now national property, include documents and MSS. of great value (e.g. the *Codex Legum Longobardorum* of 1004) and fine *incunabula*. The abbot is keeper, and also head of a boarding school.

See M. Morealdi, *Codex Diplomaticus Cavensis* (Naples and Milan, 1873-1893).

**CAVAEDIUM**, in architecture, the Latin name for the central hall or court within a Roman house, of which five species are described by Vitruvius. (1) The *Tuscanicum* responds to the greater number apparently of those at Pompeii, in which the timbers of the roof are framed together, so as to leave an open space in the centre, known as the *compluvium*; it was through this opening that all the light was received, not only in the hall itself, but in the rooms round. The rain from the roof was collected in gutters round the *compluvium*, and discharged from thence into a tank or open basin in the floor called the *impluvium*. (2) In the *tetrastylon* additional support was required in consequence of the dimensions of the hall; this was given by columns placed at the four angles of the *impluvium*. (3) *Corinthian* is the term given to the species where additional columns were required. (4) In the *displuviatum* the roofs, instead of sloping down towards the *compluvium*, sloped outwards, the gutters being on the outer walls; there was still an opening in the roof, and an *impluvium* to catch the rain falling through. This species of roof, Vitruvius states, is constantly in want of repair, as the water does not easily

run away, owing to the stoppage in the rain-water pipes. (5) The *testudinatum* was employed when the hall was small and another floor was built over it; no example of this type has been found at Pompeii, and only one of the *caevadium displuviatum*.

**CAVAGNARI, SIR PIERRE LOUIS NAPOLEON** (1841-1879), British military administrator, the son of a French general by his marriage with an Irish lady, was born at Stenay, in the department of the Meuse, on the 4th of July 1841. He nevertheless obtained naturalization as an Englishman, and entered the military service of the East India Company. After passing through the college at Addiscombe, he served through the Oudh campaign against the mutineers in 1858 and 1859. In 1861 he was appointed an assistant commissioner in the Punjab, and in 1877 became deputy commissioner of Peshawar and took part in several expeditions against the hill tribes. In 1878 he was attached to the staff of the British mission to Kabul, which the Afghans refused to allow to proceed. In May 1879, after the death of the amir Shere Ali, Cavagnari negotiated and signed the treaty of Gandamak with his successor, Yakub Khan. By this the Afghans agreed to admit a British resident at Kabul, and the post was conferred on Cavagnari, who also received the Star of India and was made a K.C.B. He took up his residence in July, and for a time all seemed to go well, but on the 3rd of September Cavagnari and the other European members of the mission were massacred in a sudden rising of mutinous Afghan troops. (See **AFGHANISTAN**.)

**CAVAIGNAC, JEAN BAPTISTE** (1762-1829), French politician, was born at Gourdon (Lot). He was sent by his department as deputy to the Convention, where he associated himself with the party of the Mountain and voted for the death of Louis XVI. He was constantly employed on missions in the provinces, and distinguished himself by his rigorous repression of opponents of the revolution in the departments of Landes, Basses-Pyrénées and Gers. With his colleague Jacques Pinet (1754-1844) he established at Bayonne a revolutionary tribunal with authority in the neighbouring towns. Charges of cruelty were preferred against him by a local society before the Convention in 1795, but were dismissed. He had represented the Convention in the armies of Brest and of the Eastern Pyrenees in 1793, and in 1795 he was sent to the armies of the Moselle and the Rhine. He filled various minor administrative offices, and in 1806 became an official at Naples in Murat's government. During the Hundred Days he was prefect of the Somme. At the restoration he was proscribed as a regicide, and spent the last years of his life at Brussels, where he died on the 24th of March 1829. His second son was General Eugène Cavaignac (q.v.).

The eldest son, **ELÉONORE LOUIS GODEFROI CAVAIGNAC** (1801-1845), was, like his father, a republican of the *intransigent* type. He was bitterly disappointed at the triumph of the monarchical principle after the revolution of July 1830, in which he had taken part. He took part in the Parisian risings of October 1830, 1832 and 1834. On the third occasion he was imprisoned, but escaped to England in 1835. When he returned to France in 1841 he worked on the staff of *La Réforme*, and carried on an energetic republican propaganda. In 1843 he became president of the Society of the Rights of Man, of which he had been one of the founders in 1832. He died on the 5th of May 1845. The recumbent statue (1847) of Godefroi Cavaignac on his tomb at Montmartre (Paris) is one of the masterpieces of the sculptor François Rude.

Jean Baptiste's brother, **JACQUES-MARIE, VICOMTE CAVAIGNAC** (1773-1855), French general, served with distinction in the army under the republic and successive governments. He commanded the cavalry of the XI. corps in the retreat from Moscow, and eventually became Vicomte Cavaignac and inspector-general of cavalry.

**CAVAIGNAC, LOUIS EUGÈNE** (1802-1857), French general, son of J. B. Cavaignac, was born at Paris on the 15th of October 1802. After going through the usual course of study for the military profession, he entered the army as an engineer officer in 1824, and served in the Morea in 1828, becoming captain in the following year. When the revolution of 1830 broke out

he was stationed at Arras, and was the first officer of his regiment to declare for the new order of things. In 1831 he was removed from active duty in consequence of his declared republicanism, but in 1832 he was recalled to the service and sent to Algeria. This continued to be the main sphere of his activity for sixteen years, and he won especial distinction in his fifteen months' command of the exposed garrison of Tlemcen, a command for which he was selected by Marshal Clausel (1836-1837), and in the defence of Cherchel (1840). Almost every step of his promotion was gained on the field of battle, and in 1844 the duc d'Aumale himself asked for Cavaignac's promotion to the rank of *maréchal de camp*. This was made in the same year, and he held various district commands in Algeria up to 1848, when the provisional government appointed him governor-general of the province with the rank of general of division. The post of minister of war was also offered to Cavaignac, but he refused it owing to the unwillingness of the government to quarter troops in Paris, a measure which the general held to be necessary for the stability of the new régime. On his election to the National Assembly, however, Cavaignac returned to Paris. When he arrived on the 17th of May he found the capital in an extremely critical state. Several *émeutes* had already taken place, and by the 22nd of June 1848 a formidable insurrection had been organized. The only course now open to the National Assembly was to assert its authority by force. Cavaignac, first as minister of war and then as dictator, was called to the task of suppressing the revolt. It was no light task, as the national guard was untrustworthy, regular troops were not at hand in sufficient numbers, and the insurgents had abundant time to prepare themselves. Various estimates at from 30,000 to 60,000 men, well armed and organized, they had entrenched themselves at every step behind formidable barricades, and were ready to avail themselves of every advantage that ferocity and despair could suggest to them. Cavaignac failed perhaps to appreciate the political exigencies of the moment; as a soldier he would not strike his blow until his plans were matured and his forces sufficiently prepared. When the troops at last advanced in three strong columns, every inch of ground was disputed, and the government troops were frequently repulsed, till, fresh regiments arriving, he forced his way to the Place de la Bastille and crushed the insurrection in its headquarters. The contest, which raged from the 23rd to the morning of the 26th of June, was without doubt the bloodiest and most resolute the streets of Paris have ever seen, and the general did not hesitate to inflict the severest punishment on the rebels.

Cavaignac was censured by some for having, by his delay, allowed the insurrection to gather head; but in the chamber he was declared by a unanimous vote to have deserved well of his country. After laying down his dictatorial powers, he continued to preside over the Executive Committee till the election of a regular president of the republic. It was expected that the suffrages of France would raise Cavaignac to that position. But the mass of the people, and especially the rural population, sick of revolution, and weary even of the moderate republicanism of Cavaignac, were anxious for a stable government. Against the five and a half million votes recorded for Louis Napoleon, Cavaignac received only a million and a half. Not without chagrin at his defeat, he withdrew into the ranks of the opposition. He continued to serve as a representative during the short remainder of the republic. At the *coup d'état* of the 2nd December 1851 he was arrested along with the other members of the opposition; but after a short imprisonment at Ham he was released, and, with his newly-married wife, lived in retirement till his death, which took place at Ourne (Sarthe) on the 28th of October 1857.

His son, JACQUES MARIE EUGÈNE GODEFROI CAVIGNAC (1853-1905), French politician, was born in Paris on the 21st of May 1853. He made public profession of his republican principles as a schoolboy at the Lycée Charlemagne by refusing in 1867 to receive a prize at the Sorbonne from the hand of the prince imperial. He received the military medal for service in the Franco-Prussian War, and in 1872 entered the École

Polytechnique. He served as a civil engineer in Angoulême until 1881, when he became master of requests in the council of state. In the next year he was elected deputy for the arrondissement of Saint-Calais (Sarthe) in the republican interest. In 1885-1886 he was under-secretary for war in the Henri Brisson ministry, and he served in the cabinet of Émile Loubet (1892) as minister of marine and of the colonies. He had exchanged his moderate republicanism for radical views before he became war minister in the cabinet of Léon Bourgeois (1895-1896). He was again minister of war in the Brisson cabinet in July 1898, when he read in the chamber a document which definitely incriminated Captain Alfred Dreyfus. On the 30th of August, however, he stated that this had been discovered to be a forgery by Colonel Henry, but he refused to concur with his colleagues in a revision of the Dreyfus prosecution, which was the logical outcome of his own exposure of the forgery. Resigning his portfolio, he continued to declare his conviction of Dreyfus's guilt, and joined the Nationalist group in the chamber, of which he became one of the leaders. He also was an energetic supporter of the Ligue de la Patrie Française. In 1899 Cavaignac was an unsuccessful candidate for the presidency of the republic. He had announced his intention of retiring from political life when he died at his country-seat near Flée (Sarthe) on the 25th of September 1905. He wrote an important book on the *Formation de la Prusse contemporaine* (2 vols., 1891-1898), dealing with the events of 1806-1813.

**CAVAILLON**, a town of south-eastern France in the department of Vaucluse, 20 m. S.E. of Avignon by rail. Pop. (1906) town, 5760; commune, 9952. Cavailon lies at the southern base of Mont St Jacques on the right bank of the Durance above its confluence with the Coulon. It has a hôtel de ville of the 18th century, a church of the 12th century, dedicated to St Véran, and the mutilated remains of a triumphal arch of the Roman period. The town is an important railway junction and the commercial centre of a rich and well-irrigated plain, which produces melons and other fruits, early vegetables (artichokes, tomatoes, celery, potatoes), and other products in profusion. Silk-worms are reared, and silk is an important article of trade. The preparation of preserved vegetables, fruits and other provisions, distilling, and the manufacture of straw hats and leather are carried on. Numerous minor relics of the Roman period have been found to the south of the present town, on the site of the ancient *Cabellio*, a place of some note in the territory of the Cavares. In medieval and modern history the town has for the most part followed the fortunes of the Comtat Venaissin, in which it was included. Till the time of the Revolution it was the see of a bishop, and had a large number of monastic establishments.

**CAVALCANTI, GUIDO** (c. 1250-1300), Italian poet and philosopher, was the son of a philosopher whom Dante, in the *Inferno*, condemns to torment among the Epicureans and Atheists; but he himself was a friend of the great poet. By marriage with Beatrice, daughter of Farinata Uberti, he became head of the Ghibellines; and when the people, weary of continual brawls, aroused themselves, and sought peace by banishing the leaders of the rival parties, he was sent to Sarzana, where he caught a fever, of which he died. Cavalcanti has left a number of love sonnets and canzoni, which were honoured by the praise of Dante. Some are simple and graceful, but many are spoiled by a mixture of metaphysics borrowed from Plato, Aristotle and the Christian Fathers. They are mostly in honour of a French lady, whom he calls Mandetta. His *Canzone d'Amore* was extremely popular, and was frequently published; and his complete poetical works are contained in Giunti's collection (Florence, 1527; Venice, 1531-1532). He also wrote in prose on philosophy and oratory.

See D. G. Rossetti, *Dante and his Circle* (1874).

**CAVALIER, JEAN** (1681-1740), the famous chief of the Camisards (*q.v.*), was born at Mas Roux, a small hamlet in the commune of Ribauter near Anduze (Gard), on the 28th of November 1681. His father, an illiterate peasant, had been compelled by persecution to become a Roman Catholic along

with his family, but his mother brought him up secretly in the Protestant faith. In his boyhood he became a shepherd, and about his twentieth year he was apprenticed to a baker. Threatened with prosecution for his religious opinions he went to Geneva, where he passed the year 1701; he returned to the Cévennes on the eve of the rebellion of the Camisards, who by the murder of the Abbé du Chayla at Pont-de-Monvert on the night of the 24th of July 1702 raised the standard of revolt. Some months later he became their leader. He showed himself possessed of an extraordinary genius for war, and Marshal Villars paid him the high compliment of saying that he was as courageous in attack as he was prudent in retreat, and that by his extraordinary knowledge of the country he displayed in the management of his troops a skill as great as that of the ablest officers. Within a period of two years he was to hold in check Count Victor Maurice de Broglie and Marshal Montrevel, generals of Louis XIV., and to carry on one of the most terrible partisan wars in French history.

He organized the Camisard forces and maintained the most severe discipline. As an orator he derived his inspiration from the prophets of Israel, and raised the enthusiasm of his rude mountaineers to a pitch so high that they were ready to die with their young leader for the sake of liberty of conscience. Each battle increased the terror of his name. On Christmas day 1702 he dared to hold a religious assembly at the very gates of Alais, and put to flight the local militia which came forth to attack him. At Vagnas, on the 10th of February 1703, he routed the royal troops, but, defeated in his turn, he was compelled to find safety in flight. But he reappeared, was again defeated at Tour de Bellot (April 30), and again recovered himself, recruits flocking to him to fill up the places of the slain. By a long series of successes he raised his reputation to the highest pitch, and gained the full confidence of the people. It was in vain that more rigorous measures were adopted against the Camisards. Cavalier boldly carried the war into the plain, made terrible reprisals, and threatened even Nîmes itself. On the 16th of April 1704 he encountered Marshal Montrevel himself at the bridge of Nages, with 1000 men against 5000, and, though defeated after a desperate conflict, he made a successful retreat with two-thirds of his men. It was at this moment that Marshal Villars, wishing to put an end to the terrible struggle, opened negotiations, and Cavalier was induced to attend a conference at Pont d'Avène near Alais on the 11th of May 1704, and on the 16th of May he made submission at Nîmes. These negotiations, with the proudest monarch in Europe, he carried on, not as a rebel, but as the leader of an army which had waged an honourable war. Louis XIV. gave him a commission as colonel, which Villars presented to him personally, and a pension of 1200 livres. At the same time he authorized the formation of a Camisard regiment for service in Spain under his command.

Before leaving the Cévennes for the last time he went to Alais and to Ribault, followed by an immense concourse of people. But Cavalier had not been able to obtain liberty of conscience, and his Camisards almost to a man broke forth in wrath against him, reproaching him for what they described as his treacherous desertion. On the 21st of June 1704, with a hundred Camisards who were still faithful to him, he departed from Nîmes and came to Neu-Brisach (Alsace), where he was to be quartered. From Dijon he went on to Paris, where Louis XIV. gave him audience and heard his explanation of the revolt of the Cévennes. Returning to Dijon, fearing to be imprisoned in the fortress of Neu-Brisach, he escaped with his troop near Montbéliard and took refuge at Lausanne. But he was too much of a soldier to abandon the career of arms. He offered his services to the duke of Savoy, and with his Camisards made war in the Val d'Aosta. After the peace he crossed to England, where he formed a regiment of refugees which took part in the Spanish expedition under the earl of Peterborough and Sir Cloudesley Shovel in May 1705. At the battle of Almanza the Camisards found themselves opposed to a French regiment, and without firing the two bodies rushed one upon the other. Cavalier wrote

later (July 10, 1707): "The only consolation that remains to me is that the regiment I had the honour to command never looked back, but sold its life dearly on the field of battle. I fought as long as a man stood beside me and until numbers overpowered me, losing also an immense quantity of blood from a dozen wounds which I received." Marshal Berwick never spoke of this tragic event without visible emotion.

On his return to England a small pension was given him and he settled at Dublin, where he published *Memoirs of the Wars of the Cévennes under Col. Cavalier*, written in French and translated into English with a dedication to Lord Carteret (1726). Though Cavalier received, no doubt, assistance in the publication of the Memoirs, it is none the less true that he provided the materials, and that his work is the most valuable source for the history of his life. He was made a general on the 27th of October 1735, and on the 25th of May 1738 was appointed lieutenant-governor of Jersey. Writing in the following year (August 26, 1739) he says: "I am overworked and weary; I am going to take the waters in England so as to be in a fit condition for the war against the Spaniards if they reject counsels of prudence." He was promoted to the rank of major-general on the 2nd of July 1739, and died in the following year. In the parochial register of St Luke's, Chelsea, there is an entry: "Burial A.D. 1740, May 18, Brigadier John Cavalier."

There is a story which represents him as the fortunate rival of Voltaire for the hand of Olympe, daughter of Madame Dunoyer, author of the *Lettres galantes*. During his stay in England he married the daughter of Captain de Ponthieu and Marguerite de la Rochefoucauld, refugees living at Portarlington. Malesherbes, the courageous defender of Louis XVI., bears the following eloquent testimony to this young hero of the Cévennes:—"I confess," he says, "that this warrior, who, without ever having served, found himself by the mere gift of nature a great general,—this Camisard who was bold to punish a crime in the presence of a fierce troop which maintained itself by little crimes—this coarse peasant who, when admitted at twenty years of age into the society of cultivated people, caught their manners and won their love and esteem, this man who, though accustomed to a stormy life, and having just cause to be proud of his success, had yet enough philosophy in him by nature to enjoy for thirty-five years a tranquil private life—appears to me to be one of the rarest characters to be found in history."

For a more detailed account see F. Puaux, *Vie de Jean Cavalier* (1868); David C. A. Agnew, *Protestant Exiles from France*, ii. 54-66 (Lond., 1871); Charvey, *Jean Cavalier: nouveaux documents inédits* (1884). Eugène Sue popularized the name of the Camisard chief in *Jean Cavalier ou les fanatiques des Cévennes* (1840). (F. P.)

**CAVALIER**, a horseman, particularly a horse-soldier or one of gentle birth trained in knightly exercises. The word is taken from one of the French words which derived ultimately from the Late Lat. *caballarius*, a horseman, from Lat. *caballus*, properly a pack-horse, which gave the Fr. *cheval*, a *chevalier*. This last word is the regular French for "knight," and is chiefly used in English for a member of certain foreign military or other orders, particularly of the Legion of Honour. Cavalier in English was early applied in a contemptuous sense to an overbearing swashbuckler—a roisterer or swaggering gallant. In Shakespeare (2 *Henry IV.* v. iii. 62) Shallow calls Bardolph's companions "cavaliers." "Cavalier" is chiefly associated with the Royalists, the supporters of Charles I. in the struggle with the Parliament in the Great Rebellion. Here again it first appears as a term of reproach and contempt, applied by the opponents of the king. Charles in the *Answer to the Petition* (June 13, 1642) speaks of cavaliers as a "word by what mistake soever it seems much in disfavour." Further quotations of the use of the word by the Parliamentary party are given in the *New English Dictionary*. It was soon adopted (as a title of honour) by the king's party, who in return applied Roundhead to their opponents, and at the Restoration the court party preserved the name, which survived till the rise of the term Tory (see *WHIG AND TORY*). The term "cavalier" has been adopted from the French as a term in fortification for a work of great command constructed in the

interior of a fort, bastion or other defence, so as to fire over the main parapet without interfering with the fire of the latter. A greater volume of fire can thus be obtained, but the great height of the cavalier makes it an easy target for a besieger's guns.

**CAVALIERE, EMILIO DEL**, 16th-century Italian musical composer, was born in Rome about 1550 of a noble family. He held a post at the court of Ferdinand I. of Tuscany from 1588 to 1597, and during his residence at Florence was on terms of intimacy with J. Peri, O. Rinuccini, G. Caccini and the rest of the Bardi circle. In 1597 he returned to Rome, and became connected with the Congregation of the Oratory founded by St Philip Neri. Here in 1600 was performed Cavaliere's contribution to the musical reformation initiated by his circle of friends in Florence—*La Rappresentazione di Anima e di Corpo*, a sacred drama, which is regarded as the first example of what is now called oratorio. It is generally supposed that he was no longer living when the work was performed, but some authorities assign 1602 as the date of his death.

Cavaliere's style is more facile than that of Peri and Caccini, but he is inferior to them in depth of musical expression. He is, however, important as being the first to apply the new monodic style to sacred music, and as the founder of the Roman school of the 17th century which included Mazzocchi, Carissimi and Alessandro Scarlatti.

See also H. Goldschmidt, *Studien zur Geschichte der italienischen Oper im 17. Jahrhundert*, Band I.

**CAVALLI, FRANCESCO** (1599?–1676), Italian musical composer, was born at Crema in 1599 or 1600. His real name was Pier Francesco Caletti-Bruni, but he is better known by that of Cavalli, the name of his patron, a Venetian nobleman. He became a singer at St Mark's in Venice in 1617, second organist in 1639, first organist in 1665, and in 1668 *maestro di cappella*. He is, however, chiefly important for his operas. He began to write for the stage in 1639 (*Le Nozze di Teti e di Peleo*), and soon established so great a reputation that he was summoned to Paris in 1660 to produce an opera (*Serse*) at the Louvre in honour of the marriage of Louis XIV. He visited Paris again in 1662, bringing out his *Ercole Amante*. His death occurred in Venice on the 14th of January 1676. Twenty-seven operas of Cavalli are still extant, most of them being preserved in the library of St Mark at Venice. Monteverde had found opera a musico-literary experiment, and left it a magnificent dramatic spectacle. Cavalli succeeded in making opera a popular entertainment. He reduced Monteverde's extravagant orchestra to more practical limits, introduced melodious arias into his music and popular types into his *libretti*. His operas have all the characteristic exaggerations and absurdities of the 17th century, but they have also a remarkably strong sense of dramatic effect as well as a great musical facility, and a grotesque humour which was characteristic of Italian grand opera down to the death of Alessandro Scarlatti.

**CAVALLINI, PIETRO** (c. 1259–1344), Italian painter, born in Rome, was an artist of the earliest epoch of the modern Roman school, and was taught painting and mosaic by Giotto while employed at Rome; it is believed that he assisted his master in the mosaic of the Navicella or ship of St Peter, in the porch of the church of that saint. He also studied under the Cosmati. Lanzi describes him as an adept in both arts, and mentions with approbation his grand fresco of a Crucifixion at Assisi, still in tolerable preservation; he was, moreover, versed in architecture and in sculpture. According to George Vertue, it is highly probable that Cavallini executed, in 1279, the mosaics and other ornaments of the tomb of Edward the Confessor in Westminster Abbey. He would thus be the "Petrus Civis Romanus" whose name is inscribed on the shrine; but a comparison of dates invalidates this surmise. He died in 1344, at the age of eighty-five, in the odour of sanctity, having in his later years been a man of eminent piety. He is said to have carved for the Basilica of San Paolo fuori le Mura, close to Rome, a crucifix which spoke in 1370 to a female saint. Some highly important works by Cavallini in the church of Santa Cecilia in Trastevere, Rome, have been recently discovered.

**CAVALLO, TIBERIUS** (1740–1809), Anglo-Italian electrician and natural philosopher, was born on the 30th of March 1740 at Naples, where his father was a physician. In 1771 he came to England with the intention of pursuing a mercantile career, but he soon turned his attention to scientific work. Although he made several ingenious improvements in scientific instruments, his mind was rather imitative and critical than creative. He published numerous works on different branches of physics, including *A Complete Treatise on Electricity* (1777), *Treatise on the Nature and Properties of Air and other permanently Elastic Fluids* (1781), *History and Practice of Aerostation* (1785), *Treatise on Magnetism* (1787), *Elements of Natural and Experimental Philosophy* (1803), *Theory and Practice of Medical Electricity* (1780), and *Medical Properties of Factitious Air* (1798). He died in London on the 21st of December 1809.

**CAVALLOTTI, FELICE** (1842–1898), Italian politician, poet and dramatic author, was born at Milan on the 6th of November 1842. In 1860 and 1866 he fought with the Garibaldian Corps, but first attained notoriety by his anti-monarchical lampoons in the *Gazzetta di Milano* and in the *Gazzetta Rosa* between 1866 and 1872. Elected to parliament as deputy for Corteolona in the latter year, he took the oath of allegiance after having publicly impugned its validity. Eloquence and turbulent combativeness in and out of parliament secured for him the leadership of the extreme Left on the death of Bertani in 1886. During his twelve years' leadership his party increased in number from twenty to seventy, and at the time of his death his parliamentary influence was greater than ever before. Though ambitious and addicted to defamatory methods of personal attack which sometimes savoured of political blackmail, Cavallotti's eloquent advocacy of democratic reform, and apparent generosity of sentiment, secured for him a popularity surpassed by that of no contemporary save Crispi. Services rendered in the cholera epidemic of 1885, his numerous lawsuits and thirty-three duels, his bitter campaign against Crispi, and his championship of French interests, combined to enhance his notoriety and to increase his political influence. By skilful alliances with the marquis di Rudini he more than once obtained practical control of the Italian government, and exacted notable concessions to Radical demands. He was killed on the 6th of March 1898 in a duel with Count Macola, editor of the conservative *Gazzetta di Venezia*, whom he had assailed with characteristic intemperance of language. By his death the house of Savoy lost a relentless foe, and the revolutionary elements in Italy a gifted, if not entirely trustworthy, leader. (H. W. S.)

**CAVALRY** (*Fr. cavalerie*, *Ger. Kavallerie* or *Reiterei*, derived ultimately from late Lat. *caballus*, horse), a word which came into use in military literature about the middle of the 16th century as applied to mounted men of all kinds employed for combatant purposes, whether intended primarily for charging in masses, in small bodies, or for dismounted fighting. By degrees, as greater refinement of terminology has become desirable, the idea has been narrowed down until it includes only "horsemen trained to achieve the purpose of their commander by the combined action of man and horse," and this definition will be found to cover the whole field of cavalry action, from the tasks entrusted to the cavalry "corps" of 10,000 sabres down to the missions devolving on isolated squadrons and even troops.

*History*.—The evolution of the cavalry arm has never been uniform at any one time over the surface of the globe, but has always been locally modified by the conditions of each community and the stage of intellectual development to which at any given moment each had attained. The first condition for the existence of the arm being the existence of the horse itself, its relative scarcity or the reverse and its adaptability to its environment in each particular district have always exercised a preponderating influence on the development of cavalry organization and tactics. The indigenous horses of Europe and Asia being very small, the first application of their capabilities for war purposes seems everywhere to have been as draught animals for chariots, the construction of which implies not only the

*Early  
use of  
mounted  
warriors.*

existence of level surfaces, perhaps of actual roads, but a very considerable degree of mechanical skill in those who designed and employed them. The whole of the classical and Oriental mythologies, together with the earliest monuments of Egypt, Assyria and India, are convincing on this point. Nowhere can we find a trace either of description or delineation of animals physically capable of carrying on their backs the armed men of the period. All the earliest allusions to the use of the horse in war either point directly to the employment as a draught animal, or where not specific, as in the description of the war-horse in Job, they would apply equally well to one harnessed to a chariot as to one ridden under the saddle.

The first trace of change is to be found, according to Prof. Wm. Ridgway (*Origin and Influence of the Thoroughbred Horse*, p. 243), in an Egyptian relief showing Nubians mounted on horses of an entirely different breed, taller and more powerful than any which had gone before them. These horses appear to have come from the vicinity of Dongola, and the strain still survives in the Sudan. The breed is traced into Arabia, where only second-rate horses had been reared hitherto, and thence to different parts of Europe, where eventually centres of cavalry activity developed. The first detailed evidence of the existence of organized bodies of mounted men is to be found in Xenophon, whose instructions for the breaking, training and command of a squadron remain almost as a model for modern practice. Their tactical employment, however, seems still to have been relatively insignificant, for the horses were still far too small and too few to deliver a charge with sufficient momentum to break the heavy armed and disciplined hoplites. The strain of ancient battle was of an entirely different order to that of modern fighting. In the absence of projectiles of sufficient range and power to sweep a whole area, the fighting was entirely between the front ranks of the opposing forces. When a front rank fighter fell, his place was immediately taken by his comrade in the rear, who took up the individual combat, excited by his comrade's fate but relatively fresh in mind and muscle. This process of feeding the fight from the rear could be protracted almost indefinitely. If then, as a consequence of a charge, a few mounted men did penetrate the ranks, they encountered such a crowd of well-protected and fresh swordsmen that they were soon pulled off their ponies and despatched. Now and again great leaders, Alexander, Hannibal and Scipio Africanus, for instance, succeeded in riding down their opponents, but in the main, and as against the Roman infantry in particular, mounted troops proved of very little service on the battlefield.

It was, however, otherwise in the sphere of strategy. There, information was of even greater importance, because harder to obtain, than it is nowadays, and the army which could push out its feelers to the greater distance, surround its enemy and intercept his communications, derived nearly the same advantages as it does at present. Hence both sides provided themselves with horsemen, and when these met, each in the performance of their several duties, charges of masses naturally ensued. This explains the value attaching in the old days to the possession of horse-flesh and the rapid spread of the relatively new Dongola or African strain over the then known world.

The primitive instinct of aboriginal man is to throw stones or other missiles for purposes of defence (apes will throw anything they can find, but they never use sticks); hence, as the Romans penetrated ever farther amongst the barbarian tribes, their horsemen in first line found ever-increasing need for protection against projectiles. But the greater the weight of armour carried, the greater the demands upon the endurance of the horse. Then, as the weight-carrying breed was expensive and, with the decay of the Roman Empire, corruption and speculation spread, a limit was soon placed on the multiplication of charging cavalry, and it became necessary to fall back on the indigenous pony, which could only carry a rider from place to place, not charge. Thus there was a gradual levelling down of the mounted arms, the heavy cavalry becoming too heavy to gallop and the light not good enough for united action. Against such opponents, the lighter and better mounted tribesmen of

Asia found their task easy. They cut off the supplies of the marching infantry, filled up or destroyed the wells, &c., and thus demonstrated the strategic necessity of superior mobility.

With the decay of civilization discipline also disappeared, and, as discipline consists essentially in the spirit of self-sacrifice for the good of the community, its opposite, self-preservation, became the guiding principle. This in turn led to the increase of armour carried, and thence to the demand for heavier horses, and this demand working through several centuries led ultimately to the breeding of the great weight-carrying animals on whose existence that of medieval chivalry depended. These horses, however, being very costly and practically useless for general purposes, could only become the property of the wealthy, who were too independent to feel the need of combination, and preferred to live on the spoil and taxation of the weak. This spoliation eventually impelled the weaker men to combine, and at first their combination took the form of the construction of fortified places, against which mounted men were powerless. On the other hand, expense put a limit to the area which fortifications could enclose, and this again limited the supplies for the garrison. Horsemen sweeping the country for miles around had no difficulty in feeding themselves, and the surrender of all beleaguered places through starvation was ultimately inevitable, unless food could be introduced from allied towns in the vicinity. It was of no use to introduce fighting men only into a place which primarily required food (cf. Lucknow, 1857) to protract its resistance. Hence some means had to be found to surround the supply-convoys with a physically impenetrable shield, and eighteen-foot pikes in the hands of powerful disciplined soldiers met the requirements. Against eight to ten ranks of such men the best cavalry in the world, relying only on their swords, were helpless, and for the time (towards the close of the 15th century) infantry remained masters of the field on the continent of Europe.

England meanwhile had developed on lines of her own. Thanks to her longbowmen and the military genius of her leaders, she might have retained indefinitely the command of the continent had it not been for the invention of gunpowder, which, though readily accepted by the English for sieges in France, proved the ultimate cause of their undoing. It was the French who developed the use of siege artillery most rapidly, and their cavalry were not slow to take the hint; unlike the longbow and the crossbow, the pistol could be used effectively from horseback, and presently the knights and their retainers, having the deepest purses, provided themselves with long pistols in addition to their lances and swords. These weapons sent a bullet through any armour which a foot-soldier could conveniently carry, or his commander afford, and if anything went wrong with their mechanism (which was complicated and uncertain) the speed of his horse soon carried the rider out of danger. A new form of attack against infantry, introduced by the French at Cerisoles, 1544, thus developed itself. A troop or squadron, formed in from twelve to sixteen ranks, trotted up to within pistol shot of the angle of the square to be attacked and halted; then each rank in succession cantered off man by man to the left, discharging his pistol at the square as he passed, and riding back to his place behind the column to reload. This could be prolonged indefinitely, and against such tactics the infantry were powerless. The stakes carried by English archers to check the direct charge of horsemen became useless, as did also *chevaux de frise*, though the latter (which originated in the 14th century) continued to be employed by the Austrians against the swiftly-charging Turks till the close of the 17th century. Thus it became necessary to devise some new impediment which, whilst remaining mobile, would also give cover and an advantage in the final hand-to-hand shock. The problem was solved in Bohemia, Poland and Moravia (Hussite wars, about 1420), where, distances being great and the country open, greater mobility and capacity in the convoys became essential. Great trains of wagons were placed in charge of an infantry escort, of which a part had become possessed of firearms, and these moved across country in as many as twelve parallel lines drilled to form *laagers*, as nowadays

in South Africa. Again the cavalry proved helpless, and for nearly a century in central Europe the word "*Wagenburg*" (wagon-fortress) became synonymous with "army." Then an unfortunate inspiration came to the wagon-men. A large gun was relatively cheaper to manufacture, and more effective than a small one. To keep their assailants at a distance, they mounted wall-pieces of about one-inch bore on their wagons. For a moment the balance inclined in their favour, but the cavalry were quick to see their advantage in this new idea, and they immediately followed suit. They, too, mounted guns on wheels, and, as their mobility gave them choice of position, they were able to concentrate their fire against any side of the laager, and again ultimate surrender was the only way out of the defenders' dilemma.

The interesting problem thus raised was never finally solved, for the scene of action now shifted to western Europe, to the valley of the Po, and more particularly to the Netherlands, where fortresses were closer together and the clayey nature of the Rhine delta had already made paved roads necessary. Then, the *Wagenburg* being no longer needed for the short transits between one fortified town and another, the infantry reasserted themselves. Firearms having been much improved in the interval the spearmen (pikemen) had already (about 1515) learnt to protect themselves by musketeers trained to take advantage of cover and ground somewhat in the same fashion as the modern skirmisher. These musketeers kept light guns at a distance from their pikemen, but dared not venture far out, as their fire was altogether inadequate to stop a rush of horsemen; when the latter threatened to intervene, they had to run for safety to the squares of pikemen, whom they assisted in turn by keeping the cavalry beyond pistol range. Hence the horsemen had to fall back upon more powerful guns, and these, being slow and requiring more train, could be most economically protected by infantry (see also ARTILLERY).

Thus about the close of the 16th century western armies differentiated themselves out into the still existing three types—cavalry, artillery and infantry. Moreover, each type was subdivided, the cavalry becoming heavy, medium and dragoons. At this period there was nothing to disturb the equilibrium of two contending forces except the characters of their respective leaders. The mercenary element had triumphed everywhere over the feudal levies. The moral qualities of all were on the same indifferent level, and battles in the open followed the recognized course. Neither army being able to outmatch the other, both drew up masses of pikes in parallel lines. The musketeers covered the deployment of the heavy guns on either side, the cavalry drew up on the wings and a strictly parallel fight ensued, for in the absence of a common cause for which men were willing to die, plunder was the ruling motive, and all control and discipline melted in the excitement of the contest.

It is to the growth of Protestantism that cavalry owes its next great forward leap. To sweep the battlefield, it was absolutely essential that men should be ready to subordinate selfish considerations to the triumph of their cause. The Roman Catholicism of the day gave many loopholes for the evasion of clear duty, but from these the reformed faith was free, and it is to the reawakened sense of duty that Gustavus Adolphus appealed. This alone rendered combination amongst his subordinate leaders possible, and on this power of combination all his victories depended. Other cavalry soldiers, once let loose in the charge, could never be trusted to return to the field, the prospective plunder of the enemy's haggage being too strong a temptation; but the king's men could be depended on, and once brought back in formed bodies, they rode over the enemy's skirmishers and captured his batteries. Then the equilibrium of force was destroyed, and all arms combined made short work of the opposing infantry alone (Breitenfeld, 1631). But the Swedish king perished with his work half done, and matters reverted to their former condition until the appearance of Cromwell, another great leader capable of animating his men with the spirit of devotion, again rendered the cavalry arm supreme. The essence

of his success lay in this, that his men were ready everywhere and always to lay down their lives for their common cause. Whether scouting 70 m. to the front of their army, or fighting dismounted to delay the enemy at defiles or to storm fortified strongholds, or charging home on the battlefield, their will power, focused on, and in turn dependent on, the personality of their great leader, dominated all human instincts of fear, rapacity or selfishness. It is true that they had not to ride against the modern rifle, but it is equally true that there was no quick-firing artillery to carry terror through the enemy's army, and it was against masses of spearmen and musketeers, not then subjected to bursting shells or the lash of shrapnel and rifle bullets, that the final charges had always to be ridden home.

Each succeeding decade thereafter has seen a steady diminution in the ultimate power of resistance of the infantry, and a corresponding increase in the power of fire preparation at the disposal of the supreme leader; and the chances of cavalry have fluctuated with the genius of that leader in the employment of the means at his disposal, and the topographical conditions existing within each theatre of war. During the campaigns in Flanders, with its multiplicity of fortresses and clayey soil, cavalry rapidly degenerated into mounted infantry, throwing aside sword and lance-proof armour, and adopting long muskets and heavier ammunition. Presently they abandoned the charge at a gallop and reverted to an approach at the trot, and if (as at Blenheim) their influence proved decisive on the field of battle, this was because the conditions were common to both combatants, and the personal influence of "Corporal John," as his soldiers called Marlborough, ensured greater steadiness and better co-operation.

When Frederick II. became king of Prussia (1740), he found his cavalry almost at the nadir of efficiency; even his cuirassiers drilled principally on foot. "They can manoeuvre," on foot, "with the same precision as my grenadiers, but unfortunately they are equally slow." His enemies the Austrians, thanks to their wars against the Turks who always charged at a gallop, had maintained greater dash and mobility, and at Mollwitz the Prussians only escaped disaster by the astounding rapidity of their infantry fire. In disgust the king then wrote, "Die Cavallerie ist nicht einmal werth dass sie der Teufel weck holet," and he immediately set about their reform with his usual energy and thoroughness. Three years after Mollwitz, the result of his exertions was apparent in the greatly increased importance the arm acquired on the battlefield, and the charge of the Bayreuth dragoons at Hohenfriedberg (June 4, 1745), who with 1500 horses rode over and dispersed 20 Austrian battalions, bringing in 2500 prisoners and 67 colours, will always rank as one of the most brilliant feats in military history.<sup>1</sup> The following years of peace (1745-1756) were devoted to the methodical preparation of the cavalry to meet the requirements that Frederick's methods of war would make upon them, and it is to this period that the student should devote special attention. From the very outbreak of the Seven Years' War (1756) this training asserted its influence, and Rossbach (1757) and Zorndorf (1758) are the principal examples of what cavalry handled in masses can effect. At Rossbach General v. Seydlitz, at the head of 38 squadrons, practically began and ended the destruction of the French army, and at Zorndorf he saved the day for the Prussians by a series of the most brilliant charges, which successively destroyed the Russian right wing and centre. These battles so conclusively demonstrated the superiority of the Prussian cavalry that their enemies completely altered their tactical procedure. They now utilized their enormous numerical superiority by working in two separate armies, each almost as strong as the whole Prussian force. When the latter moved against either, the one threatened immediately threw up heavy entrenchments, against which cavalry were, of course, ineffective, whilst the other pursued its march. When Frederick, having more or less beaten his immediate opponent,

<sup>1</sup> The loss of the regiment was twenty-eight killed and sixty-six wounded.

began to threaten the other army it entrenched likewise. Against these methods the Prussian army soon wore itself out, and though from time to time the cavalry locally distinguished itself, no further opportunities for great decisive blows presented themselves.

The increased demands made upon the mobility of the Prussian horsemen naturally resulted in the gradual rejection of everything which was not essential to their striking power. The long muskets and bayonets were laid aside, but the cuirass was retained for the *mêlée*, and by the close of the great struggle the various branches of the arm had differentiated themselves out into the types still adhered to, heavy cavalry, dragoons, hussars, whose equipment as regards essentials thenceforward hardly varied up to the latter years of the 19th century. The only striking difference lies in the entire rejection of the lance in the armament of the charging squadrons, and the reason is characteristic of the principles of the day. The Prussian cavalry had realized that success was decided, not primarily by actual collision, but by the moral effect of the appearance of an absolutely closed wall of horsemen approaching the adversary at full speed. If the necessary degree of cohesion was attained, the other side was morally beaten before collision took place, and either turned to flight, or met the shock with so little resolution that it was ridden over without difficulty. In the former case any weapon was good enough to kill a flying enemy; in the latter, in the *mêlée* which then ensued, the crush in the ranks of the victors was still so great that the lance was a hindrance rather than a help.

In the years succeeding the war the efficiency of the Prussian cavalry sank very rapidly, the initial cause being the death of Seydlitz at the early age of fifty-two. His personality had alone dominated the discontent, lethargy and hopelessness created by ruthless financial economies. When he was gone, as always in the absence of a great leader, men adapted their lives to the line of least resistance. In thirty years the wreck was complete, and within the splendid squadrons which had been accustomed to manoeuvre with perfect precision at the highest speed, there were (as F. A. von der Marwitz in his *Nachlass* clearly shows) not more than seven thoroughly trained men and horses to each, the remainder being trained for little longer and receiving less attention than is the case with modern line or auxiliary cavalry.

For the generation preceding the outbreak of the French Revolution, Frederick the Great's army, and especially his cavalry, had become the model for all Europe, but the mainspring of the excellence of his squadrons was everywhere overlooked. Seydlitz had manoeuvred great masses of horsemen, therefore every one else must have great masses also; but no nation grasped the secret, viz. the unconditional obedience of the horse to its rider, on which his success had depended. Neither was it possible under the prevailing social conditions to secure the old stamp of horse, or the former attention to detail on the part of men and officers. In France, owing to the agricultural decay of the country, suitable remounts for charging cavalry were almost unobtainable, and as this particular branch of the arm was almost exclusively commanded by the aristocracy it suffered most in the early days of the Revolution. The hussars, being chiefly recruited and officered by Alsatians and Germans from the Rhine provinces, retained their individuality and traditions much longer than the dragoons and cuirassiers, and, to the very close of the great wars, we find them always ready to charge at a gallop; but the unsteadiness and poor horsemanship of the other branches was so great that up to 1812, the year of their destruction, they always charged at a trot only, considering that the advantage of superior cohesion thus gained more than balanced the loss of momentum due to the slower pace.

Generally, the growth of the French cavalry service followed the universal law. The best big horses went to the heavy charging cavalry, viz. the cuirassiers, the best light horses to the hussars, and the dragoons received the remainder, for in principle they were only infantry placed on horseback for convenience of locomotion, and were not primarily intended for combined mounted action. Fortunately for them, their principal adversaries, the

Austrians, had altogether failed to grasp the lesson of the Seven Years' War. Writing in 1780 Colonel Mack, a very capable officer, said, "Even in 1769, the cavalry could not ride, could not manage to control their horses. Not a single squadron could keep its dressing at a gallop, and before they had gone fifty yards at least ten out of forty horses in the first rank would break out to the front," and though the veteran field marshal Lacy issued new regulations, their spirit seems always to have escaped the executive officers. The British cavalry was almost worse off, for economy had reduced its squadrons to mere skeletons, and the traditional British style of horsemanship, radically different from that in vogue in France, made their training for combined action even more difficult than elsewhere. Hence the history of cavalry during the earlier campaigns of the Revolution is marked by no decisive triumphs, the results are always inadequate when judged by the magnitude of the forces employed, and only the brilliant exploit of the 15th Light Dragoons (now Hussars) at Villers en Couthé (April 24, 1794) deserves to be cited as an instance of the extraordinary influence which even a few horsemen can exercise over a demoralized or untrained mob of infantry.

Up to the campaign of Poland (see NAPOLEONIC CAMPAIGNS) French victories were won chiefly by the brilliant infantry fighting, cavalry only intervening (as at Jena) to charge a beaten enemy and complete his destruction by pursuit. But after the terrible waste of life in the winter of 1806-7, and the appalling losses in battle, Napoleon introduced a new form of attack. The case-shot preparation of his artillery (see ARTILLERY) sowed confusion and terror in the enemy's ranks, and the opportunity was used by masses of cavalry. Henceforward this method dominated the Napoleonic tactics and strategy. The essential difference between this system and the Frederician lies in this, that with the artillery available in the former period it was not possible to say in advance at what point the intervention of cavalry would be necessary, hence the need for speed and precision of manoeuvre to ensure their arrival at the right time and place. Napoleon now selected beforehand the point he meant to overwhelm and could bring his cavalry masses within striking distance at leisure. Once placed, it was only necessary to induce them to run away in the required direction to overwhelm everything by sheer weight of men and horses. This method failed at Waterloo because the ground was too heavy, the slope of it against the charge, and the whole condition of the horses too low for the exertion demanded of them.

The British cavalry from 1793 to 1815 suffered from the same causes which at the beginning of the 20th century brought about its breakdown in the South African War. Oversea transport brought the horses to land in poor condition, and it was rarely possible to afford them sufficient time to recover and become accustomed to the change in forage, the conditions of the particular theatre of operations, &c., before they had to be led against the enemy—hence a heavy casualty roll and the introduction into the ranks of raw unbroken horses which interfered with the precision of manoeuvre of the remainder. Their losses (about 13% per annum) were small as compared with those of South Africa, but this is mainly accounted for by the fact that, operations being generally in the northern hemisphere, the change of climate was never so severe. Tactically, they suffered, like the Austrians and Prussians, from the absence of any conception of the Napoleonic strategy amongst their principal leaders. As it was not known where the great blow was to fall, they were distributed along the whole line, and thus became habituated to the idea of operating in relatively small bodies. This is the worst school for the cavalry soldier, because it is only when working in masses of forty to sixty squadrons that the cumulative consequences of small errors of detail become so apparent as to convince all ranks of the necessity of conforming accurately to established prescriptions. Nevertheless, they still retained the practice of charging at a gallop, and as a whole were by far the most efficient body of horsemen who survived at the close of the great wars.

In the reaction that then ensued all over Europe, cavalry

practically ceased to exist. The financial and agricultural exhaustion of all countries, and of Prussia in particular, was so complete that money was nowhere to be found for the great concentrations and manoeuvre practices which are

more essential to the efficiency of the cavalry than to that of the other arms. Hence a whole generation of officers grew up in ignorance of the fundamental principles which govern the employment of their arm. It was not till 1848 that the Prussians began again to unite whole cavalry divisions for drill and manoeuvre, and the soldiers of the older generation had not yet passed away when the campaigns of 1866 and 1870 brought up again the realities of the battle-field. Meanwhile the introduction of long-range artillery and small arms had entirely destroyed the tactical relation of the three arms on which the Napoleonic tactics and strategy had been based, and the idea gained ground that the battle-field would no longer afford the same opportunities to cavalry as before. The experiences gained by the Americans in the Civil War helped to confirm this preconception. If in battles waged between infantry armed only with muzzle-loading rifles, cavalry could find no opportunity to repeat past exploits, it was argued that its chances could not fail to be still further reduced by the breech-loader. But this reasoning ignored the principal factors of former successes. The mounted men in America failed not as a consequence of the armament they encountered, but because the war brought out no Napoleon to create by his skill the opportunity for decisive cavalry action, and to mass his men beforehand in confident anticipation. The same reasoning applies to the European campaigns of 1866 and 1870, and the results obtained by the arm were so small, in proportion to the numbers of squadrons available and to their cost of maintenance as compared with the other arms, that a strong reaction set in everywhere against the existing institutions, and the re-creation of the dragoon, under the new name of mounted rifleman, was advocated in the hope of obtaining a cheap and efficient substitute for the cavalryman.

Later events in South Africa and in Manchuria again brought this question prominently to the front, but the essential difference between the old and new schools of thought has not been generally realized. The "mounted rifle" adherents base their arguments on the greatly increased efficiency of the rifle itself. The "cavalry" school, on the other hand, maintains that, the weapons themselves being everywhere substantially equal in efficiency, the advantage rests with the side which can create the most favourable conditions for their employment, and that, fundamentally, superior mobility will always confer upon its possessor the choice of the circumstances under which he will elect to engage. Where the two sides are nearly equally matched in mobility, neither side can afford the time to dismount, for the other will utilize that time to manoeuvre into a position which gives him a relative superiority for whichever form of attack he may elect to adopt, and his relative superiority will always more than suffice to eliminate any advantage in accuracy of fire that his opponent may have obtained by devoting his principal attention to training his men on the range instead of on the mounted manoeuvre ground.

Finally, the "cavalry" school reasons that in no single campaign since Napoleon's time have the conditions governing encounters been normal. Either the roadless and barren nature of the country has precluded of itself the rapid marching which forms the basis of all modern strategy, as in America, Turkey, South Africa and Manchuria, or the relative power of the infantry and artillery weapons, as in Bohemia (1866) and in France (1870), has rendered wholly impossible the creation of the great tactical opportunity characteristic of Napoleon's later method, for there then existed no means of overwhelming the enemy with a sufficient hail of projectiles to render the penetration of the cavalry easible. The latest improvement in artillery, viz. the perfected shrapnel and the quick-firing guns, have, however, enormously facilitated the attainment of this primary fire superiority, and, moreover, it has simplified the procedure to such a degree that Napoleon is no longer needed to direct. The battles of the future will thus, in civilized countries, revert to the Napoleonic type,

and the side which possesses the most highly trained and mobile force of cavalry will enjoy a greater relative superiority over its adversary than at any period since the days of Frederick.

The whole experience of the past thus goes to show that no nation in peace has ever yet succeeded in maintaining a highly trained cavalry sufficiently numerous to meet all the demands of a great war. Hence at the outbreak of hostilities there has always been a demand for some kind of supplementary force which can relieve the regular squadrons of those duties of observation and exploration which wear down the horses most rapidly and thus render the squadrons ineffective for their culminating duty on the battle-field. This demand has been met by the enrolment of men willing to fight and rendered mobile by mounts of an inferior description, and the greater the urgency the greater has been the tendency to give them arms which they can quickly learn to use. To make a man an expert swordsman or lancer has always taken years, but he can be taught to use a musket or rifle sufficiently for his immediate purpose in a very short time. Hence, to begin with, arms of this description have invariably been issued to him. But once these bodies have been formed, and they have come into collision with trained cavalry, the advantages of mobility, combined with the power of shock, have become so apparent to all, that insensibly the "dragoon" has developed into the cavalry soldier, the rate of this evolution being conditioned by the nature of the country in which the fighting took place.

This evolution is best seen in the American Civil War. The men of the mounted forces engaged had been trained to the use of the rifle from childhood, while the vast majority had never seen a sword, hence the formation of "mounted rifles"; and these "mounted rifles" developed precisely in accordance with the nature of their surroundings. In districts of virgin forests and marshland they remained "mounted rifles," in the open prairie country of the west they became cavalry pure and simple, though for want of time they never rivalled the precision of manoeuvre and endurance of modern Prussian or Austrian horse. In South Africa the same sequence was followed, and had the Boer War lasted longer it is certain that such Boer leaders as de Wet and de la Rey would have reverted to cavalry tactics of shock and cold steel at the earliest possible opportunity.

Therefore when we find, extending over a cycle of ages, the same causes producing the same effects, the natural conclusion is that the evolution of the cavalry arm is subject to a universal law which persists in spite of all changes of armament.

*Employment of Cavalry.*—It is a fundamental axiom of all military action that the officer commanding the cavalry of any force comprising the three arms of the service is in the strictest sense an executive officer under the officer commanding that particular force as a whole. The latter again is himself responsible to the political power he represents. When intricate political problems are at stake, it may be, and generally is, quite impracticable that any subordinate can share the secret knowledge of the power to which he owes his allegiance.

The essence of the value of the cavalry soldier's services lies in this, that the demand is never made upon him in its supremest form until the instinct of the real commander realizes that the time has come. Whether it be to cover a retreat, and by the loss of hundreds to save the lives of tens of thousands, or to complete a victory with commensurate results in the opposite direction, the obligation remains the same—to stake the last man and horse in the attainment of the immediate object in view, the defeat of the enemy. This at once places the leader of cavalry in face of his principal problem. It is a matter of experience that the broader the front on which he can deliver a charge, the greater the chances of success. However strong the bonds of discipline may be, the line is ultimately, and at a certain nervous tension, only a number of men on horses, acting and reacting on one another in various ways. When therefore, of two lines, moving to meet one another at speed, one sees itself overlapped to either hand, the men in the line thus overlapped invariably and inevitably tend to open outwards, so as at least to meet their enemy on an equal frontage. Hence

every cavalry commander tries to strike at the flank of his enemy, and the latter manoeuvres to meet him, and if both have equal mobility, local collision must ensue on an equal and parallel front. Therefore both strive to put every available man and horse in their first line, and if men and horses were invulnerable such a line would sweep over the ground like a scythe and nothing could withstand it. Since, however, bullets kill at a distance, and inequalities and unforeseen difficulties of the ground may throw hundreds of horses and riders, a working compromise has to be found to meet eventualities, and, other things being equal, victory inclines to the leader who best measures the risks and uncertainties of his undertaking, and keeps in hand a sufficient reserve to meet all chances.

Thus there has arisen a saying, which is sometimes regarded as axiomatic, that in cavalry encounters the last closed reserve always wins. The truth is really that he who has best judged the situation and the men on both sides finds himself in possession of the last reserve at the critical moment. The next point is, how to ensure the presence of this reserve, and what is the critical moment. The battle-field is the critical moment in each phase of every campaign—not the mere chance locality on which a combat takes place, but the decisive arena on which the strategic consequences of all pre-existing conditions of national cohesion, national organization and of civilization are focussed. It is indeed the judgment-seat of nature, on which the right of the race to survive in the struggle for existence is weighed and measured in the most impartial scales.

Before, however, the final decision of the battle-field can be attained, a whole series of subordinate decisions have to be fought out, success in each of which conditions the result of the next series of encounters. Every commanding officer of cavalry thus finds himself successively called on to win a victory locally at any cost, and the question of economy of force does not concern him at all. Hence the same fundamental rules apply to all cavalry combats, of whatever magnitude, and condition the whole of cavalry tactics. Broadly speaking, if two cavalries of approximately equal mobility manoeuvre against each other in open country, neither side can afford the loss of time that dismounting to fight on foot entails. Hence, assuming that at the outset of a campaign each side aims at securing a decisive success, both seek out an open plain and a mounted charge, sword in hand, for the decision. When the speed and skill of the combatants are approximately equal, collision ensues simultaneously along parallel fronts, and the threat of the overlapping line is the principal factor in the decision. The better the individual training of man and horse the less will be the chances of unsteadiness or local failures in execution, and the less the need of reserves; hence the force which feels itself the most perfect in the individual efficiency of both man and horse (on which therefore the whole ultimately depends) can afford to keep fewer men in reserve and can thus increase the width of its first line for the direct collision. Careful preparation in peace is therefore the first guarantee of success in action. This means that cavalry, unlike infantry, cannot be expanded by the absorption of reserve men and horses on the outbreak of hostilities, but must be maintained at war strength in peace, ready to take the field at a moment's notice, and this is actually the standard of readiness attained on the continent of Europe at the present day.

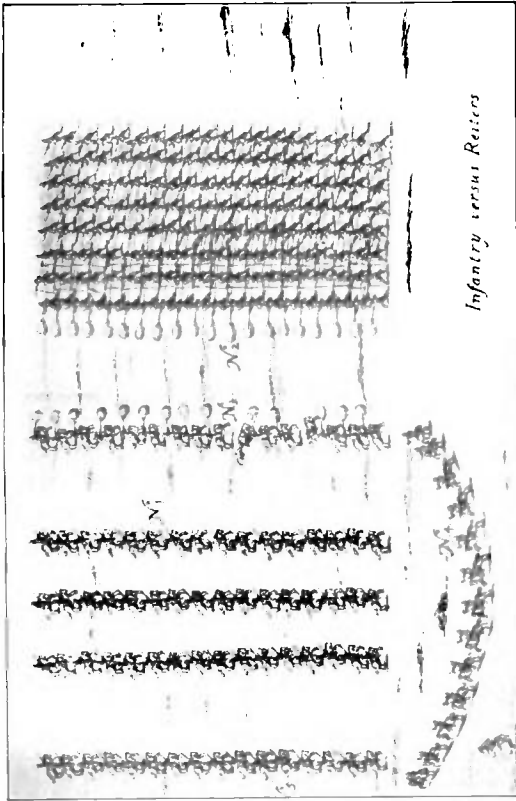

Further, uniformity of speed is the essential condition for the execution of closed charges, and this obviously cannot be assured if big men on little horses and small men on big horses are indiscriminately mixed up in the same units. Horses and men have therefore been sorted out everywhere into three categories, *light*, *medium* and *heavy*, and in periods when war was practically chronic, suitable duties have been allotted to each. It is clear, on purely mechanical grounds, that the greater the velocity of motion at the moment of collision the greater will be the chances of success, and this greater speed will be on the side of the bigger horses as a consequence of their longer stride. On the other hand, these horses, by reason of their greater weight, are used up much more rapidly than small ones. Hence, to ensure the greater speed at the moment of contact, it is necessary to save them as

much as possible to keep them fresh for the shock only, and this has been the practice of all great cavalry leaders all over the world, and has only been departed from under special circumstances, as by the Germans in France in 1870, when their cavalry practically rode everywhere unopposed.

Collisions, however, must be expected by every body of troops large or small; hence each regiment—ultimately each squadron—endeavours to save its horses as far as this is compatible with the attainment of the special object in view, and this has led everywhere and always to a demand for some intermediate arm, less expensive to raise and maintain than cavalry proper, and able to cover the ground with sufficient rapidity and collect the information necessary to ensure the proper direction of the cavalry commands. Originally this intermediate force received the designation of dragoons; but since under pressure of circumstances during long periods of war these invariably improved themselves into cavalry and became permanent units in the army organization, fresh names have had to be invented for them, of which Mounted Infantry and Mounted Rifles are the latest, and every improvement in firearms has led to an increased demand for their services.

It is now relatively easy to trace out the considerations which should govern the employment of his cavalry by the officer commanding a force of the three arms. Assuming for purposes of illustration an army numerically weak in cavalry, what course will best ensure the presence of the greatest number of sabres at the decisive point, *i.e.* on the battle-field? To push out cavalry screens far to the front will be to court destruction, nor is the information they obtain of much real service unless the means to act upon it at once is at hand. This can only be supplied economically by the use of strong advanced guards of infantry, and such supplementary security and information as these may require will be best supplied by mounted infantry, the sacrifice of whom will disturb least the fighting integrity of the whole army. Imagine an army of 300,000 men advancing by five parallel roads on a front of 50 m., each column (60,000 men, 2 army corps) being covered by a strong advance guard, coming in contact with a similarly constituted army moving in an opposite direction. A series of engagements will ensue, in each of which the object of the local commander will be to paralyse his opponent's will-power by a most vigorous attack, so that his superior officer following him on the same road will be free to act as he chooses. The front of the two armies will now be defined by a line of combats localized each about a comparatively small area, and between them will be wide gaps which it will be the chief business of the directing minds on either side to close by other troops as soon as possible. Generally the call will be made upon the artillery for this purpose, since they can cover the required distances far more rapidly than infantry. Now, as artillery is powerless when limbered up and always very vulnerable on the flanks of the long lines, a strong cavalry escort will have to be assigned to them which, trotting forward to screen the march, will either come in contact with the enemy's cavalry advancing with a similar object, or themselves find an opportunity to catch the enemy's guns at a disadvantage. These are opportunities for the cavalry, and if necessary it must sacrifice itself to turn them to the best account. The whole course of the battle depends on success or failure in the early formation of great lines of guns, for ultimately the victor in the artillery duel is himself in command of the necessary balance of guns which are needed to prepare the way for his final decisive infantry attack. If this latter succeeds, then any mounted men who can gallop and shoot will suffice for pursuit. If it fails, no cavalry, however gallant, has any hope of definitely restoring the combat against victorious infantry, cavalry, now as in the past, can but gain a little time. This time may indeed be worth the price at which it can be bought, but it will always be more economical to concentrate all efforts to prevent the emergency arising.

After the Franco-German War much was written about the possibility of vast cavalry encounters to be fought far in advance of the main armies, for the purpose of obtaining information, and ideas were freely mooted of wide-flung raids traversing

Sixteenth-Century Cavalry.

(Wallhausen's *Art militaire de la cavalerie, circa 1600.*)

Battle of Staffarda, 1690. (From a contemporary engraving.)

Action on the Bulganak, 1854. (From a lithograph by W. Simpson.)

German Guard Dragoons. (Photo, Gebrüder Haeckel.)

the enemy's communications, breaking up his depots, reserve formations, &c. But riper consideration has relegated these suggestions to the background, for it is now evident that such expeditions involve the dissemination of force, not its concentration. Austria and France for example would scarcely throw their numerically inferior cavalry against the Germans, and nothing would suit them better than that the latter should hurl their squadrons against the frontier guards, advanced posts, and, generally, against unbeaten infantry; nor indeed would the Germans stultify their whole strategic teaching by weakening themselves for the decisive struggle. It follows therefore that cavalry reconnaissance duties will be strictly local and tactical, and that arrangements will be made for procuring strategic information by wireless telegraphy, balloons, motor cars, bicycles, &c., and that on the whole that nation will be best served in war which has provided in peace a nucleus of mounted infantry capable of rapid expansion to fill the gap which history shows always to have existed between the infantry and the cavalry. Such troops need not be organized in large bodies, for their mission is to act by "slimness," not by violence. They must be the old "verlorene Haufe" (*anglice*, "forlorn hope") of former days, men whose individual bravery and decision is of the highest order. But they can never become a "decision-compelling arm," though by their devotion they may well hope to obtain the grand opportunity for their cavalry, and share with them in harvesting the fruits of victory.

The great cavalry encounters of forty to sixty squadrons on either side, which it has been shown must arise from the necessity of screening or preventing the formation of the all-important artillery lines, will take their form mainly from the topographical conditions of the district, and since on a front of 60 to 100 m. these may vary indefinitely, cavalry must be trained, as indeed it always has been, to fight either on foot or on horseback as occasion requires. In either case, thoroughness of preparation in horsemanship (which, be it observed, includes horsemastership) is the first essential, for in the end victory will rest with the side which can put in the right place with the greatest rapidity the greatest number of sabres or rifles. In the case of rifles there is a greater margin of time available and an initial failure is not irremediable, but the underlying principle is the same in either case; and since it is impossible to foretell exactly the conditions of the collision, all alike, according to the class to which they belong, must be brought up to the highest standard, for this alone guarantees the smooth and rhythmical motion required for covering long distances with the least expenditure of physical and nervous strength on the part both of horse and rider. As a consequence of successes gained in these preliminary encounters, opportunities will subsequently arise for the balance of fresh or rallied squadrons in hand to ride home upon masses of infantry disorganized and demoralized by the combined fire of infantry and artillery, and such opportunities are likely to be much more numerous at the outbreak of future wars than they have been in the past, because the enormous gain in range and rapidity of fire enables a far greater weight of metal to be concentrated on any chosen area within a given time. It cannot be too often reiterated that cavalry never has ridden over unshaken infantry of average quality by reason of its momentum alone, but that every successful cavalry charge has always owed its issue to a previously acquired moral superiority which has prevented the infantry from making adequate use of their means of defence. Nor will such charges entail greater losses than in the past, for, great though the increase of range of modern infantry weapons has been, the speed and endurance of cavalry has increased in a yet higher ratio; whereas in Napoleon's days, with an extreme range for musketry of 1000 yds., cavalry were expected only to trot 800 yds. and gallop for 200, nowadays with an extreme infantry range of under 4000 yds., the cavalry are trained to trot for 800 yds. and gallop for 2000.

Neither the experiences in South Africa nor those in Manchuria seriously influenced the views of the leading cavalry experts as above outlined, for the conditions of both cases were entirely abnormal. No nation in western Europe can afford to mount

the whole of its able-bodied manhood, nor, with the restricted area of its possessions, could repeat the Boer tactics with useful effect; in Manchuria, the theatre of operation was so far roadless, and the motives of both combatants so distinct from any conceivable as a basis for European strategy, that time was always available to construct entrenchments and obstacles physically insuperable to mounted arms. In western Europe, with its extreme development of communications, such tactics are impracticable, and under the system of compulsory service which is in force in all nations, an early decision must be sought at any cost. This motive imposes a rapid-marching campaign in the Napoleonic style, and in such warfare there is neither time nor energy available for the erection of extemporised fortresses. Victory must therefore fall to the side that can develop the greatest fire power in the shortest time. The greatest factor of fire power is the long artillery lines, and as cavalry is the one arm which by its mobility can hamper or prevent the formation of such lines, on its success in this task all else must depend. Hence both sides will concentrate every available horse and man for this special purpose, and on the issue of the collisions this mutual concentration must entail will hang the fate of the battle, and ultimately of the nation. But the cavalry which will succeed in this task will be the one in which the spirit of duty burns brightest, and the oath of allegiance, renewed daily on the cross of the sword, is held in the highest esteem.

*Organization.*—The existing organization of cavalry throughout the civilized world is an instance of the "survival of the fittest" in an extreme form. The execution of the many manoeuvres with the speed and precision which condition success is only possible by a force in which, as Frederick the Great said, "every horse and trooper has been finished with the same care that a watchmaker bestows upon each wheel of the watch mechanism." Uniformity of excellence is in fact the keystone of success, and this is only attainable where the mass is subdivided into groups, each of which requires superintendence enough to absorb the whole energy of an average commander. Thus it has been found by ages of experiment that an average officer, with the assistance of certain subordinates to whom he delegates as much or as little responsibility as he pleases, finds his time fully occupied by the care of about one hundred and fifty men and horses, each individual of which he must understand intimately, in character, physical strength and temper, for horse and man must be matched with the utmost care and judgment if the best that each is capable of is to be attained. The fundamental secret of the exceptional efficiency attained by the Prussian cavalry lies in the fact that they were the first to realize what the above implies. After the close of the Napoleonic Wars they made their squadron commanders responsible, not only for the training of the combatants of their unit, but also for the breaking in of remounts and the elementary teaching of recruits as well, and in this manner they obtained an intimate knowledge of their material which is almost unattainable by British officers owing to the conditions entailed by foreign service and frequent changes of garrisons.

Further, to obtain the maximum celerity of manoeuvre with the minimum exertion of the horses, the squadron requires to be subdivided into smaller units, generally known as *troops*, and experience has shown that with 128 sabres in the ranks (the average strength on parade, after deducting sick and young horses, and the N.C. officers required as troop guides, &c.) four troops best satisfy all conditions; as, with this number, the squadron will, under all circumstances of ground and surroundings, make any change of formation in less time and with greater accuracy than with any other number of subdivisions. The size of the unit next above the squadron, the *regiment*, is again fixed by the number of subordinates that an average commander can control, and the universal experience of all arms has settled this as not less than four and not more than eight. Experiments with eight and even ten squadrons have been tried both in Austria and Prussia, but only exceptional men have succeeded in controlling such large bodies effectively, and in the end the normal has been fixed at four or five squadrons in quarters, and three or four in the field. Of these, the larger number

is undoubtedly preferable, for, with the work of the quartermaster and the adjutant to supervise, in addition, the regimental commander is economically applied to the best advantage. The essential point, however, is that the officer commanding the regiment does not interfere in details, but commands his four squadron commanders, his quartermaster, and his adjutant, and holds them absolutely responsible for results.

There is no unity of practice in the constitution of larger units. Brigades vary according to circumstances from two regiments to four, and the composition of divisions fluctuates similarly. The custom in the German cavalry has been to form brigades of two regiments and divisions of three brigades, but this practice arose primarily from the system of recruiting and has no tactical advantage. The territory assigned to each army corps provides men and horses for two regiments of cuirassiers or lancers (classed as heavy in Germany), two of dragoons, and two of hussars, and since it is clearly essential to ensure uniformity of speed and endurance within those units most likely to have to work together, it was impossible to mix the different classes. But the views now current as to the tactical employment of cavalry contemplate the employment not only of divisions but of whole cavalry corps, forty to sixty squadrons strong, and these may be called on to fulfil the most various missions. The farthest and swiftest reconnaissances are the province of light cavalry, *i.e.* hussars, the most obstinate attack and defence of localities the task of dragoons, and the decisive charges on the battle-field essentially the duty of the heavy cavalry. It seems probable then that the brigade will become the highest unit the composition of which is fixed in peace, and that divisions and corps will be put together by brigades of uniform composition, and assigned to the several sections of the theatre of war in which each is likely to find the most suitable field for its special character. This was the case in the Frederician and Napoleonic epochs, when efficiency and experience in the field far outweighed considerations of administration and convenience in quarters.

Hitherto, horse artillery in Europe has always formed an integral portion of the divisional organization, but the system has never worked well, and in view of the technical evolution of artillery material is no longer considered desirable. As it is always possible to assign one or more batteries to any particular brigade whose line of march will bring it across villages, defiles, &c. (where the support of its fire will be essential), and on the battle-field itself responsibility for the guns is likely to prove more of a hindrance than a help to the cavalry commander, it is probable that horse artillery will revert to the inspection of its own technical officers, and that the sole tie which will be retained between it and the cavalry will be in the batteries being informed as to the cavalry units they are likely to serve with in war, so that the officers may make themselves acquainted with the idiosyncrasies of their future commanders. The same course will be pursued with the engineers and technical troops required for the cavalry, but it seems probable that, in accordance with a suggestion made by Moltke after the 1866 campaign, the supply columns for one or more cavalry corps will be held ready in peace, and specially organized to attain the highest possible mobility which modern technical progress can ensure.

The general causes which have led to the differentiation of cavalry into the three types—hussars, dragoons and heavy—have already been dealt with. Obviously big men on little horses cannot manœuvre side by side with light men on big horses. Also, since uniformity of excellence within the unit is the prime condition of efficiency, and the greatest personal dexterity is required for the management of sword or lance on horseback, a further sorting out became necessary, and the best light weights were put on the best light horses and called hussars, the best heavy weights on the best heavy horses and called lancers, the average of either type becoming dragoons and cuirassiers. In England, the lance not being indigenous and the conditions of foreign service making adherence to a logical system impossible, lancers are medium cavalry, but the difference of weights carried and type of horses is too small to render these distinctions of practical moment. In Germany, where every suitable horse

finds its place in the ranks and men have no right of individual selection, the distinctions are still maintained, and there is a very marked difference between the weights carried and the types of men and horses in each branch, though the dead weight which it is still considered necessary to carry in cavalries likely to manœuvre in large masses hardly varies with the weight of the man or size of the horse.

Where small units only are required to march and scout, the kit can be reduced to a minimum, everything superfluous for the moment being carried on hired transport, as in South Africa. But when 10,000 horses have to move by a single road all transport must be left miles to the rear, and greater mobility for the whole is attained by carrying upon the horse itself the essentials for a period of some weeks. Still, even allowing for this, it is impossible to account for the extraordinary load that is still considered necessary. In India, the British lancer, averaging 11 st. per man, could turn out in marching order at 17 st. 8 lb (less forage nets). In Germany, the hussar, averaging 10 st. 6 lb, rode at 18 st., also without forage, and the cuirassier at 21 st. to 22 st. Cavalry equipment is, in fact, far too heavy, for in the interests of the budgets of the departments which supply saddlery, harness, &c., everything is made so as to last for many years. Cavalry saddles fifty years old frequently remain in good condition, but the losses in horse-flesh this excessive solidity entails are ignored. The remount accounts are kept separately, and few realize that in war it is cheaper to replace a horse than a saddle. In any case, the armament alone of the cavalry soldier makes great demands on the horses. His sword and scabbard weigh about 4 lb, carbine or rifle 7 lb to 9 lb, 120 rounds of ammunition with pouches and belts about 12 lb, lance about 5 lb. and two days' forage and hay at the lowest 40 lb, or a gross total of 70 lb or 5 st., which with 11 st. for the man brings the total to 16 st.; add to this the lightest possible saddle, bridle, cloak and blanket, and 17 st. 8 lb is approximately the irreducible minimum. It may be imagined what care and management of the horses is required to enable them under such loads to manœuvre in masses at a trot, and gallop for distances of 5 m. and upwards without a moment for dismounting.

*Reconnaissance and Scouting.*—After 1870 public opinion, misled by the performances of the "ubiquitous Uhlan" and disappointed by the absence of great cavalry charges on the field of battle, came somewhat hastily to the conclusion that the day of "shock tactics" was past and the future of cavalry lay in acting as the eyes and ears of the following armies. But, as often happens, the fact was overlooked that the German cavalry screen was entirely unopposed in its reconnoitring expeditions, and it was not till long afterwards that it became apparent how very little these far-flung reconnaissances had contributed to the total success.

It has been calculated by German cavalry experts that not 1% of the reports sent in by the scouts during the advance from the Saar to the Meuse, August 1870, were of appreciable importance to the headquarters, and that before the orders based upon this evidence reached the front, events frequently anticipated them. Generally the conviction has asserted itself, that it is impossible to train the short-service soldiers of civilized nations sufficiently to render their reports worth the trouble of collating, and if a few cases of natural aptitude do exist nothing can ensure that these particular men should be sufficiently well mounted to transmit their information with sufficient celerity to be of importance. It is of little value to a commander to know that the enemy was at a given spot forty-eight hours previously, unless the sender of the report has a sufficient force at his disposal to compel the enemy to remain there; in other words, to attack and hold him. Cavalry and horse artillery alone, however, cannot economically exert this holding power, for, whatever their effect against worn-out men at the close of a great battle, against fresh infantry they are relatively powerless. Hence, it is probable that we shall see a revival of the strategic advanced guard of all arms; as in the Napoleonic days, which will not only reconnoitre, but fix the enemy until the army itself can execute the manœuvre designed to effect his destruction. The general situation of the

enemy's masses will, in western Europe, always be sufficiently fixed by the trend of his railway communications, checked by reports of spies, newspapers, &c., for, with neutral frontiers everywhere within a few hours' ride for a motor cyclist, anything approaching the secrecy of the Japanese in Manchuria is quite unattainable, and, once the great masses begin to move, the only "shadowing" which holds out any hope of usefulness is that undertaken by very small selected parties of officers, perfectly mounted, daring riders, and accustomed to cover distances of 100 m. and upwards. These will be supported by motor cars and advanced feelers from the field telegraphs, though probably the motor car would carry the eye-witness to his destination in less time than it would take to draft and signal a complete report.

Tactical scouting, now as always, is invaluable for securing the safety of the marching and sleeping troops, and brigade, divisional and corps commanders will remain dependent upon their own squadrons for the solution of the immediate tactical problem before them; but, since both sides will employ mounted men to screen their operations, intelligence will generally only be won by fighting, and the side which can locally develop a marked fire superiority will be the more likely to obtain the information it requires. In this direction the introduction of the motor car and of cyclists is likely to exercise a most important influence, but, whatever may be the conveyance, it must be looked upon as a means of advance only, never of retreat. The troops thus conveyed must be used to seize villages or defiles about which the cavalry and guns can manoeuvre.

**Formations and Drill.**—Cavalry, when mounted, act exclusively by "shock" or more precisely by "the threat of their shock," for the immediate result of collision is actually decided some instants before this collision takes place. Experience has shown that the best guarantee for success in this shock is afforded by a two-deep line, the men riding knee to knee within each squadron at least. Perfect cavalry can charge in larger bodies without intervals between the squadrons, but, ordinarily, intervals of about 10 yds. between adjacent squadrons are kept to localize any partial unsteadiness due to difficulties of ground, casualties, &c. The obvious drawbacks of a two-deep line are that it halves the possible extent of front, and that if a front-rank horse falls the rear-rank horse generally tumbles over it also. To minimize the latter evil, the charge in two successive lines, 150 to 200 yds. apart, has often been advocated, but this has never stood the test of serious cavalry fighting; first, because when squadrons are galloping fast and always striving to keep the touch to the centre, if a horse falls the adjacent horses close in with such force that their sidelong collision may throw down more and always creates violent oscillation; and secondly, because owing to the dust raised by the first rank the following one can never maintain its true direction. It is primarily to avoid the danger and difficulty arising from the dust that the ranks in manoeuvre are closed to within one horse's length, as, when moving at speed, the rear rank is past before the dust has time to rise.

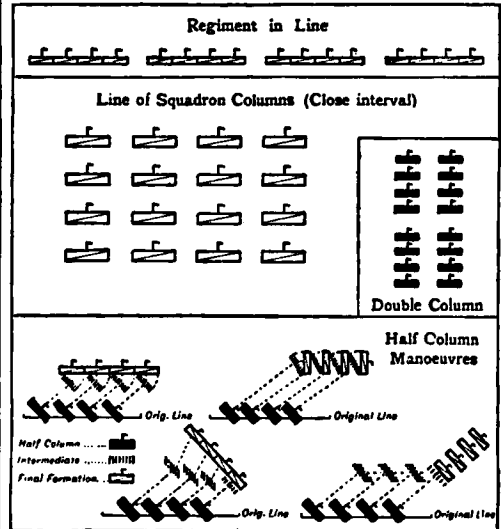

Of all formations, the line is the most difficult to handle, and, particularly, to conceal—hence various formations in column are necessary for the preliminary manoeuvres requisite to place the squadrons in position for the final deployment previous to the charge. Many forms of these columns have been tried, hut, setting aside the columns intended exclusively for marching along roads, of which "sections" (four men abreast) is most usual in England, only these survive:—

- Squadron column.
- Double column of squadrons.
- Half column.

In *squadron column*, the troops of the squadron formed are in line one behind the other at a distance equal to the front of the troop in line. The ideal squadron consists of 128 men formed in two ranks giving 64 files, and divided into four troops of 16 files—a larger number of troops makes the drill too complicated, a smaller number makes each troop slow and unhandy. When the squadron is weak, therefore, the troop should still be maintained as near 16 files as possible, the number of troops being if

necessary reduced. Thus with only 32 files, two troops of 16 files would be better than four of only 8 files.

All other formations of the regiment or brigade are fundamentally derived from the squadron column, only varying with the order in which the squadrons are grouped, and the intervals which separate them. Thus the regiment may move in *line of squadron columns* at close interval, *i.e.* 11 paces apart or in *double column* as in the diagram. To form *line* for the charge, the squadrons open out, still in column, to full interval, *i.e.* the width they occupy when in line; and then on the command "Line to the front," each troop moves up to its place in line as shown in the diagram. When in line a large body of cavalry can no longer vary its direction without sacrificing its appearance of order, and as above pointed out, it is this appearance of order which really decides the result of the charge before the actual collision. Since, however, the enemy's movements may compel a change, an intermediate formation is provided, known as the

"half column." When this formation is ordered, the troops within each squadron wheel half right or left, and each squadron is then able to form into column or line to the front as circumstances demand, or the whole line can be formed into column of troops by continuing the wheel and in this formation gallop out into a fresh direction, re-forming line by a simple wheel in the shortest possible time.

**CAVAN**, a county in the province of Ulster, Ireland, bounded N. by Fermanagh and Monaghan, E. by Monaghan and Meath, S. by Meath, Westmeath and Longford, and W. by Longford and Leitrim. The area is 477,390 acres, or about 746 sq. m. The surface of the county is uneven, consisting of hill and dale, without any great extent of level ground, but only in its northern extremity attaining a mountainous elevation. The barony of Tullyhaw, bordering on Fermanagh, a wild dreary mountain district, known as the kingdom of Glan or Glengavlin, contains the highest land in the county, reaching 2188 ft. in Cuilcagh, the place of inauguration for the Maguire, chieftains of Fermanagh, held in veneration by the peasantry, in connexion with legends and ancient superstitions. The remainder of the county is not deficient in wood, and contains numerous lakes, generally of small dimensions, but of much beauty, especially Lough Oughter, with its many inlets and islands formed by the Erne river, between the towns of Cavan and Killashandra. The county also shares with other counties the waters of Lough Gowna and Lough Sheelin, in which, as elsewhere in the county, the fishing is good. The chief river in the county is the Erne, which originates in Lough Scrabby, one of the minor sheets of water communicating with Lough Gowna on the borders of Longford. The river takes a northerly direction by Killashandra and Belturbet, being enlarged during its course by the Annalee and other smaller streams, and finally enters Lough Erne near the northern limit of the county. The other waters, consisting of numerous lakes and their connecting streams, are mostly tributary to the Erne. A copious spring called the Shannon Pot, at the foot of the Cuilcagh Mountain, in the barony of Tullyhaw, is regarded as the source of the river Shannon. The Blackwater, a tributary of the Boyne, also rises in this county, near Bailieborough. Several mineral springs exist in this county, the chief of which is near the once frequented village of Swanlinbar. In the neighbourhood of Belturbet, near the small lake of Annagh, is a carbonated chalybeate spring. There are several other springs of less importance; and the small Lough Leighs, or Lough-an-Leighaghs, which signifies the healing lake, on the summit of a mountain between Bailieborough and Kingscourt, is celebrated for its antiscorbutic properties. The level of this lake never varies. It has no visible supply nor vent for its discharge; nor is it ever frozen during the severest winters.

*Geology*.—This elongated county includes on the north-west some of the highland of Millstone Grit and Coal-Measures that rises above Lough Allen. The beds below these are referred to the English Varadale series, and include some flaggy sandstones. It is on this series that the Shannon rises, under the high outlier of grit on Cuilcagh. The Carboniferous Limestone then stretches down to Cavan town, a bold outlier of the higher strata being left above Bailieconnell. The river Erne forms, in the limestone area, a characteristic series of expansions and loops, with islands between them, known as Lough Oughter. At this point we pass on to the axis of underlying Silurian strata that runs from Longford to Donaghadee in Co. Down, and the country becomes hilly and irregular, culminating about Cross Keys on the old Dublin coach-road. A patch of granite, indicating doubtless a core like that exposed at Newry, is seen in a hollow at Crossdonny. On the south side of this axis of older rocks, we reach Carboniferous shale and limestone at Lough Sheelin, and here enter on the great central plain. The extreme south-east of the county includes part of the Triassic outlier of Kingscourt. The coal-seams and concretions of clay-ironstone in the north-west area resemble those mentioned under the head of

Co. Roscommon. Anthracite, probably of inorganic origin, has been mined without permanent success in the Silurian beds near Kilmaleck, and is traceable freely, associated with veins of quartz and haematite, at Ballyjamesduff a little farther east.

*Climate and Industries*.—The climate suffers from the dampness arising from the numerous lakes and the nature of the soil, and from the boisterous winds which frequently prevail, more especially in the higher districts. The soil is generally a stiff clay, cold and watery, but capable of much improvement by drainage, for which its undulating surface affords facilities. Only about one-sixteenth of the total area is quite barren. Agriculture makes little progress; the extent of the farms being generally small. Oats and potatoes are the principal crops. Flax, once of some importance, is almost neglected. In the mountainous parts, however, where the land is chiefly under grazing, the farms are larger, and in stock-raising the county is progressing.

Cavan is not a manufacturing county. The bleaching of linen and the distillation of whisky are both carried on to a small extent, but the people are chiefly employed in agricultural pursuits and in the sale of home produce. The soil in those districts not well adapted for tillage is peculiarly favourable for trees. The woods were formerly very considerable, and the timber found in the bogs is of large dimensions; but plantations are now chiefly found in demesnes, where they are extensive.

The county is not well served by railways. The Great Northern from Clones to Cavan, and the Midland Great Western from Mullingar in Westmeath to Cavan, form a through line from north to south. The Great Northern has branches to Belturbet from Ballyhaise, and to Cootehill from Ballybay; the Midland Great Western has a branch to Killashandra, and from Navan in Meath to Kingscourt, just within Cavan. The Cavan & Leitrim railway starts from Belturbet and soon leaves the county to the west.

*Population and Administration*.—The population (111,917 in 1891; 97,541 in 1901), of which about 80% are Roman Catholics, shows a decrease among the most serious of the Irish counties, and emigration returns are among the heaviest. The population is almost wholly rural, the only towns being the small ones of Cavan (pop. 2822, the county town), Cootehill (1509), Belturbet (1587) and Bailieborough (1004). The county is divided into eight baronies, and contains thirty-two parishes and parts of parishes. It is almost entirely within the Protestant and Roman Catholic dioceses of Kilmore. The assizes are held at Cavan, and quarter sessions are held at Cavan, Bailieborough, Cootehill and Bailieconnell. Before the Union the county returned six members to the Irish parliament, two for the county at large, and two for each of the boroughs of Cavan and Belturbet; but since that period it has been represented in the imperial parliament by two members only, for the east and west divisions.

*History and Antiquities*.—At the period of the English settlement, and for some centuries afterwards, this district was known as the Brenny, being divided between the families of O'Rourke and O'Reilly; and its inhabitants, protected by the nature of the country, long maintained their independence. In 1579 Cavan was made shire ground as part of Connaught, and in 1584 it was formed into a county of Ulster by Sir John Perrott, and subdivided into seven baronies, two of which were assigned to Sir John O'Reilly and three to other members of the family; while the two remaining, possessed by the septs of Mackernon and Magauran, and situated in the mountains bordering on O'Rourke's country, were left subject to their ancient tenures and the exactions of their Irish lord. The county subsequently came within the scheme for the plantation of Ulster under James I. The population is less mixed in race than in most parts of Ulster, being generally of Celtic extraction. Some few remains of antiquity remain in the shape of cairns, raths and the ruins of small castles, such as Cloughoughter Castle on an island (an ancient crannog) of Lough Oughter. Three miles from the town of Cavan is Kilmore, with its cathedral, a plain erection containing a Romanesque doorway brought from the abbey of Trinity Island, Lough Oughter. The bishopric dates

from about 1450. A portion of a round tower is seen in the churchyard of the parish of Drumlane at Belturbet.

**CAVAN**, a market-town and the county town of Co. Cavan, Ireland, near the centre of the county, in the west parliamentary division, 85½ m. N.W. of Dublin by the Midland Great Western railway, and the terminus of a branch of the Great Northern railway from Clones. Pop. of urban district (1901), 2822. It is on one of the tributary streams of the Annalee river, in a broad valley surrounded on every side by elevated ground, with picturesque environs, notably the demesnes of Farnham and of Kilmore, which belongs to the bishops of that diocese. Cavan has no buildings of antiquarian interest, but the principal county institutions are here, and the most conspicuous building is the grammar school, founded by Charles I. It was rebuilt in 1819 on an eminence overlooking one of the main entrances into the town, and is capable of accommodating 100 resident pupils. The college of St Patrick is near the town. Cavan has some linen trade, and a considerable retail business is transacted in the town. A monastery of Dominican friars, founded by O'Reilly, chieftain of the Brenny, formerly existed here, and became the burial-place of the celebrated Irish general, Owen O'Neill, who died as is supposed by poison, in 1649, at Cloughoughter. There was also the castle of the O'Reillys, but this and all other antiquities of the town were swept away during the violent and continuous feuds to which the country was subjected. In 1690 the chief portion of the town was burned by the Enniskilleners under General Wolsely, when they routed a body of James II.'s troops under the duke of Berwick.

**CAVANILLES, ANTONIO JOSÉ** (1745-1804), Spanish botanist, was born at Valencia on the 16th of January 1745. He was educated at the university of that town, and in 1777 went to Paris, where he resided twelve years, engaged in the study of botany. In 1801 he became director of the botanic gardens at Madrid, where he died on the 4th of May 1804. In 1785-1786 he published *Monadelphia Classis Dissertationes X.*, and in 1791 he began to issue *Icones et descriptiones plantarum Hispaniae*.

His nephew, **ANTONIO CAVANILLES** (1805-1864), was a distinguished advocate, and the author of a history of Spain, published at Madrid in 1860-1864.

**CAVATINA** (Ital. diminutive of *cavata*, the producing of tone from an instrument, plural *cavatine*), originally a short song of simple character, without a second strain or any repetition of the air. It is now frequently applied to a simple melodious air, as distinguished from a brilliant aria, recitative, &c., and often forms part of a large movement or *scena* in oratorio or opera.

**CAVE, EDWARD** (1691-1754), English printer, was born at Newton, Warwickshire, on the 27th of February 1691. His father, Joseph Cave, was of good family, but the entail of the family estate being cut off, he was reduced to becoming a cobbler at Rugby. Edward Cave entered the grammar school of that town, but was expelled for robbing the master's hen-roost. After many vicissitudes he became apprentice to a London printer, and after two years was sent to Norwich to conduct a printing house and publish a weekly paper. While still a printer he obtained a place in the post office, and was promoted to be clerk of the franks. He was at this time engaged in supplying London newspapers to various county papers; and his enemies, who had twice summoned him before the House of Commons for breach of privilege, now accused him of opening letters to obtain his news, and he was dismissed the service. With the capital which he had saved, he set up a small printing office at St John's Gate, Clerkenwell, which he carried on under the name of R. Newton. He had long formed a scheme of a magazine "to contain the essays and intelligence which appeared in the two hundred half-sheets which the London press then threw off monthly," and had tried in vain to persuade some publisher to take it up. In 1731 he himself put it into execution, and began the *Gentleman's Magazine* (see PERIODICALS), of which he was the editor, under the pseudonym "Sylvanus Urban, Gent." The magazine had a large circulation and brought a fortune to the projector. In 1732 he began to issue reports of the debates in both Houses

of Parliament. He commissioned friends to note the speeches, which he published with the initial and final letters of personal names. In 1738 Cave was censured by parliament for printing the king's answer to an address before it had been announced by the speaker. From that time he called his reports the debates of a "parliament in the empire of Lilliput" (see REPORTING). To piece together and write out the speeches for this publication was Samuel Johnson's first literary employment. In 1747 Cave was reprimanded for publishing an account of the trial of Lord Lovat, and the reports were discontinued till 1752. He died on the 10th of January 1754. Cave published Dr Johnson's *Rambler*, and his *Irene*, *London and Life of Savage*, and was the subject of a short biography by him.

**CAVE, WILLIAM** (1637-1713), English divine, was born at Pickwell in Leicestershire. He was educated at St John's College, Cambridge, and successively held the livings of Islington (1662), of All-Hallows the Great, Thames Street, London (1679), and of Isleworth in Middlesex (1690). Dr Cave was chaplain to Charles II., and in 1684 became a canon of Windsor. The two works on which his reputation principally rests are the *Apostolici*, or History of Apostles and Fathers in the first three centuries of the Church (1677), and *Scriptorum Ecclesiasticorum Historia Literaria* (1688). The best edition of the latter is the Clarendon Press, 1740-1743, which contains additions by the author and others. In both works he was drawn into controversy with Jean le Clerc, who was then writing his *Bibliothèque universelle*, and who accused him of partiality. He wrote several other works of the same nature which exhibit scholarly research and lucid arrangement. He is said to have been a good talker and an eloquent preacher. His death occurred at Windsor on the 4th of July 1713.

**CAVE** (Lat. *cavea*, from *cavus*, hollow), a hollow extending beneath the surface of the earth. The word "cavern" (Lat. *caverna*) is practically a synonym, though a distinction is sometimes drawn between sea caves and inland caverns, but the term "cave" is used here as a general description. Caves have excited the awe and wonder of mankind in all ages, and have been the centres round which have clustered many legends and superstitions. They were the abode of the sibyls and the nymphs in Roman mythology, and in Greece they were the temples of Zeus, Pan, Dionysus, Pluto and the Moon, as well as the places where the oracles were delivered at Delphi, Corinth and Mount Cithaeron. In Persia they were connected with the obscure worship of Mithras. Their names frequently are survivals of the superstitious ideas of antiquity, as, for example, the Fairy, Dragon's, or Devil's Caves of France and Germany. Long after the Fairies and Little Men had forsaken the forests and glens of Germany, they dwelt in their palaces deep in the Harz Mountains, in the Dwarfholes, &c., whence they came from time to time into the upper air.

The Seven Sleepers of Ephesus slept their long sleep in a cave. The hills of Granada are still believed by the Moorish children to contain the great Boabdil and his sleeping host, who will awake, when an adventurous mortal invades their repose, to restore the glory of the Moors in Spain.

Caves have been used in all ages by mankind for habitation, refuge and burial. In the Old Testament we read that when Lot went up out of Zoar he dwelt in a cave with his two daughters. The five kings of the Canaanites took refuge from Joshua, and David from Saul, in the caves of Palestine, just as the Aquitani fled from Caesar to those of Auvergne, and the Arabs of Algeria to those of Dahra, where they were succoured by Marshal Pelissier in 1845. In Central Africa David Livingstone discovered vast caves in which whole tribes found security with their cattle and household stuff.

The cave of Machpelah may be quoted as an example of their use as sepulchres, and the rock-hewn tombs of Palestine and of Egypt and the Catacombs of Rome probably owe their existence to the ancient practice of burial in natural hollows in the rock. We might therefore expect to find in them most important evidence as to the ancient history of mankind, which would reach long beyond written record; and since they have always

been used by wild beasts as lairs we might reasonably believe also that their exploration would throw light upon the animals which have in many cases disappeared from the countries which they formerly inhabited. The labours of Buckland, Pengelly, Falconer, Lartet and Christy, and Boyd Dawkins have added an entirely new chapter to the history of man in Europe, as well as established the changes that have taken place in the European fauna. The physical history of caves will be taken first, and we shall then pass on to the discoveries relating to man and the lower animals which have been made in them of late years.

*Physical History.*—The most obvious agent in hollowing out caves is the sea. The set of the currents, the force of the breakers, the grinding of the shingle inevitably discover the weak places in the cliff, and leave caves as one of the results of their work, modified in each case by the local conditions of the rock. Those formed in this manner are easily recognized from their floors being rarely much out of the horizontal; their entrances are all in the same plane, or in a succession of horizontal and parallel planes, if the land has been elevated at successive times. From their inaccessible position they have been rarely occupied by man. Among them Fingal's Cave, on the island of Staffa, off the south-west coast of Scotland, hollowed out of columnar basalt, is perhaps the most remarkable in Europe. In volcanic regions also there are caves formed by the passage of lava to the surface of the ground, or by the expansion of steam and gases in the lava while it was in a molten state. They have been observed in the regions round Vesuvius and Etna, in Iceland and Teneriffe. We may take as an example the Grotto del Cane ("cave of the dog"), near Pozzuoli, a few miles to the south-west of Naples, remarkable for the flow of carbonic acid from crevices in the floor, which fills the lower part of the cave and suffocates any small animal, such as a dog, immersed long enough in it.

The most important class of caves, however, and that which immediately demands our notice, is that composed of those which have been cut out of calcareous rocks by the action of carbonic acid in the rain-water, combined with the mechanical friction of the sand and stones set in motion by the streams which have, at one time or another, flowed through them. They occur at various levels, and are to be met with wherever the strata are sufficiently compact to support a roof. Those of Brixham and Torquay and of the Eifel are in the Devonian limestone; those of Wales, Somerset, the Pennine chain, Ireland, the central and northern counties of Belgium, Saxony, and Westphalia, of Maine and Anjou, of Virginia and Kentucky, are in that of the Carboniferous age. The cave of Kirkdale in Yorkshire, and most of those in Franconia and Bavaria, penetrate Jurassic limestones. The Neocomian and Cretaceous limestones contain most of the caverns of France, rendered famous by the discovery of the remains of the cave-men along with the animals which they hunted; as well as those of the Pyrenees, the Alps, Sicily, Greece, Dalmatia, Carniola and Palestine. The cave of Lunelviel near Montpellier is the most important of those which have been hollowed in limestones of the Tertiary age. They are also met with in rocks composed of gypsum; in Thuringia, for example, they occur in the saliferous and gypseous strata of the Zechstein, and in the gypseous Tertiary rocks of the neighbourhood of Paris, as, for example, at Montmorency.

Caves formed by the action of carbonic acid and the action of water are distinguished from others by the following characters. They open on the abrupt sides of valleys and ravines at various levels, and are arranged round the main axes of erosion, just as the branches are arranged round the trunk of a tree. In a great many cases the relation of the valley to the ravine, and of the ravine to the cave, is so intimate that it is impossible to deny that all three have been produced by the same causes. The caves themselves ramify in the same irregular fashion as the valleys, and are to be viewed merely as the capillaries in the general valley system through which the rain passes to join the main channels. Sometimes, as in the famous caves of Adelsberg, Kentucky, Wooky Hole in Somersetshire, the Peak in Derbyshire, and in many in the Jura, they are still the passages of subterranean streams; but very frequently the drainage has found an outlet at a lower

level, and the ancient watercourses have been deserted. These in every case present unmistakable proof that they have been traversed by water in the sand, gravel and clay which they contain, as well as in the worn surfaces of the sides and bottom. In all districts where there are caves there are funnel-shaped depressions of various sizes called pot-holes or swallow-holes, or bétaires, "chaldrons du diable," "marmites des géants," or "katavothra," in which the rain is collected before it disappears into the subterranean passages. They are to be seen in all stages, some being mere hollows which only contain water after excessive rain, while others are profound vertical shafts into which the water is continually falling. Gaping Ghyll, 330 ft., and Hell's Pot in Yorkshire, 300 ft. deep, are examples of the latter class. The *cirques* described by M. Desnoyers belong to the same class as the swallow-holes.

The history of swallow-holes, caves, ravines and valleys in calcareous strata may be summed up as follows:—The calcareous rocks are invariably traversed by joints or lines of shrinkage, which are lines of weakness by which the direction of the drainage is determined; and they are composed to a large extent of carbonate of lime, which is readily exchanged into soluble bicarbonate by the addition of carbonic acid. The rain in its passage through the air takes up carbonic acid, and it is still further charged with it in percolating through the surface soil in which there is decomposing vegetable matter. As the raindrops converge towards some one point, determined by some local accident on the surface, and always in a line of joint, the carbonic acid attacks the carbonate of lime with which it comes into contact, and thus a funnel is gradually formed ending in the vertical joint below. Both funnel and vertical joint below are being continually enlarged by this process. This chemical action goes on until the free carbonic acid is used up. The subterranean passages are enlarged in this manner, and what was originally an insignificant network of fissures is developed into a series of halls, sometimes as much as from 80 to 100 ft. high. These results are considerably furthered by the mechanical friction of the pebbles and sand hurried along by the current, and by falls of rock from the roof produced by the removal of the underlying strata. In many cases the results of this action have produced a regular subterranean river system. The thick limestones of Kentucky, for example, are traversed by subterranean waters which collect in large rivers, and ultimately appear at the surface in full power. The river Axe, near Wells, the stream flowing out of the Peak Cavern at Castleton, Derbyshire, that at Adelsberg in Carniola, flow out of caverns in full volume. The river Styx and the waters of Acheron disappear in a series of caverns which were supposed to lead down to the infernal regions.

If the direction of the drainage in the rock has been altered, either by elevations such as those with which the geologist is familiar, or by the opening out of new passages at a lower level, these watercourses become dry, and present us with the caves which have afforded shelter to man and the wild animals from the remotest ages, sometimes high up on the side of a ravine, at other times close to the level of the stream at the bottom.

Caves, as a general rule, are as little effected by disturbances of the rock as the ravines and valleys, which have been formed, in the main, irrespective of the lines of fault or dislocation.

We must now examine what happens to the bicarbonate of lime which has been formed by the action of the acid on the limestone. If a current of air play upon the surface of the water, the carbonic acid, which floats up the lime, so to speak, is given off and the insoluble carbonate is deposited, and as a result of this action we have the elaborate and fantastic stony incrustations termed stalactites and stalagmites. The water percolating through the rock covers the sides of the cavern with a stalactitic drapery, and if a line of drops persistently falls from the same point to the floor, the calcareous deposit gradually descends from the roof, forming in some cases stony tassels, and in others long columns which are ultimately united to the calcareous boss formed by the splash of the water on the floor. The surface also of the pools is sometimes covered over with an ice-like sheet of stalagmite, which shoots from the sides, and sometimes forms a

solid and firm floor when the water on which it was supported has disappeared. Sometimes the drops form a little calcareous basin, beautifully polished inside, which contains small pearl-like particles of carbonate of lime, polished by friction one against the other. The most beautiful stalactitic caves in Great Britain are those of Cheddar in Somerset, Caldý Island and Poole's Cavern at Buxton. A portion only of the carbonate of lime is thus deposited in the hollows of the rock from which it was taken; the rest is carried into the open air by the streams, in part deposited on the sides and bottom, forming tufa and the so-called petrifications, and partly being conveyed down to the sea to be ultimately secreted in the tissues of the Mollusca, Echinodermata and Foraminifera. Through these it is again collected in a solid form, and in the long course of ages it is again lifted up above the level of the water as limestone rock, and again undergoes the same series of changes. Thus the cycle of carbonate of lime is a never-ending one from the land to the ocean, from the ocean to the land, and so it has been ever since the first stratum of limestone was formed out of the remains of the animals and plants of the sea. The rate of the accumulation of stalagmite in caverns is necessarily variable, since it is determined by the presence of varying currents of air. In the Ingleborough cavern a stalagmite, measured in 1839 and in 1873, is growing at the rate of .2946 in. per annum. It is obvious, therefore, that the vast antiquity of deposits containing remains of man underneath layers of stalagmite cannot be inferred from a thickness of a few inches or even of a few feet.

The intimate relation which exists between caves and ravines renders it extremely probable that many of the latter have been originally subterranean watercourses, which have been unroofed by the degradation of the rock. In all limestone districts ravines are to be found continued in the same direction as the caves, and the process of atmospheric erosion may be seen in the fallen blocks of stone which generally are to be met with at the mouths of the caverns. In illustration of this the valley and caves of Weathercote, in Yorkshire, may be quoted, or the source of the Axe at Wookey; and the ravine formed in this way has very frequently been widened out into a valley by the action of subaerial waste, or by the grinding of glaciers through it during the glacial stage of the Pleistocene period.

For further details as to the physical history of caverns we must refer the reader to the works quoted at the end of this article, by E. A. Martel, the intrepid explorer of most of the large European caves, including those of Great Britain and Ireland. The history of the *Glaciers* or ice-caves will be found in Browne's *Ice Caves in France and Switzerland*.

**Classification.**—The caves which have offered shelter to the *mammalia* are classified according to their contents, and are of various ages, ranging from the Pliocene to the present day.

(1) Those containing the Pliocene *mammalia* belong to that age. (2) Those with the remains of the mammoth, woolly rhinoceros and other extinct species, or with paleolithic man (see ARCHAEOLOGY), are termed Pleistocene. These are sometimes called Quaternary, under the mistaken idea that they belong to an age succeeding the Tertiary period. (3) Those which contain the remains of the domestic animals in association with the remains of man either in the Neolithic, Bronze or Iron stages of civilization are termed Prehistoric. (4) The fourth group consists of those which can be brought into relation with the historic period, and are therefore termed Historic.

**The Pliocene Caves.**—It is a singular fact, only to be explained by the vast denudation of the earth's surface since the Pliocene Age, that only one cave referable to that age has as yet been discovered, that at Doveholes near Buxton, Derbyshire, described by Boyd Dawkins in 1903 (*Quart. Journ. Geol. Soc.*). The cave consists of a large horizontal chamber and a small passage, connected with a swallow-hole close by, and exposed in the working face of a quarry in 1901, at a depth of about 40 ft. from the surface. The locality is in the limestone plateau, 1158 ft. high, which forms the divide between the waters flowing into the Mersey on the west and the Humber on the east. Both swallow-hole and cave were completely blocked up with débris, and the

latter was filled with red and yellow clay, horizontally stratified and containing pebbles of sandstone from the neighbouring ridge of Axe Edge, and bones and teeth of fossil mammals, some waterworn and others without traces of transport by water. All the mammals belong to well-known species found in the Pliocene strata of East Anglia, and in Auvergne and Italy. Among them were the sabre-toothed lion (*Machairodus crenatidens*), the hyena of Auvergne, the mastodon, and the southern elephant (*E. meridionalis*), and rhinoceros (*R. Etruscus*), and Steno's horse. Most of the bones had evidently been gnawed by hyenas and accumulated in one of their dens, and had afterwards been carried by water into the chambers deep down in the rock, where they were found. Since that time the general level of the district has been lowered by denudation to an extent of more than 230 ft., and all the hyena dens destroyed with the Pliocene surface not only in this district but generally over the world. In this case a covering of limestone some 270 ft. thick, including the depth from the present surface, protected the remains from the denuding forces.

**The Pleistocene Caves.**—The search after *ebur fossile* or unicorns' horn, or in other words the fossil bones which ranked high in the *materia medica* of the 16th and 17th centuries, led to the discovery of the ossiferous caverns of the Harz Mountains, and of Hungary and Franconia. The famous cave of Gailenreuth in the last of these districts was explored by Goldfuss in 1810. The bones of the hyena, lion, wolf, fox and stag, which it contained, were identified by Baron Cuvier, and some of the skulls have been proved by Buak to belong to the grizzly bear. They were associated with the bones of the reindeer, horse and bison, as well as with those of the great cave bear. These discoveries were of very great interest, because they established the fact that the above animals had lived in Germany in ancient times. The first bone cave systematically explored in England was one at Oreston near Plymouth in 1816, which proved that an extinct species of rhinoceros (*R. leptorhinus*) lived in that district. Four years later the famous hyena den at Kirkdale in Yorkshire was explored by Buckland. He brought forward proof that it had been inhabited by hyenas, and that the broken and gnawed bones of the mammoth, rhinoceros, stag, bison and horse belonged to animals which had been dragged in for food. He pointed out that all these animals had lived in Yorkshire in ancient times, and that it was impossible for the carcasses of the rhinoceros, hyena and mammoth to have been floated from tropical regions into the places where he found their bones. He subsequently investigated bone caves in Derbyshire, South Wales and Somerset, as well as in Germany, and published his *Reliquiæ Diluvianæ* in 1822, a work which laid the foundations of the new science of cave-hunting in this country. The well-known cave of Kent's Hole near Torquay furnished McEnery, between the years 1825 and 1841, with the first flint implements discovered in intimate association with the bones of extinct animals. He recognized the fact that they proved the existence of man in Devonshire while those animals were alive, but the idea was too novel to be accepted by his contemporaries. His discoveries have since been verified by the subsequent investigations carried on by Godwin Austen, and ultimately by the committee of the British Association, which worked for several years under the guidance of Pengelly. There are four distinct strata in the cave. 1st. The surface is composed of dark earth, and contains medieval remains, Roman pottery and articles which prove that it was in use during the Iron, Bronze and Neolithic Ages. 2nd. Below this is a stalagmite floor, varying in thickness from 1 to 3 ft., and covering (3rd) the red earth, which contained bones of the hyena, lion, mammoth, rhinoceros and other animals, in association with flint implements and an engraved antler, which proved man to have been an inhabitant of the cavern during the time of its deposition. 4th. Filling the bottom of the cave is a hard breccia, with the remains of bears and flint implements, in the main ruder than those found above; in some places it was no less than 12 ft. thick. The most remarkable animal found in Kent's Hole is the sabre-toothed carnivore, *Machairodus laidensis* of Owen. While the value of McEnery's discoveries was in dispute the

exploration of the cave of Brixham near Torquay in 1858 proved that man was coeval with the extinct mammalia, and in the following year additional proof was offered by the implements that were found in Wookey Hole. Similar remains have been met with in the caves explored since that time in Wales, and in England as far north as Derbyshire (Creswell), proving that palaeolithic man hunted the mammoth and rhinoceros and other extinct animals over the whole of southern and middle England.

The discoveries in Kent's Hole and in the Creswell caves prove further that palaeolithic man was in two stages of civilization—the ruder or riverdrift man, with implements of the type found in the river gravels (see ARCHAEOLOGY; and PALAEO-LITHIC) being the older; and the more highly advanced, or the cave-man, mainly characterized by the better implements, and a singular facility in depicting animal life (as shown by the figure of a horse incised on the fragment of a bone found in the Creswell caves), being the newer. We may also conclude from the absence of palaeolithic implements from the glaciated regions in which most of these caves occur, that both riverdrift and cave-men dwelt in middle and northern Britain in the pre-glacial age, their remains being protected in the caverns from the denuding forces that removed all traces of their existence from the surface of the ground in glacial and post-glacial times. The riverdrift man is, however, proved to be post-glacial in southern and eastern England, by the occurrence of his implements in the river gravels of that age. Both these peoples inhabited southern England and the continent before and after the glacial period. The riverdrift man, whose implements occur in river deposits in middle and southern Europe, in Africa, Palestine and Hindustan, is everywhere in the same age of primitive barbarism, and has not as yet been identified with any living race. The cave-men are in a higher and more advanced stage, and led a life in Europe identical with that of the Eskimos in the Arctic regions.

*The Pleistocene Caves of the European Continent.*—The researches of Mortillet have proved that the same two groups of cave-dwellers occur in the caves of France, the older being represented by the Chelléen and Moustérien sections, and the newer by that of Solutré and La Madeleine. To the former belong the human remains found in the caverns of Spy and Neanderthal, which prove that the riverdrift man had "the most brutal of all known human skulls." To the latter we must assign all the caves and rock-shelters of Périgord, with the better implements, explored by Lartet and Christy in 1863-1864 in the valleys of the Vézère and Dordogne. These offer as vivid a picture of the life of the cave-men as that revealed of Italian manners in the 1st century by the buried cities of Herculaneum and Pompeii. The old floors of human occupation consist of broken bones of animals killed in the chase, mingled with rude implements and weapons of bone and unpolished stone, and with charcoal and burnt stones, which indicate the position of the hearths. Flakes without number, awls, lance-heads, hammers and saws made of flint rest *êle-mêle* with bone needles, sculptured reindeer antlers, arrowheads and harpoons, and bones of the reindeer, bison, horse, ibex, Saiga antelope and musk sheep. These singular accumulations of débris mark the places where the ancient hunters lived, and are merely the refuse cast aside. The reindeer formed by far the greater portion of the food, and must have lived in enormous herds at that time in the centre of France. From this, as well as from the presence of the most arctic of the herbivores, the musk sheep, we may infer the severe climate of that portion of France at that time. Besides these animals the cave bear and lion have been met with in one, and the mammoth in five localities, and their remains bear marks of cutting or scraping which showed they fell a prey to the hunters. The most remarkable remains left behind in these refuse heaps are the sculptured reindeer antlers and figures engraved on fragments of schist and on ivory. A well-defined outline of an ox stands out boldly from one piece of antler; a second represents a reindeer kneeling down in an easy attitude with his head thrown up in the air so that the antlers rest on the shoulders, and the back forms an even surface for a handle, which is too small to be grasped by an ordinary European hand;

in a third a man stands close to a horse's head, and on the other side of the same cylinder are two heads of bisons drawn with sufficient clearness to ensure recognition by any one who has seen that animal. On a fourth the natural curvature of one of the tines has been taken advantage of by the artist to engrave the bead and the characteristic recurved horns of the ibex; and on a fifth horses are represented with large heads, upright dishevelled manes and shaggy ungrooved tails. The most striking figure is that of the mammoth engraved on a fragment of its own tusk; the peculiar spiral curvature of the tusk and the long mane, which are now not to be found in any living elephant, prove that the original was familiar to the eye of the artist. These drawings probably employed the idle hours of the hunter, and hand down to us the scenes which he witnessed in the chase. They are full of artistic feeling and are evidently drawn from life. The mammoth is engraved in its own ivory, and the reindeer and the stag on their respective antlers. Further researches have revealed the fact that in Auvergne and in the Pyrenees the cave-men ornamented some of their caves with incised figures and polychrome frescoes of the wild animals. Rivière has discovered on the walls of the grotto of La Mouthe (Dordogne) three large hunting scenes, one with bisons and horses, a second representing a primitive hut, a bison, reindeer, ibex and mammoth, and a third with a mammoth, hinds and horses. In the Pyrenees similar frescoes have been described by Cartailhat and Breuil. They are on the walls of the cavern and roof of Altamira, and on the walls of Marsoulas. The outlines have been engraved first, and afterwards filled in with colour in brown and red ochre and black oxide of manganese.

The cave-men ranged over middle Europe as far south as the Pyrenees and the Alps, and inhabited the caverns of Belgium and Germany, Hungary and Switzerland. Their remains have not as yet been met with in southern Europe. They lived by hunting and fishing, they were fire users, and lit up the darkness of their caves with stone lamps filled with fat (Altamira). They were clad in skins sewn together with sinews of reindeer or strips of intestines. They used huts as well as caves for habitation. They had a marvellous facility for drawing animal figures. They possessed no domestic animals, nor were they acquainted with spinning or with the potter's art. We have no evidence that they buried their dead—the interments, such as those of Aurignac, Les Eyzies and Mentone, most probably belonging to a later age.

If these remains be compared with those of existing races, it will be found that the cave-men were in the same hunter stage of civilization as the Eskimos, and that they are unlike any other races of hunters. If they were not allied to the Eskimos by blood, there can be no doubt that they handed down to the latter their art and their manner of life. The bone needles, and many of the harpoons, as well as the flint spearheads, arrowheads and scrapers, are of precisely the same form as those now in use amongst the Eskimos. The artistic designs from the caves of France, Belgium and Switzerland, are identical in plan and workmanship with those of the Eskimos, with this difference only, that the hunting scenes familiar to the Palaeolithic cave-dwellers were not the same as those familiar to the inhabitants of the shores of the Arctic Ocean. Each represented the animals which he knew, and the whale, walrus and seal were unknown to the inland dwellers of Aquitaine, just as the mammoth, bison and wild horse are unknown to the Eskimos. The reindeer, which they both knew, is represented in the same way by both. The practice of accumulating large quantities of the bones of animals round their dwelling-places, and the habit of splitting the bones for the sake of the marrow, are the same in both. The hides were prepared with the same sort of instruments, and the needles with which they were sewn together are of the same pattern. The stone lamps were used by both. In both there was the same disregard of sepulture. All these facts can hardly be mere coincidences caused by both peoples leading a savage life under similar conditions. The conclusion, therefore, seems inevitable that, so far as we have any evidence of the race to which the cave-dwellers belong, that evidence points only in the direction

of the Eskimos. It is to a considerable extent confirmed by a consideration of the animals found in the caves. The reindeer and musk sheep afford food to the Eskimos now in the Arctic Circle, just as they afforded it to the cave-men in Europe; and both these animals have been traced by their remains from the Pyrenees to the north-east through Europe and Asia as far as the very regions in which they now live. The mammoth and bison also have been tracked by their remains in the frozen river gravels and morasses through Siberia as far as the American side of Bering Strait. Palaeolithic man appeared in Europe with the arctic mammalia, lived in Europe with them, and in all human probability retreated to the north-east along with them.

There are refuse heaps in north-eastern Siberia containing the remains of the mammoth and woolly rhinoceros as well as the reindeer and musk sheep, which may be referred with equal justice to the cave-men or to the Eskimos.

*Ancient Geography of Europe.*—The remains of man and the animals described in the preceding paragraphs have been introduced into the caves either by man or the wild beasts, or by streams of water, which may or may not now occupy their ancient courses; and the fact that the same species are to be met with in the caves of France, Switzerland and Britain implies that our island formed part of the continent, and that there were no physical barriers to prevent their migration from the Alps as far to the north-west as Ireland.

The same conclusion may be gathered from the exploration of caves in the south of Europe, which has resulted in the discovery of African species, in Gibraltar, Sicily and Malta. In the first of these the spotted hyena, the serval and Kaffre cat lie side by side with the horse, grizzly bear and slender rhinoceros (*R. leptorhinus*)—see Falconer's *Palaontographical Memoirs*. To these African animals inhabiting the Iberian peninsula in the Pleistocene age, Lartet has added the African elephant and striped hyena, found in a stratum of gravel near Madrid, along with flint implements. The hippopotamus, spotted hyena and African elephant occur in the caves of Sicily, and imply that in ancient times there was a continuity of land between that spot and Africa, just as the presence of the *Elephas antiquus* proves the non-existence of the Straits of Messina during a portion, to say the least, of the Pleistocene age. A small species of hippopotamus (*H. Penlandi*) occurs in incredible abundance in the Sicilian caves. It has also been found in those of Malta along with an extinct pigmy elephant species (*E. Melitensis*). It has also been discovered in Candia and in the Peloponnese. For these animals to have found their way to these regions, a continuity of land is necessary. The view advanced by Dr Falconer and Admiral Spratt, that Europe was formerly connected with Africa by a bridge of land extending southwards from Sicily, is fully borne out by these considerations. The present physical geography of the Mediterranean has been produced by a depression of land to the amount of about 400 fathoms, by which the Sicilo-African and Ibero-African barriers have been submerged, and Crete and Malta separated from the South-European continent. It is extremely probable that this submergence took place at the same time that the adjoining sea-bottom was elevated to about the same amount so as to constitute that region now known as the Sahara.

*Pleistocene Caves of the Americas and Australia.*—The Pleistocene caverns of the Euro-Asiatic continent contain the progenitors of the animals now alive in some parts of the Old World, the extinct forms being closely allied to those now living in the same geographical provinces. Those of Brazil and of Pennsylvania present us with animals whose nearest analogues are to be found in North and South America, such as sloths, armadillos and agoutis. Those, again, of Australia present us with marsupials (*metatheria*) only, allied to, or identical with, those of that most ancient continent. The extinct forms in each case are mainly those of the larger animals, which, from their large size, and low fecundity, would be specially liable to be beaten in the battle for life by their smaller and more fertile contemporaries, and less likely to survive those changes in their environment which have undoubtedly taken place in the long lapse of

ages. It is, therefore, certain that the mammalian life in the Old, New and Australian worlds, was as well marked out into geographical provinces in the Pleistocene age as at the present time, and that it has been continuous in these areas from that remote time to the present day.

*Prehistoric Caves of Neolithic Age in Europe.*—The prehistoric caves are distinguished from Pleistocene by their containing the remains of domestic animals, and by the wild animals to which they have afforded shelter belonging to living species. They are divisible into three groups according to the traces of man which occur in them—into the Neolithic, Bronze and Iron Ages.

The Neolithic caves are widely spread throughout Europe, and have been used as the habitations and tombs of the early races who invaded Europe from the East with their flocks and herds. The first of these systematically explored was at Perthi Chwareu, near the village of Llandegla, Denbighshire, in 1869. In the following years five others were discovered close by, as well as a second group in the neighbourhood of Cefn on the banks of the Elwy. They contained polished celts, flint flakes, rude pottery and human skeletons, along with the broken bones of the pig, dog, horse, Celtic shorthorn and goat. The remains of the wild animals belong to the wolf, fox, badger, bear, wild boar, stag, roe, hare and rabbit. Most of the bones were broken or cut, and the whole group was obviously an accumulation which resulted from these caves having been used as dwellings. They had subsequently been used for burial. The human skeletons in them were of all ages, from infancy to old age; and the interments had been successive until each became filled. The bodies were buried in the contracted posture which is so characteristic of Neolithic interments generally. The men to whom these skeletons belonged were a short race, the tallest being about 5 ft. 6 in., and the shortest 4 ft. 10 in.; their skulls are orthognathic, or not presenting jaws advancing beyond a vertical line dropped from the forehead, in shape long or oval, and of fair average capacity. The face was oval, and the cheek bones were not prominent. Some of the individuals were characterized by a peculiar flattening of the shinbone (platycnemism), which probably stood in relation to the free action of the foot that was not hampered by the use of a rigid sole or sandal. This, however, cannot be looked upon as a race character, or as a tendency towards a simian type of leg. These Neolithic cave-dwellers have been proved to be identical in physique with the builders of the cairns and tumuli which lie scattered over the face of Great Britain and Ireland. (See Thurnam, *Crania Britannica*.) They have also been met with abundantly in France. In the Caverne de l'Homme Mort, for example, in the department of Lozère, explored in 1871, the association of remains was of precisely the same nature as those mentioned above, and the human skeletons were of the same small type. The same class of remains has also been discovered in Gibraltar, in the caves of Windmill Hill, and some others. The human remains examined by Busk are of precisely the same type as those of Denbighshire. In the work of Don Manuel Gongora J. Martinez (*Antiguedades prehistoricas de Andalusia*, 1868), several interments are described in the cave of Murcielagos, which penetrates the limestone out of which the grand scenery of the southern Sierra Nevada has been to a great extent carved. In one place a group of three skeletons was met with, one of which was adorned with a plain coronet of gold, and clad in a tunic made of esparto grass finely plaited, so as to form a pattern like that on some of the gold ornaments in Etruscan tombs. In a second spot farther within, twelve skeletons formed a semicircle round one covered with a tunic of skin, and wearing a necklace of esparto grass, ear-rings of black stone, and ornaments of shell and wild boar tusk. There were other articles of plaited esparto grass, such as baskets and sandals. There were also flint flakes, polished-stone axes, implements of bone and wood, together with pottery of the same type as that from Gibraltar. The same class of remains have been discovered in the Woman's Cave, near Alhama de Granada. From the physical identity of the human remains in all these cases it may be inferred that in the Neolithic Age a long-headed,

small race inhabited the Iberian peninsula, extending through France, as far north as Britain, and to the north-west as far as Ireland—a race considered by Professor Busk "to be at the present day represented by at any rate a part of the population now inhabiting the Basque provinces." This identification of the ancient Neolithic cave-dwellers with the modern Basque-speaking inhabitant of the western Pyrenees is corroborated by the elaborate researches of Broca, Virchow and Thurnam on modern Basque skulls. It may, therefore, be concluded that in the Neolithic Age an Iberian population occupied the whole of the area mentioned above, inhabiting caves and burying their dead in caves and chambered tombs, and possessed of the same habits of life. The remains of the same small, oval-featured, long-headed race have been found in Belgium in the cave of Chauvaux, and they have been described by Sergi in southern Europe under the name of the Mediterranean race.

There is no evidence that any other race except the Iberic buried their dead in the caves of Britain in the Neolithic Age. In Belgium, however, the exploration of the cave of Sclaigneaux by Soreil proves that broad-headed men of the type defined by Huxley and Thurnam as brachycephalic, and characterized by high cheek-bones, projecting muscles and large stature, the average height being 5 ft. 8.4 in. (Thurnam), inhabited and buried their dead in the caves of that region. In France they occur in the sepulchral cave of Orrouy (Oise) in association with those of the Iberic type. They have also been met with in Gibraltar. This type is undistinguishable from the Celtic (Goidelic) or Gaulish, found so abundantly in the chambered tombs of the Neolithic Age in France. Both these ancient races are represented at the present day by the Basques and Aquitanians of France and Spain, and by the Celts or Gauls of France, Britain and the Mediterranean border of Spain, their relative antiquity being proved by an appeal to their history and geographical distribution. For just as the earliest records show that the Iberic power extended as far north as the Loire, and as far east as the Rhone, so we have proof of the gradual retrocession of the Iberic frontier southwards, under the attacks of the successive Celtic hordes, until ultimately we find the latter in possession of a considerable part of southern Spain, forming by their union with the conquered the powerful nation of Celt-Iberi. The Iberians were in possession of the continent before they were dispossessed by the Goidels, and at a later time by the Brythons. They are recognized by Tacitus in Britain in the Silures of Wales; and they are still to be seen in the small, dark, lithic inhabitants of North Wales. The discovery of the characteristic skulls of both these races in the same family vault in the cave of Gop near Prestatyn, Flintshire, proves that the two races were mingled together in Britain as far back as the Bronze Age.

From the present distribution of this non-Aryan race it is obvious that they were gradually pushed back westward by the advance of tribes coming from the East, and following those routes which were subsequently taken by the Low and High Germans.

The exploration of the Grotta dei Colombi, in the island of Palmaria, overlooking the Gulf of Spezzia, in 1873, proves that the stories scattered through the classical writers, that the caves on the Mediterranean shores were inhabited by cannibals, are not altogether without foundation. In it broken and cut bones of children and young adults were found along with those of the goat, bog, fox, wolf, wild-cat, flint flakes, bone implements and shells perforated for suspension.

*Prehistoric Caves of Bronze and Iron Ages.*—The extreme rarity of articles of bronze in the European caves implies that they were rarely used by the Bronze folk for habitation or burial. Bronze weapons mingled with gold ornaments have, however, been discovered in the Heatheryburn cave near Stanhope, Durham, as well as in those of Kirkhead in Cartmell, in Thor's cave in Staffordshire, and the Cat Hole in Gower in Glamorganshire. In the Iberian peninsula the cave of Cesareda, explored by Signor Delgado, in the valley of the Tagus, contained bronze articles, associated with broken and cut human bones, as well as those of domestic animals, rendering it probable that cannibalism was practised in early times in that region. Busk believes, however,

that the facts are insufficient to support the charge of cannibalism against the ancient Portuguese.

Caves containing articles of iron, and therefore belonging to that division of the prehistoric age, are so unimportant that they do not deserve notice in this place. As man increased in civilization he preferred to live in houses of his own building, and at no longer buried his dead in the natural sepulchres provided for him in the rock.

Prehistoric caves have been rarely explored in extra-European areas. Among those which abound in Palestine, one in Mount Lebanon, examined by Canon Tristram, contained flint implements along with charcoal and broken bones and teeth, some of which may be referred to a small ox, undistinguishable from the small short-horn, *Bos longifrons*. In North America the remains found by F. W. Putnam in the caves of Kentucky, consisting of moccasins, rudely-plaited cloth, and other articles, may be referred to the same division.

*Historic Caves in Britain.*—The historic caves have only attracted notice in fairly recent years, and in Britain alone, principally through the labours of the Settle Cave Committee from the year 1860 to the present day. To them is due the exploration of the Victoria cave, which had been discovered and partially investigated as early as the year 1838. It consists of three large ill-defined chambers opening on the face of the cliff, 1450 ft. above the sea, and filled with débris very nearly up to the roof. It presented three distinct eras of occupation—one by hyenas, which dragged into it rhinoceroses, bisons, mammoths, horses, reindeer and bears. This was defined from the next occupation, which is probably of the Neolithic Age, by a layer of grey clay, on the surface of which rested a bone harpoon and a few flint flakes and bones. Then after an interval of débris at the entrance was a layer of charcoal, broken bones, fragments of old hearths, and numerous instruments of savage life associated with broken pottery, Roman coins, and the rude British imitations of them, various articles of iron, and elaborate personal ornaments, which implied a considerable development of the arts. The evidence of the coins stamps the date of the occupation of the cave to be between the first half of the 5th century and the English conquest. Some of the brooches present a peculiar flamboyant and spiral pattern in relief, of the same character as the art of some of the illuminated manuscripts, as for example one of the Anglo-Saxon gospels at Stockholm, and of the gospels of St Columban in Trinity College, Dublin. It is mostly allied to that work which is termed by Franks late Celtic. From its localization in Britain and Ireland, it seems to be probable that it is of Celtic derivation; and if this view be accepted, there is nothing at all extraordinary in its being recognized in the illuminated Irish gospels. Ireland, in the 6th and 7th centuries, was the great centre of art, civilization and literature; and it is only reasonable to suppose that there would be intercourse between the Irish Christians and those of the west of Britain, during the time that the Romano-Celts, or Brit-Welsh, were being slowly pushed westwards by the heathen English invader. Proof of such an intercourse we find in the brief notice in the *Annales Cambriae*, in which Gildas, the Brit-Welsh historian, is stated to have sailed over to Ireland in the year A.D. 565. It is by no means improbable that about this time there was a Brit-Welsh migration into Ireland, as well as into Brittany. Objects with these designs found in Germany are probably directly or indirectly due to the Irish missionaries, who spread Christianity through those regions. The early Christian art in Ireland grew out of the late Celtic, and is to a great extent free from the influence of Rome, which is stamped on the Brit-Welsh art of the same age in this country.

Several other ornaments with enamel deserve especial notice. The enamel, composed of red, blue and yellow, has been inserted into the hollows in the bronze, and then heated so as to form a close union with it. They are of the same design as those which have been met with in late Roman tumuli in this country, and in places which are mainly in the north. They all belong to a class named late Celtic by Franks, and are considered by him to be of British manufacture. This view is supported by the only

reference to the art of enamelling furnished by the classical writers. Philostratus, a Greek sophist in the court of Julia Domna, the wife of the emperor Severus, writes, "It is said that the barbarians living in the ocean pour these colours (those of horse-trappings) on heated bronze, and that these adhere, grow as hard as stone, and preserve the designs that are made in them." It is worthy of remark that, since the emperor Severus built the wall which bears his name, marched in person against the Caledonians, and died at York, the account of the enamels may have reached Philostratus from the very district in which the Victoria Cave is situated.

Associated with these were bronze ornaments inlaid with silver, and miscellaneous iron articles, among which was a Roman key. Remains of this kind have been met with in the Albert and Kelko caves in the neighbourhood, in that of Dowker-bottom near Arncliffe, in that of Kirkhead on the northern shore of Morecambe Bay, in Poole's Cavern near Buxton, and in Thor's Cave near Ashbourne, and over a wide area ranging from Yorkshire and the Lake district southwards into Somerset and Devon.

List of Principal Animals and Objects found in Brit-Welsh Strata in Caves.

It is obvious in all these cases that men accustomed to luxury and refinement were compelled, by the pressure of some great calamity, to flee for refuge to caves with whatever they could transport thither of their property. The number of spindle-whorls and personal ornaments imply that they were accompanied by their families. We may also infer that they were cut off from the civilization to which they had been accustomed, because in some cases they extemporized spindle-whorls out of fragments of Samian ware, instead of using those which were expressly manufactured for the purpose. Why the caves were inhabited is satisfactorily explained by an appeal to contemporary history. In the pages of Gildas, in the *Anglo-Saxon Chronicle*, and in the *Annales Cambriae*, we have a graphic picture of that long war of invasion by which the inhabitants of the old Roman province of Britannia were driven back by the Jutes, Angles and Saxons, who crossed over with their families and household stuff. Slowly, and in the chances of a war which extended through three centuries, they were gradually pushed back into Cumberland, Wales and West Somerset, Devon and Cornwall. While this war was going on the coinage became debased and Roman coins afforded the patterns for the small bronze *minimi*, which are to be met with equally in these caves and in the ruins of Roman cities. As the tide of war rolled to the west, the English tongue and, until towards the close of the struggle, the worship of Thor and Odin supplanted the British tongue and the Christian faith, and a rude barbarism replaced what was left of the Roman civilization in the island. It is to this period that relics of this kind in the caves must be assigned. They are traces of the anarchy of those times, and complete the

picture of the desolation of Britain, revealed by the ashes of the cities and villas that were burnt by the invader. They prove that the vivid account given by Gildas of the straits to which his countrymen were reduced was literally true.

The shrines of Zeus in the Idaean and Dictæan caves have been explored by Halhher and Orsi (*Antichità dell'antro de Zeus Ideo*) and by Arthur Evans and Hogarth (*Journal of Hellenic Studies*). These discoveries prove that the cult of Zeus began among the Mycænaean peoples some 2000 years B.C. according to Evans, and was practised far down into the later Greek times. They show that the Greeks are indebted to the Mycænaean peoples not only for their art, but for the chief of their divinities.

**CAVEA**, the Latin name given to the subterranean cells in which the wild beasts were confined prior to the combats in the Roman arena. The term is sometimes applied to the amphitheatre (*q.v.*) itself.

**CAVEAT** (Latin for "let him beware," from *cavere*), in law, a notice given by the party interested (caveator) to the proper officer of a court of justice to prevent the taking of a certain step without warning. It is entered in connexion with dealings in land registered in the land registry, with the grant of marriage licences, to prevent the issuing of a lunacy commission, to stay the probate of a will, letters of administration, &c. Caveat is also a term used in United States patent law (see PATENTS).

*Caveat emptor* ("let the buyer beware") is a maxim which implies that the responsibility for making a bad bargain over a purchase rests on the purchaser. In an ordinary contract for the sale of goods, there is no implied warranty or condition as to the quality or fitness for any particular purpose of the goods supplied, with certain exceptions, and, therefore, the buyer takes at his own risk. The maxim does not apply (a) where the buyer, expressly or by implication, makes known to the seller the particular purpose for which the goods are required, so as to show that the buyer relies on the seller's skill or judgment, and that the goods are of a description which it is in the course of the seller's business to supply; (b) where goods are bought by description from a seller who deals in goods of that description, for there is an implied condition that the goods are of merchantable quality, though if the buyer has actually examined the goods, there is no implied condition as regards defects which the examination ought to have revealed; (c) where the usage of trade annexes an implied warranty or condition to the goods as to their quality or fitness for a particular purpose. The maxim of *caveat emptor* is said to owe its origin to the fact that in early times sales of goods took place principally in market overt. (See further SALE OF GOODS.)

**CAVEDONE, JACOPO** (1577-1660), Italian painter, born at Sassuolo in the Modenese, was educated in the school of the Caracci, and under them painted in the churches of Bologna. His principal works are the "Adoration of the Magi," the "Four Doctors," and the "Last Supper"; and more especially the "Virgin and Child in Glory," with San Petronio and other saints, painted in 1614, and now in the Bolognese Academy. Cavedone became an assistant to Guido Reni in Rome; his art was generally of a subdued undemonstrative character, with rich Titianesque colouring. In his declining years his energies broke down after his wife had been accused of witchcraft, and after the death of a cherished son. He died in extreme poverty, in a stable at Bologna.

**CAVENDISH, GEORGE** (1500-1562?), English writer, the biographer of Cardinal Wolsey, was the elder son of Thomas

Cavendish, clerk of the pipe in the exchequer, and his wife, Alice Smith of Padbrook Hall. He was probably born at his father's manor of Cavendish, in Suffolk. Later the family resided in London, in the parish of St Alban's, Wood Street, where Thomas Cavendish died in 1524. Shortly after this event George married Margery Kemp, of Spains Hall, an heiress, and the niece of Sir Thomas More. About 1527 he entered the service of Cardinal Wolsey as gentleman-usher, and for the next three years he was divided from his wife, children and estates, in the closest personal attendance on the great man. Cavendish was wholly devoted to Wolsey's interests, and also he saw in this appointment an opportunity to gratify his master-passion, a craving "to see and be acquainted with strangers, in especial with men in honour and authority." He was faithful to his master in disgrace, and showed the courage of the "loyal servant." It is plain that he enjoyed Wolsey's closest confidence to the end, for after the cardinal's death George Cavendish was called before the privy council and closely examined as to Wolsey's latest acts and words. He gave his evidence so clearly and with so much natural dignity, that he won the applause of the hostile council, and the praise of being "a just and diligent servant." He was not allowed to suffer in pocket by his fidelity to his master, but retired, as it would seem, a wealthy man to his estate of Glemsford, in West Suffolk, in 1530. He was only thirty years of age, but his appetite for being acquainted with strange acts and persons was apparently sated, for we do not hear of his engaging in any more adventures. It is not to be doubted that Cavendish had taken down notes of Wolsey's conversation and movements, for many years passed before his biography was composed. At length, in 1557, he wrote it out in its final form. It was not, however, possible to publish it in the author's lifetime, but it was widely circulated in MS. Evidently one of these MSS. fell into Shakespeare's hands, for that poet made use of it in his *King Henry VIII.*, although it is excessive to say, as Singer has done, that Shakespeare "merely put Cavendish's language into verse." The book was first printed in 1641, in a garbled text, and under the title of *The Negotiations of Thomas Wolsey*. The genuine text, from contemporary MSS., was given to the world in 1810, and more fully in 1815. Until that time it was believed that the book was the composition of George Cavendish's younger brother William, the founder of Chatsworth, who also was attached to Wolsey. Joseph Hunter proved this to be impossible, and definitely asserted the claim of George. The latter is believed to have died at Glemsford in or about 1562. The intrinsic value of Cavendish's *Life of Cardinal Wolsey* has long been perceived, for it is the sole authentic record of a multitude of events highly important in a particularly interesting section of the history of England. Its importance as a product of biographical literature was first emphasized by Bishop Creighton, who insisted over and over again on the claim of Cavendish to be recognized as the earliest of the great English biographers and an individual writer of particular charm and originality. He writes with simplicity and with a certain vivid picturesqueness, rarely yielding to the rhetorical impulses which governed the ordinary prose of his age. (E. G.)

**CAVENDISH, HENRY** (1731-1810), English chemist and physicist, elder son of Lord Charles Cavendish, brother of the 3rd duke of Devonshire, and Lady Anne Grey, daughter of the duke of Kent, was born at Nice in October 1731. He was sent to school at Hackney in 1742, and in 1749 entered Peterhouse, Cambridge, which he left in 1753, without taking a degree. Until he was about forty he seems to have enjoyed a very moderate allowance from his father, but in the latter part of his life he was left a fortune which made him one of the richest men of his time. He lived principally at Clapham Common, but he had also a town-house in Bloomsbury, while his library was in a house in Dean Street, Soho; and there he used to attend on appointed days to lend the books to men who were properly vouched for. So methodical was he that he never took down a volume for his own use without entering it in the loan-book. He was a regular attendant at the meetings of the Royal Society, of which he became a fellow in 1760, and he dined every Thursday with the

club composed of its members. Otherwise he had little intercourse with society; indeed, his chief object in life seems to have been to avoid the attention of his fellows. With his relatives he had little intercourse, and even Lord George Cavendish, whom he made his principal heir, he saw only for a few minutes once a year. His dinner was ordered daily by a note placed on the hall-table, and his women servants were instructed to keep out of his sight on pain of dismissal. In person he was tall and rather thin; his dress was old-fashioned and singularly uniform. and was inclined to be shabby about the times when the precisely arranged visits of his tailor were due. He had a slight hesitation in his speech, and his air of timidity and reserve was almost ludicrous. He was never married. He died at Clapham on the 24th of February 1810, leaving funded property worth £700,000 and a landed estate of £8000 a year, together with canal and other property, and £50,000 at his bankers.

Cavendish's scientific work is distinguished for the wideness of its range and for its extraordinary exactness and accuracy. The papers he himself published form an incomplete record of his researches, for many of the results he obtained only became generally known years after his death; yet in spite of the absence of anything approaching self-advertisement he acquired a very high reputation within his own country and abroad, recognized by the Institute of France in 1803 when it chose him as one of its eight foreign associates. Arsenic formed the subject of his first recorded investigation, on which he was engaged at least as early as 1764, and in 1766 he began those communications to the Royal Society on the chemistry of gases, which are among his chief titles to fame. The first (*Phil. Trans.*, 1766) consists of "Three papers containing experiments on Factitious Airs," dealing mostly with "inflammable air" (hydrogen), which he was the first to recognize as a distinct substance, and "fixed air" (carbon dioxide). He determined the specific gravity of these gases with reference to common air. investigated the extent to which they are absorbed by various liquids, and noted that common air containing one part in six by volume of fixed air is no longer able to support combustion and that the air produced by fermentation and putrefaction has properties identical with those of fixed air obtained from marble. In the following year he published a paper on the analysis of one of the London pump-waters (from Rathbone Place, Oxford Street), which is closely connected with the memoirs just mentioned, since it shows that the calcareous matter in that water is held in solution by the "fixed air" present and can be precipitated by lime. Electrical studies seem next to have engaged his attention, and in 1771 and 1772 he read to the Royal Society his "Attempt to explain some of the principal phenomena of electricity by an elastic fluid," which was followed in 1775 by an "Attempt to imitate the effects of the Torpedo (a fish allied to the ray)" (*Phil. Trans.*, 1776). But these two memoirs contain only a part of the electrical researches he carried out between 1771 and 1781, and many more were found after his death in a number of sealed packets of papers. The contents of these for a long time remained unknown, but ultimately by permission of the duke of Devonshire, to whom they belonged, they were edited by James Clerk Maxwell and published in 1879 by the Cambridge University Press as the *Electrical Researches of the Hon. Henry Cavendish*. About 1777 or 1778 he resumed his pneumatic inquiries, though he published nothing on the subject till 1783. In that year he described a new eudiometer to the Royal Society and detailed observations he had made to determine whether or not the atmosphere is constant in composition; after testing the air on nearly 60 different days in 1781 he could find in the proportion of oxygen no difference of which he could be sure, nor could he detect any sensible variation at different places. Two papers on "Experiments with Airs," printed in the *Phil. Trans.* for 1784 and 1785, contain his great discoveries of the compound nature of water and the composition of nitric acid. Starting from an experiment, narrated by Priestley, in which John Warlure fired a mixture of common air and hydrogen by electricity, with the result that there was a diminution of volume and a deposition of moisture,

Cavendish burnt about two parts of hydrogen with five of common air, and noticed that almost all the hydrogen and about one-fifth of the common air lost their elasticity and were condensed into a dew which lined the inside of the vessel employed. This dew he judged to be pure water. In another experiment he fired, by the electric spark, a mixture of hydrogen and oxygen (dephlogisticated air), and found that the resulting water contained nitric acid, which he argued must be due to the nitrogen present as an impurity in the oxygen ("phlogisticated air with which it [the dephlogisticated air] is debase"). In the 1785 paper he proved the correctness of this supposition by showing that when electric sparks are passed through common air there is a shrinkage of volume owing to the nitrogen uniting with the oxygen to form nitric acid. Further, remarking that little was known of the phlogisticated part of our atmosphere, and thinking it might fairly be doubted "whether there are not in reality many different substances confounded together by us under the name of phlogisticated air," he made an experiment to determine whether the whole of a given portion of nitrogen (phlogisticated air) of the atmosphere could be reduced to nitric acid. He found that a small fraction, not more than  $\frac{1}{17}$ th part, resisted the change, and in this residue he doubtless had a sample of the inert gas argon which was only recognized as a distinct entity more than a hundred years later. His last chemical paper, published in 1788, on the "Conversion of a mixture of dephlogisticated and phlogisticated air into nitrous acid by the electric spark," describes measures he took to authenticate the truth of the experiment described in the 1785 paper, which had "since been tried by persons of distinguished ability in such pursuits without success." It may be noted here that, while Cavendish adhered to the phlogistic doctrine, he did not hold it with anything like the tenacity that characterized Priestley; thus, in his 1784 paper on "Experiments on Air," he remarks that not only the experiments he is describing, but also "most other phenomena of nature seem explicable as well, or nearly as well," upon the Lavoisierian view as upon the commonly believed principle of phlogiston, and he goes on to give an explanation in terms of the antiphlogistic hypothesis.

Early in his career Cavendish took up the study of heat, and had he promptly published his results he might have anticipated Joseph Black as the discoverer of latent heat and of specific heat. But he made no reference to his work till 1783, when he presented to the Royal Society some "Observations on Mr Hutchins's experiments for determining the degree of cold at which quicksilver freezes." This paper, with others published in 1786 and 1788, is concerned with the phenomena attending the freezing of various substances, and is noteworthy because in it he expresses doubt of the supposition that "the heat of bodies is owing to their containing more or less of a substance called the matter of heat," and inclines to Newton's opinion that it "consists in the internal motion of the particles of bodies." His "Account of the Meteorological Apparatus used at the Royal Society's House" (*Phil. Trans.*, 1776) contains remarks on the precautions necessary in making and using thermometers, a subject which is continued in the following year in a report signed by him and six others.

Cavendish's last great achievement was his famous series of experiments to determine the density of the earth (*Phil. Trans.*, 1798). The apparatus he employed was devised by the Rev. John Michell, though he had the most important parts reconstructed to his own designs; it depended on measuring the attraction exercised on a horizontal bar, suspended by a vertical wire and bearing a small lead ball at each end, by two large masses of lead. (See GRAVITATION.) The figure he gives for the specific gravity of the earth is 5.48, water being 1, but in fact the mean of the 29 results he records works out at 5.448. Other publications of his later years dealt with the height of an aurora seen in 1784 (*Phil. Trans.*, 1790), the civil year of the Hindus (*Id.* 1792), and an improved method of graduating astronomical instruments (*Id.* 1800). Cavendish also had a taste for geology, and made several tours in England for the purpose of gratifying it.

A life by George Wilson (1818-1859), printed for the Cavendish Society in 1851, contains an account of his writings, both published and unpublished, together with a critical inquiry into the claims of all the alleged discoverers of the composition of water. Some of his instruments are preserved in the Royal Institution, London, and his name is commemorated in the Cavendish Physical Laboratory at Cambridge, which was built by his kinsman the 7th duke of Devonshire.

**CAVENDISH [CANDISH], THOMAS** (1555?-1592), the third circumnavigator of the globe, was born at Trimley St Martin, Suffolk. On quitting Corpus Christi College, Cambridge (without a degree), he almost ruined himself by his extravagance as a courtier. To repair his fortune he turned to maritime and colonial enterprise, and in 1585 accompanied Sir Richard Grenville to America. Soon returning to England, he undertook an elaborate imitation of Drake's great voyage. On the 21st of July 1586, he sailed from Plymouth with 123 men in three vessels, only one of which (the "Desire," of 140 tons) came home. By way of Sierra Leone, the Cape Verde Islands and C. Frio in Brazil, he coasted down to Patagonia (where he discovered "Port Desire," his only important contribution to knowledge), and passing through Magellan's Straits, fell upon the Spanish settlements and shipping on the west coast of South and Central America and of Mexico. Among his prizes were nineteen vessels of worth, and especially the treasure-galleon, the "Great St Anne," which he captured off Cape St Lucas, the southern extremity of California (November 14, 1587). After this success he struck across the Pacific for home; touched at the Ladrões, Philippines, Moluccas and Java; rounded the Cape of Good Hope; and arrived again at Plymouth (September 9-10, 1588), having circumnavigated the globe in two years and fifty days. It is said that his sailors were clothed in silk, his sails were damask, and his top-mast covered with cloth of gold. Yet by 1591 he was again in difficulties, and planned a fresh American and Pacific venture. John Davis (*q.v.*) accompanied him, but the voyage (undertaken with five vessels) was an utter failure, much of the fault lying with Cavendish himself, who falsely accused Davis, with his last breath, of deserting him (May 20, 1592). He died and was buried at sea, on the way home, in the summer of 1592.

See Hakluyt's *Principal Navigations*. (a) edition of 1589, p. 809 (N. H.'s narrative of the voyage of 1586-1588); (b) edition of 1599-1600, vol. iii, pp. 803-825 (Francis Pretty's narrative of the same); (c) edition of 1599-1600, vol. iii, pp. 251-253 (on the venture of 1585); (d) edition of 1599-1600, vol. iii, pp. 845-852 (John Lane's narrative of the last voyage, of 1591-1592); also *Stationers' Registers* (Arber), vol. ii, pp. 505-509; the Molyneux Globe of 1592, in the library of the Middle Temple, London, and the Ballads in *Biog. Brit.*, vol. i, p. 1196.

**CAVENDISH, SIR WILLIAM** (c. 1505-1557), founder of the English noble house of Cavendish, was the younger brother of George Cavendish (*q.v.*). His father, Thomas, was a descendant of Sir John Cavendish, the judge, who in 1381 was murdered by Jack Straw's insurgent peasants at Bury St Edmunds. Of William's education nothing seems known, but in 1530 he was appointed one of the commissioners for visiting monasteries; he worked directly under Thomas Cromwell, whom he calls "master" and to whom many of his extant letters are addressed. In 1541 he was auditor of the court of augmentations, in 1546 treasurer of the king's chamber, and was knighted and sworn of the privy council. Under Edward VI. and Mary he continued in favour at court; during the latter's reign he partially conformed, but on the occasion of the war with France he with other Derbyshire gentlemen refused the loan of £100 demanded by the queen. He died in 1557. Cavendish acquired large properties from the spoils of the monasteries, but in accordance with the wish of his third wife Elizabeth he sold them to purchase land in Derbyshire. This wife was the celebrated "building Bess of Hardwick," daughter of John Hardwicke, of Hardwicke, Derbyshire; she completed the original building of Chatsworth House,—began in 1553 by her husband,—of which nothing now remains. Her fourth husband was George Talbot, 6th earl of Shrewsbury. By her Cavendish had six children; an elder son who died without issue; William, who in 1618 was created earl of Devonshire; Charles, whose son William became 1st duke of Newcastle;

Frances, who married Sir Henry Pierpont, and was the ancestress of the dukes of Kingston; Elizabeth, who married Charles Stuart, earl of Lennox, and was the mother of Arabella Stuart; and Mary, who married Gilbert Talbot, 7th earl of Shrewsbury.

**CAVETTO** (Ital. diminutive of *cavo*, hollow), in architecture, the term given to a hollow concave moulding sometimes employed in the place of the cymatium of a cornice, as in that of the Doric order of the theatre of Marcellus. It forms the crowning feature of the Egyptian temples, and took the place of the cymatium in many of the Etruscan temples.

**CAVIARE**, or **CAVIAR**, the roe of various species of *Acipenser* or sturgeon (*q.v.*), prepared, in several qualities, as an article of food. The word is common to most European languages and supposed to be of Turk or Tatar origin, but the Turk word *khanyah* is probably derived from the Ital. *caviate*; the word does not appear in Russian. The best caviare, which can only be made in winter and is difficult to preserve, is the loosely granulated, almost liquid, kind, known in Russia as *ikra*. It is prepared by beating the ovaries and straining through a sieve to clear the eggs of the membranes, fibres and fatty matter; it is then salted with from 4-6% of salt. The difficulty of preparation and of transport has made it a table delicacy in western Europe, where it has been known since the 16th century, as is evidenced by Hamlet's "His play . . . pleased not the million, 'twas caviare to the general." It is eaten either as an *hors d'œuvre*, particularly in Russia and northern Europe with kummel or other liqueurs, or as a savoury, or as a flavouring to other dishes. The coarser quality, in Russia known as *pajusnaya* (from *pajus*, the adherent skin of the ovaries), is more strongly salted in brine and is pressed into a more solid form than the *ikra*; it is then packed in small barrels or hermetically-sealed tins. This forms a staple article of food in Russia and eastern Europe. Though the best forms of caviare are still made in Russia, and the greater quantity of the coarser kinds are exported from Astrakhan, the centre of the trade, larger amounts are made each year for export in America and also in Germany, Norway and Sweden. The roe of tunny and mullet, pickled in brine and vinegar, is used, under the name of "Botargo," along the Mediterranean littoral and in the Levant.

**CAVITE**, a fortified seaport, the capital of the province of Cavite, Luzon, Philippine Islands, and the seat of the principal Asiatic naval station of the United States, on a forked tongue of land in Manila Bay, 8 m. S. of the city of Manila. Pop. (1903) 4494; with the barrios of San Roque and Caridad (on the main peninsula), which are under the municipal government of Cavite (15,630). Cavite is the terminus of a railway which follows the shore of the bay from Manila. The northern part of the town, Sangle Point (one of the two forks of the main peninsula), is the principal coaling station of the U.S. fleet in Asiatic waters. The naval station proper and the old town of Cavite are on the south fork of the peninsula. Cavite's buildings are mostly of stone, with upper storeys of wood; its streets are narrow and crooked. It has five churches (one of these is an independent Filipino church), and is the seat of a provincial high school. Cavite has long been the principal naval base of the Philippine Islands, and one of the four Spanish penitentiaries in the Islands was here. During the 19th century Cavite was the centre of political disturbances in the Philippines; in 1896 on the parade ground thirteen political prisoners were executed, and to their memory a monument was erected in 1906 at the head of the isthmus connecting with the main peninsula. The town was nearly destroyed by an earthquake in 1880. It was taken from the Spanish by an American squadron under Commodore George Dewey in May 1898.

**CAVOUR, CAMILLO BENSO, COUNT** (1810-1861), Italian statesman, was born at Turin on the 1st of August 1810. The Bensos, who belonged to the old Piedmontese feudal aristocracy, were a very ancient house, said to be descended from a Saxon warrior who settled at Santena in the 12th century and married a Piedmontese heiress; Camillo's father, the marquis Michele, married a noble Genevese lady, and both he and his wife held offices in the household of Prince Borghese, the governor of Piedmont under Napoleon, and husband of the latter's sister, Pauline Bonaparte. Being a younger son (his brother Gustavo

was the eldest) Cavour was destined for the army, and when ten years old he entered the military academy at Turin. On leaving the college at the age of sixteen he was first of his class, and received a commission in the engineers. He spent the next five years in the army, residing at Ventimiglia, Genoa, and various Alpine fortresses to superintend defence works; but he spent his leisure hours in study, especially of the English language. He soon developed strongly marked Liberal tendencies and an uncompromising dislike for absolutism and clericalism, which, as he had not acquired the art of reticence, made him a suspect in the eyes of the police and of the reactionaries; at the same time he does not seem to have joined any secret society, for he was too loyal to conspire against the king whose uniform he wore, and he did not believe that the time was yet ripe for a revolution. But after the accession to the throne of Charles Albert, whom he always distrusted, he felt that his position in the army was intolerable, and resigned his commission (1831). From that moment we find him in the ranks of the opponents of the government, although his was always a loyal and straightforward opposition which held aloof from conspiracies. During the next few years he devoted himself to the study of political and social problems, to foreign travel, and to acquiring a thorough knowledge of practical agriculture. Cavour's political ideas were greatly influenced by the July revolution of 1830 in France, which proved that an historic monarchy was not incompatible with Liberal principles, and he became more than ever convinced of the benefits of a constitutional monarchy as opposed both to despotism and to republicanism. But he was not affected by the doctrinaire Liberalism of the time, and his views were strengthened by his studies of the British constitution, of which he was a great admirer; he was even nicknamed "Milord Camillo." He frequently visited Paris and London, where he plunged into the political and social questions of the day, and contributed among other essays two admirable and prophetic articles, one on the Irish question, in which he strongly defended the Union, and another on the Corn Laws. He applied his knowledge of agriculture to the management of his father's estate at Leiri, which he greatly improved, he founded the Piedmontese Agricultural Society, and took the lead in promoting the introduction of steam navigation, railways and factories into the country.

Thus his mind gradually evolved, and he began to dream dreams of a united Italy free of foreign influence, but owing to the reactionary policy of the Piedmontese government he was unable to take any active part in politics. In 1847, however, the psychological moment seemed to have arrived, for the new pope, Pius IX., showed marked Liberal tendencies and seemed ready to lead all the forces of Italian patriotism against the Austrian domination. The hopes of the Italian Liberals rose high and the so-called neo-Guelph party, represented by such men as Vincenzo Gioberti and Cesare Balbo, believed that an Italian confederation might be formed under the presidency of the pope. Cavour, although he realized that a really Liberal pope was an impossibility, saw the importance of the movement and the necessity of profiting by it. Together with Balbo, P. di Santa Rosa, and M. Castelli, he founded a newspaper at Turin called *Il Risorgimento*, which advocated the ideas of constitutional reform in Piedmont, with a view to preparing that country for an important rôle in the upheaval which seemed imminent. In January 1848 the revolution first broke out in Sicily. Cavour, in a speech before a delegation of journalists, declared that the king must take a decided line and grant his people a constitution. Strong pressure was brought to bear on Charles Albert, and after much hesitation he was induced to grant a charter of liberties (February 8, 1848). Cesare Balbo was called upon to form the first constitutional ministry; but Cavour was not offered a seat in it, being suspected by Liberals and Conservatives alike. He continued his journalistic activity, and his articles in the *Risorgimento* came to exercise great influence both on the king and on public opinion. When the news of the revolt of the Milanese against the Austrians, known as the Five Days, reached Turin on the 10th of March, Cavour felt that the time for Piedmont to act with energy had come, and advocated war against Austria. "After deliberately weighing

each word," he wrote, "we are bound in conscience to declare that only one path is open to the nation, the government, and the king: war, immediate war!" Piedmont was the only part of Italy enjoying a government at once national and independent, and if it did not hasten to the assistance of the Milanese in their desperate struggle, if possible before the Austrians were expelled, the monarchy could not survive. The situation was most critical, and even the British government was not friendly to Piedmont; but Cavour was prepared to face any danger rather than see his country inactive. In an article in the *Risorgimento* he declared that, while he never believed that material help was to be expected from England, he was convinced that she would not actively help Austria to crush the revolution, but that if she did "she would have against her a coalition not of princes, but of peoplea." Cavour's article made such an impression that it put an end to the king's vacillations, and a few days after its appearance war was declared (March 25).

For a few months patriotic and revolutionary enthusiasm carried all before it. In Hungary, in Germany, in Paris, in Vienna itself the revolution was triumphant; constitutions were granted, dynasties tottered and fell, and provisional governments were set up. In all parts of Italy, too, revolts broke out against the established order. But the Piedmontese army, although the troops behaved with gallantry, was no match for Austria's veteran legions, and except in a few minor engagements, in one of which Cavour's nephew Gustavo was killed, it was generally unsuccessful, and an armistice was concluded in the summer. In the meanwhile the elections were being held in Piedmont. Cavour himself was not returned until the supplementary elections in June, and he took his seat in parliament on the right as a Conservative. His parliamentary career was not at first very successful; he was not a ready speaker; his habit of talking French made Italian difficult for him, and, although French was at that time allowed in the chamber, he preferred to speak Italian. But he gradually developed a strong argumentative power, his speeches became models of concise reasoning, and he rose at times to the highest level of an eloquence which was never rhetorical. After the dissolution in January 1849, Cavour was not re-elected. The new parliament had to discuss, in the first instance, the all-important question of whether the campaign should be continued now that the armistice was about to expire. The king decided on a last desperate throw, and recommenced hostilities. On the 23rd of March the Piedmontese were totally defeated at Novara, a disaster which was followed immediately by the abdication of Charles Albert in favour of his son Victor Emmanuel II.

Although the new king was obliged to conclude peace with Austria and the Italian revolution was crushed, Cavour nevertheless did not despair; he believed that so long as the constitution was maintained in Piedmont, the Italian cause was safe. There were fresh elections in July, and this time Cavour was returned. He was still in the difficult position of a moderate Liberal at a time when there seemed to be room for none but reactionaries and conspirators, but by his consummate ability he convinced men that his attitude was the right one, and he made it triumph. His speech on the 7th of March 1850, in which he said that, "Piedmont, gathering to itself all the living forces of Italy, would be soon in a position to lead our mother-country to the high destinies to which she is called," made a deep impression, for it struck the first note of encouragement after the dark days of the preceding year. He supported the ministry of which Massimo d'Azeglio was president in its work of reform and restoration, and in October of the same year, on the death of Santa Rosa, he himself was appointed minister of agriculture, industry and commerce. In 1851 he also assumed the portfolio of finance, and devoted himself to the task of reorganizing the Piedmontese finances. By far the ablest man in the cabinet, he soon came to dominate it, and, in his anxiety to dominate the chamber as well, he negotiated the union of the Right Centre with the Left Centre (a manoeuvre known as the *connubio*), and promoted the election of Urbano Rattazzi to the presidency of the chamber. This, which he accomplished without d'Azeglio's knowledge,

led to a split between that statesman and Cavour, and to the latter's resignation. Cavour has been blamed for not informing his colleagues of the compact, but for public reasons it was not desirable that the *connubio* should be discussed before it was consummated. D'Azeglio indeed bore no malice, and remained Cavour's friend. Cavour made use of his freedom to visit England and France again, in order to sound public opinion on the Italian question. In London he found the leaders of both parties friendly, and Lord Palmerston told him that if the constitutional experiment in Piedmont succeeded the Italian despots were doomed. At this time Sir James Hudson was appointed British minister at Turin, where he became the intimate friend of Cavour and gave him valuable assistance. In Paris, Cavour had a long interview with Prince Louis Napoleon, then president of the republic, and he already foresaw the great part which that ruler was destined to play in Italian affairs. He also met several Italian exiles in France.

On Cavour's return he found the country in the throes of a new cabinet crisis, in consequence of which, on d'Azeglio's recommendation, he was invited to form a ministry. By the 4th of November he was prime minister, a position which he held with two short interruptions until his death. He devoted the first years of his premiership to developing the economic resources of the country; but in preparing it for greater destinies, he had to meet the heavy expenditure by increased taxation, and some of his measures made him the object of hostile demonstrations, although he soon outlived his unpopularity. Cavour's first international difficulty was with Austria; after the abortive rising at Milan in February 1853, the Austrian government, in addition to other measures of repression, confiscated the estates of those Lombards who had become naturalized Piedmontese, although they had nothing to do with the outbreak. Cavour took a strong line on this question, and on Austria's refusal to withdraw the obnoxious decree, he recalled the Piedmontese minister from Vienna, thus by his very audacity winning the sympathy of the Western powers.

Then followed the Crimean War, in which Cavour first showed his extraordinary political insight and diplomatic genius. The first suggestion of Piedmontese co-operation is usually believed to have come from England, who desired the Italian contingent, not only as material assistance, but also in order to reduce the overwhelming French preponderance. From the Piedmontese point of view there were several reasons why Cavour should desire his country to participate in the campaign. Firstly, it was advisable to use every opportunity of making the Italian question an international one; secondly, by joining the alliance Piedmont would place the Western powers under an obligation; thirdly, Cavour, like Balbo, believed that the Italian question was bound up with the Eastern problem, and as Austria was demanding the permission of the powers to occupy Alessandria, as a guarantee that Piedmont would not profit by the war in the East to create trouble in Italy, Piedmontese participation would in itself prove the best guarantee; and finally, as he always looked to Italy and not merely to Piedmont, he felt that, having proved to Europe that Italians could combine order with liberty, it remained to show that they were capable of fighting as well. But there were serious difficulties in the way. Had Austria joined the allies, as at one time seemed probable, Sardinia's position fighting by her side would have been an impossible one. On the other hand, Piedmont could not demand definite promises of future aid from the Western powers as some politicians desired, because these would never have been given, lest Austria should be offended and driven into the arms of Russia. Then, both the extreme Conservatives and the extreme Radicals were opposed to expenditure on foreign adventures for which they could see no use. In all these difficulties, however, Cavour was loyally supported by the king, who saw the advantages of Piedmontese participation, even if unattended by definite promises. General Dabormida, the minister of foreign affairs, disapproved of this policy and resigned. The vacant portfolio was offered to d'Azeglio, who refused it; whereupon Cavour assumed it himself. On the same

day (January 10, 1855) the treaty with France and England was signed, and shortly afterwards 15,000 Piedmontese troops under General La Marmora were despatched to the Crimea.

Events at first seemed to justify the fears of Cavour's opponents. Cholera attacked the Piedmontese soldiers, who for a long time had no occasion to distinguish themselves in action; public opinion became despondent and began to blame Cavour, and even he himself lost heart. Then came the news of the battle of the Tchernaya, fought and won by the Italians, which turned sadness and doubt into jubilation. Joy was felt throughout Italy, especially at Milan, where the victory was the first sign of daylight amid the gloom caused by the return of the Austrians. Everyone realized that the Piedmontese contingent was fighting Italy's battles. But to Cavour the announcement that Russia had accepted Austrian mediation (January 10, 1856) was a great disappointment. He had always hoped that if the war continued Austria would be forced to side with Russia in return for the aid given by the emperor Nicholas in suppressing the Hungarian revolt in 1849, and the Western powers would then have an opportunity of helping the Italian cause. He sent a memorandum, at Napoleon's request, to Count Walewski, the French minister of foreign affairs, setting forth a kind of minimum programme of Piedmont's claims. On the summoning of the congress of Paris at the conclusion of the war, Cavour first proposed that d'Azeglio should represent Piedmont, and on the latter's refusal decided to go himself. After much discussion, and in spite of the opposition of Austria, who as mediator occupied a predominant position, behaving "as though she had taken Sevastopol," Cavour obtained that Piedmont should be treated as one of the great powers. Although he did not expect that the congress would liberate Italy, yet by his marvellous diplomatic skill, far superior to that of his colleagues, he first succeeded in isolating Austria, secondly in indirectly compromising Napoleon in the Italian question, and thirdly in getting the wretched conditions of Italy discussed by the representatives of the great powers, who declared that some remedy to that state of things was necessary, not in the interests of Italy alone, but of all Europe. A scheme of reform proposed by Count Walewski gave Cavour the opportunity to plead the Italian cause, and from that moment it was manifest to all that the liberation of Italy was personified in him, the statesman who came to hold all the strings of European politics in his hands.

Cavour's chief measure of internal reform during this period was a bill for suppressing all monastic orders unconnected with education, preaching or charity; this aroused strong opposition from the extremists of both parties and also from the king, and led to the minister's resignation. But he was soon recalled, for the country could not do without him, and the bill was passed (May 29, 1855).

Cavour now saw that war with Austria was merely a question of time, and he began to establish connexions with the revolutionists of all parts of Italy, largely by means of La Farina; but it was necessary that this policy should not be advertised to Europe, and he strongly discountenanced Mazzini's abortive revolutionary attempts. He continued to strengthen Piedmont's military resources, and the army soon grew too large for the country and was obviously destined for more than merely defensive purposes. But he well knew that although Piedmont must be made as efficient as possible from the military point of view, it could not defeat Austria single-handed. He would have preferred an alliance with Great Britain, who would never demand territorial compensation; but although British sympathies were wholly Italian, the government was desperately anxious to avoid war. From Napoleon more was to be hoped, for the emperor still preserved some of his revolutionary instincts, while the insecurity of his situation at home made him eager to gain popularity by winning military glory abroad; but he still hesitated, and Cavour devoted the whole of his ability to overcoming his doubts. In the midst of these negotiations came Orsini's attempt on Napoleon's life (January 14, 1858), which threatened to alienate his Italian sympathies

and cause serious embarrassments to Piedmont. But after some remonstrances to Piedmont for not acting with sufficient energy against the revolutionists, the incident was settled; and Napoleon was, in fact, afraid that if he did not help the Italian cause more such attempts would be made. A month after the Orsini outrage he laid before Cavour a proposal for a Franco-Piedmontese alliance and the marriage of Prince Jerome Bonaparte with Princess Clothilde, the daughter of Victor Emmanuel.

An "accidental" meeting between Napoleon and Cavour was arranged and took place at Plombières in July, and although no one knew what passed, the news of it fell like a bombshell on the diplomatic world. No definite treaty was signed, but the basis of an agreement was laid, whereby France and Piedmont were to declare war against Austria with the object of expelling her from Italy, and a north Italian state was to be formed; in exchange for this help France was to receive Savoy and possibly Nice. But the emperor still hesitated, and refused to decide on war unless Austria attacked Piedmont; the British government, too, in its anxiety to preserve peace, was not very friendly to the Italian cause. Cavour saw that the only way to overcome all these obstacles was to force Austria's hand. Then there was the danger lest an Italy freed by French arms should be overwhelmed under French predominance; for this reason Cavour was determined to secure the co-operation of volunteers from other parts of Italy, and that the war should be accompanied by a series of risings against Austria and the local despots. It was also necessary that the risings should break out in the various provinces before the Piedmontese and French troops arrived, so that the latter should not appear as invaders and conquerors, but merely as liberators.

The moment war was seen to be imminent, parties of Italians of all classes, especially Lombards, poured into Piedmont to enlist in the army. Cavour also had a secret interview with Garibaldi, with whom he arranged to organize volunteer corps so that the army should be not merely that of Piedmont, but of all Italy. Every day the situation grew more critical, and on the 10th of January 1859 the king in his speech from the throne pronounced the memorable words "that he could not remain deaf to the cry of pain (*il grido di dolore*) that reached him from all parts of Italy"—words which, although actually suggested by Napoleon, rang like a trumpet-call throughout the land. In the meanwhile the marriage negotiations were concluded, and during the emperor's visit to Turin a military convention was signed between the two states, and Savoy and Nice were promised to France as a reward for the expulsion of the Austrians from Italy. But the British government was still unfavourable, and Napoleon, ever hesitating, again sought an excuse for backing out of his engagements; he jumped at the Russian proposal to settle the Italian question by means of his own favourite expedient, a congress. To this Austria agreed on condition that Piedmont should disarm and should be excluded from the congress; England supported the scheme, but desired that all the Italian states should be represented. Cavour was in despair at the turn events were taking, and appealed to Napoleon, actually threatening to emigrate to America and publish all his correspondence with the emperor if the latter did not keep his engagements. He decided at last most reluctantly to accept the English proposal, lest Piedmont should be abandoned by all, but clung to the hope that Austria would reject it. On the 10th of April the Austrian emperor, on the advice of the military party, did reject it; and on the 23rd, to Cavour's inexpressible joy, Austria sent an ultimatum demanding the disarmament of Piedmont. Cavour replied that his government had agreed to the congress proposed by the powers and that it had nothing more to say. On quitting the chamber that day he said to a friend: "I am leaving the last sitting of the last Piedmontese parliament"—the next would represent united Italy. France now allied herself definitely with Piedmont, and England, delighted at Cavour's acquiescence to her own proposal and enraged by Austria's ultimatum, became wholly friendly to the Italian cause. A few days later Austria declared war.

As La Marmora now took the chief command of the army, Cavour added the ministry of war to the others he already held. His activity at this time was astounding, for he was virtually dictator and controlled single-handedly nearly all the chief offices of the state. The French troops entered Piedmont, where they were received with enthusiasm, and the allies marched into Lombardy; the victory of Magenta, which opened the gates of Milan to them, was shortly followed by that of Solferino. The people rose in arms at Parma, Modena, Florence and Bologna, which had been occupied by Austria for the pope since 1849; the local princes were expelled and provisional governments set up. Cavour sent special commissioners to take charge of the various provinces in Victor Emmanuel's name. But these events, together with Prussia's menacing attitude, began to alarm Napoleon, who, although he wished to destroy Austrian influence in Italy, was afraid of a large and powerful Italian state. Consequently, after Solferino, he concluded an armistice with Austria at Villafranca on the 8th of July, without previously informing Cavour. When Cavour heard of it he was thunderstruck; he immediately interviewed the king at Monzambano, and in violent, almost disrespectful language implored him not to make peace until Venice was free. But Victor Emmanuel saw that nothing was to be gained by a refusal, and much against his own inclination, signed the peace preliminaries at Villafranca, adding the phrase, "pour ce qui me concerne," which meant that he was not responsible for what the people of other parts of Italy might do (July 12). Lombardy was to be ceded to Piedmont, Venetia to remain Austrian, the deposed princes to be reinstated, and the pope made president of an Italian confederation.

The cabinet resigned the next day, but remained in office provisionally, and Cavour privately advised the revolutionists of central Italy to resist the return of the princes, by force if necessary: "for we must now become conspirators ourselves," he said. His policy was thus continued after he left office, and Palmerston, who had meanwhile succeeded Malmesbury as foreign minister, informed France and Austria that Great Britain would never tolerate their armed intervention in favour of the central Italian despots. The new Piedmontese ministry, of which La Marmora was the president, but Rattazzi the leading spirit, hesitated between annexing central Italy and agreeing to the terms of peace, but on the 10th of November peace was signed at Zürich. Napoleon proposed a new congress, which never met, and on the fall of the Rattazzi-La Marmora cabinet the king, in spite of the quarrel at Monzambano, asked Cavour to take office again. By January he was once more premier, as well as minister for foreign affairs and of the interior. His first act was to invite the people of Italy to declare their own wishes with regard to annexation to Piedmont; but Napoleon still refused to consent to the union of Tuscany with Piedmont, for he contemplated placing one of his own relatives on the throne of the grand-duchy. Cavour now saw that Napoleon might be ready to deal, and, although the bargain of the preceding year had not been exactly fulfilled, as the Austrians were still in Venice, he again brought forward the question of Nice and Savoy. To Cavour no less than to the king the loss of these two provinces was a cruel wrench, but it was a choice between them and central Italy. The plebiscites in the latter region had unanimously declared in favour of union with Piedmont, and Napoleon became more pressing, going so far as to threaten that unless the cession were made, the French troops would leave Lombardy at the mercy of Austria and occupy Bologna and Florence. On the 24th of March the treaty was signed and the emperor's opposition to the annexation of central Italy withdrawn. On the 2nd of April the parliament representing Piedmont, the duchies of Parma and Modena, Tuscany and Romagna, met, and Cavour had the difficult and ungrateful task of explaining the cession of Nice and Savoy. In spite of some opposition, the agreement was ratified by a large majority.

The situation in the kingdom of Naples was now becoming critical, but there seemed as yet little chance of union with upper Italy, for the Bourbon government was a more or less regular one, and, although risings had broken out, there was no

general revolution. Cavour therefore had to follow a somewhat double-faced policy, on the one hand negotiating with the Bourbon king (Francis II.), suggesting a division of Italy between him and Victor Emmanuel, and on the other secretly backing up the revolutionary agitation. Having now learnt that Garibaldi was planning an expedition to Sicily with his volunteers, he decided, after some hesitation, not to oppose its departure; on the 5th of May it sailed from Quarto near Genoa, and Cavour was only deterred from declaring war on Naples by the fear of foreign complications. Garibaldi with his immortal Thousand landed at Marsala, and the whole rotten fabric of the Bourbon government collapsed. At Palermo they were welcomed by the Piedmontese admiral Persano, and soon the whole island was occupied and Garibaldi proclaimed dictator. The general now proposed to cross over to the mainland, and this placed Cavour in a serious dilemma; Russia and Austria protested against the expedition, France and Prussia were unfriendly, Great Britain alone remained warmly pro-Italian. He still hoped for a revolution in Naples, so that King Victor's authority might be established before Garibaldi's arrival, but this proved impossible. When Garibaldi crossed the straits of Messina the Neapolitan government fell, and he entered Naples in triumph. But there was still danger that he might be subsequently defeated, for the Neapolitan army was still a force in being, and Cavour feared, moreover, that, although Garibaldi himself had always loyally acted in the king of Italy's name, the red republicans around him might lead him to commit some imprudence and plunge the country into anarchy. The cession of Nice, Garibaldi's birthplace, had made an impassable gulf between the two men, and neither quite trusted the other. Cavour also feared that Garibaldi might invade the papal states, which would have led to further international complications. In any case, Rome must not be touched for the present, since Napoleon was pledged to protect the pope; but as the latter had made large armaments, and his forces, consisting largely of brigands and foreigners under the French general Lamoricière, were in a menacing attitude on the frontier, Cavour decided on the momentous step of annexing the papal states with the exception of the Roman province. The Italian army crossed the frontier from Romagna on the 11th of September, whereupon every power, except Great Britain and Sweden, withdrew its minister from Turin. But the troops advanced and were everywhere received with open arms by the people; Ancona was taken, Lamoricière was defeated and captured at the battle of Castelfidardo, and on the 20th King Victor marched into the Neapolitan kingdom. On the 1st of October Garibaldi defeated the Neapolitan troops on the Volturno, and Gaeta alone, where King Francis of Naples had retired, still held out.

New difficulties with Garibaldi arose, for he would not resign his dictatorship of the southern provinces, and wished to march on Rome. Cavour had to use all his tact to restrain him and at the same time not to appear ungrateful. He refused to act despotically, but he summoned parliament to vote on the annexation, which it did on the 11th. Two days later Garibaldi magnanimously gave in to the nation's will and handed his conquests over to King Victor as a free gift. Gaeta was invested, and after a siege prolonged through the action of Napoleon, who for some reason unknown kept his fleet before the town, preventing any attack by sea until England induced him to withdraw it, the garrison surrendered on the 13th of February, and King Francis retired to Rome. Parliament was dissolved once more; the new chamber showed an overwhelming majority in favour of Cavour, and Victor Emmanuel was proclaimed king of Italy.

The last question with which Cavour had to deal was that of Rome. For some years past the pope had only been able to maintain his authority by the help of foreign troops, and Cavour saw that as long as this state of things lasted there could be no united Italy. In October he declared in parliament that Rome must be the capital of Italy, for no other city was recognized as such by the whole country, and in January 1861 a resolution to that effect was passed. But owing to Napoleon's attitude he had to proceed warily, and made no attempt for the present to

carry out the nation's wishes. At the same time he was anxious that the church should preserve the fullest liberty, and he believed in the principle of "a free church in a free state." His great dream, save for Rome and Venice, was now realized, and Italy was free and united. But the wear and tear of these last years had been almost unbearable, and at last began to tell; the negotiations with Garibaldi were particularly trying, for while the great statesman wished to treat the hero and his volunteers generously, far more so than seemed wise to the Conservatives and the strictly military party, he did not wish the Italian cause to be endangered by their imprudences, and could not permit all the Garibaldian officers to be received into the regular army with the same grades they held in the volunteer forces. This question, together with that of Nice, led to a painful scene in the chamber between the two men, although they were formally reconciled a few days later. For some time past Cavour had been unwell and irritable, and the scene with Garibaldi undoubtedly hastened his end. A fever set in, and after a short illness he passed away on the 6th of June 1861. He was buried at his ancestral castle of Santena.

The death of Cavour was a terrible loss to Italy; there remained many problems to be solved in which his genius and personality were urgently needed. But the great work had been carried to such a point that lesser men might now complete the structure. He is undoubtedly the greatest figure of the *Risorgimento*, and although other men and other forces co-operated in the movement, it was Cavour who organized it and skillfully conducted the negotiations which overcame all, apparently insuperable, obstacles. "That which in Alfieri and Gioberti was lacking," wrote T. Artom, his private secretary, "a deep and lively sense of reality, Cavour possessed to a supreme degree. He was not a *littérateur*; he was never a political dreamer. His views broadened progressively; at each stage he discovered a new horizon, and he followed his path without ever seeking anything save what was real and possible." He was gifted with pronounced political genius and with an astounding power of foresight. In his ideas he was always a moderate Liberal, and although he disapproved of republicanism, he was an ardent constitutionalist, ever refusing to resort to arbitrary methods, for he felt that, the Italian character being what it is, Italian unity could not last if unsupported by popular feeling. In meeting opposition he could not, like Bismarck, rely on a great military power, for the Piedmontese army was a small one; Austria must first be isolated and then an alliance had to be obtained with some other power. Some of his acts, especially his policy towards the Neapolitan kingdom, have been criticized as politically immoral; but apart from the fact that few revolutions—and Cavour, after all, was a revolutionist—can be conducted without attacking vested rights, it is hard to see that any policy which led to the destruction of a government, rightly described as the "negation of God on earth," could be deemed immoral. He has been accused of changing his views, but what statesman has not? Moreover, in the extremely complicated and difficult diplomatic situations which he had to face, what was impossible or dangerous one day became possible and desirable the next. This was particularly the case with the Neapolitan question. Cavour's one absorbing passion was the liberation and regeneration of Italy, and to this he devoted his whole life and talent.

Buzzeoni, *Bibliografia Cavouriana* (Turin, 1898); Countess Evelyn Martinengo Cesaresco, *Cavour* (London, 1898), an excellent and handy little monograph which brings out the chief points of Cavour's life in the right light; G. Massari, *Il Conte di Cavour* (Turin, 1873); W. de la Rive, *Le Comte de Cavour* (Paris, 1862), interesting and valuable as the work of a contemporary and intimate friend of Cavour; L. Chiala, *Lettere edite ed inedite del Conte di Cavour* (7 vols., Turin, 1883-1887); D. Zanichelli, *Gli Scritti del Conte di Cavour* (Bologna, 1892), and *Cavour* (Florence, 1905); H. von Treitschke, "Cavour," in his *Historische und politische Aufsätze* (Leipzig, 1871); E. Dicey, *A Memoir of Cavour* (London, 1861); Conte C. di Cavour, *Discorsi parlamentari* (8 vols., Turin, 1863-1872), *Opere politico-economiche* (Cuneo, 1855); F. X. Krause, *Cavour* (Mainz, 1902); E. Artom, *L'Opere politica del Senatore T. Artom nel Risorgimento Italiano* (Bologna, 1906), a biography of Cavour's devoted private secretary, containing new material.

(L. V.)

**CAVOUR** (anc. *Caburrum* or *Forum Vibii*), a town of Piedmont, Italy, in the province of Turin, 32 m. S.W. by rail and steam tram (via Pinerolo from the town of Turin). Pop. (1901) town, 2091; commune, 6843. It lies on the north side of a huge isolated mass of granite (the Rocca di Cavour) which rises from the plain. On the summit was the Roman village, which belonged to the province of the Alpes Cottiae. There are some ruins of medieval fortifications. The town gave its name to the Benso family of Chieri, who were raised to the marquisate in 1771, and of which the statesman Cavour was a member.

For the ancient name see Th. Mommsen in *Corp. Inscrip. Lat.* v. (Berlin, 1877), p. 825.

**CAVY**, a name commonly applied to several South American rodent animals included in the family *Cavidae* (see *RODENTIA*), but perhaps properly applicable only to those belonging to the typical genus *Cavia*, of which the most familiar representative is the domesticated guinea-pig. Cavies in general, the more typical representatives of the *Cavidae*, are rodents with hoof-like nails, four front and three hind toes, imperfect collar-bones, and the cheek-teeth divided by folds of enamel into transverse plates. The tail is short or rudimentary, the incisors are short, and the outer surface of the lower jaw is marked by a distinct ridge.

True cavies, or couies (*Cavia*), are best known by the guinea-pig, a domesticated and parti-coloured race derived from one of the wild species, all of which are uniformly coloured. They are comparatively small and stoutly built animals, with short, rounded ears and no tail. In habits they are partly diurnal; and live either in burrows among the crevices of rocks, beneath the leaves of aquatic plants in marshy districts, or underneath the floors of outbuildings. Their cries are faint squeaks and grunts. They feed upon nearly all vegetable substances, but drink little. Generally they associate in small societies, and seldom wander far from home. Although the guinea-pig is a fertile breeder, the wild species only produce one or two young at a birth, and this but once in a year. The young come into the world in a highly developed condition, being able to feed themselves the day following their birth. Cavies are widely distributed in South America, and are represented by several species. Among them may be mentioned the apera or restless cavy (*C. porcellus* or *C. apera*) of Brazil; the Bolivian *C. boliviensis*, found at great elevations in the Andes; the Brazilian rock-cavy (*C. rufestris*), characterized by its short blunt claws; and the Peruvian *C. culleri*. The latter was tamed by the Incas, and is the ancestor of the guinea-pig. As to the origin of that name, some writers consider it a corruption of Guiana-pig, but it is more probable that the word "Guinea" merely signifies foreign. The guinea-pig is a singularly inoffensive and defenceless creature, of a restless disposition, and wanting in that intelligence which usually characterizes domestic pets, although said to show some discrimination. It is of no particular service to man, neither its flesh nor its fur being generally put to use, while the statement that its presence is sufficient to drive off rats and mice appears to be without foundation. It is exceedingly prolific, beginning to breed at the age of two months; the number of young varying, according to the age of the parent, from four to twelve. It has been calculated that a single pair of guinea-pigs may prove the parent stock of a thousand individuals in a single year.

A very different animal is the Patagonian cavy, or mara (*Dolichotis patagonica*), the typical representative of a genus characterized by long limbs, comparatively large ears, and a short tail. The animal is about the size of a hare, to which it approximates in form and habits. It is most abundant in the open districts of Patagonia, but also ranges on to the Argentine Pampas, where it is now scarce. Although occasionally seen in large flocks, the mara is more commonly found in small parties or in pairs, the parties commonly moving in single file. It has a peculiar kind of hopping gait; and is mainly diurnal, in accordance with which habit its eyes are protected by lashes. It lives in a burrow, generally excavated by itself; but when pursued, seeks safety in flight, rather than by a retreat to its hole. From two to five young are produced twice a year. A

much smaller species, *D. salinicola*, without the characteristic black band above the tail, inhabits the salt-plains of Argentina. Maras have been introduced into several British parks. Fossil species of *Dolichotis* occur in the caverns of Brazil, and also in the superficial deposits of Argentina. (R. L.)\*

**CAWDOR**, a village and parish of Nairnshire, Scotland. Pop. of parish (1901) 925. The village is situated 5 m. S.S.W. of Nairn and 3 m. from Gollanfield Junction on the Highland railway. The castle was the scene, according to the tradition which Shakespeare has perpetuated, of the murder of King Duncan by Macbeth, thane of Cawdor (or Calder), in 1040. Since the oldest part of the structure dates from 1454, however, and seemingly had no predecessor, the tradition has no foundation in fact. The building stands on the rocky bank of Cawdor Burn, a right-hand tributary of the Nairn. The massive keep with small turrets is the original portion of the castle, and to it were added, in the 17th century, the modern buildings forming two sides of a square.

Kilravock (pronounced *Kilrawk*) Castle, 1½ m. W. of Cawdor, occupies a commanding site on the left bank of the Nairn. Its keep dates from 1460, and the later buildings belong to the 17th century. It has been continuously tenanted by the Roses, one of the most remarkable families in Scotland. They came over with William the Conqueror and settled at Kilravock in 1293, since which date son has succeeded father without the interposition of a collateral heir, an instance of direct descent unique in Scottish history. Moreover, nearly every Rose has borne the Christian name of Hugh, and only one attained to a higher social rank than that of laird. Queen Mary was received at the castle in 1562, and Prince Charles Edward was entertained four days before the battle of Culloden. The gardens are remarkable for their beauty.

**CAWNPORE**, or **KANPUR**, a city and district of British India in the Allahabad division of the United Provinces. The city is situated on the south bank of the Ganges, 40 m. south-west of Lucknow, and formed from early times a frontier outpost of the people of Oudh and Bengal against their northern neighbours. Clive selected it, on account of its commanding position, as the cantonment for the brigade of troops lent him by the nawab of Oudh. In 1801, when the Ceded Provinces were acquired by the East India Company, it became the chief British frontier station. But by the time of the Mutiny the frontier had left it behind, and it was denuded of troops. Now it is chiefly known as the junction of four railways, the East Indian, Oudh & Rohilkand, Rajputana and Indian Midland, and as a great emporium for harness, shoes and other leather-work. In 1901 the population was 197,170, showing an increase of 4% in the decade. In 1903 the city was devastated by an epidemic of plague.

The name of Cawnpore is indelibly connected with the blackest episode in the history of the Indian Mutiny—the massacre here in July 1857 of hundreds of women and children by the Nana Sahib. The full details of the siege and massacre will be found under **INDIAN MUTINY**, and here it will suffice to refer to the local memorials of that evil time. The entrenchment, where General Sir H. M. Wheeler with his small band of soldiers and the European and Eurasian residents were exposed for 21 days to the fire of the mutineers, is merely a bare field, containing the well where many women and children were shot while getting water. This well is now surrounded by an enclosure with an inscription upon its cross. About three-quarters of a mile away, on the banks of the river Ganges, is the Massacre Ghat. A grassy road between banks 10 to 12 ft. high leads down to the river, and it was among the trees on these banks that the murderers concealed themselves who shot down the little garrison as soon as they were embarked in the boats which were to take them to safety. On the river bank is a temple to Siva, of hexagonal shape, old and going to ruin. Steps lead from this temple to an enclosed flight of stairs, which in the cold season descend to the water, but in the rains are covered almost to the top. This is the ghat where some 600 helpless people were slain, in spite of a promise of safe-conduct from the Nana. The remaining

200 victims, who had escaped the bullets of the siege and survived the butchery of the river bank, were massacred afterwards and cast down the famous well of Cawnpore, which is now marked by a memorial and surrounded by gardens. The memorial is crowned by the figure of an angel in white marble, and on the wall of the well itself is the following inscription:—

Sacred to the perpetual Memory of a great company of Christian people, chiefly Women and Children, who near this spot were cruelly murdered by the followers of the rebel Nana Dhundu Pant, of Bithur, and cast, the dying with the dead, into the well below, on the xvth day of July, MDCCCLVII.

The **DISTRICT OF CAWNPORE** is situated between the Ganges and Jumna rivers, and is a portion of the well-watered and fertile tract known as the Doab, the total area being 2384 sq. m. The general inclination of the country is from north to south. Besides the two great rivers, the principal streams are the Arand or Rhind, the Kavan or Singar, the Isan and the Pandu. The district is watered by four branches of the Ganges canal, and traversed by two lines of railway. It used to be a great centre of the indigo industry, which has now declined. The population in 1901 was 1,258,868, showing an increase of 4% during the decade.

**CAXTON, WILLIAM** (c. 1422–1491), the first English printer, was born somewhere in the Weald of Kent, perhaps at Tenterden. The name, which was apparently pronounced Cauxton, is identical with Causton, the name of a manor in the parish of Hadlow, and was a fairly common surname in the 15th century. The date of Caxton's birth was arbitrarily fixed in 1748 by Oldys as 1412. Blades, however, inferred that in 1438, when he was apprenticed to Robert Large, he would not have been more than sixteen years of age. This would place his birth in 1422–1423. Robert Large was a rich silk mercer who became sheriff in 1430 and lord mayor of London in 1439, and the fact of Caxton's apprenticeship to him argues that Caxton's own parents were in a good position. Large died in 1441, leaving a small bequest to Caxton, and his executors would be bound to place the young man where he could finish his term. He was probably sent direct to Bruges, then the central foreign market of the Anglo-Flemish trade, for he presently entered business there on his own account. In 1450 his name appears in the Bruges records as standing joint surety for the sum of £100; and in 1463 he was acting governor of the company of Merchant Adventurers in the Low Countries. This association, sometimes known as the "English Nation," was dominated by the Mercers' Company, to the livery of which Caxton had been formally admitted in London in 1453. The first governor, appointed in terms of a charter granted by Edward IV. in 1462, was W. Obay, but Caxton's position is definitely asserted in 1464. In that year he was appointed, together with Sir Richard Whitehill, to negotiate with Philip, duke of Burgundy, the renewal of a treaty concerning the wool trade, which was about to expire. These attempts failed, but he was again employed, with two other members of the Mercers' Company, in a similar but successful mission in October 1468 to the new duke, Charles the Bold, who earlier in the year had married Princess Margaret of York, sister of Edward IV. The last mention of Caxton in the capacity of governor of the "English Nation" is on the 13th of August 1469, and it was probably about that time that he entered the household of the duchess Margaret, possibly in the position of commercial adviser. In his diplomatic mission in 1468 he had been associated with Lord Scales, afterwards Earl Rivers and one of his chief patrons, and at the Burgundian court he must have come in touch with Edward IV. during his brief exile in 1470.

He had begun his translation of the popular medieval romance of Troy, *The Recuyell of the Histories of Troye*, from the French of Raoul le Fèvre, early in 1469; and, after laying it aside for some time, he resumed it at the wish of the duchess Margaret, to whom the MS. was presented in September 1471. During his thirty-three years' residence in Bruges Caxton would have access to the rich libraries of the duke of Burgundy and other nobles, and about this time he learned the art of printing. His disciple, Wynkyn de Worde, says that he was taught at Cologne, probably during a visit there in 1471, recorded in the preface to

the *Recuyell*; Blades suggests that he learnt from Colard Mansion, but there is no evidence that Mansion set up his press at Bruges before 1474. He ceased to be a member of the gild of St John (a gild of illuminators) in 1473, and the first dated book he is known to have printed is dated 1476. Mansion and Caxton were partners or associates at Bruges, where Caxton printed his *Recuyell* in 1474 or 1475. His second book, *The Game and Playe of Chess*, from the *Liber de ludo scaccorum* of Jacobus de Cessolis through the French of Jehan de Vignay, was finished in 1474, and printed soon after; the last book printed by Mansion and Caxton at Bruges was the *Quatre dernieres choses*, an anonymous treatise usually known as *De quatuor novissimis*. Other books in the same type were printed by Mansion at Bruges after Caxton's departure.

By September 1476 Caxton had established himself in the almshouse at Westminster at the sign of the Red Pale. Robert Copland the printer, who was afterwards one of Caxton's assistants, states that Caxton began by printing small pamphlets. The first dated book printed in England was Lord Rivers's translation (revised by Caxton) of *The Dictes or sayengis of the philosophes* (1477). From this time until his death in 1491 Caxton was busy writing and printing. His services to English literature, apart from his work as a printer (see TYPOGRAPHY), are very considerable. His most important original work is an eighth book added to the *Polychronicon* (vol. viii. in the Rolls Series edition) of Ralph Higden. Caxton revised and printed John of Trevisa's work, and brought down the narrative himself from 1358 to 1460, using as his authorities *Fasciculus temporum*, a popular work in the 15th century, and an unknown *Aureus de universo*. In the year before his death he complained in the preface to his *Eneydos* of the changing state of the English language, a condition of things which he did as much as any man to remedy. He printed Chaucer's *Canterbury Tales* (1478? and 1483), *Troilus and Cresida* (1483?), *the House of Fame* (1483?), and the translation of Boethius (1478?); Gower's *Confessio Amantis* (1483), and many poems of Lydgate. His press was, however, not worked for purely literary ends, but was a commercial speculation. For the many service-books which he printed there was no doubt a sure sale, and he met the taste of the upper classes by the tales of chivalry which issued regularly from his press. He printed Malory's *Morte d'Arthur*, and himself translated from the French the *Boke of Histories of Jason* (1477?), *The Historie of Reynart the Foxe* (from the Dutch, 1481 and 1489?), *Godfrey of Bolyone or The Siege and Conqueste of Jherusalem* (1481), *The Lyf of Charles the Grete* (1485), *The Knyght Perys and the Fayr Yvonne* (1485), *Blanchardyn and Eglantine* (1489?), *The Foure Sonnes of Aymon* (1489?); also the *Morale Proverbs* (1478), and the *Faylles of Armes and of Chyualrye* (1489) of Christine de Pisan. The most ambitious production of his press was perhaps his version of the *Golden Legend*, the translation of which he finished in November 1483. It is based on the lives of the saints as given in the 13th century *Legenda aurea* of Jacobus de Voragine, but Caxton chiefly used existing French and English versions for his compilation. The book is illustrated by seventy woodcuts, and Caxton says he was only encouraged to persevere in his laborious and expensive task by the liberality of William, earl of Arundel. The idleness which he so often deprecates in his prefaces was no vice of his, for in addition to his voluminous translations his output as a printer was over 18,000 pages, and he published ninety-six separate works or editions of works, with apparently little skilled assistance, though later printers, Wynkyn de Worde, Robert Copland and possibly Richard Pynson, were trained under him.

The different founts of type used by Caxton are illustrated by Blades and Duff, and there is an excellent selection of Caxton's in the British Museum, in the University library at Cambridge, besides those in private hands. A record price for a Caxton was reached in 1902 when Mr Bernard Quaritch paid £225 for *The Royal Book* (1487?), a translation of the popular *Somme des vies et des vertus*. His books have no title-pages, and from 1487 onwards are usually adorned with a curious device, consisting of the letters W. C. separated by a trade mark, with an elaborate

border above and below. The flourishes on the trade mark have been fancifully interpreted as S.C. for Sancta Colonia, implying that Caxton learnt his art at Cologne, and the whole mark has been read as 74, for 1474, the date of his first printed book. This device was first used in an edition of the Sarum missal, printed for Caxton by George Maynial in Paris, and was subsequently adopted with small alterations by his successor at the Westminster press, Wynkyn de Worde. The first of his books containing woodcut illustrations was his *Myrroure of the World* (1481), translated from Vincent de Beauvais, which has diagrams and pictures for the assistance of young students. He had used a woodcut initial letter in his broadside *Indulgence* printed in 1482.

No record of Caxton's marriage or of the birth of his children has been found, but Gerard Crophe was separated from his wife Elizabeth, daughter of William Caxton, before 1496, when Crophe made certain claims in connexion with his father-in-law's will.

**AUTHORITIES.**—Earlier biographies of Caxton were superseded by the work of William Blades, whose *Life and Typography of William Caxton* (2 vols., 1861-1863) remains the standard authority. It contains a bibliography of each of the works issued from Caxton's press. For later discoveries see George Bullen's *Catalogue of the Caxton celebration loan collection* exhibited at South Kensington in 1877; articles by E. J. L. Scott in *The Athenaeum* (Feb. 10, 1900; May 21 and June 8, 1892); articles in *Notes and Queries* (April 21, 1900; Feb. 24, 1906), and the publications of the Caxton Club, Chicago, notably *William Caxton*, by E. Gordon Duff (1905). See also *Census of Caxtons*, by Seymour de Ricci, No. xv. of the illustrated monographs of the Bibliographical Society, 1909. Many of Caxton's translations are available in modern reprints; the *Golden Legend*, the *Recuyell* and *Godfrey of Bolyone*, were printed by William Morris at the Kelmscott Press in 1892-1893; the *Boke of Curtesye* (1868), the *Lyf of Charles the Grete* (1880), Alain Chartier's *Curial* (1888), *Foure Sonnes of Aymon* (1884), *Eneydos* (1890), *Blanchardyn and Eglantine* (1890), and others, by the Early English Text Society. For modern editions of *Reynart* see REYNARD THE FOX.

No authentic portrait of Caxton is known, but a MS. at Magdalene College, Cambridge, of the last six books of the *Melanorophoss of Ovid*, translated by Caxton, is probably in his handwriting.

**CAYENNE**, a seaport and the capital of French Guiana, on the N.W. extremity of the island of Cayenne, and near the mouth of the river of that name, in 4° 56' 28" N., and 51° 20' 56" W. Pop. about 12,600. The town forms an almost perfect square, and has clean and well-macadamized streets. The houses, mostly of two storeys, are of wood, strengthened on the first and ground floors by brickwork. In the old town, which contains the government-house and Jesuits' College, the streets are not so regularly and well built as in the new. The Place d'Armes, a fine quadrangular space, lies between them. To the right of the governor's house is Mount Cépéron, on which stand Fort St Michel, the marine barracks, the signal station and the lighthouse. Here, too, are the capacious reservoirs for the water-supply of the town, the source of which is a lake to the south of the island. The harbour is shallow at its entrance, and craft drawing more than 14 ft. are obliged to anchor 6 m. from the town. There is no dock for the repair of vessels; but there are two quays at the town. The principal exports of Cayenne are gold, cocoa, phosphates, hides, woods and spices. The imports are French wines, spirits and liqueurs; silk and cotton stuffs, tobacco, hardware, glass, earthenware, clothing, preserved meat, fish, and vegetables, maize, flour, hay, bran, oils and cattle. There is a regular mail service between Cayenne and Martinique once a month. Cayenne is the seat of the government of French Guiana, and was formerly a penal settlement for political offenders. Food as well as clothing is exorbitantly dear, the only cheap articles of consumption being bread and French wines. The temperature of Cayenne is between 76° and 88° Fahr. throughout the year; but the heat is tempered by easterly winds. Between December and March a north wind blows, unfavourable to weak constitutions. Yellow and other fevers often attack the

inhabitants of the town, but the climate, though moist, is as a whole healthy. (See GUIANA.)

**CAYENNE PEPPER** (GUINEA PEPPER, SPANISH PEPPER, CHILLY), a preparation from the dried fruit of various species of *Capsicum*, a genus of the natural order Solanaceae. The true peppers are members of a totally distinct order, Piperaceae. The fruits of plants of the genus *Capsicum* have all a strong, pungent flavour. The capsicums bear a greenish white flower, with a star-shaped corolla and five anthers standing up in the centre of the flower like a tube, through which projects the slender style. The pod-like fruit consists of an envelope at first fleshy and afterwards leathery, within which are the spongy pulp and several seeds. The plants are herbaceous or shrubby; the leaves are entire, and alternate, or in pairs near one another; the flowers are solitary and do not arise in the leaf-axils. There are about thirty species, natives of Central and South America. They are now grown in various parts of the world, both for the sake of the fruit and for ornament. In England the annual sorts are sown from March to the middle of April under a frame. They can be planted out when 2 or 3 in. high, and in June may be transferred to a light rich soil in the open garden. They flower in July or August, and produce pods from August till the end of September. The perennial and shrubby kinds may be wintered in a conservatory. Several species or varieties are used to make cayenne pepper. The annual or common capsicum (*C. annuum*), the Guinea pepper plant, was brought to Europe by the Spaniards, and was grown in England in 1548. It is indigenous to South America, but is now cultivated in India, Hungary, Italy, Spain and Turkey, with the other species of capsicum. It is a hardy herbaceous plant, which attains a height of 2 or 3 ft. There are numerous cultivated forms, differing in the shape and colour of the pod, which varies from more or less roundish to narrow-conical, with a smooth or wrinkled coat, and white, yellow, red or black in colour. The principal source of cayenne pepper is *C. frutescens*, the spur or goat pepper, a dwarf shrub, a native of South America, but commonly cultivated in the East Indies. It produces a small, narrow, bright red pod, having very pungent properties. *C. tetragonum*, or bonnet pepper, is a species much esteemed in Jamaica; it bears very fleshy fruits. Other well-known kinds of capsicum are the cherry pepper (*C. cerasiforme*), with small berries; bell pepper (*C. grossum*), which has thick and pulpy fruit, well adapted for pickling; and berry or bird pepper (*C. baccatum*). The last mentioned has been grown in England since 1731; its fruit is globular, and about the size of a cherry. The West Indian stomachic *man-dram* is prepared by mashing a few pods of bird pepper and mixing them with sliced cucumber and shallots, to which have been added a little lime-juice and Madeira wine. Chillies, the dried ripe or unripe fruit of capsicums, especially *C. annuum* and *C. frutescens*, are used to make chilly-vinegar, as well as for pickles. Cayenne pepper is manufactured from the ripe fruits, which are dried, ground, mixed with wheat flour, and made into cakes with yeast; the cakes are baked till hard like biscuit, and then ground and sifted. The pepper is sometimes prepared by simply drying the pods and pounding them fine in a mortar. Cayenne pepper is occasionally adulterated with red lead, vermilion, ochre, salt, ground-rice and turmeric. The taste of the pepper is impaired by exposure to damp and the heat of the sun. Chillies have been in use from time immemorial; they are eaten in great quantity by the people of Guiana and other warm countries, and in Europe are largely consumed both as a spice and as medicine.

The dried ripe fruit of *Capsicum frutescens* from Zanzibar, known as pod pepper and Guinea pepper, is official in the British Pharmacopoeia under the name *Capsici Fructus*. The fruit has a characteristic, pungent odour and an intensely hitter taste. The chief constituents are a crystallizable resin, capsacin, a volatile alkaloid, capsicine and a volatile oil. The dose is  $\frac{1}{2}$ -1 grain. The British Pharmacopoeia contains two preparations of capsicum, a tincture (dose 5-15 minims) and an ointment. Externally the drug has the usual action of a volatile oil, being a very powerful counter-irritant. It does not, however, cause pustulation. Its internal action is also that of its class, but its

marked contact properties make it specially useful in gastronomy and flatulence, and sometimes in hysteria.

**CAYEY**, an inland district and mountain town of the department of Guayama, Porto Rico, celebrated for its cool, invigorating climate and the beauty of its scenery. Pop. (1899) of the town, 3763; of the district, 14,442. The town is surrounded by mountain summits, the highest of which, El Torito, rises to an elevation of 2362 ft. above sea-level. It was made a military post by the Spaniards and used as an acclimatizing station. The old Spanish barracks have been enlarged and improved by the American military authorities and, under the name of "Henry Barracks," are used for the same purpose. The town is a popular summer resort for residents of the coast cities. The surrounding country is wooded and very fertile, being especially noted for its coffee and tobacco. The town has large cigar factories. Cayey is connected with Guayama by an excellent military road.

**CAYLEY, ARTHUR** (1821-1895), English mathematician, was born at Richmond, in Surrey, on the 16th of August 1821, the second son of Henry Cayley, a Russian merchant, and Maria Antonia Doughty. His father, Henry Cayley, retired from business in 1829 and settled in Blackheath, where Arthur was sent to a private school kept by the Rev. G. B. F. Potticary; at the age of fourteen he was transferred to King's College school, London. He soon showed that he was a boy of great capacity, and in particular that he was possessed of remarkable mathematical ability. On the advice of the school authorities he was entered at Trinity College, Cambridge, as a pensioner. He was there coached by William Hopkins of Peterhouse, was admitted a scholar of the college in May 1840, and graduated as senior wrangler in 1842, and obtained the first Smith's Prize at the next examination. In 1842, also, he was elected a fellow of Trinity, and became a major fellow in 1845, the year in which he proceeded to the M. A. degree. He was assistant tutor of Trinity for three years. In 1846, having decided to adopt the law as a profession, he left Cambridge, entered at Lincoln's Inn, and became a pupil of the conveyancer Mr Christie. He was called to the bar in 1849, and remained at the bar fourteen years, till 1863, when he was elected to the new Sadlerian chair of pure mathematics in the university of Cambridge. He settled at Cambridge in the same year, and married Susan, daughter of Robert Moline of Greenwich. He continued to reside in Cambridge and to hold the professorship till his death, which occurred on the 26th of January 1895. From the time he went first to Cambridge till his death he was constantly engaged in mathematical investigation. The number of his papers and memoirs, some of them of considerable length, exceeds 800; they were published, at the time they were composed, in various scientific journals in Europe and America, and are now embodied, through the enterprise of the syndics of the Cambridge University Press, in thirteen large quarto volumes. These form an enduring monument to his fame. He wrote upon nearly every subject of pure mathematics, and also upon theoretical dynamics and spherical and physical astronomy. He was quite as much a geometer as he was an analyst. Among his most remarkable works may be mentioned his ten memoirs on quantics, commenced in 1854 and completed in 1878; his creation of the theory of matrices; his researches on the theory of groups; his memoir on abstract geometry, a subject which he created; his introduction into geometry of the "absolute"; his researches on the higher singularities of curves and surfaces; the classification of cubic curves; additions to the theories of rational transformation and correspondence; the theory of the twenty-seven lines that lie on a cubic surface; the theory of elliptic functions; the attraction of ellipsoids; the British Association Reports, 1857 and 1862, on recent progress in general and special theoretical dynamics, and on the secular acceleration of the moon's mean motion. He is justly regarded as one of the greatest of mathematicians. Competent judges have compared him to Leonhard Euler for his range, analytical power and introduction of new and fertile theories. He was the recipient of nearly every academic distinction that can be conferred upon an eminent man

of science. Amongst others may be noted honorary degrees by the universities of Oxford, Dublin, Edinburgh, Göttingen, Heidelberg, Leiden and Bologna. He was fellow or foreign corresponding member of the French Institute, the academies of Berlin, Göttingen, St Petersburg, Milan, Rome, Leiden, Upsala and Hungary; and he was nominated an officer of the Legion of Honour by President Carnot. At various times he was president of the Cambridge Philosophical Society, of the London Mathematical Society and of the Royal Astronomical Society. He was elected a fellow of the Royal Society in 1852, and received from that body a Royal medal in 1859 and the Copley medal in 1882. He also received the De Morgan medal from the London Mathematical Society, and the Huygens medal from Leiden. His nature was noble and generous, and the universal appreciation of this fact gave him great influence in his university. His portrait, by Lewis Dickinson, was placed in the hall of Trinity College in 1874, and his bust, by Henry Wiles, in the library of the same college in 1888. (P. A. M.)

**CAYLUS, ANNE CLAUDE PHILIPPE DE TUBIÈRES DE GRIMOARD DE PESTELS DE LÉVIS, COMTE DE**, Marquis d'Esternay, baron de Bransac (1692-1765), French archaeologist and man of letters, was born at Paris on the 31st of October 1692. He was the eldest son of Lieutenant-General Count de Caylus. His mother, Marthe Marguerite le Valois de Vilette de Murçay, comtesse de Caylus (1673-1729), was a cousin of Mme de Maintenon, who brought her up like her own daughter. She wrote valuable memoirs of the court of Louis XIV. entitled *Souvenirs*; these were edited by Voltaire (1770), and by many later editors, notably Renouard (1806), Ch. Asselineau (1860), M. de Lescurc (1874), M. E. Raunif (1881), J. Soury (1883). While a young man Caylus distinguished himself in the campaigns of the French army, from 1709 to 1714. After the peace of Rastadt he spent some time in travelling in Italy, Greece, the East, England and Germany, and devoted much attention to the study and collection of antiquities. He became an active member of the Academy of Painting and Sculpture and of the Academy of Inscriptions. Among his antiquarian works are *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines, et gauloises* (6 vols., Paris, 1752-1755), *Numismata Aurea Imperatorum Romanorum*, and a *Mémoire* (1755) on the method of encaustic painting with wax mentioned by Pliny, which he claimed to have rediscovered. Diderot, who was no friend to Caylus, maintained that the proper method had been found by J. J. Bachelier. Caylus was an admirable engraver, and copied many of the paintings of the great masters. He caused engravings to be made, at his own expense, of Bartoli's copies from ancient pictures and published *Nouveaux sujets de peinture et de sculpture* (1755) and *Tableaux tirés de l'Iliade, de l'Odyssée, et de l'Énéide* (1757). He encouraged artists whose reputations were still in the making, but his patronage was somewhat capricious. Diderot expressed this fact in an epigram in his *Salon* of 1765: "La mort nous a délivrés du plus cruel des amateurs." Caylus had quite another side to his character. He had a thorough acquaintance with the gayest and most disreputable sides of Parisian life, and left a number of more or less witty stories dealing with it. These were collected (Amsterdam, 1787) as his *Œuvres badines complètes*. The best of them is the *Histoire de M. Guillaumme, cocher* (c. 1730).

The *Souvenirs du comte de Caylus*, published in 1805, is of very doubtful authenticity. See also A. and J. de Goncourt. *Portraits intimes du XVIII<sup>e</sup> siècle*; Ch. Nisard's edition of the *Correspondance du comte de Caylus avec le père Paciaudi* (1877); and a notice by O. Uzanne prefixed to a volume of his *Facéties* (1879).

**CAYMAN ISLANDS**, a group of three low-lying islands in the West Indies. They consist of Grand Cayman, Little Cayman and Cayman Brac, and are situated between 79° 44' and 80° 26' W. and 19° 44' and 19° 46' N., forming a dependency of Jamaica, which lies 178 m. E.S.E. Grand Cayman, a rock-bound island protected by coral reefs, is 17 m. long and varies from 4 m. to 7 m. in breadth. It has two towns, Georgetown and Boddentown. Little Cayman and Cayman Brac are both about 70 m. E.N.E. of Grand Cayman. Excepting near the rocky coast, the islands are fruitful, mahogany and other valuable timbers with some dye-

wood are grown, and large quantities of coco-nuts are produced by the two smaller islands. Phosphate deposits of considerable value are worked, but the principal occupation of the inhabitants is catching turtles for export to Jamaica. The people are excellent shipwrights and do a considerable trade in schooners built of native wood. The islands are governed by a commissioner, and the laws passed by the local legislative assembly are subject to the assent of the governor of Jamaica. The population of the group is about 5000. The islands were discovered by Columbus, who named them Tortugas from the turtles with which the surrounding sea abounds. They were never occupied by the Spaniards and were colonized from Jamaica by the British.

**CAZALÈS, JACQUES ANTOINE MARIE DE** (1758-1805), French orator and politician, was born at Grenade in Languedoc, of a family of the lower nobility. Before 1789 he was a cavalry officer, but in that year was returned as deputy to the states general. In the Constituent Assembly he belonged to the section of moderate royalists who sought to set up a constitution on the English model, and his speeches in favour of retaining the right of war and peace in the king's hands and on the organization of the judiciary gained the applause even of his opponents. Apart from his eloquence, which gave him a place among the finest orators of the Assembly, Cazalès is mainly remembered for a duel fought with Barnave. After the insurrection of the 10th of August 1792, which led to the downfall of royalty, Cazalès emigrated. He fought in the army of the *émigrés* against revolutionary France, lived in Switzerland and in England, and did not return to France until 1803. He died on the 24th of November 1805. His son, Edmond de Cazalès, wrote philosophical and religious studies.

See *Discours de Cazalès*, edited by Chare (Paris, 1821), with an introduction; F. A. Aulard, *Les Orateurs de la Constituante* (2nd ed. Paris, 1905.)

**CAZALIS, HENRI** (1840-1909), French poet and man of letters, was born at Cormeilles-en-Parisis (Seine-et-Oise) in 1840. He wrote under the pseudonyms of Jean Caselli and Jean Lahot. His works include: *Chants populaires de l'Italie* (1865); *Vies tristes, Réveries fantastiques, Romances sans musique* (1865); *Le Livre du néant* (1872); *Henry Regnault, sa vie et son œuvre* (1872); *L'Illusion* (1875-1893); *Melancholia* (1878); *Castagne des cantiques* (1885); *Les Quatraines d'Al-Cazalis* (1896); *William Morris* (1897). The author of the *Livre du néant* has a predilection for gloomy subjects and especially for pictures of death. His oriental habits of thought earned for him the title of the "Hindou du Parnasse contemporain." He died in July 1909.

See a notice by P. Bourget in *Anthologie des poètes fr. du XIX<sup>e</sup> siècle* (1887-1888); J. Lemaitre, *Les Contemporains* (1889); E. Faguet in the *Revue bleue* (October 1893).

**CAZEMBE**, the hereditary name of an African chief, whose territory was situated south of Lake Mweru and north of Bangweulu, between 9° and 11° S. In the end of the 18th century the authority of the Cazembe was recognized over a very extensive district. The kingdom, known also as the Cazembe, continued to exist, though with gradually diminishing power and extent, until the last quarter of the 19th century, when the Cazembe sank to the rank of a petty chief. The country is now divided between Great Britain and Belgian Congo. The British half, lying east of the Luapula, forms part of Rhodesia, and the chief town in it is called Kazembe. The native state, ruled by a negro race who overcame the aboriginals, had attained a certain degree of civilization. Agriculture was diligently followed, and cotton cloth, earthenware and iron goods manufactured. The country contains rich deposits of copper, and copper ore was one of the principal articles of export. The Cazembe had despotic power and used it in barbarous fashion. He had hundreds of wives, and his chiefs imitated his example according to their means. On his accession every new Cazembe chose a new site for his residence. In 1796 the Cazembe was visited by Manoel Caetano Pereira, a Portuguese merchant; and in 1798 a more important journey to the same region was undertaken by Dr Francisco José Maria de Lacerda. He died in that country on

the 18th of October that year, but left behind him a valuable journal. In 1802 two native traders or *pombeiros*, Pedro João Baptista and Amaro José, were sent by the Portuguese on a visit to the Cazembe; and in 1831 a more extensive mission was despatched by the Portuguese governor of Sena. It consisted of Major José Monteiro and Antonio Gamitto, with an escort of 20 soldiers and 120 negro slaves as porters; but its reception by the Cazembe was not altogether satisfactory. In 1868 David Livingstone visited the Cazembe, whose capital at that time numbered no more than 1000 souls. Since 1894, when the country was divided between Britain and the Congo State, it has been thoroughly explored. An important copper mining industry is carried on in the Congo division of the territory.

See *The Lands of the Cazembe*, published by the Royal Geographical Society in 1873, containing translations of Lacerda and Baptista's journals, and a résumé of Gamitto's *O Muata Cazembe* (Lisbon, 1854); also Livingstone's *Last Journals* (London, 1874).

**CAZIN, JEAN CHARLES** (1840-1901), French landscape-painter, son of a well-known doctor, F. J. Cazin (1788-1864), was born at Samer, Pas-de-Calais. After studying in France, he went to England, where he was strongly influenced by the pre-Raphaelite movement. His chief earlier pictures have a religious interest, shown in such examples as "The Flight into Egypt" (1877), or "Hagar and Ishmael" (1880, Luxembourg); and afterwards his combination of luminous landscape with figure-subjects ("Souvenir de fête," 1881; "Journée faite," 1888) gave him a wide repute, and made him the leader of a new school of idealistic subject-painting in France. He was made an officer of the Legion of Honour in 1880. His charming and poetical treatment of landscape is the feature in his painting which in later years has given them an increasing value among connoisseurs. His wife, Marie Cazin, who was his pupil and exhibited her first picture at the Salon in 1876, the same year in which Cazin himself made his début there, was also a well-known artist and sculptor.

**CAZOTTE, JACQUES** (1719-1792), French author, was born at Dijon, on the 17th of October 1719. He was educated by the Jesuits, and at twenty-seven he obtained a public office at Martinique, but it was not till his return to Paris in 1760 with the rank of commissioner-general that he made a public appearance as an author. His first attempts, a mock romance, and a coarse song, gained so much popularity, both in the court and among the people, that he was encouraged to essay something more ambitious. He accordingly produced his romance, *Les Promesses inimitables d'Ollivier, marquis d'Édesse*. He also wrote a number of fantastic oriental tales, such as his *Mille et une Jadaïtes, Contes à dormir debout* (1743). His first success was with a "poem" in twelve cantos, and in prose intermixed with verse, entitled *Ollivier* (2 vols., 1762), followed in 1771 by another romance, the *Lord Impromptu*. But the most popular of his works was the *Diable amoureux* (1772), a fantastic tale in which the hero raises the devil. The value of the story lies in the picturesque setting, and the skill with which its details are carried out. Cazotte possessed extreme facility and is said to have turned off a seventh canto of Voltaire's *Guerre civile de Genève* in a single night. About 1775 Cazotte embraced the views of the Illuminati, declaring himself possessed of the power of prophecy. It was upon this fact that La Harpe based his famous *jeu d'esprit*, in which he represents Cazotte as prophesying the most minute events of the Revolution. On the discovery of some of his letters in August 1792, Cazotte was arrested; and though he escaped for a time through the love and courage of his daughter, he was executed on the 25th of the following month.

The only complete edition is the *Œuvres badines et morales, historiques et philosophiques de Jacques Casotte* (4 vols., 1816-1817), though more than one collection appeared during his lifetime. An édition de luxe of the *Diable amoureux* was edited (1878) by A. J. Pons, and a selection of Cazotte's *Contes*, edited (1880) by Octave Uzanne, is included in the series of *Petits Contes du XVIII<sup>e</sup> siècle*. The best notice of Cazotte is in the *Illuminés* (1852) of Gérard de Nerval.

**CEANOTHUS**, in botany, a genus of the natural order Rhamnaceæ, containing about forty species of shrubs or small trees, natives of North America. They are very attractive from their dense panicles of white or blue flowers, and several species are

known as garden plants. The leaves of one of these, *C. americanus*, New Jersey tea, or red-root, are used instead of the true tea; the root, which contains a red colouring matter, has long been employed by the Indians as a febrifuge.

**CEARÁ**, a northern maritime state of Brazil, bounded N. by the Atlantic, E. by the Atlantic and the states of Rio Grande do Norte and Parahyba, S. by Pernambuco, and W. by Piauh; and having an area of 40,253 sq. m. It lies partly upon the north-east slope of the great Brazilian plateau, and partly upon the sandy coastal plain. Its surface is a succession of great terraces, facing north and north-east, formed by the denudation of the ancient sandstone plateau which once covered this part of the continent; the terraces are scamed by watercourses, and their valleys are broken by hills and ranges of highlands. The latter are usually described as mountain ranges, but they are, in fact, only the remains of the ancient plateau, capped with horizontal strata of sandstone, and having a remarkably uniform altitude of 2000 to 2400 ft. The flat top of such a range is called a *chapada* or *taboieira*, and its width in places is from 32 to 56 m. The boundary line with Piauh follows one of these ranges, the Serra de Ibiapaba, which unites with another range on the southern boundary of the state, known as the Serra do Araripe. Another range, or escarpment, crosses the state from east to west, but is broken into two principal divisions, each having several local names. These ranges are not continuous, the breaking down of the ancient plateau having been irregular and uneven. The higher ranges intercept considerable moisture from the prevailing trade winds, and their flanks and valleys are covered with forest, but the plateaus are either thinly wooded or open campo. These upland forests are of a scrubby character and are called *catingas*.

The sandy, coastal plain, with a width of 12 to 18 m., is nearly bare of vegetation. The rivers of the state are small and, with one or two exceptions, become completely dry in the dry season. The largest is the Jaguaribe, which flows entirely across the state in a north-east direction with an estimated length of 210 to 465 m. The year is divided into a rainy and dry season, the rains beginning in January to March and lasting until June. The dry season, July to December, is sometimes broken by slight showers in September and October, but these are of very slight importance. The soil is thin and porous and does not retain moisture, consequently the long, dry season turns the country into a barren desert, relieved only by vegetation along the river courses and mountain ranges, and by the hardy, widely-distributed carnubá palm (*Copernicia cerifera*), which in places forms groves of considerable extent. Sometimes the rains fail altogether, and then a drought (*sêcca*) ensues, causing famine and pestilence throughout the entire region. The most destructive droughts recorded are those of 1711, 1723, 1777-1778, 1790, 1825, 1844-1845, and 1877-1878, the last-mentioned destroying nearly all the live-stock in the state, and causing the death through starvation and pestilence of nearly half-a-million people, or over half the population. The climate, which is generally described as beautiful, is hot and humid on the coast, tempered by the cool trade winds; but in the more elevated regions it is very hot and dry, although the nights are cool. The sandy zone along the coast is nearly barren, but behind this is a more elevated region with broken surfaces and sandy soil which is amenable to cultivation and produces fruit and most tropical products when conditions are favourable.

The higher plateau is devoted almost exclusively to cattle-raising, once the principal industry of the state, though recurring *sêccas* have been an insuperable obstacle to its profitable development. There is still a considerable export of cattle, hides and skins, but no effort is made to develop the production of jerked beef on a large scale. Horses are raised to a limited extent; also goats, sheep and swine. The principal agricultural products are cotton, coffee, sugar, mandioca and tropical fruits. The production of cotton has increased largely since the development of cotton manufactures in Brazil. The natural vegetable productions are important, and include *manicoba* or Ceará rubber, carnubá wax and fibre, cajú wine and ipecacuanha.

There are two lines of railway running inland from the coast: the Baturité line from Fortaleza to Senador Pompeu, 179 m., and the Sobral line from Camocim (a small port) to Ipú, 134 m. These railways were built by the national government after the drought of 1877-1878 to give work to the starving refugees, and are now operated under leases. Great dams were also begun for irrigation purposes.

The misfortunes and poverty of the people have hindered their material development to a large extent, but another obstacle is to be found in their racial and social composition. Only a very small percentage of the population which numbered 805,687 in 1890, and 849,127 in 1900, is of pure European origin, the great majority being of the coloured races and their mixtures with the whites. The number of landed proprietors, professional men, merchants, &c., is comparatively small (about one-sixth), and a part of these are of mixed blood; the remaining five-sixths own no property, pay no taxes, and derive no benefits from the social and political institutions about them beyond the protection of the proprietors upon whose estates they live, the nominal protection of the state, and an occasional day's wage. Education has made no impression upon such people, and is confined almost exclusively to the upper classes, from which some of the most prominent men in Brazilian politics and literature have come. The state of Ceará has formed a bishopric of the Roman Catholic Church since 1853, the bishop having his residence at Fortaleza. The state is represented in the national congress by three senators and ten deputies. Its local government is vested in a president and legislative assembly of one chamber elected for a period of four years. Three vice presidents are elected at the same time who succeed to the presidency in case of a vacancy according to the number of votes received. The judicial organization consists of the tribunal da Relação at the state capital and subordinate courts in the *comarcas* and *termos*. The judges of the higher courts are appointed for life. The capital of the state is Fortaleza, sometimes called Ceará, which is also the principal commercial centre and shipping port. The principal towns are Aracaty, Baturité, Acarahú, Crato, Maranguape and Sobral.

The territory of Ceará includes three of the *capitanias* originally granted by the Portuguese crown in 1534. The first attempts to settle the territory failed, and the earliest Portuguese settlement was made near the mouth of the Rio Camocim in 1604. The French were already established on the coast, with their headquarters at Saint Louis, now Maranhão. Ceará was occupied by the Dutch from 1637 to 1654, and became a dependency of Pernambuco in 1680; this relationship lasted until 1799, when the *capitania* of Ceará was made independent. The *capitania* became a province in 1822 under Dom Pedro I. A revolution followed in 1824, the president of the province was deposed fifteen days after his arrival, and a republic was proclaimed. Internal dissensions immediately broke out, the new president was assassinated, and after a brief reign of terror the province resumed its allegiance to the empire. Ceará was one of the first provinces of Brazil to abolish slavery.

See Rodolpho Theophilo, *Historia da Secca do Ceará, 1877 a 1880* (Fortaleza, 1883); Professor and Mrs Louis Agassiz, *A Journey in Brazil* (Boston, 1869); George Gardner, *Travels in the Interior of Brazil* (London, 1846); C. F. Hartt, *Geology and Physical Geography of Brazil* (Boston, 1879); and H. H. Smith, *Brazil: the Amazon and the Coast* (New York, 1879).

**CEAWLIN** (d. 593), king of the West Saxons, first mentioned in the *Anglo-Saxon Chronicle* under the date 556 as fighting with his father Cynric against the Britons at the battle of Beranbyrig or Barbury Hill. Becoming king in 560, he began a career of conquest. Silchester was taken, and moving eastwards Ceawlin and his brother Cutha defeated the forces of Æthelberht, king of Kent, at the battle of Wibbandun in 568. In 577 he led the West Saxons from Winchester towards the Severn valley; gained an important victory over some British kings at Deorham, and added the district round Gloucester, Bath and Cirencester to his kingdom. A further advance was begun in 583. Uriconium, a town near the Wrekin, and Pengwynn, the modern Shrewsbury, were destroyed; but soon Ceawlin was defeated by the Britons

at Fethanleag or Faddiley, near Nantwich, and his progress was effectually checked. Intestine strife among the West Saxons followed. In 591 Ceawlin lost the western part of his kingdom, and in 592 was defeated by his nephew, Ceolric, at Wanborough, and driven from Wessex. He was killed in 593, possibly in an attempt to regain his kingdom. Ceawlin is included in the *Chronicle* among the Bretwaldas.

See *Two of the Saxon Chronicles*, ed. by C. Plummer (Oxford, 1892); *Dictionary of National Biography*, vol. ix (London, 1887); E. Gues. *Origines Celticae*, vol. ii. (London, 1883).

**CEBES**, the name of two Greek philosophers. (1) **CEBES** of CYZICUS, mentioned in Athenaeus (iv. 156 D), seems to have been a Stoic, who lived during the reign of Marcus Aurelius. Some would attribute to him the *Tabula Cebetis* (see below), but as that work was well known in the time of Lucian, it is probably to be placed earlier. (2) **CEBES** of THEBES, a disciple of Socrates and Philolaus. He is one of the speakers in the *Phaedo* of Plato, in which he is represented as an earnest seeker after virtue and truth, keen in argument and cautious in decision. Three dialogues, the *Ἐπισήμιον*, the *Φρόνησις* and the *Ἠλιὰς* or *Tabula*, are attributed to him by Suidas and Diogenes Laërtius. The two former are lost, and most scholars deny the authenticity of the *Tabula* on the ground of material and verbal anachronisms. They attribute it either to Cebes of Cyzicus (above) or to an anonymous author, of the 1st century A.D., who assumed the character of Cebes of Thebes. The work professes to be an interpretation of an allegorical picture in the temple of Cronus at Athens or Thebes. The author develops the Platonic theory of pre-existence, and shows that true education consists not in mere erudition, but rather in the formation of character.

The *Tabula* has been widely translated both into European languages and into Arabic (the latter version published with the Greek text and Latin translation by Salmasius in 1640). It is usually printed together with Epictetus. Separate editions by C. S. Jerram (with introduction and notes, 1878), C. Prächter (1893), and many others. See Zeller's *History of Greek Philosophy*; F. Klopfer, *De Cebetis Tabula* (1818-1822); C. Prächter, *Cebetis Tabula quoniam aetate conscripta esse videatur* (1885).

**CEBÚ**, a city and municipality, port of entry, and the capital of the province of Cebú, island of Cebú, Philippine Islands, on the E. coast, a little N. of the centre. Pop. (1903) of the city proper, 18,330; of the municipality, 31,079; in the same year, after the census enumeration, the neighbouring municipalities of Mabolo (pop. 1903, 8454) and El Pardo (pop. 6461) were added to the municipality of Cebú. The surrounding country, which is level and fertile, is traversed by several good carriage roads. The port, formed by the north-west shore of the island of Mactán, is well protected from violent winds, and in front of it stands a picturesque Spanish fort. The streets are wide and regularly laid out. The government buildings are fairly good, and the church buildings very fine. Cebú is an episcopal see, and the palace of the bishop, although small, is widely known for its interior decorations. The Augustinian church is famous for its so-called miraculous image of Santo Niño. The Recoleta monastery and the seminary of San Carlos are worthy of mention. The cathedral was finished toward the end of the eighteenth century. The San José hospital here was founded by one of the religious orders. There was a leper hospital in the outskirts of the city until 1906, when a leper colony was established on the island of Culián. Commercially, Cebú is the second city of the Philippines. Hemp, tobacco, sugar and copra are the most important exports. In addition to the trade with foreign ports, an important domestic commerce is carried on with Manila, Bohol, Negros and northern Mindanao. Salt, pottery and fabrics of silk, sinamay, hemp and cotton are manufactured, and sugar sacks are woven in considerable quantity. The island of Cebú is known for its excellent mangoes and for the rare cornucopia-shaped sponges, called Venus's flower basket (*Euplectella aspergillum*), found here. Historically Cebú is famous as the scene of Magellan's landing in 1521. A cross, said to be the one first erected by him, is still preserved in the cathedral. The great explorer lost his life in the neighbouring island of Mactán; a monument marks the place where he was

killed. The first Spanish settlement in the Philippines was established at Cebu in 1565, and from that year to 1571 it was the capital of the colony. The city is unincorporated. The language is Cebu-Visayan.

**CECCO D'ASCOLI** (1257-1327), the popular name of FRANCESCO DEGLI STABILI, a famous Italian encyclopaedist and poet—Cecco being the diminutive of Francesco, and Ascoli, in the marshes of Ancona, the place of the philosopher's birth. He devoted himself to the study of mathematics and astrology, and in 1322 was made professor of the latter science at the university of Bologna. It is alleged that he entered the service of Pope John XXII. at Avignon, and that he cultivated the acquaintance of Dante only to quarrel with the great poet afterwards; but of this there is no evidence. It is certain, however, that, having published a commentary on the sphere of John de Sacrobosco, in which he propounded audacious theories concerning the employment and agency of demons, he got into difficulties with the clerical party, and was condemned in 1324 to certain fasts and prayers, and to the payment of a fine of seventy crowns. To elude this sentence he betook himself to Florence, where he was attached to the household of Carlo di Calabria. But his free-thinking and plain speaking had got him many enemies; he had attacked the *Commedia* of Dante, and the *Cansone d' Amore* of Guido Cavalcanti; and his fate was sealed. Dino di Garbo, the physician, was indefatigable in pursuit of him; and the old accusation of impiety being renewed, Cecco was again tried and sentenced, this time to the stake. He was burned at Florence the day after sentence, in the seventieth year of his age.

Cecco d' Ascoli left many works in manuscript, most of which have never been given to the world. The book by which he achieved his renown and which led to his death was the *Acerba* (from *acerus*), an encyclopaedic poem, of which in 1546, the date of the last reprint, more than twenty editions had been issued. It is unfinished, and consists of four books in *resta rima*. The first book treats of astronomy and meteorology; the second of stellar influences, of physiognomy, and of the vices and virtues; the third of minerals and of the love of animals; while the fourth propounds and solves a number of moral and physical problems. Of a fifth book, on theology, the initial chapter alone was completed. A man of immense erudition and of great and varied abilities, Cecco, whose knowledge was based on experiment and observation (a fact that of itself is enough to distinguish him from the crowd of savants of that age), had outstripped his contemporaries in many things. He knew of metallic aerolites and shooting stars; the mystery of the dew was plain to him; fossil plants were accounted for by him through terrene revolutions which had resulted in the formation of mountains; he is even said to have divined the circulation of the blood. Altogether a remarkable man, he may be described as one of the many Cassandras of the middle ages—one of the many prophets who spoke of coming light, and were listened to but to have their words cast back at them in accusations of impiety and sentences of death.

The least faulty of the many editions of the *Acerba* is that of Venice, dated 1510. The earliest known, which has become exceedingly rare, is that of Brescia, which has no date, but is ascribed to 1473 or thereabouts.

**CECILIA**, the name of a famous English family. This house, whose two branches hold each a marquessate, had a great statesman and administrator to establish and enrich it. The first Lord Burghley's many inquiries concerning the origin of his family created for it more than one splendid and improbable genealogy, although his grandfather is the first ascertained ancestor. In the latter half of the 15th century a family of yeomen or small gentry with the surname of Seyceld, whose descendants were accepted by Lord Burghley as his kinsmen, lived on their lands at Allt yr Ynys in Walterstone, a Herefordshire parish on the Welsh marches. Of the will of Richard ap Philip Seyceld of Allt yr Ynys, made in 1508, one David ap Richard Seyceld, apparently his younger son, was overseer. This David seems identical with David Cyssell, Scisseld or Cecil, a yeoman admitted in 1494 to the freedom of Stamford in Lincolnshire. He may well have been one of those men from the Welsh

border who fought at Bosworth, for at the funeral of Henry VII. he appears as a yeoman of the guard and is given a livery of black cloth. At Stamford he prospered, being three times mayor and three times member of parliament for the borough, and he served as sheriff of Northamptonshire in 1532-1533. Remaining in the service of Henry VIII. he was advanced to be yeoman of the chamber and sergeant-at-arms, being rewarded with several profitable leases and offices. His first wife was the daughter of a Stamford alderman, and his second the already twice widowed heir of a Lincolnshire squire. By the first marriage David Cecil left at his death in 1536 a son and heir, Richard Cecil, who enjoyed a place at court as yeoman of the king's wardrobe under Henry VIII. and Edward VI. A gentleman of the privy chamber and sometime sheriff of Rutland, Richard Cecil had his share at the distribution of abbey lands, St Michael's priory in Stamford being among the grants made to him. William Cecil, only son of Richard, was born, by his own account, in 1520, at Bourne in Lincolnshire. He advanced himself first in the service of the protector Somerset, after whose fall, his great abilities being necessary to the council, he was made a secretary of state and sworn of the privy council. In 1571 he was created Lord Burghley, and from 1572, when he was given the Garter, he was lord high treasurer and principal minister to Queen Elizabeth. By his first wife, Mary Cheke, sister of the scholar Sir John Cheke, tutor to Edward VI., he was father to Thomas, first earl of Exeter. By a second wife, Mildred Cooke, the most learned lady of her time, he had an only surviving son, Robert Cecil, ancestor of the house of Salisbury.

Created earl of Exeter by James I., the second Lord Burghley was more soldier than statesman, and from his death to the present day the elder line of the Cecils has taken small part in public affairs. William Cecil, 2nd earl of Exeter, took as his first wife the Lady Roos, daughter and heir of the 3rd earl of Rutland of the Manners family. The son of this marriage inherited the barony of Roos as heir general, and died as a Roman Catholic at Naples in 1618 leaving no issue. A third son of the 1st earl was Edward Cecil, a somewhat incompetent military commander, created in 1625 Lord Cecil of Putney and Viscount Wimbledon, titles that died with him in 1638, although he was thrice married. In 1801 a marquessate was given to the 10th earl of Exeter, the story of whose marriage with Sarah Hoggins, daughter of a Shropshire husbandman, has been refined by Tennyson into the romance of "The Lord of Burleigh." This elder line is still seated at Burghley, the great mansion built by their ancestor, the first lord.

The younger or Hatfield line was founded by Robert Cecil, the only surviving son of the great Burghley's second marriage. As a secretary of state he followed in his father's steps, and on the death of Elizabeth he may be said to have secured the accession of King James, who created him Lord Cecil of Essendine (1603), Viscount Cranborne (1604), and earl of Salisbury (1605). Forced by the king to exchange his house of Theobalds for Hatfield, he died in 1612, worn out with incessant labour, before he could inhabit the house which he built upon his new Hertfordshire estate. Of Burghley and his son Salisbury, "great ministers of state in the eyes of Christendom," Clarendon writes that "their wisdom and virtues died with them." The 2nd earl of Salisbury, "a man of no words, except in hunting and hawking," was at first remarked for his obsequiousness to the court party, but taking no part in the Civil War came at last to sit in the Protector's parliament. After the Restoration, Pepys saw him, old and discredited, at Hatfield, and notes him as "my simple Lord Salisbury." The 7th earl was created marquess of Salisbury in 1780.

Hatfield House, a great Jacobean mansion which has suffered much from restoration and rebuilding, contains in its library the famous series of state papers which passed through the hands of Burghley and his son Salisbury, invaluable sources for the history of their period. (O. BA.)

**CECILIA, SAINT**, in the Catholic Church the patron saint of music and of the blind. Her festival falls on the 22nd of November. It was long supposed that she was a noble lady of Romę

who, with her husband and other friends whom she had converted, suffered martyrdom, c. 230, under the emperor Alexander Severus. The martyres of de Rossi, however (*Rom. soll.* ii. 147), go to confirm the statement of Fortunatus, bishop of Poitiers (d. 600), that she perished in Sicily under Marcus Aurelius between 176 and 180. A church in her honour existed in Rome from about the 4th century, and was rebuilt with much splendour by Pope Paschal I. about the year 820, and again by Cardinal Sfondrati in 1590. It is situated in the Trastevere near the Ripa Grande quay, where in earlier days the Ghetto was located, and gives a "title" to a cardinal priest. Cecilia, whose musical fame rests on a passing notice in her legend that she praised God by instrumental as well as vocal music, has inspired many a masterpiece in art, including the Raphael at Bologna, the Rubens in Berlin, the Domenichino in Paris, and in literature, where she is commemorated especially by Chaucer's "Seconde Nonnes Tale," and by Dryden's famous ode, set to music by Handel in 1736, and later by Sir Hubert Parry (1889).

Another St Cecilia, who suffered in Africa in the persecution of Diocletian (303-304), is commemorated on the 11th of February.

See U. Chevalier, *Répertoire des sources historiques* (1905), i. 826 f.

**CECROPIA**, in botany, a genus of trees (natural order Moraceae), native of tropical America. They are of very rapid growth, affording a light wood used for making floats. *C. peltata* is the trumpet tree, so-called from the use made of its hollow stems by the Uaupé Indians as a musical instrument. It is a tree reaching about 50 ft. in height with a large spreading head, and deeply lobed leaves 12 in. or more in diameter. The hollows of the stem and branches are inhabited by ants, which in return for the shelter thus afforded, and food in the form of succulent growths on the base of the leaf-stalks, repel the attacks of leaf-cutting ants which would otherwise strip the tree of its leaves. This is an instance of "myrmecophily," i.e. a living together for mutual benefit of the ants and the plant.

**CECROPS** (Κέκροψ), traditionally the first king of Attica, and the founder of its political life (Pausanias ix. 33). He was said to have divided the inhabitants into twelve communities, to have instituted the laws of marriage and property, and a new form of worship. The introduction of bloodless sacrifice, the burial of the dead, and the invention of writing were also attributed to him. He is said to have acted as umpire during the dispute of Poseidon and Athena for the possession of Attica. He decided in favour of the goddess, who planted the first olive tree, which he adjudged to be more useful than the horse (or water) which Poseidon caused to spring forth from the Acropolis rock with a blow of his trident (Herodotus viii. 55; Apollodorus iii. 14). As one of the autochthones of Attica, Cecrops is represented as human in the upper part of his body, while the lower part is shaped like a dragon (hence he is sometimes called *δράκων* or *geminus*, Diod. Sic. i. 28; Ovid, *Metam.* ii. 555). Miss J. E. Harrison (in *Classical Review*, January 1895) endeavours to show that Cecrops is the husband of Athene, identical with the snake-like Zeus Soter or Sospolis, and the father of Erechtheus-Erichthonius.

**CEDAR** (Lat. *cedrus*, Gr. *κέδρος*), a name applied to several members of the natural order Coniferae. The word has been derived from the Arabic *Kedr*, worth or value, or from *Kedrat*, strong, and has been supposed by some to have taken its origin from the brook Kedron, in Judaea.

*Cedrus Libani*, the far-famed Cedar of Lebanon, is a tree which, on account of its beauty, stateliness and strength, has always been a favourite with poets and painters, and which, in the figurative language of prophecy, is frequently employed in the Scriptures as a symbol of power, prosperity and longevity. It grows to a vertical height of from 50 to 80 ft.—"exalted above all trees of the field"—and at an elevation of about 6000 ft. above sea-level. In the young tree, the bole is straight and upright, and one or two leading branches rise above the rest. As the tree increases in size, however, the upper branches become mingled together, and the tree is then clump-headed. Numerous lateral ramifying branches spread out from the main trunk in a

horizontal direction, tier upon tier, covering a compass of ground the diameter of which is often greater than the height of the tree. William Gilpin, in his *Forest Scenery*, describes a cedar which, at an age of about 118 years, had attained to a height of 53 ft. and had a horizontal expanse of 96 ft. The branchlets of the cedar take the same direction as the branches, and the foliage is very dense. The tree, as with the rest of the fir-tribe, except the larch, is evergreen; new leaves are developed every spring, but their fall is gradual. In shape the leaves are straight, tapering, cylindrical and pointed; they are about 1 in. long and of a dark green colour, and grow in alternate tufts of about thirty in number. The male and female flowers grow on the same tree, but are separate. The cones, which are on the upper side of the branches, are flattened at the ends and are 4 to 5 in. in length and 2 in. wide; they take two years to come to perfection and while growing exude much resin. The scales are close pressed to one another and are reddish in colour. The seeds are provided with a long membranous wing. The root of the tree is very strong and ramifying. The cedar flourishes best on sandy, loamy soils. It still grows on Lebanon, though for several centuries it was believed to be restricted to a small grove in the Kadisha valley at 6000 ft. elevation, about 15 m. from Beyroust. The number of trees in this grove has been gradually diminishing, and as no young trees or seedlings occur, the grove will probably become extinct in course of time. Cedars are now known to occur in great numbers on Mt. Lebanon, chiefly on the western slopes, not forming a continuous forest, but in groves, some of which contain several thousands of trees. There are also large forests on the higher slopes of the Taurus and Anti-Taurus mountains. Lamartine tells us that the Arabs regard the trees as endowed with the principles of continual existence, and with reasoning and prescient powers, which enable them to prepare for the changes of the seasons.

The wood of the cedar of Lebanon is fragrant, though not so strongly scented as that of the juniper or red-cedar of America. The wood is generally reddish-brown, light and of a coarse grain and spongy texture, easy to work, but liable to shrink and warp. Mountain-grown wood is harder, stronger, less liable to warp and more durable.

The cedar of Lebanon is cultivated in Europe for ornament only. It can be grown in parks and gardens, and thrives well; but the young plants are unable to bear great variations of temperature. The cedar is not mentioned in Evelyn's *Silva* (1664), but it must have been introduced shortly afterwards. The famous Enfield cedar was planted by Dr Robert Uvedale, (1642-1722), a noted schoolmaster and horticulturist, between 1662-1670, and an old cedar at Brethby Park in Derbyshire is known to have been planted in 1676. Some very old cedars exist also at Syon House, Woburn Abbey, Warwick Castle and elsewhere, which presumably date from the 17th century. The first cedars in Scotland were planted at Hopetoun House in 1740, and the first one said to have been introduced into France was brought from England by Bernard de Jussieu in 1734, and placed in the Jardin des Plantes. Cedar-wood is earliest noticed in Leviticus xiv. 4, 6, where it is prescribed among the materials to be used for the cleansing of leprosy; but the wood there spoken of was probably that of the juniper. The term *Erez* (cedar) of Scripture does not apply strictly to one kind of plant, but was used indefinitely in ancient times, as is the word cedar at present. The term *ar* is applied by the Arabs to the cedar of Lebanon, to the common pine-tree, and to the juniper; and certainly the "cedars" for masts, mentioned in Ezek. xxvii. 5, must have been pine-trees. It seems very probable that the fourscore thousand hewers employed by Solomon for cutting timber did not confine their operations simply to what would now be termed cedars and fir-trees. Dr John Lindley considered that some of the cedar-trees sent by Hiram, king of Tyre, to Jerusalem might have been procured from Mount Atlas, and have been identical with *Callitris quadrivalvis*, or arar-tree, the wood of which is hard and durable, and was much in request in former times for the building of temples. The timber-work of the roof of Cordova cathedral, built eleven centuries ago, is composed of it. In the time of

Vitruvius "cedars" were growing in Crete, Africa and Syria. Pliny says that their wood was everlasting, and therefore images of the gods were made of it; he makes mention also of the oil of cedar, or *cedrium*, distilled from the wood, and used by the ancients for preserving their books from moths and damp; papyrus anointed or rubbed with cedrium were on this account called *cedrati libri*. Drawers of cedar or chips of the wood are now employed to protect furs and woollen stuffs from injury by moths. Cedar-wood, however, is said to be injurious to natural history objects, and to instruments placed in cabinets made of it, as the resinous matter of the wood becomes deposited upon them. *Cedria*, or cedar resin, is a substance similar to mastic, that flows from incisions in the tree; and cedar manna is a sweet exudation from its branches.

The genus *Cedrus* contains two other species closely allied to *C. Libani*—*Cedrus Deodara*, the deodar, or "god tree" of the Himalayas, and *Cedrus atlantica*, of the Atlas range, North Africa. The deodar forms forests on the mountains of Afghanistan, North Beluchistan and the north-west Himalayas, flourishing in all the higher mountains from Nepal up to Kashmir, at an elevation of from 5500 to 12,000 ft.; on the peaks to the northern side of the Booring Pass it grows to a height of 60 to 70 ft. before branching. The wood is close-grained, long-fibred, perfumed and highly resinous, and resists the action of water. The foliage is of a paler green, the leaves are slender and longer, and the twigs are thinner than those of *C. Libani*. The tree is employed for a variety of useful purposes, especially in building. It is now much cultivated in England as an ornamental plant. *C. atlantica*, the Atlas cedar, has shorter and denser leaves than *C. Libani*; the leaves are glaucous, sometimes of a silvery whiteness, and the cones smaller than in the other two forms; its wood also is hard, and more rapid in growth than is that of the ordinary cedar. It is found at an altitude above the sea of from 4000 to 6000 ft.

The name cedar is applied to a variety of trees, including species of several genera of Conifers, *Juniperus*, *Thuja*, *Libocedrus* and *Cupressus*. *Thuja gigantea* of western North America is known in the United States as White (or Yellow) cedar, and the same name is applied to *Cupressus Lawsoniana*, the Port Orford or Oregon cedar, a native of the north-west States, and one of the most valuable juniper trees of North America. The Bermuda cedar (*Juniperus bermudiana*) and the red or American cedar (*J. virginiana*) are both much used in joinery and in the manufacture of pencils; though other woods are now superseding them for pencil-making. The Japanese cedar (*Cryptomeria japonica*) is a kind of cypress, the wood of which is very durable. Another species of cypress (*Cupressus thuyoides*, also known as *Chamaecyparis thuyoides* or *sphaeroidea*), found in swamps in the south of Ohio and Massachusetts, is known as the American white cedar. It has small leaves and fibrous bark, the wood is light, soft and easily-worked, and very durable in contact with the soil, and is much used for boat-building and for making fences and coopers' staves. The Spanish cedar is a name applied to *Juniperus thurifera*, a native of the western Mediterranean region, and also to another species, *J. Oxycedrus*, a common plant in the Mediterranean region, forming a shrub or low tree with spreading branches and short, stiff, prickly leaves. The latter was much used by the Greeks for making images; and its empyreumatic oil, Huile de Cade, is used medicinally for skin-diseases. A species of cypress, *Cupressus lusitanica*, which has been naturalized in the neighbourhood of Cintra is known as the cedar of Goa. The genus *Widdringtonia* of tropical and South Africa is also known locally as cedar. *W. juniperoides* is the characteristic tree of the Cederberg range in Cape Colony, while *W. Whytei*, recently discovered in Nyasaland and Rhodesia (the Mlanje cedar) is a fine tree reaching 150 ft. in height, and yielding an ornamental light yellow-brown wood, suitable for building. The order Cedrelaceae (which is entirely distinct from the Conifers) includes, along with the mahoganies and other valuable timber-trees, the Jamaica and the Australian red cedars, *Cedrela odorata*, and *C. Toona* respectively. The cedar-wood of Guiana, used for making canoes, is a species of the natural order Bur-

seraceae, *Iceia altissima*. It is a large tree, reaching 100 ft. in height, the wood is easily worked, fragrant and durable.

See Gordon's *Pinetum*; Loiseleur-Deslongchamps, *Histoire du cèdre du Liban* (Paris, 1838); Loudon, *Arboretum Britannicum*, vol. iv. pp. 2404-2432 (London, 1839); Marquis de Chambray, *Traité pratique des arbres résineux confères* (Paris, 1845); J. D. Hooker, *Nat. Hist. Review* (January, 1862), pp. 11-18; Brandis, *Forest Flora of North-west and Central India*, pp. 516-525 (London, 1874); Veitch, *Manual of Coniferae* (2nd ed., London, 1900).

**CEDAR CREEK**, a small branch of the North Fork of the Shenandoah river, Virginia, U.S.A. It is known in American history as the scene of a memorable battle, which took place on the 19th of October 1864, between the Union army under Major-General P. H. Sheridan and the Confederates under Lieut.-General J. A. Early. (See SHENANDOAH VALLEY CAMPAIGNS.)

**CEDAR FALLS**, a city of Black Hawk county, Iowa, U.S.A., on the Cedar river, about 100 m. W. of Dubuque. Pop. (1890) 3459; (1900) 5319; (1905, state census) 5329 (872 being foreign-born); (1910) 5012. It is served by the Chicago, Rock Island & Pacific, the Illinois Central, the Chicago Great Western, and the Waterloo, Cedar Falls & Northern railways. Its manufactures include flour, ground feed, other cereal preparations, hardware specialties, canned vegetables (especially Indian corn), and planing-mill products. It is the seat of the state normal school (1876), and has a public library. The settlement of the place, the oldest in the county, was begun in 1847; it was laid out as a town in 1851, incorporated as a village in 1857, chartered as a city in 1865, and for a short time in 1853 was the county-seat.

**CEDAR RAPIDS**, a city of Linn county, Iowa, U.S.A., on the Cedar river, in the east central part of the state. Pop. (1890) 18,020; (1900) 25,656, of whom 4478 were foreign-born, an unusually large and influential part being Bohemians; (1910 census) 32,811. It is served by the Chicago, Milwaukee & Saint Paul, the Chicago & North-Western, the Chicago, Rock Island & Pacific (which has repair shops here), and the Illinois Central railways, and by interurban electric lines. The city has an air of substantial prosperity; its principal streets are from 80 ft. to 120 ft. wide, paved with brick and asphalt, and well shaded. Prominent among its buildings are the federal building, the auditorium, the public library and the Masonic library, which contains one of the best collections of Masonic literature in the world. The city has two well-equipped hospitals, a home for aged women, a home for the friendless, and four parks. The grounds of the Cedar Rapids country club comprise 180 acres. Cedar Rapids is in a rich agricultural country. The name of the city was suggested from the rapids in the river, which afford abundant water power and have enabled the city to take first rank in Iowa (1905) as a manufacturing centre. From 1900 to 1905 there was an increase in the value of its manufactured products from \$11,135,435 to \$16,279,706, or 46·2%. More than one-fourth of the value of its manufactures is in Quaker Oats and other food preparations; among those of less importance are lumber and planing-mill products, foundry and machine-shop products, furniture, patent medicines, pumps, carriages and waggons, packed meats and agricultural implements. Cedar Rapids has also a large grain trade and a large jobbing business, especially in dry goods, millinery, groceries, paper and drugs. At Cedar Rapids are Coe College (co-educational; Presbyterian), which grew out of the Cedar Rapids Collegiate Institute (1851), was named in honour of Daniel Coe, a benefactor, and was chartered under its present name and opened in 1881; the Interstate Correspondence schools, and the Cedar Rapids business college. The first settlers came in 1838; but the city's early growth was slow, and it was not incorporated until 1856. It has been governed by commission since 1908.

**CEFALU** (anc. *Cephalocodium*), a seaport and episcopal see of the province of Palermo, Sicily, 42 m. E. of Palermo by rail. Pop. (1901) 13,273. The ancient town (of Sicel origin, probably, despite its Greek name) takes its name from the headland (*κεφαλή*, head) upon which it stood (1233 ft.); its fortifications extended to the shore, on the side where the modern town now is, in the form of two long walls protecting the port. There are remains of a wall of massive rectangular blocks of stone at the

modern Porta Garibaldi on the south. It does not appear in history before 396 B.C., and seems to have owed its importance mainly to its naturally strong position. The only ancient remains on the mountain are those of a small building in good polygonal work (a style of construction very rare in Sicily), consisting of a passage on each side of which a chamber opens. The doorways are of finely-cut stone, and of Greek type, and the date, though uncertain, cannot, from the careful jointing of the blocks, be very early. On the summit of the promontory are extensive remains of a Saracenic castle. The new town was founded at the foot of the mountain, by the shore, by Roger II. in 1131, and the cathedral was begun in the same year. The exterior is well preserved, and is largely decorated with interlacing pointed arches; the windows also are pointed. On each side of the façade is a massive tower of four storeys. The round-headed Norman portal is worthy of note. The interior was restored in 1559, though the pointed arches of the nave, borne by ancient granite columns, are still visible; and the only mosaics preserved are those of the apse and the last bay of the choir: they are remarkably fine specimens of the art of the period (1148) and, though restored in 1859-1862, have suffered much less than those at Palermo and Monreale from the process. The figure of the Saviour is especially fine. The groined vaulting of the roof is visible in the choir and the right transept, while the rest of the church has a wooden roof. Fine cloisters, coeval with the cathedral, adjoin it. (See G. Hubbard in *Journal of the R.I.B.A.* xv. 333 sqq., 1908.) The harbour is comparatively small. (T. As.)

**CEHEGÍN**, a town of south-eastern Spain, in the province of Murcia, on the right bank of the river Caravaca, a small tributary of the Segura. Pop. (1900) 11,601. Chegín has a thriving trade in farm produce, especially wine, olive oil and hemp; and various kinds of marble are obtained from quarries near the town. Some of the older houses, however, as well as the parish church and the convent of San Francisco, which still has well-defined Roman inscriptions on its walls, are built of stone from the ruins of *Begastri*, a Roman colony which stood on a small adjacent hill known as the Cabecico de Roenas. The name *Chegín* is sometimes connected by Spanish antiquaries with that of the *Zenaga*, *Senhaja* or *Senajeh*, a North African tribe, which invaded Spain in the 11th century.

**CEILING** (from a verb "to ceil," i.e. to line or cover; of disputed etymology, but apparently connected with Fr. *ciel*, Lat. *caelum*, sky), in architecture, the upper covering of a church, hall or room. Ceilings are now usually formed of plaster, but in former times they were commonly either boarded (of which St Albans cathedral is perhaps the earliest example), or showed the beams and joists, which in England were moulded and carved and in France and Italy were richly painted and gilded. Sometimes the ceilings were horizontal, sometimes canted on two sides, and sometimes they take the form of a barrel-vault. Ribs are sometimes planted on the boarding to divide up the surface, and their intersections are enriched with bosses. About the middle of the 16th century the ceilings were formed in plaster with projecting ribs, interlaced ornament and pendants, and the characteristics of the Elizabethan style. At Bramall Hall, Broughton Castle, Hatfield, Knowle, Sizurgh and Levens in Westmorland, and Dorfold in Cheshire, are numerous examples, some with pendants. In Italy, at the same period, the plaster ceilings were based on the forms taken by vaulting; they were of infinite variety and were richly decorated with sunk panels containing the Roman conventional foliage. Raphael, about 1520, reproduced in the Vatican some of the stucco-duro ornament which he had studied in the Golden House of Nero, excavated under his directions. Later, about the middle of the 16th century, great coves were formed round the room, which were decorated with cartouches and figures in relief, garlands and swags. The great halls of the Ducal Palace at Venice and the galleries of the Pitti Palace at Florence were ceiled in this way. These coved ceilings were introduced into England in the middle of the 17th century. In Holyrood Palace at Edinburgh there is a fine ceiling of 1671, with figures (probably executed by Italian craftsmen) and floral wreaths.

At Coleshill, Berkshire, a ceiling by Inigo Jones (1650) shows a type which became more or less universal for a century, viz. deeply sunk panels with modillions round, and bands enriched with foliage, fruit, &c. in bold relief. Wren, Nicholas Hawksmoor, James Gibbs, John Webb and other architects continued on the same lines, and in 1760 Robert Adam introduced his type of ceiling, sometimes horizontal, and sometimes segmental, in which panels are suggested only, with slight projecting lines and rings of leaves, swags and arabesque work, which, like Raphael's, was found on the ceilings of the Roman tombs and baths in Rome and Pompeii. George Richardson followed with similar work, and Sir W. Chambers, in the rooms originally occupied by the Royal Academy and the learned societies in Somerset House, designed many admirable ceilings. The moulds of all the ornamental devices of Robert Adam are preserved and are still utilized for many modern ceilings. (R. P. S.)

**CEILLIER, REMY** (1688-1761), Benedictine monk of the Lorraine congregation of St Vannes. He was the compiler of an immense Patrology, *Histoire générale des auteurs sacrés et ecclésiastiques* (23 vols., Paris, 1729-1763), being a history and analysis of the writings of all the ecclesiastical writers of the first thirteen centuries. He put infinite trouble and time into the work, and many portions of it are exceedingly well done. A later and improved edition was produced in Paris, 1858, in 14 vols. Ceillier's other work, *Apologetic de la morale des pères de l'église* (Paris, 1718), also won some celebrity.

**CELAENAE**, an ancient city of Phrygia, situated on the great trade route to the East. Its acropolis long held out against Alexander in 333 and surrendered to him at last by arrangement. His successor, Eumenes, made it for some time his headquarters, as did Antigonus until 301. From Lysimachus it passed to Seleucus, whose son Antiochus, seeing its geographical importance, refounded it on a more open site as *Apamea* (q.v.). West of the acropolis were the palace of Xerxes and the Agora, in or near which is the cavern whence the *Marsyas*, one of the sources of the Maeander, issues. According to Xenophon, Cyrus had a palace and large park full of wild animals at Celaenae.

See G. Weber, *Dineir-Celnes* (1892).

**CELANDINE**, *Chelidonium majus*, a member of the poppy family, an erect branched herb from 1 to 2 ft. high with a yellow juice, much divided leaves, and yellow flowers nearly an inch across, succeeded by a narrow thin pod opening by a pair of thin valves, separating upwards. The plant grows in waste places and hedgerows, and is probably an escape from cultivation. The lesser celandine is a species of *Ranunculus* (*R. Ficaria*), a small low-growing herb with smooth heart-shaped leaves and bright yellow flowers about an inch across, borne each on a stout stalk springing from a leaf-axil. It flowers in early spring, in pastures and waste-places.

**CELANO**, a town of the Abruzzi, Italy, in the province of Aquila, 73 m. E. of Rome by rail. Pop. (1901) 9725. It is finely situated on a hill above the Lago Fucino, and is dominated by a square castle, with round towers at the angles, erected in its present form in 1450. It contains three churches with 15th century façades in the style of those of Aquila. The origin of the town goes back to Lombard times. A count of Celano is first mentioned in 1178. It was the birthplace of Thomas of Celano, the author of the *Dies Irae*.

**CELEBES**,<sup>1</sup> one of the four Great Sunda Islands in the Dutch East Indies. Its general outline is extremely irregular, and has been compared to that of a starfish with the rays torn off from one side, corresponding to the west side of the island. It consists of four great peninsulas, extending from a comparatively small nucleus towards the north-east, east, south-east and south, and separated by the three large gulfs of Tomini or Gorontalo, Tolo or Tomaiki, and Boni. Of these gulfs the first is by far the largest, the other two having much wider entrances and not extending so far inwards. Most important among the smaller inlets are the bays of Amurang, Kwandang and Tontoli on the

<sup>1</sup> The second syllable is accented.

north coast, Palos and Pare-Pare on the west, and Kendari or Vosmaer on the east. Of the numerous considerable islands which lie north-east, east and south of Celebes (those off the west coast are few and small), the chief are prolongations of the four great peninsulas—the Sangir and Talaut islands off the north-east, the Banggai and Sula off the east, Wuna and Buton off the south-east, and Saleyer off the south. Including the adjacent islands, the area of Celebes is estimated at 77,855 sq. m., and the population at 2,000,000; without them the area is 69,255 sq. m. and the population 1,250,000.

The scenery in Celebes is most varied and picturesque. "Nowhere in the archipelago," wrote A. R. Wallace, "have I seen such gorges, chasms and precipices as abound in the district of Maros" (in the southern peninsula); "in many parts there are vertical or even overhanging precipices five or six hundred feet high, yet completely clothed with a tapestry of vegetation." Much of the country, especially round the Gulf of Tolo, is covered with primeval foresta and thickets, traversed by scarcely perceptible paths, or broken with a few clearings and villages. A considerable part of the island has been little explored, but the general character seems to be mountainous. Well-defined ranges prolong themselves through each of the peninsulas, rising in many places to a considerable elevation. Naturally there are no great river-basins or extensive plains, but one of the features of the island is the frequent occurrence, not only along the coasts, but at various heights inland, of beautiful stretches of level ground often covered with the richest pastures. Minahassa, the north-eastern extremity, consists of a plateau divided into sections by volcanoes (Klabat, 6620 ft., being the highest). Sulphur springs occur here. In the west of the northern peninsula the interior consists in part of plateaus of considerable extent enclosed by the coast ranges. Near Lake Posso, in the centre of the island, the mountains are higher; the Tampiko massif has a height of nearly 5000 ft., the chains south and west of the lake have a general altitude of about 5450 ft., with peaks still loftier. In the southern peninsula two chains stretch parallel with the west and east coasts; the former is the higher, with a general altitude of 3200 ft. In the south it joins the Peak of Bonthain, or Lompo-batang, a great volcanic mass 10,088 ft. high. In the east central part of the island the mountain Koruve exceeds 10,000 ft., and is supposed to be the highest in the island. An alluvial coast plain, 7 to 9 m. wide, stretches along the foot of the western chain, and between the two chains is the basin of the Walannat river, draining northward into Lake Tempe. Little is known of the orography of the eastern peninsula. At the base of the south-eastern there is another large lake, Tovieti. In this peninsula there are parallel ranges on the east and west flanks. The trench between them is partly occupied by the vast swamp of Lake Opa.

The rivers of the narrow mountainous peninsulas form many rapids and cataracts; as the Tondano, draining the lake of the same name to the north-west coast of Minahassa at Menado; the Ranô-i-Apo, flowing over the plateau of Mongondo to the Gulf of Amurang; the Poigar, issuing from a little-known lake of that plateau; the Lombagin, traversing narrow cañons; and the river of Boni, which has its outfall in the plain of Gorontalo, near the mouth of the Bolango or Tapa, the latter connected by a canal with the Lake of Limbotto. All these rivers are navigable by praus or rafts for only a few miles above the mouth. In central Celebes, the Kodina flows into Lake Posso, and the Kalatna discharges to the Gulf of Boni; the Posso, navigable by *botlos* (canoes formed of hollowed tree-trunks), is the only river flowing from the lake to the Gulf of Tomini. The rivers of the southern peninsula, owing to the relief of the surface, are navigable to a somewhat greater extent. The Walannat flows into Lake Tempe, and, continued by the Jenrana (Tienrana), which discharges into the Gulf of Boni, is navigable for small boats; the Sadang, with many affluents, flows to the west coast, and is navigable by *sonpons*. The Jenemaja is a broad river, navigable far from the mouth. The coasts of Celebes are often fertile and well populated; but, as shown by the marine charts, many sand, mud and stone banks lie near the shore, and con-

sequently there are few accessible or natural ports or good roadsteads.

*Geology.*—The geological observations on Celebes are too scattered to reveal its structure. The greater part of the island seems to be formed of gneiss and other crystalline rocks. These are overlaid by conglomerates, limestones and clay slates of very doubtful age, the most interesting being a radiolarian clay which occurs on the south side of the Matinang Mountains, at the north end of Lake Posso, &c.; it may correspond with the radiolarian cherts of Borneo. Tertiary beds are found, especially near the coast. The Eocene includes a series of sandstones and marls with lignite, and these are overlaid by nummulite limestones. The Miocene contains an *Orbitoides* limestone. Intrusive and volcanic rocks of great variety and of various ages occur. Peridotite and gabbro form much of the eastern peninsula (Banggai). Leucite and nepheline rocks have been found in various parts of the island, especially in the south-west. In Minahassa, at the northern extremity, there is a large area of tuffs and agglomerates consisting chiefly of augite andesite, and in this area there are many recent volcanic cones. Eruptions still take place at intervals, but the volcanoes for the most part seem to have reached the solfataric stage.

*Climate.*—The climate of the island, everywhere accessible to the influence of the sea, is maritime-tropical, the temperature ranging generally between 77° and 80° F., the extremes being about 90° and 70° F., only on the higher mountains falling during the night to 54° or 55° F. The rainfall in the northern peninsula (north of the equator) differs from that of the southern; the former has rains (not caused by the monsoon), and of smaller amount, 102 in. annually; the latter has a greater rainfall, 157 in., brought by the north-western monsoon, and of which the west coast receives a much larger share than the east.

*Fauna and Flora.*—In spite of its situation in the centre of the archipelago, Celebes possesses a fauna of a very distinctive kind. The number of species is small, but in many cases they are peculiar to the island. Of land birds, for example, about 160 species are known, and of these not less than about 90 are peculiar, the majority of the remainder being Asiatic in distinction from Australian. Mammals are few in species, but remarkable, especially *Macoccus niger*, an ape found nowhere else but in Bachián; *Anoa depressicornis*, a small ox-like quadruped which inhabits the mountainous districts; and the babirusa or pig-deer of the Malays. Some of the animals are probably descendants of specimens introduced by man; others are allied in species, but not identical, with mammals of Java and Borneo; others again, including the three just mentioned, are wholly or practically confined to Celebes. There are no large beasts of prey, and neither the elephant, the rhinoceros nor the tapir is represented. Wild-buffaloes, swine and goats are pretty common; and most of the usual domestic animals are kept. The horses are in high repute in the archipelago; formerly about 700 were yearly exported to Java, but the supply has considerably diminished.

The same peculiarity of species holds in regard to the insects of the Celebes (so far as they are known) as to the mammals and birds. Out of 118 species of butterflies, belonging to four important classes, no fewer than 86 are peculiar; while among the rose-chafers or *Celoniinae* the same is the case in 19 out of 30. Equally remarkable with this presence of peculiar species is the absence of many kinds that are common in the rest of the archipelago; and these facts have been considered to indicate connexion with a larger land-mass at a very distant geological epoch, and the subsequent continuous isolation of Celebes. This view, however, has been controverted. It is held that in the Miocene and Pliocene periods there were land connexions with the Philippines, Java and the Moluccas, and through the last with Australasian lands to the east and south-east. Migration of species took place along these lines in both directions. Those immigrants which remained in what is now Celebes may have developed new species. Moreover, while Celebes has species which are peculiar to itself and one other of the islands just mentioned, it has none which it shares exclusively with Borneo, and thus the importance of the Macassar Strait as a biological division is indicated.

Vegetation is extremely rich; but there are fewer large trees than in the other islands of the archipelago. Of plants that

furnish food for man the most important are rice, maize and millet, coffee, the coco-nut tree, sago-palm, the obi or native potato, the bread-fruit and the tamarind; with lemons, oranges, mangosteens, wild-plums, Spanish pepper, beans, melons and sugar-cane. The shaddock is to be found only in the lower plains. Indigo, cotton and tobacco are grown; the bamboo and the ratan-palm are common in the woods; and among the larger trees are sandal-wood, ebony, sapan and teak. The palm, *Arenca saccharifera*, furnishes *gemuli* fibres for ropes; its juice is manufactured into sugar and a beverage called saguier; and intoxicating drinks are prepared from several other palms.

*Products.*—As in natural vegetation and fauna, so in cultivated products, Celebes, apart from its peculiarities, presents the transitional link between the Asiatic and the Australian regions of the Malay province. For example, rice is produced here in smaller quantity and of inferior quality to that in the western part of the archipelago, but superior to that in the eastern section, where sago and sorghum form the staple articles of food. The products of the forests supply about half the total exports. The fisheries include trepang, turtle and pearl oysters. Gold is worked under European direction in the district of Gorontalo, but with only partial success; the search for coal in the southern peninsula has yielded no satisfactory results; tin, iron and copper, found in the eastern peninsula and elsewhere, are utilized only for native industries.

*Natives.*—The native population of the island is all of Malayan stock. The three most important peoples are the Bugis (*q.v.*) the Macassars and the Mandars. The medley of other Malayan tribes, of a more or less savage type, living in the island, are known under the collective name of Alifuros (*q.v.*). The Macassars are well-built and muscular, and have in general a dark-brown complexion, a broad and expressive face, black and sparkling eyes, a high forehead, a flattish nose, a large mouth and long black soft hair. The women are sprightly, clever and amiable. The men are brave and not treacherous, but ambitious, jealous and extremely revengeful. Drunkenness is rare, but they are passionate, and running amuck is frequent among them. In all sorts of bodily exercises, as swinging, wrestling, dancing, riding and hunting, they take great pleasure. Though they call themselves Mahomedans, their religion is largely mingled with pagan superstitions; they worship animals, and a certain divinity called Karaeng Lové, who has power over their fortune and health. Except where Dutch influence has made itself felt, little attention has been paid by the native races to agriculture; and their manufacturing industries are few and limited. The weaving of cotton cloth is principally carried on by women; and the process, at least for the finer description, is tedious in the extreme. The houses are built of wood and bamboo; and as the use of diagonal struts is not practised, the walls soon lean over from the force of the winds. The Macassar language, which belongs to the Malayo-Javanese group, is spoken in many parts of the southern peninsula; but it has a much smaller area than the Buginese, which is the language of Boni. It is deficient in generalizations; thus, for example, it has words for the idea of carrying in the hand, carrying on the head, carrying on the shoulder, and so on, but has no word for carrying simply. It has adopted a certain number of vocables from Sanskrit, Malay, Javanese and Portuguese, but on the whole is remarkably pure, and has undergone comparatively few recent changes. It is written in a peculiar character, which has displaced, and probably been corrupted from, an old form employed as late as the 17th century. Neither bears any trace of derivation from the Sanskrit alphabet. The priests affect the use of the Arabic letters. The literature is poor, and consists largely of romantic stories from the Malay, and religious treatises from the Arabic. Of the few original pieces the most important are the early histories of Goa, Tello and some other states of Celebes, and

the *Rapang*, or collection of the decrees and maxims of the old princes and sages. The more modern productions are letters, laws and poems, many of the last of considerable beauty.

*Divisions, Towns, Population.*—Celebes is divided by the Dutch, for administrative purposes, into the government of Celebes with dependencies (south-eastern and southern peninsulas and all west coast), and the residency of Menado (north-eastern peninsula and coast of Gulf of Tomini). The eastern peninsula and coast of the Gulf of Tolo belong politically to the residency of Ternate (*q.v.*). The following table shows approximately the distribution and composition of the population:—

	Europeans.	Chinese.	Arabs.	Other Oriental Foreigners.	Natives.	Total.
Government of Celebes and Dependencies . . . . .	1414	3738	554	54	409,739	415,499
Residency of Menado—						
Minahassa . . . . .	836	3574	286	16	430,941	436,406
Gorontalo . . . . .	115	505	133	..		

The *Government of Celebes and Dependencies* is subdivided into the government territory, the vassal states (Boni, *q.v.*, and Ternate), and the federal countries. The density of population for the whole government is estimated as 3.7 or 4 per sq. m., varying from 2.1 in the vassal and federated states to 14.7 to 18.4 for Macassar and the districts directly governed by the Dutch. The density of population in districts outside the influence of European government sinks to 1 and less per sq. m. As in the case of Minahassa, the difference must be explained by physical and moral conditions. Two-thirds of the natives live by agriculture, and one-third by trade, navigation, shipbuilding and other industries. In agreement with these principal occupations, the centres of population are found in southern Celebes, on the coast (not in the interior plains or on the lake, as in Menado). Palos (3000), with good port; Pare-Pare, connected by road with Lake Tempe; and Macassar (17,925), the seat of the governor and the centre of trade for the eastern part of the archipelago. On the south coast must also be named Bostham (4000); on the east coast, Balong-Nipa; and Buton and Selavei, seats of administration and ports of call on the island groups of the same names.

The *Residency of Menado* comprises three districts: Minahassa, the little states along the north coast west of Minahassa, and Gorontalo, including the other states of the northern peninsula lying along the Gulf of Tomini. The density of population being calculated at about 2.7 to 3 per sq. m. for Celebes, is 16.2 for Minahassa, but only 1.5 to 2 for the Residency of Menado. Centres of population in Menado are Amurang (3000), the seat of a Dutch controller, and a calling place for the steamers of the Indian Packet Company. Menado (10,000), the chief town of the residency, the principal station of the Dutch missionaries, with a fair amount of trade, but an unsafe roadstead; Tondano (12,000), near the lake and river of the same name, at an altitude of nearly 2000 ft., and one of the chief centres; Gorontalo, one of the most important towns of Celebes, carrying on direct trade with Singapore and Europe. All the other coast places have some importance as chief villages of the little states and as ports of call for the vessels of the steam packet company, but have only from 500 to 1000 inhabitants.

*History.*—Celebes was first discovered by the Portuguese in the early part of the 16th century, the exact date assigned by some authorities being 1512. The name is not used by the natives, and is apparently of foreign origin, but has been variously derived, e.g. from the mountain of Klabat or Kalabat, or from *Seli Besi*, an iron kris carried by the natives, of whom those who were first asked for the name of the island were convinced, according to this theory, to have misunderstood their questioners. At the time of the Portuguese discovery, the Macassars were the most powerful people in the island, having successfully defended themselves against the king of the Moluccas and the sultan of Ternate. In 1609 the British attempted to gain a footing. At what time the Dutch first arrived is not certainly known, but it was probably in the end of the 16th or beginning of the 17th century, since in 1607 they formed a connexion with Macassar. In 1611 the Dutch East India Company obtained the monopoly of trade on the island of Buton; and in 1618 an insurrection in Macassar gave them an opportunity of obtaining a definite establishment there. In 1660 the kingdom was subjugated, but in 1666 the war broke out anew. It was brought to an end in the following year, and the treaty of Bonga or Banga was signed, by which the Dutch were recognised as protectors.

In 1683 the north-eastern part of the island was conquered by Robert Paddenburg and placed under the command of the governor of the Moluccas. In 1703 a fort was erected at Menado. The kingdom of Boni was successfully attacked in 1824, and in August of that year the Bonga treaty was renewed in a greatly modified form. Since then the principal military event is the Boni insurrection which was quelled in 1859, but this was far from pacifying the country permanently. A series of revolts of various chiefs in 1905-6 was not arrested without considerable fighting, but after this the whole island was brought under Dutch authority, even where native rule survived.

**BIBLIOGRAPHY.**—In P. J. Veth's *Woordenboek van Nederlandsch Indië* there will be found an extensive bibliography of Celebes drawn up by H. C. Millies. For additional bibliography and data for the island and its population, see C. M. Kan, "Celebes," in the *Encyclopaedie van Nederlandsch Indië*, ed. by P. A. van der Lith and A. H. Spaan (The Hague, 1895), &c., vol. i. p. 314. See P. and F. Sarasin (who have carried out extensive explorations in the island), "Berichte aus Celebes," *Zeitschr. der Ges. f. Erdk.* xxix. 351; *Entwurf einer geographisch-geologischen Beschreibung der Insel Celebes* (Wiesbaden, 1901); *Reisen in Celebes, 1893-1896, 1902-1903* (Wiesbaden, 1903); *Versuch einer Anthropologie der Insel Celebes* (Wiesbaden, 1906); C. van der Hart, *Reize rondom het Eiland Celebes* (The Hague, 1853); Capt. R. Mundy, *Narrative of Events in Borneo and Celebes* (London, 1848); P. J. Veth, *En Nederlandsch reisger of Zuid Celebes* (Amsterdam, 1875); J. C. F. Riedel, *Nes landschap Boeoei, Noord Celebes* (1872); and "Die Landschaften Holontalo, Limoto," &c., in *Zeitschr. für Ethnologie* (1871); H. Bücking, "Beiträge zur Geologie von Celebes," *Samml. geol. Reichsanst. Wien*, vol. vii. pp. 29-205 (1902), pp. 221-224 (1904); and various articles in *Tijdschrift v. h. Aardrijkskundig Genootschap* and *Tijdsch. v. h. Batavian. Gen.*

**CELERY** (*Apium graveolens*), a biennial plant belonging to the natural order Umbelliferae, which, in its wild state, occurs in England by the sides of ditches and in marshy places, especially near the sea, producing a furrowed stalk and compound leaves with wedge-shaped leaflets, the whole plant having a coarse, rank taste and a peculiar smell. It is also widely distributed in the north temperate region of the Old World. By cultivation and blanching the stalks lose their acrid qualities and assume the mild sweetish aromatic taste peculiar to celery as a salad plant. The plants are raised from seed, sown either in a hot bed or in the open garden, according to the season of the year, and after one or two thinnings out and transplantings, they are, on attaining a height of 6 or 8 in., planted out in deep trenches for convenience of blanching, which is effected by earthing up and so excluding the stems from the influence of light. A large number of varieties are cultivated by gardeners, which are ranged under two classes, white and red,—the white varieties being generally the best flavoured and most crisp and tender. As a salad plant, celery, especially if at all "stringy," is difficult of digestion. Both blanched and green it is stewed and used in soups, the seeds also being used as a flavouring ingredient. In the south of Europe celery is seldom blanched, but is much used in its natural condition.

*Celeriac*, or turnip-rooted celery (*Apium graveolens* var. *rapaceum*), is a variety cultivated more on account of its roots than for the stalks, although both are edible and are used for salads and in soups. It is chiefly grown in the north of Europe. As the tops are not required, trenching is unnecessary, otherwise the cultivation is the same as for celery.

**CELESTE, MADAME** (1815-1882), French dancer and actress, was born in Paris on the 16th of August 1815. As a little girl she was a pupil in the ballet class at the Opéra. When fifteen, she had an offer from the United States, and made her début at the Bowery theatre, New York. Returning to England, she appeared at Liverpool as Fenella in *Masaniello*, and also in London (1831). In 1834 she aroused such enthusiasm in America that her admirers carried her on their shoulders and took the horses out of her carriage in order to pull it themselves. It is even said that President Jackson introduced her to his cabinet as an adopted citizen of the Union. Having made a large fortune, she returned to England in 1837. She now gave up dancing, and appeared as an actress, first at Drury Lane and then at the Haymarket. In 1844 she joined Benjamin Webster in the management of the Adelphi, and afterwards took the sole management

of the Lyceum till 1861. She made a third visit to the United States from 1865 to 1868, and retired in 1870. Her favourite part was Miami in Buckstone's *Green Bushes*. She died in Paris on the 12th of February 1882.

**CELESTINA, LA**, the popular alternative title attached from 1519 (or earlier) to the anonymous *Comedia de Calisto y Melibea*, a Spanish novel in dialogue which was celebrated throughout Europe during the 16th century. In the two earliest known editions (Burgos, 1499, and Seville, 1501) the *Comedia* consists of sixteen acts; the reprints issued after 1501 are entitled *Tragicomedia de Calisto y Melibea*, and contain twenty-one acts. Three of these reprints include a twenty-second act which is admittedly spurious, and the authenticity of Acts xvii.-xxi. is disputed. The authorship of the *Celestina* and the date of its composition are doubtful. An anonymous prefatory letter in the editions subsequent to 1501 attributes the book to Juan de Mena or Rodrigo Cota, but this ascription is universally rejected. The prevailing opinion is that the author of the twenty-one acts was Fernando de Rojas, apparently a Spanish Jew resident at the Puebla de Montalbán in the province of Toledo; R. Foulché-Delbosc, however, maintains that the original sixteen acts are by an unknown writer who had no part in the five supplementary acts. Some scholars give 1483 as the date of composition; others hold that the book was written in 1497. These questions are still unsettled. Though profoundly original in treatment, the *Celestina* has points of analogy with the work of earlier writers, such as Juan Ruiz (*q.v.*), the archpriest of Hita; his rapid sketches of Trota-conventas, Melón and Endrina no doubt suggested the finished portraits of Celestina, Calisto and Melibea, and the closing scene in the *Celestina* recalls the suicide in Diego Fernandez de San Pedro's *Cárcel de Amor*. Allowing for these and other debts of the same kind, it cannot be denied that the *Celestina* excels all earlier Spanish works in tragic force, in impressive conception, and in the realistic rendering of characters drawn from all classes of society. It passed through innumerable editions in Spain, and was the first Spanish book to find acceptance throughout western Europe. At least twenty works by well-known Spanish authors are derived from it; it was adapted for the English stage as early as 1525-1530, and was translated into Italian (1505), French (1527) and other European languages. A Latin version by Caspar Barth was issued under the title of *Pornoboscodiuscalus latinus* (1624) with all the critical apparatus of a recognized classic, James Mabbe's English rendering (1631) is one of the best translations ever published. The original edition of 1499 has been reprinted by R. Foulché-Delbosc in the *Bibliotheca Hispanica* (1902), vol. xii.

**BIBLIOGRAPHY.**—R. Foulché-Delbosc, "Observations sur la Celestina" in the *Revue hispanique* (Paris, 1906), vol. vii. pp. 28-80 and (Paris, 1902) vol. ix. pp. 171-199; K. Haebler, "Bemerkungen zur Celestina" in the *Revue hispanique* (Paris, 1902), vol. ix. pp. 139-170; and M. Menéndez y Pelayo's introduction to the *Celestina* (Vigo, 1899-1900). (J. F.-K.)

**CELESTINE** (CAELESTINUS), the name of five popes.

**CELESTINE I.**, pope from 422 to 432. At his accession the dissensions caused by the faction of Eulalius (see BONIFACE I.) had not yet abated. He, however, triumphed over them, and his episcopate was peaceful. When the doctrines of Nestorius were denounced to him, he instructed Cyril, bishop of Alexandria, to follow up the matter. The emperor Theodosius II. convoked an ecumenical council at Ephesus, to which Celestine sent his legates. He had some difficulties with the bishops in Africa on the question of appeals to Rome, and with the bishops of Provence with regard to the doctrines of St Augustine. To expedite the extirpation of Pelagianism, he sent to Britain a deacon called Palladius, at whose instigation St Germanus of Auxerre crossed the English Channel, as delegate of the pope and bishops of Gaul, to inculcate orthodox principles upon the clergy of Britain. He also commissioned Palladius to preach the gospel in Ireland which was beginning to rally to Christianity. Celestine was the first pope who is known to have taken a direct interest in the churches of Britain and Ireland. (L. D.\*)

**CELESTINE II.**, pope in 1143-1144. Guido of Città di Castello (Tiferno), born of noble Tuscan family, able and learned, studied

under Abelard and became a cardinal priest. Elected the successor of Innocent II. on the 26th of September 1143, he died on the 8th of March following. He removed the interdict which Innocent had employed against Louis VII. of France. At the time of his death he was on the verge of a controversy with Roger of Sicily.

See A. Certini, *Vita* (Foligno, 1716); M. Bouquet, *Recueil des historiens des Gaules* (Paris, 1738 ff.), tome 15, 408-411; Migne, *Patrologia cursus completus*, 179, 765-820; P. Jaffé, *Regesta Pontificum Romanorum*, 2nd ed. vol. ii. (Lipsiae, 1888), 1 f.; Wetzzer und Welte, *Kirchenlexikon*, 2nd ed. vol. iii. (Freiburg, 1884), 578 ff.; Herzog-Hauck, *Realencyklopädie*, 3rd ed. vol. iv. (Leipzig, 1898), 201.

**CELESTINE III.** (Giacinto Bobo), pope from 1191 to 1198, was cardinal deacon of Santa Maria in Cosmedin as early as 1144, and had reached the age of eighty-five when chosen on the 30th of March 1191 to succeed Clement III. The first pope of the house of the Orsini, his policy was marked by mildness and indecision. Henry VI. of Germany at once forced the pontiff to crown him emperor, and three or four years later took possession of the Norman kingdom of Sicily; he refused tribute and the oath of allegiance, and even appointed bishops subject to his own jurisdiction; moreover, he gave his brother in fief the estates which had belonged to the countess Matilda of Tuscany. Celestine did not dare so much as to threaten him with excommunication. It was Celestine's purpose to lay England under the interdict; but Prince John and the barons still refused to recognize the papal legate, the bishop of Ely. Richard I. had been set free before the dilatory pope put Leopold of Austria under the ban. In his last sickness Celestine wished to resign his office, but the cardinals protested. Death released him from his perplexities on the 8th of January 1198.

See "Epistolae Coelestini III. Papae," in M. Bouquet, *Recueil des historiens des Gaules et de la France*, tome 19 (Paris, 1738 ff.); J. P. Migne, *Patrologia cursus completus*, tome 206 (Paris, 1855), 867 ff.; further sources in *Neues Archiv für die ältere deutsche Geschichtskunde*, 2, 218; 11, 398 f.; 12, 411-414; P. Jaffé, *Regesta Pontificum Romanorum*, vol. ii. (2nd ed., Leipzig, 1888), 577 ff. (W. W. R.\*)

**CELESTINE IV.** (Godfrey Castiglione), pope in 1241, son of a sister of Urban III. (1185-1187), was archpriest and chancellor at Milan. After Urban's death he entered the Cistercian monastery at Hautecombe in Savoy. In 1227 Gregory IX. created him cardinal priest of St Mark's, and in 1233 made him cardinal bishop of Sabina. Elected to succeed Gregory on the 25th of October 1241, he died on the 10th of November, before consecration, and was buried in St Peter's.

See A. Pothast, *Regesta Pontificum Romanorum*, vol. i. (Berlin, 1874), 940 f.

**CELESTINE V.** (St Peter Celestine), pope in 1294, was born of poor parents at Isernia about 1215, and early entered the Benedictine order. Living as a hermit on Monte Morrone near Sulmona in the Abruzzi, he attracted other ascetics about him and organized them into a congregation of the Benedictines which was later called the Celestines (*q.v.*). The assistance of a vicar enabled him to escape from the growing administrative cares and devote himself solely to asceticism, apparently the only field of human activity in which he excelled. His *Opuscula*, published by Telera at Naples in 1640, are probably not genuine; he was *indoctus libris*. A fight between the Colonna and the Orsini, as well as hopeless dissensions among the cardinals, prevented a papal election for two years and three months after the death of Nicholas IV. Charles II. of Naples, needing a pope in order that he might regain Sicily, brought about a conclave. As the election of any cardinal seemed impossible, on the 5th of July 1294 the Sacred College united on Pietro di Morrone; the cardinals expected to rule in the name of the celebrated but incapable ascetic. Apocalyptic notions then current doubtless aided his election, for Joachim of Floris and his school looked to monasticism to furnish deliverance to the church and to the world. Multitudes came to Celestine's coronation at Aquila, and he began his reign the idol of visionaries, of extremists and of the populace. But the pope was in the power of Charles II. of Naples, and became his tool against Aragon. The king's son

Louis, a layman of twenty-one, was made archbishop of Lyons. The cardinals, scarcely consulted at all, were disconcerted. The pope, who wanted more time for his devotions, offered to leave three cardinals in charge of affairs; but his proposition was rejected. He then wished to abdicate, and at length Benedetto Gaetano, destined to succeed him as Boniface VIII., removed all scruples against this unheard-of procedure by fixing a precedent in the case of Clement I. Celestine abdicated on the 13th of December 1294. There is no sufficient ground for fixing an allusion to this act in the noted line of Dante, "Che fece per villate il gran rifiuto" ("who made from cowardice the great refusal," *Inferno*, 3, 60). Boniface at length put him in prison for safe keeping; he died in a monastic cell in the castle of Fumone near Anagni on the 10th of May 1296. He was canonized by Clement V. in 1313.

**CELESTINE, or CELESTITE**, a name applied to native strontium sulphate ( $\text{SrSO}_4$ ), having been suggested by the celestial blue colour which it occasionally presents. This colour has been referred to a trace of iron phosphate, but in some cases such an explanation appears doubtful. The mineral is usually colourless, or has only a delicate shade of blue. Celestine crystallizes in the orthorhombic system, being isomorphous with barytes (*q.v.*). The angle between the prism faces is  $76^\circ 17'$ . The cleavage is perfect parallel to the basal pinacoid, and less marked parallel to the prism. Although celestine much resembles barytes in its physical properties, having for example the same degree of hardness (3), it is less dense, its specific gravity being 3.9. Celestine is a less abundant mineral than barytes. It is, however, much more soluble, and occurs frequently in mineral waters. W. W. Stoddard showed that many plants growing on Keuper marls containing celestine near Bristol appropriated the strontium salt, and the metal could be detected spectroscopically in their ashes.

Celestine occurs in the Triassic rocks of Britain, especially in veins and geodes in the Keuper marl in the neighbourhood of Bristol. At Gweekwar and Yate in Gloucestershire it is worked for industrial purposes. Colourless crystals, of great beauty, occur in association with calcite and native sulphur in the sulphur deposits of Sicily, as at Girgenti. Fine blue crystals are yielded by the copper mines of Herregrund, in Hungary; a dark blue fibrous form is known from Jena; and small crystals occur in flint at Meudon near Paris. Very large tabular crystals are found in limestone on Strontian Island in Lake Erie; and a blue fibrous variety from near Frankstown, Blair Co., Penn., is notable as having been the original celestine on which the species was founded by A. G. Werner in 1798.

Celestine is much used for the preparation of strontium hydrate, which is employed in refining beetroot sugar in Germany. The mineral is used also as a source of various salts of strontium such as the nitrate, which finds application in pyrotechny for the production of red fire. (F. W. R.\*)

**CELESTINES**, a religious order founded about 1260 by Peter of Morrone, afterwards Pope Celestine V. (1294). It was an attempt to unite the eremitical and cenobitical modes of life. Peter's first disciples lived as hermits on Mount Majella in the Abruzzi. The Benedictine rule was taken as the basis of the life, but was supplemented by regulations notably increasing the austerities practised. The form of government was borrowed largely from those prevailing in the mendicant orders. Indeed, though the Celestines are reckoned as a branch of the Benedictines, there is little in common between them. For all that, St Celestine, during his brief tenure of the papacy, tried to spread his ideas among the Benedictines, and induced the monks of Monte Cassino to adopt his idea of the monastic life instead of St Benedict's; for this purpose fifty Celestine monks were introduced into Monte Cassino, but on Celestine's abdication of the papacy the project fortunately was at once abandoned. During the founder's lifetime the order spread rapidly, and eventually

there were about 150 monasteries in Italy, and others in France, Bohemia and the Netherlands. The French houses, twenty-one in number, formed a separate congregation, the head-house being in Paris. The French Revolution and those of the 19th century destroyed their houses, and the Celestine order seems no longer to exist.

Peter of Morrone was in close contact with the Franciscan Spirituals of the extreme type (see FRANCISCANS), and he endeavoured to form an amalgamation between them and his hermits, under the title "Poor Hermits of Celestine." On his abdication the amalgamation was dissolved, and the Franciscan element fled to the East and was finally suppressed by Boniface VIII. and compelled to re-enter the Franciscan order. The habit of the Celestines was black.

**CELIBACY** (Lat. *caelibatus*, from *caelebs*, unmarried), the state of being unmarried, a term now commonly used in the sense of complete abstinence from marriage; it originally included the state of widowhood also, and any one was strictly a *caelebs* who had no existing spouse. Physicians and physiologists have frequently discussed celibacy from their professional point of view; but it will be sufficient to note here the results of statistical inquiries. It has been established by the calculations of actuaries that married persons—women in a considerable, but men in a much greater degree—have at all periods of life a greater probability of living than the single. From the point of view of public utility, the state has sometimes attempted to discourage celibacy. The best-known enactment of this kind is that of the emperor Augustus, best known as *Lex Julia et Papia Poppaea*. This disabled *caelibes* from receiving an inheritance unless the testator were related to them within the sixth degree; it limited the amount which a wife could take by a husband's will, or the husband by the wife's, unless they had children; and preference was given to candidates for office in proportion to the number of their children.<sup>1</sup> Ecclesiastical legislators, on the other hand, have frequently favoured the unmarried state; and celibacy, partial or complete, has been more or less stringently enforced upon the ministers of different religions; many instances are quoted by H. C. Lea. The best known, of course, are the Roman Vestals; though here even the great honours and privileges accorded to these maidens were often insufficient to keep the ranks filled. In the East, however, this and other forms of asceticism have always flourished more freely; and the Buddhist monastic system is not only far older than that of Christendom, but also proportionately more extensive.<sup>2</sup> In early Judaism, chastity was indeed enjoined upon the priests at certain solemn seasons; but there was no attempt to enforce celibacy upon the sacerdotal caste. On the contrary, all priests were the sons of priests, and the case of Elizabeth shows that here, as throughout the Jewish people, barrenness was considered a disgrace. But Alexander's conquests brought the Jews into contact with Hindu and Greek mysticism; and this probably explains the growth of the ascetic Essenes some two centuries before the Christian era. The adherents of this sect, unlike the Pharisees and Sadducees, were never denounced by Christ, who seems on the contrary to have had real sympathy with the voluntary celibacy of an exceptional few (Matt. xix. 12). St Paul's utterances on this subject, though they go somewhat further, amount only to the assertion that a struggling missionary body will find more freedom in its work in the absence of wives and children. At the same time, St Paul claimed emphatically for himself and the other apostles the right of leading about a wife; and he names

among the qualifications for a bishop, an elder and a deacon, that he should be "the husband of one wife." Indeed it was freely admitted by the most learned men of the middle ages and Renaissance that celibacy had been no rule of the apostolic church; and, though writers of ability have attempted to maintain the contrary even in modern times, their contentions are unhesitatingly rejected by the latest Roman Catholic authority.<sup>3</sup>

The gradual growth of clerical celibacy, first as a custom and then as a rule of discipline, can be traced clearly enough even through the scanty records of the first few centuries. The most ascetic Christians began to question the legality of second marriages on the part of either sex, as even paganism had often reprobated second marriages of women. Though these extremists were presently branded as heretics for their eccentric ultra-ascetic tenets (Montanists, Cathari), yet as early as Tertullian's time (c. A.D. 220) the right of second marriages was theoretically denied to the priesthood. This was logically followed by a revival of the old Virginal rule which required that priests should marry none but virgins (Lev. xxi. 7, 13). Both these rules, however, proved difficult of enforcement and seem to have rested only on a vague basis of public opinion; twice-married men (*digami*) were admitted to the priesthood by Pope Calixtus I. (219-222), and even as late as the beginning of the 5th century we find husbands of widows consecrated to the episcopate. The so-called Apostolical Constitutions and Canons, the latter of which were compiled in the 4th century, give us the first clear and fairly general rules on the subject. Here we find "bishops and priests allowed to retain the wives whom they may have had before ordination, but not to marry in orders; the lower grades, deacons, subdeacons, &c., allowed to marry after entering the church; but all were to be husbands of but one wife, who must be neither a widow, a divorced woman nor a concubine" (Lea l. 28). Many causes, however, were already at work to carry public feeling beyond this stage. Quite apart from the few enthusiasts who would have given a literal interpretation to the text in Matt. xix. 12, vows of virginity became more and more frequent as the virtue itself was lauded by ecclesiastical writers in language of increasing fervour. These vows were at first purely voluntary and temporary; but public opinion naturally grew less and less tolerant of those who, having once formed and published so solemn a resolution, broke it afterwards. Again not only was the church doctrine itself more or less consciously influenced by the Manichaean tenet of the diabolical origin of all matter, including the human body, but churchmen were also naturally tempted to compete in asceticism with the many heretics who held this tenet, and whose abstinence brought them so much popular consideration. Moreover, in proportion as the clergy, no longer mere ringleaders of a despised and persecuted sect, became beneficiaries and administrators of rich endowments—and this at a time when the external safeguards against embezzlement were comparatively weak—a strong feeling grew up among the laity that church revenues should not go to support the priest's family.<sup>4</sup> Lastly, such partial attempts as we have already described to enforce upon the clergy a special rule of continence, by their very failure, suggested more heroic measures. Therefore, side by side with the evidence for difficult enforcement of the old rules, we find an equally constant series of new and more stringent enactments.

The first church council which definitely forbade marriage to the higher clergy was the local Spanish synod of Elvira (A.D. 305). A similar interpretation has sometimes been claimed for the third canon of that general council of Nicaea to which we

<sup>1</sup> 1 Cor. vii. 25 sq., ix. 5; 1 Tim. iii. 2, 11, 12; Titus i. 6; E. Vacandard in *Dict. de Théol. Cath.*, s.v. "Célibat."

<sup>2</sup> This was a natural argument for the defenders of clerical celibacy even in far later times. St Bonaventura (d. 1274) puts this very strongly: "For if archbishops and bishops now had children, they would rob and plunder all the goods of the Church so that little or nothing would be left for the poor. For since they now heap up wealth and enrich nephews removed from them by almost incalculable degrees of affinity, what would they do if they had legitimate children? . . . Therefore the Holy Ghost in His providence hath removed this stumbling-block," &c. &c. (*In Sent. lib. iv. dist. xxxvii. art. i. quaest. 3*).

<sup>3</sup> W. Smith, *Dict. of Greek and Roman Antiquities* (3rd ed.), vol. ii. p. 44.

<sup>4</sup> In the 14th century, the city of Ilchi, in Chinese Tartary, possessed 14 monasteries, averaging 3000 devotees in each; while in Tibet, at the present time, there are in the vicinity of Lhasa 12 great monasteries, containing a population of 18,500 lamas. In Ladak the proportion of lamas to the laity is as 1 to 13, in Spiti 1 to 7, and in Burmah 1 to 30" (Lea l. 103).

owe the Nicene creed (325), but this is now abandoned by the best authorities on all sides. There can be no doubt, however, that the 4th century opened a wide breach in this respect between the Eastern and Western churches. The modern Greek custom is "(a) that most candidates for Holy Orders are dismissed from the episcopal seminaries shortly before being ordained deacons, in order that they may marry (their partners being in fact mostly daughters of clergymen), and after their marriage, return to the seminaries in order to take the higher orders; (b) that, as priests, they still continue the marriages thus contracted, but may not remarry on the death of their wife; and (c) that the Greek bishops, who may not continue their married life, are commonly not chosen out of the ranks of the married secular clergy, but from among the monks."<sup>1</sup> The Eastern Church, therefore, still adheres fairly closely to the rules laid down by the Apostolical Canons in the 4th century. In the West, however, a decisive forward step was taken by Popes Damasus and Siricius during the last quarter of that century. The famous decretal of Siricius (385) not only enjoined strict celibacy on bishops, priests and deacons, but insisted on the instant separation of those who had already married, and prescribed the punishment of expulsion for disobedience (*Siric. Ep. i. c. 7*; Migne, *P.L.* xiii. col. 1138). Although we find Siricius a year later writing to the African Church on this same subject in tones rather of persuasion than of command, yet the beginning of compulsory sacerdotal celibacy in the Western Church may be conveniently dated from his decretal of A.D. 385. Leo the Great (d. 461) and Gregory the Great (d. 604) further extended the rule of celibacy to subdeacons.

For the next three or four centuries there is little to note but the continual evidence of open or secret resistance to these decrees, and the parallel frequency and stringency of ecclesiastical legislation, which by its very monotony bears witness to its own want of success. At least seven episcopal constitutions of the 8th and 9th centuries forbade the priest to have even his mother or his sister in the house.<sup>2</sup> Nor did the only difficulty lie in such secret breaches of the law; in many districts the priesthood tended to become a mere hereditary caste, to the disadvantage of church and state alike. In northern and southern Italy public clerical marriages were extremely frequent, whether with or without regular forms.<sup>3</sup> The see of Rouen was held for more than a century (942-1054) by three successive bishops who were family men and two of whom were openly married.<sup>4</sup> In England St Swithun (d. 862) was married, though very likely by special papal dispensation; and the married clergy were apparently predominant in Alfred's time. In spite of Dunstan's reforms at the end of the 10th century, the Norman Lanfranc found so many wedded priests that he dared not decree their separation; and when his successor St Anselm attempted to go further, this seemed a perilous novelty even to so distinguished an ecclesiastic as Henry of Huntingdon, who wrote: "About Michaelmas of this same year (1102) Archbishop Anselm held a council in London, wherein he forbade wives to the English priesthood, heretofore not forbidden; which seemed to some a matter of great purity, but to others a perilous thing, lest the clergy, in striving after a purity too great for human strength, should fall into horrible impurity, to the extreme dishonour of the Christian name" (*lib. vii.*; Migne, *P.L.* cxcv. col. 944). Yet this was at 2 time when the decisive and continued action of two great popes ought to have left no possible doubt as to the law of the church.

The growing tendency of the clergy to look upon their endow-

<sup>2</sup> See the quotations in Lea i. 156. These prohibitions were renewed in the 13th and 14th centuries (*ibid.* i. 410).

<sup>3</sup> Rutherius, *Uinerarium*, c. 5 (Migne, *P.L.* cxxxvi. col. 585). Gualtiero Apulus writes of southern Italy in 1059: "In these parts priests, deacons and the whole clergy were publicly married" (*De Normann. lib. ii.*).

<sup>4</sup> Dom Pommeraye, *S. Rotomag. Eccl. Concilia*, pp. 56, 65; cf. similar instances on p. 315 of Dr A. Dresner's *Kultur- und Sittengeschichte d. staatsmässigen Geistlichkeit im 10. und 11. Jhd.* (Breslau, 1890).

ments as hereditary fiefs, their consequent worldliness and (it must be added) their vices, aroused, the indignation of two very remarkable men in the latter half of the 11th century. St Pietro Damiani (988-1072) was a scholar, hermit and reformer, who did more perhaps than any one else to combat the open marriages of the clergy. He complained that exhortation was wasted even on the bishops, "because they despair of attaining to the pinnacle of chastity, and have no fear of condemnation in open synod for the vice of lechery. . . . If this evil were secret [he adds], it might perhaps be borne."<sup>5</sup> His *Liber Gomorrhianus*, addressed to and approved by St Leo IX., is sufficient in itself to explain the vehemence of his *crusade*, though it emphasizes even more strongly the impolicy of proceeding more severely against the open marriages of the clergy than against concubinage and other less public vices.<sup>6</sup> Damiani found a powerful ally in the equally ascetic but far more imperious and statesmanlike Hildebrand, afterwards Pope Gregory VII. Under the influence of these two men, five successive popes between 1045 and 1073 attempted a radical reform; and when, in this latter year, Hildebrand himself became pope, he took measures so stringent that he has sometimes been erroneously represented not merely as the most uncompromising champion, but actually as the author of the strict rule of celibacy for all clerics in sacred orders. His mind, strongly imbued with the theocratic ideal, saw more clearly than any other the enormous increase of influence which would accrue to a strictly celibate body of clergy, separated by their very ordination from the strongest earthly ties; and no statesman has ever pursued with greater energy and resolution a plan once formulated. In order to break down the desperate, and in many places organized, resistance of the clergy, he did not shrink from the perilous course, so contrary to his general policy, of subjecting them to the judgment of the laity. Not only were concubinary priests—a term which was now made to include also those who had openly married—prohibited to serve at the altar and threatened with actual deposition in cases of contumacy, but the laity were warned against attending mass said by "any priest certainly known to keep a concubine or *subintraucta*."<sup>7</sup>

But these heroic measures soon caused serious embarrassment. If the laity were to stand aloof from all incontinent priests, while (as the most orthodox churchmen constantly complained) many priests were still incontinent, then this could only result in estranging large bodies of the laity from the sacraments of the church. It became necessary, therefore, to soften a policy which to the lay mind might imply that the virtue of a sacrament was weakened by the vices of its ministers; and, whereas Peter Lombard (d. 1160) concludes that no excommunicated priest can effect transubstantiation, St Thomas Aquinas (d. 1274) agrees with all the later Schoolmen in granting him that power, though to the peril of his own soul.<sup>8</sup> For, by the last quarter of the 13th century, the struggle had entered upon a new phase. The severest measures had been tried, especially against the priests' unhappy partners. As early as the council of Augsburg (952) these were condemned to be scourged, while Leo II. and Urban II., at the councils of Rome and Amalfi (1051, 1059).

<sup>5</sup> *Opusc. xvii. praef.* The saint's evidence is carefully weighed by Dresdner (*l.c.*), especially on pp. 309 ff. and 321 ff.

<sup>6</sup> Even Pope Innocent III. was compelled to decide that priests who had kept two or more concubines, successively or simultaneously, did not thereby incur the disabilities which attended *bigamia*; or, in other words, that a layman who had contracted two lawful marriages and then proceeded to ordination on the death of his second wife, could be absolved only by the pope; whereas the concubinary priest, "as a man branded with simple fornication, might receive a valid dispensation from his own bishop (Letter to archbishop of Lund in 1212. *Regest. lib. xvi. ep. 118*; Migne, *P.L.* ccxvi. col. 914). As the great canonist Gratian remarks in a similar decretal of Pope Pelagius, "Here is a case where lechery has more rights at law than has chastity" (*Decret. p. i. dist. xxxiv. c. vii. note a*).

<sup>7</sup> The actual originator of this policy was Nicholas II., probably at Hildebrand's suggestion; but the decree remained practically a dead letter until Gregory's accession.

<sup>8</sup> Peter Lombard, *Sentent. lib. iv. dist. 13*. Aquinas, *Summa Theol. pars iii. q. lxxxiii. art. 7*, 9.

adjudged them to actual slavery.<sup>1</sup> Such enactments naturally defeated their own purpose. More was done by the gentler missionary zeal of the Franciscans and Dominicans in the early 13th century; but St Thomas Aquinas had seen half a century of that reform and had recognized its limitations; he therefore attenuated as much as possible the decree of Nicholas II. His contemporary St Bonaventura complained publicly that he himself and his fellow-friars were often compelled to hold their tongues about the evil clergy; partly because, even if one were expelled, another equally worthless would probably take his place, but "perhaps principally lest, if the people altogether lost faith in the clergy, heretics should arise and draw the people to themselves as sheep that have no shepherd, and make heretics of them, boasting that, as it were by their own testimony, the clergy were so vile that none need obey them or care for their teaching."<sup>2</sup> In other passages of his works St Bonaventura tells us plainly how little had as yet been gained by suppressing clerical marriages; and the evidence of orthodox and distinguished churchmen for the next three centuries is equally decisive. Alvarez Pelayo, a Spanish bishop and papal penitentiary, wrote in 1332, "The clergy sin commonly in these following ways . . . fourthly, in that they live very incontinently, and would that they had never promised continence! especially in Spain and southern Italy, in which provinces the sons of the laity are scarcely more numerous than those of the clergy." Cardinal Pierre d'Ailly pleaded before the council of Constance in 1415 for the reform of "that most scandalous custom, or rather abuse, whereby many [clergy] fear not to keep concubines in public."<sup>3</sup>

Meanwhile, as has been said above, the custom of open marriage among clergy in holy orders (priests, deacons and subdeacons) was gradually stamped out. A series of synods, from the early 12th century onwards, declared such marriages to be not only unlawful, but null and void in themselves. Yet the custom lingered sporadically in Germany and England until the last few years of the 13th century, though it seems to have died out earlier in France and Italy. There was also a short-lived attempt to declare that even a clerk in lower orders should lose his clerical privileges on his marriage; but Boniface VIII. in 1300 definitely permitted such marriages under the already-quoted conditions of the Apostolic Canons; in these cases, however, a bishop's licence was required to enable the cleric to officiate in church, and the episcopal registers show that the diocessans frequently insisted on the celibacy of parish-clerks. As the middle ages drew to a close, earnest churchmen were compelled to ask themselves whether it would not be better to let the priests marry than to continue a system under which concubinage was even licensed in some districts.<sup>4</sup> Serious proposals were made to reintroduce clerical marriage at the great

<sup>1</sup> Labbe-Mansi, *Concilia*, vol. xix. col. 796 and xx. col. 724. Dr Lea is probably right in suggesting that it was a confused recollection of these decrees which prompted one of Cranmer's judges to assure him that "his children were bondmen to the see of Canterbury." Strype, *Memorials of Cranmer*, bk. iii. c. 28 (ed. 1812, vol. i. p. 601).

<sup>2</sup> Bonaventura, *Libell. Apologet.* quaest. i.; cf. his parallel treatise *Quare Fratres Minores praedicant*. The first visitation of his friend Odo Rigaldi, archbishop of Rouen, shows that about 15% of the parish clergy in that diocese were notoriously incontinent (*Registrum Visitationum*, ed. Bonnin, Rouen, 1852, pp. 17 ff.). Vacandard (*loc. cit.* p. 2087) appeals rather misleadingly to this record as proving the progress made during the half-century before Odo's time. It is probable that there were many more offenders than these 15% known to the archbishop.

<sup>3</sup> Alvarez Pelagius, *De Planctu Ecclesiae*, ed. 1517, f. 131a, col. 2; cf. f. 102b, col. 2; Hermann von der Hardt, *Constantiensis Concilii*, 8c. vol. i. para. viii. col. 428.

<sup>4</sup> This more or less regular sale of licences by bishops and archdeacons flourished from the days of Gregory VII. to the 16th century; see index to Lea, s.v. "Licences." Dr Lea has, however, omitted the most striking authority of all, Gascoigne, the most distinguished Oxford chancellor of his day, writing about 1450 of John de la Bere, then bishop of St David's, says that he had refused to separate the clergy of his diocese from their concubines, giving publicly as his reason, "for then I your bishop should lose the 400 marks which I receive yearly in my diocese for the priests' lemans" (*Gascoigne, Lib. Ver. ed. Rogers*, p. 36). Even Sir Thomas More, in his polemic against the Reformers, admitted that this concubinage was too often tolerated in Wales (*English Works*, ed. 1557, p. 231, cf. 619).

reforming councils of Constance (1415) and Basel (1432); but the overwhelming majority of orthodox churchmen were unwilling to abandon a rule for which the saints had fought during so many centuries, and to which many of them probably attributed an apostolic origin.<sup>5</sup> This conservative attitude was inevitably strengthened by the attacks first of Lollard and then of Lutheran heretics; and Sir Thomas More was driven to declare, in answer to Tyndale that the marriage of priests, being essentially null and void, "defileth the priest more than double or treble whoredom." It is well known that this became one of the most violently disputed questions at the Reformation, and that for eight years it was felony in England to defend sacerdotal marriage as permissible by the law of God (Statute of the Six Articles, 31 Hen. VIII. c. 14). The diversity of practice on this point drew one of the sharpest lines between reformers and orthodox, until the disorders introduced by these religious wars tempted the latter to imitate in considerable numbers the licence of their rivals.<sup>6</sup> This moved the emperor Charles V. to obtain from Paul III. dispensations for married priests in his dominions; and his successor Ferdinand, with the equally Catholic sovereigns of France, Bavaria and Poland, pleaded strongly at the council of Trent (1545) for permissive marriage. The council, after some hesitation, took the contrary course, and in the 9th canon of its 24th session it erected sacerdotal celibacy practically, if not formally, into an article of faith. In spite of this, the emperor Joseph II. reopened the question in 1783. In France the revolutionary constitution of 1791 abolished all restrictions on marriage, and during the Terror celibacy often exposed a priest to suspicion as an enemy to the Republic; but the better part of the clergy steadily resisted this innovation, and it is estimated that only about 2% were married. The Old Catholics adopted the principle of sacerdotal marriage in 1875.

The working of the system in modern times is perhaps too controversial a question to be discussed here; but one or two points may be noted on which all fairly well informed writers would probably agree. It can scarcely be denied that the Roman Catholic clergy have always owed much of their influence to their celibacy, and that in many cases this influence has been most justly earned by the celibate's devotion to an unworldly ideal. Again, the most adverse critics would admit that much was done by the counter-Reformation, and that modern ecclesiastical discipline on this point is considerably superior to that of the middle ages; while, on the other hand, many authorities of undoubted orthodoxy are ready to confess that it is not free from serious risks even in these days of easy publicity and stringent civil discipline.<sup>7</sup> Lastly, statistical research has shown that the children of the married British clergy have been distinguished far beyond their mere numerical proportion.<sup>8</sup>

AUTHORITIES.—Henry Charles Lea, *History of Sacerdotal Celibacy* (3rd ed., 1907, 2 vols.), is by far the fullest and best work on this subject, though a good deal of important matter omitted by Dr Lea may be found in *Die Einführung der erzwungenen Ehelosigkeit* by the brothers Johann Anton and Augustin Theiner, which was put on the Roman Index, though Augustin afterwards became archivist at the Vatican (Altenburg, 1828, 2 vols.). The history of monastic celibacy has not yet been fully treated anywhere; the most important evidence of the episcopal registers is either still in MS. or has been published only in comparatively recent years. The most learned work on clerical celibacy from the strictly conservative point of view is that of Francesco Antonio Zaccaria, *Storia Polemica del celibato sacro* (Rome, 1774); but many of his most important

<sup>5</sup> One of Dr Lea's few serious mistakes is his acceptance of the spurious pamphlet in favour of priestly marriage which was attributed in the 11th century to St Ulrich of Augsburg (l. 171).

<sup>6</sup> Janssen, *Gesch. d. deutschen Volkes*, 13th ed., vol. viii. pp. 423, 49; 434. Lea ii. 195, 204 ff.

<sup>7</sup> Lea (ii. 330 ff.) gives a long series of quotations to this effect from church synods and orthodox disciplinary writers of modern times.

<sup>8</sup> Havelock Ellis, *A Study of British Genius* (London, 1904, p. 80). "Even if we compare the church with the other professions with which it is most usually classed, we find that the eminent children of the clergy considerably outnumber those of lawyers, doctors and army officers put together." Mr Ellis points out, however, that "the clerical profession . . . also produces more idiots than any other class."

conclusions are set aside by the abbé E. Vacandard in his contribution to the *Dictionnaire de théologie catholique* (vol. ii. art. "Célibat ecclésiastique").

**CELL** (from Lat. *cella*, probably from an Indo-European *kal*—seen in Lat. *celare*, to hide; another suggestion connects the word with Lat. *cera*, wax, taking the original meaning to refer to the honeycomb), in its earliest application a small detached room in a building, particularly a small monastic house (see **ABBEY**), generally in the country, belonging to large conventual buildings, and intended for change of air for the monks, as well as places to reside in to look after the lands, vassals, &c. Thus Tynemouth was a cell to St Albans; Ashwell, Herts, to Westminster Abbey. The term was also used of the small sleeping apartments of the monks, or a small apartment used by the anchorite or hermit. This use still survives in the application to the small separate chambers in a prison (*q.v.*) in which prisoners are confined. The word is applied to various small compartments which build up a compound structure such as a honeycomb, to the minute compartments in a tissue, &c. More particularly the word is used, in electrical science, of the single constituent compartments of a voltaic battery (*q.v.*), and in biology of the living units of protoplasm of which plants and animals are composed (see **CYTOLOGY**).

**CELLA**, in architecture, the Latin name for the sanctuary of a Roman temple, corresponding with the naos of the Greek temple. In the Etruscan temples, according to Vitruvius, there were three cellas, side by side; and in the temple of Venus built by Hadrian at Rome there were two cellas, both enclosed, however, in a single peristyle.

**CELLARET** (i.e. little cellar), strictly that portion of a sideboard which is used for holding bottles and decanters, so called from a cellar (which in general may be any underground unlighted apartment) being commonly used for keeping wine. Sometimes it is a drawer, divided into compartments lined with zinc, and sometimes a cupboard, but still an integral part of the sideboard. In the latter part of the 18th century, when the sideboard was in process of evolution from a side-table with drawers into the large and important piece of furniture which it eventually became, the cellaret was a detached receptacle. It was most commonly of mahogany or rosewood, many-sided or even octagonal, and occasionally oval, bound with broad bands of brass and lined with zinc partitions to hold the ice for cooling wine. Sometimes a tap was fixed in the lower part for drawing off the water from the melted ice. Cellarets were usually placed under the sideboard, and were, as a rule, handsome and well-proportioned; but as the artistic impulse which created the great 18th-century English school of furniture died away, their form grew debased, and under the influence of the English Empire fashion, which drew its inspiration from a bastard classicism, they assumed the shape of sarcophagi incongruously mounted with lions' heads and claw-feet. Hepplewhite called them "garden du vin"; they are now nearly always known as "wine-coolers."

**CELLE**, a town of Germany, in the Prussian province of Hanover, on the left bank of the navigable Aller, near its junction with the Fuxe and the Lachte, 23 m. N.E. of Hanover, on the main Lehrte-Hamburg railway. Pop. (1905) 21,400. The town has a Roman Catholic and five Protestant churches, among the latter the town-church with the burial vault of the dukes of Lüneburg-Celle. Here rest the remains of Sophia Dorothea, wife of the elector George of Hanover, afterwards George I. of England, and those of Caroline Matilda, the divorced wife of Christian VII. of Denmark and sister of George III. of England, who resided here from 1772 until her death in 1775. The most interesting building in Celle is the former ducal palace, begun in 1485 in Late Gothic style, but with extensive Renaissance additions of the close of the 17th century. The building of the court of appeal (*Oberlandesgericht*), with a valuable library of 60,000 volumes and many MSS., including a priceless copy of the *Sachsenspiegel*, the museum and the hall of the estates (*Landschaftshaus*) are also worthy of notice. There are manufactures of woollen yarn, tobacco, biscuits, umbrellas and printers'

ink, and a lively trade is carried on in wax, honey, wool and timber. Celle is the seat of the court of appeal from the superior courts of Aurich, Detmold, Göttingen, Hanover, Hildesheim, Lüneburg, Osnabrück, Stade and Verden. Founded in 1292, the town was the residence of the dukes of Lüneburg-Celle; a cadet branch of the ducal house of Brunswick, from the 14th century until 1705.

See Dehning, *Geschichte der Stadt Celle* (Celle, 1891).

**CELLIER, ALFRED** (1844-1891), English musical composer, was born at Hackney on the 1st of December 1844. From 1855 to 1860 he was a chorister at the Chapel Royal, St James's, under the Rev. Thomas Helmore, where Arthur Sullivan was one of his youthful colleagues. His first appointment was that of organist at All Saints' church, Blackheath (1862). In 1866 he succeeded Dr Chipp as director of the Ulster Hall concerts, Belfast, at the same time acting as conductor of the Belfast Philharmonic Society. In 1868 he returned to London as organist of St Alban's, Holborn. From 1871 to 1875 he was conductor at the Prince's theatre, Manchester; and from 1877 to 1879 at various London theatres. During this period he composed many comic operas and operettas, of which the most successful was *The Sultan of Mocha*, which was produced at Manchester in 1874, in London at the St James's theatre in 1876, and revived at the Strand theatre in 1887. In 1880 Cellier visited America, producing a musical version of Longfellow's *Masque of Pandora* at Boston (1881). In 1883 his setting of Gray's *Elegy* in the form of a cantata was produced at the Leeds Festival. In 1886 he won the great success of his life in *Dorothy*, a comic opera written to a libretto by B. C. Stephenson, which was produced at the Gaiety theatre on the 25th of September 1886, and transferred first to the Prince of Wales theatre and subsequently to the Lyric theatre, ran until April 1889. *Drus* (1889), and *The Mountebanks*, which was produced in January 1892, a few days after the composer's death, were less successful. Cellier owed much to the influence of Sir Arthur Sullivan. He had little of the latter's humour and vivacity, but he was a fertile melodist, and his writing is invariably distinguished by elegance and refinement. He died in London on the 28th of December 1891.

**CELLINI, BENVENUTO** (1500-1571), Italian artist, metal worker and sculptor, was born in Florence, where his family, originally landowners in the Val d'Ambra, had for three generations been settled. His father, Giovanni Cellini, was a musician and artificer of musical instruments; he married Maria Lisabetta Granacci, and eighteen years elapsed before they had any progeny. Benvenuto (meaning "Welcome") was the third child. The father destined him for the same profession as himself, and endeavoured to thwart his inclination for design and metal work. When he had reached the age of fifteen his youthful predilection had become too strong to be resisted, and his father reluctantly gave consent to his being apprenticed to a goldsmith, Antonio di Sandro, named Marcone. He had already attracted some notice in his native place, when, being implicated in a fray with some of his companions, he was banished for six months to Siena, where he worked for Francesco Castoro, a goldsmith; from thence he removed to Bologna, where he became a more accomplished flute-player and made progress in the goldsmith's art. After visiting Pisa, and after twice resetting for a while in Florence (where he was visited by the sculptor Torrigiano, who unsuccessfully suggested his accompanying him to England), he decamped to Rome, aged nineteen. His first attempt at his craft here was a silver casket, followed by some silver candlesticks, and later by a vase for the bishop of Salamanca, which introduced him to the favourable notice of Pope Clement VII.; likewise at a later date one of his celebrated works, the gold medallion of "Leda and the Swan,"—the head and torso of Leda cut in hard stone—executed for Gonfaloniere Gabriello Cesarino, which is now in the Vienna museum; he also reverted to music, practised flute-playing, and was appointed one of the pope's court-musicians. In the attack upon Rome by the constable de Bourbon, which occurred immediately after, in 1527, the bravery and address of Cellini proved of signal service

to the pontiff; if we may believe his own accounts, his was the very hand which shot the Bourbon dead, and he afterwards killed Philibert, prince of Orange. His exploits paved the way for a reconciliation with the Florentine magistrates, and his return shortly after to his native place. Here he assiduously devoted himself to the execution of medals, the most famous of which (executed a short while later) are "Hercules and the Nemean Lion," in gold repoussé work, and "Atlas supporting the Sphere," in chased gold, the latter eventually falling into the possession of Francis I. From Florence he went to the court of the duke of Mantua, and thence again to Florence and to Rome, where he was employed not only in the working of jewelry, but also in the execution of dies for private medals and for the papal mint. Here in 1529 he avenged a brother's death by slaying the slayer; and shortly afterwards had to flee to Naples to shelter himself from the consequences of an affray with a notary, Ser Benedetto, whom he wounded. Through the influence of several of the cardinals he obtained a pardon; and on the elevation of Paul III. to the pontifical throne he was reinstated in his former position of favour, notwithstanding a fresh homicide of a goldsmith which he had committed more by accident than of malice prepense in the interregnum. Once more the plots of Pierluigi Farnese, a natural son of Paul III., led to his retreat from Rome to Florence and Venice, and once more he was restored with greater honour than before. On returning from a visit to the court of Francis I., being now aged thirty-seven, he was imprisoned on a charge (apparently false) of having embezzled during the war the gems of the pontifical tiara; he remained some while confined in the castle of Sant' Angelo, escaped, was recaptured, and treated with great severity, and was in daily expectation of death on the scaffold. At last, however, he was released at the intercession of Pierluigi's wife, and more especially of the Cardinal d'Este of Ferrara, to whom he presented a splendid cup. For a while after this he worked at the court of Francis I. at Fontainebleau and in Paris; but he considered the duchesse d'Étampes to be set against him, and the intrigues of the king's favourites, whom he would not stoop to conciliate and could not venture to silence by the sword, as he had silenced his enemies in Rome, led him, after about five years of laborious and sumptuous work, and of continually-recurring jealousies and violences, to retire in 1545 in disgust to Florence, where he employed his time in works of art, and exasperated his temper in rivalries with the uneasy-natured sculptor Baccio Bandinelli. The first collision between the two had occurred several years before when Pope Clement VII. commissioned Cellini to mint his coinage. Now, in an altercation before Duke Cosimo, Bandinelli insultingly stigmatized Benvenuto as guilty of gross immorality; in his autobiography Cellini rather repels than denies the charge, but he certainly repels it with demonstrative and grotesque vivacity. Two somewhat similar charges had been made ere this: one in Paris, which he braved out in court—the other, in Florence, was a mere private quarrel, and perhaps undeserving of attention. During the war with Siena Cellini was appointed to strengthen the defences of his native city, and, though rather shabbily treated by his ducal patrons, he continued to gain the admiration of his fellow-citizens by the magnificent works which he produced. He died in Florence in 1571, unmarried, and leaving no posterity, and was buried with great pomp in the church of the Annunziata. He had supported in Florence a widowed sister and her six daughters.

Besides the works in gold and silver which have been adverted to, Cellini executed several pieces of sculpture on a grander scale. The most distinguished of these is the bronze group of "Perseus holding the head of Medusa," a work (first suggested by Duke Cosimo de' Medici) now in the Loggia dei Lanzi at Florence, full of the fire of genius and the grandeur of a terrible beauty, one of the most typical and unforgettable monuments of the Italian Renaissance. The casting of this great work gave Cellini the utmost trouble and anxiety; and its completion was hailed with rapturous homage from all parts of Italy. The original relief from the foot of the pedestal—Perseus and Andromeda—is in the Bargello, and replaced by a cast.

Not less characteristic of its splendidly gifted and barbarically untameable author are the autobiographical memoirs which he composed, beginning them in Florence in 1558,—a production of the utmost energy, directness and racy animation, setting forth one of the most singular careers in all the annals of fine art. His amours and hatreds, his passions and delights, his love of the sumptuous and the exquisite in art, his self-applause and self-assertion, running now and again into extravagances which it is impossible to credit, and difficult to set down as strictly conscious falsehoods, make this one of the most singular and fascinating books in existence. Here we read, not only of the strange and varied adventures of which we have presented a hasty sketch, but of the devout complacency with which Cellini could contemplate a satisfactorily achieved homicide; of the legion of devils which he and a conjuror evoked in the Colosseum, after one of his not innumerable mistresses had been spirited away from him by her mother; of the marvellous halo of light which he found surrounding his head at dawn and twilight after his Roman imprisonment, and his supernatural visions and angelic protection during that adversity; and of his being poisoned on two several occasions. If he is unmeasured in abusing some people, he is also unlimited in praising others. The autobiography has been translated into English by Thomas Roscoe, by J. A. Symonds, and by A. Macdonald. Cellini also wrote treatises on the goldsmith's art, on sculpture, and on design (translated by C. R. Ashbee, 1899).

Among his works of art not already mentioned, many of which have perished, were a colossal Mars for a fountain at Fontainebleau and the bronzes of the doorway, coins for the Papal and Florentine states, a Jupiter in silver of life size, and a bronze bust of Bindo Altoviti. The works of decorative art are, speaking broadly, rather florid than chastened in style.

In addition to the bronze statue of Perseus and the medallions already referred to, the works of art in existence to-day executed by him are the celebrated salt-cellar made for Francis I. at Vienna; a medallion of Clement VII. in commemoration of the peace between the Christian princes, 1530, with a bust of the pope on the reverse and a figure of Peace signing fire to a heap of arms in front of the temple of Janus, signed with the artist's name; a medal of Francis I. with his portrait, also signed; and a medal of Cardinal Pietro Bembo. Cellini, while employed at the papal mint at Rome during the papacy of Clement VII.—and later of Paul III., executed the dies of several coins and medals, some of which still survive at this now defunct mint. He was also in the service of Alessandro de' Medici, first duke of Florence, for whom he executed in 1535 a forty-soldi piece with a bust of the duke on one side and standing figures of the saints Cosmo and Damian on the other. Some connoisseurs attribute to his hand several plaques, "Jupiter crushing the Giants," "Fight between Perseus and Phineas," a Dog, &c.

The important works which have perished include the uncompleted chalice intended for Clement VII.; a gold cover for a prayer-book as a gift from Pope Paul III. to Charles V.,—both described at length in his autobiography; large silver statues of Jupiter, Vulcan and Mars, wrought for Francis I. during his sojourn in Paris; a bust of Julius Caesar; and a silver cup for the cardinal of Ferrara. The magnificent gold "button," or morse, made by Cellini for the cope of Clement VII., the competition for which is so graphically described in his autobiography, appears to have been sacrificed by Pius VI., with many other priceless specimens of the goldsmith's art, in furnishing the indemnity of 30,000,000 francs demanded by Napoleon at the conclusion of the campaign against the States of the Church in 1797. According to the terms of the treaty, the pope was permitted to pay a third of that sum in plate and jewels. Fortunately there are in the print room of the British Museum three water-colour drawings of this splendid morse by F. Bertoli, done at the instance of an Englishman named Talman in the first half of the 18th century. The obverse and reverse, as well as the rim, are drawn full size, and moreover the morse with the precious stones set therein, including a diamond then considered the second largest in the world, is fully described.

**BIBLIOGRAPHY.**—The autobiography already named is the foundation of most of the works written concerning Cellini's life. **CELLULOSE**, the name given to both an individual—cellulose proper, in the restricted sense of a chemical individual—and to a group of substances, the celluloses or cellulose group, which constitute in infinitely varied forms the containing envelope of the plant cell. They are complex carbohydrates, or "saccharo-colloids" (Tollens), and are resolved by ultimate hydrolysis into monoses. The typical cellulose is represented by the empirical formula  $C_6H_{10}O_5$ , identical with that of starch, with which it has many chemical analogies as well as physiological correlations. The representative "cellulose" is the main constituent of the cotton fibre substance, and is obtainable by treating the raw fibre with boiling dilute alkalis, followed by chlorine gas or bromine water, or simply by alkaline oxidants. The cellulose thus purified is further treated with dilute acids, and then exhaustively with alcohol and ether. Chemical filter-paper (Swedish) is practically pure cellulose, the final purification consisting in exhaustive treatment with hydrofluoric acid to remove silicious inorganic residues. The "cellulose" group, however, comprises a series of substances which, while presenting the characters generally similar to those of cotton cellulose, also exhibit marked divergences. The resemblances are maintained in their synthetical reactions; but reactions involving the decomposition of the complex show many variations. For example, cotton cellulose is difficultly hydrolysed; other celluloses are more or less readily split up by dilute acids; the extreme members readily yielding sugars: the hexoses—dextrose, mannose and galactose; and the pentoses—xylose and arabinose; these less resistant cell-wall constituents are termed hemi-celluloses.

The celluloses proper are essentially non-nitrogenous, though originating in the cell protoplasm. The cell-walls of the lower cryptogams, similarly purified, retain a notable proportion—2.0-4.0%—of constitutivaal nitrogen. When hydrolysed these fungoid celluloses yield, in addition to monoses, glucosamine and acetic acid. The celluloses of the phanerogams are generally associated, in a degree ranging from physical mixture to chemical union, with other complicated substances, constituting the "compound celluloses." The nature of the associated groups affords a convenient classification into pecto-celluloses, ligno-celluloses and cuto-celluloses. *Pecto-celluloses* are so named because the associated substances—carbohydrates, together with their oxidation products, *i.e.* containing either two carbonyls (CO) in the unit group or carboxyl (CO-OH) groups in a complex—are readily hydrolysed by weak acids to the gelatinous "pectic acids" or their salts. *Ligno-celluloses* are the substances of lignified tissue, the non-cellulose constituents of which are characterized by the presence of benzenoid and furfuroid groups; and although essentially complex,

they may be regarded as homogeneous, and are conveniently grouped under the name *lignone*. The lignone complex reacts, by its unsaturated groups, with the halogens. It is a complex containing but little hydroxyl; and is of relatively high carbon percentage (55.0-57.0%). *Cuto-celluloses* predominate in the protective coatings of plant organs, and are characterized by constituent groups, the decomposition products of which are compounds of the fatty series, and also wax alcohols, acids, cholesterol, &c.

The typical pecto-cellulose is the flax fibre, *i.e.* the bast fibre of the flax plant (*Linum usitatissimum*), as it occurs in the plant, or as the commercial textile fibre in its raw state. Rhea, or ramie, is another leading textile fibre in which the cellulose occurs associated with alkali-soluble colloidal carbohydrates. Pecto-celluloses are found in the stems of the Gramineae (cereal straws, esparto), and in the fibro-vascular bundles of monocotyledons used as textile and rope-making fibres. They are the chief constituents of the fleshy parenchyma of fruits, tubers, rhizomes. Ligno-celluloses find their chemical representative in the jute fibre. They constitute the woods, and are therefore of the widest distribution and the highest industrial utility. It is important to note that a complex having all the chemical characteristics of a ligno-cellulose occurs in a soluble colloidal form in the juice of the white currant. The formation of ligno-cellulose is the chemical equivalent of the morphological change of the plant cell known as "lignification." The typical cuto-celluloses are the epidermal tissues of all growing plants or organs, which are easily detached from the underlying tissues which it is their function to protect. To subserve this function, they are extremely resistant to the attack of reagents. The associated groups are mostly of the normal saturated series, and of very high molecular weight.

*Cellulose and Botanical Science.*—The elaboration of cellulose, *i.e.* of the cell walls, and its morphological and physiological aspects are discussed in the articles *PLANTS: Physiology, Anatomy; and CYTOLOGY*; while in the article *COAL* the part played by cellulose in the formation of these deposits receives treatment: here we may deal with its general relation to agriculture. In the analysis of fodder plants and other vegetable produce, the residue obtained after successive acid and alkaline hydrolysis is the "crude fibre" of the agricultural chemist, and is generally taken as a measure of the actual cellulose contents of the raw material. We give in tabular form the average percentage of crude fibre in typical food-stuffs and agricultural produce:—

## SEEDS

Seeds of Cereals.	Per cent of Fibre.	Leguminous and Oil Seeds.	Per cent of Fibre.
Wheat	2.8	Rape	6.4
Barley	6.3	Cotton	7.5
Oats	9.0	Beans	10.0
Maize	5.2	Peas	10.0
Rye	8.0	Lentils	10.0
Rice	2.5	Vetches	7.2

## FODDER CROPS

Stems and Foliage of Root Crops.	Per cent of Fibre.	Fodder Crops.	Per cent of Fibre. <sup>1</sup>	Cereal Straws.	Per cent of Fibre.
White Turnip	3.9	Grasses	32.0	Oats	60-68
		Meadow	25.8	Wheat	75-77
		Hay		Barley	71-74
Swedish "	4.2	Clover and	23.5		
Carrot	3.1	Trefoil			
Mangel	2.6	Vetches	25.9		
Parsnip	2.6	Lucerne	26.7		
		Sainfoin	28.7		

	Leguminous.	Oil Seeds.	Stems and Foliage of Root Crops	Fodder Crops.	Cereal Straws.
Average % of water	14	7	87	70-80	15

<sup>1</sup> This percentage is calculated on air-dry-produce containing 15% of water.

The above figures have a purely empirical value, since they represent a complicated mixture of various residues derived from the celluloses and compound celluloses. This mixture may be further resolved, and by special quantitative methods the proportions of actual cellulose, ligno-cellulose and cuto-celluloses estimated (J. König, *Ber.*, 1906, 39, p. 3564). The figures are taken as an inverse measure of digestibility; at the same time it has been established that this group of relatively indigestible food constituents are more or less digestible and assimilable as flesh and fat producers. The percentage or coefficient of digestibility of the celluloses of the more important food-stuffs—green fodder, hay, straw and grains—varies from 20 to 75%. It has also been established that their physiological efficiency is, under certain conditions, quite equal to that of starch.

It must also be borne in mind that the indigestible food residues, as finally voided by the animal, have played an important mechanical part as an aid to digestion of those constituents more readily attacked in the digestive tract of animals. They are further an important factor of the agricultural cycle. Returned to the soil as "farm-yard manure," mixed with other cellulosic matter which has served as litter, they add "fibre" to the soil and, as a mechanical diluent of the mineral soil components, maintain this in a more open condition, penetrable by the atmospheric gases, and promoting distribution of moisture. Further by breaking down, with production of "humus," a complex of colloidal "unsaturated" bodies of acid function, they fulfil important chemical functions by interaction with the mineral soil constituents.

**Chemistry of Cellulose.**—Purified cotton cellulose, which is the definitive prototype of the cellulose group or series, is a complex of monoses or their "residues." It is resolved by solution in sulphuric acid and subsequent hydrolysis of the esters thus produced into dextrose. This fundamental fact with its elementary composition, most simply expressed by the formula  $C_6H_{10}O_5$ , has caused it to be regarded as a polyanhydride of dextrose. Forming, as it does, simple esters in the ratio of the reacting hydroxyls 3OH:  $C_6H_9O_4$ , and taking into account its direct conversion into  $\omega$ -brom-methyl furfural (Fenton) a constitutional formula has been proposed by A. G. Green (*Zeit. Farb. Textil Chem.* 3, pp. 97 and 309 (1904)), which is a useful generalization of its reactions, and its ultimate relations to the

siders, moreover, that a group thus formulated may consistently represent the actual dimensions of the reacting unit, but that unit of larger dimensions, if postulated, is easily derived from the above by oxygen linkings.

From another point of view the unit group has been formulated as  $\begin{array}{c} \text{CH(OH)-CH(OH)} \\ | \quad \quad \quad | \\ \text{CO} \quad \quad \quad \text{CH}_2 \\ | \quad \quad \quad | \\ \text{CH(OH)-CH(OH)} \end{array}$ , the main linking of such units in the

complex taking place as between their respective CO and  $\text{CH}_2$  groups in the alternative enolic form  $\text{CH}-\text{C(OH)}$ . This view gives expression to the genetic relations of the celluloses to the ligno-celluloses, to the tendency to carbon condensation as in the formation of coals, and pseudo-carbons, to the relative resistance of cellulose to hydrolysis, and its other points of differentiation from starch, and more particularly to the ketonic character of its carbonyl (CO) groups, which is also more in harmony with the experimental facts established by Fenton as to the production of methyl furfural.

The probability, however, is that no simple molecular formula adequately represents the constitution of cellulose as it actually exists or indeed reacts. On the other hand, it has been suggested that cellulose is to be regarded as representing a condition of matter analogous to that of a saline electrolyte in solution, i.e. as a complex of molecular aggregates, and of residues (of monose groups) having distinct and opposite polarities; such a complex is essentially labile and its configuration will change progressively under reaction. The exposition of this view is the subject of a publication by Cross and Bevan (*Researches on Cellulose*, ii. 1906). The main purpose is to give full effect to the colloidal

characteristics of cellulose and its derivatives, with reference to the modern theory of the colloidal state as involving a particular internal equilibrium of amphotheric electrolytes.

The typical cellulose is a white fibrous substance familiar to us in the various forms of bleached cotton. Other fibrous celluloses are equally characteristic as to form and appearance, e.g. bleached flax, hemp, ramie. It is hygroscopic, absorbing 6 to 7% its weight of moisture from the air. When dry, it is an electrical insulator, and has a specific inductive capacity of about 7: when wetted it is a conductor, and manifests electrolytic phenomena.<sup>1</sup> It is insoluble in water and in the ordinary solvents; it dissolves, however, in a 40-50% solution of zinc chloride, and in ammoniacal solutions of copper oxide (3%  $\text{CuO}$ , 15%  $\text{NH}_3$ ): from these solutions it is obtained as a highly hydrated, gelatinous precipitate, from the former by dilution or addition of alcohol, from the latter by acidification; these solutions have important industrial application. Projected or drawn into a precipitating solution they may be solidified continuously to threads of various, but controlled dimensions: the regenerated cellulose, now amorphous, in its finer dimensions is known as artificial silk or lustra-cellulose. These forms of cellulose retain the general characters of the original fibrous and "natural" celluloses. In composition they differ somewhat by combination with water (of hydration), which they retain in the air-dry condition. They also further combine with an increased proportion of atmospheric moisture, viz. up to 10-11% of their weight.

**Derivatives.**—Important derivatives are the esters or ethereal salts of both inorganic and organic acids, cellulose behaving as an alcohol, the highest esters indicating that it reacts as a trihydric alcohol of the formula  $n[C_6H_7O_2(OH)_3]$ . The nitrates result by the action of concentrated nitric acid, either alone or in the presence of sulphuric acid: the normal dinitrate represents a definite stage in the series of nitrates, and the ester at this point manifests the important property of solubility in various alcoholic solvents, notably ether-alcohol. Such nitrates are the basis of collodion, of artificial silk by the processes of Chardonnet and Lehner, and of celluloid or xylonite. Higher nitrates are also obtainable up to the limit of the trinitrate, which is insoluble in ether or alcohol, but is soluble in nitroglycerin, nitrobenzene and other solvents. These higher nitrates are the basis of the most important modern explosives.

Cellulose reacts directly with acetic anhydride to form low esters; in the presence of sulphuric acid the reaction proceeds to higher limits; the triacetate is soluble in chloroform. The acid sulphuric ester,  $C_6H_4O_3(SO_3H)_3$ , is obtained by the action of sulphuric acid, but its relation to the original cellulose is doubtful. The monobenzoate and dibenzoate are formed by benzoyl chloride reacting on alkali-cellulose (see below). Cellulose xanthates are obtained from carbon bisulphide and alkali-cellulose; these are water soluble derivatives and the basis of "viscose," and of important industries. Mixed esters—aceto-sulphate, aceto-benzoate, nitrobenzoyl nitrates, aceto-nitro-sulphates—have also been investigated.

Cellulose (cotton), when treated with a 15-20% caustic soda solution, gives the compound  $C_6H_7O_2 \cdot H_2O \cdot 2NaOH$ , alkali-cellulose, the original riband-like form with reticulated walls of the cellulose being transformed into a smooth-walled cylinder. The structural changes in the ultimate fibre determine very considerable changes in the dimensions of fabrics so treated. The reactions and structural changes were investigated by J. Mercer, and are known generally as "mercerization." In recent years a very large industry in "mercerized" fabrics (cotton) has resulted from the observation that if the shrinkages of the yarns and fabrics be antagonized by mechanical means, a very high lustre is developed.

Similar, but less definite compounds, are formed with the oxides of lead, manganese, barium, iron, aluminium and chromium. These derivatives, which also find industrial applications in the dyeing and printing of fabrics, differ but little in

<sup>1</sup> C. F. Cross and E. J. Bevan, *Jour. Chem. Soc.*, 1895, 67, p. 449; C. R. Darling, *Jour. Faraday Soc.* 1904; A. Campbell, *Trans. Roy. Soc.* 1906.

appearance from the original cellulose, and are without influence on its essential characteristics.

**Decompositions.**—Hydrolysis.—By solution in sulphuric acid followed by dilution and boiling the diluted solution cellulose hydrolyses to fermentable sugars; this reaction is utilized industrially in the manufacture of glucose from rags. Hydrochloric acid produces a friable mass of "hydrocellulose," probably  $C_6H_{12}O_5$ , insoluble in water, but readily attacked by alkalis, with the production of soluble derivatives; some dextrose is formed in the original reaction. Hydrobromic acid in ethereal solution gives furfuran derivatives. Cold dilute acids have no perceptible action on cellulose. The actions of such acids are an important auxiliary to bleaching, dyeing and printing processes, but they require careful limitation in respect of concentration and temperature. Cellulose is extremely resistant to the action of dilute alkalis: a 1-2% solution of sodium hydrate having little action at temperatures up to  $150^\circ$ ; hence the use of caustic soda, soda ash and sodium silicate in bleaching processes, i.e. for the elimination of the non-cellulose components of the raw fibres. Oxidation in acid solutions gives compounds classed as "oxycelluloses," insoluble in water, but more or less soluble in alkalis; continued oxidation gives formic, acetic and carbonic acids. Oxidation in alkaline solution is more easily controlled and limited; solutions of bleaching powder, or more generally of alkaline hydrochlorites, receive industrial application in oxidizing the coloured impurities of the fibre, or residues left after more or less severe alkali treatments, leaving the cellulose practically unaffected. This, however, is obviously a question of conditions: this group of oxidants also oxidize to oxycellulose, and under more severe conditions to acid products, e.g. oxalic and carbonic acids. Certain bacteria also induce decompositions which are resolutions into ultimate products of the lowest molecular dimensions, as hydrogen, carbon dioxide, methane, acetic acid and butyric acid (Omeliansky) (*Handb. Techn. Mykologie* [F. Lafar] pp. 245-268), but generally the cellulose complex is extremely resistant to the organic ferments. Cellulose burns with a luminous flame to carbon dioxide and water; dry distillation gives a complicated mixture of gaseous and liquid products and a residue of charcoal or pseudo-carbon. Chromic acid in sulphuric acid solutions effects a complete oxidation, i.e. combustion to water and carbonic acid.

**Ligno-celluloses.**—These compounds have many of the characteristics of the cellulose esters; they are in effect ethereal compounds of cellulose and the quinonoid lignone complex, and the combination resists hydrolysis by weak alkalis or acids. The cellulose varies in amount from 80 to 50%, and the lignone varies inversely as the degree of lignification, that is, from the lignified bast fibre of annuals, of which jute is a type, to the dense tissues of the perennial dicotyledonous woods, typified by the beech. The empirical formula of the lignone complex varies from  $C_{10}H_{12}O_4$  (jute) to  $C_{20}H_{20}O_{10}$  (pine wood). In certain reactions the non-cellulose or lignone constituents are selectively converted into soluble derivatives, and may be separated as such from the cellulose which is left; for example, chlorination gives products soluble in sodium sulphite solution, by the combination of unsaturated groups of the lignone with the halogen, while digestion with bisulphite solutions at elevated temperatures ( $140^\circ$ - $160^\circ$ ) gives soluble sulphonated derivatives. This last reaction is employed industrially in the preparation of cellulose for paper-making from coniferous woods. These reactions are "quantitative" since they depend upon well-defined constitutional features of the lignone complex, and the resolution of the ligno-cellulose takes place with no further change in the lignone than the synthetical combination with the substituting groups. The constituent groups of the lignone specifically

reacting are of benzenoid type of the probable form

deduced from the similarity of the chlorinated derivatives to maingallol, the product of the action of chlorine on pyrogallol in acetic acid solution (A. Hantzsch, *Ber.* 20, p. 2033).

The complex contains methoxy ( $\text{OCH}_3$ ) groups. There is also present a residue which is readily broken down by oxidizing agents, and indeed by simple hydrolysis, to acetic acid. Another important group of actual constituents are pentosanes—partially isolated as "wood gum" by solution in alkalis—and furfural derivatives (hydroxy furfurals) derived from these. The actual constitutional relationships of these main groups, as well as the localization of the methoxy groups, are still problematical.

Certain colour reactions are characteristic, though they are in some cases reactions of certain constituents invariably present in the natural forms of the ligno-cellulose; which may be removed without affecting the essential character of the lignone complex. Aniline salts generally give a yellow coloration, dimethyl-para-phenylenediamine gives a deep red coloration, phloroglucin in hydrochloric acid gives a crimson coloration. Reactions more definitely characteristic of the lignone are:—ferric ferrocyanide, which is taken up and transformed into Prussian blue throughout the fibre, without affecting its structure, although there may be as much as a 50% gain in weight; iodine in potassium iodide solution gives a deep brown colour due to absorption of the halogen, a reaction which admits of quantitative application, i.e. as a measure of the proportion of ligno-cellulose in a fibrous mixture; nitric acid gives a deep orange yellow coloration; digested with the dilute acid (5-10%  $\text{HNO}_3$ ) at  $50^\circ$  the ligno-celluloses are entirely resolved, the lignone complex being attacked and dissolved in the form of nitroso-ketonic acids, which, on continued heating, are finally resolved to oxalic, acetic, formic and carbonic acids.

**Derivatives of Ligno-cellulose.**—By reaction with chlorine jute yields the derivative  $C_{10}H_{10}Cl_2O_4$ , soluble in alcohol, and in acetic acid; this derivative has the reactions of a quinone chloride. By reaction with sodium sulphite it is converted into a hydroquinone sulphonate of deep purple colour. The reaction of the ligno-celluloses (pine wood) with the bisulphites yields the soluble derivatives of the general formula  $C_{10}H_{10}O_4 \cdot SO_3H$  (containing two  $\text{O} \cdot \text{CH}_2$  groups). Jute reacts with nitric acid in presence of sulphuric acid to form nitrates; and with acetic anhydride to form low acetates. It reacts with alkaline hydrates with structural changes similar to those obtained with cotton; and by the further action of benzoyl chloride and of carbon bisulphide upon the resulting compounds there result the corresponding benzoates and xanthates respectively. But these synthetical derivatives are mixtures of cellulose and lignone derivatives, and so far of merely theoretical interest.

**Decompositions of Ligno-cellulose.**—In addition to the specific resolutions above described which depend upon the distinctive chemical characters of the cellulose and lignone respectively, the following may be noted: to simple hydrolytic agents the two groups are equally resistant, therefore by boiling with dilute acids or alkalis the groups are attacked *pari passu*. Weak oxidants may also be used as bleaching agents to remove coloured by-products without seriously attacking the ligno-cellulose, which is obtained in its bleached form. Nitric acid of all strengths effects complete resolution. Chromic acid in dilute solutions combines with the lignone complex, but in presence of hydrolysing acids total oxidation of the lignone is determined. The principal products are oxalic, carbonic, formic and acetic acids. This reaction is an index of constitution. Generally, the lignone is attacked under many conditions and by many reagents which are without action upon cellulose, by virtue of its unsaturated constitution, and its acid and aldehydic residues.

**Cuto-cellulose.**—A typical cuto-cellulose is the cuticle (peel) of the apple which, when purified by repeated hydrolytic treatment and finally by alcohol and ether, gives a product of the composition  $C=75.66\%$ ,  $H=11.37\%$ ,  $O=14.97\%$ . Hydrolysis by strong alkalis gives stearo-cutic acid,  $C_{26}H_{42}O_6$ , and oleo-cutic acid,  $C_{16}H_{26}O_4$  (Frémy). Cork is a complex mixture containing various compound celluloses: extraction with alcohol removes certain fatty alcohols and acids, and aromatic derivatives related to tannic acid; the residue is probably a mixture of cellulose, ligno-cellulose, cerin,  $C_{20}H_{32}O$  and suberin; the latter yields

stearic acid,  $C_{18}H_{36}O_2$ , and the acid  $C_{22}H_{44}O_2$ . The cuticelluloses have been only superficially investigated, and, with the exception of cork, are of but little direct industrial importance.

**Industrial Uses of Cellulose.**—The applications of cellulose to the necessities of human life, infinitely varied in kind as they are colossal in magnitude, depend upon two groups of qualities or properties, (1) structural, (2) chemical. The manufactures of vegetable textiles and of paper are based upon the fibrous forms of the naturally occurring celluloses, together with such structural qualities as are expressed in the terms strength, elasticity, specific gravity. As regards chemical properties, those which come into play are chiefly the negative quality of resistance to chemical change; this is obviously a primary factor of value in enabling fabrics to withstand wear and tear, contact with atmospheric oxygen and water, and such chemical treatments as laundring; positive chemical properties are brought into play in the auxiliary processes of dyeing, printing, and the treatment and preparation in connexion with these. Staple textiles of this group are cotton, flax, hemp and jute; other fibres are used in rope-making and brush-making industries. These subjects are treated in special articles under their own headings and in the article **FIBRES**. The course of industrial development in the 19th century has been one of enormous expansion in use and considerable refinement in methods of preparation and manufacture. Efforts to introduce new forms of cellulose have had little result. Rhea or ramie has been a favourite subject of investigation; the industry has been introduced into England, and doubtless its development is only a question of time, as on the continent of Europe the production of reha yarns is well established, though it is still only a relatively small trade—probably two or three tons a day total production. The paper trade has required to seek new sources of cellulose, in consequence of the enormous expansion of the uses of paper. Important phases of development were: (1) in the period of 1860 to 1870, the introduction of esparto, which has risen to a consumption of 250,000 tons a year in the United Kingdom, at which figure it remains fairly steady; (2) the decade 1870 to 1880, which saw the development of the manufacture of cellulose from coniferous woods, and this industry now furnishes a staple of world-wide consumption, though the industry is necessarily localized in countries where the coniferous woods are available in large quantities. As a development of the paper industry we must mention the manufacture of paper textiles, based upon the production of pulp yarns. Paper pulps are worked into flat strips, which are then rolled into cylindrical form, and by a final twisting process a yarn is produced sufficiently strong to be employed in weaving.

What we may call the special cellulose industries depend upon specific chemical properties of cellulose, partly intrinsic, partly belonging to the derivatives such as the esters. Thus the cellulose nitrates are the bases of our modern high explosives, as well as those now used for military purposes. Their use has been steadily developed and perfected since the middle of the 19th century. The industries in celluloid, xylonite, &c., also depend upon the nitric esters of cellulose, and the plastic state which they assume when treated with solvent liquids, such as alcohol, amyl acetate, camphor and other auxiliaries, in which state they can be readily moulded and fashioned at will. They have taken an important place as structural materials both in useful and artistic applications. The acetates of cellulose have recently been perfected, and are used in coating fine wires for electrical purposes, especially in instrument-making; this use depends upon their electrical properties of high insulation and low inductive capacity. Hydrated forms of cellulose, which result from treatment with various reagents, are the bases of the following industries: vegetable parchment results from the action of sulphuric acid upon cellulose (cotton) in the form of paper, followed by that of water, which precipitates the partially colloidalized cellulose. This industry is carried out on "continuous" machinery, the cellulose, in the form of paper, being treated in rolls. Vulcanized fibre is produced by similar processes, as for instance by treating paper with zinc chloride

solvents and cementing together a number of sheets when in the colloidal hydrated state; the goods are exhaustively washed to remove last traces of soluble electrolytes; this is necessary, as the product is used for electrical insulation. The solvent action of cupro-ammonium is used in treating cellulose goods, cotton and paper, the action being allowed to proceed sufficiently to attack the constituent fibres and convert them into colloidal cupro-ammonium compounds, which are then dried, producing a characteristic green-coloured finish of colloidal cellulose and rendering the goods impervious to water. The important industry of mercerization has been mentioned above; this is carried out on both yarns and cloth of cotton goods chiefly composed of Egyptian cottons. A high lustrous finish is produced, giving the goods very much the appearance of silk.

Of special importance are the more recent developments in the production of artificial fibres of all dimensions, by spinning or drawing the solutions of cellulose or derivatives. Three such processes are in course of evolution. (1) The first is based on the nitrates of cellulose which are dissolved in ether-alcohol, and spun through fine glass jets into air or water, the unit threads being afterwards twisted together to constitute the thread used for weaving (process of Chardonnet and Lehner). These processes were developed in the period 1883 to 1897, at which later date they had assumed serious industrial proportions. (2) The cupro-ammonium solution of cellulose is similarly employed, the solution being spun or drawn into a strong acid bath which instantly regenerates cellulose hydrate in continuous length. (3) Still more recently the "viscose" solution of cellulose, *i.e.* of the cellulose xanthogenic acid, has been perfected for the production of artificial silk or lustra-cellulose; the alkaline solution of the cellulose derivative being drawn either into concentrated ammonium salt solutions or into acid baths. This product, known as artificial silk, prepared by the three competing processes, was in 1908 an established textile with a total production in Europe of about 5000 tons a year, a quantity which bids fair to be very largely increased by the advent of the viscose process, which will effect a very considerable lowering in the cost of production. The viscose solution of cellulose is also used for a number of industrial effects in connexion with paper-sizing, paper-coating, textile finishes, and the production of book cloth and leather cloth, and, solidified in solid masses, is used in preparing structural solids which can be moulded, turned and fashioned.

For the special literature of cellulose treated from the general point of view of this article, the reader may consult the following works by C. F. Cross and E. J. Bevan: *Cellulose* (1895, 2nd ed. 1903), *Researches on Cellulose*, i. (1901), *Researches on Cellulose*, ii. (1906). (C. F. C.)

**CELSIUS, ANDERS** (1701-1744), Swedish astronomer, was born at Upsala on the 27th of November 1701. He occupied the chair of astronomy in the university of his native town from 1730 to 1744, but travelled during 1732 and some subsequent years in Germany, Italy and France. At Nuremberg he published in 1733 a collection of 316 observations of the aurora borealis made by himself and others 1716-1732. In Paris he advocated the measurement of an arc of the meridian in Lapland, and took part, in 1736, in the expedition organized for the purpose by the French Academy. Six years later he described the centigrade thermometer in a paper read before the Swedish Academy of Sciences (see **THERMOMETRY**). His death occurred at Upsala on the 25th of April 1744. He wrote: *Nova Methodus distantiam solis a terra determinandi* (1730); *De observationibus pro figura telluris determinanda* (1738); besides many less important works.

See W. Ostwald's *Klassiker der exakten Wissenschaften*, No. 57 (Leipzig, 1904), where Celsius's memoir on the thermometric scale is given in German with critical and biographical notes (p. 132); Marie, *Histoire des sciences*, viii. 30; Poggenorff's *Biog.-Literarisches Handwörterbuch*.

**CELSUS** (c. A.D. 178), a 2nd-century opponent of Christianity, known to us mainly through the reputation of his literary work, *The True Word* (or *Account*; *ἀληθὴς λόγος*), published by Origen in 248, seventy years after its composition. In that year, though the Church was under no direct threat of attack, owing

to the inertia of the emperor Philip the Arabian, the atmosphere was full of conflict. The empire was celebrating the 1000th anniversary of its birth, and imperial aspirations and ideas were naturally prominent. Over against the state and the worship of the Caesar stood as usual the Christian ideal of a rule and a citizenship not of this world, to which a thousand years were but as a day. A supernatural pride was blended with a natural anxiety, and it was at this juncture that Origen hrought to light again a book written in the days of Marcus Aurelius, which but for the great Alexandrian might have been lost for ever. Sometimes quoting, sometimes paraphrasing, sometimes merely referring, he reproduces and replies to all Celsus's arguments. His work shows many signs of haste, but be more than compensates for this by the way in which he thus preserves a singularly interesting memorial of the 2nd century. When we remember that only about one-tenth of the *True Word* is really lost and that about three-quarters of what we have is verbatim text, it would be ungracious to carp at the method.

Celsus opens the way for his own attack by rehearsing the taunts levelled at the Christians by the Jews. Jesus was born in adultery and nurtured on the wisdom of Egypt. His assertion of divine dignity is disproved by his poverty and his miserable end. Christians have no standing in the Old Testament prophecies, and their talk of a resurrection that was only revealed to some of their own adherents is foolishness. Celsus indeed says that the Jews are almost as ridiculous as the foes they attack; the latter said the saviour from Heaven had come, the former still looked for his coming. However, the Jews have the advantage of being an ancient nation with an ancient faith. The idea of an Incarnation of God is absurd; why should the human race think itself so superior to bees, ants and elephants as to be put in this unique relation to its maker? And why should God choose to come to men as a Jew? The Christian idea of a special providence is nonsense, an insult to the deity. Christians are like a council of frogs in a marsh or a synd of worms on a dunghill, croaking and squeaking. "For our sakes was the world created." It is much more reasonable to believe that each part of the world has its own special deity; prophets and supernatural messengers had forsooth appeared in more places than one. Besides being bad philosophy based on fictitious history, Christianity is not respectable. Celsus does not indeed repeat the Thyeetan charges so frequently brought against Christians by their calumniators, but he says the Christian teachers who are mainly weavers and cobblers have no power over men of education. The qualifications for conversion are ignorance and childish timidity. Like all quacks they gather a crowd of slaves, children, women and idlers. "I speak bitterly about this," says Celsus, "because I feel bitterly. When we are invited to the Mysteries the masters use another tone. They say, 'Come to us ye who are of clean hands and pure speech, ye who are unstained by crime, who have a good conscience towards God, who have done justly and lived uprightly.' The Jews say, 'Come to us ye who are sinners, ye who are fools or children, ye who are miserable, and ye shall enter into the kingdom of Heaven.' The rogue, the thief, the burglar, the poisoner, the spoiler of temples and tombs, these are their proselytes. Jesus, they say, was sent to save sinners: was he not sent to help those who have kept themselves free from sin? They pretend that God will save the unjust man if he repents and humbles himself. The just man who has held steady from the cradle in the ways of virtue He will not look upon." He pours scorn upon the exorcists—who were clearly in league with the demons themselves—and upon the excesses of the itinerant and undisciplined "prophets" who roam through cities and camps and commit to everlasting fire cities and lands and their inhabitants. Above all Christians are dishonest and every church is an illicit collegium, an insinuation deadly at any time, but especially so under Marcus Aurelius. Why cannot Christians attach themselves to the great philosophic and political authorities of the world? A properly understood worship of gods and demons is quite compatible with a purified monotheism, and they might as well give up the mad idea of winning the authorities over to their faith, or of hoping to attain anything like universal agreement on divine things.

Celsus and Porphyry (*q.v.*) are the two early literary opponents of Christianity who have most claim to consideration, and it is worth noticing that, while they agree alike in high aims, in skillful address and in devoted toil, their religious standpoints are widely dissimilar. Porphyry is above all a pure philosopher, but also a man of deep religious feeling, whose quest and goal are the knowledge of God; Celsus, the friend of Lucian, though sometimes called Epicurean and sometimes Platonist, is not a professed philosopher at all, but a man of the world, really at heart an agnostic, like Caecilius in Minucius Felix (*q.v.*), whose religion is nothing more

or less than the Empire. He is keen, positive, logical, combining with curious dashes of scepticism many genuine moral convictions and a good knowledge of the various national religions and mythologies whose relative value he is able to appreciate. "His manner of thought is under the overpowering influence of the eclectic Platonism of the time, and not of the doctrine of the Epicurean school. He is a man of the world, of philosophic culture, who accepts much of the influential Platonism of the time but has absorbed little of its positive religious sentiment. In his antipathy to Christianity, which appears to him barbaric and superstitious, he gives himself up to the scepticism and satire of a man of the world through which he comes in contact with Epicurean tendencies." He quotes approvingly from the *Timæus* of Plato: "It is a hard thing to find out the Maker and Father of this universe, and after having found him it is impossible to make him known to all." Philosophy can at best impart to the fit some notion of him which the elect soul must itself develop. The Christian on the contrary maintained that God is known to us as far as need be in Christ, and He is accessible to all. Another sharp antithesis was the problem of evil. Celsus made evil constant in amount as being the correlative of matter. Hence his scorn of the doctrine of the resurrection of the body held then in a very crude form, and his ridicule of any attempt to raise the vulgar masses from their degradation. The real root of the difficulty to Platonist as to Gnostic was his sharp antithesis of form as good and matter as evil.

Opinion at one time inclined to the view that the *True Word* was written in Rome, but the evidence (wholly internal) points much more decisively to an Egyptian, and in particular an Alexandrian origin. Not only do the many intimate references to Egyptian history and customs support this position, but it is clear that the Jews of Celsus are not Western or Roman Jews, but belong to the Orient, and especially to that circle of Judaism which had received and assimilated the idea of the Logos.

The date also is clearly defined. Besides the general indication that the Empire was passing through a military crisis, which points to the long struggle waged by Marcus Aurelius against the Marcomanni and other Germanic tribes, there is a reference (*Contra Celsum*, viii. 60) to the rescript of that emperor impressing on governors and magistrates the duty of keeping a strict watch on extravagances in religion. This edict dates from 176-177, and inaugurated the persecution which lasted from that time till the death of Marcus Aurelius in 180. During these years Commodus was associated with Marcus in the imperium, and Celsus has a reference to this joint rule (viii. 71).

Celsus shows himself familiar with the story of Jewish origins. Any pagan who wished to understand and criticize Christianity intimately had to begin by learning from the Jews, and this accounts for the opening chapters of his argument. He has a good knowledge of Genesis and Exodus, refers to the stories of Jonah, Daniel (vii. 53) and Enoch (v. 52), but does not make much use of the Prophets or the Psalter. As regards the New Testament his position is closely in agreement with that reflected in the contemporary *Acts of the Martyrs of Scilli*. He speaks of a Christian collection of writings, and knew and used the gospels, but was influenced less by the fourth than by the Synoptics. There is more evidence of Pauline ideas than of Pauline letters.

The gnostic sects and their writings were well known to him (viii. 15 and vi. 25), and so was the work of Marcion. There are indications, too, of an acquaintance with Justin Martyr and the Sibylline literature (vii. 53, cp. v. 61). "He is perfectly aware of the internal differences between Christians, and he is familiar with the various stages of development in the history of their religion. These are cleverly employed in order to heighten the impression of its instability. He plays off the sects against the Catholic Church, the primitive age against the present, Christ against the apostles, the various revisions of the Bible against the trustworthiness of the text and so forth, though he admits that everything was not really so bad at first as it is at present."

The *True Word* had very little influence either on the mutual

relations of Church and State, or on classical literature. Echoes of it are found in Tertullian and in Minucius Felix, and then it lay forgotten until Origen gave it new life. A good deal of the neo-Platonic polemic naturally went back to Celsus, and both the ideas and phrases of the *True Word* are found in Porphyry and Julian, though the closing of the New Testament canon in the meantime somewhat changed the method of attack for these writers.

Of more importance than these matters is the light which the book sheds on the strength of the Church about the year 180. It is of course easy to see that Celsus had no apprehension of the spiritual needs even of his own day which it was the Christian purpose to satisfy, that he could not grasp anything of the new life enjoyed by the poor in spirit, and that he underrated the significance of the Church, regarding it simply as one of a number of warring sections (mostly Gnostic), and so seeing only a mark of weakness. And yet, there is all through an undercurrent which runs hard against his surface verdicts, and here and there comes to expression. He is bound to admit that Christianity has been stated reasonably; against the moral teaching of Jesus he can only bring the lame charge of plagiarism, and with the Christian assertion that the Logos is the Son of God he completely accords. Most suggestive, however, is his closing appeal to the Christians. "Come," he says, "don't hold aloof from the common régime. Take your place by the emperor's side. Don't claim for yourselves another empire, or any special position." It is an overture for peace. "If all were to follow your example and abstain from politics, the affairs of the world would fall into the hands of wild and lawless barbarians" (viii. 68). Forced to admit that Christians are not *infructuosi in negotiis*, he wants them to be good citizens, to retain their own belief but conform to the state religion. It is an earnest and striking appeal on behalf of the Empire, which was clearly in great danger, and it shows the terms offered to the Church, as well as the strength of the Church at the time. Numerically, Christians may have formed perhaps a tenth of the population, i. e. in Alexandria there would be fifty or sixty thousand, but their power in a community was out of all proportion to their mere numbers.

CELT, or KELT, the generic name of an ancient people, the bulk of whom inhabited the central and western parts of Europe. (For the sense of a primitive stone tool, see the separate article, later.) Much confusion has arisen from the inaccurate use of the terms "Celt" and "Celtic." It is the practice to speak of the dark-complexioned people of France, Great Britain and Ireland as "black Celts," although the ancient writers never applied the term "Celt" to any dark-complexioned person. To them great stature, fair hair, and blue or grey eyes were the characteristics of the Celt. The philologists have added to the confusion by classing as "Celtic" the speeches of the dark-complexioned races of the west of Scotland and the west of Ireland. But, though usage has made it convenient in this work to employ the term, "Celtic" cannot be properly applied to what is really "Gaelic."

The ancient writers regarded as homogeneous all the fair-haired peoples dwelling north of the Alps; the Greeks terming them all *Keltoi*. Physically they fall into two loosely-divided groups, which shade off into each other. The first of these is restricted to north-western Europe, having its chief seat in Scandinavia. It is distinguished by a long head, a long face, a narrow aquiline nose, blue eyes, very light hair and great stature. These are the peoples usually termed Teutonic by modern writers. The other group is marked by a round head, a broad face, a nose often rather broad and heavy, hazel-grey eyes, light chestnut hair; they are thick-set and of medium height. This race is often termed "Celtic" or "Alpine" from the fact of its occurrence all along the great mountain chain from south-west France, in

Savoy, in Switzerland, the Po valley and Tirol, as well as in Auvergne, Brittany, Normandy, Burgundy, the Ardennes and the Vosges. It thus stands midway not only geographically but also in physical features between the "Teutonic" type of Scandinavian and the so-called "Mediterranean race" with its long head, long face, its rather broad nose, dark brown or black hair, dark eyes, and slender form of medium height. The "Alpine race" is commonly supposed to be Mongoloid in origin and to have come from Asia, the home of round-skulled races. But it is far more probable that they are the same in origin as the dark race south of them and the tall fair race north of them, and that the broadness of their skulls is simply due to their having been long domiciled in mountainous regions. Thus the "Celtic" or (*Bos longifrons*), from remote ages the common type in the Alpine regions, is characterized by the height of its forehead above the orbits, by its highly-developed occipital region, and its small horns. Not only do animals change their physical characteristics in new environment, but modern peoples when settled in new surroundings for even one or two centuries, e.g. the American of New England and the Boer of South Africa, prove that man is no less readily affected by his surroundings.

The northern race has ever kept pressing down on the broad-skulled, brown-complexioned men of the Alps, and intermixing with them, and at times has swept right over the great mountain chain into the tempting regions of the south, producing such races as the Celto-Ligytes, Celtiberians, Celtilyrians, Celto-Thracians and Celto-Scythians. In its turn the Alpine race has pressed down upon their darker and less warlike kindred of the south, either driven down before the tall sons of the north or swelling the hosts of the latter as they swept down south.

As the natives of the southern peninsula came into contact with these mixed people, who though differing in the shape of the skull nevertheless varied little from each other in speech and colour of their hair and eyes, the ancient writers termed them all "Keltoi." But as the most dreaded of these Celtic tribes came down from the shores of the Baltic and Northern Ocean, the ancients applied the name Celt to those peoples who are spoken of as Teutonic in modern parlance. The Teutons, whose name is generic for Germans, appear in history along with the Cimbrî, universally held to be Celts, but coming from the same region as the Guttones (Goths) by the shores of the Baltic and North Sea. Again, the Germani themselves first appear in the Celtic host destroyed by Marcellus at Clastidium in 225 B.C. All the true Celtic or Galatae in France had come across the Rhine; the Belgic tribes in northern France were Cimbrî, who also had crossed the Rhine: in Caesar's day the Germans were still constantly crossing that river, and so-called Gauls who lived near the Germans, e.g. the Treveri, closely resembled the latter in their habits, while in later times were to come Goths and Franks from beyond the great river. It is then not strange that the Gallic name for a henchman (*ambactus*) is the same as the Gothic (*ambahs*).

The earliest invaders, under the name of Celtae, had occupied all central Gaul, doubtless mixing with the aboriginal Ligurians and Iberians, who, however, maintained themselves respectively in the later Provence and in Aquitania. The Celts had firmly established themselves by the 7th century B.C. and we know not how long before, the Bituriges (whose name survives in Berry) being the dominant tribe. In the Alps and the Danube valley some of the Celts had dwelt from the Stone Age; there they had developed the working of copper, discovered bronze (an alloy of copper and tin), and the art of smelting iron (see HALSTATT). The Umbrians, who were part of the Alpine Celts, had been pressing down into Italy from the Bronze Age, though checked completely by the rise of the Etruscan power in the 10th century B.C. The invention of iron weapons made the Celts henceforth irresistible. One of the earliest movements after this discovery was probably that of the Achaeans of Homer, who about 1450 B.C. invaded Greece (see ACHAEANS), bringing with them the use of iron and brooches, the practice of cremating the dead, and the style of ornament known as Geometric. Later the Cimmerians (see SCYTHIA and CIMMERI) passed down from the

Cimbric Chersonese, doubtless following the amber routes, and then turned east along the Danube, some of their tribes, e.g. the Treres, settling in Thrace, and crossing into Asia; others settled in southern Russia, leaving their name in the Crimea; then when hard pressed by the Scythians most of them passed round the east end of the Euxine into Asia Minor, probably being the people known as Gimirri on Assyrian monuments, and ravaged that region, the relics of the race finally settling at Sinope.

At the beginning of the 6th century B.C. the Celts of France had grown very powerful under the Biturigin king Ambigatus. They appear to have spread southwards into Spain, occupying most of that country as far south as Gades (Cadiz), some tribes, e.g. Turdentani and Turduli, forming permanent settlements and being still powerful there in Roman times; and in northern central Spain, from the mixture of Celts with the native Iberians, the population henceforward was called Celtiberian. About this time also took place a great invasion of Italy; Segovius and Bellovisus, the nephews of Ambigatus, led armies through Switzerland, and over the Brenner, and by the Maritime Alps, respectively (Livy v. 34). The tribes who sent some of their numbers to invade Italy and settle there were the Bituriges, Arverni, Senones, Aedui, Ambarri, Carnuti and Aulerici.

Certain material remains found in north Italy, e.g. at Sesto Calende, may belong to this invasion. The next great wave of Celts recorded was that which swept down on north Italy shortly before 400 B.C. These invaders broke up in a few years the Etruscan power, and even occupied Rome herself after the disaster on the Allia (390 B.C.). Bought off by gold they withdrew from Rome, but they continued to hold a great part of northern Italy, extending as far south as Sena Gallica (*Simi-gaglia*), and henceforward they were a standing source of danger to Rome, especially in the Samnite Wars, until at last they were either subdued or expelled, e.g. the Boii from the plains of the Po. At the same time as the invasion of Italy they had made fresh descents into the Danube valley and the upper Balkan, and perhaps may have pushed into southern Russia, but at this time they never made their way into Greece, though the Athenian ladies copied the style of hair and dress of the Cimbrian women. About 280 B.C. the Celts gathered a great host at the head of the Adriatic, and accompanied by the Illyrian tribe of Autariatae, they overthrew the Macedonians, overran Thessaly, and invaded Phocis in order to sack Delphi, but they were finally repulsed, chiefly by the efforts of the Aetolians (279 B.C.). The remnant of those who returned from Greece joined that part of their army which had remained in Thrace, and marched for the Hellespont. Here some of their number settled near Byzantium, having conquered the native Thracians, and made Tyle their capital. The Byzantines had to pay them a yearly tribute of 80 talents, until on the death of the Gallic king Cavarus (some time after 220 B.C.) they were annihilated by the Thracians. The main body of the Gauls who had marched to the Hellespont crossed it under the leadership of Leonnorus and Lutarius. Straightway they overran the greater part of Asia Minor, and laid under tribute all west of Taurus, even the Seleucid kings. At last Attila, king of Pergamum, defeated them in a series of battles commemorated on the Pergamene sculptures, and henceforth they were confined to a strip of land in the interior of Asia Minor, the Galatia of history. Their three tribes—Trocmi, Tolistobogians and Tectosages—submitted to Rome (189 B.C.), but they remained autonomous till the death of their king Amyntas, when Augustus erected Galatia into a province. Their descendants were probably the "foolish Galatians" to whom St Paul wrote (see GALATIA).

Ancient writers spoke of all these Gauls as Cimbri, and identified them with the Cimberians of earlier date, who in Homeric times dwelt on the ocean next to the Laestrygonians, in a region of wintry gloom, but where the sun set not in summer. Nor was it only towards the south and the Hellespont that the Celtic tide ever set. They passed eastward to the Danube mouth and into southern Russia, as far as the Sea of Azov, mingling with the Scythians, as is proved by the name Celto-scyths. Mithra-

dates VI. of Pontus seems to have negotiated with them to gain their aid against Rome, and Bituitus, a Gallic mercenary, was with him at his death.

The Celts had continually moved westwards also. The Belgae, who were Cimbric in origin, had spread across the Rhine and given their name to all northern France and Belgium (*Gallia Belgica*). Many of these tribes sent colonies over into south-eastern Britain, where they had been masters for some two centuries when Caesar invaded the island (see BRITAIN). But there is evidence that from the Bronze Age there had been settlements in northern Britain who were broad-skulled and cremated their dead, a practice which had arisen in south Germany in the early Bronze Age or still earlier. It is not unlikely that, as tradition states, there were incursions of Celts from central Gaul into Ireland during the general Celtic unrest in the 6th century B.C. It is certain that at a later period invaders from the continent, bringing with them the later Iron Age culture, commonly called La Tène, which had succeeded that of Hallstatt, had settled in Ireland. Not only are relics of La Tène culture found in Ireland, but the oldest Irish epics celebrate tall, fair-haired, grey-eyed heroes, armed and clad in Gallic fashion, who had come from the continent. The Celts in Italy, in the Balkan, in France and in Britain, overspread the Indo-European peoples, who differed from themselves but slightly in speech. The Celts represented Indo-European *q* by *p*, whilst the Greeks, Illyrians, Thracians, Ligurians, and aborigines of France, Britain and Ireland represented it by *k*, *c* or *gu*. The Umbrian-Sabellian tribes had the same phonetic peculiarity as the Celts. Thus Gallic *petor* (*petor-risum*, "four-wheel"), Umbrian *petur*, Homeric *triorpes*, Boeotian (Achaean) *πῆτραρες*, Welsh *pedwar*; but Gaelic *cekkir*, Lat. *quatuor*. The Celts are thus clearly distinguished from the Gaelic-speaking dark race of Britain and Ireland, and in spite of usage it must be understood that it is strictly misleading to apply the term Celtic to the latter language.

#### CELTIC LANGUAGES

*Introduction.*—The Celtic languages form one group of the Indo-European family of languages. As might be expected from their geographical distribution, they hold a position between the Italic and Teutonic groups. They are distinguished from these and other branches of the family by certain well-marked characteristics, the most notable of which are the loss of initial and inter-vocalic *p*, cf. Ir. *athair* with Lat. *pater*; Ir. *lín*, "full," Welsh *llawn*, Breton *leun*, with Lat. *plenus*; Gaulish *are-*, "beside," Ir. *ar*. Welsh, Breton *ar*, with Gr. *ἄριπ*, *ἄριπ*; and the change of I. E. *ē* to *i*, cf. Ir. *fir*, "true," Welsh *gwir*, Breton *gwir*, Lat. *verus*. We may further mention that the I. E. labialized velar *gw* is represented by *b*, e.g. Ir. *bó*, "cow," Welsh *buwch*, Gr. *βοῖς*, Sanskr. *gáus*; Ir. *ben*, "woman," Gr. *γυνή*, whilst the medial aspirates *bh*, *dh*, *gh* result in simple voiced stops. I. E. sonant *r* and *l* become *ri*, *li*. Other distinctive features of the modern dialects are not found in Gaulish, partly owing to the character of the monuments. Such are the *ss*-preterite and the fusion of simple prepositions with pronominal elements, e.g. Ir. *fri-umm*, "against me," Welsh *wrth-yf*, Breton *ous-inn*. The initial mutations which are so characteristic of the living languages did not arise until after the Romans had left Britain. The Celtic languages betray a surprising affinity with the Italic dialects. Indeed, these two groups seem to stand in a much closer relationship to one another than any other pair. As features common to both Celtic and Italic we may mention: (1) the gen. sing. ending -i of masc. and neut. stems in *o*; (2) verbal nouns in -tion; (3) the *b*-future; (4) the passive formation in -r.

The various Celtic dialects may be divided as follows:—(1) Gaulish; (2) Goidelic, including Irish, Scottish Gaelic, and Manx; (3) Brythonic, including Welsh, Breton and Cornish. Gaulish and Brythonic, like Oscan and Umbrian among the Italic dialects, change the I. E. labialized velar guttural *q* to *p*, whilst the Goidelic dialects retain the *gw* which later gives up the labial

element and becomes *k*, e.g. Gaulish *petor-*, "four," Ir. *celthir*, Welsh *petguar*, Breton *petoar*, Lat. *quattuor*; Ir. *cia*, "who," Welsh *pwys*, Lat. *quis*; Gaulish *epo-*, "horse," Welsh *eb-ol*, Breton *eb-oul*, Ir. *ech*, Lat. *equus*. Several attempts have been made to prove the existence of Celtic dialects with *q̄* on the continent. Forms containing *p* occur in the Coligny calendar, discovered in 1897, by the side of others with *q̄*, a state of affairs not yet satisfactorily accounted for. The Rom tablets, discovered in 1898, have not been interpreted as yet, but *p* forms are found on them exclusively. In an excursus we shall deal with the language of the Picts.

No comprehensive handbook of the Celtic languages on the lines of Grober's *Grundriss der romanischen Philologie* or Paul's *Grundriss der germanischen Philologie* was available in 1909. The reader may refer to Windisch's article "Keltische Sprachen" in Ersch and Gruber's *Allgemeine Encyclopädie der Wissenschaften und Künste*, and V. Tourneur, *Esquisse d'une histoire des études celtiques* (Liège, 1905; vol. ii. with full bibliography). Also H. Zimmer, "Die kelt. Litteratur" in *Die Kultur d. Gegenwart*, T. i. Abh. xi. 1, Berlin and Leipzig, 1909. The materials for the study of the older forms of the languages are to be found in Zeuss's *Grammatica Celtica* as revised by Ebel. A comparative grammar of the Celtic dialects has been prepared by H. Pedersen (Göttingen, 1908). See also Whitley Stokes and A. Bezenberger, *Wortschatz der keltischen Sprachinheit* (Göttingen, 1894).

I. GAULISH.—Celtic place-names are found as far east as the Dniester and Dobrudja, and as far north as Westphalia. The language of the Galatians in Asia Minor must have stood in a very close relation to Gaulish. Indeed few traces of dialectical differences are to be observed in continental Celtic. Unfortunately no literary monuments written in the ancient speech of Gaul have come down to us, though Caesar makes mention of religious poems orally transmitted by the Druids, and we also hear of *bardi* and *vales*. But a large number of personal and place-names have been preserved. The classical writers have, moreover, recorded a certain number of Gaulish words which can generally be identified without difficulty by comparing them with words still living in the modern dialects, e.g. *pempedula*, "cinque-foil," cf. Welsh *pump*, "five," and *deilen*, "leaf"; *ambaci*, Welsh *amaeth*; *petorritum*, "four-wheeled chariot," cf. Welsh *pedwar*, "four," and Ir. *roth*, "wheel," or *riith*, "course." We have further between thirty and forty inscriptions (three in north Italy) which we may without hesitation ascribe to the Gauls. These inscriptions are written in either N. Etruscan or Greek or Latin characters. We are thus in a position to reconstruct much of the old system of declension, which resembles Latin very closely on the one hand, and on the other represents the forms which are postulated by the O. Ir. paradigms. Hence Gaulish is particularly valuable as preserving the final vowels which have disappeared in early Irish and Welsh. The few verb-forms which occur in the remains of Gaulish are quite obscure and have not hitherto admitted of a satisfactory explanation. The statements of ancient authors with regard to the Belgae are conflicting, but there cannot be much doubt that the language of the latter was substantially the same as Gaulish. Caesar observes that there was little difference between the speech of the Gauls and the Britons in his day, and we may regard Gaulish as closely akin to the ancestor of the Brythonic dialects. It is difficult to say when Gaulish finally became extinct. It disappeared very rapidly in the south of France, but lingered on, possibly till the 6th century, in the northern districts, and it seems unnecessary to discredit Jerome's statement that the speech of the Galatians in Asia Minor bore a strong resemblance to the language he had heard spoken in the neighbourhood of Trier. There is no evidence that Breton has been influenced by continental Celtic. The number of Gaulish words which have come down in the Romance languages is remarkably small, and though at first sight the sound-changes of French and Welsh seem to bear a strong likeness to one another, any influence of Gaulish pronunciation on French is largely discounted when we find the same changes occurring in other dialects where there is little or no question of Celtic influence.

The proper names occurring in classical writers, on inscriptions and coins, have been collected by A. Holder in his monumental *Alteltischer Sprachschatz* (Leipzig, 1896-1908). The inscriptions have been most recently treated by J. Rhys in the *Proceedings of*

*the British Academy*, vol. ii. See also a paper in this volume entitled "Celtae and Galli" by the same author for the text of the Coligny and Rom inscriptions. The value of Gaulish for grammatical purposes is set forth by Whitley Stokes in a paper on "Celtic Declension" in the *Proceedings of the London Philological Society* (1885-1886). For the extent over which Gaulish was spoken, its relation to Latin and its influence on Romance, see E. Windisch's article on "Keltische Sprache" in the section "Die vorromanischen Volkssprachen" in Grober's *Grundriss der romanischen Philologie*, vol. i. pp. 373 ff. Cf. further the introduction to J. Loth's *Chrestomathie bretonne* (Paris, 1890); G. Dottin, *Manuel pour servir à l'étude des antiquités celtiques* (Paris, 1906); R. Thurneysen, *Keltoromanisches* (Halle, 1884).

II. GOIDELIC AND BRYTHONIC.—When the monuments of the Celtic dialects of the British Islands begin to appear, we find a wide divergence between the two groups. We can only mention some of the more important cases here. The Brythonic dialects have gone very much farther in giving up inflectional endings than Goidelic. In Irish all final syllables in general disappear except long vowels followed by *s* or *r* and *u* < *ō* preceded by *i*. But these reservations do not hold good for Brythonic. Thus, whilst O. Irish possesses five cases the Brythonic dialects have only one, and they have further lost the neuter gender and the dual number in substantives. In phonology there are also very striking differences, apart from the treatment of the labialized velar *q̄* already mentioned. The sonant *n* appears in Brythonic as *an*, whereas in Goidelic the nasal disappears before *k*, *t* with compensatory lengthening of the vowel, e.g. I. E. \**kntom*, Ir. *cél*, "hundred," W. *cant*, Bret. *kant*; Prim. Celt. \**josnko-*, O. Ir. *ōac*, Mod. Ir. *ōg*, "young," W. *ieuanic*, Bret. *iaowanik*. *t*, *k* standing after a vowel and preceding *l*, *n* (and also *r* if *k* precede) disappear in Goidelic with compensatory lengthening of the vowel, e.g. Prim. Celt. \**stāllā-*, Ir. *sāl*, "heel," W. *sawdi*; Prim. Celt. \**petno-*, Ir. *ēn*, "bird," O. W. *etn*, Mod. W. *edn*. Similarly *b*, *d*, *g* disappear in Goidelic when standing after a vowel and preceding *l*, *r*, *n* with compensatory lengthening of the vowel, but in Welsh they produce a vowel forming a diphthong with the preceding vowel, e.g. Prim. Celt. \**neblo-*, Ir. *nél*, "cloud," W. *niwl*; Prim. Celt. \**ogno-*, cf. Lat. *agnus*, Ir. *uan*, Mod. W. *edn*, from \**on*, W. *oen*; Prim. Celt. \**vegno-*, cf. Ger. *Wagen*, Ir. *fén*, "wagon," O. W. *gwein*, Mod. W. *gwin*. The Goidelic dialects have preserved the vowels of accented syllables on the whole better than Brythonic. Thus Brythonic has changed Prim. Celt. *ā* (= I. E. *ā*, *ō*) to *ō* (W. *aw*, Bret. *eu*); and Prim. Celt. *ū* to *i*, e.g. Ir. *bráthir*, "brother," W. *brawd*, Bret. *breur*; Gaulish *dānum*, Ir. *dán*, "fort," W. *din*. Already in Gaulish the I. E. diphthongs show a tendency to become simple long vowels and the latter are treated differently by Goidelic and Brythonic. In early times I. E. *eu*, *ou* both became *ō* and I. E. *ei* gave *ē*. In Goidelic *ō*, *ē*, in accented syllables were diphthongized in the early part of the 8th century to *wa*, *ia* if the next syllable did not contain the vowels *e* or *i*, whereas in Brythonic *ō* gave *ū* (written *u*) and *ē* became in W. *ui* (*wy*), and in Bret. *oe* (*oue*), e.g. Gaulish *Teuto-*, *Toutius*, Ir. *tuath*, "people," W. *Bret. tud*; Brythonic *Lelo-cētum*, Ir. *liath*, "grey," W. *lwyd*, Bret. *lowed*. Similarly in loan-words, Ir. *céir*, *fiat*, W. *cwy*, O. Corn. *guil*, from Lat. *cēra*, *vēlum*. Further I. E. *ai*, *oi* are preserved in Irish as *ai* (*ae*), *oi* (*oe*), Mod. Ir. *ao*, but in Welsh I. E. *ai* gave either *ai* or *oe*, whilst *oi* changed to *ū* (written *u*), Ir. *toeb*, "side," W. *Bret. iw*; I. E. \**oinos*, Ir. *ōen*, "one," W. *Bret. un*; Prim. Celt. \**soitlo-*, cf. Lat. *saculum*, W. *hoedd*, "age," Bret. *hoel*. In Goidelic accented *e* changes to *i* before *i*, *ē*, *ō*, *i* in the following syllable, cf. Ir. *fid*, "wood," gen. sing. *fedo*, O. H. G. *witu*, and *i* changes to *e* before *a* or *o* under similar conditions. In like manner *u* becomes *ō* before *a* or *o*, whilst *ō* changes to *u* before *i*, *u*, cf. Ir. *muir*, "sea," Prim. Celt. \**mori*, gen. sing. *mora*. Of Brythonic finals which disappear, *ā*, *i*, (*ō*), *j* alone influence preceding vowels, whilst an *i* (*y*) which received the stress in O. W. was also able to modify vowels which went before it. In Goidelic the combinations *sq̄*, *sw* appear respectively as *sc*, *s* (medially *ʃ*), but in Brythonic they both give *chw*; Prim. Celt. \**specton*, Ir. *scél*, "story," W. *chwedd*; Prim. Celt. \**svesor*, Ir. *sisur*, "sister," but *mo fisur*, "my sister" (whence Scottish *piuthar* by false de-aspiration), W. *chwær*, Bret. *c'hoar*. In

Brythonic initial *s* becomes *h* in the 7th century, but this is unknown in Goidelic, e.g. Ir. *salann*, "salt." *W. halenn*, Cornish *halain*, Bret. *holenn*; Lat. *se-mem*, Ir. *síl*, "seed," *W. hil*. Initial *v* gives *f* in Goidelic in the course of the 7th century, whereas in Brythonic it appears as *gv*, cf. Lat. *vérus*, Ir. *fir*, *W. Brit. gwir*. We may also mention that in Goidelic initial *j* and medial *v* disappear, e.g. Gaulish *Jovinillus*, *W. ievann*, "young," Bret. *ioannk*, Ir. *óc*, *óc*; *W. bywyd*, "food," Ir. *biad*. Post-consonantic *j* in Brythonic sometimes gives *-id* (Mod. *W. -ydd*, Mod. Bret. *-ez*), e.g. Gaulish *novio-*, *novio-*, O. Bret. *noviid*, *W. newydd*, Bret. *newez*, Ir. *núe*. I. E. *-k* and *-p* both appear in Goidelic as *-ch* but in Brythonic as *-ih*, cf. Lat. *septem*, O. Ir. *secht*, *W. seith*, Bret. *seis*.

We unfortunately know very little about the position of the stress in ancient Gaulish. According to Meyer-Lübke in place-names the penult was accented if the vowel was long, otherwise the stress lay on the preceding syllable, e.g. *Augustodunum*, O. Fr. *Ostodun*, now *Autun*; *Catalaunos* (Châlons), *Tricasses* (Fr. Troyes), *Bituriges* (Fr. Bourges). In Goidelic the stress, which is strongly expiratory, is always placed on the first syllable except in certain cases in verbs compounded with prepositional prefixes. In Old Welsh and Old Breton, on the other hand, the final syllable, i.e. the primitive penult, received the stress, but in both languages the stress was shifted in the middle period to the penultimate. The Goidelic dialects, like the Slavonic, distinguish between palatalized and nonpalatalized consonants, according as the consonant was originally followed by a front (*e, i*) or back vowel (*a, o, u*), a phenomenon which is entirely unknown to Brythonic.

Finally, the two groups differ radically in the matter of initial mutation or, as it is often called, aspiration. These mutations are by no means confined to initial consonants, as precisely the same changes have taken place under similar conditions in the interior of words. The Goidelic changes included under this head probably took place for the most part between the 5th and 7th centuries, whilst in Brythonic the process seems to have begun and continued later. It is easier to fix the date of the changes in Brythonic than in Goidelic, as a number of British names are preserved in lives of saints, and it is possible to draw conclusions from the shape that British place-names assumed in the mouths of the Anglo-Saxons. In Goidelic, we find two mutations, the vocalic and the nasal. Initial mutation only takes place between words which belong together syntactically, and which form one single stress-group, thus between article, numeral, possessive pronoun or preposition, and a following substantive; between a verbal prefix and the verb itself.

1. When the word causing mutation ended in a vowel we get the vocalic mutation, called by Irish grammarians aspiration. The sounds affected are the tenues *k (c), t, p*; the mediae *g, d, b*; the liquids and nasals *m, n, r, l*; *s*, and Prim. Celt. *v* (Ir. *f, W. gw*). At the present day the results of this mutation in Irish and Welsh may be tabulated as follows. Where the sound is at variance with the traditional orthography, the latter is given in brackets. In the case

Original sound	k	t	p	g	d	h	m
Irish	x(ch)	h(th)	f(ph)	ǰ(gh)	ǰ(dh)	v,w(bh)	v,w(mh)
Welsh	g	d	b	nil	ǰ(dd)	v(f)	v(f)

of *n, r, l* in Goidelic we get a different variety of *n, r, l* sound. In Welsh in the case of *r, l*, the absolute initial is a voiceless *r, l* written *rh, ll*, which on mutation become voiced and are written *r, l*. In Irish *s* becomes *k* written *sh* and the mutation of *f* is written *fh*, which, however, is now silent. Examples.—Irish, *cú*, "hound," *do chú*, "thy hound"; Welsh *ci*, *dy gi* (*do, dy* represent a Prim. Celt. *\*ovo*); Irish *máthair*, "mother," *an mháthair*, "the mother," Welsh *mam*, *y fam* (the feminine of the article was originally *\*senú*, *senda*).

2. When the word causing mutation originally ended in a nasal, we get the nasal mutation called by Irish grammarians eclipse. The sounds affected are *k (c), t, p; g, d, b*; Prim. Celt. *v* (Ir. *f, W. gw*). In mod. Irish and mod. Welsh the results are tabulated below. Irish *f* becomes *w* written *bh*, whilst *W. gw* gives *ngw*. Examples.—Irish *biaidhna*, "year," *seacht m-biaidhna*, "seven years," cf. Latin *septem*, Welsh *blwydd*, *sath mlynedd*; Irish *tír*, "country," *i d-tír*,

"in a country," Welsh *tref*, "town," *yn mhref*, "in a town," cf. Latin *in*.

3. In Welsh *k (c), t, p* undergo a further change when the word

Original Sound	k	t	p	g	d	b
Irish	g	d	b	ng	a	m
Welsh	ngh	nh	mh	ng	a	m

causing mutation originally ended in *s*. There is nothing corresponding to this consonantal mutation in Goidelic. In this case *k (c), t, p* become the spirants *x (ch), th, f (ph), g, tad*, "father," *ei thad*, "her father," *ei* represents a primitive *\*esids*. In the interior of words in Brythonic, *cc, pp, tt* give the same result as initial *k, t, p* by this mutation.

The relation in which the other Celtic dialects stand to this system will be mentioned below in dealing with the various languages. It will be noted from what has been said above that, with the exception of the different treatment of the labialized velar *gv*, and the nasal sonant *v*, the features which differentiate the Brythonic from the Goidelic dialects first appear for the most part after the Romans had left Britain. At the beginning of the Christian era the difference between the two groups can only have been very slight. And Strachan has shown recently that Old Irish and Old Welsh agree in a very striking manner in the use of the verbal particle *ro* and in other syntactical peculiarities connected with the verb.

(1.) *Goidelic*.—The term Goidelic is used to embrace the Celtic dialects of Ireland, Scotland and the Isle of Man. In each case the national name for the speech is *Gaelic* (Ir. *Gaeiligh*, Scottish *Gàidhlig*, Manx *Gailck*), from Ir. *Gaelic* (*Goadal*, *Goatbeul*, Mid. Ir. *Góedel*, *W. Gwyddel*, "a Gael, inhabitant of Ireland or Scotland." Old Irish may be regarded as the ancestor of Scottish and Manx Gaelic, as the forms of these dialects can be traced back to Old Irish, and there are practically no monuments of Scottish and Manx in the oldest period. Scottish and Irish may be regarded as standing to one another in much the same relation as broad Scottish and southern English. The divergences of Scottish and Manx from Irish will be mentioned below. The language of the Ogam inscriptions is the oldest form of Goidelic with which we are acquainted. Some 300 inscriptions have up to the present been discovered in this alphabet, the majority of them hailing from the south-west of Ireland (Kerry and Cork). In Scotland 22 are known, whilst in England and Wales about 30 have turned up. Most of the latter are in South Wales, but odd ones have been found in North Wales, Devon and Cornwall, and one has occurred as far east as Hampshire. The Isle of Man also possesses two. The letters in the oldest inscriptions are formed by strokes or notches scored on either side of the edge of an upright stone. Thus we obtain the following alphabet:—

This system, which was eked out with other signs, would seem to have been framed in the south-west of Ireland by a person or persons who were familiar with the Latin alphabet. Some of the inscriptions probably go back to the 5th century and may even be earlier. As illustrations of the simplest forms of Ogam inscriptions we may mention the following: *Doveti maqi Cattini*, i.e. "(the stone) of Dovetos son of Cattinos"; *Tremagui Maqi-Treni* is rendered in Latin *Tremaguis Fili Mac-treni hic jacit*; *Sagrammi Maqi Cunatami*, "(the stone) of Sagrammos son of Cunotamos"; *Ovanos ani Ivacattus*, "(the stone) of Ovanus descendant of Ivacattus." It will be seen that in the oldest of these inscriptions *q* is still kept apart from *k (c)*, and that the final syllables have not disappeared (cf. *magui*, O. Ir. *maicc*), but it appears certain that in Ogam writing stereotyped forms were used long after they had disappeared in ordinary speech. Several stones contain bilingual inscriptions, but the key to the Ogam alphabet is supplied by a treatise on Ogam writing contained in the Book of Ballymote, a manuscript of the late 14th century. It should be mentioned that the Welsh

stones are early whilst the Scottish ones are almost without exception late, and several of the latter have so far defied interpretation. In addition to the Irish Ogam there are a number of Christian inscriptions in Latin character, but, with one exception, they are not older than the 8th century.

See R. R. Brash, *The Ogam Inscribed Monuments of the Gaedhil* (London, 1879); R. A. Stewart Macalister, *Studies in Irish Epigraphy* (London), vol. i. (1897), vol. ii. 1902, vol. iii. 1907. The Welsh inscriptions are contained in J. Rhys, *Lectures on Welsh Philology* (London, 1879). The Scottish stones have also been treated by Rhys in the *Proceedings of the Scottish Society of Antiquaries* (Edinburgh, 1892). See also G. M. Atkinson for the tract in the Book of Ballymote, *Kilkenny Journal of Archaeology* (1874). The Irish Christian inscriptions were published by Margaret Stokes as the annual volumes of the Roy. Hist. and Archaeol. Association of Ireland (1870-1877), and have been republished by R. A. Stewart Macalister.

(a) *Irish*.—We are able to trace the history of the Irish language continuously for a period of 1200 years, and from the time that the literary documents begin we are better supplied with linguistic material for the study of the language than is the case with any other Celtic dialect. At the same time that form of Irish which is to be found in the oldest documents has preserved a number of features which have entirely, or almost entirely, disappeared from the Brythonic languages. For this reason scholars have largely occupied themselves with Irish, which for purposes of comparative philology may be regarded as the classic Celtic language.

The history of Irish is divided into three periods:—Old Irish (700-1100), the documents mainly representing the language of the 8th and 9th centuries; Middle Irish, extending roughly from 1100 to 1550; Modern Irish from 1550 to the present day. These periods merge into one another to such an extent that no firm division can be made. The language of some manuscripts of the 14th century contains forms which are really Old Irish, and Middle Irish orthography was partly employed by historians and antiquarians in the middle of the 17th century. Old Irish, as compared with Brythonic, preserves a wealth of inflectional forms in declension and conjugation, but many of these tend to disappear very early. In the modern dialects of Ireland and Scotland there is a rigid rule of orthography that a palatalized, or, as it is termed, slender consonant in medial or final position, must be preceded by a palatal vowel (i), and a non-palatalized consonant by a non-palatal or broad vowel (a, o, u). This is the famous rule of the grammarians known as *caol le caol agus leathan le leathan* ("slender to slender and broad to broad"), but it is not so strictly adhered to in the spoken language as is commonly stated. In the older language the quality of medial and final consonants is only denoted very imperfectly, thus non-palatalized final consonants are regularly not denoted as such, e.g. O. and Mid. Ir. *fir*, Mod. Ir. *fir*. In Old and Mid. Irish the initial mutations are only regularly denoted in the case of the vocalic mutation of *c, p, l, s, f*, and the nasal mutation of *b, d, g*. The vocalic mutation of *c, p, l, s, f* was denoted by writing *ch, ph, th, sh, fh*, the first three symbols of which were derived from the Latin alphabet. Another method of denoting the mutation was to write a dot over the letter, originally the punctum delens, which was justified in the case of mutated *f* as the latter early became silent. But no such devices were ready at hand in the case of the medial *b, d, g*, and the mutated forms of these consonants were consequently not represented at all in the orthography. The same remark holds good in the case of the nasal mutation (eclipse) of the tenues. But it is easy to demonstrate that the same condition of affairs as we find in the modern language must have obtained in Old Irish. This insufficiency of symbols rendered the orthography of the early stages of the language very complicated. We find that *b, d, g* were used initially to denote the voiced stops, but medially and finally they represent spirants, the voiced stops in this case being denoted by *c, p, l*. It is not until much later times that the *h* in the mutated forms of the tenues, or the use of the dot, was extended to the mediae. Thus in Mid. Irish we find *do bochtáid in choimded* (Mod. Ir. *dobhoctáibh*), Mid. Ir. *ro-gab* = Mod. Ir. *do gabh*. The nasal mutation of *c, p, l* was first denoted by writing these sounds double and finally in the 18th century by writing *cc, pp, dl*. The spirants arising out of Prim. Celt. *d, b* came in Old Irish to be confused with those which developed out of Prim. Celt. *p, t, k*, in other than initial positions. In final positions in polysyllables we commonly find *d* and *b* written but medially *th* and *ph*, e.g. *dídnad*, "consolation," gen. sing. *dídnatha*. For the ending *-ad* cp. Lat. *-ātu-*. On the other hand we find *g* written medially and *ch* finally. These rules, however, are not yet applied in the oldest documents.

When we turn to the inflections we find that most of the old terminations have disappeared, but that their influence on preceding consonants is still felt and serves to distinguish one form from another; thus in the declension of *fer*, "man," nom. sing. *fer*, gen. sing. *fir*, dat. sing. *fuir*, acc. sing. *fer n*, nom. pl. *fir*, gen. pl. *fer n*, corresponding to Prim. Celt. (Gaulish) *viros, viri, virō, viron, viri, viron*, the influence of the following sound still differentiates the cases from one another. In the later language the initial mutations

come more and more to be used for this purpose. In Middle Irish the declensions and conjugations are much simplified and the neuter gender is given up in substantives. In the verb the athematic conjugation has disappeared and the distinction of primary and secondary endings is not observed. On the other hand Irish has developed a peculiar system of absolute and conjoint inflection with different sets of endings. The conjoint endings are always used in the case of compound verbs, and in simple verbs they are employed after certain proclitics, e.g. the negative particles. Thus *berid*, "he bears," is an absolute form; *do-beir*, "he gives," *ní beir*, "he does not bear," are conjoint forms. Further, the verb system is partly dominated by the various devices employed to express relative function. There are three main types of conjugation in Old Irish corresponding to the Latin first, third and fourth conjugations, the Latin types *moneo* and *audio* being difficult to distinguish in Irish. In the modern language there is in reality but one conjugation. The old Irish verb system comprises present and imperfect indicative, imperative, pres. subjunctive in *-o* or *-e* or *-i* with reduplication along with corresponding secondary future, *-s* preterite, *-t* preterite, reduplicated preterite, a preterite containing a long stem-vowel, together with deponential and passive forms in *-rd*. This system is eked out with the verbal prefix *ro*, which among other functions changes a preterite into a perfect or a present into a perfect. Such a cumbersome system was bound to fall to pieces. A number of isolated forms have come down, but the only tenses which have survived into the modern period are the present and imperfect indicative, the imperative, the present subjunctive, the *-s* preterite, the *-b* and *-t* future with corresponding secondary forms, and some of the passive forms in *-r*. At the same time in the modern language there is an increasing tendency to use analytical forms. Two noteworthy features of the Irish verb remain to be mentioned. The one is the use of pronouns as objects infixed between particle and verb, or in a verb compounded with a preposition between preposition and verb. There are two sets of forms according as to whether the verb occurs in a relative clause or not. Thus *m* is the ordinary infixed pronoun of the 1st pers. sing., whilst *-dom-* is the corresponding relative form. In the 3rd pers. sing. aspiration may be employed, e.g. *ní ceil*, "he does not hide," *ní cheil*, "he does not hide it." This has been given up in the modern language. Secondly in verbs compounded with prepositions the accent of the verb varies according as to whether the verb is used enclitically or not—thus after the negative *ní* or in the infinitive and imperative. Hence we have *do-beir*, "he gives," by the side of *ní léabair*, "he does not give," infin. *léabair*; *do-gnlu*, "I do," *ní dñnim*, "I do not do," infin. *dñnum*. The changes caused by this alternation in addition to others due to the working of the Irish accent and to the initial and internal mutations have played havoc with the verb system and render it exceedingly difficult to reconstruct the paradigms. In the later periods of the language analogy naturally plays a great part, and many of the complicated forms are done away with, but even in the modern dialects the alternation between enclitic and athematic forms still survives in the commonest verbs, e.g. Irish *beir sé* "he gives," *ní thabair sé*, "he does not give," infin. *léabair*; Scottish *bheir e, cha toir, toir*; Manx *ver eh, cha der, coyr*; Irish *ní sé*, "he does," *ní dñeamn sé*, "he does not do," infin. *dñeamn*; Scottish *ní e,* "he does," *cha dñan e,* "he will not do," infin. *dñanam*; Manx *nee eh, cha jraan eh, jannoo*.

In the early period Irish borrowed a number of words from Latin. These are mainly connected with the church or with articles of civilization which would be imported from Roman Britain. Some of these show traces of British pronunciation, e.g. O. Ir. *trindóit*, from Latin *trinitatem* with *ó* for *o*. In others again Lat. *p* is represented in Ir. by *c*, which may be due to the substitution of *g* as being the nearest Irish sound to the foreign *p*. Thus we find Ir. *corsur*, "purple," *casc*, "Easter"; *cenciges*, Whitsuntide; *cruimher*, "presbyter." In addition to these several loans were received from Norse. In the Mid. Irish period many French words came in, and during the middle and modern periods the number of English words introduced is legion. Pedersen has tried to show in his *Vergl. Gramm.* that a considerable number of words were borrowed from Brythonic (Welsh) at an early date.

[For the Latin loan-words, see J. Vendryès, *De hibernicis vocabulis quae a latina lingua originem duxerunt* (Paris, 1902); Kuno Meyer has collected a number of loan-words from Norse, Anglo-Saxon, Early English, Latin and Early French in *Revue celtique*, xii. 460 and xiii. 505. See also Whitley Stokes, *Bezzenger's Beiträge*, xviii. 56 ff. For Celtic names in Norse see W. Stokes, *Revue celtique*, iii. 186 ff., and W. A. Craigie, *Zeitschr. f. celt. Phil.* i. 439 ff.]

With regard to the dialects of Irish, there is a well-known rhyme which states the peculiarities of the speech of the four provinces, and dialectal differences must have existed at an early period, though they do not make their appearance in the literary language until the 18th century. At the present day the Irish of Leinster has vanished entirely, and we have unfortunately no records of it. But in the other three provinces the vernacular still lives, and we find the Irish of Munster, Connaught and Ulster marked off from one another by well-defined peculiarities. In general it may be stated that the south of Ireland is more conservative than the north. In Munster there is a tendency to shift the word-stress from the initial syllable to a heavy derivative syllable, e.g. *-án*. This does

not take place in Connaught, whilst in Ulster the tendency is to shorten the vowel. Again in monosyllables ending in *h, nn, m*, and under certain other conditions a short vowel becomes a diphthong and in the south, in Connaught it is merely lengthened, but in Ulster the original length is retained, e.g. Ulster *ball*, "member, limb," Connaught *báil*, Munster *baul*. Final *dh, gh* in Munster are sounded as *g*. In certain cases the north prefers the vocalic mutation where the west and south have the nasal, thus notably in the dative singular after preposition and article, e.g. Munster-Connaught *dó'n bhfeair*, "to the man," Ulster *dó'n fhear*. In the south synthetic verb-forms are employed to a much larger extent than in the north.

In the early part of the 19th century Irish was still the speech of more than half the inhabitants of Ireland. A German traveller reckoned that out of a total population of seven millions in 1835 four millions spoke Irish as their mother-tongue. The famine of 1846-1847 was felt most in those districts that were purely Irish, and these were the parts that were and still are chiefly affected by the tide of emigration. Add to this the fact that the influence of O'Connell and his satellites, and above all that of the Roman Catholic clergy, was against the language. In spite of the efforts of the Gaelic League (founded 1893), which have met with considerable success, the language is rapidly dying of internal decay. The speakers of Irish are chiefly confined to the following counties, where over 20% of the population speak Gaelic:—Waterford, Cork, Kerry, Clare, Galway, Mayo, Sligo, Donegal. The following figures will illustrate the decay of the language since the famine:—

Year.	Monoglots.	Bilinguists.
1851	319,602	1,204,684
1861	163,275	942,261
1871	103,562	714,313
1881	64,167	885,765
1891	38,192	642,053
1901	20,953	620,189

According to the 1901 census report the speakers of Irish were distributed as follows:—Leinster, 26,436; Munster, 276,268; Connaught, 245,580; Ulster, 92,858. The Gaelic movement, which has thriven largely on account of its anti-English character, would have a much better chance of galvanizing the ancient language of Ireland if it were not for the supreme difficulties of Irish spelling and phonetics. Of the hundreds of thousands of persons who attend the classes of the League not more than one or two per cent. at the outside arrive at any state of proficiency. Presbyterian Gaels in Scotland are taught to read the Bible but Irish Catholics are not encouraged to do so. The result of this is seen in the fact that, whilst many, if not all, of the local Nationalist newspapers under the pressure of the League publish badly-printed and little-read columns in Irish, there are only two regularly appearing periodicals which contain any large amount of Irish. Half the contents—and those the most important—of the weekly organ of the league, *An Claidheamh Solais* ("the flaming sword"), are in English. The latter was started in 1898 under the title of *Fáinne an Lao* ("the ring of day," i.e. the dawn). The other periodical is the monthly *Gaelic Journal* (*Iriseadhar na Gaedhíle*), a would-be literary magazine of very inferior quality which has led a precarious existence since 1882. In 1898 it was decided to hold a festival called the *Oireachtas* ("hosting, gathering") on the lines of the Welsh *Eisteddfod*. The venture was a great success and similar meetings have been held every year since, whilst each province and many of the counties have their annual local Gaelic *feis* (festival). The literary output of the movement has been prodigious, consisting in the main of a number of short stories and dramas (mostly propagandist), but nothing of any particular merit has as yet been forthcoming. The best-known writers are Dr Douglas Hyde (collector of folk-stories—*Beside the Fire*, 1890, *An Seanaidhe Gaedhealach*, 1895 (reprinted from vol. x. of the *Annales de Bretagne*), *Love Songs of Connaught*, 1893, *Religious Songs of Connaught*, 1905); P. O'Leary (author of two lengthy stories, *Seandán*, 1904, *Niamh*, 1907); P. Dinneen (author of an historical tale, *Cormac Ua Connaill*, 1901); P. O'Shea, better known as "Conan Maol," author of a collection of short stories entitled *An Buacais*, 1903.

**AUTHORITIES ON IRISH LANGUAGE.**—For the study of Old Irish—Zeuss, *Grammatica Celtica* (Berlin, 1871); B. Güterbock and R. Thurneysen, *Indices to the Irish words treated in Zeuss* (Leipzig, 1881); E. Windisch published the first grammar of Old Irish in 1879 (trans. by N. Moore, Pitt Press, 1882), but Windisch's treatment of the verb was rendered obsolete by the discovery of the laws of the Irish accent by H. Zimmer, *Keltische Studien* (Berlin, 1884), and R. Thurneysen, *Revue celtique*, vi. 309; J. Vendryès, *Grammaire du Vieil-Irlandais* (Paris, 1908); R. Thurneysen, *Handbuch des Alt-Irischen* (Heidelberg, 1909). Mention should also be made of J. Strachan, *Selections from the Old Irish Glosses* (Dublin, 1904); and the same writer's *Old Irish Paradigms* (Dublin, 1905), *Stories from the Táin* (Dublin, 1908). See also various papers on the Irish verb in the *Transactions of the London Philological Society* by Strachan (1895-1902); H. Pedersen, *Aspirationen i Irish* (Copenhagen, 1898); C. Sarauw, *Irish Studier* (Copenhagen, 1901); G. J. Ascoli, *Archivio glottologico italiano*, vol. v. and vi. For the study of Middle Irish—E. Windisch, *Irische Texte mit Wörterbuch* (Leipzig, 1880). (Other volumes in conjunction with W. Stokes.)

Editions of texts by W. Stokes, Kuno Meyer and others in the *Revue celtique*, *Zeitschrift für celtische Philologie*, *Ériu*. K. Meyer has issued an exhaustive Mid. Irish glossary (A-D) as a supplement to the *Archiv für celtische Lexikographie*. The remainder is being published under the auspices of the Royal Irish Academy. The first grammar of Modern Irish was published by Francis Molloy in 1677 at Rome under the title of *Grammatica Latino-Hibernica*. Molloy was followed by Jeremiah Curtin in 1728 with a book called *Elements of the Irish Language*. Numerous other grammars were published towards the end of the 18th and at the beginning of the 19th century, but few of them have any value. The more important of them are enumerated in the introduction to O'Donovan's *Grammar* and to Windisch's *Kurzgefasste irische-Grammatik*, and in Pedersen's *Aspirationen i Irish*, pp. 29-47. We may mention W. Neilson's *Grammar* (1808) as it is important for the Irish of E. Ulster. But the greatest native grammarian was John O'Donovan, who traversed Ireland in connexion with the Ordnance Survey, and published in 1854 a comprehensive grammar noting the differences between the various dialects. A little grammar published by Molloy in 1867 is instructive on account of the author's peculiar point of view. The most useful books for the study of the living language are the series of booklets (five) published by Father O'Growney, one of the chief promoters of the present movement. Mention should also be made of J. P. Henry's *Handbook of Modern Irish*, pts. i.-iv., and of the grammars by P. W. Joyce (Dublin, 1896) and the Christian Brothers (Dublin, 1901). For the northern form of Irish J. P. Craig's *Grammar of Modern Irish* is useful (Dublin, 1904). The phonetics of a Munster dialect have been investigated by R. Hesebry, *A Contribution to the Phonology of Dess Irish* (Greifswald, 1901). The dialect of the Aran Islands off the coast of Galway has been described by F. N. Finck, *Die Arosen Mundart, i. Lautlehre und Grammatik*, ii. *Wörterbuch* (Marburg, 1899). G. Dottin has given an account of a dialect of North Connaught (Mayo) in the *Revue celtique*, xiv. pp. 97-137. A study of the speech of the north was published by E. C. Quiggin under the title of *A Dialect of Donegal, Phonology and Text* (Cambridge, 1906). For an account of the decay of Irish see H. Zimmer, "Die keltische Bewegung in Irland," *Preussische Jahrbücher* for 1898, vol. 93, p. 59 ff. and the last chapter of Douglas Hyde's *Literary History of Ireland* (London, 1901).

The work of the earlier compilers of glosses will be mentioned in the literature section below. The first dictionary of the modern language of any importance was that published by J. O'Brien in 1768. Next came E. O'Reilly with his *Irish-English Dictionary* (Dublin, 1817). This book contains a vast store of words gathered on no principle whatever from all manner of sources, and has therefore to be used with caution, but even at the present day it renders considerable service. A second edition with a supplement by O'Donovan was published after the latter's death in 1864. The first trustworthy dictionary of the modern language was published under the auspices of the Irish Texts Society by P. J. Dinneen (London, 1904). English-Irish dictionaries have been compiled by D. Foley (Dublin, 1855); E. E. Fournier (Dublin, 1903); T. O'Neill Lane (Dublin, 1904).

**Scottish Gaelic.**—Scottish Gaelic is the form of Goidelic speech which was introduced into Scotland by the Dalriadic Scots who came over from Ireland in the early centuries of our era. We possess practically no early monuments of the language. We have one or two inscriptions in Latin characters, such as that at St Vigean's and the Ogam mentioned above, which have not yet been solved. In the *Book of Deer* there is a colophon of a few lines probably written by an Irish scribe in the 9th century, and as the language of these lines differs in no wise from the Irish of the period, we do not know if they accurately represent the Gaelic of Scotland or if they may not be pure Irish. In the same MS. there are further Gaelic scraps belonging to the 11th and 12th centuries. The word-forms in these entries are identical with those current at the time in Ireland, but the historical orthography seems to show more signs of decay than is the case in Irish. The medieval Scottish MSS. in the Advocates' Library at Edinburgh are only just being published, but they seem either to hail from Ireland or to be written in pure Irish. The end of the 15th century brought a change. The Lordship of the Isles, the great bond between Ireland and Scotland, was broken up. The Gaels of Scotland, thrown on their own resources, advanced their own dialect to the position of a literary language and tried to discard the Irish orthography. The *Book of the Dean of Lismore*, compiled about 1500, is written in a kind of phonetic orthography which has not as yet been sufficiently investigated. The language of those poems which are not directly ascribed to Irish poets, and which may therefore be regarded as representing the literary language of the Highlands at the time, seems to occupy a position midway between Irish and Scottish Gaelic. But until the beginning of the 18th century the Highlands were

under the literary dominion of Ireland, so much so that Bedell's Irish version of the Scriptures was circulated in Scotland with a glossary from 1690 to 1707, and Bishop Carswell's version of Knox's Prayer-book (1567) is pure Irish. The language of the people is poorly represented in the 16th and 17th centuries, and the orthography is not fixed until we reach the 18th century.

Irish and Scottish Gaelic differ considerably in point of vocabulary, but there are also important divergences in phonetics and inflections. In the first place, Scottish Gaelic as written has entirely given up the nasal mutation (epilipse), e.g. Scottish *ar bh*, "our cow," Irish *ar m-bó*; Scottish *nan sr.* "of the countries," Irish *na d-sr.* It should, however, be observed that in Skye and the Outer Isles the nasal mutation has been partly restored and in some places there are even parallels to the Welsh nasal mutation of *c, p, t* to *ng, mh, nh*. Secondly, post-vocalic *c, p, t* are commonly preceded by a breathed sound not represented in writing, thus *mac* "son," is pronounced *makk*; *slat* "rod," as *slakt*. Again there is a tendency to insert a sibilant in the group *st*, thus *caert*, "right," is sounded *hearts*, and the distinction between palatalized and non-palatalized sounds is not so rigidly observed as in Irish. The group *ch* is in Scotland pronounced as if *ckh*. We may also mention that Scottish Gaelic preserves an old *f* in a number of words where Irish now has *h*, e.g. Old Ir. *fer*, Scottish G. *fèr*, Irish *fèr*, but in both cases the spelling is *feor* (in this respect Scottish Gaelic goes hand in hand with Manx and the almost extinct Irish of Down). Similarly, we find that in Scottish Gaelic and Manx stressed vowels preceding a palatalized consonant have not undergone palatalization to the same extent as in Irish, e.g. in Ireland *duine*, "man," < \**duingjo*, is pronounced *dun'd*, but in Scotland *dun'd* (in Manx written *dooinjeen*). A further peculiarity of Scottish Gaelic is that it substitutes lenes or voiceless mediae for the voiced stops, and even *l, r, s* sounds show a great tendency to give up the voice. Scottish Gaelic goes farther even than Irish in the confusion of vowel-sounds, e.g. Lat. *corus*, Ir. *cor*, "foes," Sc. *cor*; Ir. *codal*, Sc. *cael*. When we turn to the inflections we find that analogy has here played a much larger part than in Irish. There is a tendency to make the plural of all substantives except masculine monosyllables end in *-an*. In the conjugation the synthetic forms have with one or two exceptions entirely disappeared and the present forms have become momentary in force. Hence in ordinary grammars it is stated that the present has become a future, thus *m'is* means "I shall do." The past participle chiefly ends in *-as* against Irish *-the, -te, or -tha, -ta*, according to the quality of the preceding sound. The present (future) and past subjunctive (conditional, representing both the imperfect indicative and secondary future of Irish) supply the place of the Irish consuetudinal forms. In idiom also Scottish has diverged very considerably from Irish, e.g. in the use of *tha* (Ir. *id*) for *is*.

It seems now to be agreed that the various dialects of Scottish Gaelic fall into two main divisions—northern and southern. Mackinnon states that the boundary between the two passes roughly up the Firth of Lorne to Loch Leven, then across country from Ballachulish to the Grampians. The country covered by the northern dialect was of old the country of the Northern Picts, whilst the portion of Argyllshire south of the boundary line, together with Bute and Arran, made up the kingdom of Dalriada. The Gaelic district south of the Grampians belonged to the Southern Picts. The southern dialect is commonly regarded as the literary language. It approaches more nearly to Irish and preserves the inflections much better than the speech of the north.

The following characteristics of the northern dialects may be mentioned:—(1) The diphthongization of open *o* to *oa* is carried much farther in the north than in the south. (2) The vowel *ao* in the north is more regularly the high-back-narrow-undrounded vowel-sound, whereas the south in many cases has a low-front-wide-undrounded sound. (3) The north has *sr* in initial position where the south prefers *sr*. Further, the northern dialects go very far in dropping unaccented final vowels. It may be remarked that in the reduction of derivative endings containing long vowels Scotland goes hand-in-hand with Ulster Irish, thus Connaught *ardn*, "bread," is in Ulster and Scotland *ardn*. Again, Scottish agrees with North Irish in the loss of synthetic verb-forms and in using as negative *cha*, Mid. Ir. *nico, necta*. But, on the other hand, Scotland, with the exception of South Argyll and some of the Isles, diphthongizes accented *a, o, e*, in monosyllables, before *ll, nn, ss*, thus resembling the speech of Munster. In South Argyll the original short vowel is lengthened.

As to the southern limits of Gaelic speech in Scotland, the boundary between Gaelic and English in medieval times was the so-called Highland line, and at the War of Independence it is probable that it extended to Stirling, Perth and the Ochil and Sidlaw Hills, the lochs being limited to a very narrow strip along the coast. Dr J. A. H. Murray traced the linguistic frontier in 1869-1870 with the following results. The line started about 3 m. west of the town of Nairn on the Moray Firth and ran in a south-east direction to the Dee, 4 m. above Ballater. On the other side of the Dee it began 4 m. above Balmoral and followed the boundary of Perth and Forfar as far as Glen Shekel where it went off to the south-west as far as Dunkeld. After passing Birnam Hill it turned due west until the upper part of Glen Almond was reached, where it bent to the south-

ward, passing through Comrie and along the braes of Doune to the Teith, 3 or 4 m. below Callander. Thence it ran along the north shore of Lake Monteith to Gartmore, and from there to Rowardennan on the east side of Loch Lomond. On the west side it passed through Glen Douglas down Loch Long and the Firth of Clyde, leaving Bute and Arran to the west. At the present day this boundary has probably receded to the extent of several miles, and even in 1870 there were districts such as Bute and the region round Dunoon where Gaelic was only spoken by the oldest natives and the immigrant population. The language is not found in the north-east of Caithness, the boundary running, according to Murray, roughly from a little north-east of Lybster to the mouth of the Forss. Celtic was driven out of Shetland and Orkney by Scandinavian some time during the middle ages. (See further J. A. H. Murray, *The Dialect of the Southern Counties of Scotland*, London, 1875; *Revue Celtique*, vol. ii, pp. 180-182.)

Until the 18th century Gaelic was spoken in Galloway and on the uplands of Ayr and Lanark. The following figures from the census returns illustrate the decrease in the number of persons who speak Gaelic:—

	Monolinguals.	Bilinguals.
1881 . . . . .	No return	231,594 (this includes Gaelic monolinguals)
1891 . . . . .	43,738	210,677
1901 . . . . .	28,106	202,700

In the last-mentioned year it appears that nearly one-half of the speakers of Gaelic are reported from the counties of Inverness and Ross (23,893 monolinguals and 82,573 bilinguals). From about 1300 we find Scottish emigrants filtering into the glens of Antrim, where the Gaelic that is spoken is still unmistakably Scottish. There have long been local societies of Highlanders for the cultivation of their native tongue, the most important one being *An Comunn Gàidhealach* (founded 1891). This society holds an annual gathering called the *Mòd* ("Eng. "moot") on the lines of the Welsh Eisteddfod, and recently the Scottish Education Department has countenanced the teaching of Gaelic in Highland schools. But the political element plays little or no part in the language movement in Scotland, and the latter is not likely to assume the proportions of the Gaelic League in Ireland. As a rule, however, Highlanders are better able to read their own language than Irish Gaels, for, the majority being Protestants, they are encouraged to read their Bibles. There are only two periodicals which devote half their space to Gaelic. The one is *An Dao-Greine* ("the sunbeam"), founded October 1905; and the other is the Catholic propagandaist quarterly *Guth na Bliadhna* ("the voice of the year"), started in 1904. Up to 1905 a fortnightly newspaper printed wholly in Gaelic appeared in Prince Edward Island, under the title of *An Mac-talla* ("the echo"), and efforts have been made to revive it. A weekly newspaper wholly in Gaelic was started in 1908 by R. Stuart Erskine under the title of *Alba*.

**AUTHORITIES ON SCOTTISH GAELIC.**—The first grammar of Scottish Gaelic was compiled by W. Shaw (*An Analysis of the Gaelic Language*, 1778). The most useful one was that published by Alexander Stewart, *Elements of Gaelic Grammar* (Edinburgh, 1801). A revised edition of this work with many additions and corrections was published by H. C. Gillies, London, 1902. This book is rather spoilt by the author's attitude, and requires to be supplemented and corrected. G. Henderson and C. W. Robertson have published important papers on the modern dialects in the *Zeitschrift für celtische Philologie*, the *Celtic Review* and the *Transactions of the Gaelic Society of Inverness*. The most useful work on Gaelic philology is Alexander Macbain's *Etymological Gaelic Dictionary* (Inverness, 1896) (a later edition by W. J. Watson). The chief dictionaries are *Dictionary of Scots-Celtic*, published by the Highland Society of Scotland (Edinburgh, 1828); R. A. Armstrong, *Gaelic Dictionary* in two parts (London, 1825); N. McAlpine, *Pronouncing Gaelic Dictionary* (Edinburgh, 1847) (this book gives the pronunciation of Islay); Macleod and Dewar, *Gaelic and English Dictionary* (latest edition, Edinburgh, 1901); *Faclair Gàidhlig*, published by E. Macdonald, Herne Bay, appearing in parts since 1902.

(c) *Manx*.—Our sources of information with regard to the language of the Isle of Man are even more scanty in the early period than they are in the case of Scotland. There are a number of references to the island in Irish literature, but the earliest monument of the vernacular we possess is the version of the Book of Common Prayer made by Bishop Phillips in 1610. In this translation the traditional Irish orthography is not followed. The spelling resembles the orthography which was employed in Scotland by the compiler of the *Book of the Dean of Lismore*. How far this system was used is a question which it is difficult to decide. In Scotland the Irish orthography has prevailed in a slightly modified form, but Manx writers adhered to a mode of spelling which was as phonetic as any system based on English, or, probably more correctly Anglo-Scottish, orthography could be. This fact, combined with the rapid phonetic decay of the

language, makes it extremely difficult to discover what sound-values are to be attached to the various symbols. At the beginning of the 18th century English was not understood by two-thirds of the natives, and in 1764 the S.P.C.K. issued a paper containing this statement: "The population of the Isle is 20,000, of whom the far greater number are ignorant of English." But from this time English gradually crept in. The last edition of the Manx Bible was issued in 1819, and of the New Testament in 1840. The present writer's great-grandmother refused to speak English, his grandfather (b. 1815) preached in Manx and English, and his father (b. 1844) only spoke English. The following figures illustrate the rapid decline of the language:—

	Monolingualists.	Bilingualists.
1875	190	12,340
		(out of a population of 41,084 exclusive of Douglas)
1901	None	4,419

Manx stands in a much closer relation to Scottish Gaelic than Irish, and fishermen state that they could understand a good deal of what is said in South Argyll, though they are quite at a loss at Kinsale. Manx exhibits the same tendency as Scottish to use analytical and periphrastic forms in the verb, thus *janmoo*, "to do," is used like Scottish *deanamh* with an infinitive to express the past and future. The present has acquired a momentary (future) signification, and the past participle ends in *-i* (Scottish *-e*). The negative is *cha* as in Scotland and Ulster. Manx goes as far as northern Scottish in dropping unstressed final vowels, e.g. *chiarn*, "lord," Irish, *tighearna*; *-yn* is the favourite plural ending in substantives. The nasal mutation has been partly given up. Old Irish stressed *é* is frequently retained, e.g. *fér*, "man," Irish *fáir* (spelt *feair*), and the vowels *ó* and *ú* are confused as in Scottish, e.g. Manx *cas*, "foot." Scottish *cas*, Irish *cas*. Manx is divided in itself about the treatment of short accented vowels before *ll*, *nn*, *m*. According to Rhys the south side lengths, whilst the north side diphthongizes; e.g. Irish *craun*, "tree," *clann*, "offspring," S. Manx *krón*, *klón*, N. Manx. *krown*, *kloun* (written *croun*, *cloun*). In the matter of stress Manx is quite original, going farther even than the dialects of the south of Ireland. Not only does it shift the stress in the case of heavy derivative suffixes like *-án* and reduce the preceding vowel, e.g. Ir. *fuairín*, S. *fuairán*, Manx *fáin*, "spring," but even in cases like *aghla*, "a variety," S. Ir. *coachla*, O. Ir. *coimnechla*; *corda*, "voice," Ir. *comhradh*. The Mid. English stress on the final is further retained in words from the French such as *ashón*; "nation," *hírty*, "deliver." As other features peculiar to Manx we may mention the following. An intervocalic *s* or *sh* shows a tendency to become liped and voiced to *d*. In monosyllables post-vocalic final *m*, *n*, are often preceded by an intrusive *b*, *d* respectively, thus *ben* "woman," may be heard as *bedn*. Ir. *d* becomes more palatal and is often *é*. Ir. *sc* becomes *sh*, *shí*, e.g. Ir. *fescor*, "evening," Manx *fastyr*; Ir. *uisce*, "water," Manx *ushley*.

**AUTHORITIES ON MANX.**—The place and personal names of the Isle of Man have been collected by A. W. Moore in *Manx Names* (London, 1903) (33% of the proper names are Scandinavian). The chief source of information about the spoken language is J. Rhys, *The Outlines of the Phonology of Manx Gaelic* (London, 1895) (the book has unfortunately no index and no texts). The only serious attempt to represent spoken Manx graphically is the transcription of a song by J. Strachan in the *Zeitschr. für celtische Philologie*, vol. i. p. 54. The native grammarian is J. Kelly, who in 1803 published *A Practical Grammar of the Ancient Gaelic or Language of the Isle of Man, usually called Manx*. This book was republished by W. Gill for the Manx Society in 1859, and a facsimile reprint of this later was made for Quercy, London, 1870. A useful little book entitled, *First Lessons in Manx* was published by Edwin Goodwin (Dublin, 1901). There are two dictionaries, one by A. Cregeen, Douglas 1835, which is now being reprinted for *An Cheshaght Gaelceach*, a Douglas society which is endeavouring to encourage the use of Manx and to get it introduced into the schools. The other dictionary is by J. Kelly in two parts—(1) Manx and English, (2) English and Manx, published by the Manx Society in 1866. Kelly also prepared a Trilog of Manx, Irish and Gaelic, based upon English, which has never been published. A useful paper on the language appeared in the *Transactions of the London Philological Society* for 1875 by H. Jenner, "The Manx Language: Its Grammar, Literature and Present State." (E. C. Q.)

(ii). *Brythonic*. The term Brythonic is used to denote the Celtic dialects of Wales, Brittany and Cornwall. Unlike the Goidels the Brythonic peoples have no common name for their language. Forms of Brythonic speech were doubtless current throughout England and Wales and the Lowlands of Scotland at the time of the Saxon invasion. The S.E. of Britain may have been extensively Romanized, and it is not impossible that

remnants of Goidelic speech may have lingered on in out-of-the-way corners. No literary documents dating from this period have been preserved, but some idea of the character of Brythonic may be gathered from the numerous inscriptions which have come to light. In the middle of the 6th century Brythonic was confined to the western half of Britain south of the Clyde and Forth. The colonization of Britannia minor or Armorica Brittany during the 5th and 6th centuries will be described later. In the latter part of the 6th century the W. Saxons pushed their conquests as far as the estuary of the Severn, and from that time the Brythons of S.W. Britain were cut off from their kinsmen in Wales. Early in the 7th century the Brythons of Strathclyde were similarly isolated by the battle of Chester (613). The kingdom of Strathclyde maintained a separate existence until the 10th century, and it is generally stated that Brythonic speech did not die out there until the 12th century. The question as to how far Brythonic names and words have survived in these districts has never been properly investigated. Certain it is that Brythonic numerals survived amongst shepherds in Cumberland, Westmorland and N.W. Yorkshire down to the second half of the 19th century, just as herrings are still counted in Manx by Manx fishermen otherwise quite innocent of the language. Accordingly, from the 7th century onwards Brythonic became gradually limited in Great Britain to three districts—Strathclyde, Wales, and Cornwall and Devon. During the 7th century the Brythons of Wales and Strathclyde often fought side by side against the Angles, and it is from this period that the name by which the Welsh call themselves is supposed to date, *Cymro* < \**Combroes*, pl. *Cymry* < \**Combroges*, i.e. "fellow-countrymen" as opposed to *W. alifro*, Gaul. *Allobroges*, "foreigners." We have no means of determining when Celtic speech became extinct in the petty states of the north which retained their independence longest.

The chief features which distinguish the Brythonic from the Goidelic dialects have already been enumerated. In the course of the 6th and 7th centuries final short vowels disappeared. In compound names the final vowel remains in the first component until the 7th century. Short vowels in other than initial syllables when immediately preceding the stress (on the historical penultimate) disappear, whilst long ones are shortened, e.g. Welsh *cardawt* from Lat. *cardiātem*. Other vowels in unstressed position are apt to be reduced, thus *ó*, *á*, give *i* in O. W. (Mid. W. *y*). A marked characteristic of Welsh as distinguished from Cornish and Breton is the treatment of *ð* under the influence of a following *i*. In Welsh the result is *ei*, in Corn. and Bret. *e*, e.g. Welsh *seint*, "saints," Bret. *sent*, sing. *sant*. The mutations seem to have started in the second half of the 6th century in the case of the tenues.

See J. Loth, *Les Mots latins dans les langues Brittoniques* (Paris, 1892); J. Loth, *Chrestomathie bretonne* (Paris, 1890).

(a) *Welsh (Cymraeg)*.—It is usual to divide the history of the Welsh language into three periods—Old, Middle and Modern. To the oldest period belong the collections of glosses, the earliest of which go back to about 800. The middle period extends from 1100 to 1500.

As a rule the medial mutation of the tenues and mediae is not denoted in O. Welsh. Intervocalic *g* is sometimes retained but generally it has disappeared, whilst after *r* and *l* it is still written. In the course of the 9th century initial *w* (*v*) becomes *gs* (later *gw*). As the O. Welsh documents consist almost entirely of isolated words, we know scarcely anything about the morphology of the language during this period. To the middle period belong the ancient poems from the Black Book of Carmarthen, but the language of these compositions is evidently much older than the date of the manuscript (12th century), as it preserves a number of very archaic features. Other important sources of information for this period are the O. Welsh Laws contained in a MS. of the 12th century. To a somewhat later date belong the Mabinogion (14th century MS.), and the prose versions of French romances published by R. Williams (15th century). In Middle Welsh the consonant mutations are in general denoted in writing, though not consistently, and from this period dates the introduction of *w* and *y* (O. W. *u*, *i*) to denote vowel sounds. The symbol *ll* to denote a voiceless *l* was already employed in Mid. W. but *rh* (=voiceless *r*), *dd* (=Eng. *th* in "thou") and *f* (=v) either do not appear or only become regular during the modern period. In Mod. W. the orthography is regularized and does not differ

materially from that of the late mediæval documents. In O.W. the old stress on the final syllable (the historical penult) appears to have been preserved, but during the middle period the accent was shifted to the penult. In consequence of this change *aw* (< a) in final syllables is reduced to *o* in Mod. W., e.g. Mid. W. *pechawt* < Lat. *peccatum*, Mod. W. *pechod*.

The comparative wealth of inflection preserved by O. Ir. has almost entirely disappeared in Welsh. There are only the faintest traces of the case forms, the dual and the neuter gender. Compared with the Irish nominal declension according to -o (-jo), -e, -f, -u, -s, -guttural, dental and nasal stems, Welsh only distinguishes the nominative and plural, the latter sometimes retaining an old formation. Thus *maen* -o stems show palatal modification, e.g. *corn*, "horn," plur. *maen* < "horn": the plural ending of -u stems, O. Gaulish -ones, gives O.W. -au, Mid. W. -aw, Mod. W. -au, e.g. *pennau*, "heads." The termination -ones of the -u stems appears as -on. The inflexion of pronominal objects between a verbal particle and the verb itself continues in use down to the present day in Breton. In the third person singular of the present indicative there are instances in the oldest Welsh of the peculiar alternation between orthotonic and absolute forms which characterize the Irish paradigms, e.g. *peraid*, "it endures," but *my phara*. The several types of conjugation represented in Irish have become obscured, traces remaining only in the endings of the third singular of the present indicative, the preterite indicative (Mid. W. -as, -es, -it) and the preterite passive (Mid. W. -at, -et, -it). The verb system of Welsh comprises the following tenses: indic. present (also used as future), imperative, imperfect, preterite (in Mid. W. forms with *u* have become prevalent as in Irish, but form corresponding to the *u* preterites in *l* of which reduplication or unreduplicated with long vowels are not infrequent in the early poetry), pluperfect (a new formation), present and preterite passive. In the subjunctive early W. distinguishes present and past, but the latter comes to be replaced by the pluperfect indicative. The sign of the subjunctive is *h* < *s*, which reminds one of the Irish subjunctive, though the formation is somewhat different. There are also traces of a future formation containing *h* < *s*. (See also under WALES.)

We have seen already that Wales began to exist as a separate entity roughly at the end of the 6th and beginning of the 7th centuries. In the second half of the 8th century the Welsh were confined in pretty much their present limits by Offa, king of Mercia, who constructed the Dyke going by his name, which has approximately remained the political boundary between England and Wales ever since. From this time onwards the bitter feeling against England which we find expressed in the fervid compositions of Iolo Goch and other political bards served to prevent any serious inroads of English on Welsh-speaking territory. With the advent of the Tudors, however, there came a great change. Henry VII. owed his throne in large measure to the support he had received from Wales and he prided himself on his Welsh ancestry. A consequence of this was that throughout the 16th century Wales received exceptionally favourable treatment at the hands of the English sovereign and parliament. In 1562 a decree was issued ordering a translation of the Bible to be made into Welsh. All this could naturally not be without effect on the attitude of the leaders of the people towards England. The change is already apparent in the poems of Lewis Glyn Cothi and others. And the striking difference in the manner in which the Reformation was regarded in Ireland and Wales is worthy of remark. During the Stuart wars the Welsh nobles fought invariably on the Royalist side, and there is plenty of other evidence that the aristocracy of Wales was becoming thoroughly Anglicized both in sentiment and language. At the same time the practice of the Tudors was reversed in many particulars. Thus it became the custom to appoint Englishmen ignorant of the national language to the Welsh bishoprics. In this manner it is not a matter for surprise that a feeling of estrangement should grow up between the bulk of the population, who only knew Welsh, and the clergy and nobles, their intellectual leaders. The neglect of the national language is evident from the large number of English words which have even crept into such classical works as Prichard's *Canyll y Cymry* and Ellis Wynn's *Cwledigaethau y Bardd Cwg*. It is stated that, of the 269 works published by Welshmen between 1546 and 1644, 44 were in Latin, 184 in English and only 41 in Welsh, and of these 37 consist of works of piety. Thus at the beginning of the 18th century there seemed a fair chance that Welsh would soon become extinct like Cornish.

An extraordinary change was brought about by the Methodist movement in Wales. The preachers, in order to get hold of the masses, addressed them in the vernacular, and their efforts were crowned with enormous success. At the same time a minister of the Established Church, Griffith Jones, went about Wales establishing lay schools to which young and old might come to learn to read the Welsh Bible. Between 1737 and 1761 3395 such schools sprang up, at which no fewer than 158,238 persons of all ages learned to read their native language. After Griffith Jones's death this work was carried on by others, notably by Charles of Bala (1755-1814), who passed over to Calvinistic Methodism and whose schools were transformed after the model of the Sunday schools instituted in 1782 by Robert Raikes. Charles of Bala was largely instrumental in the founding of the British and Foreign Bible Society, and Wales was provided with 100,000 copies of the Bible and Testament at very

moderate prices. Bishop's Morgan's version of the Scriptures made in 1598 (final revision 1620) represents the speech of North Wales which had remained more or less free from English influence, so that the language of the Welsh Bible is rightly regarded as the literary model. Three-fourths of the inhabitants of Wales belong to the various Nonconformist sects, and therefore pass almost without exception through the Sunday school, where they are drilled in its sole object of study, the Welsh Bible.

With the increasing employment of Welsh owing to the Nonconformist movement there was also awakened a new interest in the past history of the principality. A society calling itself the *Cymdeithas y Cymrodorion* was founded in London in 1751, and during the succeeding half-century two periodicals exclusively in Welsh were started, the one, *Trysorfa y Gwybodaeth*, in 1770, the other, *Cyckhgrawn Cymraeg*, in 1793. The year 1792 witnessed the creation of an important society, the *Cymdeithas y Cymreigyddion*, in London, in which the moving spirits were William Owen (Pughe), Owen Jones and Edward Williams. The results of their indefatigable search for ancient Welsh manuscripts were published in three volumes under the title *Myrryrian Archaeology* (London, 1801-1807). Owen further published an edition of the greatest mediæval Welsh poet Dafydd ap Gwilym, and also the first copious dictionary. But this was not all. In Goronwy Owen (1722-1769) a poet had arisen whose works could stand comparison with the compositions of the mediæval writers, and it was owing to the efforts of the three men above mentioned that the national Eisteddfod (=session, from *eistedd*, "to sit") was revived. The origin of these literary festivals is shrouded in obscurity. It is recorded that a S. Welsh prince, Gruffydd ap Rhys, held a festival lasting forty days in 1195 to commemorate a victorious campaign at which poets and minstrels competed for gifts and other rewards. Gruffydd's son Rhys ap Gruffydd is reported to have instituted a similar contest in 1176, at which the successful competitors received a chair whilst the others were given presents. It would seem that after the loss of Welsh independence a carefully graded order and a system of jealousy guarded rules came into existence. Similar national festivals were held under royal patronage under Henry VIII. in 1523 and again under Elizabeth in 1568. From 1568 until 1819 no general eisteddfod for all Wales was held. Since 1819 the national festival has been held annually and every little town has its own local celebration. Hence the Nonconformist Sunday school, the pulpit and the eisteddfod may be regarded as the most potent factors in resisting the inroads of English. The whole question of the vitality of Welsh and what may be called the political and social history of the language is treated in great detail by H. Zimmer, "Der Pan-Keltismus in Grossbritannien und Irland," in *Preussische Jahrbücher*, vol. xcii. (1898). In elementary schools in Wales the use of Welsh has been permitted since 1893.

With regard to the extent over which Welsh is spoken a detailed map is given in J. E. Southall's *Welsh Language Census of 1891* (Newport, 1895). A line drawn from the southern end of the estuary of the Dee about 2 m.w. of Connah's Quay to Aberthaw in Glamorgan would practically include all those districts where Welsh is spoken by 60% of the population, and considerable deductions would have to be made for parts of Flint, Montgomery, most of Radnor and the N. part of Brecon. Little Welsh is spoken in the southern half of the Gower peninsula or in S. Pembrokeshire. Over much of Anglesey 97.4% of the population spoke Welsh and in parts of Cardiganshire 98.3%. Of a total population in 1901 of 2,012,876, 929,824 were returned as speakers of Welsh, of whom 280,905 were monoglots. That Welsh is a very living language may be gathered from the following statistics. Between 1801 and 1898 no fewer than 825 volumes were published in the vernacular, whilst in 1895 there were appearing regularly 2 quarterly, 2 bi-monthlies, 28 religious and literary monthlies and 25 weekly papers. In 1909 the number was probably greater. The danger for Welsh lies rather in the direction of internal decay. The speech of the people is saturated with English words and idiom, and modern writers like Daniel Owen submit to the same influence instead of returning to the classical models of the 17th century.

Much remains to be done as regards the classification of the modern Welsh dialects. It is usual to divide them into four groups—(1) Powys (N.E.); (2) Gwynedd (N.W.); (3) Dyfed (S.W.); (4) Gwent (S.E.). One of the chief points on which N. and S. diverge is the pronunciation of the vowels *i*, *u*, *y*, which in the S. all tend to become *i*. The difference between N. and S. was noticeable as early as the time of Geraldus Cambrensis. See M. Nettlau, *Beiträge zur cymrischen Grammatik* (Leipzig, 1887), also *Rev. cell. ix.* pp. 64 ff.; 113 ff.; T. Darlington, "Some Dialectal Boundaries in Mid-Wales," *Trans. of the Hon. Soc. of Cymrodorion*, 1900-1901. The only scientific description of a living dialect is "Spoken N. Welsh," by H. Sweet, *Trans. of the London Phil. Soc.*, 1882-1884.

**AUTHORITIES ON WELSH LANGUAGE.**—For the study of older Welsh:—J. G. Leuss, *Grammatica Celtica* (Berlin, 1817)—an index to the O. Welsh glosses cited in this work was compiled by V. Tournier, *Archiv. f. Celt. Linguistic*, iii. 100-107; J. Strachan, *An Introduction to Early Welsh*, with a Reader (Manchester, 1909); J. Rhys, *Lectures on Welsh Philology* (London, 1879). Editions of texts—*The Black Book of Carmarthen*, facsimile edition by J. Gwenoigryn Evans (Pwllheli, 1906); J. Rhys and J. Gwenoigryn Evans, *The Text of the Mabinogion* (Oxford, 1887); *The Myrryrian*

*Archæology of Wales* (1801-1807; reprinted Denbigh, 1870); W. F. Skene, *The Four Ancient Books of Wales* (2 vols., Edinburgh, 1868); Aneurin Owen, *Ancient Laws and Institutes of Wales* (London, 1841); facsimile edition by A. W. Wade-Evans, *Welsh Medieval Law* (Oxford, 1909); K. Meyer, *Peredur ap Iffracw* with glossary (Leipzig, 1887); R. Williams, *Selections from the Hengwrt Manuscripts* (London, 1876-1892); J. E. Southall, *Wales and Her Language* (Newport, 1892). The earliest Welsh grammar was published as long ago as 1567 in Milan by Griffiths Roberts, reprinted in facsimile as supplement to the *Revue celtique* (Paris, 1883). An account of the language was prefixed to Owen Pughe's Dictionary (1803). During the 19th century many manuals of indifferent value saw the light of day. The most authoritative works are:—T. Rowland, *A Grammar of the Welsh Language* (Wrexham, 1853, 1876), (still the most complete work), the same author also published a companion volume of *Welsh Exercises* (Wrexham, n.d.); W. Spurrell, *A Grammar of the Welsh Language* (Carmarthen, 1870); E. Anwyl, *A Welsh Grammar for Schools*, (i) *Accidence*, (ii) *Syntax* (London, 1898). Other useful manuals for the beginner:—T. Jones, *A Guide to Welsh*, pts. i. ii. new ed. (Wrexham, n.d.); S. J. Evans, *The Elements of Welsh Grammar* (Newport, 1903). Dictionaries.—The first Welsh dictionary was compiled by William Salebury (London, 1747; facsimile reprint, London, 1877); W. Owen Pughe, *A Dictionary of the Welsh Language* (2 vols., London, 1803; reprinted Denbigh, 1870); W. Spurrell, *Welsh-English and English-Welsh Dictionary* (Carmarthen, 1904); a smaller one by W. Richards in 2 vols. (Wrexham, n.d.), and many others. A dictionary on a large scale was planned by D. Silvan Evans and subsidized by the government. Only A-Dd has, however, appeared (Carmarthen, 1893-1906), cp. J. Loth in *Archiv f. celt. Lex.* vol. i. for additions and corrections. A survey of Welsh periodical literature is contained in T. M. Jones's *Llenyddiaeth fy Ngulad* (Treffynnon, 1893). For Welsh folklore see J. Rhys, *Celtic Folklore, Welsh and Manx* (Oxford, 1901). H. H. Vaughan, *Welsh Proverbs* (London, 1889), also *Rev. celt.* iii. 419 ff. See also G. Dottin, *Revue de synthèse historique*, vi. 317 ff.; H. Zimmer and L. C. Stern in *Kultur der Gegenwart*, Teil I, Abt. xi. 1. (E. C. Q.)

(b) *Breton*.—Breton (*Brezonek*) is the name given to the language spoken by those Britons who fled from the south-west of England to Armorica (see BRITANNY) in the 5th and 6th centuries of our era to avoid being harassed by the Saxons. The first migration probably took place about 450. The Dumnonii and Cornovii founded small states in Brittany, or Britanni Minor, as it was termed, and were followed in the second half of the 6th and into the 7th century by a long stream of refugees (cf. J. Loth, *L'Émigration bretonne*, Paris, 1883; A. de la Borderie, *Histoire de la Bretagne*, vol. 1, 1905).

In the earliest stages it is difficult to distinguish Breton from Welsh. The history of the language may be divided into Old Breton from the 7th to the 11th centuries, Middle Breton from the 11th to the 17th centuries, and Modern Breton. In Old Breton the only material we possess consists of glosses and names occurring in lives of saints, Frankish authors, and charters. However, we find a few characteristics which serve to show that the old glosses are really Breton and not Welsh. Thus, an original *d* never becomes a diphthong (*au, aw*) in Old Breton, but remains *d*. In Bret. *gn* becomes *gr*. Further, in O. W. pretonic *i* is weakened to an indeterminate sound written *i* and later *y*, a phenomenon which does not occur in Breton, e.g. Lat. *culcita* appears in O. W. as *cūcet*, but in O. Br. as *colcet*. A marked characteristic of Breton is the confusion of *i* and *e*, e.g. Ir. *is* "court," W. *lys*, Br. *les*. In Old Breton as in Old Welsh neither the initial nor the medial mutations are expressed in writing, whilst in Middle Breton only the latter are regularly denoted. In this period the language diverges very rapidly from Welsh. As prominent features we may mention the following. Stressed *ð* (= Prim. Celt. and Ir. *d*) becomes *eu*, in unstressed syllables *e*; thus the suffix *-do* becomes *-euc* and later *-er*, but in Welsh *-auc* and later *-oc, -og*. Postvocalic *-r, -l* become *-d, -l* as in Welsh, but in Middle Breton they pass into *-r, -l*, which in the modern language appear as *-er, -el*; e.g. Mid. Br. *laxr*, Mod. Br. *laer*, "robber," W. *lleidr*, Lat. *lairo*. Further, *-l* becomes *-ol, -ul, e.g.* Br. *adol, aul*, "cliff," W. *allt*; Br. *awron*, "lord," Ir. *altram*, W. *allraw, aowr*, Corn. *alrown*; and more important still, *ð, ð* (W. *dd*) become *s, s*, e.g. Mid. Br. *clezess*, "sword," Mod. Br. *blez, W. cleddyf*. The orthography only followed the pronunciation very slowly, and it is not until 1659 that we find any attempt made to reform the spelling. In this year a Jesuit priest, Julien Maunoir (Br. Maner), published a manual in which a new spelling is employed, and it is usual to date Modern Breton from the appearance of this book, although in reality it marks no new epoch in the history of the language. It is only now that the initial mutations are consistently denoted in writing (medially they are already written in the 11th century), and the differences between the dialects first come into view at this time. As in Welsh the accent is withdrawn during the middle period from the final to the penultimate (except in the Vannes dialect), which causes the modern unstressed vowel to be reduced in many cases. Again, in Old Welsh and Old Breton a short stressed vowel in words of one syllable

was lengthened, e.g. W. *Mad*, "father," pl. *Madas*, but in Modern Breton the accent tends to lengthen all stressed vowels. Breton has gone its own way in the matter of initial mutation. The nasal mutation has been entirely given up in the initial position, whilst a new mutation, called medial prevoction, has arisen in the case of *b, d, g*, which become *p, t, k* after a few words which originally ended for the most part in *s* or *ch*. The vocalic mutation of initial *g* in Breton is *ch*. We may also make mention of one or two other points on which Breton differs widely from Welsh. Breton has given up the combination *ng*, e.g. Mid. Br. *moë*, Mod. Br. *moë*, "mane," W. *mwng*, Ir. *mong*. The language betrays a fondness for nasalized vowels, and in this connexion it may be noted that *u* representing an original *u* (W. *u, Ir. mû*), though generally written *u* in Middle Breton, now frequently appears as *ou*; Mid. Br. *clouf*, Mod. Br. *houf*, "sick, ill," W. *claf*, Ir. *clam*. Final *g* after *a* and *i and sometimes in monosyllables after a vowel is represented in Breton by *ch*, whilst in Welsh in the one case we find a vowel and in the other *ch*, e.g. Br. *er'ch*, "snow," W. *evry, evra*; Br. *loc'h*, "place," W. *lle*. In Welsh *mb, nd* immediately preceding the stress appear in the modern language as *mm, nn*, but in Breton we find *mp, nt*, e.g. Br. *hantel*, "candle," W. *cannwyll*, Lat. *candela*; Br. *hwmp'er*, "confusée" (in place names), W. *cymmer*, Ir. *combor*.*

With regard to the extent of country over which Breton is spoken we shall do well to note the seats of the old Breton bishoprics. These were Quimper, St Pol de Léon, Tréguier, St Briec, St Malo, Dol and Vannes. Under Count Nominoë the Bretons succeeded in throwing off the Frankish yoke (841-845) and founded an independent state. At this time of greatest political expansion the language boundary was formed by a line which started roughly a little to the west of Mont St Michel at the mouth of the Couesnon, and stretched to the mouth of the Loire. During the next three centuries, however, in consequence of political events which cannot be enumerated here, we find French encroaching rapidly on Breton, and the old dioceses of Dol, St Malo, St Briec, and in part Vannes became Romance-speaking (cp. J. Loth, *Revue celtique*, xviii. 374-403). So that since the 13th and 14th centuries the boundary between French and Breton begins in the north about Plouha (west of St Briec Bay) and stretches to the mouth of the Vilaine in the south. That is to say, the Breton speakers are confined to the department of Finistère and the west of the departments Côtes-du-Nord and Morbihan. Lower Brittany contains a population of 1,350,000, of whom roughly 1,250,000 speak Breton. The number of monoglot Bretons is stated to have been 768,000 in 1878, 679,000 in 1885, and over 520,000 in 1898. There is an infinity of dialects and subdialects in Brittany, but it is usual to divide them into four groups. These are the dialects of (1) Léon in Finistère; (2) Cornouailles in Finistère, the Côtes-du-Nord and a part of Morbihan; (3) Tréguier in the Côtes-du-Nord and Finistère; (4) Vannes in Morbihan and a portion of the Côtes-du-Nord. The first three resemble one another fairly closely, but the speech of Vannes has gone its own way entirely. The dialect of Léon is regarded as the literary dialect, thanks to Leconte de Lisle.

The modern language is unfortunately saturated with words borrowed from French which form at least a quarter of the whole vocabulary. The living speech is further characterized by innumerable cases of consonantal metathesis and by parasitic nasalization. Loth gives specimens of the most important varieties of Breton in his *Chrestomathie bretonne*, pp. 303-380, but here we must confine ourselves to pointing out the two most salient differences between the speech of Vannes and the rest of Brittany. In Vannes the stress has not been shifted from the final syllable. In Haute-Cornouailles and Goelo there is a tendency to withdraw the stress on to the antepenultimate, whilst in Tréguier certain enclitics attract the accent to the final *s, s* of the other dialects representing Welsh *ð* become *h* in Vannes, e.g. W. *caeth*, Br. *haer, haer*, "poor, miserable," Vannes *kaeh, keh*. This phenomenon occurs sporadically in other dialects. It may also be mentioned that Prim. Celt. *no*, initial *d, dd*, is retained as *s* in Léon but disappears when final or standing between vowels in the other dialects, e.g. O. Br. *sid, W. fyd*, "faith," Léon *fris*, in Cornouailles, Tréguier and Vannes *fi*. It is doubtful if the most serious differences between the dialects are older than the 16th century.

In the middle ages the language of the Breton aristocracy was French. Upper Brittany was politically more important than the western portion. The consequence was that no patronage was extended to the vernacular, and Breton sank to the level of a patois with no unity for literary purposes. But a new era dawned with the beginning of the 19th century. The national consciousness was awakened at the time of the Revolution, when the Bretons became aware of the difference between themselves and their French neighbours. It may be mentioned by the way that the Breton language was regarded with suspicion by the leaders of the First Republic and attempts were made to suppress it. A Breton named Leconte had to flee to England for fighting against the Republic. He came under the influence of the movement in Wales, and on his return sought to create a Breton literary language. He published an excellent grammar (*Grammaire cello-bretonne*, Paris, 1807) and a dictionary (*Dictionnaire breton-français*, Paris, 1821), from which he omitted the numerous French words which had crept into the language and for which native terms already existed. Leconte's

example fired a number of writers with zeal for their native tongue and the clergy became interested. Under their auspices manuals of Breton were published and the language was utilized in a number of schools. A society called the *Association Bretonne* was founded in the year 1844. But under the Second Empire, for reasons which are not easy to discover, this Breton awakening was declared to be contrary to the interests of the state, and all the means at the disposal of a highly centralized government like that of France were employed to throttle the movement. Down to the present day the use of Breton is strictly forbidden in all the state schools, and the influence of the Roman Catholic clergy has for the most part been hostile to the language. However, the attitude of the government aroused considerable dissatisfaction in the early 'nineties, and in 1896 the *Association Bretonne* (disbanded in 1859 and reconstructed in 1873) appointed a permanent committee with the object of preserving and propagating the national language. At the same time some of the clergy headed by Abbé Buléon began to move, and Breton was introduced into many of the schools not under state control. In 1898 was founded the *Union Régionaliste Bretonne*, the most important section of which endeavours to foster the native speech in conjunction with the *Comité de préservation du breton* (founded 1896). In 1899 the annual meeting of the U.R.B. was modelled on the lines of the Irish Oireachtas, the Welsh Eisteddfod and the Scottish Mòd, and festivals of this kind have been held ever since. Many Breton newspapers publish columns in Breton, thus *Ar Bobl* (a weekly newspaper founded in 1904 and published at Carhaix) frequently devotes half its columns to the language. But there is also a weekly four-page newspaper which is wholly in Breton. This is *Kroaz ar Vretoned*, edited by F. Vallée and published at St Brieuc. In addition to this there are three monthly magazines wholly in Breton. The first is *Ar Vro*, edited by the poet Jaffrennou, and in 1908 in its fifth year. The second is *Dihunamb*, written in the dialect of Vannes and started in 1905. The third is *Feis ha Breis*, started 1899.

**AUTHORITIES FOR BRETON.**—For the external history of Breton see H. Zimmer, "Die keltische Bewegung in der Bretagne," *Preussische Jahrbücher* for 1899, xcix, 454-497. For Old and Middle Breton, J. Loth, *Chrestomathie bretonne* (Paris, 1890), and the same writer's *Vocabulaire vieux-breton* (Paris, 1884). Loth and E. Ernault have been indefatigable in investigating the history of the language. Their numerous contributions are mainly to be found scattered through the *Revue celtique*, *Zeitschrift für celtische Philologie* and the *Annales de Bretagne*. Ernault has also published *Glossaire moyen-breton* in 2 vols. (Paris, 1895-1896); *Dictionnaire étymologique du moyen-breton* (Paris, 1888). Another etymological dictionary was published by V. Henry (Paris, 1900). Grammars, &c.—Dialect of Léon: Legonidec, *Grammaire cello-bretonne* (Paris, 1807, 1838\*, also contained in H. de la Villemarqué's edition of Legonidec's Dictionary); F. Vallée, *Leçons élémentaires de grammaire bretonne* (St Brieuc, 1902); E. Ernault, *Petite Grammaire bretonne* (St Brieuc, 1897, the latter also takes account of the dialects of Tréguier and Cornouailles). Dialect of Tréguier: L. le Clerc, *Grammaire bretonne* (St Brieuc, 1908); J. Hingant, *Éléments de la grammaire bretonne* (Tréguier, 1868); P. le Roux, "Mutations et assimilations de consonnes dans le dialecte armoricain de Pleubian," *Annales de Bretagne*, xii, 3-31. Dialect of Vannes: A. Guillevic and P. le Goff, *Grammaire bretonne du dialecte de Vannes* (Vannes, 1902); *Exercices sur la grammaire bretonne* (Vannes, 1903); H. d'Arbois de Jubainville, "Étude phonétique sur le dialecte breton de Vannes," *Revue celtique*, i, 85 ff. 211 ff.; E. Ernault, "Le Dialecte vannetais de Sarzeau," *Rev. cel.* iii, 47 ff., 232 ff.; J. Guilleme, *Grammaire française-bretonne* (Vannes, 1836). As a curiosity we mention P. Treasure, *An Introduction to Breton Grammar* (Carmarthen, 1903). Dictionaries: Legonidec, *Dictionnaire français-breton* (St Brieuc, 1847). *Breton-Français* (St Brieuc, 1850), both republished by de la Villemarqué and representing the Léon dialect; A. Troude, *Nouveau Dictionnaire pratique français et breton du dialecte de Léon avec les acceptions diverses dans les dialectes de Vannes, de Tréguier, et de Cornouailles* (Brest, 1869), and *Nouveau Dictionnaire pratique breton-français* (Brest, 1876); E. Ernault, "Supplément aux dictionnaires bretons-français," *Revue celtique*, iv, 145-170. The Breton words in Gallo, the French patois of Upper Brittany, were collected by E. Ernault, *Revue celtique*, v, 218 ff.

(c) **Cornish.**—The ancient language of Cornwall (*Kernowak*, *Carnock*) stood in a much closer relation to Breton than to Welsh,<sup>1</sup> though in some respects it sides with the latter against the former.

It agrees with Breton on the following points:—It has given up the nasal mutation of initials but protects the mediae. Prim. Celt. *d* is not diphthongized, but becomes *ð*, e.g. Corn. *ler*, "floor"; *Br. lew*, *W. llaw*, *Ir. lé*. *ng* is lost as in Breton, e.g. *toy*, "to swear"; *Br. toni*, *W. tyng*, *Ir. tongus*; *nd* becomes *n* before the stress and not as in Welsh, e.g. Corn. *Br. hanter*, "half," *W. hanner*. Cornish like Breton does not prefix a vowel to words beginning with *s*+consonant, e.g. Corn. *spirit*, later *spyrz*, *Br. spered*, *W. yspryd*.

<sup>1</sup> J. Loth gives it as his opinion that as late as 1400-1600 a Cornishman and a Breton might have been able to understand one another.

On the other hand, O. Cornish does not confuse *i* and *ð* to the same extent as Bret., e.g. *W. helyg*, "willow," O. Cornish *heligen*, *Br. halek*. Further, Cornish does not change *th*, *ð* to *s*, as in Breton, e.g. *beth*, "grave," *Br. bez*, *W. bedd*, and initial *g* disappears in the vocalic mutation as in Welsh. Peculiar to Cornish is the change of non-initial *i*, *d* to *s*, *z*. This occurs in the oldest Cornish after *n*, *l*, e.g. O. Corn. *sans*, "valley," *W. sant*; Corn. *ds*, "father," *W. lad*. A feature of later Cornish is the introduction of a *d* before post-vocalic *m*, *n*, e.g. *pedn*, "head," *W. pen*. In later Cornish the accent seems to have fallen on the penultimate as in Modern Welsh and Breton.

In 936 the "Welsh" were driven out of Exeter by Æthelstan, and from that time the Tamar appears to have formed a general boundary between English and Cornish, though there seems to be evidence that even as late as the reign of Elizabeth Cornish was spoken in a few places to the east of that river. The decay of Cornish has been largely attributed to the Reformation. Neither the Prayer-book nor the Scriptures were translated into the vernacular, and we find the same apathy on the part of the Church of England in Cornwall as in Wales and Ireland. Unfortunately the Methodist movement came at a time when it was too late to save the language. By 1600 Cornish had been driven into the western parts of the duchy and in 1662 we are informed by John Ray that few of the children could speak it. Lhuyd gives a list of the parishes in which Cornish was spoken, but goes on to state that every one speaks English. In 1735 there were only a few people along the coast between Penzance and Land's End who understood Cornish, and Dolly Pentreath of Mousehole, who died in 1777, is commonly stated to have been the last person who spoke it, though Jenner seems to show that there were others who lived until well into the 19th century who were able to converse in the dialect. However, the modern English speech of West Cornwall is full of Celtic words, and nine-tenths of the places and people from the Tamar to Land's End bear Cornish names. Celtic words still in use are to be found in Jago's *Dialect of Cornwall* (Truro, 1882); thus the name for the dog-fish is *morgy*, "sea-dog."

**AUTHORITIES FOR CORNISH.**—A mass of details about Cornish is collected in H. Jenner's *Handbook of the Cornish Language* (London, 1904). (Cf. J. Loth's review in the *Revue celtique*, xxvii, 93.) Lhuyd's *Archæologia Britannica* (1707) contains a grammar of the language as spoken in his day, and a *Sketch of Cornish Grammar* is to be found as an appendix to Norris's *Ancient Cornish Drama*. A dictionary was published by R. Williams entitled *Lexicon Cornu-Britannicum* (Landover, 1865), to which W. Stokes published a supplement of about 2000 words in the *Transactions of the London Philological Society* for 1868-1869. We may also mention the *English-Cornish Dictionary*, by F. W. P. Jago (Plymouth, 1887), and a *Glossary of Cornish Names*, by J. Bannister (Truro, 1871). W. Stokes published a *Glossary to Beunans Meriasek* in the *Archiv für celtische Lexikographie*, i, 101, and important articles by J. Loth have appeared in the *Revue celtique*, vols. xviii. to xxiv. W. S. Lach-Szirma, "Les Derniers Echos de la langue cornique," *Revue celtique*, iii, 239 ff. H. Jenner, "Some Rough Notes on the Present Pronunciation of Cornish Names," *Rev. cel.* xxiv, 300-305.

III. THE LANGUAGE OF THE ANCIENT PICTS.—The evidence from which we can draw any conclusions as to the affinities of the language of the Picts is so extremely scanty that the question has been the subject of great controversy. The Picts are first mentioned by Eumenius (A.D. 297), who regarded them as having inhabited Britain in the time of Cæsar. In the year 368 they are described by Ammianus Marcellinus as invading the Roman province of Britain in conjunction with the Irish Scots. In Columba's time we find the whole of Scotland east of Drumalban and north of the Forth divided into two kingdoms—north and south Pictland—and it is reasonable to identify the Picts, at any rate in part, with the Caledonians of the classical authors. Galloway and Co. Down were also inhabited by Picts. Bede in enumerating the languages of Britain mentions those of the Britons, Picts, Scots and the English. The names by which the Picts are known in history have aroused considerable discussion. It seems natural to connect Lat. *Picti* with the *Pictones* and *Pictarii* of Gaul, but in Irish they are known as *Cruithne*, which appears in Welsh as *Prydydd*, "Fict"; cp. *Prydain*, "Britain," forms corresponding to the earliest Greek name for these islands, *ἠῆροι Περραιῶν*.

Three conflicting theories have been held as to the character of the Pictish language. Rhys, relying on the strange character of the Scottish Ogam inscriptions, pronounces it to be non-Celtic and non-Indo-European. In this he has been followed by Zimmer, who bases his argument on the Pictish rule of succession. Skene maintained that the Picts spoke a language nearly allied to Goidelic, whilst Stokes, Loth, Macbain, D'Arbois and Meyer are of opinion that Pictish was more closely related

to Brythonic. Of personal names mentioned by classical writers we have Calgacus and Argentocoxus, both of which are certainly Celtic. The names occurring in Ptolemy's description of Scotland have a decidedly Celtic character, and they seem, moreover, to bear a greater resemblance to Brythonic than to Goidelic, witness such tribal designations as Epididi, Cornavii, Damnonii, Decantae, Novantae. In the case of all these names, however, it should be borne in mind that they probably reached the writers of antiquity through Brythonic channels. Bede mentions that the east end of the Antonine Wall terminated at a place called in Pictish *Pean-fahel*, and in Saxon *Pennellun*. *Pean* resembles Old Welsh *penn*, "head," Old Irish *cenn*, and the second element may possibly be connected with Gaelic *fal*, Welsh *gwawt*, "rampart." The names of the kings in the Pictish chronicles are not an absolutely trustworthy guide, as owing to the Pictish rule of succession the bearers of the names may in many cases have been Brythons. The names of some of them occur in one source in a Goidelic, in another in a Brythonic form. It is of course possible that the southern part of Pictish territory was divided between Goidels and Brythons, the population being very much mixed. On the other hand there are a number of elements in place-names on Pictish ground that do not occur in Wales or Ireland. Such are *pet*, *pit*, "farm" (?), *for*, *folher*, *fetter*, *foder*, "lower" (?), *Aber*, "confluence," on the contrary, is pure Brythonic (Gaelic *inver*). Though the majority of scholars are of opinion that Pictish was nearly akin to the Brythonic dialects, we are entirely in the dark as to the manner in which that language was ousted by the Goidelic speech of the Dalriadic Scots. In view of the comparatively unimportant part played for a considerable period in Scottish affairs by the colony from Ireland, it is well-nigh incredible that Pictish should have been supplanted by Gaelic.

**AUTHORITIES.**—J. Rhys, *Celtic Britain* (London, 1905), *The Welsh People* (London, 1902), "The Language and Inscriptions of the Northern Picts," in *Proceedings of the Society of Antiquaries of Scotland* (1892); H. Zimmer, "Das Mutterrecht der Pikten," in *Savignys Zeitschrift* (1895); also trans. by G. Henderson in *Leabhar nan Gleann* (Inverness, 1898); W. F. Skene, *Celtic Scotland* (Edinburgh, 1876); A. Macbain in appendix to reprint of Skene's *Highlands of Scotland* (Stirling, 1902); A. Macbain, "Ptolemy's Geography of Scotland," in *Transactions of the Gaelic Society of Inverness*, xvii, 267-288; W. Stokes, *Brudenbergers Beiträge*, xvii, 267 ff.; H. d'Arbois de Jubainville, *Les Druides et les dieux celtiques de forme d'animaux* (Paris, 1906). The various theories have been recently reviewed and criticized by T. Rice Holmes in an appendix to his *Caesar's Invasion of Britain* (London, 1907).

**IV. HISTORY OF CELTIC PHILOLOGY.**—For many centuries the affinities of the Celtic languages were the subject of great dispute. The languages were in turn regarded as descended from Hebrew, Teutonic and Scythian. The first attempt to treat the dialects comparatively was made by Edward Lhuyd in his *Archaeologia Britannica* (Oxford, 1707), but the work of this scholar seems to have remained unnoticed. A century later Adelung in Germany divided the dialects into true Celtic (= Goidelic) and Celtic influenced by Teutonic (= Brythonic). But it took scholars a long time to recognize that these languages belonged to the Indo-European family. Thus they were excluded by Bopp in his comparative grammar, though he did not fail to notice certain resemblances between Celtic and Sanskrit. James Pritchard was the first to demonstrate the true relationship of the group in his *Eastern Origin of the Celtic Nations* (London, 1831), but his conclusions were not accepted. As late as 1836 Pott denied the Indo-European connexion. A year later Pictet resumed Pritchard's arguments, and Bopp himself in 1838 admitted the languages into the charmed circle, showing in an able paper entitled *Über die keltischen Sprachen* that the initial mutations were due to the influence of terminations now lost. But it was reserved to a Bavarian historian, J. C. Zeuss (1806-1856), to demonstrate conclusively the Indo-European origin of the Celtic dialects. Zeuss, who may worthily rank with Grimm and Diez among the greatest German philologists, rediscovered the Old Irish glosses on the continent, and on them he reared the magnificent structure which goes by his name. The *Grammatica Celtica* was first published in 1833. The material contained in

this monumental work was greatly extended by a series of important publications by Whitley Stokes and Hermann Ebel, so much so that the latter was commissioned to prepare a second edition, which appeared in 1871. Stokes has rendered the greatest service to the cause of Celtic studies by the publication of countless texts in Irish, Cornish and Breton. In 1870 the *Recueil celtique* (vol. xviii, in 1908) was founded by Henri Gaidoz, whose mantle later fell upon H. d'Arbois de Jubainville. In 1870 E. Windisch facilitated the study of Irish by publishing a grammar of Old Irish, and a year later a volume of important Middle Irish texts with an exhaustive glossary, the first of its kind. Since then Windisch and Stokes have collaborated to bring out some of the greatest monuments of Irish literature in the series of *Irische Texte*. The text of the Würzburg glosses was published by Zimmer (1881) and by Stokes (1887), and that of the Milan glosses by Ascoli. An important step forward was the discovery of the laws of the Irish accent made simultaneously by Zimmer and Thurneysen. This discovery led to a thorough investigation of the difficult verb system of Old Irish—a task which has largely occupied the attention of Strachan in England, Thurneysen and Zimmer in Germany, and Pedersen and Sarauw in Denmark. In a sense the publication of the *Thesaurus Palaeohibernicus* (Cambridge, 1901-1903) may be regarded as marking the close of this epoch. The older stages of Irish have hitherto so monopolized the energies of scholars that other departments of Celtic philology save Breton have been left in large measure unworked. J. Strachan had begun to tap the mine of the Old Welsh poems when his career was cut short by death. J. Loth and E. Ernault have concentrated their attention on Breton, and can claim that the development of the speech of Brittany has been more thoroughly investigated than that of any other Celtic language. The number of periodicals devoted entirely to Celtic studies has increased considerably of recent years. In 1896 K. Meyer and L. C. Stern founded the *Zeitschrift für celtische Philologie* (now in its 7th volume), and in 1897 the *Archiv für celtische Lexikographie* began to appear under the direction of K. Meyer and W. Stokes. As a supplement to the latter Meyer has been publishing his invaluable contributions to Middle Irish lexicography. In Ireland a new periodical styled *Ériu* was started by the Irish School of Learning in 1904. The *Scottish Celtic Review*, dealing more particularly with Scottish and Irish Gaelic, began to appear in 1903, and the *Transactions of the Gaelic Society of Inverness* are in the 26th volume. For Wales we have *Y Cymmrodor* since 1877, and the *Transactions of the Hon. Society of Cymmrodorion* since 1802, and for Brittany the *Annales de Bretagne*, published by the Faculty of Letters at Rennes (founded 1886).

See V. Tourneur, *Esquisse d'une histoire des études celtiques* (Liège, 1905). (E. C. Q.)

#### CELTIC LITERATURE

**I. IRISH LITERATURE.**—In the absence of a native coinage it is extremely difficult to say when the use of letters was introduced into Ireland. It is probable that the Latin alphabet first came in with Christianity. With the exception of the one bilingual Ogam inscription as yet discovered in Ireland (that at Killeen Cormac) all the inscriptions in Roman letters are certainly later than 500. Indeed, apart from the stone reading "LIE LUGUAEDON MACCI MENEUEH," they are all contemporary with or later than the Old Irish glosses. With regard to the Ogam inscriptions we cannot make any confident assertions. Owing to the lack of criteria for dating certain Irish sound-changes accurately it is impossible to assign chronological limits for the earlier stones. The latter cannot be later than the 5th century, but there is nothing to show whether they are Christian or not, and if pagan they may be a century or two earlier. It is true that the heroes and druids of the older epics are represented in the stories as making constant use of Ogam letters on wood and stone, and as the state of civilization described in the oldest versions of the Ulster sagas seems largely to go back to the beginning of the Christian era, it is not impossible that this peculiar system of writing had been

Ogam  
Inscr.  
Stone.

framed by them. The Ogam system is certainly based on the Latin and not the Greek alphabet, and was probably invented by some person from the south of Ireland who received his knowledge of the Roman letters from traders from the mouth of the Loire. It may, however, be regarded as certain that the Ogam script was never employed in early times for literary purposes. We are told that the Gaulish druids disdained to commit their lore to writing, although they were familiar with the use of Greek letters, and their Irish confrères probably resembled them in this respect. Tradition connects the codification of the Brehon Laws with the name of Patrick, and there is reason for believing, as we shall see later, that the greatest Irish epic was first committed to writing in the 7th century.

The great bulk of Irish literature is contained in MSS. belonging to the Middle Irish period (1100-1550), and in order to be able to treat this literature as a whole it will be convenient

Old Irish  
MSS.

for us to deal first with those documents which are termed Old Irish, especially as the contemporary remains of the literature of the earlier period are almost exclusively of a religious nature. Most of the Old Irish documents have been printed by Stokes and Strachan in the *Thesaurus Palaeohibernicus*, and where no reference is given the reader is referred to that monumental work. The extraordinary outburst of intellectual activity in Ireland from the 6th to the 9th centuries and the compositions of Irishmen in the Latin language, belong to the history of medieval European literature and fall outside the scope of this article. For the *Confession of St Patrick* and his "Letter to the Subjects of Coroticus" see PATRICK. The only Irish document ascribed to the saint is the strange so-called "Hymn," the *faeth fada*, more properly *faid fada*, "the cry of the deer." This is a rhythmical incantation which is said

to have rendered the saint and his companions invisible to King Loigaire and his druids. The Trinity and powers of nature are invoked to help him to resist spells of women and smiths and wizards. The hymn, which contains a number of strange grammatical forms, is undoubtedly referred to in the Book of Armagh, and may very well go back to the 5th century. The Latin hymns contained in two MSS. dating from the end of the 11th or beginning of the 12th century, a Trinity College, Dublin, MS., and a MS. belonging to the Franciscan monastery in Dublin, are of interest to us as exhibiting the influence of the native metrical system. Quantity and elision are ignored, and rhymes, assonances, alliterations and harmonies abound in true Irish fashion. The line consists of two units which commonly contain either seven or eight syllables apiece. The earliest and best-known of these religious poems are the Hymn of Secundinus (Sechnall d. 447) on St Patrick, and the two hymns attributed to St Columba (d. 597) beginning "Noli pater" and "Altus prosator," the latter of which exhibits some of the peculiarities of the so-called Hibernian Latin of the *Hisperica Famina* and the *Lorica of Gildas*. The date of the Irish hymns in the *Liber Hymnorum* ranges, according to Stokes and Strachan, from the 7th to the 11th centuries. Ultán's hymn on St Brigit beginning "Brigit bé bithmaik," which is by far the most artistic of the collection, was perhaps composed in the 7th century. Definite metrical laws had evidently been elaborated when this poem was written. The beat is iambic, but the natural accent of the words is rigidly observed. The long line consists of two units of five syllables each. The rhymes are dissyllabic and perfect. Alliteration is always observed in the latter half of each line and assonances are found knitting up the half-lines. The short prayer ascribed to Ninine or to Fiacc is a highly alliterative piece without rhyme, the date of which cannot be fixed. The well-known hymn on St Patrick traditionally ascribed to Fiacc, bishop of Sletty, and the piece beginning "Sén Dé," traditionally ascribed to Colmán, are assigned on linguistic grounds to the beginning of the 9th century. The lines going by the name of "Sanctán's Hymn" probably belong to the same century, whilst the metrical catalogue of marvels performed by St Brigit contains such a medley of older and later forms, probably due to interpolation, that it is impossible to determine its age. The few lines entitled "Mael-Ísu's Hymn" are the most recent of all and probably belong to the 11th century

(Mael-Ísu d. 1086). The Patrician documents by Muirchu Maccu Machthéni, who professed to write at the command of Bishop Aed of Sletty (d. 698), and by Tirechán, who is said to have received his information from Bishop Ultán (d. 656), are contained in the Book of Armagh, a MS. compiled by Ferdnadh in 807. These documents, like the *Life of St Columba* by Adamnan, the MS. of which was written by Forhbéne, abbot of Hi (d. 713), contain a number of names and forms of great importance for the study of the language.

The earliest pieces of connected prose in Irish are three:—(1) the Cambray Homily, contained in an 8th-century codex at Cambray copied by a continental hand from a MS. in the Irish character; the language is very archaic and dates from the second half of the 7th or the beginning of the 8th century; (2) the additions to the notes of Tirechán on the life of St Patrick in the Book of Armagh; these seem to go back to the early 8th century; (3) the tract on the Mass in the Stowe Missal, which is in all probability nearly as old as the Cambray Homily, though contained in a 10th or 11th century MS. Of especial interest are the spells and poems found in the Stowe Missal and two continental MSS. The Stowe MS. (now deposited in the Royal Irish Academy) contains three rather badly preserved spells for a sore eye, a thorn and disease of the urine. A St Gall codex has preserved four Irish incantations of the 8th and 9th centuries. These are respectively against a thorn, urinary disease, headache and various ailments. Another charm, which is partly obscure, occurs in the 9th-century codex preserved at the monastery of St Paul in Carinthia. The same MS. also contains (1) a humorous poem treating of the doings of a bookish writer and his favourite cat Pangur Bán; (2) a riddling poem ascribed to Suibne Geilt, a king who is said to have lost his reason at the battle of Moira (A.D. 637); (3) verses extracted from a poem ascribed to St Moling (d. 697), who may very well have been the actual author; (4) a poem in praise of some Leinster princeling called Aed.

Earliest  
prose.

For our knowledge of the older language, however, we have to rely mainly on the numerous glosses scattered about in a large number of MSS., which it is impossible to enumerate here. Indeed, such an enumeration is now rendered superfluous owing to the publication of the *Thesaurus Palaeohibernicus*, in which all the various glosses have been collected. For our purpose it will be sufficient to mention the three most important codices containing Old Irish glosses. These are as follows:—(1) The Codex Paulinus at Würzburg, which contains the thirteen epistles of St Paul, and the Epistle to the Hebrews, with a great mass of explanatory glosses, partly in Latin, partly in Irish, partly mixed. The chief source of the commentary is the commentary of Pelagius, who is often cited by name. The date of this highly important MS. is much disputed; part of the Irish glosses seem to date from about 700, whilst the rest may be placed a little before 800. (2) The Codex Ambrosianus, formerly at Bobbio, now at Milan, which contains a commentary on the psalter with a large number of Irish glosses. In their present state these glosses were copied in the first half of the 9th century. (3) Glosses on Priscian contained in four MSS., of which the most important is the Codex Sangalensis, dating from the middle of the 9th century. Apart from the biblical glosses and scholia the other chief texts or authors provided with Irish glosses are Augustine, Bede, the Canons, the Computus, Eutychius, Juvenius, Philargyrius, Prudentius and Servius.

Old  
glosses.

The Milan and the St Gall codices just mentioned both contain several short poems in Irish. In two stanzas in the Swiss MS. we find expressed for the first time that keen sympathy with nature in all her moods which is so marked a feature of Irish and Welsh verse.

Two ponderous religious poems have now to be noticed. To Oengus the Culdee is attributed the lengthy *Féilire* or Calendar of Church Festivals, consisting of 365 quatrains in *rinnrad* metre, one for each day in the year. The language of this dry compilation, which is heavily glossed and annotated, points to 800 as the date of composition, and Oengus, who is stated to have

lived about that time, may well have been the author. This calendar has been twice edited by W. Stokes with an English translation, the first time for the Royal Irish Academy (Dublin, 1880), and again for the Bradshaw Society (London, 1905).

It may perhaps be as well to enumerate here the later Irish martyrologies. (1) *The Martyrology of Tallaght* (Tamlacht), founded on an 8th-century calendar, but containing additions down to 900 (ed. D. H. Kelly, Dublin, 1857). (2) *The metrical Martyrology of O'Gorman*, c. 1166-1174, edited by Stokes for the Bradshaw Society (London, 1895). (3) *The Martyrology of Donegal*, an important compilation in prose made by Michael O'Clery in 1630, edited by J. H. Todd (Dublin, 1864). A composition which is wrongly assigned to Oengus the Culdee is the *Saltair na Rann* or Psalter in Quatrains, contained in an Oxford MS. (Rawlinson B 502) and published without a translation by Stokes (Oxford, 1883). The work proper consists of 150 poems corresponding to the number of Psalms in the psalter, but 12 poems have been added, and in all it contains 2098 quatrains, chiefly in *deidibe* metre of seven syllables. The poems are mainly based on biblical (Old Testament) history, but they preserve a large measure of medieval sacred lore and cosmogony. The psalter received additions as late as 908, and the Oxford MS. belongs to the 12th century. We should perhaps also mention here the famous *Amra* or Eulogy of St Columba, commonly attributed to Dallán Forgaill, a contemporary of the saint, but Stokes takes the view that it was written in the 9th century, and is intentionally obscure. The oldest but not the best copy of the *Amra* is preserved in the Trinity College, Dublin, MS. of the *Liber Hymnorum*, but it also occurs in LU. and elsewhere. It invariably appears heavily gloss-laden, and the glosses and commentary added thereto are out of all proportion to the text. This piece, which is not extant in its integrity, was probably intended as artificial alliterative prose, but, as we have it, it is a medley of isolated phrases and irrelevant comment.

During the 9th and 10th centuries Ireland was harassed by the Vikings, and a host of scholars seem to have fled to the continent, carrying with them their precious books, many of which are preserved in Italy, Switzerland, Germany and elsewhere. Hence very few early Irish MSS. are preserved in Ireland itself. When the fury of the storm was past, Irish scholars showed increased interest in the old literary documents, and copied all that they could lay hands on into miscellaneous codices. The earliest of these collections, such as the *Cin of Druim Snechta*, the *Yellow Book of Slane*, the *Book of Dubdaleithe*, the *Psalter of Cashel*, exist no longer, though their names have come down and certain of them were known in the 17th century. However, copies of a goodly portion of the contents of these old books are preserved to us in one form or another, but mainly in a series of huge miscellaneous codices ranging in date from the 12th to the 16th century.

The oldest is *Lebor na h-uídre*, or Book of the Dun Cow, preserved in the Royal Irish Academy and published in facsimile (Dublin, 1870). This MS. was compiled in part in the monastery of Clonmacnoise by Moelmuire MacCeolchair, who was slain in 1106. The Book of the Dun Cow (where necessary we shall abbreviate as LU.) derives its name from a legend that Ciarán of Clonmacnoise (d. 544) took down the story of the *Táin Bó Cuainge* on a parchment made from the hide of his favourite cow. The name seems to have been wrongly applied to the 12th-century MS. in the 15th century. LU. is almost entirely devoted to romance, the stories which it contains belonging mainly to the Ulster cycle. The next MS. in point of age is the Book of Leinster (abbreviated LL.) now in Trinity College, Dublin. It was transcribed by Finn, son of Gorman, bishop of Kildare (d. 1160). LL. also contains a large number of romances in addition to other important matter, mainly historical and genealogical, bearing more particularly on the affairs of Leinster. The *Yellow Book of Lecan* (YBL), also in Trinity College, Dublin, was written at different times by the MacFirbis family, but chiefly by Gilla Isa, son of Donnchad Mór MacFirbis about 1301. The MacFirbises were

hereditary scribes and genealogists to the O'Dowds, chiefs of the Hy Fiachrach (Co. Sligo). YBL. contains a vast amount of romance, and is indispensable as supplementing and checking the contents of LU. and LL. The most extensive collection of all is the Book of Ballymore (BB.), now belonging to the Royal Irish Academy, which was compiled about the beginning of the 15th century by various scribes. The book was in the possession of the chiefs of Ballymore for more than a century. In 1522 it was purchased by the O'Donnells for 140 milch cows. BB. only contains little romantic matter, but it has preserved much valuable historical and genealogical material. The contents of the *Leabhar Breac* (LB.), or Speckled Book, now in the Royal Irish Academy, are chiefly ecclesiastical and religious. LB. seems to have been compiled in large measure before 1544. All these five codices have been published in facsimile by the Royal Irish Academy with a description of their contents. Two important Mid. Ir. MSS. in the Bodleian (Rawlinson B 512 and Laud 610), containing a good deal of romantic material, are also published in facsimile by Henry Frowde.

Other MSS. which require special mention are (1) *The Great Book of Lecan*, compiled in the year 1417 by Gilla Isa Mór MacFirbis, in the Royal Irish Academy; (2) *The Book of Lismore*, the property of the duke of Devonshire at Lismore Castle. This codex was compiled in the latter half of the 15th century from the lost book of Monasterboice and other MSS. Its contents are described in the introduction to Stokes's *Lives of Saints from the Book of Lismore* (Oxford, 1890). (3) *The Book of Fermoy* in the Royal Irish Academy. The contents are described in the introduction to O'Beirne Crowe's edition of the *Táin Bó Fraich* (Dublin, 1870). (4) *The Book of Hy Maine* recently acquired by the Royal Irish Academy. The scribe who wrote it died in 1372. O'Curry, O'Longan and O'Beirne Crowe drew up a MS. catalogue of the Irish MSS. in the Royal Irish Academy, and O'Donovan performed the same service for the Trinity College, Dublin, collection. A briefer account of the Irish MSS. in TCD. will be found in Abbott's *Catalogue of the MSS. in that library*. O'Curry also drew up a list of the Irish MSS. in the British Museum, and S. H. O'Grady has printed part i. of a descriptive catalogue of this collection (London, 1901), part ii. by T. O'Maille. The twenty-six MSS. in the Franciscan monastery in Dublin are described by J. T. Gilbert in the *Fourth Report of the Royal Commission on Historical MSS.* W. F. Skene catalogued the collection of MSS. in the Advocates' Library, Edinburgh, a printed catalogue of which has been issued by D. Mackinnon (Edinburgh, 1909; see also *Trans. Gaelic Soc. of Inverness*, xvi. 285-309).

In order to give some idea of the enormous extent of Irish MS. material we may quote some calculations made by O'Curry, who states that if the five oldest vellum MSS. were printed the result would be 9400 quarto pages. Other vellum MSS. ranging in date from 1300 to 1600 would fill 9000 pages of the same size, whilst the innumerable paper MSS. belonging chiefly to the early 18th century would cover no less than 30,000 pages. The well-known French scholar, D'Arbois de Jubainville, published in 1883 a tentative catalogue of Irish epic literature. His work is by no means complete, but his figures are instructive. He mentions 953 Irish MSS. containing epic matter preserved in Irish and English libraries. To these have to be added another 56 in continental libraries. Of this mass of material 133 Irish and British MSS. and 35 continental MSS. were written before 1600. It should, however, be stated that the same subject is treated over and over again, and much of the later material is absolutely valueless.

Before we pass on to the consideration of the literature itself, it will be well to make a few preliminary observations on the nature of the language in which the pieces are written and on the status of the poet in medieval Ireland. The language in which the huge miscellaneous codices enumerated above are contained is called by the general name of Middle Irish, which is a very wide term. Irish scribes often copied their original somewhat mechanically, without

Old collectors.

Book of the Dun Cow.

Book of Ballymore.

Speckled Book.

Other MSS. material.

Character of Middle Irish.

being tempted to change the language to that of their own time. Thus in many parts of LL. we find a thin Middle Irish veneer on what is largely Old Irish of the 8th or 9th century. Hence such a MS. often preserves forms which had been current several centuries before, and it may even happen that a 14th or 15th century MS. such as YBL. contains much older forms than a corresponding passage in LL. Of recent years several scholars—notably Strachan—have devoted much attention to the Old Irish verb-forms, so that we have now safe criteria for establishing with some degree of certainty the age of recensions of stories and poems preserved in late MSS. In this way a number of compositions have been assigned to the 9th, 10th and 11th centuries, though actual written documents belonging to this period are comparatively rare.

It remains for us to say a few words about the *filí*, the professional literary man in Ireland. The *filí* (from the stem *vel-*, "to see," Welsh, Breton, *gwelêt*, "to see") appears to have been originally a diviner and magician, and corresponds to the *vates, obdruas*, of the ancient Gauls mentioned by classical writers. In Ireland he is represented as sole possessor of three methods of divination: the *imbos forosnai, leim léid* and *dichetal di cheimnib cnaime*. The first two of these were forbidden by Patrick, but they seem to have survived as late as the 10th century. Part of the tremendous influence exercised by the *filí* was due to the belief in his powers of satire. By reciting a satirical poem or incantation he was able to raise blotches on the face of and so disfigure any person who aroused his displeasure. Numerous cases of this occur in Irish literature. The origin of the science of the *filí* is sometimes traced back to the *Dagda*, one of the figures of the Irish pantheon, and they were held in such esteem that the annalists give the obituaries of the head-ollams as if they were so many princes. With the introduction of Christianity they seem to have gradually superseded the druid, and their functions are therefore very wide. We are told that they acted in three capacities: (1) as story-tellers (*ser congne or scélaige*); (2) as judges (*briúhem*), including the professions of arbiters, legislators and lawyers; (3) as poets proper (*sercete*). We are here only concerned with the *filí* in his capacity of story-teller and poet. In accordance with the minute classification of the various ranks of society in early Ireland, the social status of the literary man was very carefully defined. The degrees vary slightly in different documents; but the following list of ten from the *Senchus Már* is very instructive: (1) The highest degree is the *ollam* (ollave), who knows 350 stories; (2) the *anruth*, 175 stories; (3) the *clif*, 80 stories; (4) the *cana*, 60 stories; (5) the *doss*, 50 stories; (6) the *macfuirmid*, 40 stories; (7) the *fochlocon*, 30 stories; (8) the *drisac*, 20 stories; (9) the *taman*, 10 stories; (10) the *oblaire*, 7 stories. In LL. we are told that the stories (*scél*) are divided into primary and secondary, and that the latter are only obligatory on the first four of the grades enumerated. Again, certain styles of composition seem to have been the monopoly of certain grades. Thus the poem which was most highly rewarded and demanded the highest technical skill was called the *anomain*, and was the exclusive right of the *ollam*. A notable instance of this kind of composition is the *Amra* of Columba, attributed to Dallán Forgaill. The higher grades were allowed a number of attendants, whom the kings had to support along with the poet himself. Thus the *fochlocon* had two and the *doss* four attendants. In the 6th century Dallán Forgaill, the chief *filí* of Ireland, claimed the right to be attended by thirty *filí*, which was the number of the train allowed to the supreme king. The reigning monarch, Aed MacAinmirech, weary of the pretensions of the poets, attempted to banish them, which led to the famous assembly of Drum Ceta, where Columba intervened and reduced the number to twenty-four (the train of a provincial king). In the plan of the hall of Tara, preserved in LL. and YBL., the *sui léire* or doctor in theology has the seat of honour opposite the king. The *ollam briúhem* or supreme judge or lawyer ranks with the highest rank of nobility, whilst the *ollam filí* is on a footing with the nobleman of the second degree.

We have already stated that the stories which formed the

stock-in-trade of the poets were divided into primary and secondary stories. Of the latter there were 100, but little is known of them. However, several more or less complete lists of the primary stories have come down to us. The oldest catalogue (contained in LL.) gives the titles of 187 of these tales arranged under the following heads—destructions, cow-spoils, courtships, battles, caves, navigations, violent deaths, expeditions, elopements and conflagrations; together with the following, which also reckon as prime-stories—irruptions, visions, loves, hostings and migrations. Of these stories sixty-eight have been preserved in a more or less complete form. The tales enumerated in these catalogues, which in their substance doubtless go back to the 8th or even to the 7th century, fall into four main categories: (1) the mythological cycle, (2) the Cúchullinn cycle, (3) the Finn cycle, (4) pieces relating to events of the 5th, 6th and 7th centuries. Meyer has estimated that of the 550 titles of epic tales in D'Arbois's *Catalogue* about 400 are known to us, though many of them only occur in a very fragmentary state; and about 100 others have since been discovered which were not known in 1883.

The course of training undergone by the *filí* was a very lengthy one. It is commonly stated to have extended over twelve years, at the end of which time the student was thoroughly versed in all the legendary, legal, historical and topographical lore of his native country, in the use of the innumerable and excessively complicated Irish metres, in Ogam writing and Irish grammar. The instruction in the schools of poetry seems to have been entirely oral, and the course consisted largely in learning by heart the verses in which the native lore was enshrined. These schools of learning existed in one form or another down to the 17th century. In the early days the *filí* is represented as employing a mysterious archaic form of speech—doubtless full of obscure kennings—which was only intelligible to the initiated. An instance of this *bérla féine*, as it was termed, is the piece entitled *Acallam an Dá Skuad* (Colloquy of the Two Sages, *Rev. Celt.* xxvi. 4 ff.). In this piece two *filí* of the 1st century A.D. are represented as contending in this dialect for the office of chief *ollam* of Ireland, much to the chagrin of King Conchobar, to whom their speeches were unintelligible. It was in consequence of this that Conchobar ruled that the office of *filí* should no longer carry with it of necessity the office of judge (*briúhem*). It ought to be observed that the church never showed itself hostile to the *filí*, as it did to the druids. Dubhthach, chief *filí* of Ireland in the time of St Patrick, is represented as the saint's constant companion, and the famous Flann Mainistrech (d. 1056), though a layman and *filí*, was head of the monastery school at Monasterboice.

Before leaving the subject of the literary classes, we must notice an inferior grade of poet—the bard. Like the official *filí*, the bards were divided into grades. There were both *The bard.* patrician and plebeian bards, each subdivided into eight degrees, having their own peculiar metres. Like the *filí* the bard had to go through a long course of study, and he was generally attached to the house of some chieftain whose praises he had to sing. In course of time the office of *filí* became extinct, owing to a variety of causes, and from the 13th to the 16th century we find the hitherto despised family bard stepping into the place of the most influential literary man in Ireland. His importance was fully realized by the English government, which did its best to suppress the order.

The mediæval romances form by far the most attractive part of Irish literature, and it is to them that we shall first turn our attention. Two main groups of stories have *Mediæval romances.* to be distinguished. The one is the Ulster cycle, with Conchobar and Cúchullinn as central figures. The other is the Southern or Leinster-Munster cycle, revolving round Finn and Ossian. Further stories dealing with mythological and historical personages will be mentioned in their turn.

The Ulster cycle may be regarded as Ireland's most important contribution to the world's literature. The chief and at the same time the lengthiest romance in which the heroes of this group figure is the great epic, the *Táin Bó Cúalnge* or the

Cattle-raid of Cooley (Co. Louth). Here we find ourselves in a world of barbaric splendour, and we are constantly reminded of the Iliad, though the Irish epic from a purely

*Ulster cycle* literary point of view cannot bear comparison with the work of Homer. The main actors in the drama are Conchobar, king of Ulster, the great warrior Cúchulinn (see CÚCHULINN), Ailill and Medb, king and queen of Connaught, and Fergus, Conchobar's predecessor as king of Ulster,

*The "Táin."* now in exile in Connaught. These persons may or may not have actually lived, but the Irish annalists and synchronists agree in placing them about the beginning of the Christian era. And there cannot be any doubt as to the antiquity of the state of civilization disclosed in this great saga. It has been repeatedly pointed out that the Irish heroes are equipped and conduct themselves in the same manner as the Gauls described by the Greek traveller Posidonius, and Prof. W. Ridgeway has shown recently that several articles of dress and armour correspond exactly to the La Tène types of the continent. To mention a few primitive traits among many—the Irish champions of the *Táin* still fight in chariots, war-dogs are employed, whilst the heads of the slain are carried off in triumph and slung round the necks of the horses. It may also be mentioned that Emain Macha, Conchobar's residence, is reported by the annalists to have been destroyed in A.D. 323, and that portions of Meath, which is stated to have been made into a separate province in the 2nd century A.D., are in the *Táin* regarded as forming part of Ulster. Noteworthy is the exalted position occupied by the druid in the Ulster sagas, showing how little the romances were influenced by Christianity. No Roman soldier ever set foot in Ireland, and this early epic literature is of supreme value as a monument of primitive Celtic civilization. Ireland has always been a pastoral country. In early times no native coins were in circulation: the land belonged to the tribe. Consequently a man's property consisted mainly of cattle. Cattle-raids were an event of daily occurrence, and Sir Walter Scott has made us familiar with similar expeditions on the part of the Scottish Highlanders in the 18th century. Hence it is not a matter for surprise that the theme of the greatest Irish epic is a cattle-raid. At the time there were two wonderful bulls in Ireland, the Dond or Brown Bull of Cualnge, and the Findbennach or White-horn, belonging to Medb. These two animals are of no ordinary nature. Other stories represent them as having existed under many different forms before they were reborn as hulls. First they appear as swineherds belonging to the supernatural people of the *sid* of fairy mounds; then they are metamorphosed successively as ravens, warriors, sea-monsters and insects. It was Queen Medb's ambition to gain possession of the Brown Bull of Cualnge, and for this purpose she collected the united hosts of Ireland to raid the province of Ulster and carry him off. Medb chooses the season when she knows the Ulstermen are all incapacitated as the result of a curse laid upon them by a fairy woman. Cúchulinn alone is exempt from this debility.

The story is divided into a number of sections, and has been summarized by Miss Hull as follows:—(1) the prologue, relating, in the form of a night dialogue between Ailill and Medb, the dispute between them which brought about the raid; (2) the collecting of Medb's hosts and the preliminary movements of the army, during which period she first became aware of the presence and powers of Cúchulinn. Her inquiry of Fergus as to who this formidable foe is leads to a long section called (3) Cúchulinn's boy-deeds, in which Fergus relates the remarkable prodigies of Cúchulinn's youth, and warns Medb that, though the hero is but a beardless youth of seventeen, he will be more than a match for all her forces. (4) A long series of single combats, of which the first part of the tale is made up; they are at first gay and bombastic in character, but become more grave as they proceed, and culminate in the combat of Cúchulinn with his old companion, Fer Diad. This section contains the account of Cúchulinn's "distortion" or frenzy, which always occurred before any great output of the hero's energy, and of the rout of the hosts of Medb which followed it. (5) The general awakening of the warriors of Ulster from their lethargy, and their gathering by

septs upon the Hill of Slane, clan by clan being described as it comes up in order. (6) The final Battle of Gairrech and Igairech, followed (7) by the rout of Medb's army and (8) the tragic death of the bulls.

The text of the *Táin* has come down to us as a whole or in part in nearly a score of MSS., most of which, however, are modern. The most important MSS. containing the story are LU, LL and YBL. Of these LU and YBL are substantially the same, whilst LL contains a longer and fuller text later in both style and language. LL attempts to give a complete and consistent narrative in more polished form. In ancient times there were doubtless other versions now lost, but from the middle of the 12th century the scribes seem to have taken few liberties with the text, whilst previously the *filid* were constantly transforming the material and adding fresh matter. The YBL version preserves a number of forms as old as the O. Ir. glosses (i.e. 8th century or earlier), and a curious story contained in LL seems to point to the fact that the *Táin* was first committed to writing in the 7th century. Senchán Torpeist, who lived in the first half of the 7th century and succeeded Dallán Forgaill as chief *allam* of Ireland, summoned the *filid* to inquire which of them knew the *Táin* in its entirety. As they were only familiar with fragments he despatched them to discover it. One of them seated himself at the grave of Fergus Mac Róig, who appeared to him in a mist and dictated the whole story to him in three days and three nights.

At this point it will be well to say a few words about the form of the *Táin*. The old Irish epic is invariably in prose with poems of varying length interspersed. The narrative and descriptive portions are in prose and are frequently followed by a brief epitome in verse. Dialogues, eulogies and laments also appear in metrical form. The oldest poems, termed *rhetoric*, which are best represented in LU, seem to be declamatory passages in rhythmical prose, not unlike the poetical passages in the Old Testament, and the original *Táin* may have consisted of such rhetorics bound together with short connecting pieces of prose. At a later date poems were inserted in the metres of the *filid* (particularly the quatrain of four heptasyllabic lines) which Thurneysen and Windisch consider to have been developed out of medieval Latin verse. When in course of time the old rhetorics became unintelligible they were often omitted altogether or new poems substituted. Thus the LL version contains a larger number of poems than the LU-YBL copy, whilst LU preserves a number of rhetorics which do not appear in the later MS. The prose portions in LU are very poor from a literary point of view. These passages are abrupt, condensed and frequently obscure, with no striving after literary effect such as we find in LL. The form in which many episodes are cast is not unlike a mnemonic, leaving the story-teller to fill in the details himself. In the 17th century certain portions of the theme possessing great human interest were vastly extended, new poems were added, and in this manner such episodes come to form sagas complete in themselves. The most notable instance of this is the "Fight with Fer Diad," which is not contained in LU. The genesis of the *Táin* may thus be briefly summarized as follows. The story was first committed to writing in the 7th or 8th century, after which it was worked up by the *filid*. Extended versions existing in the 10th or 11th century form the basis of the copies we now possess.

Though the sagas of the Ulster cycle are eminently Irish and pagan in character and origin, it cannot be denied that traces of foreign influence are to be observed. A number of Latin and Norse loan-words occur in them, and there can be little doubt that the monkish scribes consciously thrust the supernatural element into the background. However, although figures of Vikings are unmistakable in a few cases, and in one story Cúchulinn is made to fight with Hercules, such foreign elements can easily be detected in the older tales. They only affect minor details, and do not influence the body of the romances.

From what we have already said it will be plain that the Irish epic is in a fluid state. The *Táin* is of interest in the history of literature as representing the preliminary stage through which the great verse epics of other nations have had to pass, but its

value as a work of art is limited by its form. We must now say a few words about the character and style of these romances. As already stated, the atmosphere is frankly pagan and barbaric, with none of that courtly element which we find in the Arthurian epics. The two features which strike one most forcibly in the medieval Irish romances are dramatic force and humour. The unexpected and weird is always happening, the effect of which is considerably heightened by the grim nature of the actors. In particular the dialogues are remarkably brilliant and clever, and it is a matter for surprise that this gifted race never developed a drama of its own. This is doubtless partly due to the political conditions of the island. And, moreover, we are constantly struck by the lack of sustained effort which prevented the *fidid* from producing great epics in verse. Dramatic material is abundantly present in the old epics, but it has never been utilized. As one might expect from the vernacular literature of Ireland, these romances are pervaded by a keen sense of humour. We feel that the story-teller is continually expecting a laugh and he exaggerates in true Irish fashion, so that the stories are full of extravagantly grotesque passages. In the later LL version we notice a tendency to linger over pathetic situations, but this is unknown in the earlier stage. Perhaps the most serious defect of all Irish literary products is the lack of any sense of proportion, which naturally goes hand in hand with the love of the grotesque. Far too much attention is paid to trivial incidents and minute descriptions, however valuable the latter may be to the antiquarian, to the detriment of the artistic effect. Further, the story-teller does not know when to stop. He goes meandering on long after the main portion of the story is finished, with the result that Irish romances are apt to end in a most uninteresting anticlimax. Finally we are wearied with a constant repetition of the same epithets and similes, and with turgid descriptions; even the grotesque exaggerations pall when we find them to be stereotyped. But the early epics do not offend our sense of propriety in expression to the same extent as the later Finn cycle.

The *Táin Bó Cuailnge* formed a kind of nucleus round which a number of other tales clustered. A number of these are called *remscéla* or introductory stories to the *Táin*. Such are the "Revealing of the *Táin*" (already mentioned), the "Debility of the Ultonians" (giving the story of the curse), "The Cattle-Driving of Regamon, Dartaid and Flidais," "*Táin bó Regamna*," "The Cattle-Driving of Fraech," "The Dispute of the Swineherds," telling the previous history of the Bulls, "The Capture of the Fairy Mound," "The Dream of Mac óc," the "Adventures of Nera," the "Wooping of Ferb." Other stories form a kind of continuation of the *Táin*. Thus the "Battle of Rosnaree" ("*Cath Ruis na Ríg*") relates how Conchobar, as a result of the loss of the Bull, sends an army against the kings of Leinster and Tara, and would have been routed but for the prowess of Cúchulinn. The "Great Rout of the Plain of Murthemne" and "Cúchulinn's Death" tell how the hero's downfall is compassed by a monstrous brood of ill-shapen beings whose father and brothers had been slain by him during the *Táin*. He finally meets with his end at the hands of Lugaid, son of Curóí mac Daire (the central hero of a Munster cycle which has not come down to us), and Erc, king of Tara. We are also told of the terrible vengeance taken on the murderers by Conall Cernach. Other stories deal with the "Conception of Conchobar," the "Conception of Cúchulinn," "The Glories of Conchobar's Reign," with an account of how he acquired the Throne from Fergus, "The Wooing of Emer and the Hero's Education in Scotland under Scathach," "The Siege of Howth," "Bricriu's Feast and the Exile of the Sons of Doel Dermaid," "The Battle of the Boyne" (*Ériu*, vol. ii.), "The Deaths of Ailill, Medb and Conall Cernach," "Destruction of Bruden Dá Choca," "The Tragical Death of Conlaech at the hands of Cúchulinn his father," "The Deaths of Goll and Garbh," "The Sickbed of Cúchulinn," in which the hero is lured away for a time into the invisible land by a fairy, Fand, wife of Manandán, "The Intoxication of the Ultonians," telling of a wild raid by night across the entire extent of the island from Dún-da-Benn near Coleraíne to the fort of Curóí MacDaire at Temair-Luachra in Kerry, "The Death of

Conchobar," "The Phantom Chariot of Cúchulinn," in which the hero is brought up from the grave to witness before St Patrick and King Loigaire to the truth of the Christian doctrine.

Four other stories in connexion with the Ulster cycle remain to be mentioned. The first is "*Séall mucci Maic Dathó*" ("The Story of MacDathó's Pig"). Various writers of antiquity inform us that at the feasts of the Gauls the champion received the best portion of meat, which frequently led to brawls. In this savage but picturesque Irish story we find the Ulstermen vaunting their achievements against the Connaughtmen, until at last the contest lies between Conall Cernach and Cet MacMagach. Nowhere, perhaps, is the dramatic element better brought out.

Apart from the *Táin* the greatest and at the same time the longest saga in which Cúchulinn figures is *Fled Bricrend* (Bricriu's Feast). Bricriu is the mischief-maker among the Ulstermen, and he conceives the idea of building a banquetting hall in order to invite Conchobar and his nobles to a feast. After much hesitation they consent. Bricriu in turn incites the three chief heroes, Cúchulinn, Conall Cernach and Loigaire Buadach, to claim the champion's portion. He does the same thing with the spouses of the three warriors, who declaim in obscure verse the achievements and excellences of their several husbands in a passage entitled the "Women's War of Words." Loosely attached to this story follows a wild series of adventures in which the powers of the three champions are tested, Cúchulinn always proving his superiority. In order to decide the dispute, visits are paid to Medb at Rath Cruchan and to Curóí in Kerry, and the story ends with the "beheading incident," which occurs in the romance of "Sir Gawayne and the Green Knight." *Fled Bricrend* presents a number of textual difficulties. The text of the oldest MS. (LU.) shows signs of contamination, and several versions of the story seem to have been current.

But the story of the Ulster cycle which is better known than any other, is the story of the "Tragical Death of the Sons of Usnech, or the Life and Death of Deirdre," one of the "Three Sorrows of Story-telling." This is the only tale of the group which has survived in the minds of the common people down to the present day. It is foretold of Deirdre, a girl-child of great beauty, that she will be the cause of great misfortunes, but Conchobar, having lost his wife, determines to have her brought up in solitude and marry her himself. However, the maiden chafes to see a noble youth named Naisi, one of the three sons of Usnech, and persuades him to carry her off to Scotland, where they live for many years. At length they are induced to return after several of the most prominent Ulster warriors have gone bail for their safety. But Conchobar resorts to treachery, and the three sons of Usnech are slain, whilst the account of Deirdre's end varies. The oldest version of the story is found in LL., and the characters are as rugged and unsophisticated as those of the *Táin*. But in the later versions the savage features are toned down.

Before passing on, we must mention several old stories which are independent of the Ulster cycle, but which deal with events which are represented as having taken place before the Christian era. Few of the old romances deal directly with what we may call Irish mythology. The "Battle of Moytura" tells of the tremendous struggle between the Tuatha Dé Danann and their enemies, the Fomorians. Connected with the events of this saga is the story of the "Tragic Deaths of the Sons of Tuirenn," which, though mentioned in Cormac's glossary, is not found in any MS. older than the 18th century. The three sons of Tuirenn have slain Cian, father of Lug Lamhada, who lays upon them a huge eric-fine. They go through terrific ordeals and accomplish their task, but return home to die. This is the second of the "Three Sorrows of Story-telling." An old story dealing with Tuatha Dé Danann personages, but having a certain bearing on the Cúchulinn cycle, is the "Courtship of Étain," who, though of supernatural (*sid*) birth, is wedded to Eochaid Airem, a mortal king. In her previous existence she was the wife of the supernatural personage Midir of Brí-leith, who wins back Étain from her mortal husband in a game of chess and carries her off to his fairy mound.

For sake of completeness we may add the titles of two other

well-known stories here. The one is the "Story of Baile the Sweet-spoken," which tells of the deaths of two lovers for grief at the false tidings of each other's death. The other is the "Fate of the Children of Lir," the third of the "Three Sorrows of Story-telling," which is only known in a modern dress. It relates how the four daughters of Lir (father of the sea-god Manánán and the original of Shakespeare's Lear) were changed into swans by a cruel stepmother, and how, after 900 years of wandering on the ocean, they at length regain their human form through the instrumentality of St Mochoemóg.

A large number of sagas, which claim to be founded on historical events, present a great similarity to the tales of the Ulster cycle. Most of them are mentioned in the old catalogues. We can only name the more important here. The "Destruction of Dind-Rig and Exile of Labraid Loingsch" relates how the kingdom of Leinster was snatched by one brother from another in the 6th century B.C., and how the son of the murdered prince with the aid of a British force sacked Dind-Rig, the fortress of the usurper. The story of the visit of the pigmies to the court of Fergus MacLeite, king of Ulster in the 2nd century B.C., is only contained in a 15th-century MS. This tale is commonly stated to have given Swift the idea of his *Gulliver's Travels to Lilliput*. "Cathréim Chonghail Claringnigh," which only occurs in a modernized 17th-century version, deals with a revolution in the province of Ulster, supposed to have taken place before the Christian era.

The most important Old Irish saga after the *Táin* is beyond doubt the *Destruction of Dá Derga's Hostel*, contained in LU. It deals with events in the reign of the High-King Conaire Mór, who is said by the annalists to have been slain in 43 B.C. after a reign of seventy years. Conaire, who was a descendant of the Étaín mentioned above, was a just ruler, and had banished among other lawless persons his own five foster brothers. These latter devoted themselves to piracy and made common cause with one Ingcel, a son of the king of Britain, who had been outlawed by his father. The high-king was returning from Co. Clare when he found the whole of Meath in flames. He turned aside into Leinster and made for Dá Derga's hostel. The pirates perceive this, and Ingcel is sent to spy out the hostel and discover the size of Conaire's force. This gives the story-teller a chance for one of those lengthy minute descriptions of persons in which his soul delighted. This catalogue occupies one-half of the whole story. The pirates make their attack, and the king and most of his followers are butchered.

We can do no more than enumerate the titles of other historical tales: The "Destruction of the Hostel of MacDareo," describing the insurrection of the Aithech-Tuatha (1st century A.D.), "The Expulsion of the Déisi" and the "Battle of Mag Lemna" (2nd century A.D.), "Battle of Mag Mucrimme" (A.D. 195 or A.D. 218), "Siege of Drom Damgaire" (3rd century), "Adventures of the Sons of Eochaid Muigmedóin, father of Niall Nógiallach" (4th century), "Death of Crimthann" (reigned 366-378), "Death of Dathi" (d. 428), "Death of Murchertach, son of Erc," and "Death of Diarmait, son of Cerball" (6th century) "Wooring of Becfolca, who became the wife of Diarmait, son of Aed Slane" (reigned 657-664), "Battle of Mag Rath" (637), "Battle of Carn Conaill" (c. 648), "Death of Maelflohartag MacRonain" (7th century), who was a kind of Irish Hippolytus, "Battle of Allen" (722).

It will be well to deal here with another class of story in its various stages of development. We have seen that in the older romances there is a close connexion between mortals and supernatural beings. The latter are represented as either inhabiting the *sid* mounds or as dwelling in islands out in the ocean, which are pictured as abodes of bliss and variously called *Mag Mell* (Plain of Delight), *Tír na n-Óc* (Land of Youth) and *Tír Tairngiri* (Land of Promise). The visits of mortals to the Irish Elysium form the subject of three romances which we must now examine. The whole question has been exhaustively dealt with by Kuno Meyer and Alfred Nutt in the *Voyage of Bran* (London, 1895-1897). Conlta Caem, son of Conn Céthachath, was one day seated by his father on the hill of Usnech, when he saw a lady in

strange attire approaching invisible to all but himself. She describes herself as coming from the "land of the living," a place of eternal delight, and invites the prince to return with her. Conn invokes the assistance of his druid to drive away the strange visitor, who in parting throws an apple to Conlta. The young man partakes of no food save his apple, which does not diminish, and he is consumed with longing. At the end of a month the fairy-maiden again makes her appearance. Conlta can hold out no longer. He jumps into the damsel's skiff of glass. They sail away and were seen no more. This is the *Imram* or Adventure of Conlta Caem, the oldest text of which is found in LU. A similar story is entitled *Imram Brain maic Febail*, contained in YBL and Rawlinson B 512 (the end also occurs in LU.), only with this difference that Bran, with twenty-seven companions, puts to sea to discover *tír na mban* (the land of maidens). After spending some time there, one of his comrades is seized with home-sickness. They return, and the home-sick man, on being set ashore, immediately turns to dust. A later story preserved in BL, YBL and the Book of Fermoy, tells of the visit of Cormac, grandson of Conn Céthachath, to Tír Tairngiri. These themes are also worked into tales belonging to the Ossianic cycle, and Finn and Ossian in later times become the typical warriors who achieve the quest of the Land of Youth. The romances we have just mentioned are almost entirely pagan in character, but a kindred class of story shows us how the old ideas were transformed under the influence of Christianity. A typical instance is *Imram curaig Maelduin*, contained in YBL and in part in LU. Maelduin constructs a boat and sets out on a voyage with a large company to discover the murderer of his father. This forms the framework of the story. Numerous islands in the ocean are visited, each containing some great marvel. *Imram na Corra* (Book of Fermoy) and *Imram Snedgusa ocus Mac Riagla* (YBL) contain the same plan, but in this case the voyage is undertaken as an expiation for crime. In the 11th century an unknown monkish writer compiled the *Navigatio S. Brendani*, drawing the material for his episodes from *Imram curaig Maelduin*. This famous work only appears in an Irish dress in a confused and disconnected "Life of St Brendan" in the Book of Lismore. The same MS. contains yet another voyage, the "Adventure of Tadg MacCéin."

We must now turn our attention to the later heroic cycle, commonly called the Fenian or Ossianic. Unfortunately the origin of the stories and poems connected with Finn and his warriors is obscure, and scholars are by no means agreed over the question (see FINN MAC COOL). In the earlier cycle the figures and the age in which they live are sharply drawn, and we can have no hesitation in assuming that the *Táin* represents in the main the state of Ireland at the beginning of the Christian era. Finn and his companions are nebulous personages, and, although it is difficult to discover the actual starting-point of the legend, from the 12th century onwards we are able to trace the development of the saga with some degree of certainty. A remarkably small amount of space is devoted to this cycle in the oldest MSS. Of the 134 pages contained in LU. only half-a-dozen deal with Finn as against 58 with Cúchulinn. In LL the figures are, Ulster cycle 100 pp., Ossianic 25 pp., the latter being mainly made up of short ballads, whilst in 15th-century MSS., such as the Book of Lismore and Laud 610, the proportion is overwhelmingly in favour of the later group. Again in Urard MacCois's list of tales, which seems to go back to the 10th century, only two appear to deal with subjects taken from the Ossianic cycle. In the first instance Finn seems to have been a poet, and as such he appears in the 12th-century MSS., LU. and LL. Thus the subjects of the Ossianic cycle in the earliest MSS. appear in a new dress. The vehicle of the older epic is prose, but the later cycle is clothed in ballad form. Of these ballads about a dozen, apart from poems in the *Dindsenchus* are preserved in LU., LL. and YBL., and none of these poems are probably much older than the 11th century. In the commentary to the *Arena* of Columbkille a beautiful poem on winter is attributed to Finn. At the same time we do find a few prose tales, e.g., "*Fochna cailla*

Fenian or  
Ossianic  
cycle.

*Cascha* " in L.U., describing the death of Cumall, Finn's father, and in L.L. and Rawlinson B 502, part of which Zimmer assigns to the 7th century, we have the first story in which Finn actually occurs. But it is remarkable that in no case do tales belonging to the Finn cycle contain any of the old rhetorics which occur in the oldest of the Ulster romances. Already in L.L., by the side of Finn, Ossian, Cálite and Fergus Finnbel are represented as poets, and the strain of lament over the glories of the past, so characteristic a feature of the later developments of the legend, is already sounded. Hence by the 12th century the stories of the Fiann and their destruction at the battle of Gabra must have been fully developed, and from this time onward they appear gradually to have supplanted the Cúchulinn cycle in popular favour. Several reasons have been assigned for this. In the first place until the time of Brian Boróime the high-kings of Ireland had almost without exception been drawn from Ulster, and consequently the northern traditions were pre-eminent. This exclusiveness on the part of the north was largely broken down by the Viking invasions, and during the 11th century the leading poets were attached to the court of Brian and his descendants. In this manner an opportunity was afforded to the Leinster-Munster Fenian cycle to develop into a national saga. John MacNeill has pointed out Finn's connexion with a Firbolg tribe, and maintains that the Fenian cycle was the property of the subject race. Zimmer has attempted to prove with great plausibility that Finn and his warriors were transformed on the model of the Ulster heroes. Thus one text deals with the boyish exploits of Finn in the manner of Cúchulinn's youthful feats recorded in the *Táin*. And it is possible that the *Siaburcharpat Conchulainn* gave rise to the idea of connecting Ossian and Cálite with Patrick. As Cúchulinn was opposed to the whole of Ireland in the *Táin*, so Finn, representing Ireland, is pitted against the whole world in the *Battle of Ventry*.

We have already stated that the form assumed by the stories connected with Finn in the earliest MSS. is that of the ballad, and this continued down to the 18th century. But here again the Irish poets showed themselves incapable of rising from the ballad to the true epic in verse, and in the 14th century we find the prose narrative of the older cycle interpersed with verse again appearing. The oldest composition of any length which deals with the Ossianic legends is the *Acallam na Senórach* or Colloquy of the Old Men, which is mainly preserved in three 15th-century MSS., the Book of Lismore, Laud 610 and Rawlinson 487. In this text we have the framework common to so much of the later Ossianic literature. Ossian and Cálite are represented as surviving the battle of Gabra and as living on until the time of Patrick. The two warriors get on the best of terms with the saint, and Cálite is his constant companion on his journey through Ireland. Patrick inquires the significance of the names of the places they visit, and Cálite recounts his reminiscences. In this manner we are given nearly a hundred stories, the subjects of some of which occur in the short ballads in older MSS., whilst others appear later as independent tales. A careful comparison of the *Acallam* with the Cúchulinn stories, whether from the point of view of civilization or language or art, discloses that the first lengthy composition of the Ossianic cycle is but a feeble imitation of the older group. All that had become unintelligible in the Ulster stories, owing to their primitive character, is omitted, and in return for that the reminiscences of the Viking age play a very prominent part.

With the 16th century we reach the later treatment of the legend in the *Battle of Ventry*. In this tedious story Daire, the king of the whole world, comes to invade Ireland with all his forces, but is repulsed by Finn and his heroes. The *Battle of Ventry*, like all later stories, is a regular medley of incidents taken from the writers of antiquity and European medieval romance. The inflated style to which the Irishman is so prone is here seen at its worst, and we are treated to a nauseous heaping up of epithet upon epithet, e.g. we sometimes find as many as twenty-seven adjectives accompanying a substantive running in alliterating sets of three.

Of greater literary interest are the later ballads connected with

Finn and Ossian. The latter has become the typical mouthpiece of the departed glory of the Fenian warriors, and Nutt has pointed out that there is a striking difference in spirit between the *Acallam na Senórach* and the 15th-16th century poems. In the latter Ossian is represented as a "pagan, defiant and reckless, full of contempt and scorn for the howling clerics and their churlish low-bred deity," whilst Patrick is a sour and stupid fanatic, harping with wearisome monotony on the damnation of Finn and all his comrades. The earliest collection of these later Ossianic poems is that made in Scotland by James Macgregor, dean of Lismore, early in the 16th century. Another miscellany is the *Duanoire Finn*, a MS. in the Franciscan monastery in Dublin, compiled from earlier MSS. in 1627. This "song-book," which has been edited for the Irish Texts Society by John MacNeill (part I. 1908), contains no less than sixty-nine Ossianic ballads, amounting in all to some ten thousand lines. Other Ossianic poems of dates varying from the 15th to the 18th century have been published in the *Transactions of the Ossianic Society* (Dublin, 1854-1861), including amongst others "The Battle of Gabra," "Lamentation of Oisín (Ossian) after the Fenians," "Dialogue between Oisín and Patrick," "The Battle of Cnoc an Air," and "The Chase of Sliabh Guilleann." These ballads still survive amongst the peasants at the present day. We further possess a number of prose romances, which in their present form date from the 16th to the 18th century; e.g. *The Pursuit of Diarmaid and Gráinne*, *Finn and Gráinne*, *Death of Finn*, *The Clown in the Drab Coat*, *Pursuit of the Gilla Decair*, *The Enchanted Fort of the Quicken-tree*, *The Enchanted Cave of Ceis Corann*, *The Feast in the House of Conan*.

At the present moment it is impossible to give a complete survey of the other branches of medieval Irish literature. The attention of scholars has been largely devoted to the publication of the sagas to the neglect of other portions of the wide field. An excellent survey of the subject is given by K. Meyer, *Die Kultur der Gegenwart*, l. xi. 1. pp. 78-95 (Berlin-Leipzig, 1909).

We have already pointed out that as early as the Old Irish period nameless Irish poets were singing the praises of nature in a strain which sounds to our ears peculiarly modern. At the present time it is difficult to say how much of what is really poetic in Irish literature has come down to us. Our MSS. preserve whole reams of the learned productions of the *fid* which were so much prized in medieval Ireland, but it is, generally speaking, quite an accident if any of the delightful little lyrics entered in the margins or on blank spaces in the MSS. have remained. The prose romances sometimes contain beautiful snatches of verse, such as the descriptions of Mag Mell in *Serglige Conculainn*, *Tochmarc Édáine*, and the *Voyage of Bran* or the *Lament of Cúchulinn over Fer Diad*. Mention has also been made of the exquisite nature poems ascribed to Finn, which have been collected into a pamphlet with English renderings by Kuno Meyer (under the title of "Four Old Irish Songs of Summer and Winter," London, 1903). The same writer points out that the ancient treatise on Irish prosody published by Thurneysen contains no less than 340 quotations from poems, very few of which have been preserved in their entirety. To Meyer we also owe editions of two charming little texts which sufficiently illustrate the lyrical powers of the early poets. The one is a poem referred to the 10th century in the form of a colloquy between Guaire of Aidne and his brother Marban. Guaire inquires of his brother why he prefers to live in a hut in the forest, keeping the herds and swine of the king, to dwelling in the king's palace. The question calls forth so wonderful a description of the delights of nature as viewed from a shieling that Guaire exclaims, "I would give my glorious kingship to be in thy company, Marban" (*King and Hermit*, ed. with trans. by K. Meyer, London, 1901). Another text full of passionate emotion and tender regret ascribed to the 9th century tells of the parting of a young poet and poetess, who after plighting their troth are separated for ever (*Liadain and Curúir*, ed. with trans. by K. Meyer, London, 1902). In the *Old Woman of Beare* (publ. K. Meyer in *Oisín Merseana*) an old hetaira laments her departed youth, comparing her life to the ebbing of the tide (10th century).

We must now step aside from pure literature and turn our attention to the various productions of the professional learned classes of Ireland during the middle ages. The range of subjects coming under this heading is a very wide one, comprising history, genealogies, hagiology, topography, grammar, lexicography and metre, law and medicine. It will perhaps be as well first of all to deal with the learned *filid* whose works have

been preserved. Irish tradition preserves the names of a number of antiquarian poets of prehistoric or early medieval times, such as Amergin, one of the Milesian band of invaders; Moran Roigne, son of Ugainne Mór, Adna and his successor Ferceirtne, Torma (c. 400), tutor to Niall Nógiallach, Dallán Forgaill, Senchán Torpéist, and Cennfaelad (d. 678), but the poems attributed to these writers are of much later date. We can only enumerate the chief of those whose works have been preserved. To Maelmura (d. 887) is attributed a poem on the Milesian migrations. About the same time lived Flanagan, son of Cellach, who wrote a long composition on the deaths of the kings of Ireland, preserved in YBL, and Flann MacLónáin (d. 918), called by the Four Masters the Virgil of Ireland, eight of whose poems have survived, containing in all about 1000 lines. Cormacan, son of Maelbrigde (d. 946), composed a vigorous poem on the circuit of Ireland performed by Muirchertach, son of Niall Glúndub. A poet whose poems are most valuable from an antiquarian point of view is Cinaed Ua h-Artacáin (d. 975). Some 800 lines of his have been preserved in LL and elsewhere. Contemporary with him is Eochaid O'Flainn (d. c. 1003), whose chief work is a long chronological poem giving a list of the kings of Ulster from Cimbaeth down to the destruction of Emain in 331. A little later comes MacLiac (d. 1016), who celebrated in verse the glories of the reign of Brian Boroime. His best-known work is a lament over Kincora, the palace of Brian. Contemporary with MacLiac is MacGilla Coim Urard MacCoisi (d. 1023). To Cúán ua Lothcháin (d. 1024), chief poet in the reign of Maelseachlainn II., are ascribed poems on the antiquities of Tara. Sixteen hundred lines of his have come down to us. A writer who enjoyed a tremendous reputation in medieval Ireland was Flann Mainstrech (d. 1056), who in spite of his being a layman was head of the monastery school at Monasterboice. He is the author of no fewer than 2000 lines in LL, and many other poems of his are contained in other MSS. His best-known work is a *Book of Synchronisms* of the kings of Ireland and those of the ancient world. We have also poems from his pen on the monarchs descended from Niall Nógiallach and on the chronology of the high-kings and provincial kings from the time of Loigaire. Flann's successor, Gilla Coemgin (d. 1072), gives us a chronological poem dealing with the annals of the world down to A.D. 1014. He also is the author of the Irish version of Nennius which contains substantial additions dealing with early Ireland. Minor writers of the same nature whose works have come down to us are Colmán O'Sesnáin (d. 1050), Néide ua Maelchonaire (d. 1136), Gilla na noem ua Duinn (d. 1160), Gilla Moduda O' Cassidy (1143). In the 13th century these historical poems become very rare. In the next century we again find antiquarian poets of whom the best-known is John O'Dugan (d. 1372). His most valuable composition treats of the tribes of the northern half of Ireland at the time of the northern conquest. This work, containing 1660 lines in all in debide metre, was completed by his younger contemporary Gilla na naem O'Huidhir. From the beginning of the 13th century the official poets began to give way to the hereditary bards and families of scribes. Among the chief bardic families we may mention the O'Dalys, the MacWards, the O'Higgins, the MacBrody and the MacDaires. We must here content ourselves with glancing at a few of the more prominent names. Muiredach Albanach (c. 1214-1240), whose real name was O'Daly, has left behind in addition to the religious verses a considerable number of poems in praise of various patrons in Ireland and Scotland. He is said by Skene to be the first of the Macvurrichs, barons to Macdonald of Clanranald. A number of his compositions are preserved in the Book of the Dean of Lismore. Gilla Brigde MacCommidhe was a contemporary of the last-mentioned bard. He

wrote a number of poems in praise of the O'Neills and O'Donnells. We may next mention the name of an abbot of Boyle, Donnchad Mór O'Dálaig (d. 1244), a writer whose extant poems are usually of a religious character. Many of them are addressed to the Virgin. Most of them appear in late MSS., but some few are preserved in the Book of the Hy Maine. Donnchad Mór is said to be the greatest religious poet that Ireland has produced. Many other members of the O'Daly family belonging to the 14th and 15th centuries have left poems behind them, but we cannot mention them here. Angus O'Daly, who lived in the second half of the 16th century, was employed by the English to satirize the chief Gaelic families in Ireland. Two members of the O'Higgin family deserve mention, Tadg mór O'Higgin (d. 1315), and Tadg Óg O'Higgin (d. 1448), a voluminous writer who eulogized the O'Neills, O'Connors and O'Kellys. Tadg Óg also composed a number of religious poems, which enjoyed enormous popularity in both Ireland and Scotland. A *deuasaire* was inserted into YBL., which contains some forty poems by him.

Closely connected with the compositions of the official poets are the works of native topography. Most of the sagas contain a number of explanations of the origins of place-names. The *Dindsenchus* is a compilation of such etymologies. But its chief value consists in the amount of legendary matter it contains adduced in support of the etymologies given. The *Dindsenchus* has come down to us in various forms both in prose and in verse. Irish tradition ascribes it to Amergin MacAmalgaid, who lived in the 6th century, but if the kernel of the work goes back as early as this it must have been altered considerably in the course of the centuries. Both prose and verse forms of it are contained in LL. A kindred compilation is the *Cóir Anmann* (Fitness of Names), which does for personal names what the *Dindsenchus* does for geographical names. We further possess a versified compendium of geography for educational purposes dealing with the three continents, from the pen of Airbertach MacCosse-dobáin (10th century).

No people on the face of the globe have ever been more keenly interested in the past of their native country than the Irish. This will already have been patent from the *History* compositions of the *filid*, and now we may describe briefly the historical works in prose which have come down to us. The latter may be divided into two classes, (1) works containing a connected narrative, (2) annals. Closely allied to these are the sagas dealing with the high-kings. Even in the serious historical compositions we often find the manner of the sagas imitated, e.g. the supernatural plays a prominent part, and we are treated to the same exaggerated descriptions. The earliest of these histories is the wars of the Gael and Gall (*Cogad Gaeidel re Gallaid*), which gives an account of the Viking invasions of Ireland, the career of Brian Boroime and the overthrow of the Norsemen at the battle of Clontarf. This composition, a portion of which is contained in LL, is often supposed to be in part the work of MacLiac, and it is plain from internal evidence that it must have been written by an eye-witness of the battle, or from materials supplied by a person actually present. Numerous shorter tracts dealing with the same period exist, but as yet few of them have been published. *Cúilbreim Cellacháin Coisú* treats of the conflicts between the Vikings and the Irish, and the *Leabhar Oiris* gives an account of Irish history from 979 to 1027. Compilations relating to local history are the Book of Fenagh and the Book of Munster. Another ancient work also partly preserved in LL is the Book of Invasions (*Leabhar Gabhála*). This deals with the five prehistoric invasions of Ireland (see IRELAND: *Early History*) and the legendary history of the Milesians. The most complete copy of the *Leabhar Gabhála* which has been preserved was compiled by Michael O'Clery about 1630. The *Boroma* or History of the Leinster Tribe contained in LL, belongs rather to romance. Another history is the *Triumphs of Turlough O'Brian*, written about the year 1459 by John MacCraith, a Munster historian (edited by S. H. O'Grady. Camb. Press). This inflated composition is an important source of information on Munster history from the landing of the Normans to the middle of the 14th century. We also possess

several documents in Irish concerning the doings of the O'Neills and O'Donnells at the close of the 16th century. A life of Hugh Roe O'Donnell, by Lughaidh O'Clery, has been published, and a contemporary history of the *Flight of the Earls*, by Tadhg O'Ciannan, was being prepared in 1908. But the most celebrated Irish historian is certainly Geoffrey Keating (c. 1570-1646), who is at the same time the greatest master of Irish prose. Keating was a Munster priest educated in France, who drew down upon himself the displeasure of the English authorities and had to go into hiding. He travelled up and down Ireland examining all the ancient records, and compiled a history of Ireland down to the Norman Conquest. His work, entitled *Foras Feasa ar Éirias*, was never published, but it circulated from end to end of Ireland in MS. Keating's history is anything but critical. Its value for the scholar lies in the fact that the author had access to many important sources of information now lost, and has preserved accounts of events independent of and differing from those contained in the Four Masters. In addition to the history and a number of poems, Keating is also the author of two theological works in Irish, the *Defence of the Mass* (*Eochairéigíah an Aisírimh*) and a collection of sermons entitled the *Three Shafts of Death* (*Tri biorghaoilín an Bháis*), which are models of Irish prose.

From the writers of historical narrative we turn to the annalists, the most important sources of information with regard to Irish history. We have already mentioned the *Synchronisms* of Flann Mainistrech. Apart from this work the earliest collection of annals which has come down to us is the compilation by Tigernach O'Braein (d. 1088), abbot of Clonmacnoise. Tigernach, whose work is partly in Latin, partly in Irish, states that all Irish history previous to 305 B.C. is uncertain. No perfect copy is known of this work, but several fragments are in existence. The *Annals of Innisfallen* (a monastery on an island in the Lower Lake of Killarney), which are also in Latin and Irish, were perhaps compiled about 1215, though they may have begun two centuries earlier. The invaluable *Annals of Ulster* were compiled on Belle Isle on Upper Lough Erne by Cathal Maguire (d. 1498), and afterwards continued by two different writers down to 1604. This work, which deals with Irish affairs from A.D. 431, exists in several copies. The *Annals of Loch Cé* (near Boyle in Roscommon) were copied in 1588 and deal with Irish events from 1014 to 1636. The *Annals of Connacht* run from 1224 to 1562. The *Chronicon Scotorum*, one copy of which was transcribed about 1650 by the famous antiquary Duaid MacFírbis, deals with Irish affairs down to 1135. The *Annals of Boyle* extend down to 1253. The *Annals of Clonmacnoise*, which come down to 1408, only exist in an English translation made by Connell MacGeoghegan in 1627. The most important of all these collections is the *Annals of the Four Masters* (so christened by Colgan), compiled in the Franciscan monastery of Donegal by Michael, Conary and Cucogry O'Clery and Ferfesa O'Mulconry. The O'Clerys were for a long period the hereditary ollams to the O'Donnells. Michael O'Clery (1575-1643), the greatest of the four, was a lay brother in the order of St Francis, and devoted his whole life to the history of Ireland. He collected all the historical MSS. he could find, and was encouraged in his undertaking by Fergal O'Gara, prince of Coolavin, who paid all expenses. The great work, which was begun in 1632 and finished in 1636, begins with the arrival in Ireland of Ceasair, granddaughter of Noah, and comes down to 1616. Nearly all the materials from which O'Clery drew his statements are now lost. O'Clery is also the author of a catalogue of the kings of Ireland, the genealogies of the Irish saints, and the Martyrology of Donegal and the Book of Invasions.

Of less interest, but every whit as important, are the lists of genealogies which occupy a great deal of space in LL., YBL. and BB., and two Trinity College, Dublin, MSS. (H. 3. 18 and H. 2. 4). But by far the most important collection of all is that made by the last great shanachie Duaid MacFírbis, compiled between 1650 and 1666 in the college of St Nicholas at Galway. The only portions of any considerable length which have as yet been published deal with two Connacht tribes, viz. the Hy Fíachrach from Duaid mac Fírbis and the Hy Maine (O'Kellys),

and a Munster tribe, the Corcalaidbe, both from YBL. Valuable information with regard to early Irish history is often contained in the prophecies or, as they are sometimes termed, *Baile* (*raptures, visions*), a notable example of which is *Baile in Scáil* (*Vision of the Phantom*).

When we turn from secular to religious themes we find that Ireland is also possessed of a very extensive Christian literature, which is extremely valuable for the comparative study of mediæval literature. Apart from the martyrologies already mentioned in connexion with Oengus the Culdee, a number of lives of saints and other ecclesiastical literature have come down to us. One of the most important documents is the Tripartite Life of St Patrick, which cannot very well have been composed before the 10th or 11th century, as it is full of the extravagant miracles which occur in the later lives of saints. The work consists of three separate homilies, each complete in itself. A later version of the Tripartite Life was printed by Colgan in 1647. The *Leabhar Breac* contains a quantity of religious tracts, most of which have been published. R. Atkinson issued a number of them under the title of *Passions and Homilies from Leabhar Breac* (Dublin, 1887). These are not original Irish compilations, but translations from Latin lives of saints. Nor do they deal with the lives of any Irish saints. Stokes has published nine lives of Irish saints from the Book of Lismore, including Patrick, Brigit, Columba, Brendan, Findian (Clonard), Ciaran, Senan, Findchua and Mochua. They are written in the form of homilies preceded by short explanations of a text of scripture. These lives also occur in the *Leabhar Breac*. Other lives of saints have been published by O'Grady in *Síleba Gáedica*. The longest life of St Columba was compiled in 1536 at the command of Manus O'Donnell. This tedious work is a specimen of hagiology at its worst. The *Leabhar Breac* further contains a number of legends, such as those on the childhood of Christ, and scattered through many MSS. are short anecdotes of saints which are very instructive.

But the most interesting Irish religious text is the *Vision of Adamnan* (preserved in LU.), which Stokes assigns to the 11th century. The soul of Adamnan is represented as leaving his body for a space to visit heaven and hell under the conduct of an angel. The whole treatment of the theme challenges comparison with Dante's great poem, but the Irish composition contains many ideas peculiar to the land of its origin. Later specimens of this kind of literature tend to develop into grotesque huffoonery. We may mention the *Vision of Farsac*, the *Vision of Tundale* (Taugdal), published by V. Friedel and K. Meyer (Paris, 1907), Laisrén's *Vision of Hell* and the *Vision of Merino*. A further vision attributed to Adamnan contains a stern denunciation of the Irish of the 11th century. Another form of religious composition, which was very popular in mediæval Ireland, was the prophecy in verse, but scarcely any specimens have as yet been published. Kuno Meyer edited a tract on the Psalter in his *Hibernica Minora* from a 15th century Oxford MS., but he holds that the text goes back to 750. A number of collections of monastic rules both in prose and verse have been edited in *Ériu*, and the MSS. contain numerous prayers, litanies and religious poems.

In LU. are preserved two sermons, *Sella na esergi* (Tidings of Resurrection) and *Sella Iái bratha* (Tidings of Doomsday); and a number of other homilies have been published, such as the "Two Sorrows of the Kingdom of Heaven," "The Penance of Adam," the "Ever-new Tongue," and one on "Mortals' Sins." All the homilies contained in LB. have been published by R. Atkinson in his *Legends and Homilies from Leabhar Breac* (Dublin, 1887), and E. Hogan, *The Irish Nennius* (Dublin, 1895). The popular "Debate of the Body and the Soul" appears in Ireland in the form of a homily. A collection of maxims and a short moral treatise have been published by K. Meyer.

For the religious literature in general the reader may refer to O'Curry, *Lectures on the MS. Materials of Ancient Irish History* (pp. 339-434), and G. Dottin, "Notes bibliographiques sur l'ancienne littérature chrétienne de l'Irlande," in *Revue d'histoire et de littérature religieuses*, v. 162-167. See also *Revue celtique*, xi. 391-404, id. xv. 79-91.

Here we may perhaps mention an extraordinary production entitled *Aisling Meic Conglinne*, the Vision of Mac Conglinne, found in LB. and ascribed to the twelfth century (ed. K. Meyer, London, 1892). Cathal MacFinguine, king of Munster (d. 737), was possessed by a demon of gluttony and is cured by the recital of a strange vision by a vagrant scholar named MacConglinne. The composition seems to be intended as a satire on the monks, and in particular as a travesty of medieval hagiology. Another famous satire, entitled the Proceedings of the Great Bardic Institution, holds up the professional bards and their extortionate methods to ridicule. This curious work contains the story of how the great epic, the *Táin bó Cuailnge*, was recovered (see *Transactions of the Ossianic Society*, vol. v.).

Collections of pithy sayings in the form of proverbs and maxims must have been made at a very early period. Not the least remarkable are the so-called Triads (publ. K. Meyer, Dublin, 1906), which illustrate every statement with 3 examples. Over 200 such triads were brought together in the 9th century. There are also two documents attributed to 1st-century personages, "The Testament of Morann MacMóin to his son Feradach," which is quoted as early as the 8th century, and "The Instructions of Cúchulinn to his foster-son Lugaid." K. Meyer has published *Tecorca Cormaic* or the Precepts of Cormac MacAirt to his son Cairpre (Dublin, 1909). Other collections such as the *Sembriathra Fíkhail* still await publication.

With that enthusiasm for the classics which is characteristic of the Irish, it is not strange that we should find medieval versions of some of the better-known authors of antiquity.

#### Classical stories.

It is interesting to note that only those works are translated that could be utilized by the professional story-teller. So much so, that in the ancient (10th century) catalogue of sagas enumerated by Urard MacCoisi we find mention of *Togail Troi* and *Scéla Alexandir maic Pílip*. We get descriptions of battle weapons and clothing similar to those occurring in the native sagas. *Togail Troi* is taken from the medieval prose version, *Historia de Excidio Troiae* of Dares Phrygius. The oldest Irish copy is found in LL. This version is exceedingly valuable, as it enables us to determine the meaning of words and formulas in the sagas which are otherwise obscure. An Irish abstract of the *Odyssey*, following an unknown source, and part of the story of Theseus have been published by K. Meyer. *Scéla Alexandir* is preserved in LB. and BB. *Imithechtia Aensius*, taken from the *Aeneid*, is contained in BB. A number of MSS. contain the *Cath Catharda*, a version of books vi. and vii. (?) of Lucan's *Pharsalia*, which has been published by Wh. Stokes. There is further at least one MS. containing a version of Statius's *Thebaid* and of Heliodorus's *Aethiopica*. Somewhat later, the medieval literature of western Europe comes to be represented in translations. Thus we have Irish versions, amongst others of the *Gesta Romanorum*, the *Historia Brittonum*, the Wars of Charlemagne, the History of the Lombards, Sir John Maunde-ville's Travels (trans. by Fingin O'Mahony in 1475), the Book of Ser Marco Polo (abridged), Guy Earl of Warwick, Bevis of Southampton, the Quest of the Holy Grail, Octavian, the chronicle of Turpin, Barlaam and Josaphat, and the story of Fierabras. The Arthurian cycle is developed in independent fashion in the Adventures of the Eagle Boy and the Adventures of the Crop-eared Dog. For translation literature see M. Nettlau, *Revue celtique*, x. pp. 184, 460-461.

Hand in hand with the interest of the medieval Irish scholars in the history of their island goes the cultivation of the native tongue. Owing to the profound changes produced by the working of the Irish laws of accent and initial mutation, it is doubtful if any other language lends itself so well to wild etymological speculation. By the beginning of the Middle Irish period a good part of the cumbersome Old Irish verb-system had become obsolete, and texts which were at all faithfully copied had to be plentifully supplied with glosses. Moreover, if, as is probable, all the historical and legal lore was in verse, a large part of it must have been unintelligible except to those who knew the *berla féne*. But even before this Cormac mac

Cuillennáin, the bishop-king of Cashel (d. 903), had compiled a glossary of archaic words which are accompanied by explanations, etymologies, and illustrative passages containing an amount of invaluable information concerning folk-lore and legendary history. This glossary has come down to us in various recensions all considerably later in date than the original work (the oldest copy is in LB.). Later collections of archaic words are O'Mulconry's Glossary (13th century), the Lecan Glossary (15th century), which draws principally from the glosses in the *Liber Hymnorum*, O'Davoren's Glossary (16th century), drawn principally from the Brehon Laws, a 16th century list of Latin and Irish names of plants employed in medicine, and O'Clery's Glossary (published at Louvain, 1643). BB. contains a curious tract on Ogamic writing. An Irish treatise on grammar, called *Uraicept na n-éces*, the Poet's Primer, traditionally ascribed to Cenafaélad and others, is contained in BB. and YBL. It appears to be a kind of medley of Donatus and the notions of the medieval Irish concerning the origin of their language. The St Gall glosses on Priscian contain Irish terms for all the nomenclature of the Latin grammarians, and show how extensive was the use made of Irish even in this department of learning.

Thurneysen had edited from BB., Laud 610 and a TCD. MS. three treatises on metric which give an account of the countless metres practised by the *filid*. It is impossible for us here to enter into the question of Irish prosody in any great detail. We have seen that there is some reason for believing that the primitive form of Irish verse was a kind of rhythmical alliterative prose as contained in the oldest versions of the sagas. The *filid* early became acquainted with the metres of the Latin church hymns, whence rhyme was introduced into Ireland. (This is the view of Thurneysen and Wiadisch. Others like Zeuss have maintained that rhyme was an invention of the Irish.) In any case the *filid* evolved an intricate system of rhymes for which it is difficult to find a parallel. The medieval metres are called by the general name of *Dán Dírech*, "Direct Metre." Some of the more general principles were as follows. The verses are grouped in stanzas of four lines, each stanza being complete in itself. Each line must contain a fixed number of syllables, whilst the different metres vary as to the employment of internal and end rhyme, assonance and alliteration. The Irish elaborated a peculiar system of consonantal correspondence which counted as rhyme. The consonants were divided with a considerable degree of phonetic accuracy into six groups, so that a voiceless stop (*c*) rhymes with another voiceless stop (*t, p*), a voiced stop (*b*) with another voiced stop (*d, g*), and so forth. The commonest form of verse is the four-line stanza of seven syllables. Such a verse with rhymes *abab* and monosyllabic or dissyllabic finals belongs to the class *rainnigeacht*. A similar stanza with *abab* rhymes is the basis of the so-called *deáide* (cut in two) metres. A peculiarity of the latter is that the rhyming word ending the second line must contain at least one syllable more than the rhyming word which ends the first. Another frequently employed metre is the *rindard*, consisting of lines of six syllables with dissyllabic endings. In the metrical treatises examples are given of some 200 odd metres. The result of the complicated technique evolved in Ireland was an inclination to sacrifice sense to musical harmony. See K. Meyer, *A Primer of Irish Metrics* (Dublin, 1909).

We can conclude this survey of medieval Irish literature by mentioning briefly two departments of learning to which much attention was paid in Ireland. These are law and medicine. The so-called Brehon Laws (g.v.) are represented as having been codified and committed to writing in the time of St Patrick. There is doubtless some grain of truth in this statement, as a fillip may have been given to this codification by the publication of the Theodosian Code, which was speedily followed by the codes of the various Teutonic tribes. The Brehon Laws were no doubt originally transmitted from teacher to pupil in the form of verse, and traces of this are to be found in the texts which have been preserved. But the Laws as we have them do not go back to the 5th century. In our texts isolated phrases or portions of phrases are given with a commentary, and this commentary is further explained by some

later commentators. Kuno Meyer has pointed out that in the commentary to one text, *Crith Gablach*, there are linguistic forms which must go back to the 8th century, and Arbois de Jubainville, who apart from Sir Henry Maine is the only scholar who has dealt with the subject, has attempted to prove from internal evidence that part of the oldest tract, the one on *Athgabail* or *Seizure*, cannot, in its present form, be later than the close of the 6th century. Cormac's Glossary contains a number of quotations from the commentary to *Senchus Mór*, which would therefore seem to have been in existence about 900. The Irish Laws were transcribed by O'Donovan and O'Curry, and have been published with a faulty text and translation in five volumes by the government commissioners originally appointed in 1852. A number of other law tracts must have existed in early times, and several which have been preserved are still unedited. Kuno Meyer has published the *Cáin Adamnáin* or Adamnan's Law from an Oxford MS. Adamnan succeeded in getting a law passed which forbade women to go into battle. An interesting but little-investigated text in prose and verse called *Leabhar na gCeart* or Book of Rights was edited with an English translation by O'Donovan (1847). It deals with the rights to tribute of the high-king and the various provincial kings. The text of the Book of Rights is preserved in YBL and BB. In its present form it shows distinct traces of the influence of the Viking invasions, and cannot go back much beyond the year 1000. At one time it was incorporated in a larger work now lost, the Psalter of Cashel. We also possess a 9th-century treatise on Sunday observance (*Cáin Domnaig*).

The medical profession in Ireland was hereditary in a number of families, such as the O'Lees (from Irish *liaig*, "a leech"), the O'Hickeys (Irish *icid*, "the healer"), the O'Shields, the O'Cassidys, and many others. These families each had their own special leech-books, some of which are still preserved. In addition to these there are many others. The medical literature which has come down to us is contained in MSS. ranging from the 13th to the 18th centuries. The Irish MSS. are translations from the Latin with the invariable commentary, and they further contain additions derived from experience. YBL contains four of these tracts, and amongst others we may mention the Book of the O'Hickeys, a translation of the *Lilium Medicinæ* of Bernard Gordon (written 1303), the Book of the O'Lees (written in 1443), the Book of the O'Shields, transcribed in 1657, and the Book of MacAnlega, transcribed in 1512. Of these texts only two have been published as yet from MSS. in Edinburgh. O'Curry drew up a MS. catalogue of the medical MSS. in the Royal Irish Academy, and many more are described in O'Grady's catalogue of Irish MSS. in the British Museum. Some few MSS. deal with the subject of astronomy, but up to the present no description of the texts has been published.

With the steady advance of the English power after 1600 it was only natural that the school of bardic poets should decline.

But at the beginning of the 17th century for the last time they gave a great display of their resources. Later Irish Literature. Tadhg MacDaire, the ollam of the earl of Thomond,

composed a poem in elaborate verse exalting the line of Eber (represented by the reigning families of Munster) at the expense of the line of Eremón (represented by the reigning families of the other provinces). In a body of verse attributed to Torna Éces (c. 400), but obviously of more recent origin, the Eremonian, Niall Noigiallach, is lavishly praised, and Tadhg's attack takes the form of a refutation of Torna's pretensions. The challenge was immediately taken up by Lughaidh O'Clery. The recriminations of the two bards extend to nearly 3000 lines of verse, and naturally drew down the attention of the whole Irish world of letters. Soon all the hereditary poets were engaged in the conflict, which raged for many years, and the verses of both parties were collected into a volume of about 7000 lines in *debide* metre, known as the *Contention of the Poets*. Amongst the prominent poets of the period may be mentioned Tadhg Dall O'Higinn (d. shortly before 1617) and Eochaidh O'Hussey, who between them have left behind nearly 7000 lines in the classical metres, Bonaventura O'Hussey and Ferfesa O'Cainti.

The intricate classical measures gradually broke down. Dr Douglas Hyde gives it as his opinion that the exceedingly numerous metres known in Middle Irish had become restricted to a couple of dozen, and these nearly all heptasyllabic. Nevertheless they continued to be employed till into the 18th century. However, during the 17th century we find a new school arising with new principles and new methods. These consisted in (1) the adoption of vowel rhyme in place of consonantal rhyme, (2) the adoption of a certain number of accents in each line in place of a certain number of syllables. Thus, according to what we have just said, the accented syllables in a line with four accents in one line will fall on, say, the following vowels *e, u, u, e*, and the line rhyming with it will have the same sounds in the same or a different sequence. (For English imitations see Hyde, *A Literary History of Ireland*, pp. 548 ff.)

The consequences of the changed political conditions were of the greatest importance. The bards, having lost their patrons in the general upheaval, threw behind them the old classical metres and turned to the general public. At the same time they had to abandon the countless chevilles and other characteristics of the old hardic language, which were only understood by the privileged few. But to compensate for this much more freedom of expression and naturalness were possible for the first time in Irish verse. The new metres made their appearance in Ireland about 1600, and the learned Keating himself was one of the first to discard the ancient prosody. During the latter half of the 17th century and throughout the 18th century the body of verse produced in Ireland voices the sorrows and aspirations of the whole nation, and the literary activity in almost every county was correspondingly great. It is only during the last few years that the works of any of the poets of this period have been published. Pierce Ferriter was the last chieftain who held out against Cromwell's army, and he was hanged in 1653. His poems have been edited by P. S. Dinneen (Dublin, 1903). The bard of the Williamite wars was David O'Bruidar (d. 1697-1698). From this period date three powerful satires on the state of affairs in Munster, and in particular on the Cromwellian settlers. They are of a coarse and savage nature, for which reason they have never been printed. Their titles are the Parliament of Clan Thomas, the Adventures of Clan Thomas, and the Adventures of Tadhg Dubh (by Egan O'Rahilly). A description of the parliament of Clan Thomas is given by Stern in the *Zeitschr. f. celt. Phil.* v. pp. 541 ff.

A little later we come across a band of Jacobite poets. The gallant figure of Charles Edward was so popular with Irish bards that a conventional stereotyped form arose in which the poet represents himself as wandering in a wood and meeting a beautiful lady. We are treated to a full description of all her charms, and the poet compares her to all the fair heroines of antiquity. But she replies that she is none of these. She is Erin seeking refuge from the insults of foreign suitors and looking for her mate. The idea of such poems is a beautiful one, but they become tedious when one has read a dozen of them only to find that there are scores of others in exactly the same strain. Besides the *Visions (Aisling)*, as they are termed, there are several noteworthy war-songs, whilst other poems are valuable as giving a picture of the state of the country at the time. We can do no more than mention the names of John O'Neaghtan (d. c. 1720; edition of his poems by A. O'Farrelly, Dublin, 1908), Egan O'Rahilly, who flourished between 1700 and 1720; Tadhg O'Naghten, Andrew MacCurtin (d. 1479), Hugh MacCurtin, author of a grammar and part editor of O'Begley's *Dictionary*; John Clárach MacDonnell (1691-1754), John O'Tuomy (d. 1775), Andrew Magrath, Tadhg Gaolach O'Sullivan (d. c. 1795), author of a well-known volume of religious poems, a valuable source of information for the Munster dialect; and Owen Roe O'Sullivan (d. 1784), the cleverest of the Jacobite poets (his verses and *bons mots* are still well known in Munster). These poets hailed mostly from the south, and it is chiefly the works of the Munster poets that have been preserved. Ulster and Connaught also produced a number of writers, but very little beyond the mere names has been preserved except in the case of the Connaught poet Raftery

(1784-1835), whose compositions have been rescued by Hyde (*Abhráin an Reachtúire*; Dublin, 1903). Torlogh O'Carolan (1670-1738), "the last of the bards," was really a musician. Having become blind he was educated as a harper and won great fame. His poems, which were composed to suit his music, are mostly addressed to patrons or fair ladies. His celebrated "Ode to Whisky" is one of the finest bacchanalian songs in any language. Michael Comyn (b. c. 1688) is well known as the author of a version based upon older matter of "Ossian in the Land of Youth." This appears to be the only bit of deliberate creation in the later Ossianic literature. Comyn also wrote a prose story called "The Adventures of Torlogh, son of Starn, and the Adventures of his Three Sons." Brian MacGiolla Meidhre or Merriman (d. 1808) is the author of perhaps the cleverest sustained poem in the Irish language. His work, which is entitled *The Midnight Court*, contains about 1000 lines with four rhymes in each line. It describes a vision in which Aoihbhail, queen of the Munster fairies, is holding a court. A handsome girl defends herself against an old man, and complains to the queen that in spite of all her charms she is in danger of dying unwed. Merriman's poem, which was written in 1781, has recently been edited with a German translation by L. C. Stern (*Zeitschrift für celtische Philologie*, v. 193-415). Donough MacConmara (Macnamara) (d. c. 1814) is best known as the author of a famous lyric "The Fair Hills of Holy Ireland," but he also wrote a mock epic describing his voyage to America and how the ship was chased by a French cruiser. He is carried off in a dream by the queen of the Munster fairies to Elysium, where, instead of Charon, he finds Conan, the Thersites among the Fenians, acting as ferryman (*Eachtra Ghiolla an Amaráin, or The Adventures of a Luckless Fellow*, edited by T. Flannery, Dublin, 1901).

During the first half of the 19th century nothing new was produced of a high order, though the peasants retained their love for poetry and continued to copy the MSS. in their possession. Then came the famine and the consequent drain of population which gave Irish the death-blow as a living literary force. The modern movement has been dealt with above in the section on Irish language.

It remains for us to glance briefly at the later religious literature and the collections of folk-tales. The translation of the New Testament made by William O'Donnell and published in 1603 was first undertaken in the reign of Queen Elizabeth, who sent over to Dublin the first found of Irish type. Bishop Bedell, one of the very few Protestant clergymen who undertook to learn Irish, translated the remainder of the Scriptures with the help of a couple of natives, but the whole Bible was not translated and published until 1686. This version naturally never became popular, but it is a valuable source of information with regard to Modern Irish. It is perhaps of interest to note that the earliest specimen of printing in Irish is a ballad on Doomsday (Dublin, 1571). A version of the English Prayer Book was published in 1716.

The scholars of the various Irish colleges on the continent were particularly active in the production of manuals of devotion mainly translated from Latin. We can mention only a few of the more important. *Sgáthán an chrábhaidh* (The Mirror of the Pious), published in 1626 by Florence Conry; *Sgáthán sacramente na h-Aithríge* (Mirror of the Sacrament of Penance), by Hugh MacCathmaoíl, published at Louvain, 1618; *The Book of Christian Doctrine*, by Theobald Stapleton (Brussels, 1639); *Páirthis an Anna, or The Paradise of the Soul*, by Anthony Gernon (Louvain, 1645); a book on *Miracles*, by Richard MacGilla Coia (1667); *Lochrán na gceidmheach, or Lucerna Fidelium*, by Francis O'Mulloy (Louvain, 1676); O'Donlevy's *Catechism* (1742). O'Gallagher, bishop of Raphoe, published a collection of sermons which went through twenty editions and are still known at the present day. He is one of the earliest writers in whom the characteristics of the speech of the north are noticeable. The only Catholic version of any considerable portion of the Scriptures up till quite recently was the translation of the Pentateuch by Archbishop MacHale, who also turned six books

of the *Iliad* into Irish. It is only within recent years that attention has been paid to the collection of folk-songs and tales in Irish, although as long ago as 1825 Crofton Croker published three volumes of folk-lore in the south of Ireland which attracted the attention of Sir Walter Scott. Nor do the classic stories of Carleton fall within our province. We may mention among others Patrick O'Leary's *Sgeuluidheacht Chaipe Munnhan* (Dublin, 1895); Hyde's *Beside the Fire* (London, 1890) and *An Sgeuluidhe Gaedhealach*, reprinted from vol. x. of the *Annales de Bretagne* (London, 1901); Daniel O'Foghabarta's *Siamsa an Gheimhridh* (Dublin, 1892); J. Lloyd's *Sgeulaidhe Oirghiall* (Dublin, 1905); and Larminie's *West Irish Folk-Tales* (London, 1893). The most important collections of folk-songs are *Love-Songs of Connaught* (Dublin, 1893) and *Religious Songs of Connaught* (Dublin, 1906), both published by Hyde. The most extensive collection of proverbs is the one entitled *Seánfhocla Uladh* by Henry Morris (Dublin, 1907). See also T. O'Donoghue, *Seán-fhocail na Munnhan* (Dublin, 1902).

**AUTHORITIES.**—In the absence of a comprehensive history, the best manual is Eleanor Hull's *Text Book of Irish Literature* (2 parts, London, 1904-1908; vol. 2 contains a bibliographical appendix). D. Hyde's larger *History of Irish Literature* (London, 1890) is only trustworthy as regards the more modern period. A full bibliography of all published material is contained in G. Dottin's article "La littérature gaélique de l'Irlande" (*Revue de synthèse historique*, vol. iii, pp. 1 ff.). Dottin's article has been translated into English and supplemented by Joseph Dunn under the title of *The Celtic Literature of Ireland* (Washington, 1906, privately printed). The following are important works:—W. Stokes and J. Strachan, *Thesaurus Palaeohibernicus* (2 vols., Cambridge, 1901-1903); J. H. Bernard and R. Atkinson, *Liber Hymnorum* (London, 1895); E. O'Curry, *Lectures on the MS. Materials of Ancient Irish History* (Dublin, 1873) and *Lectures on the Manners and Customs of the Ancient Irish* (3 vols., Dublin, 1873); P. W. Joyce, *A Social History of Ancient Ireland* (2 vols., London, 1903); E. O'Reilly, *Irish Writers* (Dublin, 1820); S. H. O'Grady, *Catalogue of Irish MSS. in the British Museum* (London, 1901); H. d'Arbois de Jubainville, *Introduction à l'étude de la littérature celtique* (Paris, 1883), *Essai d'un catalogue de la littérature épique de l'Irlande* (Paris, 1883), *L'Épopée celtique en Irlande* (Paris, 1892), *La Civilisation des Celtes et celle de l'épopée homérique* (Paris, 1899); E. Windisch, *Tain Bó Cuailgne*, ed. with an introd. and German trans. (Leipzig, 1905); L. Winifred Faraday, *The Celtic-Raid of Cuailgne* (London, 1904); the Irish text according to LU. and YBL. has been published as a supplement to *Ériu*; Eleanor Hull, *The Cuchulinn-saga* (London, 1899); W. Ridgeway, "The Date of the First Shaping of the Cuchulinn Cycle," *Proceedings of the British Academy*, vol. ii. (London, 1907); A. Nutt, *Cuchulinn, the Irish Achilles* (London, 1899); H. Zimmer, "Keltische Beiträge" in *Zeitschrift f. deutsches Altertum*, vols. 32, 33 and 35, and "Über den compilatorischen Charakter der irischen Sagentexte in sogenannten Lebor na hUlaidre," *Kuhn's Zeitschr.* xxviii, pp. 417-689. We cannot here enumerate the numerous heroic texts which have been edited. For texts published before 1883 see d'Arbois's *Catalogue*, and the same writer gives a complete list in *Revue Celtique*, vol. xxvii, pp. 237 ff. The series of *Irish Texts*, vols. i-iv. (Leipzig, 1880-1901), by E. Windisch (vols. ii-iv. in conjunction with W. Stokes), contains a number of important texts. Others, more particularly those belonging to the Ossianic cycle, are to be found in S. H. O'Grady's *Síolta Gaeilce* (2 vols., London, 1892). See also R. Thurneysen, *Sagen aus dem alten Irland* (Berlin, 1901); P. W. Joyce, *Old Celtic Romances* (London, 1901).

For the Ossianic cycle see H. Zimmer, "Keltische Beiträge III." in vol. 35 of the *Zeitschr. f. deutsches Altertum*, also *Göttinger Gelehrte Anzeigen*, 1887, pp. 153-199; A. Nutt, *Ossian and the Ossianic Literature* (London, 1899); L. C. Stern, "Die ossianischen Heldenslieder," in *Zeitschr. f. vergleichende Literaturgeschichte* for 1895, trans. by J. L. Robertson in *Transactions of the Inverness Gaelic Society*, vol. xxii; J. MacNeill, *Duanaire Finn* (London, 1908); *Book of the Dean of Lismore*, ed. by T. MacLachlan (Edinburgh, 1862), and in vol. i. of A. Cameron's *Reliquiae Celticae* (Edinburgh, 1892); *Transactions of the Ossianic Society* (6 vols., Dublin, 1852-1861); Miss Brooke, *Reliques of Ancient Irish Poetry* (Dublin, 1786).

Keating's *History* was translated by John O'Mahony (New York, 1866). The first part was edited with Eng. trans. by W. Halliday (Dublin, 1811) and the whole work in 3 vols. for the Irish Texts Society by D. Comyn and P. Dinneen (London, 1901-1908). Comparatively few specimens have been published of the older bards. Several from a Copenhagen MS. were printed by Stern in the *Zeitschr. f. celt. Phil.* vol. ii.; J. Hardiman, *Irish Minstrelsy* (2 vols., Dublin, 1831); J. C. Mangan, *The Poets and Poetry of Munster* (Dublin, no date); G. Sigerson, *The Bards of the Gael and Gaidh* (Dublin, 1906). Editions of the poems of Ferriar, Geoffrey O'Donoghue, O'Rahilly, John O'Toomey, Andrew Magrath, John Claragh MacDonnell, Tadg Gaolach and Owen Roe O'Sullivan by Dinneen, Gaelic League, Dublin, and Irish Texts Society, London, 1900-1903. (E. C. Q.)

II. SCOTTISH GAELIC LITERATURE.—It is not until after the Forty-five that we find any great manifestation of originality in the literature of the Scottish Highlands. The reasons for this are not far to seek. Just as the dialects of Low German in the middle ages were overshadowed by the more brilliant literary dialect of the south, so Scotch Gaelic was from the outset seriously handicapped by the great activity of the professional literary class in Ireland. We may say that down to the beginning of the 18th century the literary language of the Highlands was the Gaelic of Ireland. During the dark days of the penal laws and with the extinction of the men of letters and their patrons in Ireland, an opportunity was given to the native Scottish muse to develop her powers. Another potent factor also made itself felt. After Culloden the causes of the clan feuds and animosities of the past were removed. The Highlands, perhaps for the first time in history, formed a compact whole and settled down to peace and quietude. A remarkable outburst of literary activity ensued, and the latter half of the 18th century is the period which Scottish writers love to call the golden age of Gaelic poetry. But before we attempt to deal with this period in detail, we must examine the scanty literary products of Gaelic Scotland prior to the 18th century.

The earliest document containing Gaelic matter which Scotland can claim is the *Book of Deer*, now preserved in the Cambridge University Library. This MS. contains portions of the Gospels in Latin written in an Irish hand with illuminations of the well-known Irish type. At the end there occurs a colophon in Irish which is certainly as old as the 9th century. Inserted in the margins and blank spaces are later notes and memoranda partly in Latin, partly in Gaelic. The Gaelic entries were probably made between 1000 and 1150. They relate to grants of land and other privileges made from time to time to the monastery of Deer (Aberdeenshire). The most interesting portion deals with the legend of Deer and its traditional foundation by St Columba. The language of these entries shows a striking departure from the traditional orthography employed in contemporary Irish documents. The Advocates' Library in Edinburgh contains a number of MSS. probably written in Scotland between 1400 and 1600, but with one exception the language is Irish.

The solitary exception just mentioned is the famous codex known as the *Book of the Dean of Lismore*. The pieces contained in this volume are written in the crabbed current Roman hand of the period, and the orthography is phonetic, both of which facts render the deciphering of this valuable MS. a task of supreme difficulty. The contents of this quarto volume of 311 pages are almost entirely verse compositions collected and written down by Sir James Macgregor, dean of Lismore in Argyllshire, and his brother Duncan, between the years 1512 and 1526. A disproportionate amount of space is allotted to the compositions of well-known Irish bards such as Donnchadh Mór O'Daly (d. 1244), Muireadhach Albanach (c. 1224), Tadhg Óg O'Higgins (d. 1448), Diarmaid O'Hifernan, Torna O'Mulconry (d. 1468). But native bards are also represented. We can mention Allan Mac Rorie, Gillie Calum Mac an Ollav, John of Knoydart, who celebrates the murder of the young lord of the isles by his Irish harper in 1490, Finlay MacNab, and Duncan Macgregor, the transcriber of the greater part of the volume. The poems of the last-mentioned writer are in praise of the Macgregors. A few other poems are by Scottish authors such as Campbell, Knight of Glenorchy (d. 1513), the earl of Argyll and Countess Isabella. A number consist of satires on women. These Scottish writers are still under the influence of Irish metric, and regularly employ the four-lined stanza. They do not appear to adhere to the stricter Irish measure, but delight rather in the freer forms going by the name of *óglachas*. The Irish rules for alliteration and rhyme are not rigidly observed.

The linguistic peculiarities of the Dean's Book await investigation, but among the pieces which represent the Scottish vernacular of the day are the *Ossianic Ballads*. These, twenty-eight in number, extend to upwards of 2500 lines, and form by far

the most important part of the collection. Thus the Dean's Book was compiled a full hundred years before the earliest similar collection of heroic ballads was made in Ireland. In Scotland the term Ossianic is used loosely of both the Ulster and the Fenian cycles, and it may be as well to state that three of the pieces in the volume deal with Fraoch, Conlaoh and the Bloody Rout of Conall Cearnach. It is interesting to note that nine of the poems are directly attributed to Ossian, two to Fergus File, one to Caoilte Mac Ronan, and one to Conall Cearnach, whilst others are ascribed to Allan MacRorie, Gillie Calum Mac an Ollav and Caoch O'Cluain, who are otherwise unknown. The Dean's Book was first transcribed by Ewen MacLachlan in 1813. Thomas MacLauchlan published the text of the Ossianic ballads with modern Gaelic and English renderings in 1862. In the same volume W. F. Skene gave a useful description of the MS. and its contents. Alexander Cameron revised the text of the portion printed by MacLauchlan, and his amended text is printed in his *Reliquiae Celticae*, vol. i. (See also L. C. Stern, *Zeitschr. f. celt. Phil.* i. 294-326.)

Between the Book of the Dean and the Forty-five we find another great gap, which is only bridged over by a collection which presents many points of resemblance to Macgregor's compilation. The *Book of Fernaig*, which is also written in a kind of phonetic script, was compiled by Duncan Macrae of Inverinate between 1688 and 1693. The MS. contains about 4200 lines of verse of different dates and by different authors. The contents of the collection are mainly political and religious, with a few poems which are termed didactic. As in the Dean's Book love-songs and drinking-songs are conspicuously absent, whilst the religious poetry forms about one-half of the contents. In state politics the authors are Jacobite, and in church politics Episcopalian. The Ossianic literature is represented by 36 lines. There are a number of poems by 16th-century writers, among whom is Bishop Carswell. Mackinnon has pointed out that the language of the *Book of Fernaig* corresponds exactly to the dialect spoken in Kintail at the present day. The text of the *Book of Fernaig* is printed in its entirety in vol. ii. of Cameron's *Reliquiae Celticae*, and many of the poems are to be found in standard orthography in G. Henderson's *Leabhar nan Gleann*. The metres employed in the poems show the influence of the English system of versification. (See Stern, *Zeitschr. f. celt. Phil.* ii. pp. 566 ff.)

Two other Highland MSS. need to be noticed. These are the *Red and Black Books of Clanranald*, which are largely taken up with the histories of the families of Macdonald and with the achievements of Montrose, written in the ordinary Irish of the period by the Macvurichs, hereditary bards to the Clanranald chiefs. The *Red Book* was obtained by Macpherson in 1760 from Neil Macvurich, nephew of the last great bard, and it figured largely in the Ossianic controversy. In addition to poems in Irish by Neil Macvurich, who died at a great age some time after 1715, and other bardic matter, the MSS. now contain only three Ossianic poems, and these are in Irish. During the Ossianic controversy the *Red Book of Clanranald* was supposed to contain the originals of much of Macpherson's famous work; but, on the book coming into the hands of the enthusiastic Gaels of the closing years of the 18th century, and on its contents being examined and found wanting, the MS. was tampered with.

Mackenzie's *Beauties of Gaelic Poetry* contains poems written by a number of writers who flourished towards the end of the 17th century and at the beginning of the 18th. These are Mary Macleod, John Macdonald (Iain Lom), Archibald Macdonald, Dorothy Brown, Cicely Macdonald, Iain Dubh Iain 'Ic. Ailein (b. c. 1665), the Aodan Matheson (one of his poems was rendered in English by Sir Walter Scott under the title of "Farewell to Mackenzie, High Chief of Kintail"), Hector Maclean (also known through a translation by Scott called "Warsong of Lachlan, High Chief of Maclean"), Lachlan Mackinnon, Roderick Morrison (an Clarsair Dall), and John Mackay of Gairloch, but we can here only notice the first two. The famous Mary Macleod, better known as Mairi Nighean Alastair Ruaidh

"Book of Fernaig."

"Book of Deer."

"Book of the Dean of Lismore."

"Red and Black Books of Clanranald."

Mary Macleod.

(c. 1588-1693), was family hard to Sir Norman Macleod of Bernera, and later to John "Breac" Macleod of Macleod, in honour of whom most of her poems were composed. Like very many of the Highland poets Mary had little or no education, and it would seem that none of the poems which have come down to us were composed before 1660. Her pieces are composed in the modern Irish metres with the characteristic vowel rhymes of the accented syllables. As might perhaps be expected it was only the Macvurichs (the professional bards of the Clanranald) who went on practising the classical *deòide* metre. This they still continued to do during the first quarter of the 18th century. Mary Macleod's best-known pieces comprise a dirge on the drowning of Iain Garbh (Mac'Ille Chalum) in the Minch, a song "An Talla 'm hu ghnath le MacLeoid," and an ode to Sir Norman Macleod of Bernera, produced during her exile in Mull, which begins "S mi'mshuidhe air an tulaich." For the details of her career, which are the subject of some dispute, the reader may be referred to a paper by Alexander Mackenzie in the *Transactions of the Gaelic Society of Inverness*, vol. xxii. pp. 43-66. Mary Macleod is accounted one of the most musical and original of the Highland bards.

John Macdonald, better known as Iain Lom (d. c. 1710), was a vigorous political poet whose verses exercised an extraordinary influence during his lifetime. He is said to have received a yearly pension from Charles II. for his services to the Stuart cause. His best-known poems are *Mori na Ceapach*, on the murder of the heir of Keppoch, who was eventually avenged through the poet's efforts, and a piece on the battle of Inverlochay (1645). However great the inspiration of Mary Macleod and Iain Lom, they were after all but political or family bards. In succession to them there arose a small band of men with loftier thoughts, a wider outlook and greater art. The literature of the Scottish Highlands culminates in the names of Alexander Macdonald, Duncan Bàn MacIntyre and Dugald Buchanan.

Alexander Macdonald, commonly called Alasdair MacMaignistir Alasdair (h. c. 1700), was the son of an Episcopalian clergyman in Moidart. He was sent to Glasgow University to fit himself for a professional career. But an imprudent marriage caused him to abandon his studies, and about 1729 he received an appointment as a Presbyterian teacher in his native district. He was moved from place to place, and from 1739 to 1745 he taught at Corryvullin on the Sound of Mull, the scene of some of his most beautiful lyrics. About 1740 he was invited to compile a Gaelic vocabulary, which was published in 1741. Macdonald has thus the double distinction of being the author of the first book printed in Scotch Gaelic and of being the father of Highland lexicography. The news of the landing of the Pretender brought visions of release to the poverty-stricken poet, who was by this time heartily sick of teaching and farming. He turned Roman Catholic, and was present at the unfurling of the Stuart standard. He was given the rank of captain, but rendered greater services to the Jacobite cause with his stirring poems than with the sword. After Culloden he suffered great privations. But in 1751 he visited Edinburgh and brought out a collection of his poetry, which has the honour of being the first original work printed in Scotch Gaelic. His volume was therefore entitled *Ais-eiridh na Seann Chanain Albannaich* (Resurrection of the Ancient Scottish Tongue). Till the day of his death he led a more or less wandering life, as he was dependent on the generosity of Clanranald. Only a small part of Macdonald's compositions have been preserved (thirty-one in all). These naturally fall into three groups—love-songs, descriptive poems and patriotic and Jacobite poems. In his love-songs and descriptive poems Macdonald struck an entirely new note in Gaelic literature. His *Moladh Mòraig* and *Cuachag an Fhàsaich* (also called *A' Bhanarach Dhonn*) are his best-known compositions in the amatory style. But he is distinctly at his best in the descriptive poems. We have already seen that even as early as the 8th century the poets of Ireland gave expression to that intimate love of nature which is perhaps the most striking feature in Celtic verse. Macdonald had a wonderful command of his native Gaelic. His verse is always

musical, and his skillful use of epithet, often very lavishly strewn, enables him to express with marvellous effect the various aspects of nature in her gentler and sterner moods alike. His masterpiece, the *Birlinn of Clanranald*, which is at the same time, apart from Ossianic ballads, the longest poem in the language, describes a voyage from South Uist to Carrickfergus. Here Macdonald excels in describing the movement of the ship and the fury of the storm. In *All an t-Siucair* (The Sugar Brook) we are given an exquisite picture of a beautiful scene in the country on a summer morning. Other similar poems full of melody and colour are *Faille na Mòr-thir* (Hail to the Mainland), *Oran an t-Samhradh* (Ode to Summer), and *Oran an Gheamhradh* (Ode to Winter). When this gifted son of the muses identified himself with the Stuart cause he poured forth a stream of inspiring songs which have earned for him the title of the Tyrtæus of the Rebellion. Among these we may mention *Oran nam Fineachan Gedoh* (The Song of the Clans), *Brosnachadh nam Fineachan gaib-ealach* (A Call to the Highland Clans), and various songs to the prince. But incomparably the finest of all is *Oran Luaisge na Fucaidh* (Waulking Song). Here the prince is addressed as a young girl with flowing locks of yellow hair on her shoulders, and called Morag. She had gone away over the seas, and the poet invokes her to return with a party of maidens (*i.e.* soldiers) to dress the red cloth, in other words, to beat the English red-coats. The song contains forty-seven stanzas in all, with the characteristic refrain of the waulking-songs. *Am Breacan Uallach* is a spirited poem in praise of the kilt and plaid, which had been forbidden by the English government. Macdonald is also the author of a number of poems in MS. which have been called the quintessence of indecency. His works have gone through eight editions, the last of which is dated 1892.

In connexion with Macdonald's Jacobite songs it will be well to mention here the name of a kindred spirit, John Roy Stuart (Iain Ruadh Stiubhart). Stuart was a gallant soldier who was serving in Flanders with the French against the English when the rebellion broke out. He hurried home and distinguished himself on the field of battle. After Culloden he gave vent to his dejection in two pathetic songs, one on the battle itself, while the other deals with the sad lot of the Gael.

The only poet of nature who can claim to rival Macdonald is a man of a totally different stamp. Duncan Bàn MacIntyre (Donnachadh Bàn, 1724-1812) was born of poor parents in Glenorchy, and never learned to read and write or to speak English. He was present on the English side at the battle of Falkirk, on which he wrote a famous ode, and shortly afterwards he was appointed gamekeeper to the earl of Breadalbane in Coire Cheathaich and Ben Dorain, where he lived for many years until he accepted a similar appointment from the duke of Argyll in Buachail-Eite. Stewart of Luss is credited with having taken down the 6000 lines of verse of his own composition which MacIntyre had carried about with him for many years, and his works were published in 1768. In his later years he was first a volunteer and afterwards a member of the city guard in Edinburgh. In addition to his poems descriptive of nature MacIntyre composed a number of Jacobite martial songs, songs of love and sentiment, and comic and satiric pieces. The poem *Mairi bhàn òg* addressed to his wife is, on account of its grace and delicate sentiment, generally held to be the finest love-song in the language. But it is above all as the poet of ben and corrie that MacIntyre is remembered. He has been called the Burns of the Highlands, but the bitterness and intellectual power of the Ayrshire poet are absent in MacIntyre. Duncan Bàn describes fondly and tenderly the glories of his native mountains as only one who can spend his life in daily communion with them. His two great compositions are styled *Ben Dorain* and *Coire Cheathaich*. The former is a long poem of 550 lines divided into eight parts, alternating with a sort of strophe and antistrophe, one slow called *ular* in stately trochees, the other swift called *siubhal* in a kind of galloping anapaests; the whole ending with the *cruilath* or final quick motion. It is said to follow very accurately the lilt of a pipe-tune. The poem, which might be called the "Song of the Deer," has been well

doe into English by J. S. Blackie. *Coire Cheathaich* (The Misty Corrie), a much shorter poem than Ben Dorain, gives a loving description of all the prominent features in the landscape—the fowers, the bushes, the stones, the hillocks with the birds and the game, and the whirling eddies with the glistening salmon. MacLartyre's works went through three editions in his lifetime, and a twelfth was issued in 1901.

From Duncan Bàn we pass on to consider the compositions of two men who hailed from the outlying parts of Gaeldom. Robert Mackay, or, as he is generally called, Rob Donn (1714-1778), was a native of Strathmore, Sutherlandshire, who, like Duncan Bàn, never learned to read or write. His life, which was uneventful, was spent almost entirely within the confines of the county of his birth. He left behind a large number of poems which may be roughly classified as elegiac, love and satiric poems. His elegies are of the typical Highland kind. The singer is overwhelmed with sadness and despairing in his loss. His best-known composition in this style is "The Death-Song of Hugh." Having just heard of the death of Pelham, the prime minister, Mackay finds a poor friend of his dying alone amid squalor in the heart of the mountains. In a poem composed on the spot the poet contrasts the positions of the two men and reflects on the vanity of human existence. Among his love-poems the "Shieling Song" is deservedly famous. But it was above all as a satirist that Mackay excelled during his lifetime. Indeed he seems to have had the sharpest tongue of all the Highland bards. We have already seen what powers were attributed to satirical poets in Ireland in mediæval times, and though bodily disfigurements were no longer feared in the 18th century, nothing was more dreaded, both in Ireland and Scotland, than the lash of the bard. Hence many of Rob Donn's compositions have lost their point, and opinions have been greatly divided as to his merits as a poet. His collected poems were first published in 1829, a second edition appeared in 1871, and in 1899 two new editions were issued simultaneously, the one by Hew Morrison, the other by Adam Gunn and Malcolm Macfarlane. Another satirical poet who enjoyed a tremendous reputation in his own day was John MacCodrum, a native of North Uist and a contemporary of the men just mentioned. It is related of MacCodrum that the tailors of the Long Island refused to make any clothes for him in consequence of a satire he had directed against them. He was encountered in a ragged state by the Macdonald, who on learning the cause of his sorry condition promoted him to the dignity of bard to his family. Consequently a number of his compositions are addressed to his patrons, but one delightful poem entitled *Smebrach Chlann-Domhnaill* (The Mavis of Clan Donald) describes in verses full of melody the beauties of his beloved island home.

In the lyrical outburst which followed the Forty-five it was only to be expected that religious poetry should be represented. We have seen that much of the space in the Dean's Book and in the *Book of Fernaig* is allotted to verse of a pious order, though apart from the works of such Irish singers as Donnchadh O'Daly the poems do not reach a very high pitch of excellence. The first religious poem to be printed in Scotch Gaelic was a long hymn by David Mackellar, published in 1752. But incomparably the greatest writer of hymns and sacred poems is Dugald Buchanan (1716-1768). Buchanan was born in Strathyre in Perthshire and was the son of a miller. He received a desultory kind of education and tried his hand at various trades. In 1753 he was appointed schoolmaster at Drumcastle near Kinloch Rannoch.

He was selected to assist Stewart of Killin in preparing the first Highland version of the New Testament for the Society for Propagating Christian Knowledge (published 1767), and at the same time he issued an edition of his own poems. Of all Gaelic books this has been far and away the most popular, having gone through no less than forty editions. Buchanan seems to have been very susceptible to religious influences, and the stern Puritan doctrines of retribution and eternal damnation preached around him so worked on his mind that from his ninth to his

twenty-sixth year he was a prey to that mental anguish so eloquently described by Bunyan. The awful visions which presented themselves to his vivid imagination find expression in his poems, the most notable of which are "The Majesty of God," "The Dream," "The Sufferings of Christ," "The Day of Judgment," "The Hero," "The Skull," "Winter" and "Prayer." In the "Day of Judgment," a poem of about 120 stanzas, we are given in sublime verses a vivid delineation of the crack of doom as the archangel sounds the last trumpet. The poet then goes on to depict the awful scenes consequent upon the wreck of the elements, and pictures the gathering together of the whole human race before the Throne. But Buchanan's masterpiece is admittedly "The Skull." Traces of the influence of English writers have been observed in all the poet's writings, and it seems certain that the subject of his greatest poem was suggested by Shakespeare. The poet seated by a grave espies a skull. He takes it up and muses on its history. This poem in 44 stanzas concludes with a picture of the torments of hell and the glories of heaven.

The writers whom we have been discussing are practically unknown save to those who are able to read them in the original. Now we have to turn our attention to a man whose works have never been popular in the Highlands, but who nevertheless plays a prominent part in the history of European literature. Though the precise origin of the Fenian cycle may remain a moot-point to all time, the development of the literature centring in the names of Finn and Ossian is at any rate clear from the 11th century onwards. The interest taken in Celtic studies since the middle of the 19th century in Ireland and Scotland and elsewhere has accumulated a body of evidence which has settled for all time the celebrated dispute as to the authenticity of Macpherson's Ossian. James Macpherson (1736-1796), a native of Kingussie, showed a turn for versification whilst yet a student at college. Whilst acting as tutor at Moffat he was asked by John Home as to the existence of ancient Gaelic literature in the Highlands. After some pressing Macpherson undertook to translate some of the more striking poems, and submitted to Home a rendering of "The Death of Oscar." Blair, Ferguson and Robertson, the foremost men in the Edinburgh literary circles of the day, were enthusiastic about the unearthing of such unsuspected treasures, and at their instance Macpherson published anonymously in 1760 his *Fragments of Ancient Poetry, collected in the Highlands of Scotland and translated from the Gaelic or Erse Language*. This publication contained in all fifteen translations, preceded by a preface from the pen of Blair. Published under such auspices, Macpherson's venture was bound to succeed. In the preface it was stated that among other ancient poems an epic of considerable length existed in Gaelic, and that if sufficient encouragement were forthcoming the author of the versions would undertake to recover and translate the same. A subscription was raised at once, and Macpherson set out on a journey of exploration in the Highlands and islands. As the result of this tour, on which he was accompanied by two or three competent Gaelic scholars, Macpherson published in London in 1762 a large quarto containing his epic styled *Fingal* with fifteen other smaller poems. In the following year a still larger epic appeared with the title of *Temora*. It was in eight books, and contained a number of notes in addition to *Cath-Loda* and other pieces, along with the seventh book of *Temora* in Gaelic as a specimen of the original. Ten years later a new edition of the whole was issued. The authenticity of Macpherson's translations was soon impugned by Dr Johnson, Hume and Malcolm Laing, and the author was urged by his friends to publish the originals. Macpherson prevaricated, even though the Highlanders of India sent him a cheque for £1000 to enable him to vindicate the antiquity of their native literature. Macpherson at different times, and particularly towards the end of his life, seems to have had some intention of publishing the Gaelic of his Ossian, but he was naturally deterred by the feeling that his knowledge of Gaelic was becoming shakier with his continued absence from the Highlands. At any rate he left behind a quantity of Gaelic matter in MS. which was ultimately

published by the Highland Society of London in 1807. This MS., however, was revised and transcribed by Ross and afterwards destroyed, so that we are ignorant of its nature. The Highland Society also instituted an inquiry into the whole question, but their conclusions were somewhat negative. They succeeded in establishing that the characters introduced by Macpherson were familiar in the Highlands and that Ossianic ballads really existed, which Macpherson had utilized. Macpherson's claims still found ardent advocates, such as Clark, in the 'seventies, but the question was finally disposed of in papers by Alexander Machain (1885) and L. C. Stern (1895). We can here only summarize briefly the main lines of argument. (1) Macpherson's Ossian is full of reminiscences of Homer, Milton and the Hebrew prophets. (2) He confuses the Ulster and the Fenian heroic cycles in unpardonable fashion. (3) The Gaelic text of 1807 only represents one-half of the English versions (11 poems out of 22 poems). Some Gaelic fragments from different pens appeared prior to 1807, but these differ considerably from the "official" version. (4) In the Gaelic text of 1807 the version of the passage from *Temora* is quite different from that published in 1763. (5) Macpherson's Gaelic is full of offences against idiom and un-naturally strained language. (6) The names Morven and Selma are entirely of his own invention (see also MACPHERSON, JAMES). As a result of the stir caused by Macpherson's work a number of men set about collecting the genuine popular literature of the Highlands. A few years before the appearance of *Fingal*, Jeremy Stone, a schoolmaster at Dunkeld, had collected ten Ossianic ballads and published one of them in an English versified translation. For this collection see a paper by D. Mackinnon in the *Transactions of the Gaelic Society of Inverness*, vol. xiv. pp. 314 ff. Unfortunately other persons were led to follow Macpherson's example. The chief of these imitators were (1) John Clark, who in 1778 published, along with several others, an English poem *Mordubh*, later translated into Gaelic by Gillies; (2) R. Macdonald, son of Alexander Macdonald, who is the author of *The Wish of the Aged Bard*; (3) John Smith of Campbeltown (d. 1807), author of fourteen Ossianic poems, styled *Seandàna*, published in English in 1780 and in Gaelic in 1787; (4) D. MacCallum of Arisaig, who in 1821 published *Collath* and a complete *Mordubh* "by an ancient bard Fonar."

We have now reviewed in turn the greatest writers of the Scottish Highlands. The men we have dealt with created a kind of tradition which others have attempted to carry on.

**Later poets.**  
Ewen MacIachlan (1775-1822), the first transcriber of the Dean's Book, was assistant librarian of King's College and rector of the grammar school of Aberdeen. Amongst other things he translated the greater part of seven books of Homer's *Iliad* into Gaelic heroic verse, and he also had a large share in the compilation of the Gaelic-English part of the Highland Society's *Dictionary*. A number of Gaelic poems were published by him in 1816. These consist of poems of nature, e.g. *Dàin nan Aimsirean*, *Dàn mu chonalltradh*, *Smeòrach Chloinn-Lachunn*, and of a well-known love-song, the *Ealaidh Ghaoil*. William Ross (1762-1790), a schoolmaster at Galloch, is the typical Highland poet of the tender passion, and he is commonly represented as having gone to an early grave in consequence of unrequited affection. His finest compositions are *Feargar Luain* and *Moladh na h-òighe Gaelich*. Another exquisite song *Cuachag nan Craobh*, is usually attributed to this poet, but it seems to go back to the beginning of the 18th century. A fifth edition of Ross's poems appeared in 1902. The most popular writer of sacred poems after Buchanan is undoubtedly Peter Grant, a Baptist minister in Strathspey, whose *Dàin Spioradail* (first published in 1809) reached a twentieth edition in 1904. Sweetness, grace and simplicity are the characteristics which have endeared him to the heart of the Gael. Two other well-known hymn-writers spent their lives in Nova Scotia—James Macgregor (1750-1830) and John Maclean, a native of Tiree. The compositions of the latter have been published under the title *Clarsach na Coille* (Glasgow, 1881). But John Morrison (1790-1852), the poet-blacksmith of Rodel, Harris, is the most worthy of the name of successor to Buchanan. His works have

been carefully edited in two volumes by George Henderson (2nd edition, 1896). His poems are remarkably musical and imaginative. Two of the most characteristic are *An Iondruinn* and *The duin' òg agus seann duin' agam*. William Livingston or MacDhunleibhe (1808-1870) was a native of Islay. He received scarcely any education, and was apprenticed as a tailor, but he early made his way to the mainland. He was ever a fierce Anglophobe, and did his best to make up for the deficiencies of his early training. He published in English a *Vindication of the Celtic Character*, and attempted to issue a *History of Scotland* in parts. His poems, which have been at least twice published (1858, 1882), are equally powerful in the expression of ruthless fierceness and tearful sorrow. In *Fios thàn a' Bhaird* he sings pathetically of the passing of the older order in Islay, and another powerful poem entitled *Duan Geall* deals with the campaign of the Highlanders under Sir Colin Campbell in the Crimea. Livingston's contemporary, Evan Maccoll (1808-1898), the son of a small farmer on Lochfyneside, in his early years devoured eagerly all the English literature and Gaelic lore that came in his way. In 1836 he issued a volume of songs called the *Monaidh Minstrèl*, containing his productions in Gaelic and English. Two years later two volumes appeared, one entirely in Gaelic, styled *Clarsach nam Beann*, the other in English under the old title. A third edition of the Gaelic collection was published in 1886. Maccoll acted for many years as clerk in the customhouse at Liverpool, and afterwards he filled a similar post at Kingston, Canada. He has been called the Moore of Highland song. His spirit is altogether modern, and his poems are much nearer the Lowland type than those of the older bards. Among his best-known pieces are *Bàs Mairi* and *Duanag Ghaoil*. We can do no more than mention the names of John MacIachlan of Raboy (1804-1874), James Munro (1794-1870), well known as a grammarian, Dugald Macphail (b. 1818), Mrs Mary Macpherson, Angus Macdonald (1804-1874), Mrs Mary Mackellar (1834-1890) and Neil Macleod (b. 1843), author of a popular collection *Clarsach an Doire* (1st ed., 1883; 3rd ed., 1904). Neil Macleod is also the writer of the popular song *An Gleann 's an robh mi ig*. Others whom we cannot mention here are known as the authors of one or more songs which have become popular. It is natural to compare the state of affairs at the beginning of the 20th century with that obtaining in 1800. In the dawn of the 19th century every district in the Highlands had its native poet, whilst a century later not a single Gaelic bard of known reputation existed anywhere within its borders. It is only too evident that the new writers prefer English to Gaelic as a medium of literature, partly because they know it better, but also because in it they appeal to a far wider public.

It will have been observed that we have said nothing about prose works written in Gaelic. Original Gaelic prose is conspicuous by its absence. The first printed work is the translation of Knox's *Liturgy* by Bishop Carswell, published in 1567 (reprinted in 1873). Calvin's Catechism is said to have been issued in 1631. The Psalms and Shorter Catechism appeared in 1659, while two other psalters saw the light before the end of the century, one by Kirke (1684), the other issued by the Synod of Argyll (1694). The language of all these publications may, however, be termed Irish. Apart from reprints of the catechism and psalter, the only other Gaelic matter which appeared in print before 1750 were Kirke's Irish version of the Bible in Roman type with a vocabulary (1690), and the *Vocabulary* by Alexander Macdonald (1741). But from the middle of the 18th century translations of the works of English religious writers streamed from the various presses. Alleine, Baxter, Boston, Bunyan, Doddridge and Jonathan Edwards were all prime favourites, and their works have gone through many editions. Apart from a well-meant but wholly inadequate version of Schiller's *Tell*, the only non-religious work which can be termed literature existing in a Gaelic translation is a portion of the *Arabian Nights*, though fragments of other classics such as Lamb's *Tales from Shakespeare* have appeared in magazines. The one-sided character of Gaelic literature, in addition to exercising a baneful influence on Highland character, has in the

long run of necessity proved adverse to the vitality of the language. The best standard of Gaelic is by common consent the language of the Scriptures. James Stewart of Killin's version of the New Testament, published by the Society for Propagating Christian Knowledge, was followed by a translation of the Old Testament in four parts (1783-1801), the work of John Stewart of Luss and John Smith of Campbelltown. The whole Gaelic Bible saw the light in 1807. But the revision of 1826 is regarded as standard. The translators and revisers had no norm to follow, and it is difficult to say how far they were influenced by Irish tradition. Much in the Gaelic version seems to savour of Irish idiom, and it is a pity that some competent scholar such as Henderson has not investigated the question. Of original prose works we can mention two. The one is a *History of the Forty-five (Eachdraidh a' Phrionnsa, no Bladhna Thearlaich)*, published in 1845 by John Mackenzie, the compiler of the *Beauties of Gaelic Poetry* (1806-1848). A second edition of this book appeared in 1906. The other is the more famous *Caraid nan Gaedhel*, by Norman Macleod (new edition, 1899). This volume consists mainly of a number of dialogues dealing with various departments of Highland life, which were originally contributed to various magazines from 1829 to 1848. Macleod's style is racy and elegant, and his work is deservedly popular.

In conclusion we must take notice of the more important collections of folklore. Gaelic, like Irish, is extraordinarily rich in proverbs. The first collection of Gaelic proverbs was published in 1785 by Donald Macintosh. This work was supplemented and enlarged in 1881 by Alexander Nicolson, whose book contains no fewer than 3900 short sayings. A large collection of Gaelic folk-tales was gleaned and published by J. F. Campbell under the title of *Popular Tales of the West Highlands* (4 vols., Edinburgh, 1862). Alexander Carmichael published a version of the *Táin Bó Colnne*, called *Toiric na Táine*, which he collected in South Uist (*Transactions of the Gaelic Society of Inverness*, ii. 25-42), also the story of Deirdre and the sons of Uisneach in prose taken down in Barra (*ib.* xiii. 241-257). Five volumes of popular stories, collected by J. G. Campbell, D. MacInnes, J. Macdougall and Lord Archibald Campbell, have been published (1880-1895) by Nutt under the title *Waifs and Strays of Celtic Tradition*. These collections contain a good deal of matter pertaining to the old heroic cycles. Seven ballads dealing with the Ulster cycle were collected and printed by Hector Maclean under the title *Ultonian Hero-ballads* (Glasgow, 1892). Macpherson gave a fillip to collectors of Ossianic lore, and a number of MSS. going back to his time are deposited in the Advocates' Library at Edinburgh. J. F. Campbell spent twelve years searching for variants, and his results were published in his *Leabhar na Feinne* (1872). This volume contains 54,000 lines of heroic verse. The Edinburgh MSS. were transcribed by Alexander Cameron, and published after his death by Alexander Macbain and John Kennedy in his *Reliquiae Celticae*. This work is therefore a complete corpus of Gaelic heroic verse. Finally the charms and incantations of the Highlands have been collected and published by Alexander Carmichael in two sumptuous volumes under the title *Carmina Gadelica* (1900).

**AUTHORITIES.**—The standard work is Magnus Maclean, *The Literature of the Highlands* (London, 1904); see also various chapters in the same writer's *Literature of the Celts* (London, 1902); L. C. Stern, *Die Kultur der Gegenwart*, i. xi. 1, pp. 98-109; Nigel MacNeill, *The Literature of the Highlanders* (Inverness, 1892); J. S. Blackie, *The Language and Literature of the Scottish Highlands* (Edinburgh, 1876); P. T. Pattison, *Gaelic Bards* (1890); L. Macbean, *Songs and Hymns of the Scottish Highlands* (Edinburgh, 1888); John Mackenzie, *Sàobhar nam Bàrd Gaelach, or The Beauties of Gaelic Poetry* (new ed., Edinburgh, 1904); A. Robertson in *Transactions of the Gaelic Society of Inverness*, xv. 257-325; G. Dottin, *Revue de synthèse historique*, viii. 79-91; M. C. Macleod, *Modern Gaelic Bards* (Stirling, 1908). (E. C. Q.)

**III. MANX LITERATURE.**—The literary remains written in the Manx language are much slighter than those of any other Celtic dialect. With one small exception nothing pertaining to the saga literature of Ireland has been preserved. The little we possess naturally falls under two heads—original compositions and translations. With regard to the first category we must give the place of honour to an Ossianic poem contained in a MS. in the British Museum (written in 1789), which relates how Orree, Finn's enemy, was tormented by the women of Finn's household when the latter was away hunting, how he in revenge set fire to the house, and how Finn had him torn in pieces by wild horses. Most of the existing literature of native origin, however, consists of ballads and carols, locally called carvels. These used to be sung on Christmas eve in the churches, the members of the congregation each bringing a candle. Any one who pleased could get up and sing one. These carvels deal largely with the end of the world, the judgment-day and the horrors of hell. About eighty of them were published under the title of *Carvelyn Gailckagh* (Douglas, 1891). An attempt is being made by *Yn Cheshaght Gailckagh* to revive the *Oiel Voinrey* (= Irish *Oidhche Fhéile Mhuire*), "the feast of Mary," as the festival used to be called, and gatherings in the old style have been held in Peel for the last two or three years. Apart from the carvels there are other ballads in existence, the most important of which were printed in vol. xvi. of the *Publications of the Manx Society*. The earliest is an 18th-century song of Manannan Mac y Lheir, traditionally supposed to have been written in the 16th century, and which tells of the conversion of the island by St Patrick. Then comes *Baase Iliam Dhòne* (The Death of Brown William), dealing with the death of William Christian, who was shot as a traitor in 1662. The best-known Manx song is *Mylechcharaine* (= Irish *Maolchiarán*). It is directed against a man of this name who was the first to give a dowry to his daughter, the custom having previously been for the bridegroom to pay money to the father of the bride. Others are *Ny Kirree fo Sniaghtey* (The Sheep under the Snow), a song about the loss of the Douglas herring fleet in 1787 (reprinted at Douglas, 1872), and *O Vannin Veg Veen* (Dear little Mona). A further ballad was taken down by J. Strachan and is published in the *Zeitschrift für celtische Philologie*, i. 79. In 1760 Joseph Bridson wrote a "Short Account of the Isle of Man" in Manx (*Cooneyl Ghiare jeh Ellan Vannin ayns Gailck*), which was reprinted in vol. xx. of the *Publications of the Manx Society*. The translated literature is almost entirely of a religious character. Jenner prints a list of twenty-three volumes in his article referred to below, but we can only here mention the most important. The first is the translation of the English Prayer-Book by Bishop Phillips, 1610 (published by A. W. Moore, Oxford, 1895). The *Sermons* of Bishop Wilson in 3 vols. (1783) are a very rare work, highly important for our knowledge of Manx prose, and it is to be hoped that *Yn Cheshaght Gailckagh* will see their way to reprint it. A translation of parts of Milton's *Paradise Lost* (*Pargys Caillit*) by Thomas Christian, 1796, is reprinted in vol. xx. of the *Publications of the Manx Society*. The later translation of the Church of England Prayer-Book was printed in 1765 and again in 1777 and 1840. But by far the most important of all is the translation of the Bible. The energetic Bishop Wilson managed to get parts of the Scriptures translated and the Gospel of St Matthew was printed in 1748. Wilson's successor, Bishop Hildesley, completed the work, and in 1775 the whole Bible appeared. The last reprint of the Bible appeared in 1810, that of the New Testament in 1810 (?). As a curiosity it may be mentioned that recently *Aesop's Fables* have been translated into the vernacular (Douglas, 1901).

IV. WELSH LITERATURE.—The oldest documents consist of glosses of the 9th and 10th centuries found in four MSS.—Oxonensis prior and posterior, the Cambridge Juvenus and Martianus Capella. These glosses were published by J. Loth in his *Vocabulaire vieux-breton* (1884), but their value is entirely philological. In addition, we possess two short verses, written in Irish characters, preserved in the Juvenus Manuscript in the University Library at Cambridge (printed in Skene's *Four Ancient Books of Wales*). This manuscript is a versification of the Gospels dating from the 9th century. The value of these two verses is threefold: they give us, in the first place, a specimen of the Welsh language at a time when the modern laws of euphony were in a comparatively elementary stage; secondly, they are of the utmost importance to the historian tracing the development of Welsh versification, and, in future research, they must be taken into account by the historian of modern metres in other languages; and, thirdly, the similarity of their form and diction to other verses, attributed to Llywarch Hen, and preserved in a much later orthography, will be a serious consideration to the higher critic in Welsh literature.

All the prose and verse of the succeeding centuries, that is to say from the 10th to the beginning of the 14th, is preserved in four important manuscripts, written during the latter half of the period. The first of these manuscripts is the *Black Book of Carmarthen*, a small quarto vellum manuscript of fifty leaves, written in Gothic letters by various hands during the reign of Henry II. (published in facsimile by Gwenogvryn Evans, Oxford, 1907). This book belonged originally to the priory of Black Canons at Carmarthen, from whom it passed to the church of St David; at the suppression of the monasteries in the reign of Henry VIII, it was presented by the treasurer of that church to Sir John Price, one of the king's commissioners, and from him it passed eventually into the hands of Sir Robert Vaughan, the owner of the famous Hengwrt collection. It is now among the Peniarth

Manuscripts, undoubtedly the most valuable collection of Welsh manuscripts in the United Kingdom. The second manuscript is the *Book of Aneirin*, a small quarto manuscript of nineteen leaves of vellum, written about 1250. It was at one time in the possession of Sir Thomas Phillips of Middlehill, and now belongs to the free library of the city of Cardiff. The third is the *Book of Taliessin*, in the Hengwrt and subsequently in the Peniarth collection. It is a small quarto manuscript containing thirty-eight leaves, written in Gothic letters, about the early part of the 14th century. The fourth manuscript, and in some respects the most important, is the *Red Book of Hergest*, so called from Hergest Court, one of the seats of the Vaughans. It is a folio volume of 360 leaves written by different hands between the beginning of the 14th and the middle of the 15th century. This manuscript, which is the most extensive compilation of the medieval prose and verse of Wales, is now in the possession of Jesus College, Oxford, and is kept in the Bodleian Library of that university. The main body of the poems contained in these four MSS. was printed by W. F. Skene with a tentative English version in his *Four Ancient Books of Wales*.

The other Welsh manuscripts, ranging down from the 15th to the 18th century, are far too numerous to notice, and it is outside the scope of this article to deal minutely with the original sources of the text of Welsh writings.

We will now only endeavour to sketch the history of Welsh literature from these early centuries down to our own times, and to show how the Celtic people of Wales have developed a literature true to their own genius, and how that literature stands to this day both a minister to the culture of the Welsh people and a sure indication of it.

1. *Early Latin Writers*.—The works now known as those of Gildas (*q.v.*) and Nennius (*q.v.*) are written in Latin; they throw considerable light on the origin of Welsh romantic literature and on the history of the earlier poems. Gildas was born at Ailclyd, the modern Dumbarton, that part of Britain which is

called by Welsh writers *Y Gogledd*, or the North. Several dates have been assigned for his birth and death, but he probably flourished between 500 and 580, and his book, *De Exordio Britannie* seems to have been written about 560. This work is a sketch of British history under the Romans and in the period after their withdrawal from the country, and includes the period of the wars of the Britons with the Picts, Scots and Saxons. Mr Skene suggests very reasonably that the well-known letter of the Britons to Aetius, asking for Roman aid, is misplaced, and that if put in its own place some of the anachronisms of Gildas will disappear. This work, which contains some spirited attacks on the leaders of the Britons for their sins, is strangely full of contradictions. It seems to be the work of some person well versed in the facts of that part of British history, to which he had an easy access, but who supplemented them with traditional details and with dates which were mere guess-work. Mr Skene thinks that the work of Nennius was originally written in Welsh in the north and was afterwards translated into Latin. To this nucleus was added the genealogies of the Saxon kings down to 738. Afterwards some person, called Marc in the Vatican manuscript, appended probably about 823 the life of St Germanus and the legends of St Patrick, which were subsequently incorporated with the history. Some South Welshman added to the oldest manuscript of the history in these countries, about 907, a chronicle of events from 444 to 954, in which there are genealogies beginning with Owain, son of Hywel Dda, king of South Wales. This chronicle, which is not found in other manuscripts, has been made the basis of two later chronicles brought down to 1286 and 1288 respectively. It is consequently not the work of one author. A learned Irishman named Gilla Coemgin, who died in 1072, translated it into Irish and added many things concerning the Irish and the Picts. The *Historia Britonum* is more valuable for the legendary matter which it contains than for what may be accepted as history, for it gives us the British legends of the colonization of Great Britain and Ireland, the exploits of King Arthur and the prophecies of Merlin, which are not found elsewhere before the 12th century. The date of the book is of the greatest importance to the history of medieval romance, and there can be no doubt that it is earlier than the Norman Conquest and that the legends themselves are of British origin.

2. *The Epic Period, 700-950*.—The higher criticism of the early poetry of Wales contained in the four ancient manuscripts already mentioned has undergone a good many changes since their contents first excited the curiosity of English scholars. In turn Welshmen, with more zeal than discretion, have displayed an amazing charlatanism in the extraordinary theories which they put forth, and Englishmen have shown an utmost meanness in belittling what is undoubtedly a most valuable monument of the past. But now the labours of Zeuss and others who have made a study of Celtic philology furnish us with much safer canons of criticism than existed in 1849, when even a learned Welshman, the late Thomas Stephens, who did more than any one else to establish the claims of his country to a real literature, doubted the authenticity of a large number of the poems said to have been written by Taliessin, Aneirin, Myrddin and Llywarch Hen, who are supposed to have lived in the 5th century. A great service was done to Welsh literature by the publication of the texts of those poems from the four ancient manuscripts by W. F. Skene. In addition to the text, translations of the poems were furnished by Dr Silvan Evans and the Rev. Robert Williams, but the translation, though on the whole a very creditable work, is full of mistakes which few men, writing at that time, could have avoided. The publication of the text of the *Black Book*, with notes by Dr Gwenogvryn Evans, will be of great service towards clearing up the mist which envelops this older literature.

Most of the poems in these four manuscripts are attributed to four poets, Aneirin, Llywarch Hen, Taliessin and Myrddin, who are said to have lived and written in Cumbria or Y Gogledd, where the actors in the events referred to also lived. The greater part of this region enjoyed substantial independence down to the end of the 9th century, with the exception of the

interval from 655, when they were subjected to the kingdom of Northumbria by Oswy after the defeat of Cadwallawn and Penda, to the battle of Dunnichen in 686, when Ecfrid, king of Northumbria, was defeated. From the 7th to the 9th century Cumbria, including under that name all the British territory from the Ribble to the Clyde, was the principal theatre of British and Saxon conflict. The rise of the dynasty of Maelgwn Gwynedd, who, according to Welsh tradition, was a descendant of Cunedda Wledig, one of the Picts of the north, brought Wales into close connexion with the Cumbrian kingdom, and prepared both North and South Wales for the reception of the northern traditions and the rise of a true Welsh literature.

Whether the poets of the north really wrote any of the poems which in a modified form have come down to us or not, there can be no doubt that a number of lays attributed to them lived in popular tradition, and that under the sudden burst of glory which the deeds of Cadwallawn called forth and which ended in the disastrous defeat of 655, a British literature began to spring up, and was nourished by the hopes of a future resurrection under his son Cadwaladr, whose death was disbelieved in for such a long time. These floating lays and traditions gradually gathered into North Wales, brought thither by the nobility and the bards who fled before advancing hosts of the victorious Saxon kings of the north. The heroes of the north became now the heroes of Wales, and the sites of the battles they fought were identified with places of similar name in Wales and England.

By far the longest and the most famous poem of this series is attributed to Aneurin. This spelling of his name is comparatively modern, and in the old manuscripts it is given as Aneirin. The later form seems to have been affected by the form *eurin*, "golden," and to owe the continuation of the misspelling to a belief that the poet and Gildas, whose name is supposed to be the Latin form of the Old English *gyldeu*, were one and the same person. This poem, called the *Gododin* (with notes by T. Stephens and published by Prof. Powell for the Cymmrodorion Society, London, 1888), is extremely obscure, both on account of its vocabulary and its topography and allusions. It deals mainly with "the men who went to Cattraeth," which is supposed to have been fought between the Britons and the Scots under Aedan, king of Dalriada, and the pagan Saxons and their British subjects in *Deyr* (Deira) and *Bryneich* (Bernicia), and the half-pagan Picts of Guotodin, a district corresponding to the northern half of the Lothians along the Firth of Forth. Critics have attempted with partial success to cast some light on its obscurity by supposing that the poem as a whole is made up of two parts dealing with two distinct battles. This may or may not be, but there is no doubt that many of the stanzas of the poem as found in the manuscript are not in their proper places, and a critical readjustment of the different stanzas and lines would do much towards solving its problem. It seems probable, too, that the original nucleus of the poem was handed down orally, and recited or sung by the bards and minstrels at the courts of different noblemen. It thus became the common stock-in-trade of the Welsh rhapsodist, and in time the bards, using it as a kind of framework, added to it here and there pieces of their own composition formed on the original model, especially when the heroes named happened to be the traditional forefathers of their patrons, and occasionally introduced the names of new heroes and new places as it suited their purpose; and all this seems to have been done in early times. Older fragments dealing too with the legendary heroes of the Welsh were afterwards incorporated with the poem, and some of these fragments undoubtedly preserve the orthographical and grammatical forms of the 6th century. So that, on the whole, it seems as fruitless to look for a definite record of historical events in this poem as it would be to do so in the Homeric poems, but like them, though it cannot any longer be regarded as a correct and definite account of a particular battle or war, it still stands in this day the epic of the warriors of its own nation. It matters not whether these heroes fought at far Cattraeth or on some other forgotten field of disaster; this song

still reflects, as a true national epic, the sad defeats and the brave but desperate rallies of the early Welsh. Like the music of the Welsh, its dominant note is that of sadness, expressing the exultation of battle and the very joy of life in minor notes. To a great extent Welsh poets are to this day true and faithful disciples of this early master.

Many of the poems attributed to Taliessin are undoubtedly late. Indeed, both Taliessin and Myrddin,<sup>1</sup> the one as the mythological chief of all Welsh bards and the other as a great magician, seem pre-eminently suited to attract a great deal of later Welsh poetry under their aegis; but the older poems attributed to them are worthy of any literature. Sometimes, as in the verses attributed to Llywarch Hen beginning *Stafell Cynuddylan*, an early specimen of poetic grief over departed glory, we find that gentle elegiac note which is so common in early English poetry. In the Taliessinic poems, the *Battle of Argoed Llwygwyn* and others, we have that boldness of portraiture which is found in the *Gododin*, whilst in many a noble line we seem to hear again the ravens screaming shrilly over their sword-feasts, and the strong strokes of the advancing warriors.

It was but natural that all the pseudo-prophetic poems, written of course after the events which they foretold, should be attributed to the chief among seers, Myrddin, or, as his name is written in English, Merlin; so that all the poems accredited to him, with the exception perhaps of the *Avallenau*, were not written before the 12th century.

In most of the poems attributed to Llywarch Hen and in some of the Myrddin poems, the verses begin with the same line, which, though it has no direct reference to the subject of the poem itself, is used as a refrain or catch-word, exactly like the refrains employed by Mr Swinburne and others in their ballads. These lines generally refer to some natural object or objects, as, for instance, "the snow of the mountain" or "bright are the tops of the broom."

The first period, then, of Welsh literature lies between 700 and 950. It is in most respects the epic period, the period in which poets wrote of great men and their deeds, the legendary and the historic heroes of the Cymry, men like Urien Rheged, and heroes like Hyveidd Hir. Even in the next period the epic note had not quite died out.

3. *The Prose Romances and the Poet Princes, 1100-1200.*—It will be seen that there is a considerable gap between the first and second period of Welsh literature. It must not be supposed, however, that nothing was composed or written during these years. Indeed, it may well be that some of the poetry attributed to the minor bards of the last period was composed between 900 and 1100, and that some other poetry too was written and lost. But there are abundant reasons for believing that Welsh poetry was at a very low ebb during those years. The progress of Wales as a political unit had suffered a check after the battle of Chester in 613. The effects of this defeat were not immediate, as the Welsh had still enough of their characteristic hopefulness to expect ultimate victory; we therefore have reasons for believing that the *Gododin* series of poems were still used—or perhaps used then for the first time—to spur on "the hawks of war" to greater efforts. Gradually, however, the Angles, hemming them in on all sides from the Clyde to the Severn, began to press nearer and nearer; the Welsh at last seem to have lost heart, and no one any longer "had the desire of song." Content with their old epics and their older myths, which owe perhaps to these years a darker and more sombre tinge, they allowed their song to be hushed. The great lords had hardly chosen their final abodes; the smaller lords had all been killed in war and their places taken now by one, now by another, so that the warrior prince himself had not the leisure, and hardly the inspiration necessary, for song, and the bards found but scanty patronage among such a diminished and poverty-stricken nobility. The only order that seemed to prosper was that of the monks, and we owe them our gratitude for

<sup>1</sup> It is indeed probable that Myrddin is a purely fictitious character, whose name has been made up from *Caer Fyrddin* (= Maridunum), which was certainly not a personal name.

Taliessin.

Merlin.

The *Gododin* series.

preserving the ancient writings and the ancient traditions; but they were simply copyists, though they had undoubtedly some hand in giving the *Gododin* its final form and in setting in its convenient framework the names of the forefathers of their aristocratic abbots.

In the year 1044 Gruffydd ab Llewelyn conquered Hywel ab Edwin and became king of Wales. By means of his diplomacy and his arms he succeeded in stemming the tide of Saxon invasion that was threatening to overflow even the little remnant of land that was left to the Welsh, and his strong rule gave the Welsh muse another opportunity. Gruffydd, however, died in 1063, and was eventually succeeded in 1073 by Trahaern in North Wales, and Rhys ab Owen in South Wales. The rule of these two princes was destined to be the last period of literary inertness in the long interval following the confinement of Wales to her inaccessible highlands.

During these years a man was hiding in Ireland, called Gruffydd ab Cynan, a scion of the old branch of Welsh kings. In Brittany, too, Rhys ab Tewdwr, a claimant to the throne of South Wales, had sought the protection of his Breton kinsmen. In 1073 Rhys ab Tewdwr obtained the throne of Rhys ab Owen, and, after many years of hard fighting, Gruffydd ab Cynan, with the help of Rhys ab Tewdwr, defeated Trahaern at the battle of Myrdd Carn in 1081. On the accession of these two powerful princes the whole country broke forth into songs of praise and jubilation, and the long night was at an end.

It is important to remember that both Gruffydd and Rhys had a direct personal influence on the literary revival of their times. Gruffydd ab Cynan while in exile had seen how the Irish *Oenach* was held, and had seen prizes given for poetry and song. We have it on the authority of Welsh writers that he reorganized the bards and improved the music, and in many other ways gave a great and beneficial impulse to Welsh literature. He may have brought over some of the later Irish legends which have had such a powerful effect on the literature of Wales.

Rhys ab Tewdwr, too, brought with him from Brittany an enthusiasm for the old Celtic tales, and perhaps some of the tales themselves which had been by that time forgotten in Wales, tales of the Round Table, and Arthur "begirt with British and Armoric knights," of knightly deeds and magical metamorphoses, which were destined to influence profoundly all the literatures of the West. We find, therefore, in this period that poetry flourished mostly in the North under Gruffydd ab Cynan, and prose in the south under Rhys ab Tewdwr, where the new enthusiasm for the old Welsh legends resulted in the

*History of Britain* of Geoffrey of Monmouth, which is an expansion of the books attributed to Gildas and Nennius. It was written in Latin sometime before

1147, and is dedicated to Robert, earl of Gloucester, the grandson of Rhys ab Tewdwr. In the introductory epistle, Geoffrey states that Walter, archdeacon of Oxford, had given him a very ancient book in the British tongue, giving an account of the kings of Britain from Brutus to Cadwaladr, and that he had translated it into Latin at the archdeacon's request. The book, however, is a compilation and not a translation, but the materials were probably drawn from British sources. In this history Geoffrey asserts that the deeds of Arthur "were commonly related in a pleasing manner." He was perhaps originally but the hero of some popular ballad, or of a forgotten stanza of the *Gododin*, and the importance of his name in the literature of the world seems to be due to an accident. We cannot, however, in this article consider the Arthurian Legend (*q.v.*) as a whole; we must be content with dealing with the most important of the romantic tales which are contained in the *Red Book of Hergest*. They may be divided into four classes:—

(i.) The *Mabinogi* proper, containing (1) *Pwyll*, prince of Dyvet; (2) *Branwen*, daughter of Llyr; (3) *Manawyddan*, son of Llyr; (4) *Math*, son of Mathonwy.

(ii.) Old British tales referring to Roman times, viz. (1) *Lludd and Llewelyn*; (2) The Dream of *Macsen Wledic*.

(iii.) British Arthurian tales, viz. (1) *Kilhwch and Olwen*; (2) The Dream of *Rhonabwy*.

(iv.) Later tales of chivalry, viz. (1) *The Lady of the Fountain*; (2) *Peredur*, son of *Ewrawc*; (3) *Geraint*, son of *Erbin*.

The group of four romances in the first class forms a cycle of legends and is called in the manuscript *Pedair Keinc y Mabinogi*—the Four Branches of the *Mabinogi*; so it is only

<sup>The Mabinogi</sup>  
*Mabinogi*. In these stories we have the relics of the ancient Irish mythology of the *Tuatha Dé Danann*, sometimes mixed with later myths. The *Coer Sidi*, where neither disease nor old age affects any one, is the *Sid* of Irish mythology, the residence of the gods of the *Aes Síde*. It is called in one of the old poems the prison of *Gweir*, who no doubt represents *Gaiar*, son of Manandán MacLir, the Atropos who cut the thread of life of Irish mythology. *Llyr* is the Irish sea-god Lir, and was called *Llyr Llediaith*, or the half-tongued, implying that he spoke a language only partially intelligible to the people of the country. *Bran*, the son of Llyr, is the Irish Bran MacAllait, Allait being one of the names of Lir. *Manawyddan* is clearly the Manandán or Manannán MacLir of Irish mythology. These tales contain other characters which may not have been borrowed from Irish mythology but which are common to both mythologies; for example, *Rhiannon*, the wife of *Pwyll* who possessed marvellous birds which held warriors spell-bound for eighty years by their singing, comes from *Anwen*, or the unseen world, and her son *Pryderi* gives her, on the death of *Pwyll*, as a wife to *Manawyddan*.

Of the second class the first story relates to *Lludd*, son of *Bel* the Great, son of *Manogan*, who became king after his father's death, while his brother *Llewelyn* becomes king of France and shows his brother how to get rid of the three plagues which devastated Britain:—first, a strange race, the *Coranians*, whose knowledge was so great that they heard everything no matter how low soever it might be spoken; second, a shriek which came into every house on May eve, caused by the fighting of two dragons; and third, a great giant who carried off all the provisions of the king's palace every day. The second tale relates how *Maxen*, emperor of Rome, has a dream while hunting, in which he imagines that he visits Britain, and in *Coer Sidi* or *Carnarvon* sees a beautiful damsel, *Helen*, whom he ultimately finds and marries. Both tales are British in origin and are founded on traditions referring to Roman times.

The most important of these tales are undoubtedly those contained in the first class, and the story of *Kilhwch and Olwen*. The form in which they are found in the *Red Book of Hergest* is, as we have already said, comparatively speaking, modern. But it is apparent to any one reading these tales that the writers or compilers, as *Matthew Arnold* has suggested, are "pillaging an antiquity, the secret of which they do not fully possess." The foundations of the tales are the old Celtic traditions of the gods and the older heroes, and they clearly show Goidelic influence both in the persons they introduce and in their incidents. The tales would at first exist only in oral tradition, and after the advent of Christianity the characters they contain lost their title of divinity and became simply heroes—warriors and magicians. In time the monks began to write these ancient traditions, embellishing them and suppressing no doubt that they considered to be most objectionable. These then are the tales which we now possess—the traditional doings of the old heroes as set in order by Christian writers.

The changes which these later copyists wrought in the substance of the tales fall into two main divisions. In the first place, they attempted to find some connexion between tales or cycles of tales which originally had no connexion whatever, and were therefore forced to invent new incidents or to introduce other incidents from the outside in order to establish this connexion; and secondly, as in the case of the *Gododin*, the tales were twisted and altered to support references to and explanations of names known to the writer. So we find in the tale of *Math and Mathonwy* the incident of the pigs is expanded to explain some place-names which the writer knew. It is this also that gives a local interest to the tales; for instance, *Dyvet*, the land of *Pwyll*, has come to be regarded as the home of *Hud* a *Lledrieth*, of magic and

enchancement. Some places in North Wales, especially in the vicinity of Carnarvon, seem to be well known to the writers, and, therefore, to have associated with them to all time the glamour of the Mabinogion.

Besides the scholastic efforts of the monks, which in course of time so greatly changed these old legends, there was another class of men who had no little influence on the form and matter of Welsh, and consequently of European, romance. These were the Welsh jongleurs—the professional story-tellers, against whom the bards proper nursed a deadly hatred because, presumably, their tales drew larger audiences and won greater rewards than the *awdlaw* of the poets. There is little doubt that this order existed in Wales at a very early period, being quite a natural evolution of the older poet who sang in comparatively free metres of the deeds of the great dead. It is these men who invented the term *Mabinogi*, which is supposed to mean a "tale for young people"; but whatever the word may mean, the fact that they were the stock-in-trade of the professional story-teller will explain a good many of their structural peculiarities.

Thus there existed two distinct classes of tales, though it is to be supposed that the subject matter of both was more or less common; there are, in the first place, the "four branches" and the tales of the second class, and, secondly, tales like those of the third class. With the exception of the Irish influence, which we have already referred to, and some later additions from early continental romance in the third class, we may take it that these three classes are of purely British origin. The *pedair coinc* are the old tales which were first committed to writing at an early period before the influence of the Armorican Arthur began to be felt, that is to say, about the beginning of the reign of Rhys ab Iwdrwr in 1073. The other tales, that is those we have put in the third class, remained for a much longer time unwritten and were not set in writing before the early Arthur of Armorican and British romance had been evolved. This will account for the fact that Arthur is not mentioned in the first class of tales, and that in the third class he is simply a British Arthur. The third class is, therefore, in a sense later than the first and second, but its materials are as old as the oldest of the Mabinogion proper, and they show the influence of Irish mythology to the same extent. In the first class Irish names like *Ponardim*, which have not been assimilated, show conclusively that the tale is a written one, while the eloquence of the descriptions in *Kilkruch ac Owain* seem to point to the fact that it was up to a late period a spoken tale. Other such tales there were once, but they have now been lost.

The romances of the fourth class do not claim much notice. They are mostly imitations or translations of Norman French originals, and they belong to the history of European chivalry rather than to the history of Welsh literature.

As literature the Mabinogion may rank among the world's classics. We cannot here point out their beauties, but it will be sufficient to notice that the unknown writer who gave them their final form was a true artist in every sense of the word. In *Branwen verch Lyr*, for instance, the whole setting of the story is that of a great tragedy, a tragedy neither Hellenic nor Shakespearean, but the strong and ruthless tragedy of the Celts,—the tragedy of nature among unnatural surroundings, the tragedy which in our times Mr Thomas Hardy has so successfully developed. In this tale, Branwen is introduced as the sister of Manawyddan, the king of all Britain, and as the "fairest maid in the world." But as the tragedy deepens we read how this woman, dowered with beauty and goodness and nobility of lineage, is simply used as a pawn in a political game, and the full force of the tragedy falls on her own undeserving head. She is subjected to all kinds of indignities in her husband's court in Ireland, but throughout all her severe trials she preserves the cold and detached haughtiness which characterizes the full-bodied heroines of the northern sagas; and, in the end, when her brother has delivered her and punished the Irish, and when she has safely reached the shores of her own Môn, she raises her eyes and beholds the two islands, Britain and Ireland. "'Ah God!' said she, 'is it well that two islands have been made desolate for my sake?' And she gave a deep groan and died." So was her

tragedy consummated, and the writer, with a superb tragic touch, mentions the very shape of the grave in which they lay her on the bank of the Alaw in Môn.

One of the earliest poets of this period whose productions we can be certain of is Meilir, bard of Trahaern, whom Gruffydd ab Cynan defeated at the battle of Carn, and afterwards of the conqueror Gruffydd himself. His best piece is the *Death-bed of the Bard*, a semi-religious poem which is distinguished by the structure of the verse, poetic feeling and religious thought. Meilir was the head of a family of bards; his son was Gwalchmai, one of the best Welsh poets; the latter had two sons, Einion and Meilir, some of whose poetry has reached us. In *Gorhoffedd Gwalchmai*, Gwalchmai's Delight, there is an appreciation of the charms of nature, medieval parallels to which are only to be found in Ireland. His *Arwyrain i Owain* is an ode of considerable beauty and full of vigour in praise of Owain Gwynedd, king of North Wales, on account of his victory of Tal y Moelvre, part of which has been translated by Gray under the name of "The Triumphs of Owen." Kynddelw, who lived in the second half of the 12th century, was a contemporary of Gwalchmai, and wrote on a great number of subjects including religious ones; indeed some of his eulogies have a kind of religious prelude. He had a command of words and much skill in versification, but he is pleonastic and fond of complicated metres and of ending his lines with the same syllable.

Among the other poets of the second half of the 12th century may be mentioned Owain Kyveiliog and Howel ab Owain Gwynedd. The first named was prince of Powys, and was distinguished also as a soldier. The *Hirias*, or drinking-horn, is a long poem where the prince represents himself as carousing in his hall after a fight; bidding his cup-bearer fill his great drinking-horn, he orders him to present it in turn to each of the assembled warriors. As the horn passes from hand to hand he eulogizes each in a verse beginning *Diwallaw di venestr*, "Fill, cup-bearer." Having thus praised the deeds of two warriors, Tudyr and Moreiddig, he turns round to challenge them, but suddenly recollecting that they had fallen in the fray, and listening, as it were, to their dying groans, he bursts into a broken lamentation for their loss. The second was also a prince; he was the eldest of the many sons of Owain Gwynedd, and ruled for two years after his father until he fell in a battle between himself and his step-brother Dafydd. He was a young man of conspicuous merit, and one of the most charming poets of Wales, his poems being especially free from the conceits, trivial commonplaces, and complicated metres of the professional bards, while full of a gay humour, a love of nature and a delicate appreciation of women. The Welsh poets went on circuit like their Irish brethren, staying in each place according as hospitality was extended to them. When departing, a bard was expected to leave a sample of his versification behind him. In this way many manuscripts came to be written, as we find them in different hands. Llywarch ab Llywelyn has left us one of those departing eulogies addressed to Rhys Gryg, prince of South Wales, which affords a favourable specimen of his style.

The following are a few of the poets of the 13th century whose poems are still extant. Davydd Benfras was the author of a poem in praise of Llywelyn ab Iorwerth; his works, though not so verbose or trite as bardic poems of this class usually are, do not rise much above the bardic level, and are full of alliteration. Elidir Sais was, as his name implies, able to speak the English language, and wrote chiefly religious poetry. Einiawn ab Gwgawn is the author of an extant address to Llywelyn ab Iorwerth of considerable merit. Philip Brydydd, or Philip the poet, was household bard to Rhys Gryg (Rhys the hoarse), lord of South Wales. One of his pieces, an apology to Rhys Gryg, is a striking example of the fulsome epithets a household bard was expected to bestow upon his patron, and of the privileged domesticity in which the bards lived, which, as in Ireland, must have been fatal to genius. Prydydd Bychan, the Little Poet, was a South Wales bard whose extant work consists of short poems all addressed to his own princes. The chief feature of his *Englynion* is the use of a

13th  
century  
poets.

kind of assonance in which in some cases the final vowels agreed alternately in each quatrain, and in others each line ended in a different vowel, in both cases with alliteration and consonance of final consonants or full rhyme. Llygad Gŵr is known by an ode in five parts to Llywelyn ab Gruffydd, written about the year 1270, which is a good type of the conventional flattery of a family bard. Howel Voel, who was of Irish extraction, possessed some poetical merit; his remonstrance to Llywelyn against the imprisonment of his brother Owain is a pleasing variety upon the conventional eulogy. It has many lines beginning with the same word, e.g. *gŵr*, man. The poems of Bleddyn Vardd, or Bleddyn the Bard, which have come down to us are all short eulogies and elegies. One of the latter on Llywelyn ab Gruffydd is a good example of the elaborate and artificial nature of Welsh versification.

The most illustrious name among the poets of this century is Gruffydd ab yr Ynad Coch, "Gruffydd, son of the Red Justice," who wrote many religious poems of great merit. His greatest work, however, is the elegy to Llywelyn ab Gruffydd, the last prince of Wales. It is easily first among all the elegies written in the Welsh language. We do not find in it that artificial grief which is too evident in the *Marwadau* of the Welsh poets; it re-echoes an intense personal grief, and throughout the whole piece the poet feels that he stands at the end of all things,—the end of his own ideals, the extinction of all Cymric hopes. So poignant is his grief, and in so universal a manner does the catastrophe of Llywelyn's death present itself to him, that he imagines that all the natural features of the Welsh fatherland know that the last great Welshman is dead; the winds howl over the mountains, the rain-clouds gather thick, the waves rage with grief against the Welsh coasts, and far away on the hills the giant oak-trees beat against each other in the fury of their passion. Sadly, in this manner, closes the second period of Welsh literature.

4. *The Golden Age of the Cywydd, 1340-1440.*—Just as, after the loss of the North, the Welsh music was hushed, so after the final subjugation of Wales in 1282, hardly a note was heard for many a long year. The ancient patrons of literature were dead, and the country had not yet settled down to the steady rule of England. Indeed, the conquest of Wales effectively put an end to the older Welsh poetry of that type which we noticed in the last period. These older bards were without exception subjects of the princes of North Wales, where the old heroic poetry was still popular, and when the power of these princes came to an end the old poetry too ceased. When the Welsh music emerges again from the darkness of this interval she is no longer of the North; the new poets are drawn from the Welshmen of the South, a land which had practically ceased to be a part of an independent Wales shortly after the Norman conquest of England. We find, too, that the poetry which poured forth from the Welsh bards of the south is of an altogether different type; it is modern in all its essentials, in diction, in language, and, comparatively speaking, in sentiment. Indeed, there is an infinitely greater difference between Dafydd ab Gwilym and Gruffydd ab yr Ynad Coch than there is between him and any poet writing in the alliterative metres in the 19th century. So that we must suppose that at the time when the poets of North Wales still sang of war and mead-drinking in a style and diction that was an inheritance from the times of the *Gododin*, the poets of the South, unharassed by wars, were developing a new poetry of their own, a poetry that had relinquished for ever the Old Welsh models and was at last in line with the great poetical movements of Europe. And, judging from the fact that the earliest of these poets whose works are accessible to us are in the full zenith of their poetical development, we must believe that their work is the consummation of a period, that is to say, that they must have had a long line of predecessors whose works were lost during the period intervening between the loss of Welsh independence and the rise of Dafydd ab Gwilym. These men wrote, as we have already said, in South Wales, a country which was then under the rule of the Norman lords, who, with the lapse of years and the rise of new systems, were fast becoming Welsh.

It is no wonder, then, that the poets who wrote under their patronage should show unmistakable traces of Norman influence. Most of the barons still spoke French, and it was only natural that they should be well versed in French poetry. The poets followed the lead of their patrons, and their work was modelled to a very great extent on French and Provençal poetry. Nor does this account altogether for the wonderful similarity between Welsh *cywyddau* and other poems of this period and the French lays; we must remember that the Welsh poets lived under conditions similar to those under which the troubadours and the trouvères lived, and it was natural that the same environments should produce the same kind of work. The Provençal *cibú* and the French *aube*, the *serenade* and other forms, became well known in South Wales and were of course read by the Welsh poets. We find continual references in the poets to "books of love" under the name of *llyfr Olydd*, or the "book of Ovid," and a reference in one of Dafydd ab Gwilym's poems shows conclusively that one particular *llyfr Olydd* was a work of the French poet Chrestien de Troyes. Indeed, one of the commonest names among the poets of this period—the *llatai*,<sup>1</sup> or love-messenger—may be a Romance word borrowed through the Norman-French from the Italian *Galeotto*, originally the name of the book of the loves of Galaahad, but afterwards the ordinary word for a go-between. This book of Galeotto, by the way, was the book which taught Paolo and Francesca da Rimini, in Dante's *Divina Commedia*, the tragic secret of love.

Another movement also was favourable to the rise of the new Welsh poetry. The iron hand of the church, which had been the censor of poetry for so many centuries, was slowly relaxing its grasp, and the men who a few years before would have sung religious hymns to the Virgin, now laid their tributes at the feet of divine womanhood as they saw it in the Welsh maidens and matrons living among them. The pale queen of heaven no longer held hearts captive; they had transferred their allegiance to the "brow that was as the snow of yesternight," and "the cheeks that were like the passion-flower." The Iolo MSS. assert that some time between January 1327 and November 1330 there were held, under the patronage of Ivor Hael, Dafydd ab Gwilym's patron, and others, the three *Eisteddfodau Ddedeni*, or the *Eisteddfods* of the Revival of the Muse, to reorganize the bards, and to set in order all matters pertaining to Welsh poetry. The most important bards who are reported as present at some or all of these meetings were Dafydd ab Gwilym, Sion Cent, Rhys Goch of Eryri, and Iolo Goch. It is now, however, generally agreed that this account is a fabrication and that the date of all the poets is later.

Dafydd ab Gwilym is certainly the most distinguished of all the Welsh poets, and were it not for the absolute impossibility of adequately translating his *cywyddau* he would rank amongst the greatest poets of mediæval times. By far the greater part of his poetry is written in the metre called *cywydd*, with heptasyllabic lines rhyming in couplets. It was he who imparted so much lustre to this metre that it became the vehicle of all the most important poetry from his time to the 19th century, and he is generally referred to by his contemporaries as the special poet of the *cywydd*—*Dafydd gywydd gwin*, "Dafydd of the wine-sweet *cywydd*." Most of his poems deal with love in the spirit of the mediæval writers of France and of Provence, but with this very important difference, that the French writers must base their reputation on their treatment of love as a theme, whereas Dafydd's claim to fame is based on his treatment of nature and of out-door life. In many cases, indeed, love is only a conventional peg whereon he may hang his observations on nature, and Welsh literature may claim the distinction of having had its Wordsworth in the 14th century. His treatment of nature is not merely realistic and objective, it has a certain quaint and elusive symbolism and a subjectiveness which come as a revelation to those who are acquainted with the mediæval poetry of other nations. Many

<sup>1</sup> Another derivation of this word is from *llad*, "profit" + *hai*, a suffix denoting the agent. Others derive it from or connect it with the Irish *slad*.

Dafydd ab Gwilym.

of the poems attributed to him are undoubtedly the work of later hands, but even after making all possible deductions, there is still an infinite variety among what remains, ranging as his poems do from a sturdy denunciation of monkish fraudulence to the most delicate and pathetic recollections of departed joys. He has, besides, considerable importance as a teacher, as when, for instance, he invites the nun "to leave her watercress and paternosters of Romish monks," and to come with him "to the cathedral of the birch to listen to the cuckoo's sermons," for, "were it not an equally worthy deed to save his (Dafydd's) soul in the birch-grove as to do so by following the ritual of Rome and St James of Compostella"? Even in his old age, when he is beginning to repent of his rash and merry youth, nature has not deserted him,—the very tree under which in the old days he used to meet his sweetheart has become bent and withered in sympathy with him. Though Dafydd yields not the palm to any poet of his class throughout the world, and though his influence is still a potent factor in the literature of Wales, we are certain of hardly a single fact about his life. He flourished between 1340 and 1390. His works were published in London in 1780. This edition was reprinted by Foulkes of Liverpool in 1870. See L. C. Stern, *Zeitschr. f. celt. Phil.* vol. vii.

Sion Cent was chaplain to the Scudamores of Kentchurch in Herefordshire, and though, therefore, in orders, was a most bitter opponent of the pretentious and the evil life of the monks of his time. All his writings show signs of the influence of the moralists of the middle ages, and treat of religious or of moral subjects. His poetry is strong and austere, interfused here and there with the most biting satire. He died about 1400. Like many of his contemporaries, Dunbar, Villon, Menot and Manrique, his dominant note is that of sadness and regret.

Rhys Goch Eryri had a sprightly muse which deals with fanciful subjects. His themes are often similar to those of Dafydd ab Gwilym, but whereas the subject of Dafydd's muse was nature and his treatment universal, Rhys Goch's are simply natural objects which he treats in a vigorous but narrow and cold manner.

Iolo Goch, that is, Iorwerth the Red, deserves a special mention as the poet who voiced the aspirations of a new Wales when Owen Glyndwr began to rise into power, and it is to one of his poems that we owe a most minute description of Sycarth, Owen Glyndwr's home. His poetry is slightly more archaic in diction than that of his contemporaries, as his subject—war and the glory of Welsh heroes—belonged more properly to the age before his own. In one very striking *cywydd* composed after Glyndwr's downfall, he calls upon this hero to come again and claim his own, and addresses himself fancifully to all the countries of the world where his hero may be in hiding. He died after 1405, and, if the dates generally given for his birth be even approximately correct, he must have lived to a prodigious age (cf. *Gweithiau Iolo Goch*, by Charles Ashton, London, 1896).

Rhys Goch ap Rhiccer claims to be named with Dafydd ab Gwilym as a writer of lyrics in praise of beautiful women. He has one advantage, however, over his more famous contemporary in the variety of his metres. The musical lilt and the delicate workmanship of his poems, with their recurring refrain, give him a unique position among his medieval contemporaries as the first purely lyrical poet. His *fforest* is probably a little later than that of Dafydd ab Gwilym, for we must not be misled by the late orthography of his poems.

Dafydd Nanmor is chiefly famous for two exquisite *cywyddau*, *Cwydd Marwad Merch*, or Elegy of a Maiden, and *Cwydd i wraig Llio*, or *Cwydd to Llio's Hair*. In both these poems he shows elegance rather than depth, and a fancy as bold as that of his great master Dafydd. In the first of these *cywyddau* his grief is so great that he wishes that he were but the shroud around his dead sweetheart, and, in the second, Llio Rhydderch's golden hair over her white brow is compared to the reluctance of lightning over the fine snow. He is supposed to be a younger contemporary of Rhys Goch Eryri, but there are many facts to warrant a supposition that he lived much later, even as late as 1490.

Llywelyn Goch ap Meurig Hen deserves to be mentioned as the author of the famous *Marwad Lleucu Llwyd*, an elegy which is far more convincing in its sincerity than Dafydd Nanmor's *cywydd*. Few of his compositions are extant, but the one already mentioned is sufficient to place him in the first rank of the poets of the period. He lived approximately from 1330 to 1390.

The other poets of this period who deserve some mention are Dafydd Ddu o Hiraddug, who wrote poems on religious subjects, and who is supposed to have translated part of the *Officium Beatae Mariae* into Welsh; Gruffydd Grug, between whom and Dafydd ab Gwilym a most fierce poetic quarrel raged, but who is the author of a beautiful elegy on his opponent; Gruffydd Llwyd ab Dafydd, who was the poet of Owen Glyndwr and whose *cywydd* in praise of his patron is one of the best of that type; Hywel Srdwal and Gwilym ab Ieuan Hen.

5. *The Silver Age of the Cywydd, 1440-1550*—The insurrection of Owen Glyndwr, though originally the result of a private quarrel, was the general revolt of a nation against the conquerors whom it hated, and the English king knew well enough that the discontent with his rule was fanned by the older and more national Welsh institutions, and by none more than by the system of wandering bards. The conditions which had given rise to this system were fast dying out, but the noblemen, who fortunately were still intensely Welsh, were loth to give up their family bards, and the bards themselves, never a too industrious class, were too glad of their freedom and easy life to turn to more profitable work. We find, therefore, that a law was passed in 1403, the fourth year of Henry IV.'s reign, prohibiting bards "and other vagrants" from exercising their profession in Gwynedd or North Wales. This law, however, like its predecessor in the reign of Edward I., failed utterly in its purpose. By prohibiting the Welsh noblemen from giving their patronage to the bards, and, therefore, from distinguishing between the real bards and the mendicant rhymesters, this law took away the only safeguard against the latter class, with the result that by about 1450 they had become a pest to the country. About that time there flourished a poet called Llawdden, who, noticing the very unsatisfactory state of poetry in Wales, induced his kinsman, Gruffydd ab Nicolas, a nobleman living in Y Drenewydd (Newtown), to petition Henry VI. for permission to hold an *eisteddfod* similar in purpose to the three *Eisteddfodau Dademi* of the last period. This famous *eisteddfod* was held at Caerfyrddin (Carmarthen) in 1451, and *Eisteddfod of 1451.*

shortly before the actual *eisteddfod* was held a "statute" was drawn up under the direction of Llawdden, regulating the different orders of bards and musicians and setting in order the *cyghaneddion a mesurau*, the different kinds of alliterative verse to be presented to the assembled bards at the meeting. Among those present at that *eisteddfod* the most distinguished was Dafydd ab Edmwnd, who then made famous the dictum that the purpose of an *eisteddfod* was "to bring to mind the past, to consider the present, and to deliberate about the future." He, therefore, proposed emendations in "the rules of Welsh verse," making them more strict, so as to keep the unlearned rhymesters from the privileged bardic class. This measure had a most important effect on Welsh literature. It effectively put an end to the charming spontaneity which distinguishes the poetry of Dafydd ab Gwilym and his contemporaries, and by introducing an arbitrary set of rules gave an artificial tone to almost all the poetry of the next two hundred years. It had, indeed, exactly the same retarding effect on Welsh poetry as the Unities had on the French drama. So that, whereas the poems of Dafydd ab Gwilym, though written in the difficult alliterative metres, are nearly all light and have a sweet lyrical re-echo, the poetry of Dafydd ab Edmwnd and his successors is often heavy and nearly always artificial. After making, however, all these deductions, it is a debatable point whether the hard and fast rules which now regulated Welsh poetry did not eventually justify their existence. They have helped, by inciting to carefulness, to keep the idiom and the language pure and undefiled, and to this day style in Welsh

The next important factory after St Cloud was that founded at Chantilly about 1725 under the patronage of the Prince de Condé, an enthusiastic collector of Chinese and Japanese porcelains. One distinctive feature of the Chantilly porcelain is its imitation of the Japanese Imari wares of the 17th century,

Lille and Chantilly Pottery marks.

especially those bearing delicate patterns in the Kakiemon style. This imitation was not confined to the decoration alone, but great efforts were made to reproduce the delicious tender whiteness of the original ware, by covering the body of the soft porcelain with a coating of the tin-enamel used by the French faience makers. Similar imitation of the Kakiemon style of decoration became the rage all over Europe, and was largely followed at Meissen and in England as well as in France; but no European imitations equalled those of the famous Chantilly ware.

Other porcelain factories were started at Mennecy-Villerois and at Lille, but the most important French factory was that founded at Vincennes about 1740, not only because of the many beautiful pieces produced there, but also because the works was taken under the direct patronage of the king in 1753 and was transferred to Sèvres in 1756, becoming ultimately the most important porcelain factory in Europe.

Fortunately we have documentary information of the exact composition of the artificial porcelain (*porcelaine tendre*) of Sèvres, and a brief account of its manufacture will serve to explain how all the glassy porcelains of Europe were made. The potter commenced by preparing a glass or frit, melting together pure sand, alum, sea-salt, gypsum, soda and nitre. The clear portions of this frit were powdered and washed with boiling water, and the working clay was compounded by adding to such powdered frit a small quantity of chalky clay or marl and sometimes pure chalk as well. This mixture was ground in water until the fluid was as fine as cream, and it was then boiled to a thick paste which was so little plastic in itself that black soap or parchment size was added to it to give it enough plasticity for the workman to be able to shape it. Vases and other pieces were made from this paste by pressing cakes of it in plaster moulds of considerable thickness. After pressing, of in plaster dried and were then either turned on a lathe or rubbed down with sand-paper to reduce them to sufficient thinness; while handles, spouts or other ornaments in relief were applied with a lute of slip, as is customary with every other species of pottery. The fragile objects were then fired into what is known as the "biscuit" condition; the most difficult part of the whole process. During this firing the pieces frequently went out of shape because of the excessive shrinkage of the material and its tendency to soften as it approached the melting point of the frit. Consequently an elaborate system of "propping" the pieces had to be resorted to, and even then a very large proportion became deformed. When the porcelain was drawn from the oven after the first firing, the supports were removed and the pieces were rubbed with sand to clean the surface, and were then coated with glaze by sprinkling with a brush; the glaze being a fusible glass very rich in lead. The glaze coat was melted by rehiring the piece at a lower temperature; and it was frequently necessary to repeat this process several times in order to get a perfectly even and brilliant result. The difficulties of such a process were enormous, and it was only by the financial support of wealthy patrons, or of the state, that such a method of manufacture was ever carried on for any length of time. At its best the material is an exceedingly beautiful one, lending itself especially to decoration in on-glaze colours, and the pieces produced at Vincennes and at Sèvres, between 1745 and 1770 or thereabouts, form a distinct class by themselves. Skillful chemists like Hellot and Macquer were employed to direct the operations, and many beautiful ground colours, such as the famous *ros-bles*, *bleu de roi*, *rose Pompadour*, pea-green and apple-green were invented.

*Sèvres Porcelains*.—The forms of the Sèvres porcelain are exceedingly varied. Many of the older shapes were designed by Duplessis, the king's silversmith, and, as is perhaps natural, are more proper to metal than to pottery; but the French glassy porcelain is such an artificial material in every respect that such a point should not be strained too far. Owing to the want of plasticity in the paste the pieces were always made in moulds of plaster of Paris, while in many cases they were moulded in separate parts and these united together with metal screws or mounted in bands of chased orniou. Table services made for actual use were usually painted on a plain white ground with the full palette of on-glaze colours (or enamels) and much rich

gilding. The decorative pieces such as vases, candelabra, jardinières, &c., were decorated in a much more sumptuous fashion by covering the greater part of the piece with a ground of one of the rich enamel colours previously mentioned, reserving only panels in white on which delicate miniature-like decorations of the most varied kind were subsequently painted and fired (see fig. 52; and examples of Sèvres, Plate IX.). Such collections as the Wallace at Hertford House, or the Jones Bequest in the Victoria and Albert Museum, show at once the variety and perfection to which the work attained.

This Sèvres porcelain is entirely devoid of the broad decorative treatment and rich full colour of any of the great kinds of fine pottery or porcelain. Artistically considered, it has no place beside the triumphs of the Chinese or Persian potters, or of the Italian majolists. Its shapes are too formal, and are not sufficiently imbued with a sense of the qualities of the material. The ground colours defy every natural tendency of pottery colour for they are even, flawless and mechanical, with none of the palpitating richness that comes so naturally from the potter's processes. The paintings, whether of flowers, birds or figure-subjects, are extraordinarily skillful regarded as miniatures, but as examples of pottery decoration they cannot be compared to the swift, apparently careless, brushwork of the great masters of earlier times. So pronounced was the demand of the period for smooth even finish that such ground colours as *ros-bles* and *bleu de roi*, where the colour naturally came varied and uneven, were subsequently decorated with small diapers or lines of gold in the form of *œil de perdrix* or *normicelle*, so as to produce a more regular and even effect. The most elaborate and costly of all the varieties of old Sèvres is what is known as "jewelled Sèvres," which is richly shown with imitation jewels, such as turquoises, pearls and rubies, closely resembling the real stones. These imitation jewels were in every case set in beautifully chased mountings of gold, and in the museum at Sèvres are to be found examples of the punches and other tools used in making these mounts. On account of the enormous expense involved in the production of such costly triumphs of skill, examples of jewelled Sèvres are rare even in the best collections, but the English student is fortunate in the fact that the Wallace collection contains a considerable number of them.

Many reasons—the prestige attaching to a Royal Manufactory, the knowledge that the porcelain was produced regardless of cost, the mechanical perfection of its colours, gilding and decoration, as well as the fact that the glassy porcelain was abandoned as too costly and risky after about 1780—have all conspired to raise the prices which modern collectors are prepared to pay for fine examples of *vieux Sèvres*. It is doubtful whether even the prices paid for paintings by old masters have advanced so rapidly as those paid for Sèvres porcelain of the best period. In the 'seventies of the 19th century it was deemed worthy of remark that a sum of £10,000 should have been paid at public auction for three old Sèvres vases; thirty years later one such piece would probably fetch the same price. It should be added that the extravagant prices now paid for Sèvres porcelain, which is much more a triumph of technical than of artistic skill, have led

the manufacture of porcelain was almost invariably carried on at the expense of some royal or princely patron; in England, however, the manufacture was not subsidized in this way, and it is probably for this reason that at a very early date we find the English porcelain-makers experimenting with other materials than glass and clay in order to make their processes more certain. In a patent taken out in 1749 by Thomas Frye of the Bow works we find mention of the use of bone-ash—the material that was to make English porcelain a distinct species by itself. From 1750 onwards there can be little doubt that, though a large proportion of glass was still used in the composition of the English porcelains, bone-ash was more and more introduced into the paste in order to obtain a more refractory material; yet it was not until about 1800 that Josiah Spode of Stoke-upon-Trent abandoned entirely the use of glass and composed his porcelain of china clay, bone-ash and felspathic rock for the body, glazing it with a rich lead glaze, and so laid the foundation of distinctively English porcelain. The material has many merits both from the useful and artistic points of view; it is much more easily fabricated than the old glassy porcelains, it endures better for ordinary table use than any other kind of porcelain, and it permits the fullest range of decoration.

Before entering upon a detailed notice of the important English factories of the 18th century, something should be said of the various influences that were at work in determining what the porcelain-maker should do, both in the way of shape and decoration. The eyes of all men were, of course, turned first to the porcelain brought from the far East; and in the early efforts of the English factories, as of those of France and Germany, we notice a predominance of white pieces or of pieces decorated with paintings in under-glaze blue alone, obviously inspired by the current importations from China. Bow and Chelsea produced large quantities of ware of this class, and in the early days of the Worcester factory little else was made there than white, or blue and white pieces closely simulating the Chinese. Another oriental influence was to be found in the Imari patterns of Japan, particularly those in the style of Kakiemon. It has been noted that Meissen, Chantilly and other continental factories had already created a vogue for these reproductions of Japanese decorations, and in our own country Bow, Chelsea and Worcester followed suit. The later Imari patterns, heavily decorated with blue and red and gold for the use of "the foreigner," furnished another popular style for Worcester and Derby, and the vogue of these English "Japan" patterns, in the last quarter of the 18th century and the first half of the 19th century, was so great that they represent a large proportion of the output of our English porcelain works during that period. The productions of the German and French factories also exerted a profound influence on English potters; so that throughout the 18th century English porcelains largely consisted of imitations of the foreign wares brought into the country by the wealthy.

We can only point to one method of porcelain decoration which undoubtedly arose in England. This is the method of transfer-printing, whereby patterns printed on paper from engraved copper plates are transferred to porcelain or pottery and subsequently fired, either under or on the glaze. At the best these printed patterns are in no way superior to the stencilled work of modern oriental porcelain, while, at the worst, European and American printed patterns have been perhaps the most inappropriate decoration ever applied to porcelain in the world. It has been generally urged on behalf of transfer-printing that it enables elaborate effects to be produced at a small cost and so brings decorated pottery within the reach of the humblest. The truer view is, that the simplest brushwork patterns, or even no pattern at all, would be preferable to the tawdry results that the cheapest forms of transfer-printing have rendered possible.

*Chelsea.*—Between 1750 and 1770 the Chelsea factory was the most important of all the English porcelain works, and fine specimens of this period command high prices in the saleroom to-day. We know little of the origin of this important factory, though it is believed to have been in existence from some time after 1740 to 1784, when it was finally demolished and some of

the workmen and part of the plant were removed to the then important works at Derby. The first manager was one Charles Gouyn, who was followed by a Mr Sprimont before 1750. Sprimont retained possession of the works until 1760, and died in 1771. It was during his management, from 1750 to 1770, that the finest and most characteristic pieces of Chelsea porcelain were made.

Although the styles in vogue at Chelsea are extremely varied, little was produced there that was really English in character. The earliest pieces appear to have been either in pure white or in white decorated with paintings in under-glaze blue. The goat-and-bee cream jugs, crawfish salt cellars, the shell and rockwork salt cellars, jugs, sauce boats, small cups and saucers of this type are fairly plentiful. Then came the decorations, mainly in red and gold, of the Kakiemon style, followed by reproductions of the brocade patterns of Imari porcelain. Afterwards we find the appearance of table wares modelled in imitation of leaves, animals, fruits, birds and fishes, apparently adopted from current French and German practice.

In another direction the influence of Meissen was also shown by the production of statuettes (see in Chelsea figure, Plate X.), and of the small modelled trinkets, scent-bottles and toys of which there is such a fine collection in the British Museum. In the latter days of the factory (say after 1758) we find Chelsea following in the wake of Sévres in the production of large and elaborate rococo vases, with pierced necks and covers, scroll-work bases and interlacing handles such as are to be seen in the Jones Bequest in the Victoria and Albert Museum. Pieces of this elaborate kind are overlaid with rich grounds of Mazarine blue, turquoise, pea-green, or the famous Chelsea claret-colour, while white panels are reserved framed with gilt scrolls and painted in enamel colours with flowers, birds or figure-subjects in absolute rivalry with the pieces manufactured at Sévres.

The Chelsea works appears to have come to an end through the ill-health of Sprimont, and it was sold in 1769–1770 to Duesbury, the proprietor of the Derby works. He carried on the establishment from 1770 to 1784, but in this period a great change is noticeable in the product of the factory. The "rococo" forms and decorations of the true Chelsea porcelain were replaced by works in the neo-classical style already rendered popular by the success of Josiah Wedgwood, and the Derby-Chelsea porcelain is quite a distinct production from the early works of Chelsea. The most distinctive mark of the Chelsea porcelain is an anchor—either embossed in the paste or painted in gold or colour. Often the anchors occur in pairs, and it is frequently associated with other marks such as a dagger or a cross. Some of the Derby-Chelsea pieces are marked with a conjoined D and an anchor.

Chelsea Potters' marks.

*Bow.*—The date of the establishment of the factory at Stratford-le-Bow, in what is now the East End of London, is quite uncertain, but in 1744 Edward Heylyn and Thomas Frye, who were connected with this factory, took out a patent for the manufacture of porcelain. The materials mentioned in this patent are not such as would produce porcelain at all, and it appears likely that the specification was made purposely defective. In 1749 a further patent was applied for in which we get the first mention of bone-ash, so that from the technical point of view the wares made at the Bow factory are of the utmost importance as indicating the experimental beginnings of our English porcelain in which bone-ash plays such an important part. In 1750 the works at Bow belonged to Messrs Weatherby & Crowther, and was then known as "New Canton," and as 300 workpeople were employed, the operations must have been conducted on a large scale; but ultimately, from causes that can only be surmised, the partnership was dissolved and the business failed, so that in 1775 the works was bought for a very small sum by the William Duesbury already mentioned, who transferred part of the plant and moulds to his more prosperous works at Derby. It would appear from what we know of the factory and its

productions that the business was conducted on simpler lines than at the Chelsea works. We have, for instance, no elaborate vases in imitation of Sèvres, and no important groups of figures which might challenge rivalry with Meissen. We find, as is common with all the early porcelain factories of Europe, first the production of white pieces with modelled reliefs, or of pieces painted with under-glaze blue in imitation of Chinese porcelain. Then followed the well-known "Quail," or "Partridge," and "Wheat-sheaf" patterns in red and green and gold in imitation of the Japanese patterns; and the manufacture of table ware decorated with these simple yet bright and pleasant devices seems to have formed the greater part of the work at the factory. Many figures and statuettes were also produced at Bow, but they are fewer in number and less cleverly made and decorated than the contemporary productions of the Chelsea factory. We may surmise that there was considerable rivalry between these two works

Bow Pottery marks.

situated on the outskirts of the metropolis, for we find the "anchor" mark, which is the best recognized mark of Chelsea porcelain, often occurring on specimens that from internal evidence or from the piece

itself we should rather attribute to Bow. The Bow marks are not very certain, but some of the likeliest are here given.

**Worcester.**—The third of the early English factories, and ultimately the most important of all, was that founded at Worcester in 1751 by Dr Wall, a man of unusual attainments, and a number of his friends. How Dr Wall came to learn the secret of porcelain making is absolutely unknown, but even assuming that he acquired some information from wandering workmen it is certain that the Worcester porcelain was soon developed on original lines. The nature of the paste and the glaze of the early Worcester productions, as well as the sobriety of their decorations, stamp this factory as the first where Englishmen really developed a native porcelain. Between 1751 and 1770, the first period of Worcester porcelain, the prevalent influence was that of Chinese blue-and-white, and the pieces of that period are rightly esteemed by collectors for their artistic quality. Probably nowhere in Europe, certainly nowhere in England, was oriental blue-and-white more carefully studied, and a collection of this blue-and-white Worcester is most satisfactory from the aesthetic point of view. The productions at this time were tea and coffee services, bowls, dishes, mugs and plates. The cups were usually made without handles in imitation of the oriental practice, but large, two-handled covered cups for caudle, broth and chocolate were also made during the early period. Many of these larger cups bore an embossed pattern resembling a pine-cone, possibly imitated from a shape produced at St Cloud; while openwork dishes, plates and fruit baskets were also made in imitation of a popular Meissen fashion.

The method of decorating porcelain with transfer prints was introduced at Worcester as early as 1756, when Robert Hancock, an engraver, came from York House, Battersea, where the process was first employed for the decoration of the Battersea enamels. The early Worcester prints comprised portraits of celebrities of the time (the Frederick the Great mug), or adaptations of the works of great artists such as Gainsborough and Watteau, or copies of current engravings or sporting prints. The first printing was done in black or purple, and transferred on to the fired glaze, and it was not until about 1770 that the process of printing in blue under the glaze was perfected. It is interesting to note that for many years this process of transfer printing was developed side by side with the older method of porcelain painting, and until the end of the 18th century the processes appear to have been used at Worcester quite independently. The closing of the Chelsea factory in 1770 led to the migration of some of the Chelsea painters to Worcester, and from about that date a considerable amount of Worcester porcelain was decorated on the glaze with enamel colours and gilding after the styles that had been rendered popular at Chelsea and Bow. It is only fair to remark, however, that the Worcester patterns are always

distinguished by a certain English character both in the style and the workmanship (see example, Plate X.). The first and most artistic period of Worcester porcelain came to an end before 1783, when, after the death of Dr Wall, the works passed under the control of Thomas Flight and his two sons, who had been jewellers. The Flight influence was soon noticeable from the fact that the new shapes were more and more based on those of Sèvres and Meissen, while the decoration became more mechanical and precise as befitted the work of jewellers rather than potters. King George III. and Queen Charlotte visited the works in 1788 and bestowed upon

Early Worcester Pottery marks.

the firm the privilege of styling themselves "China Manufacturers to Their Majesties," since when the works has always been known as the Worcester Royal Porcelain Works. In 1793 Martin Barr was taken into partnership; the "Flight & Barr" period, so well known to collectors, lasted until 1807.

Another Worcester porcelain works was in existence after 1784, viz. the Chamberlain factory, which was working in rivalry with the original establishment; but its productions are of no particular artistic merit, and in 1840 the two firms became amalgamated, and so gave rise to the present Worcester Royal Porcelain Co. The most noteworthy feature of the productions of both the Worcester works at the end of the 18th century were the "Armorial" services made for various royal and noble families, and those adaptations of Imari patterns known as "Old Japan."

**Derby.**—Experiments in the manufacture of porcelain appear to have been made at Derby as early as 1750 by a French refugee, Andrew Planché; but the business, which was afterwards to attain such a great development, was only founded in 1756 with William Duesbury as its manager. Duesbury was originally a decorator of china figures in London, and his career proves that he was a man of great industry and energy, for within twenty-five years he not only built up a large business at Derby, but he absorbed the decadent works at Bow and Chelsea, so that in the last quarter of the 18th century Derby was the most important china manufactory in England. As is so often the case, a commercial success like this implied the absence of any distinct artistic impulse. The porcelain produced at Derby is for the most part only an echo of the successes of Meissen, Sèvres, or the earlier English factories. It is only fair to remark that a very deep and rich under-glaze blue was attained at the Derby works,

Derby Pottery marks.

and that this was associated with very mechanical painting of birds and flowers and with gilding of exceptional quality. At this factory, too, the old Japan patterns were imitated with exceptional vigour, until "Crown-Derby Japan" became a standard trade name for this clobbered oriental style.

Mention has already been made of the "biscuit" porcelain figures made at Derby, which are superior in style to anything else made in Europe in the 18th century except the "biscuit" porcelains of Sèvres. The Derby "biscuits" of the best type range from 1790 to 1810, and the finest specimens have a "waxy" surface, though there is little or no sheen and every detail remains as crisp as when the figure left the hand of its maker. The most famous of these figures are the portrait medallions and statuettes of British generals and admirals which were modelled by an artist named Stephan. Spengler, a Swiss, modelled numerous groups adapted from the drawings of Angelica Kaufmann, while a workman named Coffee seems to have modelled only rustic figures and animals.

**Plymouth and Bristol.**—The porcelain factories at Plymouth

and Bristol are mainly noteworthy because they were the only English factories in which a true porcelain strictly analogous to the Chinese was ever manufactured. William Cookworthy, a Quaker druggist of Plymouth, was greatly interested in attempting to discover in Cornwall and Devonshire minerals similar to those which were described in the letters of Père d'Entrecolles as forming the basis of Chinese porcelain. After many years of travel and research he ascertained the nature of the Cornish stone and Cornish clay, and in 1768 he founded a works at Plymouth for the production of a porcelain similar to the Chinese from these native materials. Readers interested in this abortive enterprise, from which such great results were afterwards to come, can only be referred to the general histories of English porcelain, for the factory was removed to Bristol in 1770 and was shortly afterwards transferred to Richard Champion, a Bristol merchant, who had already been dabbling in the fashionable pursuit of porcelain making. Champion's Bristol factory lasted from 1773 to 1781, when the business had to be sold to a number of Staffordshire potters owing to the serious losses it had entailed. The Bristol porcelain, like that of Plymouth, was always a true felspathic porcelain resembling the Chinese, but made from the china clay and china stone of Cornwall. It is, therefore, harder and whiter than the other English porcelains, and its cold, harsh, glittering glaze marks it off at once from the wares of Bow, Chelsea, Worcester or Derby.

The Bristol porcelain resembled that of Meissen quite as much in its style of decoration as in the nature of its materials. One can point to nothing distinctly English about it, and if specimens now command very high prices in the salerooms it is on account of their rarity rather than of any intrinsic quality or beauty that they possess.

Table ware of various kinds formed the greater part of the production of the Bristol works, but a considerable number of figures are known, in many cases obviously copied from those of Meissen, and a few large hexagonal vases similar in style to specimens produced at Chelsea and at Worcester. The most distinctive pieces made at the Bristol factory are certain small plaques or slabs in "biscuit" porcelain, usually bearing in the centre a portrait medallion or armorial bearings surrounded by a wreath of skillfully modelled flowers. Good examples of these choice productions are to be seen in the British Museum.

The Plymouth factory is supposed to have adopted as its general mark the alchemical symbol for tin. This mark was also used to a limited extent at the Bristol factory, though the

general Bristol mark was a cross or a copy of the crossed swords of Meissen. The Staffordshire potters who bought the rights of the Bristol porcelain factory from Champion established a works at Shelton, near Stoke-upon-Trent, in Staffordshire, under the name of New Hall Porcelain Co., but they never manufactured anything of artistic account.

**Minor English Factories.**—A number of other porcelain factories were founded in England in the latter half of the 18th century, but none of these produced ware of any particular merit. The porcelain made at Longton Hall by William Littler (1752-1758), always clumsy and ugly in form, is interesting for a splendid blue colour characteristic of the factory. This small venture was ultimately absorbed by William Duesbury.

The colony of potters established in Liverpool also made a certain amount of porcelain, as well as "Delft" and other earthenwares, and the Liverpool Museum contains some good examples of their productions.

A little factory at work at Lowestoft in the last quarter of the 18th century has attracted much more attention than it deserves, because certain writers foolishly attributed to it large quantities of "Armorial" porcelain which had, undoubtedly, been made in China. Recent excavations have established the fact that this factory was only of minor importance, and was mainly occupied in producing cheap wares in rivalry with, and even in imitation of, those of the more important English factories.

Towards the end of the 18th century the manufacture of English porcelain spread into the Staffordshire potteries, and the firms of

Spode, Davenport and Minton became the most important English factories of the early 19th century. For notices of the minor English factories of the late 18th century and early 19th century, such as Caughley, Coalport, Swansea and Nantgarw, the student is referred to the special works dealing with the history of English porcelain.

**Collections.**—The British Museum and the Victoria and Albert Museum contain the best general collections of English porcelain. The museums at Bristol and Liverpool contain examples of the local wares; while the museum at the Worcester Royal Porcelain works has an admirable collection of the wares of that factory. Many noteworthy private collections are in existence, of which we may mention those of Mr Dyson Perrins, Mr Cockshutt and Mr Trapnell.

**LITERATURE.**—Alex. Brongniart, *Traité des arts céramiques* (1844); Jacquemart, *Histoire de la céramique* (Eng. ed. 1873); Jännicke, *Grundriss der Keramik* (1879); Dr Brinkmann, *Handbuch der Europäischen Porzellains in der Hamburg Museum*; Marryat, *History of Pottery and Porcelain* (1857); Jewitt, *Ceramic Art of Great Britain* (1878); Auscher, *A History and Description of French Porcelain* (1905); Burton, *A History and Description of English Porcelain* (1902); Dillon, *Porcelain* (1904); Solon, *Old English Porcelain* (1903); Burton, *Porcelain* (1906); R. Almström, *Lerövarna på deras Tillverkning* (1903). (W. B.)

#### POTTERY AND PORCELAIN DURING THE 19TH CENTURY

The development of the manufacture of pottery and porcelain in Europe and America throughout the 19th century need not be treated in such detail as the history of its growth up to that period, for modern means of communication and the general diffusion of knowledge have tended to destroy the individual character which was so marked a feature of the pottery of different countries in previous centuries. The 19th century was distinctly the century of machinery, and, for the most part, it witnessed the displacement by mechanical processes of those methods of handicraft which made the older pottery individual and interesting even in its simplest forms. Collectors are prepared to pay very large sums for choice examples of the potter's art of bygone centuries, but it is doubtful if much of the pottery of the 19th century will ever be collected for its intrinsic merits, though it may be preserved as an illustration of the spirit of the age.

In preceding sections of this article the development of the brightly painted tin-enamelled wares and the gaily decorated porcelains of various European countries have been traced down to the end of the 18th century, because that date marks, quite distinctly, the period when the old handicraft of the potter was for various reasons displaced by organized manufacture. The disturbed economic condition of Europe in the last quarter of the 18th century and the Napoleonic Wars of the early 19th century proved disastrous to most of the pottery and porcelain works where artistic wares were made, and the disturbance of traditional methods was completed by the superior mechanical perfection and cheapness of the English earthenware introduced by Wedgwood and his contemporaries. The English pottery was neater, more perfectly finished and more durable than the painted tin-enamelled pottery of the continent. It vied in finish with the expensive continental porcelains, and for nearly half a century it carried all before it, not only in England, but throughout the world. An intelligent observer, M. Faujas de Saint Fond, writing in the beginning of the 19th century, remarks of English pottery that "Its excellent workmanship, its solidity, the advantage which it possesses of sustaining the action of fire, its fine glaze impenetrable to acids, the beauty and convenience of its form, and the cheapness of its price, have given rise to a commerce so active and so universal, that in travelling from Paris to Petersburg, from Amsterdam to the farthest parts of Sweden, and from Dunkirk to the extremity of the south of France one is served at every inn upon English ware. Spain, Portugal and Italy are supplied with it; and vessels are loaded with it for the East Indies, the West Indies, and the continent of America." It was calculated that at this time three-fourths of the pottery manufactured in England was sent abroad. Such a state of things was not likely to continue, and in most of the European countries, after the settlement of 1815, such of the older factories as had survived, or new factories specially created for the purpose, adopted English methods of manufacture. In many cases

Plymouth, Bristol, Champion and Swansea marks.

experienced Staffordshire potters were procured to direct these works, and so far as ordinary domestic pottery was concerned, the first half of the 19th century witnessed the establishment in every country of Europe and in the United States of America of pottery works managed by Englishmen, where earthenwares were made after the English fashion. We shall refer presently to the survival or revival of the older styles of pottery and porcelain, but the English influence was undoubtedly paramount, with one or two notable exceptions, down to 1850, or even later. England itself witnessed a notable development of its pottery manufacture, which became more and more aggregated in that district of North Staffordshire designated emphatically "The Potteries," where, in spite of later developments, from two-thirds to three-quarters of all the pottery and porcelain made in the British Isles is still produced. This concentration of the industry in England has resulted in a race of pottery workers not to be matched elsewhere in the world, and while it was the supply of cheap coal and coarse clay which first gave Staffordshire its pre-eminence, that pre-eminence is now retained as much by the traditional skill of the workmen of the district as by the enterprise of its manufacturers.

While we must admire, from the economic point of view, the methods of manufacture which have placed England in the first rank as a pottery-producing country, inasmuch as they have brought within the reach of the humblest domestic utensils of high finish and great durability, it is impossible to say much for the taste or art associated with them. Neatness, serviceableness and durability, English domestic wares undoubtedly possess in a degree unknown to any earlier type of pottery, but the general use of transfer-printing as the principal method of decoration, and the absence of any distinctive style of ornament, must cause them to take a low rank in comparison with the wares of past centuries, when mechanical perfection was impossible and rich colour and truly decorative painting were the chief distinctions of the pottery of every country. The London International Exhibition of 1851 is generally supposed to indicate the low-water mark of art as applied to industry; it should rather be regarded as marking the period when many of the old handicrafts had been extinguished by the use of mechanical appliances and the growth of the factory system, and when the delight of men in these current developments was so great that they were regarded as triumphs in themselves, when they were only "means to an end."

Since that period the development of pottery and porcelain has followed two main directions: (1) an attempt on the part of manufacturers to produce the most artistic results possible with modern processes and methods, and (2) the interesting and valuable efforts of those individual potters in every country with whom art was the first consideration and commercial production was disregarded.

Though the English pottery factories were of such paramount importance in the first half of the 19th century, it must be remembered that some of the oldest factories in Europe were still alive and active. The royal factories in Sèvres, Meissen, Berlin, Vienna, St Petersburg and elsewhere, surviving the wreck of the Napoleonic Wars, continued at the expense of their respective states, to produce porcelains which were the legitimate development of their work during the 18th century.

*Meissen and Berlin.*—At Meissen, efforts were made to improve the technical process in use, but, unfortunately, the old Meissen wares had already become valuable, and they were reproduced, marks included, until all initiative was destroyed, and the factory continued to live, mainly, on its old reputation.

At Berlin, the financial troubles of the Prussian monarchy throughout the early years of the 19th century were severely felt, so that a cheaper class of porcelain was manufactured. The only innovations that can be ascribed to the factory during this period, though highly esteemed at the time, form striking examples of the artistic decadence of the period. Such was the lace-work decoration made by dipping lace in porcelain slip so that on firing the thread burned away, leaving a porcelain facsimile; another was the production of slabs of porcelain modelled in such a way that on viewing the piece by transmitted light it appeared like a picture painted *en grisaille*.

From the artistic point of view there is little to be said for the majority of productions of the Berlin factory, but nowhere in the world has greater attention been paid to the technical and scientific problems of porcelain manufacture, and this establishment has rendered the greatest service in the development of the important chemical and electrical industries of Germany by the splendid appliances it has invented for scientific use.

Since 1870 the works, removed to Charlottenburg, have been conducted with very great enterprise. It was here that Seger perfected his soft porcelain based on the glazes and bodies of the best Japanese porcelains, and here also he developed the manufacture of copper-red glazes in imitation of the old *sang-de-bœuf* and *flambé* glazes of the Chinese, at the same time establishing some of the scientific principles underlying their production. At Berlin, too, all the modern methods of decoration, whether in coloured glazes, raised enamels, *pâte sur pâte*, the elaborate paintings of flowers, birds or figures, or the use of crystalline glazes, have been followed with great success; but the factory has never yet given any special impetus or new direction to the decorative side of porcelain.

*Vienna.*—Few European factories were so little affected by the general trend of affairs as the royal factory at Vienna. We have already referred to the elaborate paintings and rich gilding which became the distinguishing feature of its wares towards the end of the 18th century, and this style, once perfected, seems to have been continued with little change. It has been stated by a renowned German authority, that the Viennese porcelain was at its best between 1785 and 1815. During this period the plan of painting copies of pictures on porcelain was developed to its utmost, and this, in combination with the richest gilding, marks the apotheosis of Viennese porcelain. The factory came to an end in 1864, but collectors should be warned that a flood of cheap porcelains, decorated in modern Viennese workshops, and therefore styled "Viennese porcelain," has during the last twenty years overwhelmed the English and American markets.

*Sèvres.*—The important part played by the Royal French manufactory at Sèvres has already been sketched. During the troublous years of the French Revolution the works practically came to a standstill, and under the Directory it was a question whether this manufactory, along with certain other state establishments in France, should be closed. Napoleon, however, decided that for the glory of France and as a means of encouraging its porcelain industry, seriously threatened by the English potters, the establishment at Sèvres should be conducted as a national factory. By a splendid coincidence Alexander Brongniart, a man of great natural ability, and a noted scientist, was appointed director, and retained that post under the successive governments of France until his death in 1847. In the hands of Brongniart the establishment at Sèvres became at once a school of research and a centre of practical accomplishment—the influence of which was felt throughout Europe. Its products were obviously inspired by the demands of successive French monarchs and their courts. It ministered to the grandiose ideas of Napoleon, who demanded pieces that were to speak of his victories, and after every campaign a fresh table service or new suite of vases was produced to commemorate the emperor's successes. The most striking piece of this kind was the vase made to commemorate the marriage of Napoleon and Marie Louise in 1810. It was designed by Isabey and was modelled with figures in bas-relief. The principal group contains not less than 115 such figures, while the subsidiary group, representing the acclaiming populace, contains between 2000 and 3000 figures. This vase was three years in making, and is said to have cost something like £1250. Unfortunately this was not a solitary example of the productions of Sèvres, for under every successive government of the 19th century the factory has been called to produce enormous vases which are to be found in the rooms or corridors of every palace and museum in France, and while these pieces represent wonderful technical skill, both in their manufacture and the decorations with which they are covered, very few of them possess either spontaneity or charm. They are correct, frigid, cold, and compare most unfavourably from

*hidalgo don Quixote de la Mancha* was published at Tarragona in 1614. On the assumption that Fernandez de Avellaneda is a pseudonym, this spurious sequel has been ascribed to the king's confessor, Luis de Aliaga, to Cervantes' old enemy, Blanco de Paz, to his old friend, Bartolomé Leonardo de Argensola, to the three great dramatists, Lope de Vega, Tirso de Molina and Ruiz de Alarcón, to Alonso Fernandez, to Juan José Martí, to Alonso Lamberto, to Luis de Granada, and probably to others. Some of these attributions are manifestly absurd—for example, Luis de Granada died seventeen years before the first part of *Don Quixote* was published—and all of them are improbable conjectures; if Avellaneda be not the real name of the author, his identity is still undiscovered. His book is not devoid of literary talent and robust humour, and possibly he began it under the impression that Cervantes was no more likely to finish *Don Quixote* than to finish the *Galatea*. He should, however, have abandoned his project on reading the announcement in the preface to the *Novelas ejemplares*; what he actually did was to disgrace himself by writing an insolent preface taunting Cervantes with his physical defects, his moral infirmities, his age, loneliness and experiences in jail. He was too intelligent to imagine that his continuation could hold its own against the authentic sequel, and malignantly avowed his intention of being first in the field and so spoiling Cervantes' market. It is quite possible that *Don Quixote* might have been left incomplete but for this insulting intrusion; Cervantes was a leisurely writer and was, as he states, engaged on *El Engaño de los ojos*, *Las Semanas del Jardín* and *El Famoso Bernardo*, none of which have been preserved. Avellaneda forced him to concentrate his attention on his masterpiece, and the authentic second part of *Don Quixote* appeared towards the end of 1615. No book more signally contradicts the maxim, quoted by the Bachelor Carrasco, that "no second part was ever good." It is true that the last fourteen chapters are damaged by undignified denunciations of Avellaneda; but, apart from this, the second part of *Don Quixote* is an improvement on the first. The humour is more subtle and mature; the style is of more even excellence; and the characters of the bachelor and of the physician, Pedro Recio de Agüero, are presented with a more vivid effect than any of the secondary characters in the first part. Cervantes had clearly profited by the criticism of those who objected to "the countless cudgellings inflicted on Señor Don Quixote," and to the irrelevant interpolation of extraneous stories in the text. Don Quixote moves through the second part with unruffled dignity; Sancho Panza loses something of his rustic cunning, but he gains in wit, sense and manners. The original conception is unchanged in essentials, but it is more logically developed, and there is a notable progress in construction. Cervantes had grown to love his knight and squire, and he understood his own creations better than at the outset; more completely master of his craft, he wrote his sequel with the unflinching confidence of a renowned artist bent on sustaining his reputation.

The first part of *Don Quixote* had been reprinted at Madrid in 1608; it had been produced at Brussels in 1607 and 1611, and at Milan in 1610; it had been translated into English in 1612 and into French in 1614. Cervantes was celebrated in and out of Spain, but his celebrity had not brought him wealth. The members of the French special embassy, sent to Madrid in February 1615, under the Commandeur de Sillery, heard with amazement that the author of the *Galatea*, the *Novelas ejemplares* and *Don Quixote* was "old, a soldier, a gentleman and poor." But his trials were almost at an end. Though failing in health, he worked assiduously at *Los Trabajos de Persiles y Sigismunda*, which, as he had jocosely prophesied in the preface to the second part of *Don Quixote*, would be "either the worst or the best book ever written in our tongue." It is the most carefully written of his prose works, and the least animated or attractive of them; signs of fatigue and of waning powers are unmistakably visible. Cervantes was not destined to see it in print. He was attacked by dropsy, and, on the 18th of April 1616, received the sacrament of extreme unction; next day he wrote the dedication of *Persiles y Sigismunda* to the count de Lemos—the most

moving and gallant of farewells. He died at Madrid in the Calle del León on the 23rd of April; he was borne from his house "with his face uncovered," according to the rule of the Tertiaries of St Francis, and on the 24th of April was buried in the church attached to the convent of the Trinitarian nuns in the Calle de Cantarranas. There he rests—the author of his remains being removed in 1633 to the Calle del Humilladero has no foundation in fact—but the exact position of his grave is unknown. Early in 1617 *Persiles y Sigismunda* was published, and passed through eight editions within two years; but the interest in it soon died away, and it was not reprinted between 1625 and 1719. Cervantes' wife died without issue on the 31st of October 1628; his natural daughter, who survived both the child of her first marriage and her second husband, died on the 20th of September 1652. Cervantes is represented solely by his works. The *Novelas ejemplares* alone would give him the foremost place among Spanish novelists; *Don Quixote* entitles him to rank with the greatest writers of all time: "children turn its leaves, young people read it, grown men understand it, old folk praise it." It has outlived all changes of literary taste, and is even more popular to-day than it was three centuries ago.

**CERVERA, PASCUAL CERVERA Y TOPETE** (1839-1909). Spanish admiral, was born at Medina Sidonia on the 18th of February 1839. He showed an early inclination for the sea, and his family sent him to the naval cadet school at the age of twelve. As a sub-lieutenant he took part in the naval operations on the coast of Morocco during the campaign of 1859-60. Then he was for some time engaged in operations in the Sulu Islands and the Philippines. Afterwards he was on the West India station during the early part of the first Cuban War (1868-78), returning to Spain in 1873 to serve on the Basque coast against the Carlists. He distinguished himself in defending the Carraca arsenal near Cadix against the Federals in 1873. He won each step in his promotion up to flag-rank through his steadiness and brilliant conduct in action, and was awarded the crosses of the Orders of Military and Naval Merit, Isabella the Catholic, and St Hermenegilde, besides several medals. Cervera had a great reputation for decision, unbending temper and honesty, before he was placed at the head of the Bilbao building-yards. This post he resigned after a few months in order to become minister of marine in 1892, in a cabinet presided over by Sagasta. He withdrew from the cabinet when he found that his colleagues, from political motives, declined to support him in making reforms and

on the other hand, unwisely cut down the naval estimates. When in 1898 the Spanish-American War (q.v.) broke out, he was chosen to command a squadron composed of four first-class cruisers, the "Maria Theresa," his flagship, "Oquendo," "Vizcaya," and "Columbus," and several destroyers. This ill-fated squadron only started upon its reckless cruise across the ocean after its gallant commander had repeatedly warned both the minister of marine and the prime minister, Sagasta, in despatches from Cadiz and from the Canary and Cape Verde Islands, that the ships were insufficiently provided with coal and ammunition. Some of them, indeed, even lacked proper guns. In compliance with the instructions of the government, Admiral Cervera made for the landlocked harbour of Santiago de Cuba, where he co-operated in the defence, landing some guns and a naval brigade. In spite of his energetic representations, Cervera received an order from Madrid, dictated by political considerations, to sail forth. It meant certain destruction. The gallant squadron met forces trebly superior to it, and was totally destroyed. The admiral, three of his captains, and 1800 sailors and marines were taken by the victors to Portsmouth, New Hampshire, U.S.A. After the war, Cervera and his captains were tried before the supreme naval and military court of the realm, which honourably acquitted them all. In 1901 he became vice-admiral, in 1902 was appointed chief of staff of the Spanish navy, and in 1903 was made life senator. He died at Puerto Real on the 3rd of April 1909.

**CESAREVICH**, or more properly **TSAREVICH**, the title of the heir-apparent to the Russian throne. The full official title is *Nasiednik Tsaresenich*, i.e. "heir of Caesar," and in Russia the heir to the throne is commonly called simply *Nasiednik*, the word *Tsaresenich* never being used alone. *Tsarevich*, a form now much used in England, means simply any "king's son"; it is an antiquated term now out of use in Russia, and was last borne as heir to the throne by the unfortunate Alexis, son of Peter the Great. The style of the wife of the tsaresenich is *Tsaresenova*. The Cesarewitch handicap race at Newmarket, founded in 1839, was named after the prince who was afterwards Alexander II. of Russia, who paid a state visit to England that year.

**CESARI, GIUSEPPE**, called *Il Cavaliere d'Arpino* (born in or about 1568 and created a "Cavaliere di Cristo" by Pope Clement VIII.), also named *Il Giuseppeino*, an Italian painter, much encouraged at Rome and munificently rewarded. His father had been a native of Arpino, but Giuseppe himself was born in Rome. Cesari is stigmatized by Lanzi as not less the corrupter of taste in painting than Marino was in poetry; indeed, another of the nicknames of Cesari is "*Il Marino de' Pittori*" (the pictorial Marino). There was spirit in Cesari's heads of men and horses, and his frescoes in the Capitol (story of Romulus and Remus, &c.), which occupied him at intervals during forty years, are well coloured; but he drew the human form ill. His perspective is faulty, his extremities monotonous, and his chiaroscuro defective. He died in 1640, at the age of seventy-two, or perhaps of eighty, at Rome. Cesari ranks as the head of the "Idealists" of his period, as opposed to the "Naturalists," of whom Michelangelo da Caravaggio was the leading champion.—the so-called "idealism" consisting more in reckless facility, and disregard of the common facts and common-sense of nature, than in anything to which so lofty a name could be properly accorded. He was a man of touchy and irascible character, and rose from penury to the height of opulence. His brother Bernardino assisted in many of his works.

**CESAROTTI, MELCHIORE** (1730-1808), Italian poet, was born at Padua in 1730, of a noble but impoverished family. At the university of his native place his literary progress procured for him at a very early age the chair of rhetoric, and in 1768 the professorship of Greek and Hebrew. On the invasion of Italy by the French, he gave his pen to their cause, received a pension, and was made knight of the iron crown by Napoleon I., to whom, in consequence, he addressed a bombastic and extravagantly flattering poem called *Promea*. Cesarotti is best known as the translator of Homer and Ossian. Much praise cannot be given to his version of the *Iliad*, for he has not scrupled to add, omit

and modernize. Ossian, which he held to be the finest of poems, he has, on the other hand, considerably improved in translation; and the appearance of his version attracted much attention in Italy and France, and raised up many imitators of the Ossianic style. Cesarotti also produced a number of works in prose, including a *Course of Greek Literature*, and essays *On the Origin and Progress of the Poetic Art*, *On the Sources of the Pleasure derived from Tragedy*, *On the Philosophy of Language* and *On the Philosophy of Taste*, the last being a defence of his own great eccentricities in criticism. His weakness was a straining after novelty. His style is forcible, but full of Gallicisms.

A complete edition of his works, in 42 vols. 8vo, began to appear at Pisa in 1800, and was completed in 1813, after his death. See *Memoirs*, by Barbieri (Padua, 1810), and *Un Filosofo delle lettere*, by Alemanni (Turin, 1894).

**CESENA** (anc. *Caesena*), a town and episcopal see of Emilia, Italy, in the province of Forlì, 12 m. S.E. by rail from the town of Forlì, on the line between Bologna and Rimini, 144 ft. above sea-level. Pop. (1905) 12,245 (town); 43,468 (commune). The town is picturesquely situated at the foot of the slopes of the Apennines, and is crowned by a medieval fortress (Rocca), begun by the emperor Frederick I. (Barbarossa) probably, but altered and added to later. The cathedral has two fine marble altars by the Lombardi of Venice (or their school). The library, built for Domenico Malatesta in 1452 by Matteo Nuzio, is a fine early Renaissance building, and its internal arrangements, with the original desks to which the books are still chained, are especially well preserved (see J. W. Clark, *The Care of Books*, Cambridge, 1901, p. 199). In it are valuable MSS., many of which were used by Aldus Manutius. It also contains a picture gallery with a good "Presentation in the Temple" by Francesco Francia. There are some fine palaces in the town. Three-quarters of a mile south-east on the hill stands the handsome church of S. Maria del Monte, after the style of Bramante, with carved stalls of the 16th century. Wine, hemp and silk are the main articles of trade. About the ancient Caesena little is said in classical authors: it is mentioned as a station on the Via Aemilia and as a fortress in the wars of Theodorid and Narses. During the middle ages it was at first independent. In 1357 it was unsuccessfully defended by the wife of Francesco Ordelaffi, lord of Forlì, against the papal troops under Albornoz. In 1377 it was sacked by Cardinal Robert of Geneva (afterwards Clement VII., antipope). It was then held by the Malatesta of Rimini until 1465, when it came under the dominion of the church. Both Pius VI. (1771) and Pius VII. (1742) were born at Cesena. (T. As.)

**CESNOLA, LUIGI PALMA DI** (1832-1904), Italian-American soldier and archaeologist, was born near Turin on the 20th of July 1832. Having served in the Austrian and Crimean Wars, in 1860 he went to New York, where he taught Italian and French and founded a military school for officers. He took part in the American Civil War as colonel of a cavalry regiment, and at Aldie (June 1863) was wounded and taken prisoner. He was released from Libby prison early in 1864, served in the Wilderness and Petersburg campaigns (1864-65) as a brigadier of cavalry, and at the close of the war was breveted brigadier-general. He was then appointed United States consul at Larnaca in Cyprus (1865-1877). During his stay in the island he carried on excavations, which resulted in the discovery of a large number of antiquities. The collection was purchased by the Metropolitan Museum of New York, and Cesnola became director in 1879. Doubt having been thrown by Gaston L. Feuerdant, in an article in the *New York Herald* (August 1880), upon the genuineness of his restorations, the matter was referred to a special committee, which pronounced in his favour.<sup>1</sup> He is the author of *Cyprus, its ancient Cities, Tombs and Temples* (1877), an interesting book of travel and of considerable service to the practical antiquary; and of a *Descriptive Atlas of the Cesnola Collection of Cypriote Antiquities* (3 vols., 1884-6). He died in New York on the 21st of November 1904. He was a

<sup>1</sup> For the Cesnola controversy see C. D. Cobham's *Attempt at a Bibliography of Cyprus* (4th ed., 1900). See also article **CYPRUS**.

81 m. N. of Lyons by the Paris-Lyon railway. Pop. (1906) 26,538. It is a well-built town, with fine quays, situated in an extensive plain on the right bank of the Saône at its junction with the Canal du Centre. A handsome stone bridge of the 15th century, decorated in the 18th century with obelisks, connects it with the suburb of St Laurent on an island in the river. The principal building is the church of St Vincent, once the cathedral. It dates mainly from the 12th to the 15th centuries, but the façade is modern and unpleasing. The old bishop's palace is a building of the 15th century. The church of St Pierre, with two lofty steeples, dates from the late 17th century. Chalons preserves remains of its ancient ramparts and a number of old houses. The administrative buildings are modern. An obelisk was erected in 1730 to commemorate the opening of the canal. There is a statue of J. N. Niecepe, a native of the town. Chalons is the seat of a sub-prefecture and a court of assizes, and there are tribunals of first instance and commerce, a branch of the Bank of France, a chamber of commerce, communal colleges for boys and girls, a school of drawing, a public library and a museum. Chalons ranks next to Le Creusot among the manufacturing towns of Burgundy; its position at the junction of the Canal du Centre and the Saône, and as a railway centre for Lyons, Paris, Dôle, Lons-le-Saunier and Roanne, brings it a large transit trade. The founding and working of copper and iron is its main industry; the large engineering works of Petit-Creusot, a branch of those of Le Creusot, construct bridges, tug-boats and torpedo-boats; distilleries, glass-works, chemical works, straw-hat manufactories, oil-works, tile-works and sugar refineries also occupy many hands. Wine, grain, iron, leather and timber are among the many products for which the town is an entrepôt. About 2 m. east of Chalons is St Marcel (named after the saint who in the 2nd century preached Christianity at Chalons), which has a church of the 12th century, once belonging to a famous abbey.

Chalons-sur-Saône is identified with the ancient *Cabillonum*, originally an important town of the Aedui. It was chosen in the 6th century by Gontram, king of Burgundy, as his capital; and it continued till the 10th to pay for its importance by being frequently sacked. The bishopric, founded in the 4th century, was suppressed at the Revolution. In feudal times Chalons was the capital of a countship. In 1237 it was given in exchange for other fiefs in the Jura by Jean le Sage, whose descendants nevertheless retained the title. Hugh IV., duke of Burgundy, the other party to the exchange, gave the citizens a communal charter in 1256. In its modern history the most important event was the resistance offered to a division of the Austrian army in 1814.

**CHALUKYA**, the name of an Indian dynasty which ruled in the Deccan from A.D. 550 to 750, and again from 973 to 1190. The Chalukyas themselves claimed to be Rajputs from the north who imposed their rule on the Dravidian inhabitants of the Deccan tableland, and there is some evidence for connecting them with the Chapas, a branch of the foreign Gurjaras. The dynasty was founded by a chief named Pulakesin I., who mastered the town of Vatapi (now Badami, in the Bijapur district) about 550. His sons extended their principality east and west; but the founder of the Chalukya greatness was his grandson Pulakesin II., who succeeded in 608 and proceeded to extend his rule at the expense of his neighbours. In 609 he established as his viceroy in Vengi his brother Kubja Vishnuvardhana, who in 615 declared his independence and established the dynasty of Eastern Chalukyas, which lasted till 1070. In 620 Pulakesin defeated Harsha (q.v.), the powerful overlord of northern India, and established the Nerbudda as the boundary between the South and North. He also defeated in turn the Chola, Pandya and Kerala kings, and by 630 was beyond dispute the most powerful sovereign in the Deccan. In 642, however, his capital was taken and he himself killed by the Pallava king Narasimhavarman. In 655 the Chalukya power was restored by Pulakesin's son Vikramaditya I.; but the struggle with the Pallavas continued until, in 740, Vikramaditya II. destroyed the Pallava capital. In 750 Vikramaditya's son, Kirtivarman Chalukya, was overthrown by the Rashtrakutas.

In 973, Taila or Tailapa II. (d. 995), a scion of the royal Chalukya race, succeeded in overthrowing the Rashtrakuta king Kakka II., and in recovering all the ancient territory of the Chalukyas with the exception of Gujarat. He was the founder of the dynasty known as the Chalukyas of Kalyani. About A.D. 1000 a formidable invasion by the Chola king Rajaraja the Great was defeated, and in 1052 Somesvara I., or Ahavamalla (d. 1068), the founder of Kalyani, defeated and slew the Chola Rajadhiraja. The reign of Vikramaditya VI., or Vikramanka, which lasted from 1076 to 1126, formed another period of Chalukya greatness. Vikramanka's exploits against the Hoysala kings and others, celebrated by the poet Bilhana, were held to justify him in establishing a new era dating from his accession. With his death, however, the Chalukya power began to decline. In 1156 the commander-in-chief Bijjala (or Vijjana) Kalacharya revolted, and he and his sons held the kingdom till 1183. In this year Somesvara IV. Chalukya recovered part of his patrimony, only to succumb, about 1190, to the Yadavas of Devagiri and the Hoysalas of Dorasamudra. Henceforth the Chalukya rajas ranked only as petty chieftains.

See J. F. Fleet, *Dynasties of the Kanarese Districts*; Prof. R. G. Bhandarkar, "Early History of the Deccan," in the *Bombay Gazetteer* (1896), vol. i. part ii.; Vincent A. Smith, *Early Hist. of India* (Oxford, 1908), pp. 382 ff.

**CHALYBÄUS, HEINRICH MORITZ** (1796–1862), German philosopher, was born at Pfaffroda in Saxony. For some years he taught at Dresden, and won a high reputation by his lectures on the history of philosophy in Germany. In 1839 he became professor in Kiel University, where, with the exception of one brief interval, when he was expelled with several colleagues because of his German sympathies, he remained till his death. His first published work, *Historische Entwicklung der spekultativen Philosophie von Kant bis Hegel* (1837, 5th ed. 1860), which still ranks among the best expositions of modern German thought, has been twice translated into English, by A. Tulk (London, 1854), and by A. Edersheim (Edinburgh, 1854). His chief works are *Entwurf eines Systems der Wissenschaftslehre* (Kiel, 1846) and *System der spekultativen Ethik* (2 vols., 1850). He opposed both the extreme realism of Herbart and what he regarded as the one-sided idealism of Hegel, and endeavoured to find a mean between them, to discover the ideal or formal principle which unfolds itself in the real or material world presented to it. His *Wissenschaftslehre*, accordingly, divides itself into (1) *Prinziplehre*, or theory of the one principle; (2) *Vermittellungslehre*, or theory of the means by which this principle realises itself; and (3) *Teleologie*. The most noticeable point is the position assigned by Chalybäus to the "World Ether," which is defined as the infinite in time and space, and which, he thinks, must be posited as necessarily coexisting with the Infinite Spirit or God. The fundamental principle of the *System der Ethik* is carried out with great strength of thought, and with an unusually complete command of ethical material.

**CHALYBITE**, a mineral species consisting of iron carbonate ( $\text{FeCO}_3$ ) and forming an important ore of iron. It was early known as spathose iron, spathic iron or steel ore. F. S. Beudant in 1832 gave the name siderose (from *σίδηρος*, iron), which was modified by W. Haidinger in 1845 to siderite. Chalybite (from *χάλυβις*, *χάλυβος*, Lat. *chalybs*, steel) is of slightly later date, having been given by E. F. Glocker in 1847. The name siderite is in common use, but it is open to objection since it had earlier been applied to several other species, and is also now used as a group name for meteoric irons. Chalybite crystallizes in the rhombohedral system and is isomorphous with calcite; like this it possesses perfect cleavages parallel to the faces of the primitive rhombohedron, the angles between which are  $73^\circ 0'$ . Crystals are usually rhombohedral in habit, and the primitive rhombohedron  $r\{100\}$  is a common form, the faces being often curved as represented in the figure. Acute rhombohedra in combination with the basal pinacoid are also frequent, giving crystals of octahedral aspect. The mineral often occurs in cleavable

masses with a coarse or fine granular texture; also in botryoidal or globular (sphaeroidite) and oolitic forms. When compact and mixed with much clay and sand it constitutes the well-known clay ironstone. Chalybite is usually yellowish-grey or brown in colour; it is translucent and has a vitreous lustre. Hardness 3½; sp. gr. 3.8. The double refraction ( $\omega - \epsilon = 0.241$ ) is stronger than that of calcite. When pure it contains 48.2%

Crystal of Chalybite.

of iron, but this is often partly replaced isomorphously by manganese, magnesium or calcium: the varieties known as oligon-spar or oligonite, sideroplesite and siderodote contain these elements respectively in large amount. These varieties form a passage to ankerite (*q.v.*) and mesitite, and all are referred to loosely as brown-spar. Chalybite is a common gangue mineral in metalliferous veins, and well-crystallized specimens are found with ores of copper, lead, tin, &c., in Cornwall, the Harz, Saxony and many other places. It also occurs alone as large masses in veins and beds in rocks of various kinds. The clay ironstone so extensively worked as an ore of iron occurs as nodules and beds in the Coal Measures of England and the United States, and the oolitic iron ore of the Cleveland district in Yorkshire forms beds in the Lias. The mineral is occasionally found as concretionary masses (sphaeroidite) in cavities in basic igneous rocks such as dolerite.

(L. J. S.)

**CHAMBA**, a native state of India, within the Punjab, amid the Himalayas, and lying on the southern border of Kashmir. It has an area of 3216 sq. m. Pop. (1901) 127,834. The sanatorium of Dalhousie, though within the state, is attached to the district of Gurdaspur. Chamba is entirely mountainous; in the east and north, and in the centre, are snowy ranges. The valleys in the west and south are fertile. The chief rivers are the Chandra and Ravi. The country is much in favour with sportsmen. The principal crops are rice, maize and millet. Mineral ores of various kinds are known, but unworked. Trade is chiefly in forest produce. The capital of the state is Chamba (pop. 6000), situated above the gorge of the Ravi. External communications are entirely by road. The state was founded in the 6th century, and, though sometimes nominally subject to Kashmir and afterwards tributary to the Mogul empire, always practically maintained its independence. Its chronicles are preserved in a series of inscriptions, mostly engraved on copper. It first came under British influence in 1846, when it was declared independent of Kashmir. The line of the rajahs of Chamba was founded in the 6th century A.D. by Marut, of an ancient family of Rajputs. In 1904 Bhuri Singh, K.C.S.I., C.I.E., an enlightened and capable ruler, succeeded.

**CHAMBAL**, a river of India, one of the principal tributaries of the Jumna. Rising amid the summits of the Vindhya mountains in Malwa, it flows north, and after being joined by the Chambla and Sipra, passes through the gorges of the Mokandarra hills. After receiving the waters of the Kali-Sind, Parbati and Banas, its principal confluent, the Chambal becomes a great river, enters the British district of Etawah, and joins the Jumna 40 m. below Etawah town, its total length being 650 m.

**CHAMBERLAIN, JOSEPH** (1836– ), British statesman, eldest son of Joseph Chamberlain, master of the Cordwainers' Company, was born at Camberwell Grove, London, on the 8th of July 1836. His father was a well-to-do man of business, a Unitarian in religion and a Liberal in politics. Young Chamberlain was educated at Canonbury from 1845 to 1850, and at University College school, London, from 1850 to 1852. After two years in his father's office in London, he was sent to Birmingham to join his cousin Joseph Nettlefold in a screw business in which his father had an interest; and by degrees, largely owing to his own intelligent management, this business became very successful. Nettlefold & Chamberlain employed new methods of attracting customers, and judiciously amalgamated rival

firms with their own so as to reduce competition, with the result that in 1874, after twenty-two years of commercial life, Mr Chamberlain was able to retire with an ample fortune. Meanwhile he had in 1861 married his first wife, Miss Harriet Kenrick (she died in 1863), and had gradually come to take an increasingly important part in the municipal and political life of Birmingham. He was a constant speaker at the Birmingham and Edgbaston Debating Society; and when in 1868 the Birmingham Liberal Association was reorganized, he became one of its leading members. In 1869 he was elected chairman of the executive council of the new National Education League, the outcome of Mr George Dixon's movement for promoting the education of the children of the lower classes by paying their school fees, and agitating for more accommodation and a better national system. In the same year he was elected a member of the town council, and married his second wife—a cousin of his first—Miss Florence Kenrick (d. 1875).

In 1870 he was elected a member of the first school board for Birmingham; and for the next six years, and especially after 1873, when he became leader of a majority and chairman, he actively championed the Nonconformist opposition to denominationalism. He was then regarded as a Republican—the term signifying rather that he held advanced Radical opinions, which were construed by average men in the light of the current political developments in France, than that he really favoured Republican institutions. His programme was “free Church, free land, free schools, free labour.” At the general election of 1874 he stood as a parliamentary candidate for Sheffield, but without success. Between 1869 and 1873 he was a prominent advocate in the Birmingham town council of the gospel of municipal reform preached by Mr Dawson, Dr Dale and Mr Bunce (of the *Birmingham Post*); and in 1873 his party obtained a majority, and he was elected mayor, an office he retained until June 1876. As mayor he had to receive the prince and princess of Wales on their visit in June 1874, an occasion which excited some curiosity because of his reputation as a Republican; but those who looked for an exhibition of bad taste were disappointed, and the behaviour of the Radical mayor satisfied the requirements alike of *The Times* and of *Punch*.

The period of his mayoralty was one of historic importance in the growth of modern Birmingham. New municipal buildings were erected, Highgate Park was opened as a place of recreation, the free library and art gallery were developed. But the great work carried through by Mr Chamberlain for Birmingham was the municipalization of the supply of gas and water, and the improvement scheme by which slums were cleared away and forty acres laid out in new streets and open spaces. The prosperity of modern Birmingham dates from 1875 and 1876, when these admirably administered reforms were initiated, and by his share in them Mr Chamberlain became not only one of its most popular citizens but also a man of mark outside. An orator of a business-like, straightforward type, cool and hard-hitting, his spare figure, incisive features and single eye-glass soon made him a favourite subject for the caricaturist; and in later life his aggressive personality, and the peculiarly irritating effect it had on his opponents, made his actions and speeches the object of more controversy than was the lot of any other politician of his time. His hobby for orchid-growing at his house “Highbury” near Birmingham also became famous. In private life his loyalty to his friends, and his “genius for friendship” (as John Morley said) made a curious contrast to his capacity for arousing the bitterest political hostility. It may be added here that the interest taken by him in Birmingham remained undiminished during his life, and he was largely instrumental in starting the Birmingham University (1900), of which he became chancellor. His connexion with Birmingham University was indeed peculiarly appropriate to his character as a man of business; but in spite of his representing a departure among men of the front rank in politics from the “Eton and Oxford” type, his general culture sometimes surprised those who did not know him. In later life Oxford and Cambridge gave him their doctors' degrees; and in 1897 he was made lord rector of Glasgow

was, at least in the 19th century, held to apply only to the "destitute," that is, to those who required "necessary relief"—according to the actual wording of the statute. The economic fallacy of home industries founded on rate-supplied capital clearly declared itself, and the method could only have continued as long as it did because it formed part of a general system of industrial control. When in the 18th century workhouses were established, the same industrial fallacy, as records show, repeated itself under new conditions. Within the parish it resulted in the farmer paying the labourer as small a wage as possible, and leaving the parish to provide whatever he might require in addition during his working life and in his old age. Thus, indeed, a gigantic experiment in civic employment was made for at least two centuries on a vast scale throughout the country—and failed. As was natural, the lack of economic independence reacted on the morals of the people. With pauperism came want of energy, idleness and a disregard for chastity and the obligations of marriage. The law, it is true, recognized the mutual obligations of parents and grandparents, children and grandchildren; but in the general poverty which it was itself a means of perpetuating such obligations became practically obsolete, while at all times they are difficult to enforce. Still, the fact that they were recognized implies a great advance in charitable thought. The act, passed at first from year to year, was very slowly put in force. Even before it was passed the poor-rate first assessed under the act of 1563 was felt to be "a greater tax than some subsidies," and in the time of Charles II. it amounted to a third of the revenue of England and Wales (Rogers, v. 81).

The service of villein and cottar was, as we have now seen, in part superseded by what we have called a statutory wage-control, founded on a basis of wage supplemented by relief, provided by a rate-supported poor-law. But it follows that with the decay of this system the poor-law itself should have disappeared, or should have taken some new and very limited form. Unfortunately, as in Roman times, state relief proved to be a popular and vigorous parasite that outlived the tree on which it was rooted: assessments of wage under the Statute of Labourers fell into disuse after the Restoration, it is said, and the statute was finally repealed in 1814, and sixty years later the act against illegal combinations of working men; but the serfdom of the poor-law, the *elemosyna civica*, remained, to work the gravest evil to the labouring classes, and even after the reform of 1834 greatly impeded the recovery of their independence. Nevertheless, by a new law of state alms for the aged, or by statutory outdoor relief with, as some would wish, a regulated wage, it is now proposed to bring them once again under a thralldom similar to that from which they have so slowly emancipated themselves.

The policy adopted by Queen Elizabeth for the relief of the poor (1601) included a scheme for the reorganization of voluntary charity as well as plans for the extension of rate-aided relief. During the century, as we have seen, endeavours had been made to create a system of voluntary charity.

This it was proposed to safeguard and promote concurrently with the extension of the poor-rate. Accordingly, in the poor-law it was arranged that the overseers, the new civic authority, and the churchwardens, the old parochial and charitable authority, should act in conjunction, and, subject to magisterial approval, together "raise weekly or otherwise" the necessary means "by taxation of every inhabitant." The old charitable organization was based on endowment, and the churchwarden was responsible for the administration of many such endowments. What was not available from these and other sources was to be raised "by taxation." The object of the new act was to encourage charitable gifts.

Towards the end of the 18th century, when the administration of poor relief fell into confusion, many charities were lost, or were in danger of being lost, and many were mismanaged. In 1786 and 1788 a committee of the House of Commons reported on the subject. In 1818, chiefly through the instrumentality of Lord Brougham, a commission of inquiry on educational charities was appointed, and in 1819 another commission to investigate (with some exceptions) all the charities for the poor in England and

Wales. These and subsequent commissions continued their inquiries till 1835, when a select committee of the House of Commons made a strong report, advocating the establishment of a permanent and independent board, to inquire, to compel the production of accounts, to secure the safe custody of charity property, to adapt it to new uses on cy-près lines, &c. A commission followed in 1849, and eventually in 1853 the first Charitable Trusts Act was passed, under which "The Charity Commissioners of England and Wales" were appointed.

The following are details of importance:—(1) *Definition*.—The definition of the act of 1601 (Charitable Uses, 43 Eliz. 4) still holds good. "It enumerates as charitable objects all that was once called 'alms': (a) 'The relief of aged, impotent and poor people'—the normal poor; 'the maintenance of sick and maimed soldiers and mariners'—the poor chiefly by reason of war, sometime a class of privileged mendicants; (b) education, 'schools of learning, free schools and scholars in universities'; and then (c) a group of objects which include general civic and religious purposes, and the charities of guilds and corporations: 'the repair of bridges, ports, havens, causeways, churches, sea-banks and highways; the education and preferment of orphans; the relief, stock, or maintenance for houses of correction; marriages of poor maids, supportation, aid, and help of young tradesmen, handicraftsmen, and persons decayed'; and there follows (d) 'the relief or redemption of prisoners or captives'; and, lastly, (e) 'the aid and ease of any poor inhabitants concerning payment of fifteens' (the property-tax of Tudor times), setting out of soldiers, and other taxes. The definition might be illustrated by the charitable bequests of the next 60, or indeed 225, years. It is a fair summary of them. (2) *Charitable Gifts*.—A public trust and a charitable trust are, as this definition shows, synonymous. It is a trust which relates to public charities, and is not held for the benefit of private persons, e.g. relations, but for the common good, and, subject to the instructions of the founder, by trustees responsible to the community. Gifts for charitable purposes, other than those affected by the law of mortmain, have always been viewed with favour. "Where a charitable bequest is capable of two constructions, one of which would make it void and the other would make it effectual, the latter will be adopted by the court" (Tudor's *Charitable Trusts*, ed. 1906, by Bristowe, Hunt and Burdett, p. 167). Gifts to the poor, or widows, or orphans, indefinitely, or in a particular parish, were valid under the act, or for any purpose or institution for the aid of the "poor." Thus practically the act covered the same field as the poor-law, though afterwards it was decided that, "as a rule, persons receiving parochial relief were not entitled to the benefit of a charity intended for the poor" (Tudor, p. 167). (3) *Religious Differences*.—In the administration of charities which are for the poor the broadest view is taken of religious differences. (4) *Superstitious Uses*.—The superstitious use is one that has for its object the propagation of the rights of a religion not tolerated by the law (Tudor, p. 4). Consequently, so far as charities were held or left subject to such rights, they were illegal, or became legal only as toleration was extended. Thus by degrees, since the Toleration Act of 1688, all charities to dissenters have become legal—that is, trusts for schools, places for religious instruction, education and charitable purposes generally. But bequests for masses for the soul of the donor, or for monastic orders, are still void. (5) *Administration*.—The duty of administering charitable trusts falls upon trustees or corporations, and under the term "eleemosynary corporations" are included endowed hospitals and colleges. Under schemes of the Charity Commissioners, where charities have been remodelled, besides trustees elected by corporations, there are now usually appointed *ex-officio* trustees who represent some office or institution of importance in connexion with the charity. (6) *Jurisdiction by Chancery and Charity Commission*.—The Court of Chancery has jurisdiction over charities, under the old principle that "charities are trusts of a public nature, in regard to which no one is entitled by an immediate and peculiar interest to prefer a complaint for compelling the performance by the trustees of their obligations." The court, accordingly, represents the crown as *parens patrie*. Now, by the Charitable Trusts Act 1853, and subsequent acts, a charity commission has been formed which is entrusted with large powers, formerly enforced only by the Court of Chancery. (7) *Jurisdiction by Visitor*.—A further jurisdiction is by the "visitor," a right inherent in the founder of any eleemosynary corporation, and his heirs, or those whom he appoints, or in their default, the king. The object of the visitor is "to prevent all perverting of the charity, or to compose differences among members of the corporation." Formerly the bishop's ordinary was the recognized visitor (2 Henry V. 1, 1414) of hospitals, apart from the founder. Subsequently his power was limited (14 Eliz. c. 5, 1572) to hospitals for which the founders had appointed no visitors. Then (1601) by the Charitable Uses Act commissions were issued for inquiry by county juries. Now, apart from the duty of visitors, inquiry is conducted by the charity commissioners and the assistant commissioners. By subsequent acts (see below) ecclesiastical and eleemosynary charities have been still further separated and defined. (8) *Advice*.—Trustees, or other persons concerned in the management

The endowed charities.

of a charity, may apply to the charity commissioners for their opinion, advice or direction; and any person acting under such advice is indemnified, unless he has been guilty of misrepresentation in obtaining it." (9) *Limitation of Charity Commissioners' Powers.*—The commissioners cannot, however, make any order with respect to any charity of which the gross annual income amounts to £50 or upwards, except on the application (in writing) of the trustees or a majority of them. Their powers are thus very limited, except when put in motion by the trustees. If a parish is divided they can apportion the charities if the gross income does not exceed £20. (10) *General Powers of the Charity Commission.*—Subject to the limitation of £50, &c., the charity commissioners have power (Charitable Trusts Act 1860) to make orders for the appointment or removal of trustees, or of any officer, and for the transfer, payment and vesting of any real or personal estate, or "for the establishment of any scheme for the administration" of the charity. (11) *Schemes and Remodelling of Charities.*—Under this power charities are remodelled, and small and miscellaneous charities put into one fund and applied to new purposes. The cy-près doctrine is applied, by which if a testator leaves directions that are only indefinite, or if the objects for which a charity was founded are obsolete, the charity is applied to some purpose, as far as possible, in accordance with the charitable intention of the founder. This doctrine probably received its widest application in the City of London Parochial Charities Act of 1833. Under other acts doles have been applied to education and to allotments. About 380 schemes are issued in the course of a year. (12) *Objects adopted in remodelling Charities.*—In the remodelling of charities for the general benefit of the poor some one or more of thirteen objects are usually included in the scheme. These are subscriptions to a medical charity, to a provident club or coal or clothing society, to a friendly society; for nurses, for annuities, for outfit for service, &c.; for emigration; for recreation grounds, clubs, reading-rooms, museums, lectures; for temporary relief to a limited amount in each year; for clothes fuel, tools, medical aid, food, &c., or in money "in cases of unexpected loss or sudden destitution"; or for pensions. (13) *Parochial Charities.*—By the Local Government Act of 1892, local ecclesiastical charities, i.e. endowments for "any spiritual purpose that is a legal purpose (i.e. for spiritual persons "church and other buildings, for spiritual uses, &c.), are separated from parochial charities, "the benefits of which are, or the separate distribution of the benefits of which is, confined to inhabitants of a single parish, or of a single ancient ecclesiastical parish, or not more than five neighbouring parishes." These charities, since the Local Government Act 1894, are under the supervision of the parish councils, who appoint trustees for their management in lieu of the former overseer or vestry trustees, or, under certain conditions, "additional trustees." The accounts have to be submitted to the parish meeting, and the names of the beneficiaries of dole charities published. (14) *Official Trustees.*—There is also "an official trustee of charity lands," who as "bare trustee" may hold the land or stock of the charity managed by the trustees or administrators. In 1905 the stock transferred to the official trustees amounted to £24,820,945. (15) *Audit.*—The charity commissioners have no power of audit, but the trustees of every charity have to prepare a statement of accounts annually, and transmit it to the commission. The accounts have to be "certified under the hand of one or more of the trustees and by the auditor of the charity." (16) *Taxation.*—In the case of rents and profits of lands, &c., belonging to hospitals or almshouses, or vested in trustees for charitable purposes, allowances are made in diminution of income-tax (56 Vict. 35 § 61). From the inhabited house duty any hospital charity school, or house provided for the reception or relief of poor persons, is exempted (House Tax Act 1808). Also there is an exemption from the land-tax in regard to land rents, &c., in possession of hospitals before 1603. (17) *The Digest.*—A digest of endowed charities in England and Wales was compiled in the years 1861 to 1876. A new digest of reports and financial particulars has since been completed.

The income of endowed charities in 1876 was returned at £2,108,463. It is now, no doubt, considerably larger than it was in 1876. Partial returns show that at least a million a year is now available in England and Wales for the assistance of the aged poor and for doles. Between the poor-law, which, as it is at present administered, is a permanent endowment provided from the rates for the support of a class of permanent "poor," and endowed charities, which are funds available for the poor of successive generations, there is no great difference. But in their resources and administration the difference is marked. Local endowed charities were constantly founded after Queen Elizabeth's time till about 1830, and the poor-law was at first supplementary of the local charities. When corn and fuel were dear and clothes very expensive, what now seem trivial endowments for food, fuel, coal and clothes were important assets in the thrifty management of a parish. But when the poor were recognized as a class of dependants entitled by law to relief from the community, the rate increased out of all proportion to the charities. A distinction then made itself felt between the "parish" poor and the "second" poor, or the poor who were not relieved from the rates, and relief from the rates altogether overshadowed the charitable aid. Charitable endowments were ignored, ill-administered, and often were lost. After 1834 the poor-law was brought under the control of the

central government. Poor relief was placed in the hands of boards of guardians in unions of parishes. The method of co-operation between poor-law and charity suggested by the acts of Queen Elizabeth was set aside, and, as a responsible partner in the public work of relief, charity was disestablished. In the parish, the endowed charities remained in general a disorganized medley of separate trusts, jealously guarded by incompetent administrators. To give unity to this mass of unions, so long as the principles of charity are misunderstood or ignored, has proved an almost impossible and certainly an unpopular task. So far as it has been achieved, it has been accomplished by the piecemeal legislation of schemes cautiously elaborated to meet local prejudices. Active reform has been resented, and politicians have often accentuated this resentment. In 1894 a select committee was appointed to inquire whether it was desirable to take measures to bring the action of the Charity Commission more directly under the control of parliament, but no serious grievances were substantiated. The committees' reports are of interest, however, as an indication of the initial difficulties of all charitable work, the general ignorance that prevails in regard to the elementary conditions that govern it, the common disregard of these principles, and the absence of any accepted theory or constructive policy that should regulate its development and its administration.

After the Poor-Law Act of 1601 the history of the voluntary parochial charities in a town parish is marked by their decreasing amount and utility, as poor-law relief and pauperism increased. The act, it would seem, was not adopted with much alacrity by the local authorities. From 1625 to 1646 there were many years of plague and sickness, but in St Giles's, London, as late as 1649, the amount raised by the "collectors" (or overseers) was only £176. They disbursed this to "the visited poor" as "pensions." In 1665 an extra levy of £600 is mentioned. In the accounts of St Martin's-in-the-Fields, where, as in St Giles's, gifts were received, the change wrought by another half-century (1714) is apparent. The sources of charitable relief are similar to those in all the Protestant churches—English, Scottish or continental: church collections and offertories; correctional fines, such as composition for bastards and conviction money for swearers; and besides these, income from annuities and legacies, the parish estate, the royal bounty, and "petitions to persons of quality." In all £2041 was collected, but, so far as relief was concerned, the parish relied not on it, but on the poor-rate, which produced £3765. All this was collected and disbursed on their own authority by collectors, to orphans, "pensioners" or the "known or standing" poor, or to casual poor (£1818), including nurse children and bastards. The begging poor were numerous and the infant death-rate enormous, and each year three-fourths of those christened were "inhumanly suffered to die by the barbarity of nurses." The whole administration was uncharitable, injurious to the community and the family, and inhuman to the child. If one may judge from later accounts of other parishes even up to 1834, usually it remained the same, purposeless and unintelligent; and it can hardly be denied that, generally speaking, only since the middle of the 19th century has any serious attention been paid to the charitable side of parochial work. Parallel to the parochial movement of the poor-law in England, in France (about 1617) were established the *bureaux de bienfaisance*, at first entirely voluntary institutions, then recognized by the state, and during the Revolution made the central administration for relief in the communes.

In the 17th century in England, as in France, opinion favoured the establishment of large hospitals or *maisons Dieu* for the reception of the poor of different classes. In France throughout the century there was a continuous struggle with mendicancy, and the hospitals were used as places into which offenders were summarily driven. A new humanity was, however, beginning its protest. The pitiful condition of abandoned children attracted sympathy in both countries. St Vincent de Paul established homes for the *enfants trouvés*, followed in England by the establishment of the Foundling hospital (1739). In both countries the method was applied inconsiderately and pushed to excess, and it affected family life most injuriously. Grants from parliament supported the founding movement in England, and homes were opened in many parts of the country. The demand soon became overwhelming; the mortality was enormous, and the cost so large

Charity in the parish after 1601.

Charitable movements after 1601.

that it outstripped all financial expedients. The lesson of the experiment is the same as that of the poor-law catastrophe before 1834; only, instead of the able-bodied poor of another age, infants were made the object of a compassionate but undiscerning philanthropy. With widespread relief there came widespread abandonment of duty and economic bankruptcy. Had the poor-rates instead of charitable relief been used in the same way, the moral injury would have been as great, but the annual draft from the rates would have concealed the moral and postponed the economic disaster. To amend the evil, changes were made by which the relation between child and mother was kept alive, and a personal application on her part was required; the character of the mother and her circumstances were investigated, and assistance was only given when it would be "the means of replacing the mother in the course of virtue and the way of an honest livelihood." General reforms were also made, especially through the instrumentality of Jonas Hanway, to check infant mortality, and metropolitan parishes were required to provide for their children outside London. A kindred movement led to the establishment of penitentiaries (1758), of lock hospitals and lying-in hospitals (1749-1752).

In Queen Anne's reign there was a new educational movement, "the charity school"—"to teach poor children the alphabet and the principles of religion," followed by the Sunday-school movement (1780), and about the same time (1788) by "the school of industry"—to employ children and teach them to be industrious. In 1844 the Ragged School Union was established, and until the Education Act of 1870 continued its voluntary educational work. As an outcome of these movements, through the efforts of Miss Mary Carpenter and many others, in 1854-1855 industrial and reformatory schools were established, to prevent crime and reform child criminals. The orphanage movement, beginning in 1758, when the Orphan Working Home was established, has been continued to the present day on a vastly extended scale. In 1772 a society for the discharge of persons imprisoned for small debts was established, and in 1773 Howard began his prison reforms. This raised the standard of work in institutional charities generally. After the civil wars the old hospital foundations of St Bartholomew and St Thomas, municipalized by Edward VI., became endowed charities partly supported by voluntary contributions. The same fate befell Christ's Hospital, in connexion with which the voting system, the admission of candidates by the vote of the whole body of subscribers—with that peculiarly English invention—first makes its appearance.

A new interest in hospitals sprang up at the end of the 17th century. St Thomas's was rebuilt (1693) and St Bartholomew's (1739); Guy's was founded in 1724, and on the system of free "letters" obtainable in exchange for donations, voluntary hospitals and infirmaries were established in London (1733 and later) and in most of the large towns. Towards the end of the 18th century the dispensary movement was developed—a system of local dispensaries with fairly definite districts and home visiting, a substitute for attendance at a hospital, where "hospital fever" was dreaded, and an alternative to what was then a very ill-administered system of poor-law medical relief. After 1840 the provident dispensary was introduced, in order that the patients by small contributions in the time of health might provide for illness without having to meet large doctors' bills, and the doctor might receive some sufficient remuneration for his attendance on poor patients. This movement was largely extended after 1860. Three hospital funds for collecting contributions for hospitals and making them grants, a movement that originated in Birmingham in 1859, were established in London in 1873 and 1897.

Since 1868 the poor-law medical system of Great Britain has been immensely improved and extended, while at the same time the number of persons in receipt of free medical relief in most of the large towns has greatly increased. The following figures refer to London: at hospitals, 97 in number, in-patients (1904) during the year, 118,536; out-patients and casualty cases, 1,858,800; patients at free, part-pay, or provident dispensaries, about 280,000; orders issued for attendance at poor-law dispensaries and at home, 114,158. The number of beds in poor-law infirmaries (1904) was 16,976. There are in London 12 general hospitals with, 18 without, medical

schools, and 67 special hospitals. Thus the population in receipt of public and voluntary medical relief is very large, indeed altogether excessive.

Each religious movement has brought with it its several charities. The Society of Friends, the Wesleyans, the Baptists have large charities. With the extension of the High Church movement there have been established many sisterhoods which support penitentiaries, convalescent homes and hospitals, schools, missions, &c.

The magnitude of this accumulating provision of charitable relief is evident, though it cannot be summed up in any single total.

At the beginning of the 19th century anti-mendicity societies were established; and later, about 1869, in England and Scotland a movement began for the organization of charitable relief, in connexion with which there are now societies and committees in most of the larger towns in Great Britain, in the colonies, and in the United States of America. More recently the movement for the establishment of settlements in poor districts, initiated by Canon Barnett at Toynbee Hall—"to educate citizens in the knowledge of one another, and to provide them with teaching and recreation"—has spread to many towns in England and America.

These notes of charitable movements suggest an altogether new development of thought. On behalf of the charity school of Queen Anne's time were preached very formal sermons, which showed but little sympathy with child life. After the first half of the century a new humanism with which we connect the name of Rousseau, slowly superseded this formal beneficence. Rousseau made

Progress of thought in 18th and 19th centuries.

the world open its eyes and see nature in the child, the family and the community. He analysed social life, intent on explaining it and discovering on what its well-being depended; and he stimulated that desire to meet definite social needs which is apparent in the charities of the century. Little as it may appear to be so at first sight, it was a period of charitable reformation. Law revised the religious conception of charity, though he was himself so strangely devoid of social instinct that, like some of his successors, he linked the utmost earnestness in belief to that form of almsgiving which most effectually fosters beggardon. Howard introduced the era of inspection, the ardent apostle of a new social sagacity; and Bentham, no less sagacious, propounded opinions, plans and suggestions which, perhaps it may be said, in due course moulded the principles and methods of the poor-law of 1834. In the broader sense the turn of thought is religious, for while usually stress is laid on the religious scepticism of the century, the deeper, fervent, conscientious and evangelical charity in which Nonconformists, and especially "the Friends," took so large a part, is often forgotten. Sometimes, indeed, as often happens now, the feeling of charity passed into the merest sentimentality. This is evident, for instance, from so ill-considered a measure as Pitt's Bill for the relief of the poor. On the other hand, during the 18th century the poor-law was the object of constant criticism, though so long as the labour statutes and the old law of settlement were in force, and the relief of the labouring population as state "poor" prevailed, it was impossible to reform it. Indeed, the criticism itself was generally vitiated by a tacit acceptance of "the poor" as a class, a permanent and irrevocable charge on the funds of the community; and at the end of the 18th century, when the labour statutes were abrogated, but the conditions under which poor relief was administered remained the same, serfdom in its later stage, the serfdom of the poor-law, asserted itself in its extremest form in times of dearth and difficulty during the Napoleonic War. In 1802-1803 it was calculated (Marshall's *Digest*) that 28% of the population were in receipt of permanent or occasional relief. Those in receipt of the former numbered 734,817, including children—so real had this serfdom of the poor become.

In 1832 the expenditure on pauperism in England and Wales was £7,036,968. In the early years of the 19th century the mendicity societies, established in some of the larger towns, were a sign of the general discontent with existing methods of administration. The Society for Bettering the Condition of the

**Poor**—representing a group of men such as Patrick Colquhoun, Sir I. Bernard, Dr Lettson, Dr Haygarth, James Neald, Count Rumford and others—took a more positive line and issued many useful publications (1796). After 1833 the very atmosphere of thought seems changed. There was a general desire to be quit of the serfdom of pauperism. The Poor-law Amendment Act was passed in 1834, and since then male able-bodied pauperism has dwindled to a minimum. The bad years of 1860-1870 revived the problem in England and Scotland, and the old spirit of reform for a time prevailed. Improved administration working with economic progress effected still further reductions of pauperism, till on the 1st of January 1905 (exclusive of lunatics in county asylums and casual paupers) the mean number of paupers stood at 764,589, or 22·6 per thousand of the population, instead of 41·8 per thousand as in 1859 (see POOR-LAW).

Charity organization societies were formed after 1869, with the object of "improving the condition of the poor," or, in other words, to promote independence by an ordered and co-operative charity; and the Association for Befriending Young Servants, and workhouse aid committees, in order to prevent relapse into pauperism on the part of those who as children or young women received relief from the poor-law. The Local Government Board adopted a restricted out-door relief policy, and a new interest was felt in all the chief problems of local administration. The movement was general. The results of the Elberfeld system of municipal relief administered by unpaid almoners, each dealing with but one or two cases, influenced thought both in England and America. The experience gained by Mr Joseph Tuckerman of Boston of the utility of registering applications for relief, and the teaching of Miss Octavia Hill, led to the foundation of the system of friendly visiting and associated charity at Boston (1880) and elsewhere. Since that time the influence of Arnold Toynbee and the investigations of Charles Booth have led to a better appreciation of the conditions of labour; and to some extent, in London and elsewhere, the spirit of charity has assumed the form of a new devotion to the duties of citizenship. But perhaps, in regard to charity in Great Britain, the most important change has been the revival of the teaching of Dr Chalmers (1780-1847), who (1819) introduced a system of parochial charity at St John's, Glasgow, on independent lines, consistent with the best traditions of the Scottish church. In the development of the theory of charitable relief on the economic side this has been a main factor. His view, which he tested by experience, may be summed up as follows: Society is a growing, self-supporting organism. It has within it, as between family and family, neighbour and neighbour, master and employee, endless links of sympathy and self-support. Poverty is not an absolute, but a relative term. Naturally the members of one class help one another; the poor help the poor. There is thus a large invisible fund available and constantly used by those who, by their proximity to one another, know best how to help. The philanthropist is an alien to this life around him. Moved by a sense of contrast between his own lot, as he understands it, and the lot of those about him, whom he but little understands, he concludes that he should relieve them. But his gift, unless it be given in such a way as to promote this self-support, instead of weakening it, is really injurious. In the first place, by his interference he puts a check on the charitable resources of another class and lessens their social energy. What he gives they do not give, though they might do so. But next, he does more harm than this. He stimulates expectation, so that by a false arithmetic his gift of a few shillings seems to those who receive it and to those who hear of it a possible source of help in any difficulty. To them it represents a large command of means; and where one has received what, though it be little, is yet, relative to wage, a large sum to be acquired without labour, many will seek more, and with that object will waste their time and be put off their work, or even be tempted to lie and cheat. So social energy is diverted from its proper use. Alms thus given weakens social ties, diminishes the natural relief funds of mutual help, and beggars a neighbour instead of benefiting him. By this argument a clear and well-defined purpose is placed before charity. Charity

becomes a science based on social principles and observation. Not to give alms, but to keep alive the saving health of the family, becomes its problem: relief becomes altogether subordinate to this, and institutions or societies are serviceable or the reverse according as they serve or fail to serve this purpose. Not poverty, but distress is the plea for help; not almsgiving, but charity the means. To charity is given a definite social aim, and a desire to use consistently with this aim every method that increasing knowledge and trained ability can devise.

Under such influences as these, joined with better economic conditions, a great reform has been made. The poor-law, however, remains—the modern *elemosyna civica*. It now, indeed, absorbs a proportionately lesser amount of the largely increased national income, but, excluding the maintenance of lunatics, it costs Great Britain more than twelve millions a year; and among the lower classes of the poor, directly or indirectly, it serves as a bounty on dependence and is a permanent obstacle to thrift and self-reliance. The number of those who are within the circle of its more immediate attraction is now perhaps, in different parts of the country or different districts in a town, not more than, say, 20% of the population. Upon that population the statistics of a day census would show a pauperism not of 2·63, the percentage of the mean day pauperism on the population in 1908, but of 13·15%; and the percentage would be much greater—twice as large, perhaps—if the total number of those who in some way received poor relief in the course of a year were taken into account. The English poor-law is thus among the lower classes, those most tempted to dependence—say some six or seven millions of the people—a very potent influence definitely antagonistic to the good development of family life, unless it be limited to very narrow proportions; as, for instance, to restricted indoor or institutional relief for the sick, for the aged and infirm, who in extreme old age require special care and nursing, and for the afflicted, for whom no sufficient charitable provision is procurable. As ample experience shows, only on these conditions can poor-law relief be justified from the point of view of charity and the common good. In marked contrast to this opinion is the English movement for Old Age pensions, which came to its first fruition in 1908—a huge charity started on the credit of the state, the extension of which might ultimately involve a cost comparable with that of the army or the navy. Schemes of the kind have been adopted in the Australasian colonies with limitations and safeguards; and they seem likely to develop into a new type of poor-relief organization for the aged and infirm (Report: Royal Commission on Old Age Pensions, Commonwealth of Australia, 1906). In England, partly to meet the demand for better state provision for the aged, the Local Government Board in 1900 urged the boards of guardians to give more adequate outdoor relief to aged deserving people, and laid no stress on the test of destitution, or, in other words, the limitation of relief to what was actually "necessary," the neglect of which has led to new difficulties. History has proved that demoralization results from the wholesale relief whether of the mass of the citizens, or of the able-bodied, or of the children, and the proposal to limit the endowment to the aged makes no substantial difference. The social results must be similar; but social forces work slowly, and usually only the unanswerable argument of financial bankruptcy suffices to convert a people habituated to dependence, though the inward decay of vitality and character may long before be manifest. Ultimately the distribution of pensions by way of out-door relief, corrupting a far more independent people, is calculated to work a far greater injury than the *annona civica*. Such an endowment of old age might indeed be justified as part of a system of regulated labour, which, as in earlier times, could not be enforced without some such extraneous help, but it could not be justified otherwise. It is naturally associated, therefore, with socialistic proposals for the regulation of wage.

In the light of the principles of charity, which we have considered historically, we have now to turn to two questions: charity and economics, and charity and socialism.

The object of charity is to render to our neighbour the services and duties of goodwill, friendship and love. To prevent distress

charity has for its further object to preserve and develop the manhood and womanhood of individuals and their self-maintenance in and through the family; and any form of state intervention is approved or disapproved by the same standard. By self-maintenance is meant self-support throughout life in its ordinary contingencies—sickness, widowhood, old age, &c. Political economy we would define as the science of exchange and exchange value. Here it has to be considered in relation to the purposes of charity. By way of illustration we take, accordingly, three points: distribution and use, supplementation of wage, and the standard of well-being or comfort in relation to wage.

(1) *Distribution and Use.*—Economy in the Greek sense begins at this point—the administration and the use of means and resources. Political economy generally ignores this part of the problem. Yet from the point of view of charity it is cardinal to the whole issue. The distribution of wage may or may not be largely influenced by trades unions; but the variation of wage, as is generally the case, by the increase or decrease of a few pence is of less importance than its use. Comparing a careful and an unthrifty family, the difference in use may amount to as much as a third on the total wage. Mere abstention from alcohol may make, in a normal family, a difference of 6s. in a wage of 25s. On the other hand, membership of a friendly society is at a time of sickness equivalent to the command of a large sum of money, for the common stock of capital is by that means placed at the disposal of each individual who has a share in it. Further, even a small amount saved may place the holder in a position to get a better market for his labour; he can wait when another man cannot. Rent may be high, but by co-operation that too may be reduced. Other points are obvious and need not be mentioned. It is evident that while the amount of wage is important, still more important is its use. In use it has a large expansive value. (2) *Supplementation of Wage.*—The exchange between skill and wage must be free if it is to be valid. The less the skill the greater is the temptation to philanthropists to supplement the lesser wage; and the more important is non-supplementation, for the skilled can usually look after their own interests in the market, while the less skilled, because their labour is less marketable, have to make the greater effort to avoid dependence. But the dole of endowed charities, outdoor relief, and any constant giving, tend to reduce wage, and thus to deprive the recipients of some part of the means of independence. The employer is pressed by competition himself, and in return he presses for profit through a reduced wage, if circumstances make it possible for the workman to take it. And thus a few individuals may lower the wages of a large class of poorly skilled or unskilled hands. In these conditions unionism, even if it were likely to be advantageous, is not feasible. Unionism can only create a coherent unit of workers where there is a limited market and a definite saleable skill. Except for the time, insufficient wage will not be remedied in the individual case by supplementation in any form—dole, clothes, or other kinds of relief; and in that case, too, the relief will probably produce lessened energy after a short time, or in other words lessened ability to live. An insufficient wage may be prevented by increasing the skill of the worker, who will then have the advantage of a better series of economic exchanges, but hardly otherwise. If the supplementation be not immediate, but postponed, as in the case of old-age pensions, its effect will be similar. To the extent of the prospective adventitious gain the attraction to the friendly society and to mutual help and saving will grow less. Necessity has been the inventor of these; and where wage is small, a little that would otherwise be saved is quickly spent if the necessity for saving it is removed. Only necessity schools most men, especially the weak, to whom it makes most difference ultimately, whether they are thrifty or whether or not they save for the future in any way. (3) *The Standard of Well-being or Comfort in Relation to Wage.*—With an increase of income there has to be an increase in the power to use income intelligently. Whatever is not so used reacts on the family to its undoing. Constantly when the wife can earn a few shillings a week, the husband will every week idle for two or three days; so also if the husband finds that in a few days he can earn enough to meet what he considers to be his requirements for the week. In these circumstances the standard of well-being falls below the standard of wage; the wage is in excess of the energy and intelligence necessary to its economic use, and in these cases ultimately pauperism often ensues. The family is demoralized. Thus, with a view to the prevention of distress in good times, when there is the less poverty there is the more need of charity, rightly understood; for charity would strive to promote the right use of wage, as the best means of preventing distress and preserving the economic well-being of the family.

The theory of charity separates it entirely from socialism, as that word is commonly used. Strictly socialism means, in questions affecting the community, a dominant regard for the common or social good in so far as it is contrary to private or individual advantage. But even so the antithesis is misleading,

for the two need not be inconsistent. On the contrary, the common good is really and ultimately only individual good (not advantage) harmonized to a common end. The issue, indeed, is that of old Greek days, and the conditions of a settlement of it are not substantially different. Charity and socialism. Using modern terms one may say that charity is "interventionist." It has sought to transform the world by the transformation of the will and the inward life in the individual and in society. It would intensify the spirit and feeling of membership in society and would aim at improving social conditions, as science makes clear what the lines of reform should be. So it has constantly intervened in all kinds of ways, and, in the 19th century for instance, it has initiated many movements afterwards taken up by public authorities—such as prison reform, industrial schools, child protection, housing, food reform, &c., and it has been a friendly ally in many reforms that affect industry very closely, as, for instance, in the introduction of the factory acts. But it has never aimed at recasting society itself on a new economic plan, as does socialism. Socialism indeed offers the people a new state of social security. It recognizes that the *annona civica* and the old poor-law may have been bad, but it would meet the objection made against them by insisting on the gradual creation of a new industrial society in which wage would be regulated and all would be supported, some by wage in adult life, some by allowance in old age, and others by maintenance in childhood. Accordingly for it all schemes for the state maintenance of school children, old age pensions, or state provision for the unemployed are, like municipal trading, steps towards a final stage, in which none shall want because all shall be supported by society or be dependent on it industrially. To charity this position seems to exclude the ethical element in life and to treat the people primarily or chiefly as human animals. It seems also to exclude the motives for energy and endeavour that come from self-maintenance. Against it, on the other hand, socialism would urge, that only by close regulation and penalty will the lowest classes be improved, and that only the society that maintains them can control them. Charity from its experience doubts the possibility of such control without a fatal loss of initiative on the part of those controlled, and it believes both that there is constant improvement on the present conditions of society and that there will be constantly more as science grows and its conclusions are put in force. Thus charity and socialism, in the usual meaning of the word, imply ultimately two quite different theories of social life. The one would re-found society industrially, the other would develop it and allow it to develop.

The springs of charity lie in sympathy and religion, and, one would now add, in science. To organize it is to give to it the "ordered nature" of an organic whole, to give it a definite social purpose, and to associate the members The organization of charity. of the community for the fulfilment of that purpose. This in turn depends on the recognition of common principles, the adoption of a common method, self-discipline and training, and co-operation. In a mass of people there may be a large variation in motives coincident with much unity in action. Thus there may be acceptance of a common social purpose in charity, while in one the impulse is similar to that which moved St Francis or George Herbert, in another to that which moved Howard or Dr Chalmers, or a modern poor-law reformer like Sir G. Nicholls or E. Denison. Accepting, then, the principles of charity, we pass to the method in relation to assistance and relief. Details may vary, but on the following points there is general agreement among students and workers:—

(1) *The Committee or Conference.*—There are usually two kinds of local relief: the public or poor-law relief, and relief connected with religious agencies. Besides, there is the relief of endowments, societies and charitable persons. Therefore, as a condition precedent to all organization, there must be some local centre of association for information and common help. A town should be divided for this purpose into manageable areas coincident with parishes or poor-law divisions, or other districts. Subject to an acceptance of general principles, those engaged in charity should be members of a local conference or committee, or allied to it. The committee would thus be the rallying-point of a large and somewhat loosely knit

association of friends and workers. (2) *Inquiry, Aid and Registration.*—The object of inquiry is to ascertain the actual causes of distress or dependence, and to carry on the work there must usually be a staff of several honorary and one or two paid workers. Two methods may be adopted: to inquire in regard to applications for help with a view to forming some plan of material help or friendly aid, or both, which will lead to the ultimate self-support of the family and its members, and, under certain conditions, in the case of the aged or sick, to their continuous or their sufficient help; or to ascertain the facts partly at once, partly by degrees, and then to form and carry out some plan of help, or continue to befriending the family in need of help, in the hope of bringing them to conditions of self-support, leaving the work of relief entirely to other agencies. The committee in neither case should be a relief committee—itsself a direct source of relief. On the former method it has usually no relief fund, but it raises from relations, employers, charities and charitable persons the relief required, according to the plan of help agreed upon, unless, indeed, it is better not to relieve the case, or to leave it to the poor-law. The committee thus makes itself responsible for endeavouring to the best of its ability to raise the necessary relief, and acts as trustee for those who co-operate without it, in such a way as to keep intact and to give play to all the natural obligations that lie within the inner circles of a self-supporting community. On the latter method the work of relief is left to general charity, or to private persons, or to the poor-law; and the effort is made to help the family in self-support by a friendly visitor. This procedure is that adopted by the associated charities in Boston, Mass., and other similar societies in America and elsewhere. It is akin also to that adopted in the municipal system of relief in Elberfeld—which has become with many variations in detail the standard method of poor relief in Germany. The method of associated help, combined with personal work, represents the usual practice of charity organization societies. *Mutatis mutandis*, the plan can be adopted on the simplest scale in parochial or other relief committees, subject to the safeguards of sufficient training and settled method. The inquiry should cover the following points: names and address, and ages of family, previous addresses, past employment and wages, present income, rent and liabilities, membership of friendly or other society, and savings, relations, relief (if any) from any source. These points should be verified, and reference should be made to the clergy, the poor-law authorities, and others, to ascertain if they know the applicant. The result should be to show how the applicant has been living, and what are the sources of possible help, and also what is his character. The problem, however, is not whether the person is "deserving" or "undeserving," but whether, granted the facts, the distress can be stayed and self-support attained. If the help can be given privately from within the circle of the family, so much the better. Often it may be best to advise, but not to interfere. In some cases but little help may be necessary; in others again the friendly relation between applicant and friend may last for months and even years. Usually in charitable work the question of the kind of relief available—money, tickets, clothes, &c.—governs the decision how the case should be assisted. But this is quite wrong: the opposite is the true rule. The wants of the case, rightly understood, should govern the decision as to what charity should do and what it should provide. Cases are overwhelming in number, as at the out-patient and casualty departments of a hospital, where the admissions are made without inquiry, and subject practically to no restrictions; but when there is inquiry, and each case is seriously considered and aided with a view to self-support, the numbers will seldom be overwhelming. On this plan appeal is made to the strength of the applicant, and requires an effort on his part. Indiscriminate relief, on the other hand, attracts the applicant by an appeal to his weakness, and it requires of him no effort. Hence, apart even from the differentiating effect of inquiry, one method makes applicants, the other limits their number, although on the latter plan much more strenuous endeavours be made to assist the lesser number of claimants. For the routine work of the office an extremely simple system of records with card index, &c., has been devised. In some cities, particularly in the United States and America, there is a central registration of cases, notified by individual charities, poor-relief authorities and private persons. The system of charity organization or associated charity, it will be seen, allows of the utmost variety of treatment, according to the difficulties in each instance and the remedies available, and the utmost scope for personal work. (3) *Training.*—If charitable work is an art, those who undertake it must needs be trained both in practice and method and in judgment. It requires, too, that self-discipline which blends intelligence with emotion, and so endows emotion with strength and purpose. In times of distress a reserve of trained workers is of the utmost service. At all times they do more and produce, socially, better results; but when there is general distress of any kind they do not lose their heads like new recruits, but prevent at least some of the mischief that comes of the panic which often takes possession of a community, when distress is apprehended, and leads to the wildest distribution of relief. Also trained workers make the most useful poor-law guardians, trustees of charities, secretaries of charitable societies and district visitors. All clergy and ministers and all medical men who have to be engaged in the administration of medical relief should learn the art of charity.

Poor-law guardians are usually elected on political or general grounds, and have no special knowledge of good methods of charity; and trustees are seldom appointed on the score of their qualifications on this head. To provide the necessary education in charity there should be competent helpers and teachers at charity organization committees and elsewhere, and an alliance for this purpose should be formed between them and professors and teachers of moral science and economics and the "settlements." Those who study social problems in connexion with what a doctor would call "cases" or "practice" see the limits and the falsity of schemes that on paper seem logical enough. This puts a check on the influence of scheme-building and that literary sensationalism which makes capital out of social conditions. (4) *Co-operation.*—Organization in charity depends on extensive co-operation, and ultimately on the acceptance of common views. This comes but slowly. But with much tribulation the goal may be reached, if in case after case the effort is made to provide friendly help through charities and private persons,—unless, as may well be, it should seem best not to interfere, but to leave the applicant to apply to the administrators of public relief. Experience of what is right and wrong in charity is thus gained on both sides. Many sources may have to be utilized for aid of different kinds even in a single case, and for the prevention of distress co-operation with members of friendly societies and with co-operative and thrift agencies is indispensable.

Where there is accord between charity and the poor-law pauperism may be largely reduced. The poor-law in most countries has at its disposal certain institutional relief and out-door allowances, but it has no means of devising plans of help which may prevent application to the rates or "take" people "off the rates." Thus a widow in the first days of widowhood applies and receives an allowance according to the number of her children. Helped at the outset by charity on some definite plan, she may become self-supporting; and if her family be large one or two of her children may be placed in schools by the guardians, while she maintains the remaining children and herself. As far as possible there should be a division of labour between the poor-law and charity. Except where some plan such as that just mentioned is adopted, one or the other should take whole charge of the case relieved. There should be no supplementation of poor-law relief by charity. This will weaken the strength and dissipate the resources of charity without adding to the efficiency of the poor-law. Unless the guardians adopt a restrictive out-door relief policy, there is no scope for any useful division of labour between them and charity; for the many cases which, taken in time, charity might save from pauperism, they will draw into chronic dependence by their allowances a very much larger number. But if there is a restrictive out-door policy, so far as relief is necessary, charity may undertake to meet on its own lines distress which the poor-law would otherwise have met by allowances, and, subject to the assistance of urgent cases, poor-law relief may thus by degrees become institutional only. Then, in the main, natural social forces would come into play, and dependence on any form of *annona civica* would cease.

Open-handed hospitality always creates mendicants. This is what the hospitals offer in the out-patient and casualty departments, and they have created a class of hospital mendicants. The cases are quickly dealt with, without inquiry and without regard to home conditions. The medical man in the hospital does not co-operate with any fellow-workers outside the hospital. Where his physic or advice ceases to operate his usefulness ceases. He regards no conditions of morality. In a large number of cases drink or vice is the cause of application, and the cure of the patient is dependent on moral conditions; but he returns home, drinks and may beat his wife, and then on another visit to the hospital he will again be physicked and so on. The man is not even referred to the poor-law infirmary for relief. Nor are conditions of home sanitation regarded. One cause of constant sickness is thus entirely overlooked, while drugs, otherwise unnecessary, are constantly given at the hospital. The hospitals are thus large isolated relief stations which are creating a new kind of pauperism. So far as the patients can pay—and many can do so—the general practitioners, to whom they would otherwise go, are deprived of their gains. Still worse is it when the hospital itself charges a fee in its out-patient department. The relief is then claimed even more absolutely as a right, and the general

practitioners are still further injured. The doctors, as a medical staff, are not only medical men, but whether they recognize the fact or not, they are also almsgivers or almoners; what they give is relief. Yet few or none of them have ever been trained for that work, and consequently they do not realize how very advantageous, even for the cure of their own patients, would be a thorough treatment of each case both at the hospital and outside it. Nor can they understand how their methods at present protract sickness and promote habitual dependence. Where this side of their work studied by them in any way they would be the first, probably, to press upon the governors of their hospitals the necessity for a change. Unfortunately, at present the governors are themselves untrained, and to finance the hospital and to make it a good institution is their sole object. Hospitals, however, are, after all, only a part of the general administration of charity, though as they are now managed they have seldom any systematic connexion with that administration. Nor is there any co-ordination between the several hospitals and dispensaries. If one rightly refuses further treatment to certain applicants, they have only to wander to some other hospital, there to be admitted with little or no scrutiny. For usually outpatients and casualty patients are not even registered, nor can they be identified if they apply again. Practically they come and go at will. The definite limitation of cases, according to some standard of effectual work, association with general charity, trained almonership and inquiry, and a just regard for the interests of general practitioners, are stepping-stones to reform. In towns where medical charities are numerous a representative board would promote mutual help and organization.

Like the poor-law, endowed charities may be permanent institutions established to meet what should be passing and decreasing needs (cf. the arguments in *The State and Endowed Charities*, by T. Mackay). Administered as they usually are in isolation—apart from the living voluntary charities of the generation, and consisting often of small trusts difficult to utilize satisfactorily, they tend to create a permanent demand which they meet by fixed quantities of relief. Also, as a rule, they make no systematic inquiries with a view to the verification of the statements of the applicants, for they have no staff for these purposes; nor have they the assistance of almoners or friendly visitors. Nor does the relief which they give form part of any plan of help in conjunction with other aid from without; nor is the administration subject to frequent inspection, as in the case of the poor-law. All these conditions have led to a want of progress in the actual administration of endowed charities, in regard to which it is often very difficult to prevent the exercise of an undue patronage. But there is no reason why these charities should not become a responsible part of the country's administration, aiding it to reduce outdoor pauperism. It was never intended that the poor-law should extinguish the endowed charities, still less, as statistics now prove, that where endowments abound the rate of pauperism should be considerably above the average of the rest of the country. This shows that these charities often foster pauperism instead of preventing it. As a step to reform, the publication of an annual register of endowed charities in England and Wales is greatly needed. The consolidating schemes of the charity commissioner have done much good; still more may be done in some counties by extending to the county the benefits of the charities of well-endowed towns, as has been accomplished by the extension of the eleemosynary endowments of the city of London to the metropolitan police area. Nor, again, until quite lately, and that as yet only in a few schemes, has the principle been adopted that pensions or other relief should be given only in supplementation of the relief of relations, former employers and friends, and not in substitution of it. This, coupled with good methods of inquiry and supervision, has proved very beneficial. Hitherto, however, to a large extent, endowed charities, it must be admitted, have tended to weaken the family and to pauperize.

In many places funds are raised for the relief of school children by the supply of meals during the winter and spring; and an act has now been passed in England (1906) enabling the cost to be

put upon the rates. Usually a very large number of children are said to be underfed, but inquiry shows that such statements may be taken as altogether excessive. They are sometimes based on information drawn from the children at school; or sometimes on general deductions; they are seldom founded on any systematic and competent inquiry at the homes. When this has been made, the numbers dwindle to very small proportions. Teachers of experience have noted the effect of the meals in weakening the independence of the family. While they are forthcoming women sometimes give up cooking meals at home, use their money for other things, and tell the child he can get his meal at school. Great temptations are put before a parent to neglect her family, and very much distress is due to this. The meals—just at a time when, owing to the age of her children, the mother's care is most needed, and just in those families where the temptation is greatest, and where the family instinct should be strengthened—stimulate this neglect. Considered from the point of view of meeting by eleemosynary provision a normal economic demand for food, intervention can only have one result. The demand must continue to outstrip the supply, so long as there are resources available on the one side, and until on the other side the desire of the social class that is chiefly exposed to the temptations of dependence in relation to such relief has been satisfied. If the provision be made from the resources of local or general taxation the largeness of the fund available will allow practically of an unlimited expansion of the supply of food. If the provision be made from voluntary sources, in some measure limited therefore and less certain, this very fact will tend to circumscribe demand and limit the offer of relief. It is indeed the problem of poor-law relief in 1832 over again. The relief provided by local taxation practically unlimited will create a mass of constant claimants, with a kind of assumed right to aid based on the payment of rates; while voluntary relief, whatever its shortcomings, will be less injurious because it is less amply endowed. In Paris the municipal subvention for meals rose from 545,900 francs in 1892 to 1,000,000 in 1904. Between 1894 and 1904 there was an increase of 9% in the school population; and an increase of 28% in the municipal grant. In that period the contributions from the local school funds (*caisses des écoles*) decreased 36%; while the voluntary contributions otherwise received were insignificant; and the payments for meals increased 2%.

The subject has been lately considered from a somewhat different standpoint (cf. the reports of the Scottish Royal Commission on Physical Education, 1903; of the Inter-departmental committees on Physical Deterioration, 1905, and on Medical Inspection and the Feeding of School Children, 1905; also the report of the special committee of the Charity Organization Society on "the assistance of school children," 1893). After careful investigations medical officers especially have drawn attention to the low physical condition of children in schools in the poorer parts of large English towns, their low stature, their physical defects, the improper food supplied to them at home, their uncleanness, and their want of decent bringing-up, and sometimes their want of food. Other inquiries have shown that, as women more usually become breadwinners their children receive less attention, and the home and its duties are neglected, while in the lowest sections of the poorer classes social irresponsibility reaches its maximum. Cheap but often quite improper food is provided, and infant mortality, which is largely preventable, remains as high as ever, though adult life is longer. This, with a marked decrease in the birth-rate in recent years, has, it may be said, opened out a new field for charitable effort and social work. Science is at each revision of the problem making its task more definite. Actually the mere demand for meals stands for less; the reform of home conditions for more. So it was hoped that instead of making school meals a charge on taxation, as parliament has done, it would be content to leave it a voluntary charge, while the medical inspection of elementary schools will be made universal; representative relief committees formed for schools or groups of schools; the cases of want or distress among the school children dealt with individually in

connexion with their families, and, where necessary, day schools established on the lines of day industrial schools.

At a time of exceptional distress the following suggestions founded on much English experience may be of service (cf.

Report of special committee of the Charity Organization Society on the best means of dealing with exceptional distress, 1886). Usually at such a time proposals are made to establish special funds, and to provide employment to men and women out of work. But it is best, if possible and as long as possible, to rely on existing agencies, and to strengthen them. Round them there are usually workers more or less trained. A new fund usually draws to it new people, many of whom may not have had any special experience at all. If a new fund is inevitable, it is best that it should make its grants to existing agencies after consultation with them. In any case, a clear policy should be adopted, and people should keep their heads. The exaggeration of feeling at a time of apprehended or actual distress is sometimes extraordinary, and the unwise action which it prompts is often a cause of continuing pauperism afterwards. Where there is public or poor-law relief the following plan may be adopted:—In any large town there are usually different recognized poor-law, charitable or other areas. The local people already at work in these areas should be formed into local committees. In each case a quick inquiry should be made, and the relieving officer communicated with, some central facts verified, and the home visited. Roughly, cases may be divided into three classes: the irresponsible casual labouring class, a middle class of men with decent homes, who have made no provision for the future, and are not members of either friendly society or trades union; and a third class, who have made some provision. These usually are affected last of all; at all hazards they should be kept from receiving public relief, and should be helped, as far as possible, privately and personally. If there are public works, the second class might be referred to them; if there are not, probably some should be left to the poor-law, some assisted in the same way as members of class three. Much would turn upon the family and the home. The first class should be left to the poor-law. If there is no poor-law system at work they should be put on public works. Working men of independent position, not the creatures of any political club, but such as are respected members of a friendly society, or are otherwise well qualified for the task, should be called into consultation. The relief should be settled according to the requirements of each case, but if the pressure is great, at first at least it may be necessary to make grants according to some generally sufficient scale. There should be as constant a revision of cases as time permits. Great care should be taken to stop the relief as soon as possible, and to do nothing to make it the stepping-stone to permanent dependence.

If employment be provided it should be work within the skill of all; it should be fairly remunerated, so that at least the scantiness of the pay may not be an excuse for neglect; and it should be paid for according to measured or piece work. The discipline should be strict, though due regard should be paid at first to those unaccustomed to digging or earthwork. In England and Wales the guardians have power to open labour yards. These, like charities which provide work, tend to attract and keep in employment a low class of labourer or workman, who finds it pays him to use the institution as a convenience. It is best, therefore, to avoid the opening of a labour yard if possible. If it is opened, the discipline should be very strict, and when there is laziness or insubordination, relief in the work-house should at once be offered. The relief furnished to men employed in a labour yard, of which in England at least half has to be given in kind, should, it has been said, be dealt out from day to day. This leads to the men giving up the work sooner than they otherwise would. They have less to spend.

In Great Britain a great change has taken place in regard to the provision of employment in connexion with the state.

Since about 1890 there has been a feeling that men in distress from want of employment should not be dealt with by the poor-law. A circular letter issued by the

Local Government Board in 1886, and subsequently in 1895,

coincided with this feeling. It was addressed to town councils and other local authorities, asking them to provide work (1) which will not involve the stigma of pauperism, (2) which all can perform whatever may have been their previous avocations, and (3) which does not compete with that of other labourers at present in employment. This circular led to the vestries and subsequently the borough councils in many districts becoming partially recognized relief authorities for the unemployed, concurrently with the poor-law. Much confusion resulted. The local authorities had seldom any suitable organization for the investigation of applications. It was difficult to supply work on the terms required; and the work was often ill-done and costly. Also it was found that the same set of people would apply year after year, unskilled labourers usually out of work part of the winter, or men habitually "unemployed." As on other occasions when public work was provided, very few of the applicants were found to be artisans, or members of trades unions or of friendly societies. In 1904 Mr Long, then president of the Local Government Board, proposed that local voluntary distress committees should be established in London consisting of poor-law guardians and town councillors and others, more or less supervised by a central committee and ultimately by the Local Government Board. This organization was set on foot and large sums were subscribed for its work. The report on the results of the movement was somewhat doubtful (Report, London Unemployed Fund, 1904-1905, p. 101, &c.), but in 1905 the Unemployed Workmen's Act was passed, and in London and elsewhere distress committees like the voluntary committees of the previous year were established by statute. It was enacted that for establishment expenses, emigration and removal, labour exchanges, and the acquisition of land a halfpenny rate might be levied, but that the rate would not be available for the remuneration of men employed. For this purpose (1905-1906) a large charitable fund was raised. A training farm at Hollesley Bay was acquired, and it was hoped to train Londoners there to become fit for agricultural work. It is impossible to judge this experiment properly, on the evidence available up to 1908. But one or two points are important: (1) something very like the "right to labour" has been granted by the legislature; (2) this has been done apart from the conditions required by the poor-laws and orders of the Local Government Board on poor relief and without imposing disfranchisement on the men employed; (3) a labour rate has not been levied, but a rate has been levied in aid of the provision of employment; (4) if the line of development that the act suggests were to be followed (as the renewed Labour agitation in 1908-1909 made probable) it must tend to create a class of "unemployed," unskilled labourers of varying grades of industry who may become the dependent and state-supported proletariat of modern urban life. Thus, unless the administration be extremely rigorous, once more will a kind of serfdom be established, to be, as some would say, taken over hereafter by the socialist state.

In some of the English colonies Homeric hospitality still prevails, but by degrees the station-house or some refuge is established in the towns as they grow more populous. Finally, some system of labour in exchange for relief is evolved. At first this is voluntary, afterwards it is officially recognized, and finally it may become part of the system of public relief. As bad years come, these changes are made step by step. In England the vagrant or wayfarer is tolerated and discouraged, but not kept employed. He should be under greater pressure to maintain himself, it is thought. The provision made for him in different parts of the country is far from uniform, and now, usually, at least in the larger towns, after he has had a bath and food, he is admitted to a separate room or cell in a casual ward. Before he leaves he has to do a task of work, and, subject to the discretion of the master, he is detained two nights. This plan has reduced vagrancy, and if it were universally adopted clean accommodation would everywhere be provided for the vagrant without the attractions of a common or "associated" ward; and probably vagrancy would diminish still further. It seems almost needless to say that, in these circumstances at any

Excep-  
tional  
distress.

Unem-  
ployment.

rate, casual alms should not be given to vagrants. They know much better how to provide for themselves than the almsgiver imagines, for vagrancy is in the main a mode of life not the result of any casual difficulty. Vagrancy and criminality are also nearly allied. The magistrate, therefore, rather than the almsgiver, should usually interfere; and, as a rule, where the magistrates are strict, vagrancy in a county diminishes. An inter-departmental committee (1906) taking generally this line, reported in favour of vagrants being placed entirely under police control, and it recommended a system of wayfarers' tickets for men on the roads who are not habitual vagrants, and the committal of men likely to become habitual vagrants to certified labour colonies for not less than six months. Still undoubtedly vagrancy has its economic side. In a bad year the number of tramps is increased by the addition of unskilled and irresponsible labourers, who are soonest discharged when work is slack. As a part-voluntary system under official recognition the German *Arbeiter-colonien* are of interest. This in a measure has led to the introduction of labour homes in England, the justification of which should be that they recruit the energy of the men who find their way to them, and enable them to earn a living which they could not do otherwise. In a small percentage of cases their result may be achieved. Charitable refuges or philanthropic common lodging-houses, usually established in districts where this class already congregate, only aggravate the difficulty. They give additional attractions to a vagrant and casual life, and make it more endurable. They also make a comfortable avoidance of the responsibilities of family life comparatively easy, and in so far as they do this they are clearly injurious to the community.

The English colonists of the New England states and Pennsylvania introduced the disciplinary religious and relief system of Protestantism and the Elizabethan poor-law. To the former reference has already been made. With an appreciation of the fact that the cause of distress is not usually poverty, but weakness of character and want of judgment, and that relief is in itself no remedy, those who have inherited the old Puritan traditions have, in the light of toleration and a larger social experience, organized the method of friendly visiting, the object of which is illustrated by the motto, "Not alms, but a friend." To the friendship of charity is thus given a disciplinary force, capable of immense expansion and usefulness, if the friendship on the side of those who would help is sincere and guided by practical knowledge and sagacity, and if on the side of those in distress there is awakened a reciprocal regard and a willingness to change their way of life by degrees. Visiting by "districts" is set aside, for "friendliness" is not a quality easily diffused over a wide area. To be real it must be limited as time and ability allow. Consequently, a friendly visitor usually befriends but one or two, or in any case only a few, families. The friendly visitor is the outcome of the movement for "associated charities," but in America charity organization societies have also adopted the term, and to a certain extent the method. Between the two movements there is the closest affinity. The registration of applicants for relief is much more complete in American cities than in England, where the plan meets with comparatively little support. At the office of the associated charities in Boston there is a central and practically a complete register of all the applications made to the public authority for poor relief, to the associated charities, and to many other voluntary bodies.

The Elizabethan poor-law system, with the machinery of overseers, poor-houses and out-door relief, is still maintained in New England, New York state and Pennsylvania, but with many modifications, especially in New York. A chief factor in these changes has been immigration. While the county or town remained the administrative area for local poor relief, the large number of immigrant and "unsettled" poor, and the business connected with their removal from the state, entailed the establishment of a secondary or state system of administration and aid, with special classes of institutions to which the counties or towns could send their poor, as, for instance, state reform schools, farms, almshouses, &c. For the oversight of these

institutions, and often of prisons also and lunatic asylums, in many states there have been established state boards of "charity or corrections and charity." The members of these boards are selected by the state for a term of years, and give their services honorarily. There are state boards in Massachusetts, New York, Pennsylvania, Ohio, Illinois, Minnesota, Michigan, Wisconsin, Iowa, Colorado, North Carolina and elsewhere. There is also a district board of charities in the district of Columbia. These boards publish most useful and detailed reports. Besides the state board there is sometimes also, as in New York, a State Charities Aid Association, whose members, in the counties in which they reside, have a legal right of entry to visit and inspect any public or charitable institution owned by the state, and any county and other poor-house. A large association of visitors accustomed to inspect and report on institutions has thus been created. Further, the counties and towns in New York state, for instance, and Massachusetts, and the almshouse districts in Pennsylvania, are under boards of supervision. Usually the overseers give out-door relief, and the pauperism of some areas is as high as that in some English unions, 3, 4 and 5%. On the whole population of the United States, however, and of individual states, consisting to a great extent of comparatively young and energetic immigrants, the pauperism is insignificant. In Massachusetts "it has been the general policy of the state to order the removal to the state almshouse of unsettled residents of the several cities and towns in need of temporary aid, thus avoiding some of the abuses incident to out-door relief." In New York state, in the city of New York, including Brooklyn, the distribution of out-door relief by the department of charities is forbidden, except for purposes of transportation and for the adult blind. Most counties in the state have an almshouse, and the county superintendents and overseers of the poor "furnish necessary relief to such of the county poor as may require only temporary assistance, or are so disabled that they cannot be safely removed to the almshouse." Public attention is in many cases being drawn to the intility and injury of out-door relief.

In some states and cities the system of subsidizing voluntary institutions is in full force, and it is in force also in many English colonies. At first sight it has the advantage of providing relief for public purposes without the creation of a new staff or establishment. There is thus an apparent economy. But the evils are many. Political partisanship and favour may influence the amount and disposition of the grants. The grants act as a bounty on the establishment and continuance of charitable institutions, homes for children, hospitals, &c., but not on the expansion of the voluntary charitable funds and efforts that should maintain them; and thus charitable homes exist in which charity in its truer sense may have little part, but in which the chief motive of the administration may be to support sectarian interests by public subsidies. Claimants for relief have little scruple in turning such institutions to their own account; and the institutions, being financially irresponsible, are not in these circumstances scrupulous on their side to prevent a misdirection of their bounties. "Parents unload their children upon the community more recklessly when they know that such children will be provided for in private orphan asylums and protectories, where the religious training that the parents prefer will be given them" (Amos G. Warner, in *International Congress: Charities and Correction*, 1893). Past history in New York city illustrates the same evil. The admission was entirely in the hands of the managers. They admitted; the city paid. In New York city the population between 1870 and 1890 increased about 80%; the subsidies for prisoners and public paupers increased by 43% but those for paupers in private institutions increased from \$334,828 to \$1,845,872, or about 461%. The total was at that time \$3,794,972; in 1898 it was rather less, \$3,132,786. The alternative to this system is either the establishment of state or municipal institutions, and possibly in special cases payments to voluntary homes for the maintenance of inmates admitted at the request of a state authority, as at certified and other homes in England, with grants made conditional on the work being conducted on specified lines, and subject to a certain increasing

amount of voluntary financial support; or a close general and financial inspection of charitable institutions—the method of reform adopted in New York; or payment for only those inmates who are sent by public authorities and admitted on their request.

The enormous extent to which children's aid societies have been increased in the United States, sometimes with the help of considerable public grants, suggests the greatest need for caution from the point of the preservation of the family as the central element of social strength in the community. The problem of charity in relation to medical relief in the large towns of the United States is similar to that of England; its difficulties are alike.

**LITERATURE.**—As good translations of the classics become accessible it is easy for the general reader or student to combine a study of the principles of charity in relation to the community with a study of history. Thus, and in connexion with special investigations and the conditions of practical charity, social economics may best be studied. In N. Masterman, *Chalmers on Charity* (1900); T. Mackay, *Methods of Social Reform* (1896); B. Bosanquet and others, *Some Aspects of the Social Problem* (1894); and C. S. Loch, *Methods of Social Advance* (1904), this point of view is generally assumed. Special investigations of importance may be found in the reports of medical officers of health. See Report of Committee on Physical Deterioration referred to above, and, for instance, Dr Newsholme's *Vital Statistics and Charles Booth's Labour and Life in London*. For the history of charity there is no good single work. On details there are many good articles in *Daremborg's Dictionary of Classical Antiquities*, and similar works. *Modern Methods of Charity*, by C. H. Henderson and others (1904), supplies much general information in regard to poor relief and charity in different countries. Apart from books and official documents mentioned in the text as indicating the present state of charitable and public relief, or as aids to practical work, the following may be of service. England.—*Annual Charities' Register and Digest, with Introduction on "How to help Cases of Distress"*; the *Charity Organisation Review*; *Occasional Papers* (3 vols.), published by the London Charity Organization Society (1896-1906); *Reports of Proceedings of Conferences of Poor-Law Guardians, The Strength of the People*, by Helen Bosanquet; *Homes of the London Poor and Our Common Land*, by Miss Octavia Hill; *The Queen's Poor*, by M. Loane. United States of America.—*The Proceedings of the International Conference on Charities and Correction* (1894), and the proceedings of the annual conferences; *Friendly Visiting among the Poor*, by Mary E. Richmond (1899); *American Charities*, by Amos G. Warner (1908); *The Practice of Charity*, by E. T. Devine; *Handwörterbuch der Staatswissenschaften*, by Dr J. Conrad, &c., vol. ii.; *Das Armenwesen in den Vereinigten Staaten von America*, by Dr Francis G. Peabody (1897); the *Charities Review*, published monthly by the New York Charity Organization Society; the *Papers and Reports of the Boston and Baltimore societies*. France.—*La Bibliographie charitable*, by Camille Granier (1891); *La Charité avant et depuis 1789*, by F. Hubert Valleroux; *Fascicules du Conseil supérieur de l'assistance publique; Revue d'assistance*, published by the *Société internationale pour l'étude des questions d'assistance*. Germany.—*Reports and Proceedings of the Deutsche Verein für Armenpflege und Wohltätigkeit; Die Armenpflege*, a practical handbook, by Dr E. Münsterberg (1897). Austria.—*Oesterreichs Wohlfahrtsrichtungen, 1848-1898*, by Dr Ernest Mischler (1899). (C. S. L.)

**CHARIVARI**, a French term of uncertain origin, but probably onomatopoeic, for a mock serenade "rough music," made by beating on kettles, fire-irons, tea-trays or what not. The charivari was anciently in France a regular wedding custom, all bridal couples being thus serenaded. Later it was reserved for ill-assorted and unpopular marriages, for widows or widowers who remarried too soon, and generally as a mockery for all who were unpopular. At the beginning of the 17th century, wedding charivaris were forbidden by the Council of Tours under pain of excommunication, but the custom still lingers in rural districts. The French of Louisiana and Canada introduced the charivari into America, where it became known under the corrupted name of "shivaree."

**CHARKHARI**, a native state in the Bundelkhand agency of Central India. Area, 745 sq. m.; pop. (1901) 123,504; estimated revenue £33,000. It is surrounded on all sides by other states of Central India, except near Charkhari town, where it meets the United Provinces. It was founded by Bijai Bahadur (vikramaditya), a *sanad* being granted him in 1804 and another in 1811. The chief, whose title is maharaja, is a Rajput of the Bundela clan, descended from Chhatar Sal, the champion of the independence of Bundelkhand in the 18th century. In 1857 Raja

Ratan Singh received a hereditary salute of 11 guns, a *khilaf* and a perpetual *jagir* of £1,300 a year in recognition of his services during the Mutiny. The town of Charkhari (locally *Maharaj-nagar*) is 40 m. W. of Banda; pop. (1901) 11,718.

**CHARLATAN** (Ital. *ciarlatano*, from *ciarlare*, to chatter), originally one who "patters" to a crowd to sell his wares, like a "cheap-jack" or "quack" doctor—"quack" being similarly derived from the noise made by a duck; so an impostor who pretends to have some special skill or knowledge.

**CHARLEMAGNE** [CHARLES THE GREAT] (c. 742-814), Roman emperor, and king of the Franks, was the elder son of Pippin the Short, king of the Franks, and Bertha, or Bertrada, daughter of Charibert, count of Laon. The place of his birth is unknown and its date uncertain, although some authorities give it as the 2nd of April 742; doubts have been cast upon his legitimacy, and it is just possible that the marriage of Pippin and Bertha took place subsequent to the birth of their elder son. When Pippin was crowned king of the Franks at St Denis on the 28th of July 754 by Pope Stephen II., Charles, and his brother Carloman were anointed by the pope as a sign of their kingly rank. The rough surroundings of the Frankish court were unfavourable to the acquisition of learning, and Charles grew up almost ignorant of letters, but hardy in body and skilled in the use of weapons.

In 761 he accompanied his father on a campaign in Aquitaine, and in 763 undertook the government of several counties. In 768 Pippin divided his dominions between his two sons, and on his death soon afterwards Charles became the ruler of the northern portion of the Frankish kingdom, and was crowned at Noyon on the 9th of October 768. Bad feeling had existed for some time between Charles and Carloman, and when Charles early in 769 was called upon to suppress a rising in Aquitaine, his brother refused to afford him any assistance. This rebellion, however, was easily crushed, its leader, the Aquitainian duke Hunold, was made prisoner, and his territory more closely attached to the Frankish kingdom. About this time Bertha, having effected a temporary reconciliation between her sons, overcame the repugnance with which Pope Stephen III. regarded an alliance between Frank and Lombard, and brought about a marriage between Charles and a daughter of Desiderius, king of the Lombards. Charles had previously contracted a union, probably of an irregular nature, with a Frankish lady named Himiltrude, who had borne him a son Pippin, the "Hunchback." The peace with the Lombards, in which the Bavarians as allies of Desiderius joined, was, however, soon broken. Charles thereupon repudiated his Lombard wife (Bertha or Desiderata) and married in 771 a princess of the Alamanni named Hildegard. Carloman died in December 771, and Charles was at once recognized at Corbeny as sole king of the Franks. Carloman's widow Gerberga had fled to the protection of the Lombard king, who espoused her cause and requested the new pope, Adrian I., to recognize her two sons as the lawful Frankish kings. Adrian, between whom and the Lombards other causes of quarrel existed, refused to assent to this demand, and when Desiderius invaded the papal territories he appealed to the Frankish king for help. Charles, who was at the moment engaged in his first Saxon campaign, expostulated with Desiderius; but when such mild measures proved useless he led his forces across the Alps in 773. Gerberga and her children were delivered up and disappear from history; the siege of Pavia was undertaken; and at Easter 774 the king left the seat of war and visited Rome, where he was received with great respect.

During his stay in the city Charles renewed the donation which his father Pippin had made to the papacy in 754 or 756. This transaction has given rise to much discussion as to its trustworthiness and the extent of its operation. Our only authority, a passage in the *Liber Pontificalis*, describes the gift as including the whole of Italy and Corsica, except the lands north of the Po, Calabria and the city of Naples. The vast extent of this donation, which, moreover, included territories not owing Charles's authority, and the fact that the king did not execute, or apparently attempt to execute, its provisions, has caused many scholars to look upon the passage as a forgery; but the better

opinion would appear to be that it is genuine, or at least has a genuine basis. Various explanations have been suggested. The area of the grant may have been enlarged by later interpolations; or it may have dealt with property rather than with sovereignty, and have only referred to estates claimed by the pope in the territories named; or it is possible that Charles may have actually intended to establish an extensive papal kingdom in Italy, but was released from his promise by Adrian when the pope saw no chance of its fulfilment. Another supposition is that the author of the *Liber Pontificalis* gives the papal interpretation of a grant that had been expressed by Pippin in ambiguous terms; and this view is supported by the history of the subsequent controversy between king and pope.

Returning to the scene of hostilities, Charles witnessed the capitulation of Pavia in June 774, and the capture of Desiderius, who was sent into a monastery. He now took the title "king of the Lombards," to which he added the dignity of "Patrician of the Romans," which had been granted to his father. Adalgis, the son of Desiderius, who was residing at Constantinople, hoped the emperor Leo IV. would assist him in recovering his father's kingdom; but a coalition formed for this purpose was ineffectual, and a rising led by his ally Rothgaud, duke of Friuli, was easily crushed by Charles in 776. In 777 the king was visited at Paderborn by three Saracen chiefs who implored his aid against Abd-ar-Rabman, the caliph of Cordova, and promised some Spanish cities in return for help. Seizing this opportunity to extend his influence Charles marched into Spain in 778 and took Pampeluna, but meeting with some checks decided to return. As the Frankish forces were defiling through the passes of the Pyrenees they were attacked by the Wascones (probably Basques), and the rearguard of the army was almost annihilated. It was useless to attempt to avenge this disaster, which occurred on the 15th of August 778, for the enemy disappeared as quickly as he came; the incident has passed from the domain of history into that of legend and romance, being associated by tradition with the pass of Roncesvalles. Among the slain was one Hruodland, or Roland, margrave of the Breton march, whose death gave rise to the *Chanson de Roland* (see ROLAND, LEGEND OR).

Charles now sought to increase his authority in Italy, where Frankish counts were set over various districts, and where Hildebrand, duke of Spoleto, appears to have recognized his overlordship. In 780 he was again in the peninsula, and at Mantua issued an important *capitulary* which increased the authority of the Lombard bishops, relieved freemen who under stress of famine had sold themselves into servitude, and condemned abuses of the system of vassalage. At the same time commerce was encouraged by the abolition of unauthorized tolls and by an improvement of the coinage; while the sale of arms to hostile peoples, and the trade in Christian slaves were forbidden. Proceeding to Rome, the king appears to have come to some arrangement with Adrian about the donation of 774. At Easter 781, Carloman, his second son by Hildegarde, was renamed Pippin and crowned king of Italy by Pope Adrian, and his youngest son Louis was crowned king of Aquitaine; but no mention was made at the time of his eldest son Charles, who was doubtless intended to be king of the Franks. In 783 the king, having lost his wife Hildegarde, married Fastrada, the daughter of a Frankish count named Radolf; and in the same year his mother Bertha died. The emperor Constantine VI. was at this time exhibiting some interest in Italian affairs, and Adalgis the Lombard was still residing at his court; so Charles sought to avert danger from this quarter by consenting in 781 to a marriage between Constantine and his own daughter Rothrude. In 786 the entreaties of the pope and the hostile attitude of Arichis II., duke of Benevento, a son-in-law of Desiderius, called the king again into Italy. Arichis submitted without a struggle, though the basis of Frankish authority in his duchy was far from secure; but in conjunction with Adalgis he sought aid from Constantinople. His plans were ended by his death in 787, and although the empress Irene, the real ruler of the eastern empire, broke off the projected marriage between her son and Rothrude, she appears to have given very little assistance to Adalgis,

whose attack on Italy was easily repulsed. During this visit Charles had presented certain towns to Adrian, but an estrangement soon arose between king and pope over the claim of Charles to confirm the election to the archbishopric of Ravenna, and it was accentuated by Adrian's objection to the establishment by Charles of Grimoald III. as duke of Benevento, in succession to his father Arichis.

These journeys and campaigns, however, were but interludes in the long and stubborn struggle between Charles and the Saxons, which began in 772 and ended in 804 with the incorporation of Saxony in the Carolingian empire (see SAXONY). This contest, in which the king himself took a very active part, brought the Franks into collision with the Wiltzi, a tribe dwelling east of the Elbe, who in 789 was reduced to dependence. A similar sequence of events took place in southern Germany. Tassilo III., duke of the Bavarians, who had on several occasions adopted a line of conduct inconsistent with his allegiance to Charles, was deposed in 788 and his duchy placed under the rule of Gerold, a brother-in-law of Charles, to be governed on the Frankish system (see BAVARIA). Having thus taken upon himself the control of Bavaria, Charles felt himself responsible for protecting its eastern frontier, which had long been menaced by the Avars, a people inhabiting the region now known as Hungary. He accordingly ravaged their country in 791 at the head of an army containing Saxon, Frisian, Bavarian and Alamannian warriors, which penetrated as far as the Raab; and he spent the following year in Bavaria preparing for a second campaign against them, the conduct of which, however, he was compelled by further trouble in Saxony to entrust to his son king Pippin, and to Eric, margrave of Friuli. These deputies succeeded in 795 and 796 in taking possession of the vast treasures of the Avars, which were distributed by the king with lavish generosity to churches, courtiers and friends. A conspiracy against Charles, which his friend and biographer Einhard alleges was provoked by the cruelties of Queen Fastrada, was suppressed without difficulty in 792, and its leader, the king's illegitimate son Pippin, was confined in a monastery till his death in 811. Fastrada died in August 794, when Charles took for his fourth wife an Alamannian lady named Liutgarde.

The continuous interest taken by the king in ecclesiastical affairs was shown at the synod of Frankfurt, over which he presided in 794. It was on his initiative that this synod condemned the heresy of *adoptionism* and the worship of images, which had been restored in 787 by the second council of Nicea; and at the same time that council was declared to have been superfluous. This policy caused a further breach with Pope Adrian; but when Adrian died in December 795, his successor, Leo III., in notifying his elevation to the king, sent him the keys of St Peter's grave and the banner of the city, and asked Charles to send an envoy to receive his oath of fidelity. There is no doubt that Leo recognized Charles as sovereign of Rome. He was the first pope to date his acts according to the years of the Frankish monarchy, and a mosaic of the time in the Lateran palace represents St Peter bestowing the banners upon Charles as a token of temporal supremacy, while the coinage issued by the pope bears witness to the same idea. Leo soon had occasion to invoke the aid of his protector. In 799, after he had been attacked and maltreated in the streets of Rome during a procession, he escaped to the king at Paderborn, and Charles sent him back to Italy escorted by some of his most trusted servants. Taking the same journey himself shortly afterwards, the king reached Rome in 800 for the purpose (as he declared) of restoring discipline in the church. His authority was undisputed; and after Leo had cleared himself by an oath of certain charges made against him, Charles restored the pope and banished his leading opponents.

The great event of this visit took place on the succeeding Christmas Day, when Charles on rising from prayer in St Peter's was crowned by Leo and proclaimed emperor and *augustus* amid the acclamations of the crowd. This act can hardly have been unpremeditated, and some doubt has been cast upon the statement which Einhard attributes to Charles, that he would not

have entered the building had he known of the intention of Leo. He accepted the dignity at any rate without demur, and there seems little doubt that the question of assuming, or obtaining, this title had previously been discussed. His policy had been steadily leading up to this position, which was rather the emblem of the power he already held than an extension of the area of his authority. It is probable therefore that Charles either considered the coronation premature, as he was hoping to obtain the assent of the eastern empire to this step, or that, from fear of evils which he foresaw from the claim of the pope to crown the emperor, he wished to crown himself. All the evidence tends to show that it was the time or manner of the act rather than the act itself which aroused his temporary displeasure. Contemporary accounts lay stress upon the fact that as there was then no emperor, Constantinople being under the rule of Irene, it seemed good to Leo and his counsellors and the "rest of the Christian people" to choose Charles, already ruler of Rome, to fill the vacant office. However doubtful such conjectures concerning his intentions may be, it is certain that immediately after his coronation Charles sought to establish friendly relations with Constantinople, and even suggested a marriage between himself and Irene, as he had again become a widower in 800. The deposition and death of the empress foiled this plan; and after a desultory warfare in Italy between the two empires, negotiations were recommenced which in 810 led to an arrangement between Charles and the eastern emperor, Nicephorus I. The death of Nicephorus and the accession of Michael I. did not interfere with the relations, and in 812 an embassy from Constantinople arrived at Aix-la-Chapelle, when Charles was acknowledged as emperor, and in return agreed to cede Venice and Dalmatia to Michael.

Increasing years and accumulating responsibilities now caused the emperor to alter somewhat his manner of life. No longer leading his armies in person he entrusted the direction of campaigns in various parts of his empire to his sons and other lieutenants, and from his favourite residence at Aix watched their progress with a keen and sustained interest. In 802 he ordered that a new oath of fidelity to him as emperor should be taken by all his subjects over twelve years of age. In 804 he was visited by Pope Leo, who returned to Rome laden with gifts. Before his coronation as emperor, Charles had entered into communications with the caliph of Bagdad, Harun-al-Rashid, probably in order to protect the eastern Christians, and in 801 he had received an embassy and presents from Harun. In the same year the patriarch of Jerusalem sent him the keys of the Holy Sepulchre; and in 807 Harun not only sent further gifts, but appears to have confirmed the emperor's rights in Jerusalem, which, however, probably amounted to no more than an undefined protectorate over the Christians in that part of the world. While thus extending his influence even into Asia, there was scarcely any part of Europe where the power of Charles did not make itself felt. He had not visited Spain since the disaster of Roncesvalles, but he continued to take a lively interest in the affairs of that country. In 798 he had concluded an alliance with Alphonso II., king of the Asturias, and a series of campaigns mainly under the leadership of King Louis resulted in the establishment of the "Spanish march," a district between the Pyrenees and the Ebro stretching from Pampeluna to Barcelona, as a defence against the Saracens. In 799 the Balearic Islands had been handed over to Charles, and a long warfare was carried on both by sea and land between Frank and Saracen until 810, when peace was made between the emperor and El-Hakem, the emir of Cordova. Italy was equally the scene of continuous fighting. Grimoald of Benevento rebelled against his overlord; the possession of Venice and Dalmatia was disputed by the two empires; and Istria was brought into subjection.

With England the emperor had already entered into relations, and at one time a marriage was proposed between his son Charles and a daughter of Offa, king of the Mercians. English exiles were welcomed at his court; he was mainly instrumental in restoring Eardwulf to the throne of Northumbria in 809; and Einhard includes the Scots within the sphere of his influence.

In eastern Europe the Avars had owned themselves completely under his power in 805; campaigns against the Czechs in 805 and 806 had met with some success, and about the same time the land of the Sorbs was ravaged; while at the western extremity of the continent the Breton nobles had done homage to Charles at Tours in 800. Thus the emperor's dominions now stretched from the Eider to the Ebro, and from the Atlantic to the Elbe, the Saale and the Raab, and they also included the greater part of Italy; while even beyond these bounds he exercised an acknowledged but shadowy authority. In 806 Charles arranged a division of his territories among his three legitimate sons, but this arrangement came to nothing owing to the death of Pippin in 810, and of the younger Charles in the following year. Charles then named his remaining son Louis as his successor; and at his father's command Louis took the crown from the altar and placed it upon his own head. This ceremony took place at Aix on the 11th of September 813. In 808 the Frankish authority over the Obotrites was interfered with by Gudrod (Godfrey), king of the Danes, who ravaged the Frisian coasts and spoke boastfully of leading his troops to Aix. To ward off these attacks Charles took a warm interest in the building of a fleet, which he reviewed in 811; but by this time Gudrod had been killed, and his successor Hemming made peace with the emperor.

In 811 Charles made his will, which shows that he contemplated the possibility of abdication. The bulk of his possessions were left to the twenty-one metropolitan churches of his dominions, and the remainder to his children, his servants and the poor. In his last years he passed most of his days at Aix, though he had sufficient energy to take the field for a short time during the Danish War. Early in 814 he was attacked by a fever which he sought to subdue by fasting; but pleurisy supervened, and after partaking of the communion, he died on the 28th of January 814, and on the same day his body was hurried in the church of St Mary at Aix. In the year 1000 his tomb was opened by the emperor Otto III., but the account that Otto found the body upright upon a throne with a golden crown on the head and holding a golden sceptre in the hands, is generally regarded as legendary. The tomb was again opened by the emperor Frederick I. in 1165, when the remains were removed from a marble sarcophagus and placed in a wooden coffin. Fifty years later they were transferred by order of the emperor Frederick II. to a splendid shrine, in which the relics are still exhibited once in every six years. The sarcophagus in which the body originally lay may still be seen at Aix, and other relics of the great emperor are in the imperial treasury at Vienna. In 1165 Charles was canonized by the antipope Paschal III. at the instance of the emperor Frederick I., and Louis XI. of France gave strict orders that the feast of the saint should be observed.

The personal appearance of Charles is thus described by Einhard:—"Big and robust in frame, he was tall, but not excessively so, measuring about seven of his own feet in height. His eyes were large and lustrous, his nose rather long and his countenance bright and cheerful." He had a commanding presence, a clear but somewhat feeble voice, and in later life became rather corpulent. His health was uniformly good, owing perhaps to his moderation in eating and drinking, and to his love for hunting and swimming. He was an affectionate father, and loved to pass his time in the company of his children, to whose education he paid the closest attention. His sons were trained for war and the chase, and his daughters instructed in the spinning of wool and other feminine arts. His ideas of sexual morality were primitive. Many concubines are spoken of, he had several illegitimate children, and the morals of his daughters were very loose. He was a regular observer of religious rites, took great pains to secure decorum in the services of the church, and was generous in almsgiving both within his empire and without. He reformed the Frankish liturgy, and brought singers from Rome to improve the services of the church. He had considerable knowledge of theology, took a prominent part in the theological controversies of the time, and was responsible for the addition of the clause *filioque* to the Nicene Creed. The most

attractive feature of his character, however, was his love of learning. In addition to his native tongue he could read Latin and understood Greek, but he was unable to write, and Einhard gives an account of his futile efforts to learn this art in later life. He loved the reading of histories and astronomy, and by questioning travellers gained some knowledge of distant parts of the earth. He attended lectures on grammar, and his favourite work was St Augustine's *De civitate Dei*. He caused Frankish sagas to be collected, began a grammar of his native tongue, and spent some of his last hours in correcting a text of the Vulgate. He delighted in the society of scholars—Alcuin, Angilbert, Paul the Lombard, Peter of Pisa and others, and in this company the trappings of rank were laid aside and the emperor was known simply as David. Under his patronage Alcuin organized the school of the palace, where the royal children were taught in the company of others, and founded a school at Tours which became the model for many other establishments. Charles was unwearying in his efforts to improve the education of clergy and laity, and in 789 ordered that schools should be established in every diocese. The atmosphere of these schools was strictly ecclesiastical and the questions discussed by the scholars were often puerile, but the greatness of the educational work of Charles will not be doubted when one considers the rude condition of Frankish society half a century before. The main work of the Carolingian renaissance was to restore Latin to its position as a literary language, and to reintroduce a correct system of spelling and an improved handwriting. The manuscripts of the time are accurate and artistic, copies of valuable books were made and by careful collation the texts were purified.

Charles was not a great warrior. His victories were won rather by the power of organization, which he possessed in a marked degree, and he was eager to seize ideas and prompt in their execution. He erected a stone bridge with wooden piers across the Rhine at Mainz, and began a canal between the Altmühl and the Rednitz to connect the Rhine and the Danube, but this work was not finished. He built palaces at Aix (his favourite residence), Nijmegen and Ingelheim, and erected the church of St Mary at Aix, modelled on that of St Vitalis at Ravenna and adorned with columns and mosaics brought from the same city. He loved the simple dress and manners of the Franks, and on two occasions only did he assume the more stately attire of a Roman noble. The administrative system of Charles in church and state was largely personal, and he brought to the work an untiring industry, and a marvellous grasp of detail. He admonished the pope, appointed the bishops, watched over the morals and work of the clergy, and took an active part in the deliberations of church synods; he founded bishoprics and monasteries, was lavish in his gifts to ecclesiastical foundations, and chose bishops and abbots for administrative work. As the real founder of the ecclesiastical state, he must be held mainly responsible for the evils which resulted from the policy of the church in exalting the ecclesiastical over the secular authority.

In secular affairs Charles abolished the office of duke, placed counts over districts smaller than the former duchies, and supervised their government by means of *missi dominici*, officials responsible to himself alone. Marches were formed on all the borders of the empire, and the exigencies of military service led to the growth of a system of land-tenure which contained the germ of feudalism. The assemblies of the people gradually changed their character under his rule. No longer did the nation come together to direct and govern, but the emperor summoned his people to assent to his acts. Taking a lively interest in commerce and agriculture, Charles issued various regulations for the organization of the one and the improvement of the other. He introduced a new system of weights and measures, which he ordered should be used throughout his kingdom, and took steps to reform the coinage. He was a voluminous lawgiver. Without abolishing the customary law of the German tribes, which is said to have been committed to writing by his orders, he added to it by means of *capitularies*, and thus introduced

certain Christian principles and customs, and some degree of uniformity.

The extent and glamour of his empire exercised a potent spell on western Europe. The aim of the greatest of his successors was to restore it to its pristine position and influence, while many of the French rulers made its re-establishment the goal of their policy. Otto the Great to a considerable extent succeeded, Louis XIV. referred frequently to the empire of Charlemagne, and Napoleon regarded him as his prototype and predecessor. The empire of Charles, however, was not lasting. In spite of his own wonderful genius the seeds of weakness were sown in his lifetime. The church was too powerful, an incipient feudalism was present, and there was no real bond of union between the different races that acknowledged his authority. All the vigilance of the emperor could not restrain the dishonesty and the cupidity of his servants, and no sooner was the strong hand of their ruler removed than they began to acquire territorial power for themselves.

**AUTHORITIES.**—The chief authorities for the life and times of Charlemagne are Einhard's *Vita Karoli Magni*, the *Annales Leobenses majores*, the *Annales Fuldenses*, and other annals, which are published in the *Monumenta Germaniae historica. Scriptores*, Band i. and ii., edited by G. H. Pertz (Hanover and Berlin, 1826-1857). For the capitularies see *Capitularia regum Francorum*, edited by A. Boretius in the *Monumenta. Leges*. Many of the songs of the period appear in the *Poetae Latini aevi Carolini*, edited by E. Dümmler (Berlin, 1881-1884). The *Bibliotheca rerum Germanicarum*, tome iv., edited by Ph. Jaffé (Berlin, 1864-1873), contains some of the emperor's correspondence, and Hincmar's *De ordine palatii*, edited by M. Prou (Paris, 1869), is also valuable.

The best modern authorities are S. Abel and B. Simson, *Lehrbücher des fränkischen Reiches unter Karl dem Grossen* (Leipzig, 1883-1888); G. Richter and H. Kohl, *Annalen des fränkischen Reiches im Zeitalter der Karolinger* (Halle, 1885-1887); E. Mühlbacher, *Deutsche Geschichte unter den Karolingern* (Stuttgart, 1886); H. Brosien, *Karl der Grosse* (Leipzig and Prague, 1885); J. I. Mombert, *History of Charles the Great* (London, 1888); M. Lipp, *Das fränkische Grossenystem unter Karl dem Grossen* (Breslau, 1892); J. von Dollinger, *Das Kaiserthum Karls des Grossen und seiner Nachfolge* (Munich, 1864); F. von Wyss, *Karl der Grosse als Gesetzgeber* (Zürich, 1869); Th. Sickel, *Lehre von den Urkunden der ersten Karolinger* (Vienna, 1867); E. Dümmler in the *Allgemeine deutsche Biographie*, Band xv.; Th. Lindner, *Die Fabel von der Bestattung Karls des Grossen* (Aix-la-Chapelle, 1893); J. A. Kettner, *Karl der Grosse und die Kirche* (Munich and Leipzig, 1898); and J. B. Mullinger, *The Schools of Charles the Great and the Restoration of Education in the 9th century* (London, 1877).

The work of the monk of St Gall is found in the *Monarchia*, Band ii.; an edition of the *Historia de vita Karoli Magni et Rolandi*, edited by F. Castets, has been published (Paris, 1880), and an edition of the *Kaiserchronik*, edited by E. Schröder (Hanover, 1892). See also P. Clemen, *Die Porträtstellung Karls des Grossen* (Aix-la-Chapelle, 1896). (A. W. H.)

#### THE CHARLEMAGNE LEGENDS

Innumerable legends soon gathered round the memory of the great emperor. He was represented as a warrior performing superhuman feats, as a ruler dispensing perfect justice, and even as a martyr suffering for the faith. It was confidently believed towards the close of the 10th century that he had made a pilgrimage to Jerusalem; and, like many other great rulers, it was reported that he was only sleeping to awake in the hour of his country's need. We know from Einhard (*Vita Karoli*, cap. xxix.) that the Frankish heroic ballads were drawn up in writing by Charlemagne's order, and it may be accepted as certain that he was himself the subject of many such during his lifetime. The legendary element crept even into the Latin panegyrics produced by the court poets. Before the end of the 9th century a monk of St Gall drew up a chronicle *De gestis Karoli Magni*, which was based partly on oral tradition, received from an old soldier named Adalbert, who had served in Charlemagne's army. This recital contains various fabulous incidents. The author relates a conversation between Otkar the Frank (Ogier the Dane) and the Lombard king Desiderius (Didier) on the walls of Pavia in view of Charlemagne's advancing army. To Didier's repeated question "Is this the emperor?" Otkar continues to answer "Not yet," adding at last "When thou shalt see the fields bristling with an iron harvest, and the Po and the Ticino swollen with sea-floods, inundating the walls of the city

with iron billows, then shall Karl be nigh at hand." This episode, which bears the marks of popular heroic poetry, may well be the substance of a lost Carolingian *cantilena*.<sup>1</sup>

The legendary Charlemagne and his warriors were endowed with the great deeds of earlier kings and heroes of the Frankish kingdom, for the romancers were not troubled by considerations of chronology. National traditions extending over centuries were grouped round Charlemagne, his father Pippin, and his son Louis. The history of Charles Martel especially was absorbed in the Charlemagne legend. But if Charles's name was associated with the heroism of his predecessors he was credited with equal readiness with the weaknesses of his successors. In the earlier *chansons de geste* he is invariably a majestic figure and represents within limitations the grandeur of the historic Charles. But in the histories of the wars with his vassals he is often little more than a tyrannical dotard, who is made to submit to gross insult. This picture of affairs is drawn from later times, and the sympathies of the poet are generally with the rebels against the monarchy. Historical tradition was already dim when the hypothetical and much discussed *cantilena*, which may be taken to have formed the repository of the national legends from the 8th to the 10th century, were succeeded in the 11th and the early 12th centuries by the *chansons de geste*. The early poems of the cycle sometimes contain curious information on the Frankish methods in war, in council and in judicial procedure, which had no parallels in contemporary institutions. The account in the *Chanson de Roland* of the trial of Ganelon after the battle of Roncesvalles must have been adopted almost intact from earlier poets, and provides a striking example of the value of the *chansons de geste* to the historian of manners and customs. In general, however, the trouvère depicted the feeling and manners of his own time.

Charlemagne's wars in Italy, Spain and Saxony formed part of the common epic material, and there are references to his wars against the Slavs; but especially he remained in the popular mind as the great champion of Christianity against the creed of Mahomet, and even his Norman and Saxon enemies became Saracens in current legend. He is the Christian emperor directly inspired by angels; his sword Joyeuse contained the point of the lance used in the Passion; his standard was Romaine, the banner of St Peter, which, as the oriflamme of Saint Denis, was later to be borne in battle before the kings of France; and in 164 Charles was canonized at the desire of the emperor Frederick I. Barbarossa by the anti-pope Pascal III. This gave him no real claim to sainthood, but his festival was observed in some places until comparatively recent times. Charlemagne was endowed with the good and bad qualities of the epic king, and as in the case of Agamemnon and Arthur, his exploits paled beside those of his chief warriors. These were not originally known as the twelve peers<sup>2</sup> famous in later Carolingian romance. The twelve peers were in the first instance the companions in arms of Roland in the Teutonic sense.<sup>3</sup> The idea of the paladins forming an association corresponding to the Arthurian Round Table first appears in the romance of *Fierabras*. The lists of them are very various, but all include the names of Roland and

<sup>1</sup> A remnant of the popular poetry contemporary with Charlemagne and written in the vernacular has been thought to be discernible under its Latin translation in the description of a siege during Charlemagne's war against the Saracens, known as the "Fragment from the Hague" (Pertz, *Script.* iii. pp. 708-710).

<sup>2</sup> The words *dozse pairs* were anglicized in a variety of forms ranging from *douzpers* to *dozopers*. The word even occurred as a singular in the metrical romance of *Ottavian*:—"Ferst they sent out a dozoper." At the beginning of the 13th century there existed a *cour des pairs* which exercised judicial functions and dated possibly from the 11th century, but their prerogatives at the beginning of the 14th century appear to have been mainly ceremonial and decorative. In 1257 the twelve peers were the chiefs of the great feudal provinces, the dukes of Normandy, Burgundy and Aquitaine, the counts of Toulouse, Champagne and Flanders, and six spiritual peers, the archbishop of Reims, the bishops of Laon, Châlons-sur-Marne, Beauvais, Langres and Noyon. (See Du Cange, *Glossarium*, s.v. "Par.")

<sup>3</sup> See J. Flach, *Le Compagnonnage dans les chansons de geste* (Paris, 1891).

Oliver. The chief heroes who fought Charlemagne's battles were Roland; Ganelon, afterwards the traitor; Turpin, the fighting archbishop of Reims; Duke Naimes of Bavaria, the wise counsellor who is always on the side of justice; Ogier the Dane, the hero of a whole series of romances; and Guillaume of Toulouse, the defender of Narbonne. Gradually most of the *chansons de geste* were attached to the name of Charlemagne, whose poetical history falls into three cycles—the *geste du roi*, relating his wars and the personal history of himself and his family; the southern cycle, of which Guillaume of Toulouse is the central figure; and the feudal epic, dealing with the revolts of the barons against the emperor, the rebels being invariably connected by the *trouvères* with the family of Doon de Mayence (q.v.).

The earliest poems of the cycle are naturally the closest to historical truth. The central point of the *geste du roi* is the 11th-century *Chanson de Roland* (see *ROLAND, LEGEND OF*), one of the greatest of medieval poems. Strangely enough the defeat of Roncesvalles, which so deeply impressed the popular mind, has not a corresponding importance in real history. But it chanced to find as its exponent a poet whose genius established a model for his successors, and definitely fixed the type of later heroic poems. The other early *chansons* to which reference is made in *Roland*—*Aspremont*, *Enfances Ogier*, *Guiteclin*, *Balan*, relating to Charlemagne's wars in Italy and Saxony—are not preserved in their original form, and only the first in an early recension. *Basin or Carl et Elégast* (preserved in Dutch and Icelandic), the *Voyage de Charlemagne à Jerusalem* and *Le Couronnement Loosy* also belong to the heroic period. The purely fictitious and romantic tales added to the personal history of Charlemagne and his warriors in the 13th century are inferior in manner, and belong to the decadence of romance. The old tales, very much distorted in the 15th-century prose versions, were to undergo still further degradation in 18th-century compilations.

According to *Berte aus grans piés*, in the 13th-century *remaniement* of the Brabantine trouvère Adenès li Rois, Charlemagne was the son of Pippin and of Berte, the daughter of Flore and Blanche fleur, king and queen of Hungary. The tale bears marks of high antiquity, and presents one of the few incidents in the French cycle which may be referred to a mythic origin. On the night of Berte's marriage a slave, Margiste, is substituted for her, and reigns in her place for nine years, at the expiration of which Blanche fleur exposes the deception; whereupon Berte is restored from her refuge in the forest to her rightful place as queen. *Mainet* (12th century) and the kindred poems in German and Italian are perhaps based on the adventures of Charles Martel, who after his father's death had to flee to the Ardennes. They relate that, after the death of his parents, Charles was driven by the machinations of the two sons of Margiste to take refuge in Spain, where he accomplished his *enfances* (youthful exploits) with the Mussulman king Galafre under the feigned name of Mainet. He delivered Rome from the besieging Saracens, and returned to France in triumph. But his wife Galienne, daughter of Galafre, whom he had converted to the Christian faith, died on her way to rejoin him. Charlemagne then made an expedition to Italy (*Enfances Ogier* in the Venetian *Charlemagne*, and the first part of the *Chevalerie Ogier de Dannemarche* by Raimbert of Paris, 12th century) to raise the siege of Rome, which was besieged by the Saracen emir Corsuble. He crossed the Alps under the guidance of a white hart, miraculously sent to assist the passage of the army. *Aspremont* (12th century) describes a fictitious campaign against the Saracen King Agolant in Calabria, and is chiefly devoted to the *enfances* of Roland. The wars of Charlemagne with his vassals are described in *Girart de Roussillon*, *Renaus de Montauban*, recounting the deeds of the four sons of Aymon, *Huon de Bordeaux*, and in the latter part of the *Chevalerie Ogier*, which belong properly to the cycle connected with Doon of Mayence.

The account of the pilgrimage of Charlemagne and his twelve paladins to the Holy Sepulchre must in its first form have been earlier than the Crusades, as the patriarch asks the emperor to

free Spain, not the Holy Land, from the Saracens. The legend probably originated in a desire to authenticate the relics in the abbey of Saint Denis, supposed to have been brought to Aix by Charlemagne, and is preserved in a 12th-century romance, *Le Voyage de Charlemagne à Jérusalem et à Constantinople*.<sup>1</sup> This journey forms the subject of a window in the cathedral of Chartres, and there was originally a similar one at Saint-Denis. On the way home Charles and his paladins visited the emperor Hugon at Constantinople, where they indulged in a series of *gabs* which they were made to carry out. *Galien*, a favourite 15th-century romance, was attached to this episode, for Galien was the son of the amours of Oliver with Jacqueline, Hugon's daughter. The traditions of Charlemagne's fights with the Norsemen (Norois, Noreins) are preserved in *Aiquin* (12th century), which describes the emperor's reconquest of Armorica from the "Saracen" king Aiquin, and a disaster at Cézembre as terrible in its way as those of Roncesvalles and Aliscans. *La destruction de Rome* is a 13th-century version of the older *chansons* of the emir Balan, who collected an army in Spain and sailed to Rome. The defenders were overpowered and the city destroyed before the advent of Charlemagne, who, however, avenged the disaster by a great battle in Spain. The romance of *Fierabras* (13th century) was one of the most popular in the 15th century, and by later additions came to have pretensions to be a complete history of Charlemagne. The first part represents an episode in Spain three years before Roncesvalles, in which Oliver defeats the Saracen giant Fierabras in single combat, and converts him. The hero of the second part is Gui de Bourgogne, who recovers the relics of the Passion, lost in the siege of Rome. *Otinel* (13th century) is also pure fiction. *L'Entrée en Espagne*, preserved in a 14th-century Italian compilation, relates the beginning of the Spanish War, the siege of Pampeluna, and the legendary combat of Roland with Ferragus. Charlemagne's march on Saragossa, and the capture of Huesca, Barcelona and Girone, gave rise to *La Prise de Pampelune* (14th century, based on a lost *chanson*); and *Gui de Bourgogne* (12th century) tells how the children of the barons, after appointing Guy as king of France, set out to find and rescue their fathers, who are represented as having been fighting in Spain for twenty-seven years. The *Chanson de Roland* relates the historic defeat of Roncesvalles on the 15th of August 778, and forms the very crown of the whole Carolingian legend. The two 13th-century romances, *Gaidon*, by Herbert Leduc de Dammartin, and *Anséis de Carthage*, contain a purely fictitious account of the end of the war in Spain, and of the establishment of a Frankish kingdom under the rule of Anséis. Charlemagne was recalled from Spain by the news of the outbreak of the Saxons. The contest between Charlemagne and Widukind (*Guiteclin*) offered abundant epic material. Unfortunately the original *Guiteclin* is lost, but the legend is preserved in *Les Saisnes* (c. 1300) of Jehan Bodel, which is largely occupied by the loves of Baudouin and Sibille, the wife of Guiteclin. The adventures of Blanchefleur, wife of Charlemagne, form a variation of the common tale of the innocent wife falsely accused, and are told in *Macaire* and in the extant fragments of *La Reine Sibille* (14th century). After the conquest of the Saracens and the Saxons, the defeat of the Northmen, and the suppression of the feudal revolts, the emperor abdicated in favour of his son Louis (*Le Couronnement Loays*, 12th century). Charles's sharangue to his son is in the best tradition of epic romance. The memory of Roncesvalles haunts him on his death-bed, and at the moment of death he has a vision of Roland.

The mythic element is practically lacking in the French legends, but in Germany some part of the Odin myth was associated with Charles's name. The constellation of the Great Bear, generally associated with Odin, is *Karlswagen* in German, and Charles's Wain in English. According to tradition in Hesse, he awaits resurrection, probably symbolic of the triumph of the sun over winter, within the Gudensberg (Hill of Odin). Bavarian

tradition asserts that he is seated in the Untersberg in a char, as in his tomb at Aix-la-Chapelle. His white beard goes on growing, and when it has thrice encircled the stone table before him the end of the world will come; or, according to another version, Charles will arise and after fighting a great battle on the plain of Wals will reign over a new Germany. There were medieval chroniclers who did not fear to assert that Charles rose from the dead to take part in the Crusades. In the MS. *Annales S. Stephani Frisingenses* (15th century), which formerly belonged to the abbey of Weihenstephan, and is now at Munich, the childhood of Charlemagne is practically the same as that of many mythic heroes. This work, generally known as the chronicle of Weihenstephan, gives among other legends a curious history of the emperor's passion for a dead woman, caused by a charm given to Charles by a serpent to whom he had rendered justice. The charm was finally dropped into a well at Aix, which thereupon became Charles's favourite residence. The story of Roland's birth from the union of Charles with his sister Galien, also found in German and Scandinavian versions, has abundant parallels in mythology, and was probably transferred from mythology to Charlemagne.

The Latin chronicle, wrongly ascribed to Turpin (Tilpinus, bishop of Reims from 753 to 800, was in reality later than the earlier poems of the French cycle, and the first properly authenticated mention of it is in 1165. Its primary object was to authenticate the relics of St James at Compostela. Alberic Trium Fontium, a monk of the Cistercian monastery of Trois Fontaines in the diocese of Châlons, embodied much poetical fiction in his chronicle (c. 1249). A large section of the *Chronique rimée* (c. 1243) of Philippe Mousket is devoted to Charlemagne's exploits. At the beginning of the 14th century Girard of Amiens made a dull compilation known as *Charlemagne* from the *chansons de geste*, authentic history and the pseudo-Turpin. *La Conquête que fit le grand roi Charlemagne et Espagnes* (pr. 1486) is the same work as the prose compilation of *Fierabras* (pr. 1478), and Caxton's *Lyf of Charles the Great* (1485).

The Charlemagne legend was fully developed in Italy, where it was to have later a great poetic development at the hands of Boiardo, Ariosto and Tasso. There are two important Italian compilations, MS. XIII. of the library of St Mark, Venice (c. 1200), and the *Reali di Francia* (c. 1400) of a Florentine writer, Andrea da Barberino (b. 1370), edited by G. Vandelli (Bologna, 1892). The six books of this work are rivalled in importance by the ten branches of the Norse *Karlamagnus saga*, written under the reign of Haakon V. This forms a consecutive legendary history of Charles, and is apparently based on earlier versions of the French Charlemagne poems than those which we possess. It thus furnishes a guide to the older forms of stories, and moreover preserves the substance of others which have not survived in their French form. A popular abridgment, the *Keiser Karl Magnus Krønike* (pr. Malmö, 1534), drawn up in Danish, serves in some cases to complete the earlier work. The 2000 lines of the German *Kaiserchronik* on the history of Charlemagne belong to the first half of the 12th century, and were perhaps the work of Conrad, the poet of the *Ruolanter Lied*. The German poet known as the Stricker used the same sources as the author of the chronicle of Weihenstephan for his *Karl* (c. 1230). The earliest important Spanish version was the *Chronica Hispaniae* (c. 1284) of Rodrigo de Toledo.

The French and Norman-French *chansons* circulated as freely in England as in France, and it was therefore not until the period of decadence that English versions were made. The English metrical romances of Charlemagne are:—*Rowlandes Song* (15th century); *The Taill of Rauf Coilyear* (c. 1475, pr. by R. Lek-preuk, St Andrews, 1472), apparently original; *Sir Ferabras* (c. 1380) and the *Soudone of Babyllone* (c. 1400) from an early version of *Fierabras*; a fragmentary *Roland and Vernage* (Ferragus); two versions of *Otinel* (Otinel); and a *Sege of Melayne* (c. 1390), forming a prologue to *Otinel* unknown in France.

<sup>1</sup> For clerical accounts of Charles's voyage to the Holy Land see the *Chronicon* (c. 968) of Benedict, a monk of St André, and *Descriptio qualiter Karolus Magnus clavum et coronam Domini . . . detulerit*, by an 11th-century writer.

**BIBLIOGRAPHY.**—The most important works on the Charlemagne cycle of romance are:—G. Paris, *Hist. politique de Charlemagne* (Paris, 1865; reprint, with additional notes by Paris and P. Meyer, 1905); L. Gautier, *Les Épopées françaises* (Paris, 4 vols. new ed., 1878, 1892, 1880, 1882) and the supplementary *Bibliographie des chansons de geste* (1897). The third volume of the *Épopées françaises* contains an analysis and full particulars of the *chansons de geste* immediately connected with the history of Charlemagne. See also G. Rauschen, *Die Legende Karls des Grossen im 11ten und 12ten Jahrhundert* (Leipzig, 1890); Kristoffer Nyrop, *Den oldfranske Hæledsigtning* (Copenhagen, 1883; Ital. trans. Turin, 1886); Pio Rajna, *La Origini dell' epopea francese* (Florence, 1884); G. T. Graesse, "Die grossen Sagenkreise des Mittelalters," in his *Literär-geschichte* (Dresden, 1842); *Histoire littéraire de la France* (vol. xxii., 1852); H. L. Ward, *Catalogue of Romances in the Dept. of MSS. in the British Museum* (1883), vol. i. pp. 546-689; E. Muntz, *La Légende de Charlemagne dans l'art du moyen âge* (Paris, 1885); and for the German legend, vol. iii. of H. F. Massmann's edition of the *Kaiserchronik* (Quedlinburg, 1849-1854). The *English Charlemagne Romances* were edited (extra series) for the Early Eng. Text Soc. by Sidney J. Herrtage, Emil Hausknecht, Octavius Richardson and Sidney Lee (1879-1881), the romance of *Duke Huon of Bordeaux* containing a general account of the cycle by Sidney Lee; the *Karlamagnus saga*, by C. R. Unger (Christiania, 1866); see also G. Paris in *Bibl. de l'École des Chartes* (1864-1865). For individual *chansons* see *Antis de Carthage*, ed. J. Alton (Tübingen, 1892); *Aiquin*, ed. F. Jouon des Longrais (Nantes, 1880); *Aspremont*, ed. F. Guessard and L. Gautier (Paris, 1885); *Basin*, or *Charles et Éléast* or *Le Couronnement de Charles*, preserved only in former versions (see Paris, *Hist. Polit.* pp. 315, seq.); *Berta de li gran pié*, ed. A. Mussafia, in *Romania* (vols. iii. and iv., 1874-1875); *Berte aus grans piés*, ed. A. Scheler (Brussels, 1874); *Charlemagne*, by Girard d'Amiens, detailed analysis in Paris, *Hist. Polit.* (Appendix iv.); *Couronnement Looyis*, ed. E. Langlois (Le Puy, 1888); *Désier* (Desiderius or Didier), lost songs of the wars of Lombardy, some fragments of which are preserved in *Ogier le Danois*; *Destruction de Rome*, ed. G. Gröber in *Romania* (1873); A. Thomas, *Nouvelles recherches sur "l'entrée de Spagne"*, in *Bibl. des écoles françaises de Rome* (Paris, 1882); *Fierabras*, ed. A. Kröber and G. Servois (Paris, 1860) in *Anciens poëtes de la France*, and Provencal text, ed. I. Bekker (Berlin, 1829); *Galien*, ed. E. Stengel and K. Pfeil (Marburg, 1890); *Gaydon*, ed. F. Guessard and S. Luce (*Anciens poëtes* . . . 1862); *Gai de Bourgogne*, ed. F. Guessard and H. Michelant (same series, 1859); *Mainet* (fragments only extant), ed. G. Paris, in *Romania* (1875); *Otinet*, ed. F. Guessard and Michelant (*Anciens poëtes*, 1859); and *Sir Otuel*, ed. S. J. Herrtage (*E. E. T. S.*, 1880); *Prise de Pampeune* (ed. A. Mussafia, Vienna, 1864); for the Carolingian romances relating to Roland, see *ROLAND*, see *F. Michel* (1839); *The Siege of Melaine*, introductory to *Otinet*, preserved in English only (ed. *E. E. T. S.*, 1880); *Simon de Pouille*, analysis in *Köschwitz* (iii. pp. 345 sq.); *Voyage de C. à Jérusalem*, ed. E. Koschwitz (Heilbronn, 1879). For the chronicle of the Pseudo-Turpin, see an edition by Castets (Paris, 1881) for the "Société des langues romanes," and the dissertation by G. Paris, *De Pseudo-Turpino* (Paris, 1865). The Spanish versions of Carolingian legends are studied by Milá y Fontanals in *De la poesia heroico-popular castellana* (Barcelona, 1874). (M. Br.)

**CHARLEMAGNE, JEAN ARMAND** (1753-1838), French dramatic author, was born at Bourget (Seine) on the 30th of November 1753. Originally intended for the church, he turned first to being a lawyer's clerk and then a soldier. He served in the American War of Independence, and on returning to France (1783) began to employ his pen on economic subjects, and later in writing for the stage. He became the author of a large number of plays, poems and romances, among which may be mentioned the comedies *M. de Crac à Paris* (1793), *Le Souper des Jacobins* (1795) and *L'Agioleur* (1796), and *Observations de quelques patriotes sur la nécessité de conserver les monuments de la littérature et des arts* (1794), an essay written in collaboration with M. M. Chardin and Renouard, which induced the Convention to protect books adorned with the coats of arms of their former owners and other treasures from destruction at the hands of the revolutionists. He died in Paris on the 6th of March 1838.

**CHARLEMONT, JAMES CAULFIELD**, 1ST EARL OF (1728-1799), Irish statesman, son of the 3rd viscount Charlemont, was born in Dublin on the 18th of August 1728, and succeeded his father as 4th viscount in 1734. The title of Charlemont descended from Sir Toby Caulfield (1565-1627) of Oxfordshire, England, who was given lands in Ireland, and created Baron Charlemont (the name of a fort on the Blackwater), for his services to King James I. in 1620, and the 1st viscount was the 5th baron (d. 1671), who was advanced by Charles II. Lord Charlemont is historically interesting for his political connexion with Flood and Grattan;

he was a cultivated man with literary and artistic tastes, and both in Dublin and in London his amiable character gave him considerable social influence. For various early services in Ireland he was made an earl in 1763, but he disregarded court favours and cordially joined Grattan in 1780 in the assertion of Irish independence. He was president of the volunteer convention in Dublin in November 1783, having taken from the first a leading part in the embodiment of the volunteers; and he was a strong opponent of the proposals for the Union. He died on the 4th of August 1799; his eldest son, who succeeded him, being subsequently (1837) created an English baron.

His *Life*, by F. Hardy, appeared in 1810.

**CHARLEROI** (*Carolus Rex*), a town in the province of Hainaut, Belgium. Pop. (1904) 26,528. It was founded in 1666 on the site of a village called Charnoy by the Spanish governor Roderigo and named after his sovereign Charles II. of Spain. Charleroi is the centre of the iron industry of Belgium. It is connected by a canal with Brussels, and from its position on the Sambre enjoys facilities of communication by water with France as well as Belgium. It was ceded soon after its foundation to France by the treaty of Aix-la-Chapelle, and Vauban fortified it. During the French occupation the town was considerably extended, and the fortifications were made so strong that Charleroi twice successfully resisted the strenuous attacks of William of Orange. In 1794 Charleroi again fell into the hands of the French, and on this occasion instead of fortifying they dismantled it. In 1816 Charleroi was refortified under Wellington's direction, and it was finally dismantled in 1859. Some portions of the old ramparts are left near the railway station. There is an archaeological museum with a miscellaneous collection of Roman and Frank antiquities.

**CHARLEROI**, a borough of Washington county, Pennsylvania, U.S.A., on the Monongahela river, near the S.W. corner of the state, about 20 m. S. of Pittsburgh. Pop. (1900) 5930, (1749 foreign-born); (1910) 9615. It is served by the Pennsylvania railway. The surrounding country has good farming land and large coal mines. In 1905 the borough ranked fifth among the cities of the United States in the manufacture of glass (plate-glass, lamp chimneys and bottles), its product (valued at \$1,841,368) being 2-3% of that of the whole country. Charleroi was settled in 1890 and was incorporated in 1891.

**CHARLES** (Fr. *Charles*; Span. *Carlos*; Ital. *Carlo*; Ger. *Karl*; derived from O. H. G. *Charal*, latinized as *Carolus*, meaning originally "man"; cf. Mod. Ger., *Karl*; "fellow," A.S. *ceorl*, Mod. Eng. "churl"), a masculine proper name. It has been borne by many European princes, notices of the more important of whom are given below in the following order: (1) Roman emperors, (2) kings of England, (3) other kings in the alphabetical order of their states, (4) other reigning princes in the same order, (5) non-reigning princes. Those princes who are known by a name in addition to Charles (Charles Albert, &c.) will be found after the private individuals bearing Charles as a surname.

**CHARLES II.**<sup>1</sup> called **THE BALD** (823-877), Roman emperor and king of the West Franks, was the son of the emperor Louis the Pious and of his second wife Judith and was born in 823. The attempts made by his father to assign him a kingdom, first Alamannia (829), then the country between the Meuse and the Pyrenees (839), at the expense of his half-brothers Lothair and Louis led to a rising on the part of these two (see **LOUIS I.**, the Pious). The death of the emperor in 840 was the signal for the outbreak of war between his sons. Charles allied himself with his brother Louis the German to resist the pretensions of the emperor Lothair, and the two allies conquered him in the bloody victory of Fontenoy-en-Puisaye (25 June 841). In the following year, the two brothers confirmed their alliance by the celebrated oaths of Strassburg, made by Charles in the Teutonic language spoken by the subjects of Louis, and by Louis in the Romance tongue of Charles's subjects. The war was brought to an end by the treaty of Verdun (August 843), which gave to Charles the Bald the kingdom of the western Franks, which practically corresponded with what

<sup>1</sup> For Charles I., Roman emperor, see **CHARLEMAGNE**; cf. under Charles I. of France below.

is now France, as far as the Meuse, the Saône and the Rhone, with the addition of the Spanish March as far as the Ebro. The first years of his reign up to the death of Lothair I. (855) were comparatively peaceful, and during them was continued the system of "confraternal government" of the sons of Louis the Pious, who had various meetings with one another, at Colenz (848), at Meerssen (851), and at Atigny (854). In 858 Louis the German, summoned by the disaffected nobles, invaded the kingdom of Charles, who fled to Burgundy, and was only saved by the help of the bishops, and by the fidelity of the family of the Welfs, who were related to Judith. In 860 he in his turn tried to seize the kingdom of his nephew, Charles of Provence, but met with a repulse. On the death of Lothair II. in 869 he tried to seize his dominions, but by the treaty of Mersen (870) was compelled to share them with Louis the German. Besides this, Charles had to struggle against the incessant rebellions in Aquitaine, against the Bretons, whose revolt was led by their chief Nomenoë and Erispoë, and who inflicted on the king the defeats of Ballon (845) and Juvardel (851), and especially against the Normans, who devastated the country in the north of Gaul, the valleys of the Seine and Loire, and even up to the borders of Aquitaine. Charles was several times compelled to purchase their retreat at a heavy price. He has been accused of being incapable of resisting them, but we must take into account the unwillingness of the nobles, who continually refused to join the royal army; moreover, the Frankish army does not seem to have been sufficiently accustomed to war to make any headway against the pirates. At any rate, Charles led various expeditions against the invaders, and tried to put a barrier in their way by having fortified bridges built over all the rivers. In 875, after the death of the emperor Louis II., Charles the Bald, supported by Pope John VIII., descended into Italy, receiving the royal crown at Pavia and the imperial crown at Rome (20th December). But Louis the German, who was also a candidate for the succession of Louis II., revenged himself for Charles's success by invading and devastating his dominions. Charles was recalled to Gaul, and after the death of Louis the German (28th August 876), in his turn made an attempt to seize his kingdom, but at Andernach met with a shameful defeat (8th October 876). In the meantime, John VIII., who was menaced by the Saracens, was continually urging him to come to Italy, and Charles, after having taken at Quierzy the necessary measures for safeguarding the government of his dominions in his absence, again crossed the Alps, but this expedition had been received with small enthusiasm by the nobles, and even by Boso, Charles's brother-in-law, who had been entrusted by him with the government of Lombardy, and they refused to come with their men to join the imperial army. At the same time Carloman, son of Louis the German, entered northern Italy. Charles, ill and in great distress, started on his way back to Gaul, and died while crossing the pass of the Mont Cenis on the 5th or 6th of October 877. He was succeeded by his son Louis the Stammerer, the child of Ermentrude, daughter of a count of Orleans, whom he had married in 842, and who had died in 860. In 870 he had married Richilde, who was descended from a noble family of Lorraine, but none of the children whom he had by her played a part of any importance. Charles seems to have been a prince of education and letters, a friend of the church, and conscious of the support he could find in the episcopate against his unruly nobles, for he chose his councillors for preference from among the higher clergy, as in the case of Guenelon of Sens, who betrayed him, or of Hincmar of Reims. But his character and his reign have been judged very variously. The general tendency seems to have been to accept too easily the accounts of the chroniclers of the east Frankish kingdom, which are favourable to Louis the German, and to accuse Charles of cowardice and bad faith. He seems on the contrary not to have lacked activity or decision.

**AUTHORITIES.**—The most important authority for the history of Charles's reign is represented by the *Annales Bertiniani*, which were the work of Prudentius, bishop of Troyes, up to 861, then up to 882 of the celebrated Hincmar, archbishop of Reims. This prince's charters are to be found published in the collections of the *Académie des Inscriptions*, by M. M. Prou. The most complete

history of the reign is found in E. Dümmler, *Geschichte des ostfränkischen Reiches* (3 vols., Leipzig, 1887-1888). See also J. Calmette, *La Diplomatie carolingienne du traité de Verdun à la mort de Charles le Chauve* (Paris, 1901), and F. Lot, "Une Année du règne de Charles le Chauve," in *Le Moyen-Âge*, (1902) pp. 393-438.

**CHARLES III., THE FAT** (832-888), Roman emperor and king of the West Franks, was the youngest of the three sons of Louis the German, and received from his father the kingdom of Swabia (Alamannia). After the death of his two brothers in succession, Carloman (881) and Louis the Young (882), he inherited the whole of his father's dominions. In 880 he had helped his two cousins in the west Frankish realm, Louis III. and Carloman, in their struggle with the usurper Boso of Provence, but abandoned them during the campaign in order to be crowned emperor at Rome by Pope John VIII. (February 881). On his return he led an expedition against the Norsemen of Friesland, who were entrenched in their camp at Elsoo, but instead of engaging with them he preferred to make terms and paid them tribute. In 884 the death of Carloman brought into his possession the west Frankish realm, and in 885 he got rid of his rival Hugh of Alsace, an illegitimate son of Lothair II., taking him prisoner by treachery and putting out his eyes. However, in spite of his six expeditions into Italy, he did not succeed in pacifying the country, nor in delivering it from the Saracens. He was equally unfortunate in Gaul and in Germany against the Norsemen, who in 886-87 besieged Paris. The emperor appeared before the city with a large army (October 886), but contented himself by treating with them, buying the retreat of the invaders at the price of a heavy ransom, and his permission for them to ravage Burgundy without his interfering. On his return to Alamannia, however, the general discontent showed itself openly and a conspiracy was formed against him. He was first forced to dismiss his favourite, the chancellor Liutward, bishop of Vercelli. The dissolution of his marriage with the pious empress Richarde, in spite of her innocence as proved by the judicial examination, alienated his nobles still more from him. He was deposed by an assembly which met at Frankfort or at Tribur (November 887), and died in poverty at Neidingen on the Danube (18th January 888).

**CHARLES IV.** (1316-1378), Roman emperor and king of Bohemia, was the eldest son of John of Luxemburg, king of Bohemia, and Elizabeth, sister of Wenceslas III., the last Bohemian king of the Premyslides dynasty. He was born at Prague on the 14th of May 1316, and in 1323 went to the court of his uncle, Charles IV., king of France, and exchanged his baptismal name of Wenceslas for that of Charles. He remained for seven years in France, where he was well educated and learnt five languages; and there he married Blanche, sister of King Philip VI., the successor of Charles IV. In 1331 he gained some experience of warfare in Italy with his father; and on his return to Bohemia in 1333 he was made margrave of Moravia. Three years later he undertook the government of Tirol on behalf of his brother John Henry, and was soon actively concerned in a struggle for the possession of this county. In consequence of an alliance between his father and Pope Clement VI., the relentless enemy of the emperor Louis IV., Charles was chosen German king in opposition to Louis by some of the princes at Rense on the 11th of July 1346. As he had previously promised to be subservient to Clement he made extensive concessions to the pope in 1347. Confirming the papacy in the possession of wide territories, he promised to annul the acts of Louis against Clement, to take no part in Italian affairs, and to defend and protect the church. Meanwhile he had accompanied his father into France and had taken part in the battle of Crécy in August 1346, when John was killed and Charles escaped wounded from the field. As king of Bohemia he returned to Germany, and after being crowned German king at Bonn on the 20th of November 1346, prepared to attack Louis. Hostilities were interrupted by the death of the emperor in October 1347, and Günther, count of Schwarzburg, who was chosen king by the

This surname has only been applied to Charles since the 13th century.

partisans of Louis, soon abandoned the struggle. Charles, having made good use of the difficulties of his opponents, was recrowned at Aix-la-Chapelle on the 25th of July 1349, and was soon the undisputed ruler of Germany. Gifts or promises had won the support of the Rhenish and Swabian towns; a marriage alliance secured the friendship of the Hahsburgs; and that of Rudolph II., count palatine of the Rhine, was obtained when Charles, who had become a widower in 1348, married his daughter Anna.

In 1350 the king was visited at Prague by Cola di Rienzi, who urged him to go to Italy, where the poet Petrarch and the citizens of Florence also implored his presence. Turning a deaf ear to these entreaties, Charles kept Rienzi in prison for a year, and then handed him as a prisoner to Clement at Avignon. Four years later, however, he crossed the Alps without an army, received the Lombard crown at Milan on the 6th of January 1355, and was crowned emperor at Rome by a cardinal on the 5th of April in the same year. His sole object appears to have been to obtain the imperial crown in peace, and in accordance with a promise previously made to Pope Clement the only remained in the city for a few hours, in spite of the expressed wishes of the Romans. Having virtually abandoned all the imperial rights in Italy, the emperor recrossed the Alps, pursued by the scornful words of Petrarch but laden with considerable wealth. On his return Charles was occupied with the administration of Germany, then just recovering from the Black Death, and in 1356 he promulgated the Golden Bull (*q.s.*) to regulate the election of the king. Having given Moravia to one brother, John Henry, and erected the county of Luxemburg into a duchy for another, Wenceslas, he was unremitting in his efforts to secure other territories as compensation and to strengthen the Bohemian monarchy. To this end he purchased part of the upper Palatinate of the Rhine in 1353, and in 1367 annexed Lower Lusatia to Bohemia and bought numerous estates in various parts of Germany. On the death in 1363 of Meinhard, duke of Upper Bavaria and count of Tirol, Upper Bavaria was claimed by the sons of the emperor Louis IV., and Tirol by Rudolph IV., duke of Austria. Both claims were admitted by Charles on the understanding that if these families died out both territories should pass to the house of Luxemburg. About the same time he was promised the succession to the margraviate of Brandenburg, which he actually obtained for his son Wenceslas in 1373. He also gained a considerable portion of Silesian territory, partly by inheritance through his third wife, Anna, daughter of Henry II., duke of Schweidnitz. In 1365 Charles visited Pope Urban V. at Avignon and undertook to escort him to Rome; and on the same occasion was crowned king of Burgundy, or Arles, at Arles on the 4th of June 1365.

His second journey to Italy took place in 1368, when he had a meeting with Urban at Viterbo, was besieged in his palace at Siena, and left the country before the end of the year 1369. During his later years the emperor took little part in German affairs beyond securing the election of his son Wenceslas as king of the Romans in 1376, and negotiating a peace between the Swabian league and some nobles in 1378. After dividing his lands between his three sons, he died on the 29th of November 1378 at Prague, where he was buried, and where a statue was erected to his memory in 1848.

Charles, who according to the emperor Maximilian I. was the step-father of the Empire, but the father of Bohemia, brought the latter country to a high state of prosperity. He reformed the finances, caused roads to be made, provided for greater security to life and property, and introduced or encouraged various forms of industry. In 1348 he founded the university of Prague, and afterwards made this city the seat of an archbishop, and beautified it by the erection of several fine buildings. He was an accomplished diplomatist, possessed a penetrating intellect, and was capable of much trickery in order to gain his ends. By refusing to become entangled in Italian troubles and confining himself to Bohemia, he proved that he preferred the substance of power to its shadow. Apparently the most pliant of men, he had in reality great persistence of character, and if

foiled in one set of plans readily turned round and reached his goal by a totally different path. He was superstitious and peace-loving, had few personal wants, and is described as a round-shouldered man of medium height, with black hair and beard, and sallow cheeks.

His autobiography the "Vita Caroli IV.," which deals with events down to the year 1346, and various other documents relating to his life and times, are published in the *Fontes rerum Germanicarum*, Band I., edited by J. F. Böhmer (Leipzig, 1885). For other documents relating to the time see *Die Regierung des Kaiserreichs unter Kaiser Karl IV.*, edited by J. F. Böhmer and A. **CHARLES V.** (1500-1558), Roman emperor and (as CHARLES I.) king of Spain, was born at Ghent on the 24th of February 1500. His parents were Philip of Burgundy and Joanna, third child of Ferdinand and Isabella. Philip died in 1506, and Charles succeeded to his Netherland possessions and the county of Burgundy (Franche Comté). His grandfather, the emperor Maximilian, as regent, appointed his daughter Margaret vice-regent, and under her strenuous guardianship Charles lived in the Netherlands until the estates declared him of age in 1515. In Castile, Ferdinand, king of Aragon, acted as regent for his daughter Joanna, whose intellect was already clouded. On the 23rd of January 1516 Ferdinand died. Charles's visit to Spain was delayed until the autumn of 1517, and only in 1518 was he formally recognized as king conjointly with his mother; firstly by the cortes of Castile, and then by those of Aragon. Joanna lived to the very eve of her son's abdication, so that he was only for some months technically sole king of Spain. During this Spanish visit Maximilian died, and Charles succeeded to the inheritance of the Hahsburgs, to which was shortly added the duchy of Württemberg. Maximilian had also intended that he should succeed as emperor. In spite of the formidable rivalry of Francis I. and the opposition of Pope Leo X., pecuniary corruption and national feeling combined to secure his election in 1519. Charles hurriedly left Spain, and after a visit to Henry VIII. and his aunt Catherine, was crowned at Aix on the 23rd of October 1520.

The difficulty of Charles's reign consists in the complexity of interests caused by the unnatural aggregate of distinct territories and races. The crown of Castile brought with it the two recently conquered kingdoms of Navarre and Granada, together with the new colonies in America and scattered possessions in northern Africa. That of Aragon comprised the three distinct states of Aragon, Valencia and Catalonia, and in addition the kingdoms of Naples, Sicily and Sardinia, each with a separate character and constitution of its own. No less than eight independent cortes or parliaments existed in this Spanish-Italian group, adding greatly to the intricacy of government. In the Netherland provinces again the tie was almost purely personal; there existed only the rudiments of a central administration and a common representative system, while the county of Burgundy had a history apart. Much the same was true of the Hahsburg group of states, but Charles soon freed himself from direct responsibility for their government by making them over, together with Württemberg, to his brother Ferdinand. The Empire entailed serious liabilities on its ruler without furnishing any reliable assets: only through the cumbrous machinery of the diet could Charles tap the military and financial resources of Germany. His problem here was complicated by the growth of Lutheranism, which he had to face at his very first diet in 1521. In addition to such administrative difficulties Charles had

inherited a quarrel with France, to which the rivalry of Francis I. for the Empire gave a personal character. Almost equally formidable was the advance of Sultan Suliman up the Danube, and the union of the Turkish naval power with that of the Barbary States of northern Africa. Against Lutheran Germany the Catholic emperor might hope to rely upon the pope, and against France on England. But the attitude of the popes was almost uniformly disagreeable, while from Henry VIII. and Edward VI. Charles met with more unpleasantness than favour.

The difficulty of Charles himself is also that of the historian and reader of his reign. It is probably more instructive to treat it according to the emperor's several problems than in strict chronological order. Yet an attempt to distinguish the several periods of his career may serve as a useful introduction. The two best dividing lines are, perhaps, the coronation as emperor at Bologna in 1530, and the peace of Crépy in 1544. Until his visit to Italy (1529) Charles remained in the background of the European stage, except for his momentous meeting with Luther at the diet of Worms (1521). This meeting in itself forms a subdivision. Previously to this, during his nominal rule in the Netherlands, his visit to Spain, and his candidature for the Empire, he seemed, as it was said, spell-bound under the ferule of his minister Chièvres. Almost every report represented him as colourless, reserved and weak. His dependence on his Flemish counsellors provoked the rising in Castile, the feebleness of his government the social war in Aragon. The religious question first gave him a living interest, and at this moment Chièvres died. Aleander, the papal nuncio at Worms, now recognized that public opinion had been wrong in its estimate of Charles. Never again was he under tutelage. The necessity, however, of residence in Spain prevented his taking a personal part in the great fight with Francis I. for Italy. He could claim no credit for the capture of his rival at Pavia. When his army sacked Rome and held Pope Clement VII. prisoner, he could not have known where this army was. And when later the French overran Naples, and all but deprived him of his hold on Italy, he had to instruct his generals that they must shift for themselves. The world had become afraid of him, but knew little of his character. In the second main division of his career Charles changed all this. No monarch until Napoleon was so widely seen in Europe and in Africa. Complexity of problems is the characteristic of this period. At the head of his army Charles forced the Turks backwards down the Danube (1532). He personally conquered Tunis (1535), and was only prevented by "act of God" from winning Algiers (1541). The invasion of Provence in 1536 was headed by the emperor. In person he crushed the rebellion of Ghent (1540). In his last war with Francis (1542-44) he journeyed from Spain to the Netherlands, brought the rebellious duke of Cleves to his knees, and was within easy reach of Paris when he made the peace of Crépy (1544). In Germany, meanwhile, from the diet of Augsburg (1530) onwards, he had presided at the diets or conferences, which, as he hoped, would effect the reunion of the church.

Peace with France and the Turk and a short spell of friendliness with Pope Paul III. enabled Charles at last to devote his whole energies to the healing of religious schism. Conciliation proving impossible, he led the army which received the submission of the Lutheran states, and then captured the elector of Saxony at Mühlberg, after which the other leader, Philip of Hesse, capitulated. The Armed Diet of 1548 was the high-water mark of Charles's power. Here, in defiance of the pope, he published the Interim which was meant to reconcile the Lutherans with the church, and the so-called Reform which was to amend its abuses. During the next four years, owing to ill-health and loss of insight, his power was ebbing. In 1552 he was flying over the Brenner from Maurice of Saxony, a princeless whose fortunes he had made. Once again the old complications had arisen. His old enemy's son, Henry II., had attacked him indirectly in Piedmont and Parma, and then directly in Germany in alliance with Maurice. Once more the Turk was moving in the Danube and in the western Mediterranean. The humiliation of his flight gave Charles new spirit, and he once more led an army through Germany against the French, only to be checked by the duke of

Guise's defence of Metz. Henceforth the waves of his fortune plashed to and fro until his abdication without much ostensible loss or gain.

Charles had abundance of good sense, but little creative genius, and he was by nature conservative. Consequently he never sought to impose any new or common principles of administration on his several states. He took them as he found them, and at most, as in the Netherlands, improved upon what he found. So also in dealing with rival powers his policy may be called opportunist. He was indeed accused by his enemies of emulating Charlemagne, of aiming at universal empire. Historians have frequently repeated this charge. Charles himself in later life laughingly denied the imputation, and facts are in favour of his denial. When Francis I. was in his power he made no attempt to dismember France, in spite of his pledges to his allies Henry VIII. and the duke of Bourbon. He did, indeed, demand the duchy of Burgundy, because he believed this to have been unrighteously stolen by Louis XI. from his grandmother when a helpless girl. The claim was not pressed, and at the height of his fortunes in 1548 he advised his son never to surrender it, but also never to make it a cause of war. When Clement VII. was his prisoner, he was vehemently urged to overthrow the temporal power, to restore imperial dominion in Italy, at least to make the papacy harmless for the future. In reply he restored his enemy to the whole of his dominions, even reimposing him by force on the Florentine republic. To the end of his life his conscience was sensitive as to Ferdinand's expulsion of the house of Albrecht from Spanish Navarre, though this was essential to the safety of Spain. Though always at war he was essentially a lover of peace, and all his wars were virtually defensive. "Not greedy of territory," wrote Marcaantonio Contarini in 1536, "but most greedy of peace and quiet." For peace he made sacrifices which angered his hot-headed brother Ferdinand. He would not aid in expelling the sultan's puppet Zapolya from Ferdinand's kingdom of Hungary, and he suffered the restoration of the ruffianly duke of Württemberg, to the grave prejudice of German Catholicism. In spite of his protests, Henry VIII. with impunity ill-treated his aunt Catherine, and the feeble government of Edward VI. bullied his cousin Mary, who had been his fiancée. No serious efforts were made to restore his brother-in-law, Christian II., to the throne of Denmark, and he advised his son Philip to make friends with the usurper. After the defeat of the Lutheran powers in 1547 he did not gain a palm's breadth of territory for himself. He resisted Ferdinand's claim for Württemberg, which the duke had deserved to forfeit; he disliked his acceptance of the voluntary surrender of the city of Constance; he would not have it said that he had gone to war for the benefit of the house of Habsburg.

On the other hand, Charles V.'s policy was not merely negative. He enlarged upon the old Habsburg practice of marriage as a means of alliance of influence. Previously to his election as emperor, his sister Isabella was married to Christian II. of Denmark, and the marriages of Mary and Ferdinand with the king of Hungary and his sister had been arranged. Before he was twenty Charles himself had been engaged some ten times with a view to political combinations. Naturally, therefore, he regarded his near relations as diplomatic assets. The federative system was equally familiar; Germany, the Netherlands, and even Spain, were in a measure federations. Combining these two principles, he would within his more immediate spheres of influence strengthen existing federations by intermarriage, while he hoped that the same means would convert the jarring powers of Europe into a happy family. He made it a condition of the treaty of Madrid (1526) that Francis I. should marry his sister Eleanor, Manuel of Portugal's widow, in the hope, not that she would be an ally or a spy within the enemy's camp, but an instrument of peace. His son's marriage with Mary Tudor would not only save the rubs with England, but give such absolute security to the Netherlands that France would shrink from war. The personal union of all the Iberian kingdoms under a single ruler had long been an aim of Spanish statecraft. So Charles had married his sister Eleanor, much against her will, to the old king Manuel, and then his sister Catherine to his successor. The empress was a Portuguese

infanta, and Philip's first wife was another. It is thus small wonder that, within a quarter of a century of Charles's death, Philip became king of Portugal.

In the wars with Francis I. Italy was the stake. In spite of his success Charles for long made no direct conquests. He would convert the peninsula into a federation mainly matrimonial. Savoy, the important buffer state, was detached from France by the marriage of the somewhat feeble duke to Charles's capable and devoted sister-in-law, Beatrice of Portugal. Milan, conquered from France, was granted to Francesco Sforza, heir of the old dynasty, and even after his treason was restored to him. In the vain hope of offspring Charles sacrificed his niece, Christina of Denmark, to the valetudinarian duke. In the long negotiations for a Habsburg-Valois dynasty which followed Francesco's death, Charles was probably sincere. He insisted that his daughter or niece should marry the third rather than the second son of Francis I., in order, apart from other reasons, to run less risk of the duchy falling under French dominion. The final investiture of Philip was forced upon him, and does not represent his saner policy. The Medici of Florence, the Gonzaga of Mantua, the papal house of Farnese, were all attached by Habsburg marriages. The republics of Genoa and Siena were drawn into the circle through the agency of their chief noble families, the Doria and Piccolomini; while Charles behaved with scrupulous moderation towards Venice in spite of her active hostility before and after the League of Cognac. Occasional acts of violence there were, such as the participation in the murder of Pierluigi Farnese, and the measures which provoked the rebellion of Siena. These were due to the difficulty of controlling the imperial agents from a distance, and in part to the faults of the victim prince and republic. On the whole, the loose federation of viceroalties and principalities harmonized with Italian interests and traditions. The alternative was not Italian independence, but French domination. At any rate, Charles's structure was so durable that the French met with no real success in Italy until the 18th century.

Germany offered a fine field for a creative intellect, since the evils of her disintegration stood confessed. On the other hand, princes and towns were so jealous of an increase of central authority that Charles, at least until his victory over the League of Schmalkalden, had little effective power. Owing to his wars with French and Turks he was rarely in Germany, and his visits were very short. His problem was infinitely complicated by the union of Lutheranism and princely independence. He fell back on the old policy of Maximilian, and strove to create a party by personal alliances and intermarriage. In this he met with some success. The friendship of the electors of Brandenburg, whether Catholic or Protestant, was unbroken. In the war of Schmalkalden half the Protestant princes were on Charles's side or friendly neutrals. At the critical moment which preceded this, the lately rebellious duke of Cleves and the heir of Bavaria were secured through the agency of two of Ferdinand's invaluable daughters. The relations, indeed, between the two old enemies, Austria and Bavaria, were permanently improved. The elector palatine, whose love affairs with his sister Eleanor Charles as a boy had roughly broken, received in compensation a Danish niece. Her sister, widow of Francesco Sforza, was utilized to gain a hold upon the French dynasty which ruled Lorraine. More than once there were proposals for winning the hostile house of Saxony by matrimonial means. After his victory over the League of Schmalkalden, Charles perhaps had really a chance of making the imperial power a reality. But he lacked either courage or imagination, contenting himself with proposals for voluntary association on the lines of the defunct Swabian League, and dropping even these when public opinion was against them. Now, too, he made his great mistake in attempting to foist Philip upon the Empire as Ferdinand's successor. Gossip reported that Ferdinand himself was to be set aside, and careless historians have given currency to this. Such an idea was impossible. Charles wished Philip to succeed Ferdinand, while he ultimately conceded that Ferdinand's son Maximilian should follow Philip, and even in his lifetime exercise the practical

power in Germany. This scheme irritated Ferdinand and his popular and ambitious son at the critical moment when it was essential that the Habsburgs should hold together against princely malcontents. Philip was imprudently introduced to Germany, which had also just received a foretaste of the unpleasant characteristics of Spanish troops. Yet the person rather than the policy was, perhaps, at fault. It was natural that the quasi-hereditary succession should revert to the elder line. France proved her recuperative power by the occupation of Savoy and of Metz, Toul and Verdun, the military keys of Lorraine. The separation of the Empire and Spain left two weakened powers not always at accord, and neither of them permanently able to cope on equal terms with France. Nevertheless, this scheme did contribute in no small measure to the failure of Charles in Germany. The main cause was, of course, the religious schism, but his treatment of this requires separate consideration.

The characteristics of Charles's government, its mingled conservatism and adaptability, are best seen in Spain and the Netherlands, with which he was in closer personal contact than with Italy and Germany. In Spain, when once he knew the country, he never repeated the mistakes which on his first visit caused the rising of the communes. The cortes of Castile were regularly summoned, and though he would allow no encroachment on the crown's prerogatives, he was equally scrupulous in respecting their constitutional rights. They became, perhaps, during the reign slightly more dependent on the crown. This has been ascribed to the system of gratuities which in later reigns became a scandal, but was not introduced by Charles, and as yet amounted to little more than the payment of members' expenses. Indirectly, crown influence increased owing to the greater control which had gradually been exercised over the composition of the municipal councils, which often returned the deputies for the cortes. Charles was throughout nervous as to the power and wealth of the greater nobles. They rather than the crown had conquered the communes, and in the past they rather than the towns had been the enemies of monarchy. He earnestly warned his son against giving them administrative power, especially the duke of Alva, who in spite of his sanctimonious and humble bearing cherished the highest ambitions: in foreign affairs and war he might be freely used, for he was Spain's best soldier. In the cortes of 1538 Charles came into collision with the nobles as a class. They usually attended only on ceremonial occasions, since they were exempted from direct taxation, which was the main function of the cortes. Now, however, they were summoned, because Charles was bent upon a scheme of indirect taxation which would have affected all classes. They offered an uncompromising opposition, and Charles somewhat angrily dismissed them, nor did he ever summon them again. The peculiar Spanish system of departmental councils was further developed, so that it may be said that the bureaucratic element was slightly increasing just as the parliamentary element was on the wane. The evils of this tendency were as yet scarcely apparent owing to Charles's personal intervention in all departments. The councils presented their reports through the minister chiefly concerned; Charles heard their advice, and formed his own conclusions. He impressed upon Philip that he should never become the servant of his ministers: let him hear them all but decide himself. Naturally enough, he was well served by his ministers, whom he very rarely changed. After the death of the Piedmontese Gattinara he relied mainly on Nicolas Perrenot de Granvella for Netherland and German affairs, and on Francisco de los Cobos for Spanish, while the younger Granvella was being trained. From 1520 to 1555 these were the only ministers of high importance. Above all, Charles never had a court favourite, and the only women who exercised any influence were his natural advisers, his wife, his aunt Margaret and his sister Mary. In all these ladies he was peculiarly fortunate. Charles was never quite popular in Spain, but the empress whom he married at his people's request was much beloved. Complaints were made of his absenteeism, but until 1543 he spent the greater portion of his reign in Spain, or on expeditions

such as those against Tunis and Algiers which were distinctively in Spanish interests. Spaniards disliked his Netherland and German connexions, but without the vigorous blows which these enabled him to strike at France, it is improbable that Spain could have retained her hold on Italy, or her monopoly of commerce with the Indies. The wars with Francis I. were, in spite of the rival candidature for the Empire, Spanish wars entailed by Ferdinand's retention of Roussillon, his annexation of Navarre, his summary eviction of the French from Naples. The Netherlands had become convinced on commercial grounds of the wisdom of peace with France, and the German interest in Milan was not sufficiently active to be a standing cause of war. Charles and Francis had inherited the hostility of Ferdinand and Louis XII.

The reign of Charles was in America the age of conquest and organization. Upon his accession the settlements upon the mainland were insignificant; by 1556 conquest was practically complete, and civil and ecclesiastical government firmly established. Actual expansion was the work of great adventurers starting on their own impulse from the older colonies. To Charles fell the task of encouraging such ventures, of controlling the conquerors, of settling the relations between colonists and natives, which involved those between the colonists and the missionary colonial church. He must arrest depopulation, provide for the labour market, regulate oceanic trade, and check military preponderance by civil and ecclesiastical organization. In America Charles took an unceasing interest; he had a boundless belief in its possibilities, and a determination to safeguard the interests of the crown. Cortes, Alvarado and the brothers Pizarro were brought into close personal communication with the emperor. If he bestowed on Cortes the confidence which the loyal conqueror deserved, he showed the sternest determination in crushing the rebellious and autonomous instincts of Almagro and the Pizarros. But for this, Peru and Chile must have become independent almost as soon as they were conquered. Throughout he strove to protect the natives, to prevent actual slavery, and the consequent raids upon the natives. Legislation was not, indeed, always consistent, because the claims of the colonists could not always be resisted, but on the whole he gave earnest support to the missionaries, who upheld the cause of the natives against the military, and sometimes the civil and ecclesiastical elements. His humane care for his native subjects may well be studied in the instructions sent to Philip from Germany in 1548, when Charles was at the summit of his power. If Charles had had his will, he would have opened the colonial trade to the whole of his wide possessions. The Castilians, however, jealously confined it to the city of Seville, artificially fostering the indolence of the colonists to maintain the agricultural and manufacturing monopoly of Castile, and by extreme protective measures forcing them to live on smuggled goods from other countries. Charles did actually attempt to cure the exclusive interest of the colonists in mineral wealth by the establishment of peasant and artisan colonies. If in many respects he failed, yet the organization of Spanish America and the survival of the native races were perhaps the most permanent results of his reign. It is a proof of the complexity of his interests that the march of the Turk upon Vienna and of the French on Naples delayed until the following reign the foundation of Spain's eastern empire. Charles carefully organized the expedition of Magellan, which sailed for the Moluccas and discovered the Philippines. Unfortunately, his straits for money in 1529 compelled him to mortgage to Portugal his disputed claim to the Moluccas, and the Philippines consequently dropped out of sight.

If in the administration of Spain Charles did little more than mark time, in the Netherlands advance was rapid. Of the seven northern provinces he added five, containing more than half the area of the later United Provinces. In the south he freed Flanders and Artois from French suzerainty, annexed Tournai and Cambrai, and closed the natural line of French advance through the great bishopric of Liège by a line of fortresses across its western frontier. Much was done to convert the aggregate of jarring provinces into a harmonious unity by means of common

principles of law and finance, and by the creation of a national army. While every province had its own assembly, there were at Charles's accession only the rudiments of estates general for the Netherlands at large. At the close of the reign the common parliamentary system was in full swing, and was fast converting the loosely knit provinces into a state. By these means the ruler had wished to facilitate the process of supply, but supply soon entailed redress, and the provinces could recognize their common interests and grievances. Under Philip II. all patriotic spirits passionately turned to this creation of his father as the palladium of Netherland liberty. This process of consolidation was infinitely difficult, and conflicts between local and central authorities were frequent. That they were safely tided over was due to Charles's moderation and his legal mind, which prompted him to draw back when his case was bad. The harshest act of his life was the punishment of the rebellion of Ghent. Yet the city met with little or no sympathy in other quarters, because she had refused to act in concert with the other members of Flanders and the other provinces. It was no mere local quarrel, but a breach of the growing national unity.

In the Netherlands Charles showed none of the jealousy with which he regarded the Spanish nobles. He encouraged the growth of large estates through primogeniture; he gave the nobles the provincial governorships, the great court offices, the command of the professional cavalry. In the Order of the Golden Fleece and the long established presence of the court at Brussels, he possessed advantages which he lacked in Spain. The nobility were utilized as a link between the court and the provinces. Very different was it with the church. By far the greater part of the Netherlands fell under foreign sees, which were peculiarly liable to papal exactions and to the intrigues of rival powers. Thus the usual conflict between civil and ecclesiastical jurisdiction was peculiarly acute. To remedy this dualism of authority and the consequent moral and religious abuses, Charles early designed the creation of a national diocesan system, and this was a darling project throughout his life. He was doing what every German territorial prince, Catholic or Lutheran, attempted, making bishoprics and abbeys dependent on the crown, with nomination and institution in his hands, and with reasonable control over taxation and jurisdiction. The papacy unfortunately thwarted him, and the scheme, which under Charles would have been carried with national assent, and created a national church, took the appearance under Philip of alien domination.

If in Germany Charles was emperor, he was in the Netherlands territorial prince, and thus his interests might easily be at discord with those of the Empire. Consequently, just as he had shaken off French suzerainty from Flanders and Artois, so he loosened the tie of the other provinces to Germany. In 1545 they were declared free and sovereign principalities not subject to imperial laws, and all the territories were incorporated in the Burgundian circle. It was, indeed, agreed that they should contribute to imperial taxation, and in return receive imperial protection. But this soon became a dead letter, and the Netherlands were really severed from the Empire, save for the nominal feudal tie in the case of some provinces. Thus some writers have dated their independence from Charles's convention of 1548 rather than from the peace of Westphalia, a century later. Having converted his heterogeneous territories into a self-sufficient state, Charles often contemplated the formation of a middle kingdom between France and Germany. At the last moment he spoiled his own work by granting the Netherlands to Philip. It was indeed hard to set aside the order of inheritance, and the commercial interests of the provinces were closely bound with Spain, and with England, whose queen Philip had married. Under any other ruler than Philip the breach might not have come so early. Yet it must be regretted that Charles had not the courage of his convictions, and that he lost the opportunity of completing the new nation which he had faithfully laboured to create.

Charles V. is in the eyes of many the very picture of a Catholic zealot. Popular opinion is probably mainly based upon the

letters written from Yuste in 1558, when two hot-beds of heresy had been discovered in Spain herself, and on the contemporary codicil to his will. These were, perhaps, really in part responsible for the later persecution. Yet the circumstances were far from being typical of the emperor's career. Death was very near him; devotional exercises were his main occupation. The letters, moreover, were cries of warning, and not edicts. Charles was not then the responsible authority. There is a long step between a violent letter and a violent act. Few men would care to have their lives judged by letters written in the last extremities of gout. Less pardonable was the earlier persecution of the Valencian Moriscos in 1525-1526. They had fought for their landlords in the cause of order, had been forcibly converted by the revolutionaries, and on the suppression of revolution had naturally relapsed. But for this momentary conversion the Inquisition would have had no hold upon them. The edict of persecution was cruel and unnecessary, and all expert opinion in Valencia was against it. It was not, however, actually enforced until after the victory of Pavia. It seems likely that Charles in a fit of religious exaltation regarded the persecution as a sacrificial thank-offering for his miraculous preservation. It is characteristic that, when in the following year he was brought into personal contact with the Moors of Granada, he allowed them to buy themselves off from the more obnoxious measures of the Inquisition. Henceforth the reign was marked by extreme leniency. Spain enjoyed a long lull in the activity of her Inquisition. At Naples in 1547 a rumour that the Spanish Inquisition was to be introduced to check the growth of heresy in influential quarters produced a dangerous revolt. The briefs were, however, issued by Paul III., no friend of Charles, and when a Neapolitan deputation visited the emperor he disclaimed any intention of making innovations. Of a different type to all the above was the persecution in the Netherlands. Here it was deliberate, chronic, and on an ascending scale. It is not a sufficient explanation that heresy also was persistent, ubiquitous and increasing, for this was also the case in Germany where Charles's methods were neither uniform nor drastic. But in the Netherlands the heretics were his immediate subjects, and as in every other state, Catholic or Lutheran, they must conform to their prince's religion. But there was more than this. After the suppression of the German peasant revolt in 1525 many of the refugees found shelter in the teeming Netherland cities, and heresy took the form, not of Lutheranism, but of Anabaptism, which was believed to be perilous to society and the state. The government put down Anabaptism, as a modern government might stamp out Anarchism. The edicts were, indeed, directed against heresy in general, and were as harsh as they could be—at least on paper. Yet when Charles was assured that they were embarrassing foreign trade he let it be understood that they should not affect the foreign mercantile communities. Prudential considerations proved frequently a drag upon religious zeal.

The relations of Charles to heresy must be judged in the main by his treatment of German Lutheranism. Here he had to deal, not with drawing-room imprudences nor hole-and-corner contentions, not with oriental survivals nor millenary aspirations, but with organized churches protected by their princes, supported by revenues filched from his own church and stiffened by formulae as rigid as those of Catholicism. The length and stubbornness of the conflict will serve to show that Charles's religious conservatism had a measure of elasticity, that he was not a bigot and nothing more. It should be remembered that all his principal ministers were inclined to be Erasmus or indifferent, that one of his favourite confessors, Loaysa, advised compromise, and that several intimate members of his court and chapel were, after his death, victims of the Inquisition. The two more obvious courses towards the restoration of Catholic unity were force and reconciliation, in other words, a religious war or a general council. Neither of these was a simple remedy. The latter was impossible without papal concurrence, inoperative without the assistance of the European powers, and merely irritant without the adhesion of the Lutherans. It was most improbable that the papacy, the

powers and the Lutherans would combine in a measure so palpably advantageous to the emperor. Force was hopeless save in the absence of war with France and the Turk, and of papal hostility in Italian territorial politics. Charles must obtain subsidies from ecclesiastical sources, and the support of all German Catholics, especially of the traditional rival, Bavaria. Even so the Protestants would probably be the stronger, and therefore they must be divided by utilizing any religious split, any class distinction, any personal or traditional dislikes, or else by bribery. Force and reconciliation seeming equally difficult, could an alternative be found in toleration? The experiment might take the form either of individual toleration, or of toleration for the Lutheran states. The former would be equally objectionable to Lutheran and Catholic princes as loosening their grip upon their subjects. Territorial toleration might seem equally obnoxious to the emperor, for its recognition would strengthen the anti-imperial particularism so closely associated with Lutheranism. If Charles could find no permanent specific, he must apply a provisional palliative. It was absolutely necessary to patch, if not to cure, because Germany must be pulled together to resist French and Turks. Such palliatives were two—suspension and comprehension. Suspension deferred the execution of penalties incurred by heresy, either for a term of years, or until a council should decide. Thus it recognized the divorce of the two religions, but limited it by time. Comprehension instead of recognizing the divorce would strive to conceal the breach. It was a domestic remedy, German and national, not European and papal. To become permanent it must receive the sanction of pope and council, for the Roman emperor could not set up a church of Germany. Yet the formula adopted might conceivably be found to fall within the four corners of the faith, and so obviate the necessity alike of force or council. Such were the conditions of the emperor's task, and such the methods which he actually pursued. He would advance now on one line, now on another, now on two or three concurrently, but he never definitely abandoned any. This fusion of obstinacy and versatility was a marked feature of his character.

Suspension was of course often accidental and involuntary. The two chief stages of Lutheran growth naturally corresponded with the periods, each of nine years, when Charles was absent. Deliberate suspension was usually a consequence of the failure of comprehension. Thus at Augsburg in 1530 the wide gulf between the Lutheran confession and the Catholic confutation led to the definite suspensive treaty granted to the Lutherans at Nuremberg (1532). Charles dared not employ the alternative of force, because he needed their aid for the Turkish war. In 1541, after a series of religious conferences, he personally presented a compromise in the so-called Book of Regensburg, which was rejected by both parties. He then proposed that the articles agreed upon should be compulsory, while on others toleration should be exercised until a national council should decide. Never before nor after did he go so far upon the path of toleration, or so nearly accept a national settlement. He was then burning to set sail for Algiers. His last formal suspensive measure was that of Speyer (Speyer) in 1544, when he was marching against Francis. He promised a free and general council to be held in Germany, and, as a preparation, a national religious congress. The Lutherans were privately assured that a measure of comprehension should be concluded with or without papal approval. Meanwhile all edicts against heresy were suspended. No wonder that Charles afterwards confessed that he could scarcely reconcile these concessions with his conscience, but he won Lutheran aid for his campaign. The peace of Crépy gave all the conditions required for the employment of force. He had peace with French and Turk, he won the active support of the pope, he had deeply divided the Lutherans and reconciled Bavaria. Finding that the Lutherans would not accept the council summoned by the pope to Trent, he resorted to force, and force succeeded. At the Armed Diet of 1548 reunion seemed within reach. But Paul III. in direct opposition to Charles's wish had withdrawn the council from Trent to Bologna. Charles could not force Lutherans to submit to a council which he did not himself recognize, and he could not

bring himself to national schism. Thus, falling back upon his old palliatives, he issued the Interim and the accompanying Reform of the Clergy, pending a final settlement by a satisfactory general council. These measures pleased neither party, and Charles at the very height of his power had failed. He was conscious of failure, and made few attempts even to enforce the Interim. Henceforward political complications gathered round him anew. The only remedy was toleration in some form, independent of the papacy and limitless in time. To this Charles could never assent. His ideal was shattered, but it was a great ideal, and the patience, the moderation, even at times the adroitness with which he had striven towards it, proved him to be no bigot.

The idea of abdication had long been present with Charles. After his failure to eject the French from Metz he had not shrunk from a wearisome campaign against Henry II., and he was now tired out. His mother's death removed an obstacle, for there could now be no question as to his son's succession to the Spanish kingdoms. Religious settlement in Germany could no longer be postponed, and he shrank from the responsibility; the hand that should rend the seamless raiment of God's church must not be his. To Ferdinand he gave his full authority as emperor, although at his brother's earnest request formal abdication was delayed until 1558. In the Hall of the Golden Fleece at Brussels on the 25th of October 1555 he formally resigned to Philip the sovereignty of his beloved Netherlands. Turning from his son to the representatives of the estates he said, "Gentlemen, you must not be astonished if, old and feeble as I am in all my members, and also from the love I bear you, I shed some tears." In the Netherlands at least the love was reciprocal, and tears were infectious among the thousand deputies who listened to their sovereign's last speech. On the 16th of January 1556, Charles resigned his Spanish kingdoms and that of Sicily, and shortly afterwards his county of Burgundy. On the 17th of September he sailed from Flushing on the last of his many voyages, an English fleet from Portland bearing him company down the Channel. In February 1557 he was installed in the home which he had chosen at Yuste in Estremadura.

The excellent books which have been written upon the emperor's retirement have inspired an interest out of all proportion to its real significance. His little house was attached to the monastery, but was not within it. He was neither an ascetic nor a recluse. Gastronomic indiscretions still entailed their inevitable penalties. Society was not confined to interchange of civilities with the brethren. His relations, his chief friends, his official historians, all found their way to Yuste. Couriers brought news of Philip's war and peace with Pope Paul IV., of the victories of Saint Quentin and Gravelines, of the French capture of Calais, of the danger of Oran. As head of the family he intervened in the delicate relations with the closely allied house of Portugal: he even negotiated with the house of Navarre for reparation for the wrong done by his grandfather Ferdinand, which appeared to weigh upon his conscience. Above all he was shocked by the discovery that Spain, his own court, and his very chapel were infected with heresy. His violent letters to his son and daughter recommending immediate persecution, his profession of regret at having kept his word when Luther was in his power, have weighed too heavily on his reputation. The feverish phrases of religious exaltation due to broken health and unnatural retirement cannot balance the deliberate humanity and honour of wholesome manhood. Apart from such occasional moments of excitement, the emperor's last years passed tranquilly enough. At first he would shoot pigeons in the monastery woods, and till his last illness tended his garden and his animal pets, or watched the operations of Torriani, maker of clocks and mechanical toys. After an illness of three weeks the call came in the early hours of the feast of St Matthew, who, as his chaplain said, had for Christ's sake forsaken wealth even as Charles had forsaken empire. The dying man clasped his wife's crucifix to his breast till his fingers lost their hold. The archbishop held it before his eyes, and with the cry of "Ay Jesús!" died, in the words of his faithful squire D. Luis de Quijada, "the chief of men that had ever been or

would ever be." Posterity need not agree, but no great man can boast a more honest panegyric.

In character Charles stands high among contemporary princes. It consists of pairs of contrasts, but the better side is usually stronger than the worse. Steadfast honesty of purpose was occasionally warped by self-interest, or rather he was apt to think that his own course must needs be that of righteousness. Self-control would give way, but very rarely, to squalls of passion. Obstinacy and irresolution were fairly balanced, the former generally bearing upon ends, the latter upon means. His own ideals were constant, but he could gradually assimilate the views of others, and could bend to argument and circumstance; yet even here he had a habit of harking back to earlier schemes which he had seemed to have definitely abandoned. Intercourse with different nationalities taught him a certain versatility; he was dignified with Spaniards, familiar with Flemings, while the material Italians were pleased with his good sense. His sympathies were neither wide nor quick, but he was a most faithful friend, and the most considerate of masters. For all who sought him his courtesy and patience were unfailing. At his abdication he dwelt with reasonable pride upon his labours and his journeyings. Few monarchs have lived a more strenuous life. Yet his industry was broken by fits of indolence, which were probably due to health. In his prime his confessor warned him against this defect, and it caused, indeed, the last great disaster of his life. Fortunately he was conscious of his obstinacy, his irresolution and his indolence. He would accept admonition from the chapter of the Golden Fleece, would comment on his failings as a warning to his son. When Cardinal Contarini politely assured him that to hold fast to good opinions is not obstinacy but firmness, the emperor replied, "Ahl but I sometimes stick to bad ones." Charles was not cruel, indeed the character of his reign was peculiarly merciful. But he was somewhat unforgiving. He especially resented any slight upon his honour, and his unwise severity to Philip of Hesse was probably due to the unfounded accusation that he had imprisoned him in violation of his pledge. The excesses of his troops in Italy, in Guelders and on the Austrian frontiers caused him acute pain, although he called himself "hard to weep." No great nobleman, statesman or financier was executed at Charles's order. He was proud of his generakship, classing himself with Alva and Montmorenci as the best of his day. Yet his failures nearly balanced his successes. It is true that in his most important campaign, that against the League of Schmalkalden, the main credit must be ascribed to his well-judged audacity at the opening, and his dogged persistency at the close. As a soldier he must rank very high. It was said that his being emperor lost to Spain the best light horseman of her army. At every crisis he was admirably cool, setting a truly royal example to his men. His mettle was displayed when he was attacked on the burning sands of Tunis, when his troops were driven in panic from Algiers, when in spite of physical suffering he forded the Elbe at Mühlberg, and when he was bombarded by the vastly superior Lutheran artillery under the walls of Ingolstadt. When blamed for exposing himself on this last occasion, "I could not help it," he apologized; "we were short of hands, I could not set a bad example." Nevertheless he was by nature timid. Just before this very action he had a fit of trembling, and he was afraid of mice and spiders. The force of his example was not confined to the field. Melancthon wrote from Augsburg in 1530 that he was a model of continence, temperance and moderation, that the old domestic discipline was now only preserved in the imperial household. He tenderly loved his wife, whom he had married for pecuniary and diplomatic reasons. Of his two well-known illegitimate children, Margaret was born before he married, and Don John long after his wife's death, but he felt this latter to be a child of shame. His sobriety was frequently contrasted with the universal drunkenness of the German and Flemish nobles, which he earnestly condemned. But on his appetite he could place no control, in spite of the ruinous effects of his gluttony upon his health. In dress, in his household, and in his stable he was simple and economical. He loved children, flowers, animals and birds. Professional

jesters amused him, and he was not above a joke himself. Maps and mechanical inventions greatly interested him, and in later life he became fond of reading. He takes his place indeed among authors, for he dictated the commentaries on his own career. Of music he possessed a really fine knowledge, and his high appreciation of Titian proves the purity of his feeling for art. The little collection of books and pictures which he carried to Yuste is an index of his tastes. Charles was undeniably plain. He confessed that he was by nature ugly, but that as artists usually painted him uglier than he was, strangers on seeing him were agreeably disappointed. The protruding lower jaw and the thin pale face were redeemed by the fine open brow and the bright speaking eyes. He was, moreover, well made, and in youth had an incomparable leg. Above all no man could doubt his dignity; Charles was every inch an emperor.

Robertson, *History of the Emperor Charles V.* (latest ed., London, 1887); an English class, which needs supplementing by late authorities; F. A. Mignet, *Rivalité de François I et de Charles-Quint* (2 vols., Paris, 1875); E. Armstrong, *The Emperor Charles V.* (2 vols., London, 1902), to which reference may be made for monographs and collections of documents bearing on the reign; H. Baumgarten, *Geschichte Karls V.* (3 vols., Stuttgart, 1885-1893), very full but extending only to 1539; G. de Leva, *Storia documentata di Carlo V. in correlazione all'Italia* (5 vols., Venice, 1862-1894), a general history of the reign, though with special reference to its Italian aspects, and extending to 1552; article by L. P. Gachard in *Biographie nationale*, vol. iii., 1872, an excellent compressed account. The life of Charles V. at Yuste may be studied in L. P. Gachard's *Retraite et mort de Charles-Quint au monastère de Yuste* (Brussels, 1854-1855), and in Sir W. Stirling-Maxwell's *The Cloister Life of the Emperor Charles V.* (London, 4 editions from 1852); also in W. H. Prescott's edition of Robertson's *History* (1857). (E. A.)

**CHARLES VI.** (1685-1740), Roman emperor, was born on the 1st of October 1685 at Vienna. He was the second son of the emperor Leopold I. by his third marriage with Eleonore, daughter of Philip William of Neuburg, elector palatine of the Rhine. When the Spanish branch of the house of Habsburg became extinct in 1700, he was put forward as the lawful heir in opposition to Philip V., the Bourbon to whom the Spanish dominions had been left by the will of Charles II. of Spain. He was proclaimed at Vienna on the 19th of September 1703, and made his way to Spain by the Low Countries, England and Lisbon, remaining in Spain till 1711, mostly in Catalonia, where the Habsburg party was strong. Although he had a certain tenacity of purpose, which he showed in later life, he displayed none of the qualities required in a prince who had to gain his throne by the sword (see SPANISH SUCCESSION, WAR OF). He was so afraid of appearing to be ruled by a favourite that he would not take good advice, but was easily earwigged by flatterers who played on his weakness for appearing independent. In 1708 he was married at Barcelona to Elizabeth Christina of Brunswick-Wolfenbüttel (1691-1750), a Lutheran princess who was persuaded to accept Roman Catholicism by the assurances of Protestant divines and of the philosopher Leibnitz, that she could always give an Evangelical meaning to Catholic ceremonies. On the death of his elder brother Joseph I. on the 17th of April 1711, Charles inherited the hereditary possessions of the house of Habsburg, and their claims on the Empire. The death of Joseph without male issue had been foreseen, and Charles had at one time been prepared to give up Spain and the Indies on condition that he was allowed to retain Naples, Sicily and the Milanese. But when the case arose, his natural obstinacy led him to declare that he would not think of surrendering any of the rights of his family. It was with great difficulty that he was persuaded to leave Spain, months after the death of his brother (on the 27th of September 1711). Only the emphatic refusal of the European powers to tolerate the reconstruction of the empire of Charles V. forced him to give a sullen submission to necessity. He abandoned Spain and was crowned emperor in December 1711, but for a long time he would not recognize Philip V. It is to his honour that he was very reluctant to desert the Catalans who had fought for his cause. Some of their

chiefs followed him to Vienna, and their advice had an unfortunate influence on his mind. They almost succeeded in arousing his suspicions of the loyalty of Prince Eugene at the very moment when the prince's splendid victories over the Turks had led to the peace of Passarowitz on the 28th of July 1718, and a great extension of the Austrian dominions eastward. Charles showed an enlightened, though not always successful, interest in the commercial prosperity of his subjects, but from the date of his return to Germany till his death his ruling passion was to secure his inheritance against dismemberment. As early as 1713 he had begun to prepare the "Pragmatic Sanction" which was to regulate the succession. An only son, born on the 13th of April 1716, died in infancy, and it became the object of his policy to obtain the recognition of his daughter Maria Theresa as his heiress. He made great concessions to obtain his aim, and embarked on complicated diplomatic negotiations. His last days were embittered by a disastrous war with Turkey, in which he lost almost all he had gained by the peace of Passarowitz. He died at Vienna on the 20th of October 1740, and with him expired the male line of his house. Charles VI. was an admirable representative of the tenacious ambition of the Habsburgs, and of their belief in their own "august greatness" and boundless rights.

For the personal character of Charles VI. see A. von Arneth, *Geschichte Maria Theresas* (Vienna, 1863-1879). Dr Franz Krones, R. v. Marchland, *Grundriss der österreichischen Geschichte* (Vienna, 1882), gives a very copious bibliography.

**CHARLES VII.** (1697-1745), Roman emperor, known also as Charles Albert, elector of Bavaria, was the son of the elector Maximilian Emanuel and his second wife, Theresa Cunigunda, daughter of John Sobieski, king of Poland. He was born on the 6th of August 1697. His father having taken the side of Louis XIV. of France in the War of the Spanish Succession (q.v.), Bavaria was occupied by the allies. Charles and his brother Clement, afterwards archbishop of Cologne, were carried prisoners to Vienna, and were educated by the Jesuits under the name of the counts of Wittelsbach. When his father was restored to his electorate, Charles was released, and in 1717 he led the Bavarian contingent of the imperial army which served under Prince Eugene against the Turks, and is said to have distinguished himself at Belgrade. On the 25th of September 1722 he was betrothed to Maria Amelia, the younger of the two orphan daughters of the emperor Joseph I. Her uncle Charles VI. insisted that the Bavarian house should recognize the Pragmatic Sanction which established his daughter Maria Theresa as heiress of the Habsburg dominions. They did so, but with secret protests and mental reservations of their rights, which were designed to render the recognition valueless. The electors of Bavaria had claims on the possessions of the Habsburgs under the will of the emperor Ferdinand I., who died in 1564.

Charles succeeded his father on the 26th of February 1726. As a ruler of Bavaria, he showed a vague disposition to improve the condition of his subjects, but his profuse habits and his efforts to rival the splendour of the French court crippled his finances. His policy was one of much duplicity, for he was constantly endeavouring to keep on good terms with the emperor while slipping out of his obligation to accept the Pragmatic Sanction and intriguing to secure French support for his claims whenever Charles VI. should die. On hearing of the emperor's last illness, he ordered his agent at Vienna to renew his claim to the Austrian inheritance. The claim was advanced immediately after the death of Charles VI. on the 20th of October 1740. Charles Albert now entered into the league against Maria Theresa, to the great misfortune of himself and his subjects. By the help of her enemies he was elected emperor in opposition to her husband Francis, grand duke of Tuscany, on the 24th of January 1742, under the title of Charles VII., and was crowned at Frankfort-on-Main on the 12th of February. But as his army had been neglected, he was utterly unable to resist the Austrian troops. While he was being crowned his hereditary dominions in Bavaria were being overrun. He described himself as attacked by stone and gout, ill, without money or land, and in distress comparable to the

sorrows of Job. During the War of the Austrian Succession (*q.v.*) he was a mere puppet in the hands of the anti-Austrian coalition, and was often in want of mere necessities. In the changes of the war he was able to re-enter his capital, Munich, in 1743, but had immediately afterwards to take flight again. He was restored by Frederick the Great in October 1744, but died worn out at Munich on the 20th of January 1745.

See A. von Arneth, *Geschichte Maria Theresias* (Vienna, 1863-1879); and P. T. Heigel, *Der österreichische Erbfolgestreit und die Kaiserwahl Karls VII.* (Munich, 1877).

**CHARLES I.** (1600-1649), king of Great Britain and Ireland, second son of James I. and Anne of Denmark, was born at Dunfermline on the 19th of November 1600. At his baptism he was created duke of Albany, and on the 16th of January 1605 duke of York. In 1612, by the death of his elder brother Henry, he became heir-apparent, and was created prince of Wales on the 3rd of November 1616. In 1620 he took up warmly the cause of his sister the queen of Bohemia, and in 1621 he defended Bacon, using his influence to prevent the chancellor's degradation from the peerage. The prince's marriage with the infanta Maria, daughter of Philip III. of Spain, had been for some time the subject of negotiation, James desiring to obtain through Spanish support the restitution of his son-in-law, Frederick, to the Palatinate; and in 1623 Charles was persuaded by Buckingham, who now obtained a complete ascendancy over him in opposition to wiser advisers and the king's own wishes, to make a secret expedition himself to Spain, put an end to all formalities, and bring home his mistress himself: "a gallant and brave thing for his Highness." "Steenie" and "Baby Charles," as James called them, started on the 17th of February, arriving at Paris on the 21st and at Madrid on the 7th of March, where they assumed the unromantic names of Mr Smith, and Mr Brown. They found the Spanish court by no means enthusiastic for the marriage and the princess herself averse. The prince's immediate conversion was expected, and a complete religious tolerance for the Roman Catholics in England demanded. James engaged to allow the infanta the right of public worship and to use his influence to modify the law, but Charles himself went much further. He promised the alteration of the penal laws within three years, conceded the education of the children to the mother till the age of twelve, and undertook to listen to the infanta's priests in matters of religion, signing the marriage contract on the 25th of July 1623. The Spanish, however, did not trust to words, and Charles was informed that his wife could only follow him to England when these promises were executed. Moreover, they had no intention whatever of aiding the Protestant Frederick. Meanwhile Buckingham, incensed at the failure of the expedition, had quarrelled with the grandees, and Charles left Madrid, landing at Portsmouth on the 5th of October, to the joy of the people, to whom the proposed alliance was odious. He now with Buckingham urged James to make war on Spain, and in December 1624 signed a marriage treaty with Henrietta Maria, daughter of Henry IV. of France. In April Charles had declared solemnly to the parliament that in case of his marriage to a Roman Catholic princess no concessions should be granted to recusants, but these were in September 1624 deliberately promised by James and Charles in a secret article, the first instance of the duplicity and deception practised by Charles in dealing with the parliament and the nation. The French on their side promised to assist in Mansfield's expedition for the recovery of the Palatinate, but Louis in October refused to allow the men to pass through France; and the army, without pay or provisions, dwindled away in Holland to nothing.

On the 27th of March 1625 Charles I. succeeded to the throne by the death of his father, and on the 1st of May he was married by proxy to Henrietta Maria. He received her at Canterbury on the 13th of June, and on the 18th his first parliament assembled. On the day of his marriage Charles had given directions that the prosecutions of the Roman Catholics should cease, but he now declared his intention of enforcing the laws against them, and demanded subsidies for carrying on the war against

Spain. The Commons, however, responded coldly. Charles had lent ships to Louis XIII. to be used against the Protestants at La Rochelle, and the Commons were not aware of the subtleties and fictitious delays intended to prevent their employment. The Protestant feelings of the Commons were also aroused by the king's support of the royal chaplain, Richard Montagu, who had repudiated Calvinistic doctrine. They only voted small sums, and sent up a petition on the state of religion and reflecting upon Buckingham, whom they deemed responsible for the failure of Mansfield's expedition, at the same time demanding counsellors in whom they could trust. Parliament was accordingly dissolved by Charles on the 12th of August. He hoped that greater success abroad would persuade the Commons to be more generous. On the 8th of September 1625 he made the treaty of Southampton with the Dutch against Spain, and sent an expedition to Cadiz under Sir Edward Cecil, which, however, was a failure. In order to make himself independent of parliament he attempted to raise money on the crown jewels in Holland, and to diminish the opposition in the Commons he excluded the chief leaders by appointing them sheriffs. When the second parliament met, however, on the 6th of February 1626, the opposition, led by Sir John Eliot, was more determined than before, and their attack was concentrated upon Buckingham. On the 29th of March Charles, calling the Commons into his presence, accused them of leading him into the war and of taking advantage of his difficulties to "make their own game." "I pray you not to be deceived," he said, "it is not a parliamentary way, nor 'tis not a way to deal with a king. Remember that parliaments are altogether in my power for their calling, sitting, and dissolution; therefore as I find the fruits of them good or evil, they are to continue or not to be." Charles, however, was worsted in several collisions with the two houses, with a consequent loss of influence. He was obliged by the peers to set at liberty Thomas Howard, earl of Arundel, whom he had put into the Tower, and to send a summons to the earl of Bristol, whom he had attempted to exclude from parliament, while the Commons compelled him, with a threat of doing no business, to liberate Eliot and Digges, the managers of Buckingham's impeachment, whom he had imprisoned. Finally in June the Commons answered Charles's demand for money by a remonstrance asking for Buckingham's dismissal, which they decided must precede the grant of supply. They claimed responsible ministers, while Charles considered himself the executive and the sole and unfettered judge of the necessities of the state. Accordingly on the 15th Charles dissolved the parliament.

The king was now in great need of money. He was at war with Spain and had promised to pay £30,000 a month to Christian IV. of Denmark in support of the Protestant campaign in Germany. To these necessities was now added a war with France. Charles had never kept his promise concerning the recusants; disputes arose in consequence with his wife, and on the 31st of July 1626 he ordered all her French attendants to be expelled from Whitehall and sent back to France. At the same time several French ships carrying contraband goods to the Spanish Netherlands were seized by English warships. On the 27th of June 1627 Buckingham with a large expedition sailed to the Isle of Ré to relieve La Rochelle, then besieged by the forces of Louis XIII. Though the success of the French Protestants was an object much desired in England, Buckingham's unpopularity prevented support being given to the expedition, and the duke returned to Plymouth on the 11th of November completely defeated. Meanwhile Charles had endeavoured to get the money refused to him by parliament by means of a forced loan, dismissing Chief Justice Crewe for declining to support its legality, and imprisoning several of the leaders of the opposition for refusing to subscribe to it. These summary measures, however, only brought a small sum into the treasury. On the 2nd of January 1628 Charles ordered the release of all the persons imprisoned, and on the 17th of March summoned his third parliament.

Instead of relieving the king's necessities the Commons immediately proceeded to discuss the constitutional position and to formulate the Petition of Right, forbidding taxation without

<sup>1</sup> *Hist. MSS. Comm.* 11 Rep. app. Pt. iv. 21.

consent of parliament, arbitrary and illegal imprisonment, compulsory billeting in private houses, and martial law. Charles, on the 1st of May, first demanded that they should "rest on his royal word and promise." He obtained an opinion from the judges that the acceptance of the petition would not absolutely preclude in certain cases imprisonments without showing cause, and after a futile endeavour to avoid an acceptance by returning an ambiguous answer which only exasperated the Commons, he gave his consent on the 7th of June in the full and usual form. Charles now obtained his subsidies, but no real settlement was reached, and his relations with the parliament remained as unfriendly as before. They proceeded to remonstrate against his government and against his support of Buckingham, and denied his right to tonnage and poundage. Accordingly, on the 26th of June they were prorogued. New disasters befell Charles, in the assassination of Buckingham and in the failure of the fresh expedition sent to Ré. In January 1629 the parliament re-assembled, irritated by the exaction of the duties and seizure of goods during the interval, and suspicious of "innovations in religion," the king having forbidden the clergy to continue the controversy concerning Calvinistic and Arminian doctrines, the latter of which the parliament desired to suppress. While they were discussing these matters, on the 2nd of March 1629, the king ordered them to adjourn, but amidst a scene of great excitement the speaker, Sir John Finch, was held down in his chair and the doors were locked, whilst resolutions against innovations in religion and declaring those who levied or paid tonnage and poundage enemies to their country were passed. Parliament was immediately dissolved, and Charles imprisoned nine members, leaders of the opposition, Eliot, Holles, Strode, Selden, Valentine, Coryton, Heyman, Hobart and Long, his vengeance being especially shown in the case of Eliot, the most formidable of his opponents, who died in the Tower of consumption after long years of close and unhealthy confinement, and whose corpse even Charles refused to give up to his family.

For eleven years Charles ruled without parliaments and with some success. There seemed no reason to think that "that noise," to use Laud's expression concerning parliaments, would ever be heard again by those then living. A revenue of about £618,000 was obtained by enforcing the payment of tonnage and poundage, and while avoiding the taxes, loans, and benevolences forbidden by the petition of right, by monopolies, fines for knighthood, and for pretended encroachments on the royal domains and forests, which enabled the king to meet expenditure at home. In Ireland, Charles, in order to get money, had granted the Graces in 1628, conceding security of titles of more than sixty years' standing, and a more moderate oath of allegiance for the Roman Catholics, together with the renunciation of the shilling fine for non-attendance at church. He continued, however, to make various attempts to get estates into his possession on the pretext of invalid title, and on the 12th of May 1633 the city of London estates were sequestered. Charles here destroyed one of the most valuable settlements in Ireland founded by James I. in the interests of national defence, and at the same time extinguished the historic loyalty of the city of London, which henceforth steadily favoured the parliamentary cause. In 1633 Wentworth had been sent to Ireland to establish a medieval monarchy and get money, and his success in organization seemed great enough to justify the attempt to extend the system to England. Charles at the same time restricted his foreign policy to scarcely more than a wish for the recovery of the Palatinate, to further which he engaged in a series of numerous and mutually destructive negotiations with Gustavus Adolphus and with Spain, finally making peace with Spain on the 5th of November 1630, an agreement which was followed on the 2nd of January 1631 by a further secret treaty, the two kings binding themselves to make war on the Dutch and partition their territories. A notable feature of this agreement was that while in Charles's portion Roman Catholicism was to be tolerated, there was no guarantee for the security of Protestantism in the territory to be ceded to Spain.

In 1634 Charles levied ship-money from the seaport towns for

the increase of the navy, and in 1635 the tax was extended to the inland counties, which aroused considerable opposition. In February 1637 Charles obtained an opinion in favour of his claims from the judges, and in 1638 the great Hampden case was decided in his favour. The apparent success, however, of Charles was imperilled by the general and growing resentment aroused by his exactions and whole policy, and this again was small compared with the fears excited by the king's attitude towards religion and Protestantism. He supported zealously Laud's rigid Anglican orthodoxy, his compulsory introduction of unwelcome ritual, and his narrow, intolerant and despotic policy, which was marked by several savage prosecutions and sentences in the Star Chamber, drove numbers of moderate Protestants out of the Church into Presbyterianism, and created an intense feeling of hostility to the government throughout the country. Charles further increased the popular fears on the subject of religion by his welcome given to Panzani, the pope's agent, in 1634, who endeavoured unsuccessfully to reconcile the two churches, and afterwards to George Conn, papal agent at the court of Henrietta Maria, while the favour shown by the king to these was contrasted with the severe sentences passed upon the Puritans.

The same imprudent neglect of the national sentiment was pursued in Scotland. Charles had already made powerful enemies there by a declaration announcing the arbitrary revocation of former church estates to the crown. On the 18th of June 1633 he was crowned at Edinburgh with full Anglican ceremonial, which lost him the hearts of numbers of his Scottish subjects and aroused hostility to his government in parliament. After his return to England he gave further offence by ordering the use of the surplice, by his appointment of Archbishop Spotswood as chancellor of Scotland, and by introducing other bishops into the privy council. In 1636 the new *Book of Canons* was issued by the king's authority, ordering the communion table to be placed at the east end, enjoining confession, and declaring excommunicate any who should presume to attack the new prayer-book. The latter was ordered to be used on the 18th of October 1636, but it did not arrive in Scotland till May 1637. It was intensely disliked both as "popish" and as English. A riot followed its first use in St Giles' cathedral on the 23rd of July, and Charles's order to enforce it on the 10th of September was met by fresh disturbances and by the establishment of the "Tables," national committees which now became the real though informal government of Scotland. In 1638 the national covenant was drawn up, binding those that signed it to defend their religion to the death, and was taken by large numbers with enthusiasm all over the country. Charles now drew back, promised to enforce the canons and prayer-book only in a "fair and legal way," and sent the marquis of Hamilton as a mediator. The latter, however, a weak and incapable man, desirous of popularity with all parties, and unfaithful to the king's interests, yielded everything, without obtaining the return of Charles's subjects to their allegiance. The assembly met at Glasgow on the 21st of November, and in spite of Hamilton's opposition immediately proceeded to judge the bishops. On the 28th Hamilton dissolved it, but it continued to sit, deposed the bishops and re-established Presbyterianism. The rebellion had now begun, and an appeal to arms alone could decide the quarrel between Charles and his subjects. On the 28th of May 1639 he arrived at Berwick with a small and ill-trained force, thus beginning what is known as the first Bishops' War; but being confronted by the Scottish army at Duns Law, he was compelled to sign the treaty of Berwick on the 18th of June, which provided for the disbandment of both armies and the restitution to the king of the royal castles, referring all questions to a general assembly and a parliament. When the assembly met it abolished episcopacy, but Charles, who on the 3rd of August had returned to Whitehall, refused his consent to this and to other measures proposed by the Scottish parliament. His extreme financial necessities, and the prospect of renewed hostilities with the Scots, now moved Charles, at the instigation of Strafford, who in September had left Ireland to become the king's chief adviser, to turn again to parliament for assistance as the last resource,

and on the 13th of April 1640 the Short Parliament assembled. But on its discussing grievances before granting supplies and finally refusing subsidies till peace was made with the Scots, it was dissolved on the 5th of May. Charles returned once more to measures of repression, and on the 10th imprisoned some of the London aldermen who refused to lend money. He prepared for war, scraping together what money he could and obtaining a grant through Strafford from Ireland. His position, however, was hopeless; his forces were totally undisciplined, and the Scots were supported by the parliamentary opposition in England. On the 20th of August the Scots crossed the Tweed, beginning the so-called second Bishops' War, defeated the king's army at Newburn on the 28th, and subsequently occupied Newcastle and Durham. Charles at this juncture, on the 24th of September, summoned a great council of the peers; and on the 21st of October a cessation of arms was agreed to by the treaty of Ripon, the Scots receiving £850 a day for the maintenance of the army, and further negotiations being transferred to London. On the 3rd of November the king summoned the Long Parliament.

Such was the final issue of Charles's attempt to govern without parliaments—Scotland in triumphant rebellion, Ireland only waiting for a signal to rise, and in England the parliament revived with almost irresistible strength, in spite of the king, by the force of circumstances alone. At this great crisis, which would indeed have taxed the resolution and resource of the most cool-headed and sagacious statesman, Charles failed signally. Two alternative courses were open to him, either of which still offered good chances of success. He might have taken his stand on the ancient and undoubted prerogative of the crown, resisted all encroachments on the executive by the parliament by legal and constitutional means, which were probably ample, and in case of necessity have appealed to the loyalty of the nation to support him in arms; or he might have waived his rights, and, acknowledging the mistakes of his past administration, have united with the parliament and created once more that union of interests and sentiment of the monarchy with the nation which had made England so powerful. Charles, however, pretended to do both simultaneously or by turns, and therefore accomplished neither. The illegally imprisoned members of the last parliament, now smarting with the sense of their wrongs, were set free to stimulate the violence of the opposition to the king in the new assembly. Of Charles's double statecraft, however, the series of incidents which terminated the career of the great Strafford form the most terrible example. Strafford had come to London in November, having been assured by Charles that he "should not suffer in his person, honour or fortune," but was impeached and thrown into the Tower almost immediately. Charles took no steps to hinder the progress of the proceedings against him, but entered into schemes for saving him by bringing up an army to London, and this step exasperated Strafford's enemies and added new zeal to the prosecution. On the 23rd of April, after the passing of the attainder by the Commons, he repeated to Strafford his former assurances of protection. On the 1st of May he appealed to the Lords to spare his life and be satisfied with rendering him incapable of holding office. On the 2nd he made an attempt to seize the Tower by force. On the 10th, yielding to the queen's fears and to the mob surging round his palace, he signed his death-warrant. "If my own person only were in danger," he declared to the council, "I would gladly venture it to save my Lord Strafford's life; but seeing my wife, children, all my kingdom are concerned in it, I am forced to give way to it." On the 11th he sent to the peers a petition for Strafford's life, the force of which was completely annulled by the strange postscript: "If he must die, it were a charity to reprieve him until Saturday." This tragic surrender of his great and devoted servant left an indelible stain upon the king's character, and he lived to repent it bitterly. One of his last admonitions to the prince of Wales was "never to give way to the punishment of any for their faithful service to the crown." It was regarded by Charles as the cause of his own subsequent misfortunes, and on the scaffold the remembrance of it disturbed his own last moments. The surrender of Strafford was followed by another

stupendous concession by Charles, the surrender of his right to dissolve the parliament without its own consent, and the parliament immediately proceeded, with Charles's consent, to sweep away the star-chamber, high commission and other extra-legal courts, and all extra-parliamentary taxation. Charles, however, did not remain long or consistently in the yielding mood. In June 1641 he engaged in a second army plot for bringing up the forces to London, and on the 10th of August he set out for Scotland in order to obtain the Scottish army against the parliament in England; this plan was obviously doomed to failure and was interrupted by another appeal to force, the so-called Incident, at which Charles was suspected (in all probability unjustly) of having connived, consisting in an attempt to kidnap and murder Argyll, Hamilton and Lanark, with whom he was negotiating. Charles had also apparently been intriguing with Irish Roman Catholic lords for military help in return for concessions, and he was suspected of complicity in the Irish rebellion which now broke out. He left Scotland more discredited than ever, having by his concessions made, to use Hyde's words, "a perfect deed of gift of that kingdom," and without gaining any advantage.

Charles returned to London on the 25th of November 1641 and was immediately confronted by the Grand Remonstrance (passed on the 22nd), in which, after reciting the chief points of the king's misgovernment, the parliament demanded the appointment of acceptable ministers and the constitution of an assembly of divines to settle the religious question. On the 2nd of January 1642 Charles gave office to the opposition members Colepeper and Falkland, and at the same time Hyde left the opposition party to serve the king. Charles promised to take no serious step without their advice. Nevertheless, entirely without their knowledge, through the influence of the queen whose impeachment was intended, Charles on the 4th made the rash and fatal attempt to seize with an armed force the five members of the Commons, Pym, Hampden, Holles, Hesilrige and Strode, whom, together with Mandeville (afterwards earl of Manchester) in the Lords, he had impeached of high treason. No English sovereign ever had (or has since that time) penetrated into the House of Commons. So complete and flagrant a violation of parliamentary liberties, and an appeal so crude and glaring to brute force, could only be justified by complete success; but the court plans had been betrayed, and were known to the offending members, who, by order of the House, had taken refuge in the city before the king's arrival with the soldiers. Charles, on entering the House, found "the birds flown," and returned baffled, having thrown away the last chance of a peaceful settlement (see LESTBALL, WILLIAM). The next day Charles was equally unsuccessful in obtaining their surrender in the city. "The king had the worst day in London yesterday," wrote a spectator of the scene, "that ever he had, the people crying 'privilege of parliament' by thousands and prayed God to turn the heart of the king, shutting up their shops and standing at their doors with swords and halberds."<sup>1</sup> On the 10th, amidst general manifestations of hostility, Charles left Whitehall to prepare for war, destined never to return till he was brought back by his victorious enemies to die.

Several months followed spent in manoeuvres to obtain the control of the forces and in a paper war of controversy. On the 23rd of April Charles was refused entry into Hull, and on the 2nd of June the parliament sent to him the "Nineteen Propositions," claiming the whole sovereignty and government for the parliament, including the choice of the ministers, the judges, and the control of the army, and the execution of the laws against the Roman Catholics. The military events of the war are described in the article GREAT REBELLION. On the 22nd of August the king set up his standard at Nottingham, and on the 23rd of October he fought the indecisive battle of Edgehill, occupying Oxford and advancing as far as Brentford. It seemed possible that the war might immediately be ended by Charles penetrating to the heart of the enemy's position and occupying London, but he drew hack on the 13th of November before the parliamentary force at Turnham Green, and avoided a decisive contest.

<sup>1</sup> Hist. MSS. Comm.: MSS. of Lord Montagu of Beaulieu, 142.

Next year (1643) another campaign, for surrounding instead of penetrating into London, was projected. Newcastle and Hopton were to advance from the north and west, seize the north and south banks of the river below the city, destroy its commerce, and combine with Charles at Oxford. The royalist force, however, in spite of victories at Adwalton Moor (June 30th) and Roundway Down (July 13th), did not succeed in combining with Charles, Newcastle in the north being kept back by the Eastern Association and the presence of the enemy at Hull, and Hopton in the west being detained by their successful holding out at Plymouth. Being too weak to attempt anything alone against London, Charles marched to besiege Gloucester, Essex following him and relieving the place. Subsequently the rival forces fought the indecisive first battle of Newbury, and Charles failed in preventing the return of Essex to London. Meanwhile on the 1st of February the parliament had submitted proposals to Charles at Oxford, but the negotiations came to nothing, and Charles's unwise attempt at the same time to stir up a rising in his favour in the city, known as Waller's Plot, injured his cause considerably. He once more turned for help to Ireland, where the cessation of the campaign against the rebels was agreed upon on the 15th of September 1643, and several English regiments became thereby available for employment by the king in England. Charles also accepted the proposal for bringing over 2000 Irish. On the 22nd of January 1644 the king opened the rival parliament at Oxford.

The campaign of 1644 began far less favourably for Charles than the two last, principally owing to the alliance now made between the Scots and the parliament, the parliament taking the Solemn League and Covenant on the 25th of September 1643, and the Scottish army crossing the border on the 10th of January 1644. No attempt, was this year made against London, and Rupert was sent to Newcastle's succour in the north, where the great disaster of Marston Moor on the 2nd of July ruined Charles's last chances in that quarter. Meanwhile Charles himself had defeated Waller at Cropredy Bridge on the 29th of June, and he subsequently followed Essex to the west, compelling the surrender of Essex's infantry at Lostwithiel on the 2nd of September. With an ill-timed leniency he allowed the men to go free after giving up their stores and arms, and on his return towards Oxford he was confronted again by Essex's army at Newbury, combined now with that of Waller and of Manchester. Charles owed his escape here from complete annihilation only to Manchester's unwillingness to inflict a total defeat, and he was allowed to get away with his artillery to Oxford and to revictual Donnington Castle and Basing House.

The negotiations carried on at Uxbridge during January and February 1645 failed to secure a settlement, and on the 14th of June the crushing defeat of the king's forces by the new model army at Naseby practically ended the civil war. Charles, however, refused to make peace on Rupert's advice, and considered it a point of honour "neither to abandon God's cause, injure my successors, nor forsake my friends." His chief hope was to join Montrose in Scotland, but his march north was prevented by the parliamentary forces, and on the 24th of September he witnessed from the walls of Chester the rout of his followers at Rowton Heath. He now entered into a series of intrigues, mutually destructive, which, becoming known to the different parties, exasperated all and diminished still further the king's credit. One proposal was the levy of a foreign force to reduce the kingdom; another, the supply through the marquis of Ormonde of 10,000 Irish. Correspondence relating to these schemes, fatally compromising as they were if Charles hoped ever to rule England again, was discovered by his enemies, including the Glamorgan treaty, which went much further than the instructions to Ormonde, but of which the full responsibility has never been really traced to Charles, who on the 29th of January 1646 disavowed his agent's proceedings. He simultaneously treated with the parliament, and promised toleration to the Roman Catholics if they and the pope would aid in the restoration of the monarchy and the church. Nor was this all. The parliamentary forces had been closing round Oxford. On the 27th of April the king left the city, and on the 5th of May gave himself up to the Scottish

army at Newark, arriving on the 13th with them at Newcastle. On the 13th of July the parliament sent to Charles the "Newcastle Propositions," which included the extreme demands of Charles's acceptance of the Covenants, the abolition of episcopacy and establishment of Presbyterianism, severer laws against the Roman Catholics and parliamentary control of the forces, with the withdrawal of the Irish Cessation, and a long list of royalists to be exempted from pardon. Charles returned no definite answer for several months. He imagined that he might now find support in Scottish royalism, encouraged by Montrose's series of brilliant victories, but these hopes were destroyed by the latter's defeat at Philiphaugh on the 3rd of September. The Scots insisted on the Covenant and on the permanent establishment of Presbyterianism, while Charles would only consent to a temporary maintenance for three years. Accordingly the Scots, in return for the payment of part of their army arrears by the parliament, marched home on the 30th of January 1647, leaving Charles behind, who under the care of the parliamentary commissioners was conducted to Holmby House. Thence on the 12th of May he sent his answer to the Newcastle Propositions, offering the militia to the parliament for ten years and the establishment of Presbyterianism for three, while a final settlement on religion was to be reached through an assembly of twenty divines at Westminster. But in the midst of the negotiation with the parliament Charles's person was seized, on the 3rd of June 1647, by Cornet Joyce under instructions of the army, which soon afterwards occupied London and overpowered the parliament, placing Charles at Hampton Court.

If Charles could have remained firm to either one or the other faction, and have made concessions either to Presbyterianism or on the subject of the militia, he might even now have prevailed. But he had learned nothing by experience, and continued at this juncture his characteristic policy of intrigue and double-dealing, "playing his game," to use his own words, negotiating with both parties at once, not with the object or wish to arrive at a settlement with either, but to augment their disputes, gain time and profit ultimately by their divisions. The "Heads of the Proposals," submitted to Charles by the army on the 28th of July 1647, were terms conceived on a basis far broader and more statesmanlike than the Newcastle Propositions, and such as Charles might well have accepted. The proposals on religion anticipated the Toleration Act of 1689. There was no mention of episcopacy, and its existence was thereby indirectly admitted, but complete religious freedom for all Protestant denominations was provided, and the power of the church to inflict civil penalties abolished, while it was also suggested that dangers from Roman Catholics and Jesuits might be avoided by means other than enforcing attendance at church. The parliament was to dissolve itself and be succeeded by biennial assemblies elected on a reformed franchise, not to be dissolved without their own consent before 120 days, and not to sit more than 240 days in the two years. A council of state was to conduct the foreign policy of the state and conclude peace and war subject to the approval of parliament, and to control the militia for ten years, the commanders being appointed by parliament, as also the officers of state for ten years. No peer created since May the 21st, 1642, was to sit in parliament without consent of both Houses, and the judicial decisions of the House of Lords were to be ratified by the Commons. Only five persons were excepted from amnesty, but royalists were not to hold office for five years and not to sit in the Commons till the end of the second biennial parliament. Proposals for a series of reforms were also added. Charles, however, was at the same time negotiating with Lauderdale for an invasion of England by the Scots, and imagined he could win over Cromwell and Fairfax by "proffers of advantage to themselves." The precious opportunity was therefore allowed to slip by. On the 9th of September he rejected the proposals of the parliament for the establishment of Presbyterianism. His hopes of gaining advantages by playing upon the differences of his opponents proved a complete failure. Fresh terms were drawn up by the army and parliament together on the 10th of November, but before these could be presented, Charles, on the 11th, had escaped to Carisbrooke Castle in the Isle of Wight.

Thence on the 16th he sent a message offering Presbyterianism for three years and the militia for his lifetime to the parliament, but insisting on the maintenance of episcopacy. On the 28th of December he refused his assent to the Four Bills, which demanded the militia for parliament for twenty years and practically for ever, annulled the honours recently granted by the king and his declarations against the Houses, and gave to parliament the right to adjourn to any place it wished. On the 3rd of January 1648 the Commons agreed to a resolution to address the king no further, in which they were joined by the Lords on the 15th.

Charles had meanwhile taken a further fatal step which brought about his total destruction. On the 26th of December 1647 he had signed at Carisbrooke with the Scottish commissioners the secret treaty called the "Engagement," whereby the Scots undertook to invade England on his behalf and restore him to the throne on condition of the establishment of Presbyterianism for three years and the suppression of the sectarians. In consequence the second civil war broke out and the Scots invaded England under Hamilton. The royalist risings in England were soon suppressed, and Cromwell gained an easy and decisive victory over the Scots at Preston. Charles was now left alone to face his enemies, with the whole tale of his intrigues and deceptions unmasked and exposed. The last intrigue with the Scots was the most unpardonable in the eyes of his contemporaries, no less wicked and monstrous than his design to conquer England by the Irish soldiers; "a more prodigious treason," said Cromwell, "than any that had been perfected before; because the former quarrel was that Englishmen might rule over one another; this to vassalize us to a foreign nation." Cromwell, who up to this point had shown himself foremost in supporting the negotiations with the king, now spoke of the treaty of Newport, which he found the parliament in the act of negotiating on his return from Scotland, as "this ruining hypocritical agreement." Charles had engaged in these negotiations only to gain time and find opportunity to escape. "The great concession I made this day," he wrote on the 7th of October, "was made merely in order to my escape." At the beginning he had stipulated that no concession from him should be valid unless an agreement were reached upon every point. He had now consented to most of the demands of the parliament, including the repudiation of the Irish Cession, the surrender of the delinquents and the cession of the militia for twenty years, and of the offices of state to parliament, but remained firm in his refusal to abolish episcopacy, consenting only to Presbyterianism for three years. Charles's devotion to the church is undoubted. In April 1646, before his flight from Oxford, inspired perhaps by superstitious fears as to the origin of his misfortunes, he had delivered to Sheldon, afterwards archbishop of Canterbury, a written vow (now in the library of St Paul's cathedral) to restore all church lands held by the crown on his restoration to the throne; and almost his last injunction to the prince of Wales was that of fidelity to the national church. His present firmness, however, in its support was caused probably less by his devotion to it than by his desire to secure the failure of the whole treaty, and his attempts to escape naturally weakened the chances of success. Cromwell now supported the petitions of the army against the treaty. On the 16th of November the council of officers demanded the trial of the king, "the capital and grand author of our troubles," and on the 27th of November the parliamentary commissioners returned from Newport without having secured Charles's consent. Charles was removed to Hurst Castle on the 1st of December, where he remained till the 19th, thence being taken to Windsor, where he arrived on the 23rd. On the 6th "Pride's Purge" had removed from the Commons all those who might show any favour to the king. On the 25th a last attempt by the council of officers to come to terms with him was repulsed. On the 1st of January the remnant of the Commons resolved that Charles was guilty of treason by "levying war against the parliament and kingdom of England"; on the 4th they declared their own power to make laws without the lords or the sovereign,

and on the 6th established a "high court of justice" to try the king. On the 10th Charles was brought to St James's Palace, and on the next day his trial began in Westminster Hall, without the assistance of any of the judges, who all refused to take part in the proceedings. He laughed aloud at hearing himself called a traitor, and immediately demanded by what authority he was tried. He had been in treaty with the parliament in the Isle of Wight and taken thence by force; he saw no lords present. He was told by Bradshaw, the president of the court, that he was tried by the authority of the people of England, who had elected him king; Charles making the obvious reply that he was king by inheritance and not by election, that England had been for more than 1000 years an hereditary kingdom, and Bradshaw cutting short the discussion by adjourning the court. On the 22nd Charles repeated his reasoning, adding, "It is not my case alone; it is the freedom and liberty of the people of England, and do you pretend what you will, I stand more for their liberties, for if power without law may make laws . . . I do not know what subject he is in England that can be sure of his life or anything that he calls his own." On the 23rd he again refused to plead. The court was adjourned, and there were several signs that the army in their prosecution of the king had not the notion at their back. While the soldiers had shouted "Justice! justice!" as the king passed through their ranks, the civilian spectators from the end of the hall had cried "God save the king!" There was considerable opposition and reluctance to proceed among the members of the court. On the 26th, however, the court decided unanimously upon his execution, and on the 27th Charles was brought into court for the last time to hear his sentence. His request to be heard before the Lords and Commons was rejected, and his attempts to answer the charges of the president were silenced. Sentence was pronounced, and the king was removed by the soldiers, uttering his last broken protest: "I am not suffered to speak. Expect what justice other people will have."

In these last hours Charles, who was probably weary of life, showed a remarkable dignity and self-possession, and a firm resignation supported by religious faith and by the absolute conviction of his own innocence, which, says Burnet, "amazed all people and that so much the more because it was not natural to him. It was imputed to a very extraordinary measure of supernatural assistance . . . ; it was owing to something within himself that he went through so many indignities with so much true greatness without disorder or any sort of affectation." Nothing in his life became Charles like the leaving it. "He nothing common did or mean Upon that memorable scene." On the morning of the 29th of January he said his last adieu to his younger children, Elizabeth and Henry, duke of Gloucester. On the 30th at ten o'clock he walked across from St James's to Whitehall, calling on his guard "in a pleasant manner" to walk apace, and at two he stepped upon the scaffold from a window, probably the middle one, of the Banqueting House (see ARCHITECTURE, Plate VI., fig. 75). He was separated from the people by large ranks of soldiers, and his last speech only reached Juxon and those with him on the scaffold. He declared that he had desired the liberty and freedom of the people as much as any; "but I must tell you that their liberty and freedom consists in having government. . . . It is not their having a share in the government; that is nothing appertaining unto them. A subject and a sovereign are clean different things." These, together with his declaration that he died a member of the Church of England, and the mysterious "Remember," spoken to Juxon, were Charles's last words. "It much discontented the citizens," wrote a spectator; "ye manner of his deportment was very resolutely with some smiling countenances, intimating his willingness to be out of his troubles."<sup>1</sup> "The blow I saw given," wrote another, Philip Henry, "and can truly say with a sad heart, at the instant whereof, I remember well, there was such a groan by the Thousands then present as I never heard before and desire I may never hear again. There was according to

<sup>1</sup> *Notes and Queries*, 7th ser., viii. 326.

order one Troop immediately marching fromwards Charing-Cross to Westminster and another fromwards Westminster to Charing-Cross, purposely to masker" (i.e. to overpower) "the people and to disperse and scatter them, so that I had much ado amongst the rest to escape home without hurt."<sup>1</sup>

Amidst such scenes of violence was at last effected the destruction of Charles. "It is lawful," wrote Milton, "and hath been held so through all ages for any one who have the power to call to account a Tyrant or wicked King and after due conviction to depose and put him to death."<sup>2</sup> But here (it might well be contended) there had been no "due conviction." The execution had been the act of the king's personal enemies, of "only some fifty or sixty governing Englishmen with Oliver Cromwell in the midst of them" an act technically illegal, morally unjustifiable because the supposed crimes of Charles had been condoned by the later negotiations with him, and indefensible on the ground of public expediency, for the king's death proved a far greater obstacle to the re-establishment of settled government than his life could have been. The result was an extraordinary revulsion of feeling in favour of Charles and the monarchy, in which the incidents of his misgovernment were completely forgotten. He soon became in the popular veneration a martyr and a saint. His fate was compared with the Crucifixion, and his trials and sufferings to those of the Saviour. Handkerchiefs dipped in his blood wrought "miracles," and the *Eikon Basilike*, published on the day of his funeral, presented to the public a touching if not a genuine portrait of the unfortunate sovereign. At the Restoration the anniversary of his death was ordered to be kept as a day of fasting and humiliation, and the service appointed for use on the occasion was only removed from the prayer-book in 1859. The same conception of Charles as a martyr for religion appeals still to many, and has been stimulated by modern writers. "Had Charles been willing to abandon the church and give up episcopacy," says Bishop Creighton, "he might have saved his throne and his life. But on this point Charles stood firm, for this he died and by dying saved it for the future."<sup>3</sup> Gladstone, Keble, Newman write in the same strain. "It was for the Church," says Gladstone, "that Charles shed his blood upon the scaffold."<sup>4</sup> "I rest," says Newman, "or the scenes of past years, from the Upper Room in Acts to the Court of Carisbrooke and Uxbridge." The injustice and violence of the king's death, however, the pathetic dignity of his last days, and the many noble traits in his character, cannot blind us to the real causes of his downfall and destruction, and a sober judgment cannot allow that Charles was really a martyr either for the church or for the popular liberties.

The constitutional struggle between the crown and parliament had not been initiated by Charles I. It was in full existence in the reign of James I., and distinct traces appear towards the latter part of that of Elizabeth. Charles, therefore, in some degree inherited a situation for which he was not responsible, nor can he be justly blamed, according to the ideas of kingship which then prevailed, for defending the prerogatives of the crown as precious and sacred personal possessions which it was his duty to hand down intact to his successors. Neither will his persistence in refusing to yield up the control of the executive to the parliament or the army, or his zeal in defending the national church, be altogether censured. In the event the parliament proved quite incapable of governing, an army uncontrolled by the sovereign was shown to constitute a more grievous tyranny than Charles's most arbitrary rule, and the downfall of the church seen to make room only for a sectarian despotism as intolerable as the Laudian. The natural inference might be that both conceptions of government had much to support them, that they were bound sooner or later to come into collision, and that the actual individuals in the drama, including the king himself, were rather the victims of the greatness of events than real actors in the scene, still less the controllers of their own

and the national destiny. A closer insight, however, shows that biographical more than abstract historical elements determined the actual course and issue of the Rebellion. The great constitutional and religious points of dispute between the king and parliament, though doubtless involving principles vital to the national interests, would not alone have sufficed to destroy Charles. Monarchy was too much venerated, was too deeply rooted in the national life, to be hastily and easily extirpated; the perils of removing the foundation of all government, law and order were too obvious not to be shunned at almost all costs. Still less can the crowning tragedy of the king's death find its real explanation or justification in these disputes and antagonisms. The real cause was the complete discredit into which Charles had brought himself and the monarchy. The ordinary routine of daily life and of business cannot continue without some degree of mutual confidence between the individuals brought into contact, far less could relations be maintained by subjects with a king endowed with the enormous powers then attached to the kingship, and with whom agreements, promises, negotiations were merely subterfuges and prevarications. We have seen the series of unhappy falsehoods and deceptions which constituted Charles's statecraft, beginning with the fraud concerning the concessions to the Roman Catholics at his marriage, the evasions with which he met the Petition of Right, the abandonment of Strafford, the simultaneous negotiation with, and betrayal of, all parties. Strafford's reported words on hearing of his desertion by Charles, "Put not your trust in princes," re-echo through the whole of Charles's reign. It was the degradation and dishonour of the kingship, and the personal loss of credit which Charles suffered through these transactions—which never appear to have caused him a moment's regret or uneasiness, but the fatal consequences of which were seen only too clearly by men like Hyde and Falkland—that were the real causes of the rebellion and of the king's execution. The constitutional and religious grievances were the outward and visible sign of the corroding suspicions which slowly consumed the national loyalty. In themselves there was nothing incapable of settlement either through the spirit of union which existed between Elizabeth and her subjects, or by the principle of compromise which formed the basis of the constitutional settlement in 1688. The bond of union between his people and himself Charles had, however, early broken, and compromise is only possible between parties both of whom can acknowledge to some extent the force of the other's position, which can trust one another, and which are sincere in their endeavour to reach agreement. Thus on Charles himself chiefly falls the responsibility for the catastrophe.

His character and motives fill a large place in English history, but they have never been fully understood and possibly were largely due to physical causes. His weakness as a child was so extreme that his life was despaired of. He outgrew physical defects, and as a young man excelled in horsemanship and in the sports of the times, but always retained an impediment of speech. At the time of his accession his reserve and reticence were especially noticed. Buckingham was the only person who ever enjoyed his friendship, and after his death Charles placed entire confidence in no man. This isolation was the cause of an ignorance of men and of the world, and of an incapacity to appreciate the ideas, principles and motives of others, while it prepared at the same time a fertile soil for receiving those exalted conceptions of kingship, of divine right and prerogative, which came into vogue at this period, together with those exaggerated ideas of his own personal supremacy and importance to which minds not quite normal are always especially inclined. His character was marked by a weakness which shirked and postponed the settlement of difficulties, by a meanness and ingratitude even when dealing with his most devoted followers, by an obstinacy which only feigned compliance and by an untruthfulness which differed widely from his son's unblushing deceit, which found always some reservation or excuse, but which while more scrupulous was also more dangerous and insidious because employed continually as a principle of conduct. Yet Charles, in

spite of his failings, had many fine qualities. Clarendon, who was fully conscious of them, who does not venture to call him a good king, and allows that "his kingly virtues had some mixture and alloy that hindered them from shining in full lustre," declares that "he was if ever any, the most worthy of the title of an Honest Man, so great a lover of justice that no temptation could dispose him to a wrongful action except that it was disguised to him that he believed it just," "the worthiest of gentlemen, the best master, the best friend, the best husband, the best father and the best Christian that the age in which he lived produced." With all its deplorable mistakes and failings Charles I.'s reign belongs to a sphere infinitely superior to that of his unscrupulous, corrupt, selfish but more successful son. His private life was without a blemish. Immediately on his accession he had suppressed the disorder which had existed in the household of James I., and let it be known that whoever had business with him "must never approach him by backstairs or private doors."<sup>1</sup> He maintained a strict sobriety in food and dress. He had a fine artistic sense, and Milton reprehends him for having made Shakespeare "the closest companion of his solitudes." "Monsieur le Prince de Galles," wrote Rubens in 1625, "est le prince le plus amateur de la peinture qui soit au monde." He succeeded in bringing together during twenty years an unrivalled collection, of which a great part was dispersed at his death. He showed a noble insensibility to flattery. He was deeply and sincerely religious. He wished to do right, and was conscious of the purity of his motives. Those who came into contact with him, even the most bitter of his opponents, were impressed with his goodness. The great tragedy of his life, to be read in his well-known, dignified, but weak and unhappy features, and to be followed in his inexplicable and mysterious choice of baneful instruments, such as Rupert, Laud, Hamilton, Glamorgana, Henrietta Maria—all in their several ways working out his destruction—seems to have been inspired by a fateful insanity or infirmity of mind or will, recalling the great Greek dramas in which the poets depicted frenzied mortals rushing into their own destruction, impelled by the unseen and superior powers.

The king's body, after being embalmed, was buried by the few followers who remained with him to the last, hastily and without any funeral service, which was forbidden by the authorities, in the tomb of Henry VIII., in St George's Chapel, Windsor, where his coffin was identified and opened in 1813. An "account of what appeared" was published by Sir Henry Hallford, and a boase abstracted on the occasion was replaced in the vault by the prince of Wales (afterwards Edward VII.) in 1888. Charles I. left, besides three children who died in infancy, Charles (afterwards Charles II.); James (afterwards James II.); Henry, duke of Gloucester (1630-1660); Mary (1631-1660), who married William of Orange; Elizabeth (1635-1650); and Henrietta, duchess of Orleans (1644-1670).

**CHARLES II.** (1630-1685), king of Great Britain and Ireland, second son of Charles I. and Queen Henrietta Maria, was born on the 29th of May 1630 at St James's Palace, and was brought  
<sup>1</sup>Salveti's Corresp. in *Hist. MSS. Comm.* 11th Rep. app. pt. i. p. 6.

up under the care successively of the countess of Dorset, William Cavendish, duke of Newcastle, and the marquess of Hertford. He accompanied the king during the campaigns of the Civil War, and sat in the parliament at Oxford, but on the 4th of March 1645 he was sent by Charles I. to the west, accompanied by Hyde and others who formed his council. Owing, however, to the mutual jealousies and misconduct of Goring and Grenville, and the prince's own disregard and contempt of the council, his presence was in no way advantageous, and could not prevent the final overthrow of the king's forces in 1646. He retired (17th of February) to Pendennis Castle at Falmouth, and on the approach of Fairfax (2nd of March) to Scilly, where he remained with Hyde till the 16th of April. Thence he fled to Jersey, and finally refusing all the overtures from the parliament, and in opposition to the counsels of Hyde, who desired the prince to remain on English territory, he repaired to the queen at Paris, where he remained for two years. He is described at this time by Mme de Motteville as "well-made, with a swarthy complexion agreeing well with his fine black eyes, a large ugly mouth, a graceful and dignified carriage and a fine figure"; and according to the description circulated later for his capture after the battle of Worcester, he was over six feet tall. He received instruction in mathematics from Hobbes, and was early initiated into all the vices of the age by Buckingham and Percy. In July 1648 the prince joined the royalist fleet and blockaded the Thames with a fleet of eleven ships, returning to Holland, where he received the news of the final royalist defeats and afterwards of the execution of his father. On the 14th of January 1649 he had forwarded to the council a signed *carte blanche*, granting any conditions provided his father's life were spared. He immediately assumed the title of king, and was proclaimed in Scotland (5th of February) and in some parts of Ireland. On the 17th of September, after a visit to his mother at St Germain, Charles went to Jersey and issued a declaration proclaiming his rights; but, owing to the arrival of the fleet at Portsmouth, he was obliged, on the 13th of February 1650, to return again to Breda. The projected invasion of Ireland was delayed through want of funds till it was too late; Hyde's mission to Spain, in the midst of Cromwell's successes, brought no assistance, and Charles now turned to Scotland for aid. Employing the same unscrupulous and treacherous methods which had proved so fatal to his father, he simultaneously supported and encouraged the expedition of Montrose and the royalists, and negotiated with the covenanters. On the 1st of May he signed the first draft of a treaty at Breda with the latter, in which he accepted the Solemn League and Covenant, conceded the control of public and church affairs to the parliament and the kirk, and undertook to establish Presbyterianism in the three kingdoms. He also signed privately a paper repudiating Ormonde and the loyal Irish, and recalling the commissions granted to them. In acting thus he did not scruple to desert his own royalist followers, and to repudiate and abandon the great and noble Montrose, whose heroic efforts he was apparently merely using in order to extort better terms from the covenanters, and who, having been captured on the 4th of May, was executed on the 21st in spite of some attempts by Charles to procure for him an indemnity.

Thus perjured and disgraced the young king embarked for Scotland on the 2nd of June; on the 11th when off Heilgoland he signed the treaty, and on the 23rd, on his arrival at Spey mouth, before landing, he swore to both the covenants. He proceeded to Falkland near Perth and passed through Aberdeen, where he saw the mutilated arm of Montrose suspended over the city gate. He was compelled to dismiss all his followers except Buckingham, and to submit to interminable sermons, which generally contained violent invectives against his parents and himself. To Argyll he promised the payment of £10,000 at his restoration, doubtless the sum owing as arrears of the Scottish army unpaid when Charles I. was surrendered to the English at Newcastle, and entered into negotiations for marrying his daughter. In August he was forced to sign a further declaration, confessing his own wickedness in dealing with the Irish, his father's blood-guiltiness, his mother's idolatry, and his abhorrence

of prelacy, besides ratifying his allegiance to the covenants and to Presbyterianism. At the same time he declared himself secretly to King, dean of Tuam, "a true child of the Church of England," "a true Cavalier," and avowed that "what concerns Ireland is in no ways binding"; while to the Roman Catholics in England he promised concessions and expressed his goodwill towards their church to Pope Innocent X. His attempt, called "The Start," on the 4th of October 1650, to escape from the faction at Perth and to join Huntly and the royalists in the north failed, and he was overtaken and compelled to return. On the 1st of January 1651 he was crowned at Scone, when he was forced to repeat his oaths to both the covenants.

Meanwhile Cromwell had advanced and had defeated the Presbyterians at Dunbar on the 3rd of September 1650, subsequently occupying Edinburgh. This defeat was not wholly unwelcome to Charles in the circumstances; in the following summer, during Cromwell's advance to the north, he shook off the Presbyterian influence, and on the 31st of July 1651 marched south into England with an army of about 10,000 commanded by David Leslie. He was proclaimed king at Carlisle, joined by the earl of Derby in Lancashire, evaded the troops of Lambert and Harrison in Cheshire, marched through Shropshire, meeting with a rebuff at Shrewsbury, and entered Worcester with a small, tired and dispirited force of only 16,000 men (22nd of August). Here the decisive battle, which ruined his hopes, and in which Charles distinguished himself by conspicuous courage and fortitude, was fought on the 3rd of September. After leading an unsuccessful cavalry charge against the enemy he fled, about 6 P.M., accompanied by Buckingham, Derby, Wilmot, Lauderdale and others, towards Kidderminster, taking refuge at White-ladies, about 25 m. from Worcester, where he separated himself from all his followers except Wilmot, concealing himself in the famous oak during the 6th of September, moving subsequently to Boscobel, to Moseley and Bentley Hall, and thence, disguised as Miss Lane's attendant, to Abbots Leigh near Bristol, to Trent in Somersetshire, and finally to the George Inn at Brighton, having been recognized during the forty-one days of his wanderings by about fifty persons, none of whom, in spite of the reward of £1,000 offered for his capture, or of the death penalty threatened for aiding his concealment, had betrayed him.

He set sail from Shoreham on the 15th of October 1651, and landed at Fécamp in Normandy the next day. He resided at Paris at St Germain till June 1654, in inactivity, unable to make any further effort, and living with difficulty on a grant from Louis XIV. of 600 livres a month. Various missions to foreign powers met with failure; he was excluded from Holland by the treaty made with England in April 1654, and he anticipated his expulsion from France, owing to the new relations of friendship established with Cromwell, by quitting the country in July. He visited his sister, the princess of Orange, at Spa, and went to Aix-la-Chapelle, thence finally proceeding in November to Cologne, where he was hospitably received. The conclusion of Cromwell's treaty with France in October 1655, and the war between England and Spain, gave hope of aid from the latter power. In April 1656 Charles went to Bruges, and on the 7th of February 1658 to Brussels, where he signed a treaty with Don John of Austria, governor of the Spanish Netherlands, by which he received an allowance in place of his French pension and undertook to assemble all his subjects in France in aid of the Spanish against the French. This plan, however, came to nothing; projected risings in England were betrayed, and by the capture of Dunkirk in June 1658, after the battle of the Dunes, by the French and Cromwell's Ironsides, the Spanish cause in Flanders was ruined.

As long as Cromwell lived there appeared little hope of the restoration of the monarchy, and Charles and Hyde had been aware of the plots for his assassination, which had aroused no disapproval. By the protector's death on the 3rd of September 1658 the scene was wholly changed, and amidst the consequent confusion of factions the cry for the restoration of the monarchy grew daily in strength. The premature royalist rising, however, in August 1659 was defeated, and Charles, who had awaited

the result on the coast of Brittany, proceeded to Fuenterrabia on the Spanish frontier, where Mazarin and Luis de Haro were negotiating the treaty of the Pyrenees, to induce both powers to support his cause; but the failure of the attempt in England ensured the rejection of his request, and he returned to Brussels in December, visiting his mother at Paris on the way. Events had meanwhile developed fast in favour of a restoration. Charles, by Hyde's advice, had not interfered in the movement, and had avoided inconvenient concessions to the various factions by referring all to a "free parliament." He left Brussels for Breda, and issued in April 1660, together with the letters to the council, the officers of the army and the houses of parliament and the city, the declaration of an amnesty for all except those specially excluded afterwards by parliament, which referred to parliament the settlement of estates and promised a liberty to tender consciences in matters of religion not contrary to the peace of the kingdom.

On the 8th of May Charles II. was proclaimed king in Westminster Hall and elsewhere in London. On the 24th he sailed from the Hague, landing on the 26th at Dover, where he was met by Monk, whom he saluted as father, and by the mayor, from whom he accepted a "very rich bible," "the thing that he loved above all things in the world." He reached London on the 29th, his thirtieth birthday, arriving with the procession, amidst general rejoicings and "through a lane of happy faces," at seven in the evening at Whitehall, where the houses of parliament awaited his coming, to offer in the name of the nation their congratulations and allegiance.

No event in the history of England had been attended with more lively and general rejoicing than Charles's restoration, and none was destined to cause greater subsequent disappointment and disillusion. Indolent, sensual and dissipated by nature, Charles's vices had greatly increased during his exile abroad, and were now, with the great turn of fortune which gave him full opportunity to indulge them, to surpass all the bounds of decency and control. A long residence till the age of thirty abroad, together with his French blood, had made him politically more of a foreigner than an Englishman, and he returned to England ignorant of the English constitution, a Roman Catholic and a secret adversary of the national religion, and untouched by the sentiment of England's greatness or of patriotism. Pure selfishness was the basis of his policy both in domestic and foreign affairs. Abroad the great national interests were eagerly sacrificed for the sake of a pension, and at home his personal ease and pleasure alone decided every measure, and the fate of every minister and subject. During his exile he had surrounded himself with young men of the same spirit as himself, such as Buckingham and Bennet, who, without having any claim to statesmanship, inattentive to business, neglectful of the national interests and national prejudices, became Charles's chief advisers. With them, as with their master, public office was only desirable as a means of procuring enjoyment, for which an absolute monarchy provided the most favourable conditions. Such persons were now, accordingly, destined to supplant the older and responsible ministers of the type of Clarendon and Ormonde, men of high character and patriotism, who followed definite lines of policy, while at the same time the younger men of ability and standing were shut out from office.

The first period of Charles II.'s reign (1660-1667) was that of the administration of Lord Clarendon, the principal author of the Restoration settlement. The king was granted the large revenue of £1,300,000. The naval and military forces were disbanded, but Charles managed to retain under the name of guards three regiments, which remained the nucleus of a standing army. The settlement of estates on a legal basis provided ill for a large number of the king's adherents who had impoverished themselves in his cause. The king's honour was directly involved in their compensation and, except for the gratification of a few individuals, was tarnished by his neglect to afford them relief. Charles used his influence to carry through parliament the act of indemnity, and the execution of some of the regicides was a measure not more severe than was to be expected in the times and circumstances;

but that of Sir Henry Vane, who was not a regicide and whose life Charles had promised the parliament to spare in case of his condemnation, was brought about by Charles's personal insistence in revenge for the victim's high bearing during his trial, and was an act of gross cruelty and perfidy. Charles was in favour of religious toleration, and a declaration issued by him in October 1660 aroused great hopes; but he made little effort to conciliate the Presbyterians or to effect a settlement through the Savoy conference, and his real object was to gain power over all the factions and to free his co-religionists, the Roman Catholics, in favour of whom he issued his first declaration of indulgence (26th of December 1662), the bill to give effect to it being opposed by Clarendon and defeated in the Lords, and being replied to by the passing of further acts against religious liberty. Meanwhile the plot of Venner and of the Fifth Monarchy men had been suppressed in January 1661, and the king was crowned on the 23rd of April. The convention parliament had been dissolved on the 29th of December 1660, and Charles's first parliament, the Long Parliament of the Restoration, which met on the 8th of May 1661 and continued till January 1679, declared the command of the forces inherent in the crown, repudiated the taking up of arms against the king, and repealed in 1664 the Triennial Act, adding only a provision that there should not be intermission of parliaments for more than three years. In Ireland the church was re-established, and a new settlement of land introduced by the Act of Settlement 1661 and the Act of Explanation 1665. The island was excluded from the benefit of the Navigation Laws, and in 1666 the importation of cattle and horses into England was forbidden. In Scotland episcopacy was set up, the covenant to which Charles had taken so many solemn oaths burnt by the common hangman, and Argyll brought to the scaffold, while the kingdom was given over to the savage and corrupt administration of Lauderdale. On the 21st of May 1662, in pursuance of the pro-French and anti-Spanish policy, Charles married Catherine of Braganza, daughter of John IV. of Portugal, by which alliance England obtained Tangier and Bombay. She brought him no children, and her attractions for Charles were inferior to those of his mistress, Lady Castlemaine, whom she was compelled to receive as a lady of her bedchamber. In February 1665 the ill-omened war with Holland was declared, during the progress of which it became apparent how greatly the condition of the national services and the state of administration had deteriorated since the Commonwealth, and to what extent England was isolated and abandoned abroad, Michael de Ruyter, on the 13th of June 1667, carrying out his celebrated attack on Chatham and burning several warships. The disgrace was unprecedented. Charles did not show himself and it was reported that he had abdicated, but to allay the popular panic it was given out "that he was very cheerful that night at supper with his mistresses." The treaty of Breda with Holland (21st of July 1667) removed the danger, but not the ignominy, and Charles showed the real baseness of his character when he joined in the popular outcry against Clarendon, the upright and devoted adherent of his father and himself during twenty-five years of misfortune, and drove him into poverty and exile in his old age, recalling ominously Charles I.'s betrayal of Strafford.

To Clarendon now succeeded the ministry of Buckingham and Arlington, who with Lauderdale, Ashley (afterwards Lord Shaftesbury) and Clifford, constituted the so-called Cabal ministry in 1672. With these advisers Charles entered into those schemes so antagonistic to the national interests which have disgraced his reign. His plan was to render himself independent of parliament and of the nation by hindering himself to France and the French policy of aggrandizement, and receiving a French pension with the secret intention as well of introducing the Roman Catholic religion again into England. In 1661 under Clarendon's rule, the evil precedent had been admitted of receiving money from France, in 1662 Dunkirk had been sold to Louis, and in February 1667, during the Dutch war a secret alliance had been made with Louis, Charles promising him a free hand in the Netherlands and Louis undertaking to support Charles's designs "in or out of the kingdom." In January 1668 Sir W. Temple had made with Sweden and Holland the Triple Alliance against

the encroachments and aggrandizement of France, but this national policy was soon upset by the king's own secret plans. In 1668 the conversion of his brother James to Romanism became known to Charles. Already in 1662 the king had sent Sir Richard Bellings to Rome to arrange the terms of England's conversion, and now in 1668 he was in correspondence with Oliva, the general of the Jesuits in Rome, through James de la Cloche, the eldest of his natural sons, of whom he had become the father when scarcely sixteen during his residence at Jersey. On the 15th of January 1669, at a secret meeting between the two royal brothers, with Arlington, Clifford and Arundell of Wardour, it was determined to announce to Louis XIV. the projected conversion of Charles and the realm, and subsequent negotiations terminated in the two secret treaties of Dover. The first, signed only, among the ministers, by Arlington and Clifford, the rest not being initiated, on the 20th of May 1670, provided for the return of England to Rome and the joint attack of France and England upon Holland, England's ally, together with Charles's support of the Bourbon claims to the throne of Spain, while Charles received a pension of £200,000 a year. In the second, signed by Arlington, Buckingham, Lauderdale and Ashley on the 31st of December 1670, nothing was said about the conversion, and the pension provided for that purpose was added to the military subsidy, neither of these treaties being communicated to parliament or to the nation. An immediate gain to Charles was the acquisition of another mistress in the person of Louise de K roualle, the so-called "Madam Carwell," who had accompanied the duchess of Orleans, the king's sister, to Dover, at the time of the negotiations, and who joined Charles's seraglio, being created duchess of Portsmouth, and acting as the agent of the French alliance throughout the reign.

On the 24th of October 1670, at the very time that these treaties were in progress, Charles opened parliament and obtained a vote of £800,000 on the plea of supporting the Triple Alliance. Parliament was prorogued in April 1671, not assembling again till February 1673, and on the 2nd of January 1672 was announced the "stop of the exchequer," or national bankruptcy, one of the most blameworthy and unscrupulous acts of the reign, by which the payments from the exchequer ceased, and large numbers of persons who had lent to the government were thus ruined. On the reassembling of parliament on the 4th of February 1673 a strong opposition was shown to the Cabal ministry which had been constituted at the end of 1672. The Dutch War, declared on the 17th of March 1672, though the commercial and naval jealousies of Holland had certainly not disappeared in England, was unpopular because of the alliance with France and the attack upon Protestantism, while the king's second declaration of indulgence (15th of March 1672) aroused still further antagonism, was declared illegal by the parliament, and was followed up by the Test Act, which obliged James and Clifford to resign their offices. In February 1674 the war with Holland was closed by the treaty of London, or of Westminster, though Charles still gave Louis a free hand in his aggressive policy towards the Netherlands, and the Cabal was driven from office. Danby (afterwards duke of Leeds) now became chief minister; but, though in reality a strong supporter of the national policy, he could not hope to keep his place without acquiescence in the king's schemes. In November 1675 Charles again prorogued parliament, and did not summon it again till February 1677, when it was almost immediately prorogued. On the 17th of February 1676, with Danby's knowledge, Charles concluded a further treaty with Louis by which he undertook to subordinate entirely his foreign policy to that of France, and received an annual pension of £100,000. On the other hand, Danby succeeded in effecting the marriage (4th of November 1677) between William of Orange and the princess Mary, which proved the most important political event in the whole reign. Louis revenged himself by intriguing with the Opposition and by turning his streams of gold in that direction, and a further treaty with France for the annual payment to Charles of £300,000 and the dismissal of his parliament, concluded on the 17th of May 1678, was not executed. Louis made peace with Holland

at Nijmegen on the 10th of August, and punished Danby by disclosing his secret negotiations, thus causing the minister's fall and impeachment. To save Danby Charles now prorogued the parliament on the 30th of December, dissolving it on the 24th of January 1679.

Meanwhile the "Popish Plot," the creation of a band of impostors encouraged by Shaftesbury and the most violent and unscrupulous of the extreme Protestant party in order to exclude James from the throne, had thrown the whole country into a panic. Charles's conduct in this conjuncture was highly characteristic and was marked by his usual cynical selfishness. He carefully refrained from incurring suspicion and unpopularity by opposing the general outcry, and though he saw through the imposture from the beginning he made no attempt to moderate the popular frenzy or to save the life of any of the victims, his co-religionists, not even intervening in the case of Lord Stafford, and allowing Titus Oates to be lodged at Whitehall with a pension. His policy was to take advantage of the violence of the faction, to "give them line enough," to use his own words, to encourage it rather than repress it, with the expectation of procuring finally a strong royalist reaction. In his resistance to the great movement for the exclusion of James from the succession, Charles was aided by moderate men such as Halifax, who desired only a restriction of James's powers, and still more by the violence of the extreme exclusionists themselves, who headed by Shaftesbury brought about their own downfall and that of their cause by their support of the legitimacy and claims of Charles's natural son, the duke of Monmouth. In 1679 Charles denied, in council, his supposed marriage with Lucy Walter, Monmouth's mother, his declarations being published in 1680 to refute the legend of the black box which was supposed to contain the contract of marriage, and told Burnet he would rather see him hanged than legitimize him. He deprived him of his general's commission in consequence of his quasi-royal progresses about the country, and in December on Monmouth's return to England he was forbidden to appear at court. In February 1679 the king had consented to order James to go abroad, and even approved of the attempt of the primate and the bishop of Winchester to convert him to Protestantism. To weaken the opposition to his government Charles accepted Sir W. Temple's new scheme of governing by a council which included the leaders of the Opposition, and which might have become a rival to the parliament, but this was an immediate failure. In May 1679 he prorogued the new parliament which had attained Danby, and in July dissolved it, while in October he prorogued another parliament of the same mind till January and finally till October 1680, having resolved "to wait till this violence should wear off." He even made overtures to Shaftesbury in November 1679, but the latter insisted on the departure of both the queen and James. All attempts at compromise failed, and on the assembling of the parliament in October 1680 the Exclusion Bill passed the Commons, being, however, thrown out in the Lords through the influence of Halifax. Charles dissolved the parliament in January 1681, declaring that he would never give his consent to the Exclusion Bill, and summoned another at Oxford, which met there on the 21st of March 1681, Shaftesbury's faction arriving accompanied by armed bands. Charles expressed his willingness to consent to the handing over of the administration to the control of a Protestant, in the case of a Roman Catholic sovereign, but the Opposition insisted on Charles's nomination of Monmouth as his successor, and the parliament was accordingly once more (28th of March) dissolved by Charles, while a royal proclamation ordered to be read in all the churches proclaimed the ill-deeds of the parliament and the king's affection for the Protestant religion.

Charles's tenacity and clever tact were now rewarded. A great popular reaction ensued in favour of the monarchy, and a large number of loyal addresses were sent in, most of them condemning the Exclusion Bill. Shaftesbury was imprisoned, and though the Middlesex jury threw out his indictment and he was liberated, he never recovered his power, and in October 1682 left England for ever. The Exclusion Bill and the limitation

of James's powers were no more heard of, and full liberty was granted to the king to pursue the retrograde and arbitrary policy to which his disposition naturally inclined. In Scotland James set up a tyrannical administration of the worst type. The royal enmity towards William of Orange was increased by a visit of the latter to England in July. No more parliaments were called, and Charles subsisted on his permanent revenue and his French pensions. He continued the policy of double-dealing and treachery, deceiving his ministers as at the treaty of Dover, by pretending to support Holland and Spain while he was secretly engaged to Louis to betray them. On the 22nd of March 1681 he entered into a compact with Louis whereby he undertook to desert his allies and offer no resistance to French aggressions. In August he joined with Spain and Holland in a manifesto against France, while secretly for a million livres he engaged himself to Louis, and in 1682 he proposed himself as arbitrator with the intention of treacherously handing over Luxemburg to France, an offer which was rejected owing to Spanish suspicions of collusion. In the event, Charles's duplicity enabled Louis to seize Strassburg in 1681 and Luxemburg in 1684. The government at home was carried on principally by Rochester, Sunderland and Godolphin, while Guilford was lord chancellor and Jeffreys lord chief justice. The laws against the Nonconformists were strictly enforced. In order to obtain servile parliaments and also obsequious juries, who with the co-operation of judges of the stamp of Jeffreys could be depended upon to carry out the wishes of the court, the borough charters were confiscated, the charter of the city of London being forfeited on the 12th of June 1683.

The popularity of Charles, now greatly increased, was raised to national enthusiasm by the discovery of the Rye House plot in 1683, said to be a scheme to assassinate Charles and James at an isolated house on the high road near Hoddesdon in Hertfordshire as they returned from Newmarket to London, among those implicated being Algernon Sidney, Lord Russell and Monmouth, the two former paying the death penalty and Monmouth being finally banished to the Hague. The administration became more and more despotic, and Tangier was abandoned in order to reduce expenses and to increase the forces at home for overawing opposition. The first preliminary steps were now taken for the reintroduction of the Roman Catholic religion. Danby and those confined on account of participation in the popish plot were liberated, and Titus Oates thrown into prison. A scheme was announced for withdrawing the control of the army in Ireland from Rochester, the lord-lieutenant, and placing it in the king's own hands, and the commission to which the king had delegated ecclesiastical patronage was revoked. In May 1684 the office of lord high admiral, in spite of the Test Act, was again given to James, who had now returned from Scotland. To all appearances the same policy afterwards pursued so recklessly and disastrously by James was now cautiously initiated by Charles, who, however, not being inspired by the same religious zeal as his brother, and not desiring "to go on his travels again," would probably have drawn back prudently before his throne was endangered. The developments of this movement were, however, now interrupted by the death of Charles after a short illness on the 6th of February 1685. He was buried on the 17th in Henry VII.'s chapel in Westminster Abbey with funeral ceremonies criticized by contemporaries as mean and wanting in respect, but the scantiness of which was probably owing to the fact that he had died a Roman Catholic.

On his death-bed Charles had at length declared himself an adherent of that religion and had received the last rites according to the Romanist usage. There appears to be no trustworthy record of his formal conversion, assigned to various times and various agencies. As a youth, says Clarendon, "the ill-bred familiarity of the Scotch divines had given him a distaste" for Presbyterianism, which he indeed declared "no religion for gentlemen," and the mean figure which the fallen national church made in exile repelled him at the same time that he was attracted by the "genteel part of the Catholic religion." With Charles religion was not the serious matter it was with James, and was largely regarded from the political aspect and from that

of ease and personal convenience. Presbyterianism constituted a dangerous encroachment on the royal prerogative; the national church and the cavalier party were indeed the natural supporters of the authority of the crown, but on the other hand they refused to countenance the dependence upon France; Roman Catholicism at that moment was the obvious medium of governing without parliaments, of French pensions and of reigning without trouble, and was naturally the faith of Charles's choice. Of the two papers in defence of the Roman Catholic religion in Charles's own hand, published by James, Halifax says "though neither his temper nor education made him very fit to be an author, yet in this case . . . he might write it all himself and yet not one word of it his own. . . ."

Of his amours and mistresses the same shrewd observer of human character, who was also well acquainted with the king, declares "that his inclinations to love were the effects of health and a good constitution with as little mixture of the *seraphic* part as ever man had. . . . I am apt to think his stayed as much' as any man's ever did in the *lower* region." His health was the one subject to which he gave unremitting attention, and his fine constitution and devotion to all kinds of sport and physical exercise kept off the effects of uncontrolled debauchery for thirty years. In later years the society of his mistresses seems to have been chiefly acceptable as a means to avoid business and petitioners, and in the case of the duchess of Portsmouth was the price paid for ease and the continuance of the French pensions. His ministers he never scrupled to sacrifice to his ease. The love of ease exercised an entire sovereignty in his thoughts. "The motive of his giving bounties was rather to make men less uneasy to him than more easy to themselves." He would rob his own treasury and take bribes to press a measure through the council. He had a natural affability, but too general to be much valued, and he was fickle and deceitful. Neither gratitude nor revenge moved him, and good or ill services left little impression on his mind. Halifax, however, concludes by desiring to moderate the roughness of his picture by emphasizing the excellence of his intellect and memory and his mechanical talent, by deprecating a too censorious judgment and by dwelling upon the disadvantages of his bringing up, the difficulties and temptations of his position, and on the fact that his vices were those common to human frailty. His capacity for king-craft, knowledge of the world, and easy address enabled him to surmount difficulties and dangers which would have proved fatal to his father or to his brother. "It was a common saying that he could send away a person better pleased at receiving nothing than those in the good king his father's time that had requests granted them,"<sup>1</sup> and his good-humoured tact and familiarity compensated for and concealed his ingratitude and perfidy and preserved his popularity. He had good taste in art and literature, was fond of chemistry and science, and the Royal Society was founded in his reign. According to Evelyn he was "débonnaire and easy of access, naturally kind-hearted and possessed an excellent temper," virtues which covered a multitude of sins.

These small traits of amiability, however, which pleased his contemporaries, cannot disguise for us the broad lines of Charles's career and character. How far the extraordinary corruption of private morals which has gained for the restoration period so unenviable a notoriety was owing to the king's own example of flagrant debauchery, how far to the natural reaction from an artificial Puritanism, is uncertain, but it is incontestable that Charles's cynical selfishness was the chief cause of the degradation of public life which marks his reign, and of the disgraceful and unscrupulous betrayal of the national interests which raised France to a threatening predominance and imperilled the very existence of Britain for generations. The reign of his predecessor Charles I., and even of that of his successor James II., with their mistaken principles and ideals, have a saving dignity wholly wanting in that of Charles II., and the administration of Cromwell, in spite of the popularity of the restoration, was soon regretted. "A lazy Prince," writes Pepys, "no Council, no money, no reputation at home or abroad. It is strange

<sup>1</sup> *Mem. of Thomas, earl of Ailesbury*, p. 95.

how . . . everybody do nowadays reflect upon Oliver and commend him, what brave things he did and made all the neighbour princes fear him; while here a prince, come in with all the love and prayers and good liking of his people . . . hath lost all so soon. . . ."

Charles II. had no children by his queen. By his numerous mistresses he had a large illegitimate progeny. By Barbara Villiers, Mrs Palmer, afterwards countess of Castlemaine and duchess of Cleveland, mistress *en titre* till she was superseded by the duchess of Portsmouth, he had Charles Fitzroy, duke of Southampton and Cleveland, Henry Fitzroy, duke of Grafton, George Fitzroy, duke of Northumberland, Anne, countess of Sussex, Charlotte, countess of Lichfield, and Barbara, a nun; by Louise de Kéroualle, duchess of Portsmouth, Charles Lennox, duke of Richmond; by Lucy Walter, James, duke of Monmouth and Buccleuch, and a daughter; by Nell Gwyn, Charles Beauclerk, duke of St Albans, and James Beauclerk; by Catherine Peg, Charles Fitz Charles, earl of Plymouth; by Lady Shannou, Charlotte, countess of Yarmouth; by Mary Davis, Mary Tudor, countess of Derwentwater.

**CHARLES I. and II.**, kings of France. By the French, Charles the Great, Roman emperor and king of the Franks, is reckoned the first of the series of French kings named Charles (see CHARLEMAGNE). Similarly the emperor Charles II. the Bald (*q.v.*) is reckoned as Charles II. of France. In some enumerations the emperor Charles III. the Fat (*q.v.*) is reckoned as Charles II. of France, Charlemagne not being included in the list, and Charles the Bald being styled Charles I.

**CHARLES III.**, the Simple (879-929), king of France, was a posthumous son of Louis the Stammerer and of his second wife Adelaide. On the deposition of Charles the Fat in 887 he was excluded from the throne by his youth; but during the reign of Odo, who had succeeded Charles, he succeeded in gaining the recognition of a certain number of notables and in securing his coronation at Reims on the 28th of January 893. He now obtained the alliance of the emperor, and forced Odo to cede part of Neustria. In 898, by the death of his rival (Jan. 1), he obtained possession of the whole kingdom. His most important act was the treaty of Saint-Clair-sur-Epte with the Normans in 911. Some of them were baptized; the territory which was afterwards known as the duchy of Normandy was ceded to them; but the story of the marriage of their chief Rollo with a sister of the king, related by the chronicler Dudo of Saint Quentin, is very doubtful. The same year Charles, on the invitation of the barons, took possession of the kingdom of Lotharinga. In 920 the barons, jealous of the growth of the royal authority and discontented with the favour shown by the king to his counsellor Hagano, rebelled, and in 922 elected Robert, brother of King Odo, in place of Charles. Robert was killed in the battle of

Soissons, but the victory remained with his party, who elected Rudolph, duke of Burgundy, king. In his extremity Charles trusted himself to Herbert, count of Vermandois, who deceived him, and threw him into confinement at Château-Thierry and afterwards at Péronne. In the latter town he died on the 7th of October 929. In 907 he had married Frederona, sister of Bovo, bishop of Chalons. After her death he married Eadgyfu (Odgiva), daughter of Edward the Elder, king of the English, who was the mother of Louis IV.

See A. Eckel, *Charles le Simple* (Paris, 1899).

**CHARLES IV.** (1294–1328), king of France, called **THE FAIR**, was the third and youngest son of Philip IV. and Jeanne of Navarre. In 1316 he was created count of La Marche, and succeeded his brother Philip V. as king of France and Navarre early in 1322. He followed the policy of his predecessors in enforcing the royal authority over the nobles, but the machinery of a centralized government strong enough to hold nobility in check increased the royal expenditure, to meet which Charles had recourse to doubtful financial expedients. At the beginning of his reign he ordered a recast of the coinage, with serious results to commerce; civil officials were deprived of offices, which had been conferred free, but were now put up to auction; duties were imposed on exported merchandise and on goods brought into Paris; the practice of exacting heavy fines was encouraged by making the salaries of the magistrates dependent on them; and on the pretext of a crusade to free Armenia from the Turks, Charles obtained from the pope a tithe levied on the clergy, the proceeds of which he kept for his own use; he also confiscated the property of the Lombard bankers who had been invited to France by his father at a time of financial crisis. The history of the assemblies summoned by Charles IV. is obscure, but in 1326, on the outbreak of war with England, an assembly of prelates and barons met at Meaux. Commissioners were afterwards despatched to the provinces to state the position of affairs and to receive complaints. The king justified his failure to summon the estates on the ground of the expense incurred by provincial deputies. The external politics of his reign were not marked by any striking events. He maintained excellent relations with Pope John XXII., who made overtures to him, indirectly, offering his support in case of his candidature for the imperial crown. Charles tried to form a party in Italy in support of the pope against the emperor Louis IV. of Bavaria, but failed. A treaty with the English which secured the district of Agneais for France was followed by a feudal war in Guienne. Isabella, Charles's sister and the wife of Edward II., was sent to France to negotiate, and with her brother's help arranged the final conspiracy against her husband. Charles's first wife was Blanche, daughter of Otto IV., count of Burgundy, and of Matilda (Mahaut), countess of Artois, to whom he was married in 1307. In May 1314, by order of King Philip IV., she was arrested and imprisoned in the Château-Gaillard with her sister-in-law Marguerite, daughter of Robert II., duke of Burgundy, and wife of Louis Hutin, on the charge of adultery with two gentlemen of the royal household, Philippe and Gautier d'Aunai. Jeanne, sister of Marguerite and wife of Philip the Tall, was also arrested for not having denounced the culprits, and imprisoned at Dourdan. The two knights were put to the torture and executed, and their goods confiscated. It is impossible to say how far the charges were true. Tradition has involved and obscured the story, which is the origin of the legend of the *tour de Nesle* made famous by the drama of A. Dumas the elder. Marguerite died shortly in prison; Jeanne was declared innocent by the parlement and returned to her husband. Blanche was still in prison when Charles became king. He induced Pope John XXII. to declare the marriage null, on the ground that Blanche's mother had been his godmother. Blanche died in 1326, still in confinement, though at the last in the abbey of Maubuisson.

In 1322, freed from his first marriage, Charles married his cousin Mary of Luxemburg, daughter of the emperor Henry VII., and upon her death, two years later, Jeanne, daughter of Louis, count of Evreux. Charles IV. died at Vincennes on the 1st of

February 1328. He left no issue by his first two wives to succeed him, and daughters only by Jeanne of Evreux. He was the last of the direct line of Capetians.

Hellot in *Mém. de la soc. de l'hist. de Paris* (xi., 1884, pp. 1-207).

**CHARLES V.** (1337–1380), king of France, called **THE WISE**, was born at the château of Vincennes on the 21st of January 1337, the son of John II. and Bonne of Luxemburg. In 1349 he became dauphin of the Viennois by purchase from Humbert II., and in 1355 he was created duke of Normandy. At the battle of Poitiers (1356) his father ordered him to leave the field when the battle turned against the French, and he was thus saved from the imprisonment that overtook his father. After arranging for the government of Normandy he proceeded to Paris, where he took the title of lieutenant of the kingdom. During the years of John II.'s imprisonment in England Charles was virtually king of France. He summoned the states-general of northern France (Langued'oil) to Paris in October 1356 to obtain men and money to carry on the war. But under the leadership of Étienne Marcel, provost of the Parisian merchants and president of the third estate, and Robert le Coq, bishop of Laon, president of the clergy, a partisan of Charles of Navarre, the states refused any "aid" except on conditions which Charles declined to accept. They demanded the dismissal of a number of the royal ministers; the establishment of a commission elected from the three estates to regulate the dauphin's administration, and of another board to act as council of war; also the release of Charles the Bad, king of Navarre, who had been imprisoned by King John. The estates of Languedoc, summoned to Toulouse, also made protests against misgovernment, but they agreed to raise a war-levy on terms to which the dauphin acceded. Charles sought the alliance of his uncle, the emperor Charles IV., to whom he did homage at Metz as dauphin of the Viennois, and he was also made imperial vicar of Dauphiné, thus acknowledging the imperial jurisdiction. But he gained small material advantage from these proceedings. The states-general were again convoked in February 1357. Their demands were more moderate than in the preceding year, but they nominated members to replace certain obnoxious persons on the royal council, demanded the right to assemble without the royal summons, and certain administrative reforms. In return they promised to raise and finance an army of 30,000 men, but the money—a tithe levied on the annual revenues of the clergy and nobility—voted for this object was not to pass through the dauphin's hands. Charles appeared to consent, but the agreement was annulled by letters from King John, announcing at the same time the conclusion of a two years' truce, and the reformers failed to secure their ends. Charles had escaped from their power by leaving Paris, but he returned for a new meeting of the estates in the autumn of 1357.

Meanwhile Charles of Navarre had been released by his partisans, and allying himself with Marcel had become a popular hero in Paris. The dauphin was obliged to receive him and to undergo an apparent reconciliation. In Paris Étienne Marcel was supreme. He forced his way into the dauphin's palace (February 1358), and Charles's servant, Jean de Conflans, marshal of Champagne, and Robert de Clermont, marshal of Normandy, were murdered before his eyes. Charles was powerless openly to resent these outrages, but he obtained from the provincial assemblies the money refused him by the states-general, and deferred his vengeance until the dissensions of his enemies should offer him an opportunity. Charles of Navarre, now in league with the English and master of lower Normandy and of the approaches to Paris, returned to the immediate neighbourhood of the city, and Marcel found himself driven to avowed co-operation with the dauphin's enemies, the English

and the Navarrese. Charles had been compelled in March to take the title of regent to prevent the possibility of further intervention from King John. In defiance of a recent ordinance prohibiting provincial assemblies, he presided over the estates of Picardy and Artois, and then over those of Champagne. The states-general of 1358 were summoned to Compiègne instead of Paris, and granted a large aid. The condition of northern France was rendered more desperate by the outbreak (May-June 1358) of the peasant revolt known as the Jacquerie, which was repressed with a barbarity far exceeding the excesses of the rebels. Within the walls of Paris Jean Maillart had formed a royalist party; Marcel was assassinated (31st July 1358), and the dauphin entered Paris in the following month. A reaction in Charles's favour had set in, and from the estates of 1359 he regained the authority he had lost. It was with their full concurrence that he restored their honours to the officials who had been dismissed by the estates of 1356 and 1357. They supported him in repudiating the treaty of London (1359), which King John had signed in anxiety for his personal freedom, and voted money unconditionally for the continuation of the war. From this time the estates were only once convoked by Charles, who contented himself thenceforward by appeals to the assembly of notables or to the provincial bodies. Charles of Navarre was now at open war with the regent; Edward III. landed at Calais in October; and a great part of the country was exposed to double depredations from the English and the Navarrese troops. In the scarcity of money Charles had recourse to the debasement of the coinage, which suffered no less than twenty-two variations in the two years before the treaty of Brétigny. This disastrous financial expedient was made good later, the coinage being established on a firm basis during the last sixteen years of Charles's reign in accordance with the principles of Nicolas Oresme. On the conclusion of peace King John was restored to France, but, being unable to raise his ransom, he returned in 1364 to England, where he died in April, leaving the crown to Charles, who was crowned at Reims on the 19th of May.

The new king found an able servant in Bertrand du Guesclin, who won a victory over the Navarrese troops at Cocherel and took prisoner their best general, Jean de Gailli, captal of Buch. The establishment of Charles's brother, Philip the Bold, in the duchy of Burgundy, though it constituted in the event a serious menace to the monarchy, put an end to the king of Navarre's ambitions in that direction. A treaty of peace between the two kings was signed in 1365, by which Charles of Navarre gave up Mantes, Meulan and the county of Longueville in exchange for Montpellier. Negotiations were renewed in 1370 when Charles of Navarre did homage for his French possessions, though he was then considering an offensive and defensive alliance with Edward III. Du Guesclin undertook to free France from the depredations of the "free companies," mercenary soldiers put out of employment by the cessation of the war. An attempt to send them on a crusade against the Turks failed, and Du Guesclin led them to Spain to put Henry of Trastámara on the throne of Castile. By the marriage of his brother Philip the Bold with Margaret of Flanders, Charles detached the Flemings from the English alliance, and as soon as he had restored something like order in the internal affairs of the kingdom he provoked a quarrel with the English. The text of the treaty of Brétigny presented technical difficulties of which Charles was not slow to avail himself. The English power in Guienne was weakened by the disastrous Spanish expedition of the Black Prince, whom Charles summoned before the parlement of Paris in January 1369 to answer the charges preferred against him by his subjects, thus expressly repudiating the English supremacy in Guienne. War was renewed in May after a meeting of the states-general. Between 1371 and 1373 Poitou and Saintonge were reconquered by Du Guesclin, and soon the English had to abandon all their territory north of the Garonne. John IV. of Brittany (Jean de Montfort) had won his duchy with English help by the defeat of Charles of Blois, the French nominee, at Auray in 1364. His sympathies remained English, but he was now (1373) obliged to take refuge in England, and

later in Flanders, while the English only retained a footing in two or three coast towns. Charles's generals avoided pitched battles, and contented themselves with defensive and guerrilla tactics, with the result that in 1380 only Bayonne, Bordeaux, Brest and Calais were still in English hands.

Charles had in 1378 obtained proof of Charles of Navarre's treasonable designs. He seized the Norman towns held by the Navarrese, while Henry of Trastámara invaded Navarre, and imposed conditions of peace which rendered his lifelong enemy at last powerless. A premature attempt to amalgamate the duchy of Brittany with the French crown failed. Charles summoned the duke to Paris in 1378, and on his non-appearance committed one of his rare errors of policy by confiscating his duchy. But the Bretons rose to defend their independence, and recalled their duke. The matter was still unsettled when Charles died at Vincennes on the 16th of September 1380. His health, always delicate, had been further weakened, according to popular report, by a slow poison prepared for him by the king of Navarre. His wife, Jeanne of Bourbon, died in 1378, and the succession devolved on their elder son Charles, a boy of twelve. Their younger son was Louis, duke of Orleans.

Personally Charles was no soldier. He owed the signal successes of his reign partly to his skillful choice of advisers and administrators, to his chancellors Jean and Guillaume de Dormans and Pierre d'Orgemont, to Hugues Aubriot, provost of Paris, Bureau de la Rivière and others; partly to a singular coolness and subtlety in the exercise of a not over-scrupulous diplomacy, which made him a dangerous enemy. He had learnt prudence and self-restraint in the troubled times of the regency, and did not lose his moderation in success. He modelled his private life on that of his predecessor Saint Louis, but was no fanatic in religion, for he refused his support to the violent methods of the Inquisition in southern France, and allowed the Jews to return to the country, at the same time confirming their privileges. His support of the schismatic pope Clement VII. at Avignon was doubtless due to political considerations, as favouring the independence of the Gallican church. Charles V. was a student of astrology, medicine, law and philosophy, and collected a large and valuable library at the Louvre. He gathered round him a group of distinguished writers and thinkers, among whom were Raoul de Presles, Philippe de Mézières, Nicolas Oresme and others. The ideas of these men were applied by him to the practical work of administration, though he confined himself chiefly to the consolidation and improvement of existing institutions. The power of the nobility was lessened by restrictions which, without prohibiting private wars, made them practically impossible. The feudal fortresses were regularly inspected by the central authority, and the nobles themselves became in many cases paid officers of the king. Charles established a merchant marine and a formidable navy, which under Jean de Vienne threatened the English coast between 1377 and 1380. The states-general were silenced and the royal prerogative increased; the royal domains were extended, and the wealth of the crown was augmented; additions were made to the revenue by the sale of municipal charters and patents; and taxation became heavier, since Charles set no limits to the gratification of his tastes either in the collection of jewels and precious objects, of books, or of his love of building, examples of which are the renovation of the Louvre and the erection of the palace of Saint Paul in Paris.

Vuitry, *Études sur le régime financier de la France*, vols. i. and ii. (1883); and R. Delachenal, *Histoire de Charles V.* (Paris, 1908).

**CHARLES VI.** (1368–1422), king of France, son of Charles V. and Jeanne of Bourbon, was born in Paris on the 3rd of December 1368. He received the appanage of Dauphiné at his birth, and was thus the first of the princes of France to bear the title of dauphin from infancy. Charles V. had entrusted his education to Philippe de Mézières, and had fixed his majority at fourteen. He succeeded to the throne in 1380, at the age of twelve, and the royal authority was divided between his paternal uncles, Louis, duke of Anjou, John, duke of Berry, Philip the Bold, duke of Burgundy, and his mother's brother, Louis II., duke of Bourbon. In accordance with an ordinance of the late king the duke of Anjou became regent, while the guardianship of the young king, together with the control of Paris and Normandy, passed to the dukes of Burgundy and Bourbon, who were to be assisted by certain of the councillors of Charles V. The duke of Berry, excluded by this arrangement, was compensated by the government of Languedoc and Guienne. Anjou held the regency for a few months only, until the king's coronation in November 1380. He enriched himself from the estate of Charles V. and by excessive exactions, before he set out in 1382 for Italy to effect the conquest of Naples. Considerable discontent existed in the south of France at the time of the death of Charles V., and when the duke of Anjou re-imposed certain taxes which the late king had remitted at the end of his reign, there were revolts at Puy and Montpellier. Paris, Rouen, the cities of Flanders, with Amiens, Orleans, Reims and other French towns, also rose (1382) in revolt against their masters. The *Mailloins*, as the Parisian insurgents were named from the weapon they used, gained the upper hand in Paris, and were able temporarily to make terms, but the commune of Rouen was abolished, and the *Tuchins*, as the marauders in Languedoc were called, were pitilessly hunted down. Charles VI. marched to the help of the count of Flanders against the insurgents headed by Philip van Artevelde, and gained a complete victory at Roosebeke (November 27th, 1382). Strengthened by this success the king, on his return to Paris in the following January, exacted vengeance on the citizens by fines, executions and the suppression of the privileges of the city. The help sent by the English to the Flemish cities resulted in a second Flemish campaign. In 1385 Jean de Vienne made an unsuccessful descent on the Scottish coast, and Charles equipped a fleet at Sluys for the invasion of England, but a series of delays ended in the destruction of the ships by the English.

In 1385 Charles VI. married Elizabeth, daughter of Stephen II., duke of Bavaria, her name being gallicized as Isabeau. Three years later, with the help of his brother, Louis of Orleans, duke of Touraine, he threw off the tutelage of his uncles, whom he replaced by Bureau de la Rivière and others among his father's counsellors, nicknamed by the royal princes the *marmousets* because of their humble origin. Two years later he deprived the duke of Berry of the government of Languedoc. The opening years of Charles VI.'s effective rule promised well, but excess in gaiety of all kinds undermined his constitution, and in 1392 he had an attack of madness at Le Mans, when on his way to Brittany to force from John V. the surrender of his cousin Pierre de Craon, who had tried to assassinate the constable Olivier de Clisson in the streets of Paris. Other attacks followed, and it became evident that Charles was unable permanently to sustain the royal authority. Clisson, Bureau de la Rivière, Jean de Mercier, and the other *marmousets* were driven from office, and the royal dukes regained their power. The rivalries between the most powerful of these—the duke of Burgundy, who during the king's attacks of madness practically ruled the country, and the duke of Orleans—were a constant menace to peace. In 1396 peace with England seemed assured by the marriage of Richard II. with Charles VI.'s daughter Isabella, but the Lancastrian revolution of 1399 destroyed the diplomatic advantages gained by this union. In France the country was disturbed by the papal schism. At an assembly of the clergy held in Paris in 1398 it was resolved to refuse to recognize the authority of Benedict XIII., who succeeded Clement VII. as schismatic pope at Avignon. The question became a party

one; Benedict was supported by Louis of Orleans, while Philip the Bold and the university of Paris opposed him. Obedience to Benedict's authority was resumed in 1403, only to be withdrawn again in 1408, when the king declared himself the guardian and protector of the French church, which was indeed for a time self-governing. Edicts further extending the royal power in ecclesiastical affairs were even issued in 1418, after the schism was at an end.

The king's intelligence became yearly feebler, and in 1404 the death of Philip the Bold aggravated the position of affairs. The new duke, John the Fearless, did not immediately replace his father in general affairs, and the influence of the duke of Orleans increased. Queen Isabeau, who had generally supported the Burgundian party, was now practically separated from her husband, whose madness had become pronounced. She was replaced by a young Burgundian lady, Odette de Champdivers, called by her contemporaries *la petite reine*, who rescued the king from the state of neglect into which he had fallen. Isabeau of Bavaria was freely accused of intrigue with the duke of Orleans. She was from time to time regent of France, and as her policy was directed by personal considerations and by her love of splendour she further added to the general distress. The relations between John the Fearless and the duke of Orleans became more embittered, and on the 23rd of November 1407 Orleans was murdered in the streets of Paris at the instigation of his rival. The young duke Charles of Orleans married the daughter of the Gascon count Bernard VII. of Armagnac, and presently formed alliances with the dukes of Berry, Bourbon and Brittany, and others who formed the party known as the Armagnacs (see ARMAGNAC), against the Burgundians who had gained the upper hand in the royal council. In 1411 John the Fearless contracted an alliance with Henry IV. of England, and civil war began in the autumn, but in 1412 the Armagnacs in their turn sought English aid, and, by promising the sovereignty of Aquitaine to the English king, gave John the opportunity of posing as defender of France. In Paris the Burgundians were hand in hand with the corporation of the butchers, who were the leaders of the Parisian populace. The malcontents, who took their name from one of their number, Cabochien, penetrated into the palace of the dauphin Louis, and demanded the surrender of the unpopular members of his household. A royal ordinance, promising reforms in administration, was promulgated on the 27th of May 1413, and some of the royal advisers were executed. The king and the dauphin, powerless in the hands of Duke John and the Parisians, appealed secretly to the Armagnac princes for deliverance. They entered Paris in September; the ordinance extracted by the Cabochiens was rescinded; and numbers of the insurgents were banished the city.

In the next year Henry V. of England, after concluding an alliance with Burgundy, resumed the pretensions of Edward III. to the crown of France, and in 1415 followed the disastrous battle of Agincourt. The two elder sons of Charles VI., Louis, duke of Guienne, and John, duke of Touraine, died in 1415 and 1417, and Charles, count of Ponthieu, became heir apparent. Paris was governed by Bernard of Armagnac, constable of France, who expelled all suspected of Burgundian sympathies and treated Paris like a conquered city. Queen Isabeau was imprisoned at Tours, but escaped to Burgundy. The capture of Paris by the Burgundians on the 29th of May 1418 was followed by a series of horrible massacres of the Armagnacs; and in July Duke John and Isabeau, who assumed the title of regent, entered Paris. Meanwhile Henry V. had completed the conquest of Normandy. The murder of John the Fearless in 1419 under the eyes of the dauphin Charles threw the Burgundians definitely into the arms of the English, and his successor Philip the Good, in concert with Queen Isabeau, concluded (1420) the treaty of Troyes with Henry V., who became master of France. Charles VII. had long been of no account in the government, and the state of neglect in which he existed at Senlis induced Henry V. to undertake the re-organization of his household. He came to Paris in September 1422, and died on the 21st of October.

The chief authorities for the reign of Charles VI. are:—*Chronica Caroli VI.*, written by a monk of Saint Denis, commissioned officially to write the history of his time, edited by C. Bellaguet with a French translation (6 vols., 1839–1852); Jean Juvénal des Ursins, *Chronique*, printed by D. Godefroy in *Histoire de Charles VI* (1653), chiefly an abridgment of the monk of St Denis's narrative; a fragment of the *Grandes Chroniques de Saint Denis* covering the years 1381 to 1383 (ed. J. Pichon 1864); correspondence of Charles VI. printed by Champollion-Figeac in *Lettres de rois*, vol. ii.; *Choix de pièces inédites sur le règne de Charles VI* (2 vols., 1865–1864), edited by L. Douët d'Arco for the Société de l'histoire de France; J. Froissart, *Chroniques*; Enguerrand de Monstrelet, *Chroniques*, covering the first half of the 15th century (Eng. trans., 4 vols., 1809); *Chronique des quatre premiers Valois*, by an unknown author, ed. S. Luce (1862). See also E. Lavisse, *Hist. de France*, iv. 267 seq.; E. Petit, "Séjours de Charles VI." *Bull. du com. des travaux hist.* (1893); Vallet de Viriville, "Isabeau de Bavière," *Revue française* (1858–1859); M. Thibaut, *Isabeau de Bavière* (1903).

**CHARLES VII.** (1403–1461), king of France, fifth son of Charles VI. and Isabeau of Bavaria, was born in Paris on the 22nd of February 1403. The count of Pontreue, as he was called in his boyhood, was betrothed in 1413 to Mary of Anjou, daughter of Louis II., duke of Anjou and king of Sicily, and spent the next two years at the Angevin court. He received the duchy of Touraine in 1416, and in the next year the death of his brother John made him dauphin of France. He became lieutenant-general of the kingdom in 1417, and made active efforts to combat the complaisance of his mother. He assumed the title of regent in December 1418, but his authority in northern France was paralysed in 1419 by the murder of John the Fearless, duke of Burgundy, in his presence at Montreue. Although the deed was not apparently premeditated, as the English and Burgundians declared, it ruined Charles's cause for the time. He was disinherited by the treaty of Troyes in 1420, and at the time of his father's death in 1422 had retired to Mehun-sur-Yèvre, near Bourges, which had been the nominal seat of government since 1418. He was recognized as king in Touraine, Berry and Poitou, in Languedoc and other provinces of southern France; but the English power in the north was presently increased by the provinces of Champagne and Maine, as the result of the victories of Crevant (1423) and Verneuil (1424). The Armagnac administrators who had been driven out of Paris by the duke of Bedford gathered round the young king, nicknamed the "king of Bourges," but he was weak in body and mind, and was under the domination of Jean Louvet and Tanguy du Chastel, the instigators of the murder of John the Fearless, and other discredited partisans. The power of these favourites was shaken by the influence of the queen's mother, Yolande of Aragon, duchess of Anjou. She sought the alliance of John V., duke of Brittany, who, however, vacillated throughout his life between the English and French alliance, concerned chiefly to maintain the independence of his duchy. His brother, Arthur of Brittany, earl of Richmond (comte de Richemont), was reconciled with the king, and became constable in 1425, with the avowed intention of making peace between Charles VII. and the duke of Burgundy. Richemont caused the assassination of Charles's favourites Pierre de Giac and Le Camus de Beaulieu, and imposed one of his own choosing, Georges de la Trémoille, an adventurer who rapidly usurped the constable's power. For five years (1427–1432) a private war between these two exhausted the Armagnac forces, and central France returned to anarchy.

Meanwhile Bedford had established settled government throughout the north of France, and in 1428 he advanced to the siege of Orleans. For the movement which was to lead to the deliverance of France from the English invaders, see **JOAN OF ARC**. The siege of Orleans was raised by her efforts on the 8th of May 1429, and two months later Charles VII. was crowned at Reims. Charles's intimate counsellors, La Trémoille and Regnault de Chartres, archbishop of Reims, saw their profits menaced by the triumphs of Joan of Arc, and accordingly the court put every difficulty in the way of her military career, and received the news of her capture before Compiègne (1430) with indifference. No measures were taken for her deliverance or her ransom, and Normandy and the Isle of France remained in English hands. Fifteen years of anarchy and civil war intervened

before peace was restored. Bands of armed men fighting for their own hand traversed the country, and in the ten years between 1434 and 1444 the provinces were terrorized by these *écourcheurs*, who, with the decline of discipline in the English army, were also recruited from the ranks of the invaders. The duke of Bedford died in 1435, and in the same year Philip the Good of Burgundy concluded a treaty with Charles VII. at Arras, after fruitless negotiations for an English treaty. From this time Charles's policy was strengthened. La Trémoille had been assassinated in 1433 by the constable's orders, with the connivance of Yolande of Aragon. For his former favourites were substituted energetic advisers, his brother-in-law Charles of Anjou, Dunois (the famous bastard of Orleans), Pierre de Brézé, Richemont and others. Richemont entered Paris on the 13th of April 1436, and in the next five years the finance of the country was re-established on a settled basis. Charles himself commanded the troops who captured Poitiers in 1441, and in the next year he made a successful expedition in the south.

Meanwhile the princes of the blood and the great nobles resented the ascendancy of counsellors and soldiers drawn from the smaller nobility and the *bourgeoisie*. They made a formidable league against the crown in 1440 which included Charles I., duke of Bourbon, John II., duke of Alençon, John IV. of Armagnac, and the dauphin, afterwards Louis XI. The revolt broke out in Poitou in 1440 and was known as the *Praguerie*. Charles VII. repressed the rising, and showed great skill with the rebel nobles, finally buying them over individually by considerable concessions. In 1444 a truce was concluded with England at Tours, and Charles proceeded to organize a regular army. The central authority was gradually made effective, and a definite system of payment, by removing the original cause of brigandage, and the establishment of a strict discipline learnt perhaps from the English troops, gradually stamped out the most serious of the many evils under which the country had suffered. Pierre Bessonneau, and the brothers Gaspard and Jean Bureau created a considerable force of artillery. Domestic troubles in their own country weakened the English in France. The conquest of Normandy was completed by the battle of Formigny (15th of April 1450). Guienne was conquered in 1451 by Dunois, but not subdued, and another expedition was necessary in 1453, when Talbot was defeated and slain at Castillon. Meanwhile in 1450 Charles VII. had resolved on the rehabilitation of Joan of Arc, thus rendering a tardy recognition of her services. This was granted in 1456 by the Holy See. The only foothold retained by the English on French ground was Calais. In its earlier stages the deliverance of France from the English had been the work of the people themselves. The change which made Charles take an active part in public affairs is said to have been largely due to the influence of Agnes Sorel, who became his mistress in 1444 and died in 1450. She was the first to play a public and political rôle as mistress of a king of France, and may be said to have established a tradition. Pierre de Brézé, who had had a large share in the repression of the Praguerie, obtained through her a dominating influence over the king, and he inspired the monarch himself and the whole administration with new vigour. Charles and René of Anjou retired from court, and the greater part of the members of the king's council were drawn from the bourgeois classes. The most famous of all these was Jacques Cœur (*q.v.*). It was by the zeal of these counsellors that Charles obtained the surname of "The Well-Served."

Charles VII. continued his father's general policy in church matters. He desired to lessen the power of the Holy See in France and to preserve as far as possible the liberties of the Gallican church. With the council of Constance (1414–1418) the great schism was practically healed. Charles, while careful to protest against its renewal, supported the anti-papal contentions of the French members of the council of Basel (1431–1449), and in 1438 he promulgated the Pragmatic Sanction at Bourges, by which the patronage of ecclesiastical benefices was removed from the Holy See, while certain interventions of the royal power were admitted. Bishops and abbots were to be elected, in accordance with ancient custom, by their clergy.

After the English had evacuated French territory Charles still had to cope with feudal revolt, and with the hostility of the dauphin, who was in open revolt in 1446, and for the next ten years ruled like an independent sovereign in Dauphiné. He took refuge in 1457 with Charles's most formidable enemy, Philip of Burgundy. Charles VII. nevertheless found means to prevent Philip from attaining his ambitions in Lorraine and in Germany. But the dauphin succeeded in embarrassing his father's policy at home and abroad, and had his own party in the court itself. Charles VII. died at Mehun-sur-Yèvre on the 22nd of July 1461. He believed that he was poisoned by his son, who cannot, however, be accused of anything more than an eager expectation of his death.

**AUTHORITIES.**—The history of the reign of Charles VII. has been written by two modern historians.—Vallet de Viriville, *Histoire de Charles VII. . . et de son époque* (Paris, 3 vols., 1862-1865), and G. du Fresne de Beaucourt, *Hist. de Charles VII* (Paris, 6 vols., 1881-1891). There is abundant contemporary material. The herald, Jacques le Bouvier or Berry (b. 1386), whose *Chroniques du feu roi Charles VII* was first printed in 1528 as the work of Alain Chartier, was an eye-witness of many of the events he described. His *Recouvrement de Normandie*, with other material on the same subject, was edited for the "Rolls" series (*Chronicles and Memorials*) by Joseph Stevenson in 1863. The *Histoire de Charles VII* by Jean Chartier, historiographer-royal from 1437, was included in the *Grandes Chroniques de Saint-Denis*, and was first printed under Chartier's name by Denis Godefroy, together with other contemporary narratives, in 1661. It was re-edited by Vallet de Viriville (Paris, 3 vols., 1858-1859). With these must be considered the Burgundian chroniclers Enguerrand de Monstrelet, whose chronicle (ed. L. Douët d'Arce; Paris, 6 vols., 1857-1862) covers the years 1400-1444, and Georges Chastellain, the existing fragments of whose chronicle are published in his *Œuvres* (ed. Kervyn de Lettenhove; Brussels, 8 vols., 1863-1866). For a detailed bibliography and an account of printed and MS. documents see du Fresne de Beaucourt, already cited, also A. Molinier, *Manuel de bibliographie historique*, iv. 240-306.

**CHARLES VIII.** (1470-1498), king of France, was the only son of Louis XI. During the whole of his childhood Charles lived far from his father at the château of Amboise, which was throughout his life his favourite residence. On the death of Louis XI. in 1483 Charles, a lad of thirteen, was of age, but was absolutely incapable of governing. Until 1492 he abandoned the government to his sister Anne of Beaujeu. In 1491 he married Anne, duchess of Brittany, who was already betrothed to Maximilian of Austria. Urged by his favourite, Étienne de Vesc, he then, at the age of twenty-two, threw off the yoke of the Beaujeus, and at the same time discarded their wise and able policy. But he was thoroughly worthless man with a weak and ill-balanced intellect. He had a romantic imagination and conceived vast projects. He proposed at first to claim the rights of the house of Anjou, to which Louis XI. had succeeded, on the kingdom of Naples, and to use this as a stepping-stone to the capture of Constantinople from the Turks and his own coronation as emperor of the East. He sacrificed everything to this adventurous policy, signed disastrous treaties to keep his hands free, and set out for Italy in 1494. The ceremonial side of the expedition being in his eyes the most important, he allowed himself to be intoxicated by his easy triumph and duped by the Italians. On the 12th of May 1495 he entered Naples in great pomp, clothed in the imperial insignia. A general coalition was, however, formed against him, and he was forced to return precipitately to France. It cannot be denied that he showed bravery at the battle of Fornovo (the 5th of July 1495). He was preparing a fresh expedition to Italy, when he died on the 8th of April 1498, from the results of an accident, at the château of Amboise.

See *Histoire de Charles VIII. roy de France*, by G. de Jaligny, André de la Vigne, &c., edited by Godefroy (Paris, 1684); De Cherrier, *Histoire de Charles VIII* (Paris, 1868); H. Fr. Delaborde, *Expédition de Charles VIII en Italie* (Paris, 1888). For a complete bibliography see H. Hauser, *Les Sources de l'histoire de France, 1494-1610*, vol. i. (Paris, 1906); and E. Lavisse, *Histoire de France*, vol. v. part i., by H. Lemonnier (Paris, 1903).

**CHARLES IX.** (1550-1574), king of France, was the third son of Henry II. and Catherine de' Medici. At first he bore the title of duke of Orleans. He became king in 1560 by the death of his brother Francis II., but as he was only ten years old the power

was in the hands of the queen-mother, Catherine. Charles seems to have been a youth of good parts, lively and agreeable, but he had a weak, passionate and fantastic nature. His education had spoiled him. He was left to his whims—even the strangest—and to his taste for violent exercises; and the excesses to which he gave himself up ruined his health. Proclaimed of age on the 17th of August 1563, he continued to be absorbed in his fantasies and his hunting, and submitted docilely to the authority of his mother. In 1570 he was married to Elizabeth of Austria, daughter of Maximilian II. It was about this time that he dreamed of making a figure in the world. The successes of his brother, the duke of Anjou, at Jarnac and Moncontour had already caused him some jealousy. When Coligny came to court, he received him very warmly, and seemed at first to accept the idea of an intervention in the Netherlands against the Spaniards. For the upshot of this adventure see the article ST BARTHOLOMEW, MASSACRE OF. Charles was in these circumstances no hypocrite, but weak, hesitating and ill-balanced. Moreover, the terrible events in which he had played a part transformed his character. He became melancholy, severe and taciturn. "It is feared," said the Venetian ambassador, "that he may become cruel." Undermined by fever, at the age of twenty he had the appearance of an old man, and night and day he was haunted with nightmares. He died on the 30th of May 1574. By his mistress, Marie Touchet, he had one son, Charles, duke of Angoulême. Charles IX. had a sincere love of letters, himself practised poetry, was the patron of Ronsard and the poets of the Pleiad, and granted privileges to the first academy founded by Antoine de Balf (afterwards the Académie du Palais). He left a work on hunting, *Traité de la chasse royale*, which was published in 1625, and reprinted in 1859.

**AUTHORITIES.**—The principal sources are the contemporary memoirs and chronicles of T. A. d'Aubigné, Brantôme, Castelnau, Haton, la Place, Montluc, la Noue, l'Estoile, Ste Foy, de Thou, Tavannes, &c.; the published correspondence of Catherine de' Medici, Marguerite de Valois, and the Venetian ambassadors; and *Calendars of State Papers*, &c. See also Abel Desjardins, *Charles IX., deux années de règne* (Paris, 1873); de la Ferrière, *Le XVI<sup>e</sup> siècle et les Valois* (Paris, 1879); H. Mariéjol, *La Réforme et la Ligue* (Paris, 1904), in vol. v. of the *Histoire de France*, by E. Lavisse, which contains a bibliography for the reign.

**CHARLES X.** (1757-1836), king of France from 1824 to 1830, was the fourth child of the dauphin, son of Louis XV. and of Marie Josephine of Saxony, and consequently brother of Louis XVI. He was known before his accession as Charles Philippe, count of Artois. At the age of sixteen he married Marie Thérèse of Savoy, sister-in-law of his brother, the count of Provence (Louis XVIII.). His youth was passed in scandalous dissipation, which drew upon himself and his coterie the detestation of the people of Paris. Although lacking military tastes, he joined the French army at the siege of Gibraltar in 1772, merely for distraction. In a few years he had incurred a debt of 56 million francs, a burden assumed by the impoverished state. Prior to the Revolution he took only a minor part in politics, but when it broke out he soon became, with the queen, the chief of the reactionary party at court. In July 1789 he left France, became leader of the *émigrés*, and visited several of the courts of Europe in the interest of the royalist cause. After the execution of Louis XVI. he received from his brother, the count of Provence, the title of lieutenant-general of the realm, and, on the death of Louis XVII., that of "Monsieur." In 1795 he attempted to aid the royalist rising of La Vendée, landing at the island of Yeu. But he refused to advance farther and to put himself resolutely at the head of his party, although warmly acclaimed by it, and courage failing him, he returned to England, settling first in London, then in Holywood Palace at Edinburgh and afterwards at Hartwell. There he remained until 1813, returning to France in February 1814, and entering Paris in April, in the track of the Allies.

During the reign of his brother, Louis XVIII., he was the leader of the ultra-royalists, the party of extreme reaction. On succeeding to the throne in September 1824 the dignity of his address and his affable condescension won him a passing popularity. But his coronation at Reims, with all the gorgeous

ceremonial of the old régime, proclaimed his intention of ruling, as the Most Christian King, by divine right. His first acts, indeed, allayed the worst alarms of the Liberals; but it was soon apparent that the weight of the crown would be consistently thrown into the scale of the reactionary forces. The *émigrés* were awarded a milliard as compensation for their confiscated lands; and Gallicans and Liberals alike were offended by measures which threw increased power into the hands of the Jesuits and Ultramontanes. In a few months there were disquieting signs of the growing unpopularity of the king. The royal princesses were insulted in the streets; and on the 20th of April 1825 Charles, when reviewing the National Guard, was met with cries from the ranks of "Down with the ministers!" His reply was, next day, a decree disbanding the citizen army.

It was not till 1829, when the result of the elections had proved the futility of Villèle's policy of repression, that Charles consented unwillingly to try a policy of compromise. It was, however, too late. Villèle's successor was the vicomte de Martignac, who took Decazes for his model; and in the speech from the throne Charles declared that the happiness of France depended on "the sincere union of the royal authority with the liberties consecrated by the charter." But Charles had none of the patience and common-sense which had enabled Louis XVIII. to play with decency the part of a constitutional king. "I would rather hew wood," he exclaimed, "than be a king under the conditions of the king of England"; and when the Liberal opposition obstructed all the measures proposed by a ministry not selected from the parliamentary majority, he lost patience. "I told you," he said, "that there was no coming to terms with these men." Martignac was dismissed; and Prince Jules de Polignac, the very incarnation of clericalism and reaction, was called to the helm of state.

The inevitable result was obvious to all the world. "There is no such thing as political experience," wrote Wellington, certainly no friend of Liberalism; "with the warning of James II. before him, Charles X. was setting up a government by priests, through priests, for priests." A formidable agitation sprang up in France, which only served to make the king more obstinate. In opening the session of 1830 he declared that he would "find the power" to overcome the obstacles placed in his path by "culpable manoeuvres." The reply of the chambers was a protest against "the unjust distrust of the sentiment and reason of France"; whereupon they were first prorogued, and on the 16th of May dissolved. The result of the new elections was what might have been foreseen: a large increase in the Opposition; and Charles, on the advice of his ministers, determined on a virtual suspension of the constitution. On the 25th of July were issued the famous "four ordinances" which were the immediate cause of the revolution that followed.

With singular fatuity Charles had taken no precautions in view of a violent outbreak. Marshal Marmont, who commanded the scattered troops in Paris, had received no orders, beyond a jesting command from the duke of Angoulême to place them under arms "as some windows might be broken." At the beginning of the revolution Charles was at St Cloud, whence on the news of the fighting he withdrew first to Versailles and then to Rambouillet. So little did he understand the seriousness of the situation that, when the laconic message "All is over!" was brought to him, he believed that the insurrection had been suppressed. On realizing the truth he hastily abdicated in favour of his grandson, the duke of Bordeaux (comte de Chambord), and appointed Louis Philippe, duke of Orleans, lieutenant-general of the kingdom (July 30th). But, on the news of Louis Philippe's acceptance of the crown, he gave up the contest and began a dignified retreat to the sea-coast, followed by his suite, and surrounded by the infantry, cavalry and artillery of the guard. Beyond sending a corps of observation to follow his movements, the new government did nothing to arrest his escape. At Maintenon Charles took leave of the bulk of his troops, and proceeding with an escort of some 1200 men to Cherbourg, took ship there for England on the 16th of August. For a time he returned to Holyrood Palace at Edinburgh, which was again placed at his dis-

posal. He died at Goritz, whither he had gone for his health, on the 6th of November 1836.

The best that can be said of Charles X. is that, if he did not know how to rule, he knew how to cease to rule. The dignity of his exit was more worthy of the ancient splendour of the royal house of France than the theatrical humility of Louis Philippe's entrance. But Charles was an impossible monarch for the 19th century, or perhaps for any other century. He was a typical Bourbon, unable either to learn or to forget; and the closing years of his life he spent in religious austerities, intended to expiate, not his failure to grasp a great opportunity, but the comparatively venial excesses of his youth.<sup>1</sup>

**CHARLES I.** (1288-1342), king of Hungary, the son of Charles Martell of Naples, and Clemencia, daughter of the emperor Rudolph, was known as Charles Robert previously to being enthroned king of Hungary in 1309. He claimed the Hungarian crown, as the grandson of Stephen V., under the banner of the pope, and in August 1300 proceeded from Naples to Dalmatia to make good his claim. He was crowned at Esztergom after the death of the last Arpad, Andrew III. (1307), but was forced the same year to surrender the crown to Wenceslaus II. of Bohemia (1289-1306). His failure only made Pope Boniface VIII. still more zealous on his behalf, and at the diet of Pressburg (1304) his Magyar adherents induced him to attempt to recover the crown of St Stephen from the Czechs. But in the meantime (1305) Wenceslaus transferred his rights to Duke Otto of Bavaria, who in his turn was taken prisoner by the Hungarian rebels. Charles's prospects now improved, and he was enthroned at Buda on the 15th of June 1309, though his installation was not regarded as valid till he was crowned with the sacred crown (which was at last recovered from the robber-barons) at Székesfehérvár on the 27th of August 1310. For the next three years Charles had to contend with rebellion after rebellion, and it was only after his great victory over all the elements of rapine and disorder at Rozgony (June 15, 1312) that he was really master in his own land. His foreign policy aimed at the aggrandisement of his family, but his plans were prudent as well as ambitious, and Hungary benefited by them greatly. His most successful achievement was the union with Poland for mutual defence against the Habsburgs and the Czechs. This was accomplished by the convention of Trencsén (1335), confirmed the same year at the brilliant congress of Visegrád, where all the princes of central Europe met to compose their differences and were splendidly entertained during the months of October and November. The immediate result of the congress was a combined attack by the Magyars and Poles upon the emperor Louis and his ally Albert of Austria, which resulted in favour of Charles in 1337. Charles's desire to unite the kingdoms of Hungary and Naples under the eldest son Louis was frustrated by Venice and the pope, from fear lest Hungary might become the dominant

<sup>1</sup> This, at any rate, represents the general verdict of history. It is interesting, however, to note that so liberal-minded and shrewd a critic of men as King Leopold I. of the Belgians formed a different estimate. In a letter of the 18th of November 1836 addressed to Princess (afterwards Queen) Victoria he writes—"History will state that Louis XVIII. was a most liberal monarch, reigning with great mildness and justice to his end, but that his brother, from his despotic and harsh disposition, upset all the other had done, and lost the throne. Louis XVIII. was a clever, hard-hearted man, shackled by no principle, very proud and false. Charles X. an honest man, a kind friend, an honourable master, sincere in his opinions, and inclined to do everything that is right. That teaches us what we ought to believe in history as it is compiled according to ostensible events and results known to the generality of people."

Adriatic power. He was, however, more than compensated for this disappointment by his compact (1339) with his ally and brother-in-law, Casimir of Poland, whereby it was agreed that Louis should succeed to the Polish throne on the death of the childless Casimir. For an account of the numerous important reforms effected by Charles see HUNGARY: *History*. A statesman of the first rank, he not only raised Hungary once more to the rank of a great power, but enriched and civilized her. In character he was pious, courtly and valiant, popular alike with the nobility and the middle classes, whose increasing welfare he did so much to promote, and much beloved by the clergy. His court was famous throughout Europe as a school of chivalry.

Charles was married thrice. His first wife was Maria, daughter of Duke Casimir of Teschen, whom he wedded in 1306. On her death in 1318 he married Beatrice, daughter of the emperor Henry VII. On her decease two years later he gave his hand to Elizabeth, daughter of Wladislaus Lokietek, king of Poland. Five sons were the fruit of these marriages, of whom three, Louis, Andrew and Stephen, survived him. He died on the 16th of July 1342, and was laid beside the high altar at Székesfehérvár, the ancient burial-place of the Arpads.

**CHARLES I.** (1226-1285), king of Naples and Sicily and count of Anjou, was the seventh child of Louis VIII. of France and Blanche of Castile. Louis died a few months after Charles's birth and was succeeded by his son Louis IX. (St Louis), and on the death in 1232 of the third son John, count of Anjou and Maine, those fiefs were conferred on Charles. In 1246 he married Beatrice, daughter and heiress of Raymond Bérenger V., the last count of Provence, and after defeating James I. of Aragon and other rivals with the help of his brother the French king, he took possession of his new county. In 1248 he accompanied Louis in the crusade to Egypt, but on the defeat of the Crusaders he was taken prisoner with his brother. Shortly afterwards he was ransomed, and returned to Provence in 1250. During his absence several towns had asserted their independence; but he succeeded in subduing them without much difficulty and gradually suppressed their communal liberties. Charles's ambition aimed at wider fields, and when Margaret, countess of Flanders, asked help of the French court against the German king William of Holland, by whom she had been defeated, he gladly accepted her offer of the county of Hainaut in exchange for his assistance (1253); this arrangement was, however, rescinded by Louis of France, who returned from captivity in 1254, and Charles gave up Hainaut for an immense sum of money. He extended his influence by the subjugation of Marseilles in 1257, then one of the most important maritime cities of the world, and two years later several communes of Piedmont recognized Charles's suzerainty. In 1262 Pope Urban IV. determined to destroy the power of the Hohenstaufen in Italy, and offered the kingdoms of Naples and Sicily, in consideration of a yearly tribute, to Charles of Anjou, in opposition to Manfred, the bastard son of the late emperor Frederick II. The next year Charles succeeded in getting himself elected senator of Rome, which gave him an advantage in dealing with the pope. After long negotiations he accepted the Sicilian and Neapolitan crowns, and in 1264 he sent a first expedition of Provençals to Italy; he also collected a large army and navy in Provence and France with the help of King Louis, and by an alliance with the cities of Lombardy was able to send part of his force overland. Pope Clement IV. confirmed the Sicilian agreement on conditions even more favourable to Charles, who sailed in 1265, and conferred on the expedition all the privileges of a crusade. After narrowly escaping capture by Manfred's fleet he reached Rome safely, where he was crowned king of the Two Sicilies. The land army arrived soon afterwards, and on the 26th of February 1266 Charles encountered Manfred at Benevento, where after a hard-fought battle Manfred was defeated and killed, and the whole

kingdom was soon in Charles's possession. Then Conradin, Frederick's grandson and last legitimate descendant of the Hohenstaufen, came into Italy, where he found many partisans among the Ghibellines of Lombardy and Tuscany, and among Manfred's former adherents in the south. He gathered a large army consisting partly of Germans and Saracens, but was totally defeated by Charles at Tagliacozzo (23rd of August 1268); taken prisoner, he was tried as a rebel and executed at Naples. Charles, in a spirit of the most vindictive cruelty, had large numbers of Conradin's barons put to death and their estates confiscated, and the whole population of several towns massacred.

He was now one of the most powerful sovereigns of Europe, for besides ruling over Provence and Anjou and the kingdom of the Two Sicilies, he was imperial vicar of Tuscany, lord of many cities of Lombardy and Piedmont, and as the pope's favourite practically arbiter of the papal states, especially during the interregnum between the death of Clement IV. (1268) and the election of Gregory X. (1272). But his ambition was by no means satisfied, and he even aspired to the crown of the East Roman empire. In 1272 he took part with Louis IX. in a crusade to north Africa, where the French king died of fever, and Charles, after defeating the sultan of Tunis, returned to Sicily. The election of Rudolph of Habsburg as German king after a long interregnum, and that of Nicholas III. to the Holy See (1277), diminished Charles's power, for the new pope set himself to compose the difference between Guelfs and Ghibellines in the Italian cities, but at his death Charles secured the election of his benchman Martin IV. (1281), who recommenced persecuting the Ghibellines, excommunicated the Greek emperor, Michael Palaeologus, proclaimed a crusade against the Greeks, filled every appointment in the papal states with Charles's vassals, and reappointed the Angevin king senator of Rome. But the cruelty of the French rulers of Sicily drove the people of the island to despair, and a Neapolitan nobleman, Giovanni da Procida, organized the rebellion known as the Sicilian Vespers (see VESPERS, SICILIAN), in which the French in Sicily were all massacred or expelled (1282). Charles determined to subjugate the island and sailed with his fleet for Messina. The city held out until Peter III. of Aragon, whose wife Constance was a daughter of Manfred, arrived in Sicily, and a Sicilian-Catalan fleet under the Calabrese admiral, Ruggiero di Lauria, completely destroyed that of Charles. "If thou art determined, O God, to destroy me," the unhappy Angevin exclaimed, "let my fall be gradual!" He was forced to abandon all attempts at reconquest, but proposed to decide the question by single combat between himself and Peter, to take place at Bordeaux under English protection. The Aragonese accepted, but fearing treachery, as the French army was in the neighbourhood, he failed to appear on the appointed day. In the meanwhile Ruggiero di Lauria appeared before Naples and destroyed another Angevin fleet commanded by Charles's son, who was taken prisoner (May 1284). Charles came to Naples with a new fleet from Provence, and was preparing to invade Sicily again, when he contracted a fever and died at Foggia on the 7th of January 1285. He was undoubtedly an extremely able soldier and a skilful statesman, and much of his legislation shows a real political sense; but his inordinate ambition, his oppressive methods of government and taxation, and his cruelty created enemies on all sides, and led to the collapse of the edifice of dominion which he had raised.

**CHARLES II.** (1250-1309), king of Naples and Sicily, son of Charles I., had been captured by Ruggiero di Lauria in the naval battle at Naples in 1284, and when his father died he was still a prisoner in the hands of Peter of Aragon. In 1288 King Edward I. of England had mediated to make peace, and Charles was liberated on the understanding that he was to retain Naples alone, Sicily being left to the Aragonese; Charles was also to induce his cousin Charles of Valois to renounce for twenty thousand pounds of silver the kingdom of Aragon which had been given to him by Pope Martin IV. to punish Peter for having invaded Sicily, but which the Valois had never effectively occupied. The Angevin king was thereupon set free, leaving

three of his sons and sixty Provençal nobles as hostages, promising to pay 30,000 marks and to return a prisoner if the conditions were not fulfilled within three years. He went to Rieti, where the new pope Nicholas IV. immediately absolved him from all the conditions he had sworn to observe, crowned him king of the Two Sicilies (1286), and excommunicated Alphonso, while Charles of Valois, in alliance with Castile, prepared to take possession of Aragon. Alphonso III., the Aragonese king, being hard pressed, had to promise to withdraw the troops he had sent to help his brother James in Sicily, to renounce all rights over the island, and pay a tribute to the Holy See. But Alphonso died childless in 1291 before the treaty could be carried out, and James took possession of Aragon, leaving the government of Sicily to the third brother Frederick. The new pope Boniface VIII., elected in 1294 at Naples under the auspices of King Charles, mediated between the latter and James, and a most dishonourable treaty was signed: James was to marry Charles's daughter Bianca and was promised the investiture by the pope of Sardinia and Corsica, while he was to leave the Angevin a free hand in Sicily and even to assist him if the Sicilians resisted. An attempt was made to bribe Frederick into consenting to this arrangement, but being backed up by his people he refused, and was afterwards crowned king of Sicily. The war was fought with great fury on land and sea, but Charles, although aided by the pope, by Charles of Valois, and by James II. of Aragon, was unable to conquer the island, and his son the prince of Taranto was taken prisoner at the battle of La Falconara in 1299. Peace was at last made in 1302 at Caltabellotta, Charles II. giving up all rights to Sicily and agreeing to the marriage of his daughter Leonora to King Frederick; the treaty was ratified by the pope in 1303. Charles spent his last years quietly in Naples, which city he improved and embellished. He died in August 1309, and was succeeded by his son Robert.

**BIBLIOGRAPHY.**—A. de Saint-Priest, *Histoire de la conquête de Naples par Charles d'Anjou* (4 vols., Paris, 1847-1849), is still of use for the documents from the archives of Barcelona, but it needs to be collated with more recent works: S. de Sismondi, in vol. ii. of his *Histoire des républiques italiennes* (Brussels, 1838), gives a good general sketch of the reigns of Charles I. and II., but is occasionally inaccurate as to details; the best authority on the early life of Charles I. is R. Sternfeld, *Karl von Anjou als Graf von Provence* (Berlin, 1888); Charles's connexion with north Italy is dealt with in Merkel's *La Dominazione di Carlo d'Angiò in Piemonte e in Lombardia* (Turin, 1891), while the R. Deputazione di Storia Patria Toscana has recently published a *Codice diplomatico delle relazioni di Carlo d'Angiò con la Toscana*; the contents of the Angevin archives at Naples have been published by Durrien, *Archives angevines de Naples* (Toulouse, 1866-1867). M. Amari's *La Guerra del Vespro Siciliano* (8th ed., Florence, 1876) is a valuable history, but the author is too bitterly prejudiced against the French to be quite impartial; his work should be compared with L. Cadier's *Essai sur l'administration du royaume de Sicile sous Charles I et Charles II d'Anjou* (Paris, 1891, *Bibl. des écoles françaises d'Athènes et de Rome*, fasc. 59), which contains many documents, and tends somewhat to rehabilitate the Angevin rule.

**CHARLES II.** (1332-1387), called *THE BAD*, king of Navarre and count of Evreux, was a son of Jeanne II., queen of Navarre, by her marriage with Philip, count of Evreux (d. 1343). Having become king of Navarre on Jeanne's death in 1349, he suppressed a rising at Pampeluna with much cruelty, and by this and similar actions thoroughly earned his surname of "The Bad." In 1356 he married Jeanne (d. 1393), a daughter of John II., king of France, a union which made his relationship to the French crown still more complicated. Through his mother he was a grandson of Louis X. and through his father a great-grandson of Philip III., having thus a better claim to the throne of France than Edward III. of England; and, moreover, he held lands under the suzerainty of the French king, whose son-in-law he now became. Charles was a man of great ability, possessing popular manners and considerable eloquence, but he was singularly unscrupulous, a quality which was revealed during the years in which he played an important part in the internal affairs of France. Trouble soon arose between King John and his son-in-law. The promised dowry had not been paid, and the county of Angoulême, which had formerly belonged to Jeanne of Navarre, was now in the possession of the French king's favourite, the constable Charles la Cerda. In

January 1354 the constable was assassinated by order of Charles, and preparations for war were begun. The king of Navarre, who defended this deed, had, however, many friends in France and was in communication with Edward III.; and consequently John was forced to make a treaty at Mantes and to compensate him for the loss of Angoulême by a large grant of lands, chiefly in Normandy. This peace did not last long, and in 1355 John was compelled to confirm the treaty of Mantes. Returning to Normandy, Charles was partly responsible for some unrest in the duchy, and in April 1356 he was treacherously seized by the French king at Rouen, remaining in captivity until November 1357, when John, after his defeat at Poitiers, was a prisoner in England. Charles was regarded with much favour in France, and the states-general demanded his release, which, however, was effected by a surprise. Owing to his popularity he was considered by Étienne Marcel and his party as a suitable rival to the dauphin, afterwards King Charles V., and on entering Paris he was well received and delivered an eloquent harangue to the Parisians. Subsequently peace was made with the dauphin, who promised to restore to Charles his confiscated estates. This peace was not enduring, and as his lands were not given back Charles had some ground for complaint. War again broke out, quickly followed by a new treaty, after which the king of Navarre took part in suppressing the peasant rising known as the *Jacquerie*. Answering the entreaties of Marcel he returned to Paris on June 1358, and became captain-general of the city, which was soon besieged by the dauphin. This position, however, did not prevent him from negotiating both with the dauphin and with the English; terms were soon arranged with the former, and Charles, having lost much of his popularity, left Paris just before the murder of Marcel in July 1358. He continued his alternate policy of war and peace, meanwhile adding if possible by his depredations to the misery of France, until the conclusion of the treaty of Brétigny in May 1360 deprived him of the alliance of the English, and compelled him to make peace with King John in the following October. A new cause of trouble arose when the duchy of Burgundy was left without a ruler in November 1361, and was claimed by Charles; but, lacking both allies and money, he was unable to prevent the French king from seizing Burgundy, while he himself returned to Navarre.

In his own kingdom Charles took some steps to reform the financial and judicial administration and so to increase his revenue; but he was soon occupied once more with foreign entanglements, and in July 1362, in alliance with Peter the Cruel, king of Castile, he invaded Aragon, deserting his new ally soon afterwards for Peter IV., king of Aragon. Meanwhile the war with the dauphin had been renewed. Still hankering after Burgundy, Charles saw his French estates again seized; but after some desultory warfare, chiefly in Normandy, peace was made in March 1365, and he returned to his work of interference in the politics of the Spanish kingdoms. In turn he made treaties with the kings of Castile and Aragon, who were at war with each other; promising to assist Peter the Cruel to regain his throne, from which he had been driven in 1366 by his half-brother Henry of Trastámara, and then assuring Henry and his ally Peter of Aragon that he would aid them to retain Castile. He continued this treacherous policy when Edward the Black Prince advanced to succour Peter the Cruel; then signed a treaty with Edward of England, and then in 1371 allied himself with Charles V. of France. His next important move was to offer his assistance to Richard II. of England for an attack upon France. About this time serious charges were brought against him. Accused of attempting to poison the king of France and other prominent persons, and of other crimes, his French estates were seized by order of Charles V., and soon afterwards Navarre was invaded by the Castilians. Won over by the surrender of Cherbourg in July 1378, the English under John of Gaunt, duke of Lancaster, came to his aid; but a heavy price had to be paid for the neutrality of the king of Castile. After the death of Charles V. in 1380, the king of Navarre did not interfere in the internal affairs of France, although he endeavoured vainly again to obtain aid from Richard II., and to regain Cherbourg. His lands in France were handed

over to his eldest son Charles, who governed them with the consent of the new king Charles VI. Charles died on the 1st of January 1387, and many stories are current regarding the manner of his death. Froissart relates that he was burned to death through his bedclothes catching fire; Secousse says that he died in peace with many signs of contrition; another story says he died of leprosy; and a popular legend tells how he expired by a divine judgment through the burning of the clothes steeped in sulphur and spirits in which he had been wrapped as a cure for a loathsome disease caused by his debauchery. He had three sons and four daughters, and was succeeded by his eldest son Charles; one of his daughters, Jeanne, became the wife of Henry IV. of England.

See Jean Froissart, *Chroniques*, edited by S. Luce and G. Raynaud (Paris, 1869-1897); D. F. Secousse, *Mémoires pour servir à l'histoire de Charles II, roi de Navarre* (Paris, 1755-1768); E. Meyer, *Charles II, roi de Navarre et la Normandie au XIV<sup>e</sup> siècle* (Paris, 1898); F. T. Perrens, *Etienne Marcel* (Paris, 1874); R. Delachanal, *Premières négociations de Charles le Mauvais avec les Anglais* (Paris, 1900); and E. Lavisse, *Histoire de France*, tome iv. (Paris, 1902).

CHARLES III. (1361-1425), called THE NOBLE, king of Navarre and count of Evreux, was the eldest son of Charles II. the Bad, king of Navarre, by his marriage with Jeanne, daughter of John II., king of France, and was married in 1375 to Leonora (d. 1415), daughter of Henry II., king of Castile. Having passed much of his early life in France, he became king of Navarre on the death of Charles II. in January 1387, and his reign was a period of peace and order, thus contrasting sharply with the long and calamitous reign of his father. In 1393 he regained Cherbourg, which had been handed over by Charles II. to Richard II. of England, and in 1403 he came to an arrangement with the representatives of Charles VI. of France concerning the extensive lands which he claimed in that country. Cherbourg was given to the French king; certain exchanges of land were made; and in the following year Charles III. surrendered the county of Evreux, and was created duke of Nemours and made a peer of France. After this his only interference in the internal affairs of France was when he sought to make peace between the rival factions in that country. Charles sought to improve the condition of Navarre by making canals and rendering the rivers navigable, and in other ways. He died at Olite on the 8th of September 1425 and was buried at Pampeluna. After the death of his two sons in 1402 the king decreed that his kingdom should pass to his daughter Blanche (d. 1441), who took for her second husband John, afterwards John II., king of Aragon; and the cortes of Navarre swore to recognize Charles (q.v.), prince of Viana, her son by this marriage, as king after his mother's death.

CHARLES (KARL EITEL ZEPHYRIN LUDWIG; in Rum. CAROL), king of Rumania (1830- ), second son of Prince Karl Anton of Hohenzollern-Sigmaringen, was born on the 20th of April 1839. He was educated at Dresden (1850-1856), and passed through his university course at Bonn. Entering the Prussian army in 1857, he won considerable distinction in the Danish war of 1864, and received instruction in strategy from General von Moltke. He afterwards travelled in France, Italy, Spain and Algeria. He was a captain in the 2nd regiment of Prussian Dragon Guards when he was elected *hospodar* or prince of Rumania on the 20th of April 1866, after the compulsory abdication of Prince Alexander John Cuza. Regarded at first with distrust by Turkey, Russia and Austria, he succeeded in gaining general recognition in six months; but he had to contend for ten years with fierce party struggles between the Conservatives and the Liberals.

During this period, however, Charles displayed great tact in his dealings with both parties, and kept his country in the path of administrative and economic reform, organizing the army, developing the railways, and establishing commercial relations with foreign powers. The sympathy of Rumania with France in the Franco-Prussian War of 1870, and the consequent interruption of certain commercial undertakings, led to a hostile movement against Prince Charles, which, being fostered by Russia, made him resolve to abdicate; and it was with difficulty that he was persuaded to remain. In the Russo-Turkish War

of 1877-78 he joined the Russians before Plevna (q.v.), and being placed in command of the combined Russian and Rumanian forces, forced Osman Pasha to surrender. As a consequence of the prince's vigorous action the independence of Rumania, which had been proclaimed in May 1877, was confirmed by various treaties in 1878, and recognized by Great Britain, France and Germany in 1880. On the 26th of March 1881 he was proclaimed king of Rumania, and, with his consort, was crowned on the 22nd of May following. From that time he pursued a successful career in home and foreign policy, and greatly improved the financial and military position of his country; while his appreciation of the fine arts was shown by his formation of an important collection of paintings of all schools in his palaces at Sinaia and Bucharest. For a detailed account of his reign, see RUMANIA. On the 1st of November 1869 he married Princess Elizabeth (q.v.), a daughter of Prince Hermann of Wied, widely known under her literary name of "Carmen Sylva." As the only child of the marriage, a daughter, died in 1874, the succession was finally settled upon the king's nephew, Prince Ferdinand of Hohenzollern-Sigmaringen, who was created prince of Rumania on the 18th of March 1889, and married, on the 10th of January 1893, Princess Marie, daughter of Alfred, duke of Saxe-Coburg, their children being Prince Carol (h. 1893) and Princess Elizabeth (b. 1894).

The official life of King Charles, mainly his own composition, *Aus dem Leben König Karls von Rumänien* (Stuttgart, 1894-1900, 4 vols.), deals mainly with political history. See for an account of his domestic life, M. Krennitz, *König Karl von Rumänien. Ein Lebensbild* (Breslau, 1903).

CHARLES II. (1661-1700), king of Spain, known among Spanish kings as "The Desired" and "The Bewitched," was the son of Philip IV. by his second marriage with Maria, daughter of the emperor Ferdinand III., his niece. He was born on the 11th of November 1661, and was the only surviving son of his father's two marriages—a child of old age and disease, in whom the constant intermarriages of the Habsburgs had developed the family type to deformity. His birth was greeted with joy by the Spaniards, who feared the dispute as to the succession which must have ensued if Philip IV. left no male issue. The boy was so feeble that till the age of five or six he was fed only from the breast of a nurse. For years afterwards it was not thought safe to allow him to walk. That he might not be overtaxed he was left entirely uneducated, and his indolence was indulged to such an extent that he was not even expected to be clean. When his brother, the younger Don John of Austria, a natural son of Philip IV., obtained power by exiling the queen mother from court he insisted that at least the king's hair should be combed. Charles made the malicious remark that nothing was safe from Don John—not even vermin. The king was then fifteen, and, according to Spanish law, of age. But he never became a man in body or mind. The personages who ruled in his name arranged a marriage for him with Maria Louisa of Orleans. The French princess, a lively young woman of no sense, died in the stifling atmosphere of the Spanish court, and from the attendance of Spanish doctors. Again his advisers arranged a marriage with Maria Ana of Neuburg. The Bavarian wife stood the strain and survived him. Both marriages were merely political—the first a victory for the French, and the second for the Austrian party. France and Austria were alike preparing for the day when the Spanish succession would have to be fought for. The king was a mere puppet in the hands of each alternately. By natural instinct he hated the French, but there was no room in his nearly imbecile mind for more than childish superstition, insane pride of birth, and an interest in court etiquette. The only touch of manhood was a taste for shooting which he occasionally indulged in the preserves of the Escorial. In his later days he suffered much pain, and was driven wild by the conflict between his wish to transmit his inheritance to "the illustrious house of Austria," his own kin, and the belief instilled into him by the partisans of the French claimant that only the power of Louis XIV. could avert the dismemberment of the empire. A silly fanatic made the discovery that the king was bewitched, and his confessor Froilan Diaz supported the

belief. The king was exorcised, and the exorcists of the kingdom were called upon to put stringent questions to the devils they cast out. The Inquisition interfered, and the dying king was driven mad among them. Very near his end he had the lugubrious curiosity to cause the coffins of his embalmed ancestors to be opened at the Escorial. The sight of the body of his first wife, at whom he also insisted on looking, provoked a passion of tears and despair. Under severe pressure from the cardinal archbishop of Toledo, Portocarrero, he finally made a will in favour of Philip, duke of Anjou, grandson of Louis XIV., and died on the 1st of November 1700, after a lifetime of senile decay.

The best picture of Charles II. is to be found in *Les Mémoires de la cour d'Espagne* of the Marquis de Villars (London, 1861), and the *Letters of the Marquise de Villars* (Paris, 1868).

**CHARLES III.** (1716-1788), king of Spain, born on the 20th January 1716, was the first son of the second marriage of Philip V. with Elizabeth Farnese of Parma. It was his good fortune to be sent to rule as duke of Parma by right of his mother at the age of sixteen, and thus came under more intelligent influence than he could have found in Spain. In 1734 he made himself master of Naples and Sicily by arms. Charles had, however, no military tastes, seldom wore uniform, and could with difficulty be persuaded to witness a review. The peremptory action of the British admiral commanding in the Mediterranean at the approach of the War of the Austrian Succession, who forced him to promise to observe neutrality under a threat to bombard Naples, made a deep impression on his mind. It gave him a feeling of hostility to England which in after-times influenced his policy.

As king of the Two Sicilies Charles began there the work of internal reform which he afterwards continued in Spain. Foreign ministers who dealt with him agreed that he had no great natural ability, but he was honestly desirous to do his duty as king, and he showed good judgment in his choice of ministers. The chief minister in Naples, Tanucci, had a considerable influence over him. On the death of his half-brother Ferdinand VI. he became king of Spain, and resigned the Two Sicilies to his third son Ferdinand. As king of Spain his foreign policy was disastrous. His strong family feeling and his detestation of England, which was unchecked after the death of his wife, Maria Amelia, daughter of Frederick Augustus II. of Saxony, led him into the Family Compact with France. Spain was entangled in the close of the Seven Years' War, to her great loss. In 1770 he almost ran into another war over the barren Falkland Islands. In 1770 he was, somewhat reluctantly, led to join France and the American insurgents against England, though he well knew that the independence of the English colonies must have a ruinous influence on his own American dominions. For his army he did practically nothing, and for his fleet very little except build fine ships without taking measures to train officers and men.

But his internal government was on the whole beneficial to the country. He began by compelling the people of Madrid to give up emptying their slops out of the windows, and when they objected he said they were like children who cried when their faces were washed. In 1766 his attempt to force the Madrileños to adopt the French dress led to a riot during which he did not display much personal courage. For a long time after it he remained at Aranjuez, leaving the government in the hands of his minister Aranda. All his reforms were not of this formal kind. Charles was a thorough despot of the benevolent order, and had been deeply offended by the real or suspected share of the Jesuits in the riot of 1766. He therefore consented to the expulsion of the order, and was then the main advocate for its suppression. His quarrel with the Jesuits, and the recollection of some disputes with the pope he had had when king of Naples, turned him towards a general policy of restriction of the overgrown power of the church. The number of the idle clergy, and more particularly of the monastic orders, was reduced, and the Inquisition, though not abolished, was rendered torpid. In the meantime much antiquated legislation which tended to restrict

trade and industry was abolished; roads, canals and drainage works were carried out. Many of his paternal ventures led to little more than waste of money, or the creation of hotbeds of jobbery. Yet on the whole the country prospered. The result was largely due to the king, who even when he was ill-advised did at least work steadily at his task of government. His example was not without effect on some at least of the nobles. In his domestic life King Charles was regular, and was a considerate master, though he had a somewhat caustic tongue and took a rather cynical view of mankind. He was passionately fond of hunting. During his later years he had some trouble with his eldest son and his daughter-in-law. If Charles had lived to see the beginning of the French Revolution he would probably have been frightened into reaction. As he died on the 14th of December 1788 he left the reputation of a philanthropic and "philosophic" king. In spite of his hostility to the Jesuits, his dislike of friars in general, and his jealousy of the Inquisition, he was a very sincere Roman Catholic, and showed much zeal in endeavouring to persuade the pope to proclaim the Immaculate Conception as a dogma necessary to salvation.

See the *Reign of Charles III.*, by M. Danvila y Collado (6 vols.), in the *Historia General de España de la Real Academia de la Historia* (Madrid, 1892, &c.); and F. Rousseau, *Règne de Charles III d'Espagne* (Paris, 1907).

**CHARLES IV.** (1748-1810), king of Spain, second son of Charles III. and his wife Maria Amelia of Saxony, was born at Portici on the 11th of November 1748, while his father was king of the Two Sicilies. The elder brother was set aside as imbecile and epileptic. Charles had inherited a great frame and immense physical strength from the Saxon line of his mother. When young he was fond of wrestling with the strongest countrymen he could find. In character he was not malignant, but he was intellectually torpid, and of a credulity which almost passes belief. His wife, Maria Luisa of Parma, his first cousin, a thoroughly coarse and vicious woman, ruled him completely, though he was capable of obstinacy at times. During his father's lifetime he was led by her into court intrigues which aimed at driving the king's favourite minister, Florida Blanca, from office, and replacing him by Aranda, the chief of the "Aragonese" party. After he succeeded to the throne in 1788 his one serious occupation was hunting. Affairs were left to be directed by his wife and her lover Godoy (*q.v.*). For Godoy the king had an unaffected liking, and the lifelong favour he showed him is almost pathetic. When terrified by the French Revolution he turned to the Inquisition to help him against the party which would have carried the reforming policy of Charles III. much further. But he was too slothful to have more than a passive part in the direction of his own government. He simply obeyed the impulse given him by the queen and Godoy. If he ever knew his wife's real character he thought it more consistent with his dignity to shut his eyes. For he had a profound belief in his divine right and the sanctity of his person. If he understood that his kingdom was treated as a mere dependence by France, he also thought it due to his "face" to make believe that he was a powerful monarch. Royalty never wore a more silly aspect than in the person of Charles IV., and it is highly credible that he never knew what his wife was, or what was the position of his kingdom. When he was told that his son Ferdinand was appealing to the emperor Napoleon against Godoy, he took the side of the favourite. When the populace rose at Aranjuez in 1808 he abdicated to save the minister. He took refuge in France, and when he and Ferdinand were both prisoners of Napoleon's, he was with difficulty restrained from assaulting his son. Then he abdicated in favour of Napoleon, handing over his people like a herd of cattle. He accepted a pension from the French emperor and spent the rest of his life between his wife and Godoy. He died at Rome on the 20th of January 1810, probably without having once suspected that he had done anything unbecoming a king by divine right and a gentleman.

See *Historia del Reinado de Carlos IV.*, by General Gomez de Arceche (3 vols.), in the *Historia General de España de la Real Academia de la Historia* (Madrid, 1892, &c.).

**CHARLES IX.** (1550-1611), king of Sweden, was the youngest son of Gustavus Vasa and Margareto Lejonhufvud. By his father's will he got, by way of appanage, the duchy of Södermanland, which included the provinces of Neriké and Vermland; but he did not come into actual possession of them till after the fall of Eric XIV. (1566). In 1568 he was the real leader of the rebellion against Eric, but took no part in the designs of his brother John against the unhappy king after his deposition. Indeed, Charles's relations with John III. were always more or less strained. He had no sympathy with John's high-church tendencies on the one hand, and he sturdily resisted all the king's endeavours to restrict his authority as duke of Södermanland (Sudermania) on the other. The nobility and the majority of the *Riksdag* supported John, however, in his endeavours to unify the realm, and Charles had consequently (1587) to resign his pretensions to autonomy within his duchy; but, fanatical Calvinist as he was, on the religious question he was immovable. The matter came to a crisis on the death of John III. (1592). The heir to the throne was John's eldest son, Sigismund, already king of Poland and a devoted Catholic. The fear lest Sigismund might re-catholicize the land alarmed the Protestant majority in Sweden, and Charles came forward as their champion, and also as the defender of the Vasa dynasty against foreign interference. It was due entirely to him that Sigismund was forced to confirm the resolutions of the council of Upsala, thereby recognizing the fact that Sweden was essentially a Protestant state (see SWEDEN: *History*). In the ensuing years Charles's task was extraordinarily difficult. He had steadily to oppose Sigismund's reactionary tendencies; he had also to curb the nobility, which he did with cruel rigour. Necessity compelled him to work rather with the people than the gentry; hence it was that the *Riksdag* assumed under his government a power and an importance which it had never possessed before. In 1595 the *Riksdag* of Söderköping elected Charles regent, and his attempt to force Klas Fleming, governor of Finland, to submit to his authority, rather than to that of the king, provoked a civil war. Technically Charles was, without doubt, guilty of high treason, and the considerable minority of all classes which adhered to Sigismund on his landing in Sweden in 1598 indisputably behaved like loyal subjects. But Sigismund was both an alien and a heretic to the majority of the Swedish nation, and his formal deposition by the *Riksdag* in 1599 was, in effect, a natural vindication and legitimation of Charles's position. Finally, the diet of Linköping (Feb. 24, 1600) declared that Sigismund and his posterity had forfeited the Swedish throne, and, passing over duke John, the second son of John III., a youth of ten, recognized duke Charles as their sovereign under the title of Charles IX.

Charles's short reign was an uninterrupted warfare. The hostility of Poland and the break up of Russia involved him in two overseas contests for the possession of Livonia and Ingria, while his pretensions to Lapland brought upon him a war with Denmark in the last year of his reign. In all these struggles he was more or less unsuccessful, owing partly to the fact that he had to do with superior generals (e.g. Chodkiewicz and Christian IV.) and partly to sheer ill-luck. Compared with his foreign policy, the domestic policy of Charles IX. was comparatively unimportant. It aimed at confirming and supplementing what had already been done during his regency. Not till the 6th of March 1604, after Duke John had formally renounced his rights to the throne, did Charles IX. begin to style himself king. The first deed in which the title appears is dated the 20th of March 1604; but he was not crowned till the 15th of March 1607. Four and a half years later Charles IX. died at Nyköping (Oct. 30, 1611). As a ruler he is the link between his great father and his still greater son. He consolidated the work of Gustavus Vasa, the creation of a great Protestant state; he prepared the way for the erection of the Protestant empire of Gustavus Adolphus. Swedish historians have been excusably indulgent to the father of their greatest ruler. Indisputably Charles was cruel, ungenerous and vindictive; yet he seems, at all hazards, strenuously to have endeavoured to do his duty during a period of political and religious transition, and, despite

his violence and brutality, possessed many of the qualities of a wise and courageous statesman. By his first wife Marie, daughter of the elector palatine Louis VI., he had six children, of whom only one daughter, Catherine, survived; by his second wife, Christina, daughter of Adolphus, duke of Holstein-Gottorp, he had five children, including Gustavus Adolphus and Charles Philip, duke of Finland.

See *Sveriges Historia*, vol. iii. (Stockholm, 1878); Robert Nisbet Bain, *Scandinavia* (Cambridge, 1905), caps. 5-7. (R. N. B.)

**CHARLES X.** [CHARLES GUSTAVUS] (1622-1660), king of Sweden, son of John Casimir, count palatine of Zweibrücken, and Catherine, sister of Gustavus Adolphus, was born at Nyköping Castle on the 8th of November 1622. He learnt the art of war under the great Lennart Torstensson, being present at the second battle of Breitenfeld and at Jankowitz. From 1646 to 1648 he frequented the Swedish court. It was supposed that he would marry the queen regnant, Christina, but her unsurmountable objection to wedlock put an end to these anticipations, and to compensate her cousin for a broken half-promise she declared him (1649) her successor, despite the opposition of the senate headed by the venerable Axel Oxenstierna. In 1648 he was appointed generalissimo of the Swedish forces in Germany. The conclusion of the treaties of Westphalia prevented him from winning the military laurels he so ardently desired, but as the Swedish plenipotentiary at the executive congress of Nuremberg, he had unrivalled opportunities of learning diplomacy, in which science he speedily became a past-master. As the recognized heir to the throne, his position on his return to Sweden was not without danger, for the growing discontent with the queen turned the eyes of thousands to him as a possible deliverer. He therefore withdrew to the isle of Öland till the abdication of Christina (June 5, 1654) called him to the throne.

The beginning of his reign was devoted to the healing of domestic discords, and the rallying of all the forces of the nation round his standard for a new policy of conquest. He contracted a political marriage (Oct. 24, 1654) with Hedwig Leonora, the daughter of Frederick III., duke of Holstein-Gottorp, by way of securing a future ally against Denmark. The two great pressing national questions, war and the restitution of the alienated crown lands, were duly considered at the *Riksdag* which assembled at Stockholm in March 1655. The war question was decided in three days by a secret committee presided over by the king, who easily persuaded the delegates that a war with Poland was necessary and might prove very advantageous; but the consideration of the question of the subsidies due to the crown for military purposes was postponed to the following *Riksdag* (see SWEDEN: *History*). On the 10th of July Charles quitted Sweden to engage in his Polish adventure. By the time war was declared he had at his disposal 50,000 men and 50 warships. Hostilities had already begun with the occupation of Dünaburg (Dvinsk) in Polish Livonia by the Swedes (July 1, 1655), and the Polish army encamped among the marshes of the Netze concluded a convention (July 25) whereby the palatinates of Posen and Kalisz placed themselves under the protection of the Swedish king. Thereupon the Swedes entered Warsaw without opposition and occupied the whole of Great Poland. The Polish king, John Casimir, fled to Silesia. Meanwhile Charles pressed on towards Cracow, which was captured after a two months' siege. The fall of Cracow extinguished the last hope of the boldest Pole; but before the end of the year an extraordinary reaction began in Poland itself. On the 18th of October the Swedes invested the fortress-monastery of Czenstochowa, but the place was heroically defended; and after a seventy days' siege the besiegers were compelled to retire with great loss.

This astounding success elicited an outburst of popular enthusiasm which gave the war a national and religious character. The tactlessness of Charles, the rapacity of his generals, the barbarity of his mercenaries, his refusal to legalize his position by summoning the Polish diet, his negotiations for the partition of the very state he affected to befriend, awoke the long slumbering public spirit of the country. In the beginning of 1656 John Casimir returned from exile and the Polish army was reorganized

and increased. By this time Charles had discovered that it was easier to defeat the Poles than to conquer Poland. His chief object, the conquest of Prussia, was still unaccomplished, and a new foe arose in the elector of Brandenburg, alarmed by the ambition of the Swedish king. Charles forced the elector, indeed, at the point of the sword to become his ally and vassal (treaty of Königsberg, Jan. 17, 1656); but the Polish national rising now imperatively demanded his presence in the south. For weeks he scoured the interminable snow-covered plains of Poland in pursuit of the Polish guerrillas, penetrating as far south as Jaroslau in Galicia, by which time he had lost two-thirds of his 15,000 men with no apparent result. His retreat from Jaroslau to Warsaw, with the fragments of his host, amidst three converging armies, in a marshy forest region, intersected in every direction by well-guarded rivers, was one of his most brilliant achievements. But his necessities were overwhelming. On the 21st of June Warsaw was retaken by the Poles, and four days later Charles was obliged to purchase the assistance of Frederick William by the treaty of Marienburg. On July 18-20 the combined Swedes and Brandenburgers, 18,000 strong, after a three days' battle, defeated John Casimir's army of 100,000 at Warsaw and reoccupied the Polish capital; but this brilliant feat of arms was altogether useless, and when the suspicious attitude of Frederick William compelled the Swedish king at last to open negotiations with the Poles, they refused the terms offered, the war was resumed, and Charles concluded an offensive and defensive alliance with the elector of Brandenburg (treaty of Labiau, Nov. 20) whereby it was agreed that Frederick William and his heirs should henceforth possess the full sovereignty of East Prussia.

This was an essential modification of Charles's Baltic policy; but the alliance of the elector had now become indispensable on almost any terms. So serious, indeed, were the difficulties of Charles X. in Poland that it was with extreme satisfaction that he received the tidings of the Danish declaration of war (June 1, 1657). The hostile action of Denmark enabled him honourably to emerge from the inglorious Polish imbroglio, and he was certain of the zealous support of his own people. He had learnt from Torstensson that Denmark was most vulnerable if attacked from the south, and, imitating the strategy of his master, he fell upon her with a velocity which paralysed resistance. At the end of June 1657, at the head of 8000 seasoned veterans, he broke up from Bromberg in Prussia and reached the borders of Holstein on the 18th of July. The Danish army at once dispersed and the duchy of Bremen was recovered by the Swedes, who in the early autumn swarmed over Jutland and firmly established themselves in the duchies. But the fortress of Fredriksodde (Fredericia) held Charles's little army at bay from mid-August to mid-October, while the fleet of Denmark, after a stubborn two days' battle, compelled the Swedish fleet to abandon its projected attack on the Danish islands. The position of the Swedish king had now become critical. In July an offensive and defensive alliance was concluded between Denmark and Poland. Still more ominously, the elector of Brandenburg, perceiving Sweden to be in difficulties, joined the league against her and compelled Charles to accept the proffered mediation of Cromwell and Mazarin. The negotiations foundered, however, upon the refusal of Sweden to refer the points in dispute to a general peace-congress, and Charles was still further encouraged by the capture of Fredriksodde (Oct. 23-24), whereupon he began to make preparations for conveying his troops over to Fünen in transport vessels. But soon another and cheaper expedient presented itself. In the middle of December 1657 began the great frost which was to be so fatal to Denmark. In a few weeks the cold had grown so intense that even the freezing of an arm of the sea with so rapid a current as the Little Belt became a conceivable possibility; and henceforth meteorological observations formed an essential part of the strategy of the Swedes. On the 28th of January 1658, Charles X. arrived at Haderslev (Hadersleben) in South Jutland, when it was estimated that in a couple of days the ice of the Little Belt would be firm enough to bear even the passage of a

mail-clad host. The cold during the night of the 29th of January was most severe; and early in the morning of the 30th the Swedish king gave the order to start, the horsemen dismounting where the ice was weakest, and cautiously leading their horses as far apart as possible, when they swung into their saddles again, closed their ranks and made a dash for the shore. The Danish troops lining the opposite coast were quickly overpowered, and the whole of Fünen was won with the loss of only two companies of cavalry, which disappeared under the ice while fighting with the Danish left wing. Pursuing his irresistible march, Charles X., with his eyes fixed steadily on Copenhagen, resolved to cross the frozen Great Belt also. After some hesitation, he accepted the advice of his chief engineer officer Eric Dahlberg, who acted as pioneer throughout and chose the more circuitous route from Svendborg, by the islands of Langelad, Laaland and Falster, in preference to the direct route from Nyborg to Korsör, which would have been across a broad, almost uninterrupted expanse of ice. Yet this second adventure was not embarked upon without much anxious consideration. A council of war, which met at two o'clock in the morning to consider the practicability of Dahlberg's proposal, at once dismissed it as criminally hazardous. Even the king wavered for an instant; but, Dahlberg persisting in his opinion, Charles overruled the objections of the commanders. On the night of the 5th of February the transit began, the cavalry leading the way through the snow-covered ice, which quickly thawed beneath the horses' hoofs so that the infantry which followed after had to wade through half an ell of sludge, fearing every moment lest the rotting ice should break beneath their feet. At three o'clock in the afternoon, Dahlberg leading the way, the army reached Grimsted in Laaland without losing a man. On the 8th of February Charles reached Falster. On the 11th he stood safely on the soil of Sjaelland (Zealand). Not without reason did the medal struck to commemorate "the glorious transit of the Baltic Sea" bear the haughty inscription: *Natura hoc debuit uni*. An exploit unique in history had been achieved.

The crushing effect of this unheard-of achievement on the Danish government found expression in the treaties of Taastrep (Feb. 18) and Roskilde (Feb. 26, 1658), whereby Denmark sacrificed nearly half her territory to save the rest (see DENMARK: *History*). But even this was not enough for the conqueror. Military ambition and greed of conquest moved Charles X. to what, divested of all its pomp and circumstance, was an outrageous act of political brigandage. At a council held at Gottorp (July 7), Charles X. resolved to wipe from the map of Europe an inconvenient rival, and without any warning, in defiance of all international equity, let loose his veterans upon Denmark a second time. For the details of this second struggle, with the concomitant diplomatic intervention of the western powers, see DENMARK: *History*, and SWEDEN: *History*. Only after great hesitation would Charles X. consent to reopen negotiations with Denmark direct, at the same time proposing to exercise pressure upon the enemy by a simultaneous winter campaign in Norway. Such an enterprise necessitated fresh subsidies from his already impoverished people, and obliged him in December 1659 to cross over to Sweden to meet the estates, whom he had summoned to Gothenburg. The lower estates murmured at the imposition of fresh burdens; and Charles had need of all his adroitness to persuade them that his demands were reasonable and necessary. At the very beginning of the *Riksdag*, in January 1660, it was noticed that the king was ill; but he spared himself as little in the council-chamber as in the battle-field, till death suddenly overtook him on the night of the 13th of February 1660, in his thirty-eighth year. The abrupt cessation of such an inexhaustible fount of enterprise and energy was a distinct loss to Sweden; and signs are not wanting that, in his latter years, Charles had begun to feel the need and value of repose. Had he lived long enough to overcome his martial ardour, and develop and organize the empire he helped to create, Sweden might perhaps have remained a great power to this day. Even so she owes her natural frontiers in the Scandinavian peninsula to Charles X.

Hauman, *La Guerre du nord et la paix d'Oliva* (Paris, 1893); Robert Nisbet Bain, *Scandinavia* (Cambridge, 1905); G. Jones, *The Diplomatic Relations between Cromwell and Charles X.* (Lincoln, Nebraska, 1897). (R.N.B.)

**CHARLES XI.** (1655-1697), king of Sweden, the only son of Charles X., and Hedwig Leonora of Holstein-Gottorp, was born in the palace at Stockholm, on the 24th of November 1655. His father, who died when the child was in his fourth year, left the care of his education to the regents whom he had appointed. So shamefully did they neglect their duty that when, at the age of seventeen, Charles XI. attained his majority, he was ignorant of the very rudiments of state-craft and almost illiterate. Yet those nearest to him had great hopes of him. He was known to be truthful, upright and God-fearing; if he had neglected his studies it was to devote himself to manly sports and exercises; and in the pursuit of his favourite pastime, bear-hunting, he had already given proofs of the most splendid courage. It was the general disaster produced by the speculative policy of his former guardians which first called forth his sterling qualities and hardened him into a premature manhood. With indefatigable energy he at once attempted to grapple with the difficulties of the situation, waging an almost desperate struggle with sloth, corruption and incompetence. Amidst universal anarchy, the young king, barely twenty years of age, inexperienced, ill-served, snatching at every expedient, worked day and night in his newly-formed camp in Scania (Skåne) to arm the nation for its mortal struggle. The victory of Fyllebro (Aug. 17, 1676), when Charles and his commander-in-chief S. G. Helmfeld routed a Danish division, was the first gleam of good luck, and on the 4th of December, on the tableland of Helgonabäck, near Lund, the young Swedish monarch defeated Christian V. of Denmark, who also commanded his army in person. After a ferocious contest, the Danes were practically annihilated. The battle of Lund was, relatively to the number engaged, one of the bloodiest engagements of modern times. More than half the combatants (8357, of whom 3000 were Swedes) actually perished on the battle-field. All the Swedish commanders showed remarkable ability, but the chief glory of the day indisputably belongs to Charles XI. This great victory restored to the Swedes their self-confidence and prestige. In the following year, Charles with 9000 men routed 12,000 Danes near Malmö (July 15, 1678). This proved to be the last pitched battle of the war, the Danes never again venturing to attack their once more invincible enemy in the open field. In 1679 Louis XIV. dictated the terms of a general pacification, and Charles XI., who bitterly resented "the insufferable tutelage" of the French king, was forced at last to acquiesce in a peace which at least left his empire practically intact. Charles devoted the rest of his life to the gigantic task of rehabilitating Sweden by means of a *reduktion*, or recovery of alienated crown lands, a process which involved the examination of every title deed in the kingdom, and resulted in the complete readjustment of the finances. But vast as it was, the *reduktion* represents only a tithe of Charles XI.'s immense activity. The constructive part of his administration was equally thorough-going, and entirely beneficial. Here, too, everything was due to his personal initiative. Finance, commerce, the national armaments by sea and land, judicial procedure, church government, education, even art and science—everything, in short—emerged recast from his shaping hand. Charles XI. died on the 5th of April 1697, in his forty-first year. By his beloved consort Ulrica Leonora of Denmark, from the shock of whose death in July 1693 he never recovered, he had seven children, of whom only three survived him, a son Charles, and two daughters, Hedwig Sophia, duchess of Holstein, and Ulrica Leonora, who ultimately succeeded her brother on the Swedish throne. After Gustavus Vasa and Gustavus Adolphus Charles XI. was, perhaps, the greatest of all the kings of Sweden. His modest, homespun figure has indeed been unduly eclipsed by the brilliant and colossal shapes of his heroic father and his meteoric son; yet in reality Charles XI. is far worthier of admiration than either Charles X. or Charles XII. He was in

an eminent degree a great master-builder. He found Sweden in ruins, and devoted his whole life to laying the solid foundations of a new order of things which, in its essential features, has endured to the present day.

See Martin Veibull, *Sveriges Storhæstid* (Stockholm, 1881); Frederick Ferdinand Carlson, *Sveriges Historia under Konungarne af Pfalziska Huset* (Stockholm, 1883-1885); Robert Nisbet Bain, *Scandinavia* (Cambridge, 1905); O. Sjögren, *Karl den Elfte och Svenska Folket* (Stockholm, 1897); S. Jacobsen, *Den nordiske Krigs Krønike, 1675-1679* (Copenhagen, 1897); J. A. de Meemes d'Avaux, *Négociations du comte d'Avaux, 1693, 1697, 1698* (Utrecht, 1882, &c.). (R. N. B.)

**CHARLES XII.** (1682-1718), king of Sweden, the only surviving son of Charles XI. and Ulrica Leonora, daughter of Frederick III. of Denmark, was born on the 17th of June 1682. He was carefully educated by excellent tutors under the watchful eyes of his parents. His natural parts were excellent; and a strong bias in the direction of abstract thought, and mathematics in particular, was noticeable at an early date. His memory was astonishing. He could translate Latin into Swedish or German, or Swedish or German into Latin at sight. Charles XI. personally supervised his son's physical training. He was taught to ride before he was four, at eight was quite at home in his saddle, and when only eleven, hrougt down his first bear at a single shot. As he grew older his father took him on all his rounds, reviewing troops, inspecting studs, foundries, dockyards and granaries. Thus the lad was gradually initiated into all the *minutiae* of administration. The influence of Charles XI. over his son was, indeed, far greater than is commonly supposed, and it accounts for much in Charles XII.'s character which is otherwise inexplicable, for instance his precocious reserve and taciturnity, his dislike of everything French, and his inordinate contempt for purely diplomatic methods. On the whole, his early training was admirable; but the young prince was not allowed the opportunity of gradually gaining experience under his guardians. At the *Riksdag* assembled at Stockholm in 1697, the estates, jealous of the influence of the regents, offered full sovereignty to the young monarch, the senate acquiesced, and, after some hesitation, Charles at last declared that he could not resist the urgent appeal of his subjects and would take over the government of the realm "in God's name." The subsequent coronation was marked by portentous novelties, the most significant of which was the king's omission to take the usual coronation oath, which omission was interpreted to mean that he considered himself under no obligation to his subjects. The general opinion of the young king was, however, still favourable. His conduct was evidently regulated by strict principle and not by mere caprice. His refusal to countenance torture as an instrument of judicial investigation, on the ground that "confessions so extorted give no sure criteria for forming a judgment," showed him to be more humane as well as more enlightened than the majority of his council, which had defended the contrary opinion. His intense application to affairs is noted by the English minister, John Robinson (1650-1723), who informed his court that there was every prospect of a happy reign in Sweden, provided his majesty were well served and did not injure his health by too much work.

The coalition formed against Sweden by Johann Reinhold Patkul, which resulted in the outbreak of the Great Northern War (1699), abruptly put an end to Charles XII.'s political apprenticeship, and forced into his hand the sword he was never again to relinquish. The young king resolved to attack the nearest of his three enemies—Denmark—first. The timidity of the Danish admiral Ulrik C. Gyldenløve, and the daring of Charles, who forced his nervous and protesting admiral to attempt the passage of the eastern channel of the Sound, the dangerous *fjinterend*, hitherto reputed to be unnavigable, enabled the Swedish king to effect a landing at Humleback in Sjaelland (Zealand), a few miles north of Copenhagen (Aug. 4, 1700). He now hoped to accomplish what his grandfather, fifty years before, had vainly attempted—the destruction of the Danish-Norwegian monarchy by capturing its capital. But for once prudential considerations prevailed, and the short and bloodless war was terminated by the peace of Travendal (Aug. 18), whereby

Frederick IV. conceded full sovereignty to Charles's ally and kinsman the duke of Gottorp, besides paying him an indemnity of 200,000 rix-dollars and solemnly engaging to commit no hostilities against Sweden in future. From Sjaelland Charles now hastened to Livonia with 8000 men. On the 6th of October he had reached Pernau, with the intention of first relieving Riga, but, hearing that Narva was in great straits, he decided to turn northwards against the tsar. He set out for Narva on the 13th of November, against the advice of all his generals, who feared the effect on untried troops of a week's march through a wasted land, along boggy roads guarded by no fewer than three formidable passes which a little engineering skill could easily have made impregnable. Fortunately, the two first passes were unoccupied; and the third, Pyhäjoggi, was captured by Charles, who with 400 horsemen put 6000 Russian cavalry to flight. On the 10th of November the little army reached Lagena, a village about 9 m. from Narva, whence it signalled its approach to the beleaguered fortress, and early on the following morning it advanced in battle array. The attack on the Russian fortified camp began at two o'clock in the afternoon, in the midst of a violent snowstorm; and by nightfall the whole position was in the hands of the Swedes: the Russian army was annihilated. The triumph was as cheap as it was crushing; it cost Charles less than 2000 men.

After Narva, Charles XII. stood at the parting of ways. His best advisers urged him to turn all his forces against the panic-stricken Muscovites; to go into winter-quarters amongst them and live at their expense; to fan into a flame the smouldering discontent caused by the reforms of Peter the Great, and so disable Russia for some time to come. But Charles's determination promptly to punish the treachery of Augustus prevailed over every other consideration. It is easy from the vantage-point of two centuries to criticize Charles XII. for neglecting the Russians to pursue the Saxons; but at the beginning of the 18th century his decision was natural enough. The real question was, which of the two foes was the more dangerous, and Charles had many reasons to think the civilized and martial Saxons far more formidable than the imbecile Muscovites. Charles also rightly felt that he could never trust the treacherous Augustus to remain quiet, even if he made peace with him. To leave such a foe in his rear, while he plunged into the heart of Russia would have been hazardous indeed. From this point of view Charles's whole Polish policy, which has been blamed so long and so loudly—the policy of placing a nominee of his own on the Polish throne—takes quite another complexion: it was a policy not of overvaulting ambition, but of prudential self-defence.

First, however, Charles cleared Livonia of the invader (July 1701), subsequently occupying the duchy of Courland and converting it into a Swedish governor-generalship. In January 1702 Charles established himself at Bielowiec in Lithuania, and, after issuing a proclamation declaring that "the elector of Saxony" had forfeited the Polish crown, set out for Warsaw, which he reached on the 14th of May. The cardinal-primate was then sent for and commanded to summon a diet, for the purpose of deposing Augustus. A fortnight later Charles quitted Warsaw, to seek the elector; on the 2nd of July routed the combined Poles and Saxons at Klissow; and three weeks later, captured the fortress of Cracow by an act of almost fabulous audacity. Thus, within four months of the opening of the campaign, the Polish capital and the coronation city were both in the possession of the Swedes. After Klissow, Augustus made every effort to put an end to the war, but Charles would not even consider his offers. By this time, too, he had conceived a passion for the perils and adventures of warfare. His character was hardening, and he deliberately adopted the most barbarous expedients for converting the Augustan Poles to his views. Such commands as "ravage, singe, and burn all about, and reduce the whole district to a wilderness!" "sweat contributions well out of them!" "rather let the innocent suffer than the guilty escape!" became painfully frequent in the mouth of the young commander, not yet 21, who was far from being naturally cruel.

The campaign of 1703 was remarkable for Charles's victory at Pultusk (April 21) and the long siege of Thorn, which occupied him eight months but cost him only 50 men. On the 2nd of July 1704, with the assistance of a bribing fund, Charles's ambassador at Warsaw, Count Arvid Bernard Horn, succeeded in forcing through the election of Charles's candidate to the Polish throne, Stanislaus Leszczyński, who could not be crowned however till the 24th of September 1705, by which time the Saxons had again been defeated at Punitz. From the autumn of 1705 to the spring of 1706, Charles was occupied in pursuing the Russian auxiliary army under Ogilvie through the forests of Lithuania. On the 5th of August, he recrossed the Vistula and established himself in Saxony, where his presence in the heart of Europe at the very crisis of the war of the Spanish Succession, fluttered all the western diplomats. The allies, in particular, at once suspected that Louis XIV. had bought the Swedes. Marlborough was forthwith sent from the Hague to the castle of Altranstädt near Leipzig, where Charles had fixed his headquarters, "to endeavour to penetrate the designs" of the king of Sweden. He soon convinced himself that western Europe had nothing to fear from Charles, and that no bribes were necessary to turn the Swedish arms from Germany to Russia. Five months later (Sept. 1707) Augustus was forced to sign the peace of Altranstädt, whereby he resigned the Polish throne and renounced every anti-Swedish alliance. Charles's departure from Saxony was delayed for twelve months by a quarrel with the emperor. The court of Vienna had treated the Silesian Protestants with tyrannical severity, in direct contravention of the treaty of Osabrück, of which Sweden was one of the guarantors; and Charles demanded summary and complete restitution so dictatorially that the emperor prepared for war. But the allies interfered in Charles's favour, lest he might be tempted to aid France, and induced the emperor to satisfy all the Swedish king's demands, the maritime Powers at the same time agreeing to guarantee the provisions of the peace of Altranstädt.

Nothing now prevented Charles from turning his victorious arms against the tsar; and on the 13th of August 1707, he evacuated Saxony at the head of the largest host he ever commanded, consisting of 24,000 horse and 20,000 foot. Delayed during the autumn months in Poland by the tardy arrival of reinforcements from Pomerania, it was not till November 1707 that Charles was able to take the field. On New Year's Day 1708 he crossed the Vistula, though the ice was in a dangerous condition. On the 4th of July 1708 he cut in two the line of the Russian army, 6 m. long, which barred his progress on the Wabis, near Holowczyn, and compelled it to retreat. The victory of Holowczyn, memorable besides as the last pitched battle won by Charles XII., opened up the way to the Dnieper. The Swedish army now began to suffer severely, bread and fodder running short, and the soldiers subsisting entirely on captured bullocks. The Russians slowly retired before the invader, burning and destroying everything in his path. On the 20th of December it was plain to Charles himself that Moscow was inaccessible. But the idea of a retreat was intolerable to him, so he determined to march southwards instead of northwards as suggested by his generals, and join his forces with those of the hetman of the Dnieperian Cossacks, Ivan Mazepa, who had 100,000 horsemen and a fresh and fruitful land at his disposal. Short of falling back upon Livonia, it was the best plan adoptable in the circumstances, but it was rendered abortive by Peter's destruction of Mazepa's capital Baturin, so that when Mazepa joined Charles at Horki, on the 8th of November 1708, it was as a ruined man with little more than 1300 personal attendants (see MAZEPA-KOLEDINSKY). A still more serious blow was the destruction of the relief army which Levenhaupt was bringing to Charles from Livonia, and which, hampered by hundreds of loaded wagons, was overtaken and almost destroyed by Peter at Lyesna after a two days' battle against fourfold odds (October). The very elements now began to fight against the perishing but still unconquered host. The winter of 1708 was the severest that Europe had known for a century. By the 1st of November

firewood would not ignite in the open air, and the soldiers warmed themselves over big bonfires of straw. By the time the army reached the little Ukrainian fortress of Hadjazc in January 1700, wine and spirits froze into solid masses of ice; birds on the wing fell dead; saliva congealed on its passage from the mouth to the ground. "Nevertheless," says an eye-witness, "though earth, sea and sky were against us, the king's orders had to be obeyed and the daily march made."

Never had Charles XII. seemed so superhuman as during these awful days. It is not too much to say that his imperturbable equanimity, his serene *bonhomie* kept the host together. The frost broke at the end of February 1700, and then the spring floods put an end to all active operations till May, when Charles began the siege of the fortress of Poltava, which he wished to make a base for subsequent operations while awaiting reinforcements from Sweden and Poland. On the 7th of June a bullet wound put Charles *hors de combat*, whereupon Peter threw the greater part of his forces over the river Vorskla, which separated the two armies (June 19-25). On the 26th of June Charles held a council of war, at which it was resolved to attack the Russians in their entrenchments on the following day. The Swedes joyfully accepted the chances of battle and, advancing with irresistible *élan*, were, at first, successful on both wings. Then one or two tactical blunders were committed; and the tsar, taking courage, enveloped the little band in a vast semicircle bristling with the most modern guns, which fired five times to the Swedes' once, and swept away the guards before they could draw their swords. The Swedish infantry was well nigh annihilated, while the 14,000 cavalry, exhausted and demoralized, surrendered two days later at Perevolochna on Dnieper. Charles himself with 1500 horsemen took refuge in Turkish territory.

For the first time in his life Charles was now obliged to have recourse to diplomacy; and his pen proved almost as formidable as his sword. He procured the dismissal of four Russo-phil grand-viziers in succession, and between 1710 and 1712 induced the Porte to declare war against the tsar three times. But after November 1712 the Porte had no more money to spare; and, the tsar making a show of submission, the sultan began to regard Charles as a troublesome guest. On the 1st of February 1713 he was attacked by the Turks in his camp at Bender, and made prisoner after a contest which reads more like an extravagant episode from some heroic folk-tale than an incident of sober 18th-century history. Charles lingered on in Turkey fifteen months longer, in the hope of obtaining a cavalry escort sufficiently strong to enable him to restore his credit in Poland. Disappointed of this last hope, and moved by the despairing appeals of his sister Ulrica and the senate to return to Sweden while there was still a Sweden to return to, he quitted Demotika on the 20th of September 1714, and attended by a single squire arrived unexpectedly at midnight, on the 11th of November, at Stralsund, which, excepting Wismar, was now all that remained to him on German soil.

For the diplomatic events of these critical years see SWEDEN: *History*. Here it need only be said that Sweden, during the course of the Great Northern War, had innumerable opportunities of obtaining an honourable and even advantageous peace, but they all foundered on the dogged refusal of Charles to consent to the smallest concession to his despoilers. Even now he would listen to no offers of compromise, and after defending Stralsund with desperate courage till it was a mere rubbish heap, returned to Sweden after an absence of 14 years. Here he collected another army of 20,000 men, with which he so strongly entrenched himself on the Scanian coast in 1716 that his combined enemies shrank from attacking him, whereupon he assumed the offensive by attacking Norway in 1717, and again, in 1718, in order to conquer sufficient territory to enable him to extort better terms from his enemies. It was during this second adventure that he met his death. On the 11th of December, when the Swedish approaches had come within 280 paces of the fortress of Fredriksten, which the Swedes were closely besieging, Charles looked over the parapet of the foremost trench, and was shot through the head by a bullet from the fortress.

**CHARLES XIII.** (1748-1818), king of Sweden and Norway, the second son of Adolphus Frederick, king of Sweden, and Louisa Ulrica, sister of Frederick the Great, was born at Stockholm on the 7th of October 1748. In 1772 he co-operated in the revolutionary plans of his brother Gustavus III. (*q.v.*). On the outbreak of the Russo-Swedish War of 1788 he served with distinction as admiral of the fleet, especially at the battles of Hogland (June 17, 1788) and Öland (July 26, 1789). On the latter occasion he would have won a signal victory but for the unaccountable remissness of his second-in-command, Admiral Liljehorn. On the death of Gustavus III., Charles, now duke of Sudermania, acted as regent of Sweden till 1796; but the real ruler of the country was the narrow-minded and vindictive Gustaf Adolf Reuterholm (*q.v.*), whose mischievous influence over him was supreme. These four years were perhaps the most miserable and degrading in Swedish history (an age of lead succeeding an age of gold, as it has well been called) and may be briefly described as alternations of fantastic jacobinism and ruthless despotism. On the accession of Gustavus IV. (November 1796), the duke became a mere cipher in politics till the 13th of March 1809, when those who had dethroned Gustavus IV. appointed him regent, and finally elected him king. But by this time he was prematurely decrepit, and Bernadotte (see CHARLES XIV.) took over the government as soon as he landed in Sweden (1810). By the union of 1814 Charles became the first king of Sweden and Norway. He married his cousin Hedwig Elizabeth Charlotte of Holstein-Gottorp (1759-1818), but their only child, Carl Adolf, duke of Vermland, died in infancy (1798). Charles XIII., who for eight years had been king only in title, died on the 5th of February 1818.

**CHARLES XIV.** (1763-1844), king of Sweden and Norway, born at Pau on the 26th of January 1763, was the son of Henri Bernadotte (1711-1780), procurator at Pau, and Jeanne St Jean (1725-1809). The family name was originally Deu Pouey, but was changed into Bernadotte in the beginning of the 17th century. Bernadotte's christian names were Jean Baptiste; he added the name Jules subsequently. He entered the French army on the 3rd of September 1780, and first saw service in Corsica. On the outbreak of the Revolution his eminent military qualities brought him speedy promotion. In 1794 we find him as brigadier attached to the army of the Sambre et Meuse, and after Jourdan's victory at Fleurus he was appointed a general of division. At the battle of Theiningen, 1796, he contributed, more than any one else, to the successful retreat of the French army over the Rhine after its defeat by the archduke Charles. In 1797 he brought reinforcements from the Rhine to Bonaparte's army in Italy, distinguishing himself greatly at the passage of the Tagliamento, and in 1798 was sent as ambassador to Vienna, but was compelled to quit his post owing to the disturbances caused by his hoisting the tricolor over the embassy. On the 16th of August 1798 he married Désirée Clary (1777-1860), the daughter of a Marseilles banker, and sister of Joseph Bonaparte's wife. From the 2nd of July to the 14th of September he was war minister, in which capacity he displayed great ability. About this time he held aloof from Bonaparte, but though he declined to help Napoleon in the preparations for the *coup d'état* of November 1799, he accepted employment from the Consulate, and from April 1800 till the 18th of August 1801 commanded the army in La Vendée. On the introduction of the empire he

was made one of the eighteen marshals of France, and, from June 1804 to September 1805, acted as governor of the recently-occupied Hanover. During the campaign of 1805, Bernadotte with an army corps from Hanover co-operated in the great movement which resulted in the shutting up of Mack in Ulm. He was rewarded for his services at Austerlitz (December 2, 1805) by the principality of Ponte Corvo (June 5, 1806), but during the campaign against Prussia, the same year, was severely reproached by Napoleon for not participating with his army corps in the battles of Jena and Auerstädt, though close at hand. In 1808, as governor of the Hanse towns, he was to have directed the expedition against Sweden, via the Danish islands, but the plan came to nought because of the want of transports and the defection of the Spanish contingent. In the war against Austria, Bernadotte led the Saxon contingent at the battle of Wagram, on which occasion, on his own initiative he issued an order of the day, attributing the victory principally to the valour of his Saxons, which Napoleon at once disavowed.

Bernadotte, considerably piqued, thereupon returned to Paris, where the council of ministers entrusted him with the defence of the Netherlands against the English. In 1810 he was about to enter upon his new post of governor of Rome when he was, unexpectedly, elected successor to the Swedish throne, partly because a large part of the Swedish army, in view of future complications with Russia, were in favour of electing a soldier, and partly because Bernadotte was very popular in Sweden, owing to the kindness he had shown to the Swedish prisoners during the late war with Denmark. The matter was decided by one of the Swedish couriers, Baron Karl Otto Mörner, who, entirely on his own initiative, offered the succession to the Swedish crown to Bernadotte. Bernadotte communicated Mörner's offer to Napoleon, who treated the whole affair as an absurdity. Bernadotte thereupon informed Mörner that he would not refuse the honour if he were duly elected. Although the Swedish government, amazed at Mörner's effrontery, at once placed him under arrest on his return to Sweden, the candidature of Bernadotte gradually gained favour there, and, on the 21st of August 1810, he was elected crown-prince.

On the 2nd of November Bernadotte made his solemn entry into Stockholm, and on the 5th he received the homage of the estates and was adopted by Charles XIII. under the name of Charles John. The new crown-prince was very soon the most popular and the most powerful man in Sweden. The infirmity of the old king and the dissensions in the council of state placed the government, and especially the control of foreign affairs, entirely in his hands. The keynote of his whole policy was the acquisition of Norway, a policy which led him into many tortuous ways (see SWEDEN: *History*), and made him a very tricky ally during the struggle with Napoleon in 1813. Great Britain and Prussia very properly insisted that Charles John's first duty was to them, the former power rigorously protesting against the expenditure of her subsidies on the nefarious Norwegian adventure before the common enemy had been crushed. After the defeats of Lützen and Bautzen, it was the Swedish crown-prince who put fresh heart into the allies; and at the conference of Trachenberg he drew up the general plan for the campaign which began after the expiration of the truce of Pläswitz. Though undoubtedly sparing his Swedes unduly, to the just displeasure of the allies, Charles John, as commander-in-chief of the northern army, successfully defended the approaches to Berlin against Oudinot in August and against Ney in September; but after Leipzig he went his own way, determined at all hazards to cripple Denmark and secure Norway. For the events which led to the union of Norway and Sweden, see SWEDEN: *History* and NORWAY: *History*. As unional king, Charles XIV. (who succeeded to that title in 1818 on the death of Charles XIII.) was popular in both countries. Though his ultra-conservative views were detested, and as far as possible opposed (especially after 1823), his dynasty was never in serious danger, and Swedes and Norsemen alike were proud of a monarch with a European reputation. It is true that the *Riksdag* of 1840 meditated compelling him to abdicate, but the storm blew over and his jubilee

was celebrated with great enthusiasm in 1843. He died at Stockholm on the 8th of March 1844. His reign was one of uninterrupted peace, and the great material development of the two kingdoms during the first half of the 19th century was largely due to his energy and foresight.

See J. E. Sars, *Norges politiske historia* (Christiania, 1899); Yngvar Nielsen, *Carl Johan som han virkelig var* (Christiania, 1897); Johan Almén, *Allen Bernadotte* (Stockholm, 1893); C. Schefer, *Bernadottes roi* (Paris, 1899); G. R. Lagerhjelm, *Napoleon och Carl Johan under Kriget i Tyskland, 1813* (Stockholm, 1891). (R. N. B.)

**CHARLES XV.** (1826–1872), king of Sweden and Norway, eldest son of Oscar I., king of Sweden and Norway, and Josephine Beauharnais of Leuchtenberg, was born on the 3rd of May 1826. On the 19th of June 1850 he married Louisa, daughter of Prince Frederick of the Netherlands. He became regent on the 25th of September 1857, and king on the death of his father (8th of July 1859). As crown-prince, Charles's brusque and downright manners had led many to regard his future accession with some apprehension, yet he proved to be one of the most popular of Scandinavian kings and a constitutional ruler in the best sense of the word. His reign was remarkable for its manifold and far-reaching reforms. Sweden's existing communal law (1862), ecclesiastical law (1863) and criminal law (1864) were enacted appropriately enough under the direction of a king whose motto was: "Build up the land upon the laws!" Charles XV. also materially assisted De Geer (q.v.) to carry through his memorable reform of the constitution in 1863. Charles was a warm advocate of "Scandinavianism" and the political solidarity of the three northern kingdoms, and his warm friendship for Frederick VII., it is said, led him to give half promises of help to Denmark on the eve of the war of 1864, which, in the circumstances, were perhaps misleading and unjustifiable. In view, however, of the unpreparedness of the Swedish army and the difficulties of the situation, Charles was forced to observe a strict neutrality. He died at Malmö on the 18th of September 1872. Charles XV. was highly gifted in many directions. He attained to some eminence as a painter, and his *Digte* show him to have been a true poet. He left but one child, a daughter, Louisa Josephina Eugenia, who in 1869 married the crown-prince Frederick of Denmark.

See Cecilia Bååth-Holmberg, *Carl XV., som enskild man, hövling och konstnär* (Stockholm, 1891); Yngvar Nielsen, *Det norske og svenske Kongehus fra 1818* (Christiania, 1883). (R. N. B.)

**CHARLES** (c. 1319–1364), duke of Brittany, known as CHARLES OF BLOIS and CHARLES OF CHÂTILLON, was the son of Guy of Châtillon, count of Blois (d. 1342), and of Marguerite of Valois, sister of Philip VI. of France. In 1337 he married Jeanne of Penthièvre (d. 1384), daughter of Guy of Brittany, count of Penthièvre (d. 1331), and thus acquired a right to the succession of the duchy of Brittany. On the death of John III., duke of Brittany, in April 1341, his brother John, count of Montfort-l'Amaury, and his niece Jeanne, wife of Charles of Blois, disputed the succession. Charles of Blois, sustained by Philip VI., captured John of Montfort, who was supported by King Edward III. at Nantes, besieged his wife Jeanne of Flanders at Hennebont, and took Quimper and Guérande (1344). But next year his partisans were defeated at Cadoreff, and in June 1347 he was himself wounded and taken prisoner at Roche-Derrien. He was not liberated until 1356, when he continued the war against the young John of Montfort, and perished in the battle of Auray, on the 29th of September 1364. Charles bore a high reputation for piety, and was believed to have performed miracles. The Roman Church has canonized him.

See Siméon Luce, *Histoire de Bertrand du Guesclin et de son époque* (Paris, 1876).

**CHARLES**, called THE BOLD (1433–1477), duke of Burgundy, son of Philip the Good of Burgundy and Isabella of Portugal, was born at Dijon on the 10th of November 1433. In his father's lifetime he bore the title of count of Charolais. He was brought up under the direction of the seigneur d'Auxy, and early showed great application to study and also to warlike exercises. Although he was on familiar terms with the dauphin (afterwards Louis XI.), when the latter was a refugee at the court of Burgundy, he could

not but view with chagrin the repurchase by the king of France of the towns on the Somme, which had been temporarily ceded to Philip the Good by the treaty of Arras; and when his father's failing health enabled him to take into his hands the reins of government (which Philip abandoned to him completely by an act of the 12th of April 1465), he entered upon his lifelong struggle against Louis XI., and became one of the principal leaders of the League of the Public Weal. His brilliant bravery at the battle of Montlbery (16th of July 1465), where he was wounded and was left master of the field, neither prevented the king from re-entering Paris nor assured Charles a decisive victory. He succeeded, however, in forcing upon Louis the treaty of Conflans (1466), by which the king restored to him the towns on the Somme, and promised him the hand of his infant daughter Catherine, with Champagne as dowry. In the meanwhile the count of Charolais obtained the surrender of Pontthieu. The revolt of Liège and Dinant intervened to divert his attention from the affairs of France. On the 25th of August 1466 Charles took possession of Dinant, which he pillaged and sacked, and succeeded in treating at the same time with the Liégeois. After the death of Philip the Good (15th June 1467), the Liégeois renewed hostilities, but Charles defeated them at St Trond, and made a victorious entry into Liège, which he dismantled and deprived of some of its privileges.

Alarmed by these early successes of the duke of Burgundy, and anxious to settle various questions relating to the execution of the treaty of Conflans, Louis requested a meeting with Charles and placed himself in his hands at Péronne. In the course of the negotiations the duke was informed of a fresh revolt of the Liégeois secretly fomented by Louis. After deliberating for four days how to deal with his adversary, who had thus maliciously placed himself at his mercy, Charles decided to respect the parole he had given and to treat with Louis (October 1468), at the same time forcing him to assist in quelling the revolt. The town was carried by assault and the inhabitants were massacred, Louis not having the courage to intervene on behalf of his ancient allies. At the expiry of the one year's truce which followed the treaty of Péronne, the king accused Charles of treason, cited him to appear before the parlement, and seized some of the towns on the Somme (1471). The duke retaliated by invading France with a large army, taking possession of Nesle and massacring its inhabitants. He failed, however, in an attack on Beauvais, and had to content himself with ravaging the country as far as Rouen, eventually retiring without having attained any useful result.

Other matters, moreover, engaged his attention. Relinquishing, if not the stately magnificence, at least the gay and wasteful profusion which had characterized the court of Burgundy under the preceding duke, he had bent all his efforts towards the development of his military and political power. Since the beginning of his reign he had employed himself in reorganizing his army and the administration of his territories. While retaining the principles of feudal recruiting, he had endeavoured to establish a system of rigid discipline among his troops, which he had strengthened by taking into his pay foreign mercenaries, particularly Englishmen and Italians, and by developing his artillery. Furthermore, he had lost no opportunity of extending his power. In 1469 the archduke of Austria, Sigismund, had sold him the county of Ferrette, and the landgraviate of Alsace and some other towns, reserving to himself the right to repurchase. In 1472-1473 Charles bought the reversion of the duchy of Gelderland from its old duke, Arnold, whom he had supported against the rebellion of his son. Not content with being "the grand duke of the West," he conceived the project of forming a kingdom of Burgundy or Arles with himself as independent sovereign, and even persuaded the emperor Frederick to assent to crown him king at Trier. The ceremony, however, did not take place owing to the emperor's precipitate flight by night (September 1473), occasioned by his displeasure at the duke's attitude. In the following year Charles involved himself in a series of difficulties and struggles which ultimately brought about his downfall. He embroiled himself successively

with Sigismund of Austria, to whom he refused to restore his possessions in Alsace for the stipulated sum; with the Swiss, who supported the free towns of Alsace in their revolt against the tyranny of the ducal governor, Peter von Hagenbach (who was condemned and executed by the rebels in May 1474); and finally, with René of Lorraine, with whom he disputed the succession of Lorraine, the possession of which had united the two principal portions of Charles's territories—Flanders and the duchy and county of Burgundy. All these enemies, incited and supported as they were by Louis, were not long in joining forces against their common adversary. Charles suffered a first rebuff in endeavouring to protect his kinsman, the archbishop of Cologne, against his rebel subjects. He spent ten months (July 1474-June 1475) in besieging the little town of Neuss on the Rhine, but was compelled by the approach of a powerful imperial army to raise the siege. Moreover, the expedition he had persuaded his brother-in-law, Edward IV. of England, to undertake against Louis was stopped by the treaty of Picquigny (20th of August 1475). He was more successful in Lorraine, where he seized Nancy (30th of November 1475). From Nancy he marched against the Swiss, hanging and drowning the garrison of Granson in spite of the capitulation. Some days later, however, he was attacked before Granson by the confederate army and suffered a shameful defeat, being compelled to fly with a handful of attendants, and leaving his artillery and an immense booty in the hands of the allies (February 1476). He succeeded in raising a fresh army of 30,000 men, with which he attacked Morat, but he was again defeated by the Swiss army, assisted by the cavalry of René of Lorraine (22nd of June 1476). On the 6th of October Charles lost Nancy, which was re-entered by René. Making a last effort, Charles formed a new army and arrived in the depth of winter before the walls of Nancy. Having lost many of his troops through the severe cold, it was with only a few thousand men that he met the joint forces of the Lorrainers and the Swiss, who had come to the relief of the town (6th of January 1477). He himself perished in the fight, his mutilated body being discovered some days afterwards.

Charles the Bold has often been regarded as the last representative of the feudal spirit—a man who possessed no other quality than a blind bravery—and accordingly has often been contrasted with his rival Louis XI. as representing modern politics. In reality, he was a prince of wide knowledge and culture, knowing several languages and austere in morals; and although he cannot be acquitted of occasional harshness, he had the secret of winning the hearts of his subjects, who never refused him their support in times of difficulty. He was thrice married—to Catherine (d. 1446), daughter of Charles VII. of France, by whom he had one daughter, Mary, afterwards the wife of the Emperor Maximilian I.; to Isabella (d. 1465), daughter of Charles I., duke of Bourbon; and to Margaret of York, sister of Edward IV. of England, whom he married in 1468.

The original authorities for the life and times of Charles the Bold are the numerous French, Burgundian and Flemish chroniclers of the latter part of the 15th century. Special mention may be made of the *Mémoires* of Philippe de Comines; and of the *Mémoires* and other writings of Olivier de la Marche. See also A. Molinier, *Les Sources de l'histoire de France*, tome iv. (1904), and the compendious bibliography in U. Chevalier's *Répertoire des sources historiques*, part iii. (1904). *Charles the Bold*, by J. F. Kirk (1863-1868), is a good English biography for its date; a more recent life is R. Putnam's *Charles the Bold* (1908). For a general sketch of the relations between France and Burgundy at this time see E. Lavisse, *Histoire de France*, tome iv. (1902). (R. Po.)

**CHARLES**, called THE GOOD (le Bon), or THE DANE (c. 1084-1127), count of Flanders, only son of Canute or Knut IV., king of Denmark, by Adela, daughter of Robert the Frisian, count of Flanders, was born about 1084. After the assassination of Canute in 1086, his widow took refuge in Flanders, taking with her her son. Charles was brought up by his mother and grandfather, Robert the Frisian, on whose death he did great services to his uncle, Robert II., and his cousin, Baldwin VII., counts of Flanders. Baldwin died of a wound received in battle in 1110, and, having no issue, left by will the succession to his countship to Charles the Dane. Charles did not secure his

heritage without a civil war, but he was speedily victorious and made his position secure by treating his opponents with great clemency. He now devoted himself to promoting the welfare of his subjects, and did his utmost to support the cause of Christianity, both by his bounty and by his example. He well deserved the surname of *Le Bon*, by which he is known to posterity. He refused the offer of the crown of Jerusalem on the death of Baldwin, and declined to be nominated as a candidate for the imperial crown in succession to the emperor Henry V. He was murdered in the church of St Donat at Bruges on the 2nd of March 1127.

See J. Perneel, *Histoire du règne de Charles le Bon, précédé d'un résumé de l'histoire de Flandres* (Brussels, 1830).

**CHARLES I.** (c. 950-c. 992), duke of Lower Lorraine, was a younger son of the Frankish king Louis IV., and consequently a member of the Carolingian family. Unable to obtain the duchy of Burgundy owing to the opposition of his brother, King Lothair, he went to the court of his maternal uncle, the emperor Otto the Great, about 965, and in 977 received from the emperor Otto II. the duchy of Lower Lorraine. His authority in Lorraine was nominal; but he aided Otto in his struggle with Lothair, and on the death of his nephew, Louis V., made an effort to secure the Frankish crown. Hugh Capet, however, was the successful candidate and war broke out. Charles had gained some successes and had captured Reims, when in 991 he was treacherously seized by Adalberon, bishop of Laon, and handed over to Hugh. Imprisoned with his wife and children at Orleans, Charles did not long survive his humiliation. His eldest son Otto, duke of Lower Lorraine, died in 1005.

**CHARLES II.** (d. 1431), duke of Lorraine, called **THE BOLD**, is sometimes referred to as Charles I. A son of Duke John I., he succeeded his father in 1390; but he neglected his duchy and passed his life in warfare. He died on the 25th of January 1431, leaving two daughters, one of whom, Isabella (d. 1453), married René I. of Anjou (1400-1480), king of Naples, who succeeded his father-in-law as duke of Lorraine.

**CHARLES III.** or **II.** (1543-1608), called **THE GREAT**, duke of Lorraine, was a son of Duke Francis I. (d. 1545), and a descendant of René of Anjou. He was only an infant when he became duke, and was brought up at the court of Henry II. of France, marrying Henry's daughter Claude in 1559. He took part in the wars of religion in France, and was a member of the League; but he was overshadowed by his kinsmen the Guises, although he was a possible candidate for the French crown in 1589. The duke, who was an excellent ruler of Lorraine, died at Nancy on the 14th of May 1608. He had three sons: Henry (d. 1624) and Francis (d. 1632), who became in turn dukes of Lorraine, and Charles (d. 1607), bishop of Metz and Strassburg.

**CHARLES IV.** or **III.** (1604-1675), duke of Lorraine, was a son of Duke Francis II., and was born on the 5th of April 1604. He became duke on the abdication of his father in 1624, and obtained the duchy of Bar through his marriage with his cousin Nicole (d. 1657), daughter of Duke Henry. Mixing in the tortuous politics of his time, he was in continual conflict with the crown of France, and spent much of his time in assisting her enemies and in losing and regaining his duchies (see **LORRAINE**). He lived an adventurous life, and in the intervals between his several struggles with France fought for the emperor Ferdinand II. at Nordlingen and elsewhere; talked of succouring Charles I. in England; and after the conclusion of the treaty of Westphalia in 1648 entered the service of Spain. He died on the 18th of September 1675, leaving by his second wife, Béatrix de Cusance (d. 1663), a son, Charles Henry, count of Vaudemont (1642-1723).

**CHARLES V.** or **IV.** (1643-1690), duke of Lorraine, nephew of Duke Charles IV., was born on the 3rd of April 1643, and in 1664 received a colonelcy in the emperor's army. In the same year he fought with distinction at the battle of St Gotthard, in which he captured a standard from the Turks. He was a candidate for the elective crown of Poland in 1668. In 1670 the emperor made him general of horse, and during the following years he was constantly on active service, first against the Turks

and subsequently against the French. At Seneff (1674) he was wounded. In the same year he was again a candidate for the Polish crown, but was unsuccessful, John Sobieski, who was to be associated with him in his greatest feat of arms, being elected. In 1675, on the death of Charles IV., he rode with a cavalry corps into the duchy of Lorraine, then occupied by the French, and secured the adhesion of the Lorraine troops to himself; a little after this he succeeded Montecucculi as general of the imperial army on the Rhine, and was made a field marshal. The chief success of his campaign of 1676 was the capture of Philipsburg after a long and arduous siege. The war continued without decisive result for some time, and the fate of the duchy, which was still occupied by the French, was the subject of endless diplomacy. At the general peace Charles had to accept the hard conditions imposed by Louis XIV., and he never entered into effective possession of his sovereignty. In 1678 he married the widowed queen of Poland, Eleonora Maria of Austria, and for nearly five years they lived quietly at Innsbruck. The Turkish invasion of 1683, the last great effort of the Turks to impose their will on Europe, called Charles into the field again. At the head of a weak imperial army the duke offered the best resistance he could to the advance of the Turks on Vienna. But he had to fall back, contesting every position, and the Turks finally invested Vienna (July 13th, 1683). At this critical moment other powers came to the assistance of Austria, reinforcements poured into Charles's camp, and John Sobieski, king of Poland, brought 27,000 Poles. Sobieski and Charles had now over 80,000 men, Poles, Austrians and Germans, and on the morning of the 12th of September they moved forward to the attack. By nightfall the Turks were in complete disorder, Vienna was relieved, and the danger was at an end. Soon the victors took the offensive and reconquered part of the kingdom of Hungary. The Germans and Poles went home in the winter, but Charles continued his offensive with the imperialists alone. Ofen (Buda) resisted his efforts in 1684, but in the campaign of 1685 Neuhausel was taken by storm, and in 1686 Charles, now reinforced by German auxiliaries, resumed the siege of Ofen. All attempts to relieve the place were repulsed, and Ofen was stormed on the 2nd of September. In the following campaign the Austrians won a decisive victory on the famous battle-ground of Mohacs (August 18th, 1687). In 1689 Charles took the field on the Rhine against the forces of Louis XIV., the enemy of his house. Mainz and Bonn were taken in the first campaign, but Charles in travelling from Vienna to the front died suddenly at Wels on the 18th of April 1690.

His eldest son, Leopold Joseph (1670-1729), at the peace of Ryswick in 1697 obtained the duchy, of which his father had been dispossessed by France, and was the father of Francis Stephen, duke of Lorraine, who became the husband of Maria Theresa (q.v.), and of Charles (Karl Alexander), a distinguished Austrian commander in the wars with Frederick the Great. The duchy was ceded by Francis Stephen to Stanislaus Leczynski, the dethroned king of Poland, in 1736, Francis receiving instead the grand-duchy of Tuscany.

**CHARLES II.** [**CHARLES LOUIS DE BOURBON**] (1799-1833), duke of Parma, succeeded his mother, Maria Louisa, duchess of Lucca, as duke of Lucca in 1824. He introduced economy into the administration, increased the schools, and in 1832 as a reaction against the bigotry of the priests and monks with which his mother had surrounded him, he became a Protestant. He at first evinced Liberal tendencies, gave asylum to the Modenese political refugees of 1831, and was indeed suspected of being a Carbonaro. But his profligacy and eccentricities soon made him the laughing-stock of Italy. In 1842 he returned to the Catholic Church and made Thomas Ward, an English groom, his prime minister, a man not without ability and tact. Charles gradually abandoned all his Liberal ideas, and in 1847 declared himself hostile to the reforms introduced by Pius IX. The Lucchesi demanded the constitution of 1805, promised them by the treaty of Vienna, and a national guard, but the duke, in spite of the warnings of Ward, refused all concessions. A few weeks later he retired to Modena, selling his life-interest

in the duchy to Tuscany. On the 17th of October Maria Louisa of Austria, duchess of Parma, died, and Charles Louis succeeded to her throne by the terms of the Florence treaty, assuming the style of Charles II. His administration of Parma was characterized by ruinous finance, debts, disorder and increased taxation, and he concluded an offensive and defensive alliance with Austria. But on the outbreak of the revolution of 1848 there were riots in his capital (19th of March), and he declared his readiness to throw in his lot with Charles Albert, the pope, and Leopold of Tuscany, repudiated the Austrian treaty and promised a constitution. Then he again changed his mind, abdicated in April, and left Parma in the hands of a provisional government, whereupon the people voted for union with Piedmont. After the armistice between Charles Albert and Austria (August 1848) the Austrian general Thurn occupied the duchy, and Charles II. issued an edict from Weistropp annulling the acts of the provisional government. When Piedmont attacked Austria again in 1849, Parma was evacuated, but reoccupied by General d'Aspre in April.

In May 1849 Charles confirmed his abdication, and was succeeded by his son CHARLES III. (1823-1854), who, protected by Austrian troops, placed Parma under martial law, inflicted heavy penalties on the members of the late provisional government, closed the university, and instituted a regular policy of persecution. A violent ruler, a drunkard and a libertine, he was assassinated on the 26th of March 1854. At his death his widow Maria Louisa, sister of the comte de Chambord, became regent, during the minority of his son Robert. The duchess introduced some sort of order into the administration, seemed inclined to rule more mildly and dismissed some of her husband's more obnoxious ministers, but the riots of the Mazzinians in July 1854 were repressed with ruthless severity, and the rest of her reign was characterized by political trials, executions and imprisonments, to which the revolutionists replied with assassinations.

**CHARLES [KARL LUDWIG] (1771-1847)**, archduke of Austria and duke of Teschen, third son of the emperor Leopold II., was born at Florence (his father being then grand-duke of Tuscany) on the 5th of September 1771. His youth was spent in Tuscany, at Vienna and in the Austrian Netherlands, where he began his career of military service in the war of the French Revolution. He commanded a brigade at Jemappes, and in the campaign of 1793 distinguished himself at the action of Aldenhoven and the battle of Neerwinden. In this year he became *Statthalter* in Belgium and received the army rank of lieutenant field marshal, which promotion was soon followed by that to *Feldzeugmeister*. In the remainder of the war in the Low Countries he held high commands, and he was present at Fleurus. In 1795 he served on the Rhine, and in the following year was entrusted with the chief control of all the Austrian forces on that river. His conduct of the operations against Jourdan and Moreau in 1796 marked him out at once as one of the greatest generals in Europe. At first falling back carefully and avoiding a decision, he finally marched away, leaving a mere screen in front of Moreau; falling upon Jourdan he beat him in the battles of Amberg and Würzburg, and drove him over the Rhine with great loss. He then turned upon Moreau's army, which he defeated and forced out of Germany. For this campaign, one of the most brilliant in modern history, see FRENCH REVOLUTIONARY WARS. In 1797 he was sent to arrest the victorious march of General Bonaparte in Italy, and he conducted the retreat of the over-matched Austrians with the highest skill. In the campaign of 1799 he was once more opposed to Jourdan, whom he defeated in the battles of Ostrach and Stokach, following up his success by invading Switzerland and defeating Masséna in the (first) battle of Zürich, after which he re-entered Germany and drove

the French once more over the Rhine. Ill-health, however, forced him to retire to Bohemia, whence he was soon recalled to undertake the task of checking Moreau's advance on Vienna. The result of the battle of Hohenlinden had, however, foredoomed the attempt, and the archduke had to make the armistice of Steyer. His popularity was now such that the diet of Regensburg, which met in 1802, resolved to erect a statue in his honour and to give him the title of saviour of his country; but Charles refused both distinctions.

In the short and disastrous war of 1805 the archduke Charles commanded what was intended to be the main army, in Italy, but events made Germany the decisive theatre of operations, and the defeats sustained on the Danube neutralized the success obtained by the archduke over Masséna in the desperately fought battle of Caldiero. With the conclusion of peace began his active work of army reorganization, which was first tested on the field in 1809. As generalissimo of the army he had been made field marshal some years before. As president of the Council of War, and supported by the prestige of being the only general who had proved capable of defeating the French, he promptly initiated a far-reaching scheme of reform, which replaced the obsolete methods of the 18th century, the chief characteristics of the new order being the adoption of the "nation in arms" principle and of the French war organization and tactics. The new army was surprised in the process of transition by the war of 1809, in which Charles commanded in chief; yet even so it proved a far more formidable opponent than the old, and, against the now heterogeneous army of which Napoleon disposed (see NAPOLEONIC CAMPAIGNS) it succumbed only after a desperate struggle. Its initial successes were neutralized by the reverses of Abensberg, Landshut and Eckmühl; but, after the evacuation of Vienna, the archduke won the great battle of Aspern-Essling (*q.v.*) and soon afterwards fought the still more desperate battle of Wagram (*q.v.*), at the close of which the Austrians were defeated but not routed; they had inflicted upon Napoleon a loss of over 50,000 men in the two battles. At the end of the campaign the archduke gave up all his military offices, and spent the rest of his life in retirement, except a short time in 1815, when he was governor of Mainz. In 1822 he succeeded to the duchy of Saxe-Teschen. The archduke Charles married, in 1815, Princess Henrietta of Nassau-Weilburg (d. 1829). He had four sons, the eldest of whom, the archduke Albert (*q.v.*) became one of the most celebrated generals in Europe, and two daughters, the elder of whom became queen of Naples. He died at Vienna on the 30th of April 1847. An equestrian statue was erected to his memory in Vienna, 1860.

The caution which the archduke preached so earnestly in his strategical works, he displayed in practice only when the situation seemed to demand it, though his education certainly prejudiced him in favour of the defensive at all costs. He was at the same time capable of forming and executing the most daring offensive strategy, and his tactical skill in the handling of troops, whether in wide turning movements, as at Würzburg and Zürich, or in masses, as at Aspern and Wagram, was certainly equal to that of any leader of his time, Napoleon only excepted. The campaign of 1796 is considered almost faultless. That he sustained defeat in 1809 was due in part to the great numerical superiority of the French and their allies, and in part to the condition of his newly reorganized troops. His six weeks' inaction after the victory of Aspern is, however, open to unfavourable criticism. As a military writer, his position in the evolution of the art of war is very important, and his doctrines had naturally the greatest weight. Nevertheless they cannot but be considered as antiquated even in 1806. Caution and the importance of "strategic points" are the chief features of his system. The rigidity of his geographical strategy may be gathered from the prescription that "this principle is *never* to be departed from." Again and again he repeats the advice that nothing should be hazarded unless one's army is *completely* secure, a rule which he himself neglected with such brilliant results in 1796. "Strategic points," he says (not the defeat of the enemy's army), "decide the fate of one's own country, and must

constantly remain the general's main solicitude"—a maxim which was never more remarkably disproved than in the war of 1809. The editor of the archduke's work is able to make but a feeble defence against Clausewitz's reproach that Charles attached more value to ground than to the annihilation of the foe. In his tactical writings the same spirit is conspicuous. His reserve in battle is designed to "cover a retreat." The baneful influence of these antiquated principles was clearly shown in the maintenance of Königgrätz-Josefstadt in 1866 as a "strategic point," which was preferred to the defeat of the separated Prussian armies; in the strange plans produced in Vienna for the campaign of 1859, and in the "almost unintelligible" battle of Montebello in the same year. The theory and the practice of the archduke Charles form one of the most curious contrasts in military history. In the one he is unreal, in the other he displayed, along with the greatest skill, a vivid activity which made him for long the most formidable opponent of Napoleon.

His writings were edited by the archduke Albert and his brother the archduke William in the *Ausgewählte Schriften* *veiland Sr. K. Hohel. Erz. Carl v. Österreich* (1862; reprinted 1893, Vienna and Leipzig), which includes the *Grundsätze der Kriegskunst für die Generale* (1806), *Grundsätze der Strategie erläutert durch die Darstellung des Feldzugs 1796* (1814), *Gesch. des Feldzugs von 1799* (1819)—the two latter invaluable contributions to the history of the war, and papers "on the higher art of war," "on practical training in the field," &c. See, besides the histories of the period, C. von B(ücher)-K(riegelstein), *Geist und Stoff im Kriege* (Vienna, 1895); Caemmerer, *Development of Strategic Science* (English transl.), ch. iv.; M. Adler v. Angeli, *Erzherzog Carl v. Österr.* (Vienna and Leipzig, 1896); Duller, *Erzh. Karl v. Österr.* (Vienna, 1845); Schneidawind, *Karl, Erzherzog v. Österr. und die österr. Armee* (Vienna, 1840); *Das Buch vom Erz. Carl* (1848); Thielein, *Erzh. Karl v. Österr.* (1858); Wolf, *Erzh. Carl* (1860); H. von Zeissberg, *Erzh. Karl v. Österr.* (Vienna, 1895); M. von Angeli, *Erzh. Karl als Feldherr und Organisator* (Vienna, 1896).

**CHARLES** (1525-1574), cardinal of Lorraine, French statesman, was the second son of Claude of Lorraine, duke of Guise, and brother of Francis, duke of Guise. He was archbishop of Reims in 1538, and cardinal in 1547. At first he was called the cardinal of Guise, but in 1550, on the death of his uncle John, cardinal of Lorraine, he in his turn took the style of cardinal of Lorraine. Brilliant, cunning and a master of intrigue, he was, like all the Guises, devoured with ambition and devoid of scruples. He had, said Brantôme, "a soul exceeding smirched," and, he adds, "by nature he was exceedingly craven." Together with his brother, Duke Francis, the cardinal of Lorraine was all-powerful during the reigns of Henry II. and Francis II.; in 1558 and 1559 he was one of the negotiators of the treaty of Cateau-Cambrésis; he fought and pitilessly persecuted the reformers, and by his intolerant policy helped to provoke the crisis of the wars of religion. The death of Francis II. deprived him of power, but he remained one of the principal leaders of the Catholic party. In 1561, at the Colloquy of Poissy, he was commissioned to reply to Theodore Beza. In 1562 he went to the council of Trent, where he at first defended the rights of the Gallican Church against the pretensions of the pope; but after the assassination of his brother, he approached the court of Rome, and on his return to France he endeavoured, but without success, to obtain the promulgation of the decrees of the council (1564). In 1567, when the Protestants took up arms, he held for some time the first place in the king's council, but Catherine de' Medici soon grew weary of his arrogance, and in 1570 he had to leave the court. He endeavoured to regain favour by negotiating at Rome the dispensation for the marriage of Henry of Navarre with Margaret of Valois (1572). He died on the 26th of December 1574, at the beginning of the reign of Henry III. An orator of talent, he left several harangues or sermons, among them being *Oraison prononcée au Colloque de Poissy* (Paris, 1562) and *Oratio habita in Concil. Trident. (Concil. Trident. Orationes, Louvain, 1567)*.

A large amount of correspondence is preserved in the Bibliothèque Nationale, Paris. See also René de Bouillé, *Histoire des ducs de Guise* (Paris, 1840); H. Forneron, *Les Guises et leur époque* (Paris, 1877); Guillemin, *Le Cardinal de Lorraine* (1847).

**CHARLES** [KARL ALEXANDER] (1712-1780), prince of Lorraine, was the youngest son of Leopold, duke of Lorraine, and

grandson of Charles V., duke of Lorraine (see above), the famous general. He was born at Lunéville on the 12th of December 1712, and educated for a military career. After his elder brother Francis, the duke, had exchanged Lorraine for Tuscany and married Maria Theresa, Charles became an Austrian officer, and he served in the campaigns of 1737 and 1738 against the Turks. At the outbreak of the Silesian wars in 1740 (see AUSTRIAN SUCCESSION, WAR OF THE), the queen made her brother-in-law a field marshal, though he was not yet thirty years old, and in 1742 Charles encountered Frederick the Great for the first time at the battle of Chotusitz (May 17th). The victory of the Prussians on that field was far from decisive, and Charles drew off his forces in good order. His conduct of the successful campaign of 1743 against the French and Bavarians heightened his reputation. He married, in January 1744, Marianne of Austria, sister of Maria Theresa, who made them jointly governors-general of the Austrian Netherlands. Very soon the war broke out afresh, and Charles, at the head of the Austrian army on the Rhine, won great renown by his brilliant crossing of the Rhine. Once more a Lorraine prince at the head of Austrian troops invaded the duchy and drove the French before him, but at this moment Frederick resumed the Silesian war, all available troops were called back to oppose him, and the French maintained their hold on Lorraine. Charles hurried to Bohemia, whence, aided by the advice of the veteran field marshal Traun, he quickly expelled the Prussians. At the close of his victorious campaign he received the news that his wife, to whom he was deeply attached, had died in childbirth on the 16th of December 1744 at Brussels. He took the field again in 1745 in Silesia, but this time without the advice of Traun, and he was twice severely defeated by Frederick, at Hohenfriedberg and at Soor. Subsequently, as commander-in-chief in the Low Countries he received, at Roucoux, a heavy defeat at the hands of Marshal Saxe. His government of the Austrian Netherlands during the peace of 1749-1756 was marked by many reforms, and the prince won the regard of the people by his ceaseless activity on their behalf. After the first reverses of the Seven Years' War (*q.v.*), Maria Theresa called Charles again to the supreme command in the field. The campaign of 1757 opened with Frederick's great victory of Prague, and Prince Charles was shut up with his army in that fortress. In the victory of the relieving army under Daun at Kolin Charles had no part. Nevertheless the battle of Breslau, in which the Prussians suffered a defeat even more serious than that of Kolin, was won by him, and great enthusiasm was displayed in Austria over the victory, which seemed to be the final blow to Frederick. But soon afterwards the king of Prussia routed the French at Rossbach, and, swiftly returning to Silesia, he inflicted on Charles the complete and crushing defeat of Leuthen (December 5, 1757). A mere remnant of the Austrian army reassembled after the pursuit, and Charles was relieved of his command. He received, however, from the hands of the empress the grand cross of the newly founded order of Maria Theresa. For a year thereafter Prince Charles acted as a military adviser at Vienna, he then returned to Brussels, where, during the remainder of his life, he continued to govern in the same liberal spirit as before. The affection of the people for the prince was displayed during his dangerous illness in 1765, and in 1775 the estates of Brabant erected a statue in his honour at Brussels. He died on the 4th of July 1780 at the castle of Tervoeren, and was buried with his Lorraine ancestors at Nancy.

**CHARLES** (1270-1325), count of Valois, of Maine, and of Anjou, third son of Philip III., king of France, surnamed the Bold, and of Isabella of Aragon, was born on the 12th of March 1270. By his father's will he inherited the four lordships of Crépy, La Ferté-Milon, Pierrefonds and Béthisy, which together formed the countship of Valois. In 1284 Martin IV., having excommunicated Pedro III., king of Aragon, offered that kingdom to Charles. King Philip failed in an attempt to place his son on this throne, and died on the return of the expedition. In 1290 Charles married Margaret, daughter of Charles II., king of Naples, and renounced his pretensions to Aragon. In

1304, at the beginning of the hostilities against England, he invaded Guienne and took La Réole and Saint-Sever. During the war Flanders (1300), he took Douai, Béthune and Dam, received the submission of Guy of Dampierre, and aided King Philip IV., the Fair, to gain the battle of Mons-en-Pève, on the 18th of August 1304. Asked by Boniface VIII. for his aid against the Ghibellines, he crossed the Alps in June 1301, entered Florence, and helped Charles II., the Lame, king of Sicily, to reconquer Calabria and Apulia from the house of Aragon, but was defeated in Sicily. As after the death of his first wife Charles had married Catherine de Courtenay, a granddaughter of Baldwin II., the last Latin emperor of Constantinople, he tried to assert his rights to that throne. Philip the Fair also wished to get him elected emperor; but Clement V. quashed his candidature in favour of Henry of Luxemburg, afterwards the emperor Henry VII. Under Louis X. Charles headed the party of feudal reaction, and was among those who compassed the ruin of Enguerrand de Marigny. In the reign of Charles IV., the Fair, he fought yet again in Guienne (1324), and died at Perray (Seine-et-Oise) on the 16th of December 1325. His second wife had died in 1307, and in July 1308 he had married a third wife, Mahaut de Châtillon, countess of Saint-Pol. Philip, his eldest son, ascended the French throne in 1328, and from him sprang the royal house of Valois.

See Joseph Petit, *Charles de Valois* (Paris, 1900).

**CHARLES** (1421-1461), prince of Viana, sometimes called Charles IV. king of Navarre, was the son of John, afterwards John II., king of Aragon, by his marriage with Blanche, daughter and heiress of Charles III., king of Navarre. Both his grandfather Charles and his mother, who ruled over Navarre from 1425 to 1441, had bequeathed this kingdom to Charles, whose right had also been recognized by the Cortes; but when Blanche died in 1441 her husband John seized the government to the exclusion of his son. The ill-feeling between father and son was increased when in 1447 John took for his second wife Joanna Henríquez, a Castilian princess, who soon bore him a son, afterwards Ferdinand I. king of Spain, and who regarded her stepson as an interloper. When Joanna began to interfere in the internal affairs of Navarre civil war broke out; and in 1452 Charles, although aided by John II., king of Castile, was defeated and taken prisoner. Released upon promising not to take the kindly title until after his father's death, the prince, again unsuccessful in an appeal to arms, took refuge in Italy with Alphonso V., king of Aragon, Naples and Sicily. In 1458 Alphonso died and John became king of Aragon, while Charles was offered the crowns of Naples and Sicily. He declined these proposals, and having been reconciled with his father returned to Navarre in 1459. Aspiring to marry a Castilian princess, he was then thrown into prison by his father, and the Catalans rose in his favour. This insurrection soon became general and John was obliged to yield. He released his son, and recognized him as perpetual governor of Catalonia, and heir to the kingdom. Soon afterwards, however, on the 23rd of September 1461, the prince died at Barcelona, not without a suspicion that he had been poisoned by his stepmother. Charles was a cultured and amiable prince, fond of music and literature. He translated the *Ethics* of Aristotle into Spanish, a work first published at Saragossa in 1509, and wrote a chronicle of the kings of Navarre, *Crónica de los reyes de Navarra*, an edition which, edited by J. Yangués y Miranda, was published at Pampeluna in 1843.

See J. de Moret and F. de Aleson, *Anales del reyno de Navarra*, tome iv. (Pampeluna, 1866); M. J. Quintana, *Vidas de españoles célebres* (Paris, 1827); and G. Deslevisus du Désert, *Carlos d'Aragon* (Paris, 1889).

**CHARLES, ELIZABETH** (1828-1896), English author, was born at Tavistock on the 2nd of January 1828, the daughter of John Rundle, M.P. Some of her youthful poems won the praise of Tennyson, who read them in manuscript. In 1851 she married Andrew Paton Charles. Her best known book, written to order for an editor who wished for a story about Martin Luther, *The Chronicles of the Schönberg-Cotta Family*, was published in 1862, and was translated into most of the European languages, into

Arabic, and into many Indian dialects. Mrs Charles wrote in all some fifty books, the majority of a semi-religious character. She took an active part in the work of various charitable institutions, and among her friends and correspondents were Dean Stanley, Archbishop Tait, Charles Kingsley, Jowett and Pusey. She died at Hampstead on the 28th of March 1896.

**CHARLES, JACQUES ALEXANDRE CÉSAR** (1746-1823), French mathematician and physicist, was born at Beaugency, Loiret, on the 12th of November 1746. After spending some years as a clerk in the ministry of finance, he turned to scientific pursuits, and attracted considerable attention by his skilful and elaborate demonstrations of physical experiments. He was the first, in 1783, to employ hydrogen for the inflation of balloons (see AERONAUTICS), and about 1787 he anticipated Gay Lussac's law of the dilatation of gases with heat, which on that account is sometimes known by his name. In 1785 he was elected to the Academy of Sciences, and subsequently he became professor of physics at the Conservatoire des Arts et Métiers. He died in Paris on the 7th of April 1823. His published papers are chiefly concerned with mathematical topics.

**CHARLES, THOMAS** (1755-1814), Welsh Nonconformist divine, was born of humble parentage at Longmoor, in the parish of Llanfihangel Abercwywn, near St Clears, Carmarthenshire, on the 14th of October 1755. He was educated for the Anglican ministry at Llanddowror and Carmarthen, and at Jesus College, Oxford (1775-1778). In 1777 he studied theology under the evangelical John Newton at Olney. He was ordained deacon in 1778 on the title of the curacies of Shepton Beauchamp and Sparkford, Somerset; and took priest's orders in 1780. He afterwards added to his charge at Sparkford, Lovington, South Barrow and North Barrow, and in September 1782 was presented to the perpetual curacy of South Barrow by the Rev. John Hughes, Coln St Denys. But he never left Sparkford, though the contrary has been maintained, until he resigned all his curacies in June 1783, and returned to Wales, marrying (on August 20th) Sarah Jones of Bala, the orphan of a flourishing shopkeeper. He had early fallen under the influence of the great revival movement in Wales, and at the age of seventeen had been "converted" by a sermon of Daniel Rowland's. This was enough to make him unpopular with many of the Welsh clergy, and being denied the privilege of preaching for nothing at two churches, he helped his old Oxford friend John Mayor, now vicar of Shawbury, Shropshire, from October until January 11th, 1784. On the 25th of January he took charge of Llan yn Mowddwy (14 m. from Bala), but was not allowed to continue there more than three months. Three influential people, among them the rector of Bala, agitated some of the parishioners against him, and persuaded his rector to dismiss him. His preaching, his catechizing of the children after evensong, and his connexion with the Bala Methodists—his wife's stepfather being a Methodist preacher—gave great offence. After a fortnight more at Shawbury, he wrote to John Newton and another clergyman friend in London for advice. The Church of England denied him employment, and the Methodists desired his services. His friends advised him to return to England, but it was too late. By September he had crossed the Rubicon, Henry Newman (his rector at Shepton Beauchamp and Sparkford) accompanying him on a tour in Carnarvonshire. In December, he was preaching at the Bont Uchel Association; so that he joined the Methodists (see CALVINISTIC METHODISTS) in 1784.

Before taking this step, he had been wont in his enforced leisure to gather the poor children of Bala into his house for instruction, and so thickly did they come that he had to adjourn with them to the chapel. This was the origin of the Welsh Circulating Schools, which he developed on the lines adopted by Griffith Jones (d. 1761), formerly vicar of Llanddowror. First one man was trained for the work by himself, then he was sent to a district for six months, where, (for £8 a year) he taught gratis the children and young people (in fact, all comers) reading and Christian principles. Writing was added later. The expenses were met by collections made in the Calvinistic Methodist Societies, and as the funds increased masters were multiplied,

until in 1786 Charles had seven masters to whom he paid £10 per annum; in 1787, twelve; in 1789, fifteen; in 1794, twenty. By this time the salary had been increased to £12; in 1801 it was £14. He had learnt of Raikes's Sunday Schools before he left the Establishment, but he rightly considered the system set on foot by himself far superior; the work and object being the same, he gave six days' tuition for every one given by them, and many people not only objected to working as teachers on Sunday, but thought the children forgot in the six days what they learnt on the one. But Sunday Schools were first adopted by Charles to meet the case of young people in service who could not attend during the week, and even in that form much opposition was shown to them because teaching was thought to be a form of Sabbath breaking. His first Sunday School was in 1787. Wilberforce, Charles Grant, John Thornton and his son Henry, were among the philanthropists who contributed to his funds; in 1798 the Sunday School Society (established 1785) extended its operations to Wales, making him its agent, and Sunday Schools grew rapidly in number and favour. A powerful revival broke out at Bala in the autumn of 1791, and his account of it in letters to correspondents, sent without his knowledge to magazines, kindled a similar fire at Huntly. The scarcity of Welsh bibles was Charles's greatest difficulty in his work. John Thornton and Thomas Scott helped him to secure supplies from the Society for the Promotion of Christian Knowledge from 1787 to 1789, when the stock became all but exhausted. In 1799 a new edition was brought out by the Society, and he managed to secure 700 copies of the 10,000 issued; the Sunday School Society got 3000 testaments printed, and most of them passed into his hands in 1801.

In 1800, when a frost-bitten thumb gave him great pain and much fear for his life, his friend, Rev. Philip Oliver of Chester, died, leaving him director and one of three trustees over his chapel at Boughton; and this added much to his anxiety. The Welsh causes at Manchester and London, too, gave him much uneasiness, and burdened him with great responsibilities at this juncture. In November 1802 he went to London, and on the 7th of December he sat at a committee meeting of the Religious Tract Society, as a country member, when his friend, Joseph Tarn—a member of the Spa Fields and Religious Tract Society committees—introduced the subject of a regular supply of bibles for Wales. Charles was asked to state his case to the committee, and so forcibly did he impress them, that it was there and then decided to move in the matter of a general dispersion of the bible. When he visited London a year later, his friends were ready to discuss the name of a new Society, and the sole object of which should be to supply bibles. Charles returned to Wales on the 30th of January 1804, and the British and Foreign Bible Society was formally and publicly inaugurated on March the 7th. The first Welsh testament issued by that Society appeared on the 6th of May 1806, the bible on the 7th of May 1807—both being edited by Charles.

Between 1805 and 1811 he issued his Biblical Dictionary in four volumes, which still remains the standard work of its kind in Welsh. Three editions of his Welsh catechism were published for the use of his schools (1789, 1791 and 1794); an English catechism for the use of schools in Lady Huntingdon's Connexion was drawn up by him in 1797; his shorter catechism in Welsh appeared in 1799, and passed through several editions, in Welsh and English, before 1807, when his *Instructor* (still the Connexional catechism) appeared. From April 1799 to December 1801 six numbers of a Welsh magazine called *Trysorfa Ysprydol* (Spiritual Treasury) were edited by Thomas Jones of Mold and himself; in March 1809 the first number of the second volume appeared, and the twelfth and last in November 1813.

The London Hibernian Society asked him to accompany Dr David Bogue, the Rev. Joseph Hughes, and Samuel Mills to Ireland in August 1807, to report on the state of Protestant religion in the country. Their report is still extant, and among the movements initiated as a result of their visit was the Circulating Schools system. In 1810, owing to the growth of Methodism and the lack of ordained ministers, he led the Connexion in the movement for connexionally ordained ministers, and his influence

was the chief factor in the success of that important step. From 1811 to 1814 his energy was mainly devoted to establishing auxiliary Bible Societies. By correspondence he stimulated some friends in Edinburgh to establish charity schools in the Highlands, and the Gaelic School Society (1811) was his idea. His last work was a corrected edition of the Welsh Bible issued in small pica by the Bible Society. As a preacher he was in great request, though possessing but few of the qualities of the popular preacher. All his work received very small remuneration; the family was maintained by the profits of a business managed by Mrs Charles—a keen, active and good woman. He died on the 5th of October 1814. His influence is still felt, and he is rightly claimed as one of the makers of modern Wales. (D. E. J.)

**CHARLES ALBERT** [CARLO ALBERTO] (1798–1849), king of Sardinia (Piedmont), son of Prince Charles of Savoy-Carignano and Princess Albertine of Saxe-Courland, was born on the 2nd of October 1798, a few days before the French occupied Piedmont and forced his cousin King Charles Emmanuel to take refuge in Sardinia. Although Prince and Princess Carignano adhered to the French Republican régime, they soon fell under suspicion and were summoned to Paris. Prince Charles died in 1800, and his widow married a Count de Montléart and for some years led a wandering existence, chiefly in Switzerland, neglecting her son and giving him mere scraps of education, now under a devotee of J. J. Rousseau, now under a Genevan Calvinist. In 1802 King Charles Emmanuel abdicated in favour of his brother Victor Emmanuel I.; the latter's only son being dead, his brother Charles Felix was heir to the throne, and after him Charles Albert. On the fall of Napoleon in 1814 the Piedmontese court returned to Turin and the king was anxious to secure the succession for Charles Albert, knowing that Austria meditated excluding him from it in favour of an Austrian archduke, but at the same time he regarded him as an objectionable person on account of his revolutionary upbringing. Charles Albert was summoned to Turin, given tutors to instruct him in legitimist principles, and on the 1st of October 1817 married the archduchess Maria Theresa of Tuscany, who, on the 14th of March 1820, gave birth to Victor Emmanuel, afterwards king of Italy.

The Piedmontese government at this time was most reactionary, and had made a clean sweep of all French institutions. But there were strong Italian nationalists and anti-Austrian tendencies among the younger nobles and army officers, and the Carbonari and other revolutionary societies had made much progress.

Their hopes centred in the young Carignano, whose agreeable manners had endeared him to all, and who had many friends among the Liberals and Carbonari. Early in 1820 a revolutionary movement was set on foot, and vague plans of combined risings all over Italy and a war with Austria were talked of. Charles Albert no doubt was aware of this, but he never actually became a Carbonaro, and was surprised and startled when after the outbreak of the Neapolitan revolution of 1820 some of the leading conspirators in the Piedmontese army, including Count Santorre di Santarosa and Count San Marzano, informed him that a military rising was ready and that they counted on his help (2nd March 1821). He induced them to delay the outbreak and informed the king, requesting him, however, not to punish anyone. On the 10th the garrison of Alessandria mutinied, and two days later Turin was in the hands of the insurgents, the people demanding the Spanish constitution. The king at once abdicated and appointed Charles Albert regent. The latter, pressed by the revolutionists and abandoned by his ministers, granted the constitution and sent to inform Charles Felix, who was now king, of the occurrence. Charles Felix, who was then at Modena, repudiated the regent's acts, accepted Austrian military assistance, with which the rising was easily quelled, and exiled Charles Albert to Florence. The young prince found himself the most unpopular man in Italy, for while the Liberals looked on him as a traitor, to the king and the Conservatives he was a dangerous revolutionist. At the Congress of Verona (1822) the Austrian chancellor, Prince Metternich, tried to induce Charles Felix to set aside Charles Albert's rights of succession.

But the king was piqued by Austria's interference, and as both the grand-duke of Tuscany and the duke of Wellington supported him, Charles Albert's claims were respected. France having decided to intervene in the Spanish revolution on the side of autocracy, Charles Albert asked permission to join the duc d'Angoulême's expedition. The king granted it and the young prince set out for Spain, where he fought with such gallantry at the storming of the Trocadero (1st of September 1823) that the French soldiers proclaimed him the "first Grenadier of France." But it was not until he had signed a secret undertaking binding himself, as soon as he ascended the throne, to place himself under the tutelage of a council composed of the higher clergy and the knights of the Annunziata, and to maintain the existing forms of the monarchy (D. Berti, *Cesare Alfieri*, xi. 77, Rome, 1871), that he was allowed to return to Turin and forgiven.

On the death of Charles Felix (27th of April 1831) Charles Albert succeeded; he inherited a kingdom without an army, with an empty treasury, a chaotic administration and medieval laws. His first task was to set his house in order; he reorganized the finances, created the army, and started Piedmont on a path which if not liberalism was at least progress. "He was," wrote his reactionary minister, Count della Margherita, "hostile to Austria from the depths of his soul and full of illusions as to the possibility of freeing Italy from dependence on her. . . . As for the revolutionaries, he detested them but feared them, and was convinced that sooner or later he would be their victim." In 1833 a conspiracy of the *Giovane Italia* Society, organized by Mazzini, was discovered, and a number of its members punished with ruthless severity. On the election in 1846 of Pius IX., who appeared to be a Liberal and an Italian patriot, the eyes of all Italy were turned on him as the heaven-born leader who was to rescue the country from the foreigner. This to some extent reconciled the king to the Liberal movement, for it accorded with his religious views. "I confess," he wrote to the marquis of Villamarina, in 1847, "that a war of national independence which should have for its object the defence of the pope would be the greatest happiness that could befall me." On the 30th of October he issued a decree granting wide reforms, and when risings broke out in other parts of Italy early in 1848 and further liberties were demanded, he was at last induced to grant the constitution (8th February).

When the news of the Milanese revolt against the Austrians reached Turin (10th of March) public opinion demanded that the Piedmontese should succour their struggling brothers; and after some hesitation the king declared war. But much time had been wasted and many precious opportunities lost. With an army of 60,000 Piedmontese troops and 30,000 men from other parts of Italy the king took the field, and after defeating the Austrians at Pastrengo on the 30th of April, and at Goito on the 30th of May, where he was himself slightly wounded, more time was wasted in useless operations. Radetzky, the Austrian general, having received reinforcements, drove the centre of the extended Italian line back across the Mincio (23rd of July), and in the two days' fighting at Custoza (24th and 25th of July) the Piedmontese were beaten, forced to retreat, and to ask for an armistice. On re-entering Milan Charles Albert was badly received and reviled as a traitor by the Republicans, and although he declared himself ready to die defending the city the municipality treated with Radetzky for a capitulation; the mob, urged on by the demagogues, made a savage demonstration against him at the Palazzo Greppi, whence he escaped in the night with difficulty and returned to Piedmont with his defeated army. The French Republic offered to intervene in the spring of 1848, but Charles Albert did not desire foreign aid, the more so as in this case it would have had to be paid for by the cession of Nice and Savoy. The revolutionary movement throughout Italy was breaking down, but Charles Albert felt that while he possessed an army he could not abandon the Lombards and Venetians, and determined to stake all on a last chance. On the 12th of March 1849 he denounced the armistice and took the field again with an army of 80,000 men, but gave the chief command to the Polish general Chrzanowski. General

Ramorino commanding the Lombard division proved unable to prevent the Austrians from crossing the Ticino (20th of April), and Chrzanowski was completely out-generalled and defeated at La Bicocca near Novara on the 23rd. The Piedmontese fought with great bravery, and the unhappy king sought death in vain. After the battle he asked terms of Radetzky, who demanded the occupation by Austria of a large part of Piedmont and the heir to the throne as a hostage. Thereupon, feeling himself to be the obstacle to better conditions, Charles Albert abdicated in favour of his son Victor Emmanuel. That same night he departed alone and made his way to Oporto, where he retired into a monastery and died on the 28th of July 1849.

Charles Albert was not a man of first-rate ability; he was of a hopelessly vacillating character. Devout and mystical to an almost morbid degree, hating revolution and distrusting Liberalism, he was a confirmed pessimist, yet he had many noble qualities: he was brave to the verge of foolhardiness, devoted to his country, and ready to risk his crown to free Italy from the foreigner. To him the people of Italy owe a great debt, for if he failed in his object he at least materialized the idea of the Risorgimento in a practical shape, and the charges which the Republicans and demagogues brought against him were monstrously unjust.

**BIBLIOGRAPHY.**—Besides the general works on modern Italy, see the Marquis Costa de Beauregard's interesting volumes *La Jeunesse des rois Charles Albert* (Paris, 1899) and *Novare el Oporto* (1890), based on the king's letters and the journal of Sylvain Coeta, his faithful secretary, though the author's views are those of an old-fashioned Savoyard who dislikes the idea of Italian unity; Ernesto Masi's *Il Segreto del Re Carlo Alberto* (Bologna, 1891) is a very illuminating essay; Domenico Perrero, *Gli Ultimi Reali di Savoia* (Turin, 1889); L. Cappelletti, *Storia di Carlo Alberto* (Rome, 1891); Nicomede Bianchi, *Storia della diplomazia europea in Italia* (8 vols., Turin, 1865, &c.), a most important work of a general character, and the same author's *Scritti e lettere di Carlo Alberto* (Rome, 1879) and his *Storia della monarchia piemontese* (Turin, 1877); Count S. della Margherita, *Memorandum storico-politico* (Turin, 1851).

**CHARLES AUGUSTUS** [KARL AUGUST] (1757-1828), grand-duke of Saxe-Weimar, son of Constantine, duke of Saxe-Weimar-Eisenach, and Anna Amalia of Brunswick, was born on the 3rd of September 1757. His father died when he was only nine months old, and the boy was brought up under the regency and supervision of his mother, a woman of enlightened but masterful temperament. His governor was Count Eustach von Görz, a German nobleman of the old strait-laced school; but a more humane element was introduced into his training when, in 1771, Wieland was appointed his tutor. In 1774 the poet Karl Ludwig von Knebel came to Weimar as tutor to the young Prince Constantine; and in the same year the two princes set out, with Count Görz and Knebel, for Paris. At Frankfort, Knebel introduced Karl August to the young Goethe: the beginning of a momentous friendship. In 1775 Karl August returned to Weimar, and the same year came of age and married Princess Louise of Hesse-Darmstadt.

One of the first acts of the young grand-duke was to summon Goethe to Weimar, and in 1776 he was made a member of the privy council. "People of discernment," he said, "congratulate me on possessing this man. His intellect, his genius is known. It makes no difference if the world is offended because I have made Dr Goethe a member of my most important collegium without his having passed through the stages of minor official professor and councillor of state." To the undiscerning, the beneficial effect of this appointment was not at once apparent. With Goethe the "storm and stress" spirit descended upon Weimar, and the stiff traditions of the little court dissolved in a riot of youthful exuberance. The duke was a deep drinker, but also a good sportsman; and the revels of the court were alternated with break-neck rides across country, ending in nights spent round the camp fire under the stars. Karl August, however, had more serious tastes. He was interested in literature, in art, in science; critics, unsuspected of flattery, praised his judgment in painting; biologists found in him an expert in anatomy. Nor did he neglect the government of his little state. His reforms were the outcome of something more than the spirit of the

"enlightened despots" of the 18th century; for from the first he had realized that the powers of the prince to play "earthly providence" were strictly limited. His aim, then, was to educate his people to work out their own political and social salvation, the object of education being in his view, as he explained later to the dismay of Metternich and his school, to help men to "independence of judgment." To this end Herder was summoned to Weimar to reform the educational system; and it is little wonder that, under a patron so enlightened, the university of Jena attained the zenith of its fame, and Weimar became the intellectual centre of Germany.

Meanwhile, in the affairs of Germany and of Europe the character of Karl August gave him an influence out of all proportion to his position as a sovereign prince. He had early faced the problem presented by the decay of the Empire, and began to work for the unity of Germany. The plans of the emperor Joseph II., which threatened to absorb a great part of Germany into the heterogeneous Habsburg monarchy, threw him into the arms of Prussia, and he was the prime mover in the establishment of the league of princes (*Fürstentbund*) in 1785, by which, under the leadership of Frederick the Great, Joseph's intrigues were frustrated. He was, however, under no illusion as to the power of Austria, and he wisely refused the offer of the Hungarian crown, made to him in 1787 by Prussia at the instance of the Magyar malcontents, with the dry remark that he had no desire to be another "Winter King." In 1788 Karl August took service in the Prussian army as major-general in active command of a regiment. As such he was present, with Goethe, at the cannonade of Valmy in 1792, and in 1794 at the siege of Mainz and the battles of Pirmasenz (September 14) and Kaiserslautern (October 28-30). After this, dissatisfied with the attitude of the powers, he resigned; but rejoined on the accession of his friend King Frederick William III. to the Prussian throne. The disastrous campaign of Jena (1806) followed; on the 14th of October, the day after the battle, Weimar was sacked; and Karl August, to prevent the confiscation of his territories, was forced to join the Confederation of the Rhine. From this time till after the Moscow campaign of 1812 his contingent fought under the French flag in all Napoleon's wars. In 1813, however, he joined the Grand Alliance, and at the beginning of 1814 took the command of a corps of 30,000 men operating in the Netherlands.

At the congress of Vienna Karl August was present in person, and protested vainly against the narrow policy of the powers in confining their debates to the "rights of the princes" to the exclusion of the "rights of the people." His services in the war of liberation were rewarded with an extension of territory and the title of grand-duke; but his liberal attitude had already made him suspect, and his subsequent action brought him still further into antagonism to the reactionary powers. He was the first of the German princes to grant a liberal constitution to his state under Article XIII. of the Act of Confederation (May 5, 1816); and his concession of full liberty to the press made Weimar for a while the focus of journalistic agitation against the existing order. Metternich dubbed him contemptuously "der grosse Bursche" for his patronage of the "revolutionary" *Burschenschaften*; and the celebrated "festival" held at the Warthurg by his permission in 1818, though in effect the mildest of political demonstrations, brought down upon him the wrath of the great powers. Karl August, against his better judgment, was compelled to yield to the remonstrances of Prussia, Austria and Russia; the liberty of the press was again restricted in the grand-duchy, but, thanks to the good understanding between the grand-duke and his people, the régime of the Carlsbad Decrees pressed less heavily upon Weimar than upon other German states.

Karl August died on the 14th of June 1828. Upon his contemporaries of the most various types his personality made a great impression. Karl von Dalberg, the prince-primate, who owed the coadjutorship of Mainz to the duke's friendship, said that he had never met a prince "with so much understanding, character, frankness and true-heartedness"; the Milanese, when

he visited their city, called him the "uomo principe"; and Goethe himself said of him "he had the gift of discriminating intellects and characters and setting each one in his place. He was inspired by the noblest good-will, the purest humanity, and with his whole soul desired only what was best. There was in him something of the divine. He would gladly have wrought the happiness of all mankind. And finally, he was greater than his surroundings. . . . Everywhere he himself saw and judged, and in all circumstances his surest foundation was in himself." He left two sons: Charles Frederick (d. 1853), by whom he was succeeded, and Bernhard, duke of Saxe-Weimar (1799-1862), a distinguished soldier, who, after the congress of Vienna, became colonel of a regiment in the service of the king of the Netherlands, distinguished himself as commander of the Dutch troops in the Belgian campaign of 1830, and from 1847 to 1850 held the command of the forces in the Dutch East Indies. Bernhard's son, William Augustus Edward, known as Prince Edward of Saxe-Weimar (1823-1902), entered the British army, served with much distinction in the Crimean War, and became colonel of the 1st Life Guards and a field marshal; in 1851 he contracted a morganatic marriage with Lady Augusta Gordon-Leaumont (d. 1904), daughter of the 5th duke of Richmond and Gordon, who in Germany received the title of countess of Dornburg, but was granted the rank of princess in Great Britain by royal decree in 1866. Karl August's only daughter, Caroline, married Frederick Louis, hereditary grand-duke of Mecklenburg-Schwerin, and was the mother of Helene (1814-1858), wife of Ferdinand, duke of Orleans, eldest son of King Louis Philippe.

Karl August's correspondence with Goethe was published in 2 vols. at Weimar in 1863. See the biography by von Wegele in the *Allgem. deutsche Biographie*.

**CHARLES EDWARD** [CHARLES EDWARD LOUIS PHILIP CASIMIR STUART] (1720-1788), English prince, called the "Young Pretender" and also the "Young Chevalier," was born at Rome on December 31st, 1720. He was the grandson of King James II. of England and elder son of James, the "Old Pretender," by whom (as James III.) he was created at his birth prince of Wales, the title he bore among the English Jacobites during his father's lifetime. The young prince was educated at his father's miniature court in Rome, with James Murray, Jacobite earl of Dunbar, for his governor, and under various tutors, amongst whom were the learned Chevalier Ramsay, Sir Thomas Sheridan and the abbé Légoux. He quickly became conversant with the English, French and Italian languages, but all his extant letters written in English appear singularly ill-spelt and illiterate. In 1734 his cousin, the duke of Liria, afterwards duke of Berwick, who was proceeding to join Don Carlos in his struggle for the crown of Naples, passed through Rome. He offered to take Charles on his expedition, and the boy of thirteen, having been appointed general of artillery by Don Carlos, shared with credit the dangers of the successful siege of Gaeta.

The handsome and accomplished youth, whose doings were eagerly reported by the English ambassador at Florence and by the spy, John Walton, at Rome, was now introduced by his father and the pope to the highest Italian society, which he fascinated by the frankness of his manner and the grace and dignity of his bearing. In 1737 James despatched his son on a tour through the chief Italian cities, that his education as a prince and man of the world might be completed. The distinction with which he was received on his journey, the royal honours paid to him in Venice, and the jealous interference of the English ambassador in regard to his reception by the grand-duke of Tuscany, show how great was the respect in which the exiled house was held at this period by foreign Catholic powers, as well as the watchful policy of England in regard to its fortunes. The Old Pretender himself calculated upon foreign aid in his attempts to restore the monarchy of the Stuarts; and the idea of rebellion unassisted by invasion or by support of any kind from abroad was one which it was left for Charles Edward to endeavour to realize. Of all the European nations France was the one on which Jacobite hopes mainly rested, and the warm

sympathy which Cardinal Tencin, who had succeeded Fleury as French minister, felt for the Old Pretender resulted in a definite scheme for an invasion of England to be timed simultaneously with a prearranged Scottish rebellion. Charles was secretly despatched to Paris in January 1744. A squadron under Admiral Roquefeuil sailed from the coast of France. Transports containing 7000 troops, to be led by Marshal Saxe, accompanied by the young prince, were in readiness to set sail for England. A severe storm effected, however, a complete disaster without any actual engagement taking place.

The loss in ships of the line, in transports, and in lives was a crushing blow to the hopes of Charles, who remained in France for over a year in a retirement which he keenly felt. He had at Rome already made the acquaintance of Lord Elcho and of John Murray of Broughton; at Paris he had seen many supporters of the Stuart cause; he was aware that in every European court the Jacobites were represented in earnest intrigue; and he had now taken a considerable share in correspondence and other actual work connected with the promotion of his own and his father's interests. Although dissuaded by all his friends, on the 13th of July 1745 he sailed from Nantes for Scotland on board the small brig "La Doutelle," which was accompanied by a French man-of-war, the "Elisabeth," laden with arms and ammunition. The latter fell in with an English man-of-war, the "Lion," and had to return to France; Charles escaped during the engagement, and at length arrived on the 2nd of August off Erisca, a little island of the Hebrides. Receiving, however, but a cool reception from Macdonald of Boisdale, he set sail again and arrived at the bay of Lochnanuagh on the west coast of Inverness-shire.

The Macdonalds of Clanranald and Kinloch Moidart, along with other chieftains, again attempted to dissuade him from the rashness of an unaided rising, but they yielded at last to the enthusiasm and charm of his manner, and Charles landed on Scottish soil in the company of the "Seven Men of Moidart" who had come with him from France. Everywhere, however, he met with discouragement among the chiefs, whose adherence he wished to secure; but at last, by enlisting the support of Cameron of Lochiel, he gained a footing for a serious rebellion. With secrecy and speed communications were entered into with the known leaders of the Highland clans, and on the 19th of August, in the valley of Glenfinnan, the standard of James III. and VIII. was raised in the midst of a motley but increasing crowd. On the same day Sir John Cope at the head of 1500 men left Edinburgh in search of Charles; but, fearing an attack in the Pass of Corryarrick, he changed his proposed route to Inverness, and Charles thus had the undefended south country before him. In the beginning of September he entered Perth, having gained numerous accessions to his forces on his march. Crossing the Forth unopposed at the Fords of Frew and passing through Stirling and Linlithgow, he arrived within a few miles of the astonished metropolis, and on the 16th of September a body of his skirmishers defeated the dragoons of Colonel Gardiner in what was known as the "Canter of Coltrig." His success was still further augmented by his being enabled to enter the city, a few of Cameron's Highlanders having on the following morning, by a happy ruse, forced their way through the Canon-gate. On the 18th he publicly proclaimed James VIII. of Scotland at the Market Cross and occupied Holyrood.

Cope had by this time brought his disappointed forces by sea to Dunbar. On the 20th Charles met and defeated him at Prestonpans, and returned to prosecute the siege of Edinburgh Castle, which, however, he raised on General Guest's threatening to lay the city in ruins. In the beginning of November Charles left Edinburgh, never to return. He was at the head of at least 6000 men; but the ranks were being gradually thinned by the desertion of Highlanders, whose traditions had led them to consider war merely as a raid and an immediate return with plunder. Having passed through Kelso, on the 9th of November he laid siege to Carlisle, which capitulated in a week. Manchester received the prince with a warm welcome and with 150 recruits under Francis Towneley. On the 4th of December he had reached

Derby and was within ten days' march of London, where the inhabitants were terror-struck and a commercial panic immediately ensued. Two armies under English leadership were now in the field against him, one under Marshal Wade, whom he had evaded by entering England by the west, and the other under William, duke of Cumberland, who had returned from the continent. London was not to be supposed helpless in such an emergency; Manchester, Glasgow and Dumfries, rid of his presence, had risen against him, and Charles paused. There was division among his advisers and desertion among his men, and on the 6th of December he reluctantly was forced to begin his retreat northward. Closely pursued by Cumberland, he marched by way of Carlisle across the border, and at last stopped to invest Stirling Castle. At Falkirk, on the 17th of January 1746, he defeated General Hawley, who had marched from Edinburgh to intercept his retreat. A fortnight later, however, Charles raised the siege of Stirling, and after a weary though successful march rested his troops at Inverness. Having taken Forts George and Augustus, and after varying success against the supporters of the government in the north, he at last prepared to face the duke of Cumberland, who had passed the early spring at Aberdeen. On the 8th of April the duke marched thence to meet Charles, whose little army, exhausted with a futile night march, half-starving, and broken by desertion, was completely worsted at Culloden on the 16th of April 1746.

This decisive and cruel defeat sealed the fate of Charles Edward and the house of Stuart. Accompanied by the faithful Ned Burke and a few other followers, Charles at last gained the wild western coast. Hunted hither and thither, he wandered on foot or cruised restlessly in open boats among the many barren isles of the Scottish shore, enduring the greatest hardships with marvellous courage and cheerfulness. Charles, upon whose head a reward of £30,000 had a year before been set, was thus for over five months relentlessly pursued by the troops and spies of the government. Disguised in female attire and aided by a passport obtained by the devoted Flora Macdonald, he passed through Skye and parted from his gallant conductress at Portree. Towards the end of July he took refuge in the cave of Coiraghoth in the Braes of Glenmoriston, and in August he joined Lochiel and Cluny Macpherson, with whom he remained in hiding until the news was brought that two French ships were in waiting for him at the place of his first arrival in Scotland—Lochnanuagh. He embarked with speed and sailed for France, reaching the little port of Roscoff, near Morlaix, on the 29th of September 1746. He was warmly welcomed by Louis XV., and ere long he was again vigorously intriguing in Paris, and even in Madrid. So far as political assistance was concerned, his efforts proved fruitless, but he became at once the popular hero and idol of the people of Paris. So enraged was he with his brother Henry's acceptance of a cardinal's hat in July 1747, that he deliberately broke off communication with his father in Rome (who had approved the step), nor did he ever see him again. The enmity of the British government to Charles Edward made peace with France an impossibility so long as she continued to harbour the young prince. A condition of the treaty of Aix-la-Chapelle, concluded in October 1748, was that every member of the house of Stuart should be expelled the French dominions. Charles had forestalled the proclamation of the treaty by an indignant protest against its injustice, and a declaration that he would not be bound by its provisions. But his indignation and persistent refusal to comply with the request that he should voluntarily leave France had to be met at last with force: he was apprehended, imprisoned for a week at Vincennes, and on the 17th of December conducted to the French border. He lingered at Avignon; but the French, compelled to hard measures by the English, refused to be satisfied; and Pope Benedict XIV., alarmed by the threat of a bombardment of Civita Vecchia, advised the prince to withdraw. Charles quietly disappeared; for years Europe watched for him in vain. It is now established, almost with certainty, that he returned to the neighbourhood of Paris; and it is supposed that his residence was known to the French ministers, who, however, firmly

in the southern hemisphere; but they also, or rocks very similar to them, occur in Norway, France, Germany, Scotland and North America, though in these countries they have been mostly described as pyroxene granulites, pyroxene gneisses, anorthosites, &c. They are usually regarded as being of Archean age (pre-Cambrian), and in most cases this can be definitely proved, though not in all. It is astonishing to find that in spite of their great age their minerals are often in excellent preservation. In India they form the Nilgiri Hills, the Shevaroyas and part of the Western Ghats, extending southward to Cape Comorin and re-appearing in Ceylon. Although they are certainly for the most part igneous gneisses (or orthogneisses), rocks occur along with them, such as marbles, scapolite limestones, and corundum rocks, which were probably of sedimentary origin. (J. S. F.)

**CHARNWOOD FOREST**, an upland tract in the N.-W. of Leicestershire, England. It is undulating, rocky, picturesque, and in great part barren, though there are some extensive tracts of woodland; its elevation is generally 600 ft. and upwards, the area exceeding this height being about 600 acres. The loftiest point, Bardon Hill, is 912 ft. On its western flank lies a coalfield, with Coalville and other mining towns, and granite and honestones are worked.

**CHAROLLES**, a town of east-central France, capital of an arrondissement in the department of Saône-et-Loire, situated at the confluence of the Semence and the Arconce, 39 m. W.N.W. of Mâcon on the Paris-Lyon railway. Pop. (1906) 3228. It has a sub-prefecture, tribunals of primary instance and commerce, and a communal college. There are stone quarries in the vicinity; the town manufactures pottery, and is the centre for trade in the famous breed of Charolais cattle and in agricultural products. The ruins of the castle of the counts of Charolais occupy the summit of a hill in the immediate vicinity of the town. Charolles was the capital of Charolais, an old division of France, which from the early 14th century gave the title of count to its possessors. In 1327 the countship passed by marriage to the house of Armagnac, and in 1390 it was sold to Philip of Burgundy. After the death of Charles the Bold, who in his youth had borne the title of count of Charolais, it was seized by Louis XI. of France, but in 1493 it was ceded by Charles VIII. to Maximilian of Austria, the representative of the Burgundian family. Ultimately passing to the Spanish kings, it became for a considerable period an object of dispute between France and Spain, until at length in 1684 it was assigned to the great Condé, a creditor of the king of Spain. It was united to the French crown in 1771.

**CHARRON**, in Greek mythology, the son of Erebus and Nyx (Night). It was his duty to ferry over the Styx (or Acheron) those souls of the deceased who had duly received the rites of burial, in payment for which service he received an obol, which was placed in the mouth of the corpse. It was only exceptionally that he carried living passengers (*Aeneid*, vi. 295 ff.). As ferryman of the dead he is not mentioned in Homer or Hesiod, and in this character is probably of Egyptian origin. He is represented as a morose and grisly old man in a black sailor's cape. By the Etruscans he was also supposed to be a kind of executioner of the powers of the nether world, who, armed with an enormous hammer, was associated with Mars in the slaughter of battle. Finally he came to be regarded as the image of death and the world below. As such he survives in the Charos or Charontas of the modern Greeks—a black bird which darts down upon its prey, or a winged horseman who fastens his victims to the saddle and bears them away to the realms of the dead.

See J. A. Ambrosch, *De Charonte Etrusco* (1837), a learned and exhaustive monograph; B. Schmidt, *Volksleben der Neugriechen* (1871), i. 222-251; O. Waser, *Charon, Charon, Charos, mythologisch-archaische Monographie* (1898); S. Rocco, "Sull' origine del Mito di Caronte," in *Rivista di storia antica*, ii. (1897), who considers Charon to be an old name for the sun-god Helios embarking during the night for the East.

**CHARONDAS**, a celebrated lawyer of Catania in Sicily. His date is uncertain. Some make him a pupil of Pythagoras (c. 580-504 B.C.); but all that can be said is that he was earlier than Anaxilaus of Rhegium (494-476), since his laws were in use amongst the Rhegians until they were abolished by that

tyrant. His laws, originally written in verse, were adopted by the other Chalcidic colonies in Sicily and Italy. According to Aristotle there was nothing special about these laws, except that Charondas introduced actions for perjury; but he speaks highly of the precision with which they were drawn up (*Politics*, ii. 12). The story that Charondas killed himself because he entered the public assembly wearing a sword, which was a violation of his own law, is also told of Diocles and Zaleucus (*Diad. Sic. xii. 11-19*). The fragments of laws attributed to him by Stobaeus and Diodorus are of late (neo-Pythagorean) origin.

See Bentley, *On Phalaris*, which (according to B. Niese L.S. in Pauly, *Realencyclopädie*) contains what is even now the best account of Charondas; A. Holm, *Geschichte Siciliens*, i.; F. D. Gerlach, *Zaleukos, Charondas, und Pythagoras* (1858); also art. GREEK LAW.

**CHARPENTIER, FRANÇOIS** (1620-1702), French archaeologist and man of letters, was born in Paris on the 15th of February 1620. He was intended for the bar, but was employed by Colbert, who had determined on the foundation of a French East India Company, to draw up an explanatory account of the project for Louis XIV. Charpentier regarded as absurd the use of Latin in monumental inscriptions, and to him was entrusted the task of supplying the paintings of Lebrun in the Versailles Gallery with appropriate legends. His verses were so indifferent that they had to be replaced by others, the work of Racine and Boileau, both enemies of his. Charpentier in his *Excellence de la langue française* (1683) had anticipated Perrault in the famous academical dispute concerning the relative merit of the ancients and moderns. He is credited with a share in the production of the magnificent series of medals that commemorate the principal events of the age of Louis XIV. Charpentier, who was long in receipt of a pension of 1200 livres from Colbert, was erudite and ingenious, but he was always heavy and commonplace. His other works include a *Vie de Socrate* (1650), a translation of the *Cyropaedia* of Xenophon (1658), and the *Traité de la peinture parlante* (1684).

**CHARRIÈRE, AGNÈS ISABELLE ÉMILIE DE** (1740-1805), Swiss author, was Dutch by birth, her maiden name being van Tuyl van Seerokerken van Zuylen. She married in 1771 her brother's tutor, M. de Charrière, and settled with him at Colombier, near Lausanne. She made her name by the publication of her *Lettres neuchâtelaises* (Amsterdam, 1784), offering a simple and attractive picture of French manners. This, with *Caliste, ou lettres écrites de Lausanne* (2 vols. Geneva, 1785-1788), was analysed and highly praised by Sainte-Beuve in his *Portraits de femmes* and in vol. iii of his *Portraits littéraires*. She wrote a number of other novels, and some political tracts; but is perhaps best remembered by her liaison with Benjamin Constant between 1787 and 1796.

Her letters to Constant were printed in the *Revue suisse* (April 1844), her *Lettres-Mémoires* by E. H. Gaullieur in the same review in 1857, and all the available material is utilized in a monograph on her and her work by P. Godet, *Madame de Charrière et ses amis* (2 vols., Geneva, 1906).

**CHARRON, PIERRE** (1541-1603), French philosopher, born in Paris, was one of the twenty-five children of a bookseller. After studying law he practised at Paris as an advocate, but, having met with no great success, entered the church, and soon gained the highest popularity as a preacher, rising to the dignity of canon, and being appointed preacher in ordinary to Marguerite, wife of Henry IV. of Navarre. About 1588, he determined to fulfil a vow which he had once made to enter a cloister; but being rejected by the Carthusians and the Celestines, he held himself absolved, and continued to follow his old profession. He delivered a course of sermons at Angers, and in the next year passed to Bordeaux, where he formed a famous friendship with Montaigne. At the death of Montaigne, in 1592, Charron was requested in his will to bear the Montaigne arms.

In 1594 Charron published (at first anonymously, afterwards under the name of "Benoit Vaillant, Advocate of the Holy Faith," and also, in 1594, in his own name) *Les Trois Vérités*, in which by methodical and orthodox arguments, he seeks to prove that there is a God and a true religion, that the true religion is the Christian, and that the true church is the Roman Catholic.

The last book (which is three-fourths of the whole work) is chiefly an answer to the famous Protestant work entitled *Le Traité de l'Église* by Du Plessis Mornay; and in the second edition (1595) there is an elaborate reply to an attack made on the third *Vérité* by a Protestant writer. *Les Trois Vérités* ran through several editions, and obtained for its author the favour of the bishop of Cahors, who appointed him grand vicar and theological canon. It also led to his being chosen deputy to the general assembly of the clergy, of which body he became chief secretary. It was followed in 1600 by *Discours chrétiens*, a book of sermons, similar in tone, half of which treat of the Eucharist. In 1601 Charron published at Bordeaux his third and most remarkable work—the famous *De la sagesse*, a complete popular system of moral philosophy. Usually, and so far correctly, it is coupled with the *Essays* of Montaigne, to which the author is under very extensive obligations. There is, however, distinct individuality in the book. It is specially interesting from the time when it appeared, and the man by whom it was written. Conspicuous as a champion of orthodoxy against atheists, Jews and Protestants—without resigning this position, and still upholding practical orthodoxy—Charron suddenly stood forth as the representative of the most complete intellectual scepticism. The *De la sagesse*, which represented a considerable advance on the standpoint of the *Trois Vérités*, brought upon its author the most violent attacks, the chief being by the Jesuit François Garasse (1585–1631), who described him as a “brutal atheist.” It received, however, the warm support of Henry IV. and of the president Pierre Jeannin (1540–1622). A second edition was soon called for. In 1603, notwithstanding much opposition, it began to appear; but only a few pages had been printed when Charron died suddenly in the street of apoplexy. His death was regarded as a judgment for his impiety.

Charron's psychology is sensationalist. With sense all our knowledge commences, and into sense all may be resolved. The soul, located in the ventricles of the brain, is affected by the temperament of the individual; the dry temperament produces acute intelligence; the moist, memory; the hot, imagination. Dividing the intelligent soul into these three faculties, he shows—after the manner which Francis Bacon subsequently adopted—what branches of science correspond with each. With regard to the nature of the soul he merely quotes opinions. The belief in its immortality, he says, is the most universal of beliefs, but the most feebly supported by reason. As to man's power of attaining truth his scepticism is decided; and he plainly declares that none of our faculties enable us to distinguish truth from error. In comparing man with the lower animals, Charron insists that there are no breaks in nature. The latter have reason; nay, they have virtue; and, though inferior in some respects, in others they are superior. The estimate formed of man is not, indeed, flattering. His most essential qualities are vanity, weakness, inconstancy, presumption. Upon this view of human nature and the human lot Charron founds his moral system. Equally sceptical with Montaigne, and decidedly more cynical, he is distinguished by a deeper and sterner tone. Man comes into the world to endure; let him endure then, and that in silence. Our compassion should be like that of God, who succours the suffering without sharing in their pain. Avoid vulgar errors; cherish universal sympathy. Let no passion or attachment become too powerful for restraint. Follow the customs and laws which surround you. Morality has no connexion with religion. Reason is the ultimate criterion.

Special interest attaches to Charron's treatment of religion. He insists on the diversities in religions; he dwells also on what would indicate a common origin. All grow from small beginnings and increase by a sort of popular contagion; all teach that God is to be appeased by prayers, presents, vows, but especially, and most irrationally, by human suffering. Each is said by its devotees to have been given by inspiration. In fact, however, a man is a Christian, Jew, or Mahomedan, before he knows he is a man. One religion is built upon another. But while he openly declares religion to be “strange to common sense,” the practical result at which Charron arrives is that one is not

to sit in judgment on his faith, but to be “simple and obedient;” and to allow himself to be led by public authority. This is one rule of wisdom with regard to religion; and another equally important is to avoid superstition, which he boldly defines as the belief that God is like a hard judge who, eager to find fault, narrowly examines our slightest act, that He is revengeful and hard to appease, and that therefore He must be flattered and importuned, and won over by pain and sacrifice. True piety, which is the first of duties, is, on the other hand, the knowledge of God and of one's self, the latter knowledge being necessary to the former. It is the abasing of man, the exalting of God,—the belief that what He sends is all good, and that all the bad is from ourselves. It leads to spiritual worship; for external ceremony is merely for our advantage, not for His glory. Charron is thus the founder of modern secularism. His political views are neither original nor independent. He pours much hackneyed scorn on the common herd, declares the sovereign to be the source of law, and asserts that popular freedom is dangerous.

A summary and defence of the *Sagesse*, written shortly before his death, appeared in 1606. In 1604 his friend Michel de la Roche-maillet prefixed to an edition of the *Sagesse* a Life, which depicts Charron as a most amiable man of purest character. His complete works, with this Life, were published in 1635. An excellent abridgment of the *Sagesse* is given in Tennemann's *Philosophie*, vol. ix.; an edition with notes by A. Duval appeared in 1820.

Buckle, *Introduct. to History of Civilization in England*, vol. ii. 19; Abbé Lezat, *De la prédication sous Henri IV.* c. vi.; J. M. Robertson, *Short History of Free Thought* (London, 1906), vol. ii. p. 19; J. Owen, *Skeptics of the French Renaissance* (1893); Lecky, *Rationalism in Europe* (1865).

**CHARRUA**, a tribe of South American Indians, wild and warlike, formerly ranging over Uruguay and part of S. Brazil. They were dark and heavily built, fought on horses and used the bolas or weighted lasso. They were always at war with the Spaniards, and Juan Diaz de Solis was killed by them in 1516. As a tribe they are now almost extinct, but the modern Gauchos of Uruguay have much Charrua blood in them.

**CHART** (from Lat. *carta*, *charta*, a map). A chart is a marine map intended specially for the use of seamen (for history, see MAP), though the word is also used loosely for other varieties of graphical representation. The marine or nautical chart is constructed for the purpose of ascertaining the position of a ship with reference to the land, of finding the direction in which she has to steer, the distance to sail or steam, and the hidden dangers to avoid. The surface of the sea on charts is studded with numerous small figures. These are known as the *soundings*, indicating in fathoms or in feet (as shown upon the title of the chart), at low water of ordinary spring tides, the least depth of water through which the ship may be sailing. Charts show the nature of the unseen bottom of the sea—with the irregularities in its character in the shape of hidden rocks or sand-banks, and give information of the greatest importance to the mariner. No matter how well the land may be surveyed or finely delineated, unless the soundings are shown a chart is of little use.

The British admiralty charts are compiled, drawn and issued by the hydrographic office. This department of the admiralty was established under Earl Spencer by an order in council in 1795, consisting of the hydrographer, one assistant and a draughtsman. The first hydrographer was Alexander Dalrymple, a gentleman in the East India Company's civil service. From this small beginning arose the important department which is now the main source of the supply of hydrographical information to the whole of the maritime world. The charts prepared by the officers and draughtsmen of the hydrographic office, and published by order of the lords commissioners of the admiralty, are compiled chiefly from the labours of British naval officers employed in the surveying service; and also from valuable contributions received from time to time from officers of the royal navy and mercantile marine. In addition to the work of British sailors, the labours of other nations have been collected and utilized. Charts of the coasts of Europe have naturally been taken from the surveys made by the various nations, and in charts of other quarters of the world considerable assistance has

been received from the labours of French, Spanish, Dutch and American surveyors. Important work is done by the Hydrographic Office of the American navy, and the U.S. Coast and Geodetic Survey. The admiralty charts are published with the view of meeting the wants of the sailor in all parts of the world. They may be classed under five heads, viz. ocean, general, and coast charts, harbour plans and physical charts; for instance, the Indian Ocean, the Mediterranean, approaches to Plymouth, Plymouth Sound and wind and current charts. The harbour plans and coast sheets are constructed on the simple principles of plane trigonometry by the surveying officers. (See SURVEYING: *Nautical*.) That important feature, the depth of the sea, is obtained by the ordinary sounding line or wire; all soundings are reduced to low water of ordinary spring tides. The times and heights of the tides, with the direction and velocity of the tidal streams, are also ascertained. These MS. charts are forwarded to the admiralty, and form the foundation of the hydrography of the world. The ocean and general charts are compiled and drawn at the hydrographic office, and as originals, existing charts, latest surveys and maps, have to be consulted, their compilation requires considerable experience and is a painstaking work, for the compiler has to decide what to omit, what to insert, and to arrange the necessary names in such a manner that while full information is given, the features of the coast are not interfered with. As a very slight error in the position of a light or buoy, dot, cross or figure, might lead to grave disaster, every symbol on the admiralty chart has been delineated with great care and consideration, and no pains are spared in the effort to lay before the public the labours of the nautical surveyors and explorers not only of England, but of the maritime world; reducing their various styles into a comprehensive system furnishing the intelligent seaman with an intelligible guide, which common industry will soon enable him to appreciate and take full advantage of.

As certain abbreviations are used in the charts, attention is called to the "signs and abbreviations adopted in the charts published by the admiralty." Certain parts of the world are still unsurveyed, or not surveyed in sufficient detail for the requirements that steamships now demand. Charts of these localities are therefore drawn in a light hair-line and unfinished manner, so that the experienced seaman sees at a glance that less trust is to be reposed upon charts drawn in this manner. The charts given to the public are only correct up to the time of their actual publication. They have to be kept up to date. Recent publications by foreign governments, newly reported dangers, changes in character or position of lights and buoys, are as soon as practicable inserted on the charts and due notice given of such insertions in the admiralty "Notices to Mariners."

The charts are supplemented by the *Admiralty Pilots*, or books of sailing directions, with tide tables, and lists of lighthouses, light vessels, &c., for the coasts to which a ship may be bound. The physical charts are the continuation of the work so ably begun by Maury of the United States and FitzRoy of the British navy, and give the sailor a good general idea of the world's ocean winds and currents at the different periods of the year; the probable tracks and seasons of the tropical revolving or cyclonic storms; the coastal winds; the extent or months of the rainy seasons; localities and times where ice may be fallen in with; and, lastly, the direction and force of the stream and drift currents of the oceans. (T. A. H.)

**CHARTER** (Lat. *charta*, *carta*, from Gr. *χάρτης*, originally for *papyrus*, material for writing, thence transferred to paper and from this material to the document, in O. Eng. *booc*, book), a written instrument, contract or convention by which cessions of sales of property or of rights and privileges are confirmed and held, and which may be produced by the grantees in proof of lawful possession. The use of the word for any written document is obsolete in England, but is preserved in France, e.g. the *École des Chartes* at Paris. In feudal times charters of privileges were granted, not only by the crown, but by mesne lords both lay and ecclesiastical, as well to communities, such as boroughs, guilds and religious foundations, as to individuals. In modern usage grants by charter have become all but obsolete, though in England this form is still used in the incorporation by the crown of such societies as the *British Academy*.

The grant of the Great Charter by King John in 1215 (see *MAGNA CARTA*), which guaranteed the preservation of English liberties, led to a special association of the word with constitutional privileges, and so in modern times it has been applied to constitutions granted by sovereigns to their subjects, in contradistinction to those based on "the will of the people." Such was the Charter (*Charte*) granted by Louis XVIII to France in 1814. In Portugal the constitution granted by Dom Pedro in 1826 was called by the French party the "Charter," while that devised by the Cortes in 1821 was known as the "Constitution." *Magna Carta* also suggested to the English radicals in 1838 the name "People's Charter," which they gave to their published programme of reforms (see *CHARTISM*). This association of the idea of liberty with the word charter led to its figurative use in the sense of freedom or licence. This is, however, rare; the most common use being in the phrase "chartered libertine" (Shakespeare, *Henry V.* Act i. Sc. 1) from the derivative verb "to charter," e.g. to grant a charter. The common colloquialism "to charter," in the sense of to take, or hire, is derived from the special use of "to charter" as to hire (a ship) by charter-party.

**CHARTERED COMPANIES.** A chartered company is a trading corporation enjoying certain rights and privileges, and bound by certain obligations under a special charter granted to it by the sovereign authority of the state, such charter defining and limiting those rights, privileges and obligations, and the localities in which they are to be exercised. Such companies existed in early times, but have undergone changes and modifications in accordance with the developments which have taken place in the economic history of the states where they have existed. In Great Britain the first trading charters were granted, not to English companies, which were then non-existent, but to branches of the Hanseatic League (*g.z.*), and it was not till 1597 that England was finally relieved from the presence of a foreign chartered company. In that year Queen Elizabeth closed the steel-yard where Teutons had been established for 700 years.

The origin of all English trading companies is to be sought in the Merchants of the Staple. They lingered on into the 18th century, but only as a name, for their business was solely to export English products which, as English manufactures grew, were wanted at home. Of all early English chartered companies, the "Merchant Adventurers" conducted its operations the most widely. Its development of very early trading guilds, at the height of its prosperity it employed as many as 50,000 persons in the Netherlands, and the enormous influence it was able to exercise undoubtedly saved Antwerp from the institution of the Inquisition within its walls in the time of Charles V. In the reign of Elizabeth British trade with the Netherlands reached in one year 12,000,000 ducats, and in that of James I. the company's yearly commerce with Germany and the Netherlands was as much as £1,000,000. Hamburg afterwards was its principal depot, and it became known as the "Hamburg Company." In the "Merchant Adventurers'" enterprises is to be seen the germ of the trading companies which had so remarkable a development in the 16th and 17th centuries. These old regulated trade guilds passed gradually into joint-stock associations, which were capable of far greater extension, both as to the number of members and amount of stock, each member being only accountable for the amount of his own stock, and being able to transfer it at will to any other person.

It was in the age of Elizabeth and the early Stuarts that the chartered company, in the modern sense of the term, had its rise. The discovery of the New World, and the opening out of fresh trading routes to the Indies, gave an extraordinary impulse to shipping, commerce and industrial enterprise throughout western Europe. The English, French and Dutch governments were ready to assist trade by the granting of charters to trading associations. It is to the "Russia Company," which received its first charter in 1554, that Great Britain owed its first intercourse with an empire then almost unknown. The first recorded instance of a purely chartered company annexing territory is to be found in the action of this company in settling

up a cross at Spitzbergen in 1613 with King James's arms upon it. Among other associations trading to the continent of Europe, receiving charters at this time, were the Turkey Company (Levant Co.) and the Eastland Company. Both the Russia and Turkey Companies had an important effect upon British relations with those empires. They maintained British influence in those countries, and even paid the expenses of the embassies which were sent out by the English government to their courts. The Russia Company carried on a large trade with Persia through Russian territory; but from various causes their business gradually declined, though the Turkey Company existed in name until 1825.

The chartered companies which were formed during this period for trade with the Indies and the New World have had a more wide-reaching influence in history. The extraordinary career of the East India Company (*q.v.*) is dealt with elsewhere.

Charters were given to companies trading to Guinea, Morocco, Guiana and the Canaries, but none of these enjoyed a very long or prosperous existence, principally owing to the difficulties caused by foreign competition. It is when we turn to North America that the importance of the chartered company, as a colonizing rather than a trading agency, is seen in its full development. The "Hudson's Bay Company," which still exists as a commercial concern, is dealt with under its own heading, but most of the thirteen British North American colonies were in their inception chartered companies very much in the modern acceptance of the term. The history of these companies will be found under the heading of the different colonies of which they were the origin. It is necessary, however, to bear in mind that two classes of charters are to be found in force among the early American colonies: (1) Those granted to trading associations, which were often useful when the colony was first founded, but which formed a serious obstacle to its progress when the country had become settled and was looking forward to commercial expansion; the existence of these charters then often led to serious conflicts between the grantees of the charter and the colonies; ultimately elective assemblies everywhere superseded control of trading companies. (2) The second class of charters were those granted to the settlers themselves, to protect them against the oppressions of the crown and the provincial governors. These were highly prized by the colonists.

In France and Holland, no less than in England, the institution of chartered companies became a settled principle of the governments of those countries during the whole of the period in question. In France from 1599 to 1789, more than 70 of such companies came into existence, but after 1770, when the great *Compagnie des Indes orientales* went into liquidation, they were almost abandoned, and finally perished in the general sweeping away of privileges which followed on the outbreak of the Revolution.

If we inquire into the economic ideas which induced the granting of charters to these earlier companies and animated their promoters, we shall find that they were entirely consistent with the general principles of government at the time and what were then held to be sound commercial views. Under the old régime everything was a matter of monopoly and privilege, and to this state of things the constitution of the old companies corresponded, the sovereign rights accorded to them being also quite in accordance with the views of the time. It would have been thought impossible then that private individuals could have found the funds or maintained the magnitude of such enterprises. It was only this necessity which induced statesmen like Colbert to countenance them, and Montesquieu took the same view (*Esprit des lois*, t. xx. c. 10). John de Witt's view was that such companies were not useful for colonization properly so called, because they want quick returns to pay their dividends. So, even in France and Holland, opinion was by no means settled as to their utility. In England historic protests were made against such monopolies, but the chartered companies were less exclusive in England than in either France or Holland, the governors of provinces almost always allowing strangers to trade on receiving some pecuniary inducement. French com-

mercial companies were more privileged, exclusive and artificial than those in Holland and England. Those of Holland may be said to have been national enterprises. French companies rested more than did their rivals on false principles; they were more fettered by the royal power, and had less initiative of their own, and therefore had less chance of surviving. As an example of the kind of rules which prevented the growth of the French companies, it may be pointed out that no Protestants were allowed to take part in them. State subventions, rather than commerce or colonization, were often their object; but that has been a characteristic of French colonial enterprise at all times.

Such companies, however, under the old commercial system could hardly have come into existence without exclusive privileges. Their existence might have been prolonged had the whole people in time been allowed the chance of participating in them.

To sum up the causes of failure of the old chartered companies, they are to be attributed to (1) bad administration; (2) want of capital and credit; (3) bad economic organization; (4) distribution of dividends made prematurely or fictitiously. But those survived the longest which extended the most widely their privileges to outsiders. According to contemporary protests, they had a most injurious effect on the commerce of the countries where they had their rise. They were monopolies, and therefore, of course, obnoxious; and it is undoubted that the colonies they founded only became prosperous when they had escaped from their yoke.

On the other hand, it must not be forgotten that they contributed in no small degree to the commercial progress of their own states. They gave colonies to the mother country, and an impulse to the development of its fleet. In the case of England and Holland, the enterprise of the companies saved them from suffering from the monopolies of Spain and Portugal, and the wars of the English, and those of the Dutch in the Indies with Spain and Portugal, were paid for by the companies. They furnished the mother country with luxuries which, by the 18th century, had become necessities. They offered a career for the younger sons of good families, and sometimes greatly assisted large and useful enterprises.

During the last twenty years of the 19th century there was a great revival of the system of chartered companies in Great Britain. It is a feature of the general growth of interest in colonial expansion and commercial development which has made itself felt almost universally among European nations. Great Britain, however, alone has succeeded in establishing such companies as have materially contributed to the growth of her empire. These companies succeed or fail for reasons different from those which affected the chartered companies of former days, though there are points in common. Apart from causes inherent in the particular case of each company, which necessitates their being examined separately, recent experience leads us to lay down certain general principles regarding them. The modern companies are not like those of the 16th and 17th centuries. They are not privileged in the sense that those companies were. They are not monopolists; they have only a limited sovereignty, always being subject to the control of the home government. It is true that they have certain advantages given them, for without these advantages no capital would risk itself in the lands where they carry on their operations. They often have very heavy corresponding obligations, as will be seen in the case of one (the East Africa) where the obligations were too onerous for the company to discharge, though they were inseparable from its position. The charters of modern companies differ in two points strongly from those of the old: they contain clauses prohibiting any monopoly of trade, and they generally confer some special political rights directly under the control of the secretary of state. The political freedom of the old companies was much greater. In these charters state control has been made a distinguishing feature. It is to be exercised in almost all directions in which the companies may come into contact with matters political. Of course, it is inevitable in all disputes of the companies with foreign powers,

and is extended over all decrees of the company regarding the administration of its territories, the taxation of natives, and mining regulations. In all cases of dispute between the companies and the natives the secretary of state is *ex officio* the judge, and to the secretary of state (in the case of the South Africa Company) the accounts of administration have to be submitted for his approbation. It is deserving of notice that the British character of the company is insisted upon in each case in the charter which calls it into life. The crown always retains complete control over the company by reserving to itself the power of revoking the charter in case of the neglect of its stipulations. Special clauses were inserted in the charters of the British East Africa and South Africa Companies enabling the government to forfeit their charters if they did not promote the objects alleged as reasons for demanding a charter. This bound them still more strongly; and in the case of the South Africa Company the duration of the charter was fixed at twenty-five years.

The chartered company of these days is therefore very strongly fixed within limits imposed by law on its political action. As a whole, however, very remarkable results have been achieved. This may be attributed in no small degree to the personality of the men who have had the supreme direction at home and abroad, and who have, by their social position and personal qualities, acquired the confidence of the public. With the exception of the Royal Niger Company, it would be incorrect to say that they have been financially successful, but in the domain of government generally it may be said that they have added vast territories to the British empire (in Africa about 1,700,000 sq. m.), and in these territories they have acted as a civilizing force. They have made roads, opened facilities for trade, enforced peace, and laid at all events the foundation of settled administration. It is not too much to say that they have often acted unselfishly for the benefit of the mother country and even humanity. We may instance the anti-slavery and anti-alcohol campaigns which have been carried on, the latter certainly being against the immediate pecuniary interests of the companies themselves. It must, of course, be recognized that to a certain extent this has been done under the influence of the home government. The occupation of Uganda certainly, and of the Nigerian territory and Rhodesia probably, will prove to have been rather for the benefit of posterity than of the companies which effected it. In the two cases where the companies have been bought out by the state, they have had no compensation for much that they have expended. In fact, it would have been impossible to take into account actual expenditure day by day, and the cost of wars. To use the expression of Sir William Mackinnon, the shareholders have been compelled in some cases to "take out their dividends in philanthropy."

The existence of such companies to-day is justified in certain political and economic conditions only. It may be highly desirable for the government to occupy certain territories, but political exigencies at home will not permit it to incur the expenditure, or international relations may make such an undertaking inexpedient at the time. In such a case the formation of a chartered company may be the best way out of the difficulty. But it has been demonstrated again and again that, directly the company's interests begin to clash with those of foreign powers, the home government must assume a protectorate over its territories in order to simplify the situation and save perhaps disastrous collisions. So long as the political relations of such a company are with savages or semi-savages, it may be left free to act, but directly it becomes involved with a civilized power the state has (if it wishes to retain the territory) to acquire by purchase the political rights of the company, and it is obviously much easier to induce a popular assembly to grant money for the purpose of maintaining rights already existing than to acquire new ones. With the strict system of government supervision enforced by modern charters it is not easy for the state to be involved against its will in foreign complications. Economically such companies are also justifiable up to a certain point. When there is no other means of entering into commercial relations with remote and savage races save by enterprise of such magnitude that private

individuals could not incur the risk involved, then a company may be well entrusted with special privileges for the purpose, as an inventor is accorded a certain protection by law by means of a patent which enables him to bring out his invention at a profit if there is anything in it. But such privileges should not be continued longer than is necessary for the purpose of reasonably recompensing the adventurers. A successful company, even when it has lost monopoly or privileges, has, by its command of capital and general resources, established so strong a position that private individuals or new companies can rarely compete with it successfully. That this is so is clearly shown in the case of the Hudson's Bay Company as at present constituted. In colonizing new lands these companies often act successfully. They have proved more potent than the direct action of governments. This may be seen in Africa, where France and England have of late acquired vast areas, but have developed them with very different results, acting from the opposite principles of private and state promotion of colonization. Apart from national characteristics, the individual has far more to gain under the British system of private enterprise. A strong point in favour of some of the British companies has been that their undertakings have been practically extensions of existing British colonies rather than entirely isolated ventures. But a chartered company can never be anything but a transition stage of colonization; sooner or later the state must take the lead. A company may act beneficially so long as a country is undeveloped, but as soon as it becomes even semi-civilized its conflicts with private interests become so frequent and serious that its authority has to make way for that of the central government.

The companies which have been formed in France during recent years do not yet afford material for profitable study, for they have been subject to so much vexatious interference from home owing to lack of a fixed system of control sanctioned by government, that they have not been able, like the British, to develop along their own lines.

See also BORNEO; NIGERIA; BRIT. EAST AFRICA; RHODESIA; &c. The following works deal with the subject of chartered companies generally: Bonnaissieux, *Les Grandes Compagnies de commerce* (Paris, 1892); Chailly-Bert, *Les Compagnies de colonisation sous l'ancien régime* (Paris, 1898); Cawston and Keane, *The Early Chartered Companies* (London, 1896); W. Cunningham, *A History of British Industry and Commerce* (Cambridge, 1890, 1892); Egerton, *A Short History of British Colonial Policy* (London, 1897); J. Scott Keltie, *The Partition of Africa* (London, 1895); Leroy-Beaulieu, *De la colonisation chez les peuples modernes* (Paris, 1898); *Les Nouvelles Sociétés anglo-saxonnes* (Paris, 1897); MacDonald, *Select Charters illustrative of American History, 1606-1775* (New York, 1899); B. P. Poore, *Federal and State Constitutions, &c* (Washington, 1877; a more complete collection of American colonial charters); H. L. Osgood, *American Colonies in the 17th Cent.* (1904-7); Carton de Wiart, *Les Grandes Compagnies coloniales anglaises au 19<sup>e</sup> siècle* (Paris, 1899). Wood Renton (London, 1907-1909). (W. B. Du.)

**CHARTERHOUSE.** This name is an English corruption of the French *maison chartréuse*, a religious house of the Carthusian order. As such it occurs not uncommonly in England, in various places (e.g. Charterhouse-on-Mendip, Charterhouse Hinton) where the Carthusians were established. It is most familiar, however, in its application to the Charterhouse, London. On a site near the old city wall, west of the modern thoroughfare of Aldersgate, a Carthusian monastery was founded in 1371 by Sir Walter de Manny, a knight of French birth. After its dissolution in 1535 the property passed through various hands. In 1558, while in the possession of Lord North, it was occupied by Queen Elizabeth during the preparations for her coronation, and James I. held court here on his first entrance into London. The Charterhouse was then in the hands of Thomas Howard, earl of Suffolk, but in May 1611 it came into those of Thomas Sutton (1532-1611) of Snaith, Lincolnshire. He acquired a fortune by the discovery of coal on two estates which he had leased near Newcastle-on-Tyne, and afterwards, removing to London, he carried on a commercial career. In the year of his death, which took place on the 12th of December 1612, he

endowed a hospital on the site of the Charterhouse, calling it the hospital of King James; and in his will he bequeathed moneys to maintain a chapel, hospital (almshouse) and school. The will was hotly contested but upheld in court, and the foundation was finally constituted to afford a home for eighty male pensioners ("gentlemen by descent and in poverty, soldiers that have borne arms by sea or land, merchants decayed by piracy or shipwreck, or servants in household to the King or Queen's Majesty"), and to educate forty boys. The school developed beyond the original intentions of its founder, and now ranks among the most eminent public schools in England. In 1872 it was removed, during the headmastership (1863-1897) of the Rev. William Haig-Brown (d. 1907), to new buildings near Godalming in Surrey, which were opened on the 18th of June in that year. The number of foundation scholarships is increased to sixty. The scholars are not now distinguished by wearing a special dress or by forming a separate house, though one house is known as Gownboys, preserving the former title of the scholars. The land on which the old school buildings stood in London was sold for new buildings to accommodate the Merchant-Tailors' school, but the pensioners still occupy their picturesque home, themselves picturesque figures in the black gowns designed for them under the foundation. The buildings, of mellowed red brick, include a panelled chapel, in which is the founder's tomb, a fine dining-hall, governors' room with ornate ceiling and tapestried walls, the old library, and the beautiful great staircase.

**CHARTER-PARTY** (Lat. *charta partita*, a legal paper or instrument, "divided," i.e. written in duplicate so that each party retains half), a written, or partly written and partly printed, contract between merchant and shipowner, by which a ship is let or hired for the conveyance of goods on a specified voyage, or for a definite period. (See **AFREIGHTMENT**.)

**CHARTERS TOWERS**, a mining town of Devonport county, Queensland, Australia, 82 m. by rail S.W. of Townsville and 820 m. direct N.N.W. of Brisbane. It is the centre of an important gold-field, the reefs of which improve at the lower depths, the deepest shaft on the field being 2558 ft. below the surface-level. The gold is of a very fine quality. An abundant water-supply is obtained from the Burdekin river, some 8 m. distant. The population of the town in 1901 was 5523; but within a 5 m. radius it was 20,976. Charters Towers became a municipality in 1877.

**CHARTIER, ALAIN** (c. 1392-c. 1430), French poet and political writer, was born at Bayeux about 1392. Chartier belonged to a family marked by considerable ability. His eldest brother Guillaume became bishop of Paris; and Thomas became notary to the king. Jean Chartier, a monk of St Denis, whose history of Charles VII. is printed in vol. iii. of *Les Grands Chroniques de Saint-Denis* (1477), was not, as is sometimes stated, also a brother of the poet. Alain studied, as his elder brother had done, at the university of Paris. His earliest poem is the *Livre des quatre dames*, written after the battle of Agincourt: This was followed by the *Débat du réveille-matin*, *La Belle Dame sans merci*, and others. None of these poems show any very patriotic feeling, though Chartier's prose is evidence that he was not indifferent to the misfortunes of his country. He followed the fortunes of the dauphin, afterwards Charles VII., acting in the triple capacity of clerk, notary and financial secretary. In 1422 he wrote the famous *Quadrilogue invectif*. The interlocutors in this dialogue are France herself and the three orders of the state. Chartier lays bare the abuses of the feudal army and the sufferings of the peasants. He rendered an immense service to his country by maintaining that the cause of France, though desperate to all appearance, was not yet lost if the contending factions could lay aside their differences in the face of the common enemy. In 1424 Chartier was sent on an embassy to Germany, and three years later he accompanied to Scotland the mission sent to negotiate the marriage of Margaret of Scotland, then not four years old, with the dauphin, afterwards Louis XI. In 1429 he wrote the *Livre d'espérance*, which contains a fierce attack on the nobility and clergy. He was the author of a diatribe on the courtiers of Charles VII. entitled *Le Curial*,

translated into English (*Here followeth the copy of a lettre whyche maistre A. Chartier wrote to his brother*) by Caxton about 1484. The date of his death is to be placed about 1430. A Latin epitaph, discovered in the 18th century, says, however, that he was archdeacon of Paris, and declares that he died in the city of Avignon in 1449. This is obviously not authentic, for Alain described himself as a *simple clerc* and certainly died long before 1449. The story of the famous kiss bestowed by Margaret of Scotland on *la précieuse bouche de laquelle sont issus et sortis tant de bons mots et vertueuses paroles* is mythical, for Margaret did not come to France till 1436, after the poet's death; but the story, first told by Guillaume Bouchet in his *Annales d'Aquitaine* (1524), is interesting, if only as a proof of the high degree of estimation in which the ugliest man of his day was held. Jean de Masles, who annotated a portion of his verse, has recorded how the pages and young gentlemen of that epoch were required daily to learn by heart passages of his *Breviaire des nobles*. John Lydgate studied him affectionately. His *Belle Dame sans merci* was translated into English by Sir Richard Ros about 1640, with an introduction of his own; and Clément Marot and Octavien de Saint-Gelais, writing fifty years after his death, find many fair words for the old poet, their master and predecessor.

See Mancel, *Alain Chartier, étude bibliographique et littéraire*, 8vo (Paris, 1849); D. Delaunay's *Étude sur Alain Chartier* (1876), with considerable extracts from his writings. His works were edited by A. Duchesne (Paris, 1617). On Jean Chartier see Vallet de Viriville, "Essais critiques sur les historiens originaux du règne de Charles VIII.," in the *Bibl. de l'École des Chartes* (July-August 1857).

**CHARTISM**, the name given to a movement for political reform in England, from the so-called "People's Charter" or "National Charter," the document in which in 1838 the scheme of reforms was embodied. The movement itself may be traced to the latter years of the 18th century. Checked for a while by the reaction due to the excesses of the French Revolution, it received a fresh impetus from the awful misery that followed the Napoleonic wars and the economic changes due to the introduction of machinery. The Six Acts of 1819 were directed, not only against agrarian and industrial rioting, but against the political movement of which Sir Francis Burdett was the spokesman in the House of Commons, which demanded manhood suffrage, the ballot, annual parliaments, the abolition of the property qualification for members of parliament and their payment. The movement was checked for a while by the Reform Bill of 1832; but it was soon discovered that, though the middle classes had been enfranchised, the economic and political grievances of the labouring population remained unredressed. Two separate movements now developed: one socialistic, associated with the name of Robert Owen; the other radical, aiming at the enfranchisement of the "masses" as the first step to the amelioration of their condition. The latter was represented in the Working Men's Association, by which in 1838 the "People's Charter" was drawn up. It embodied exactly the same programme as that of the radical reformers mentioned above, with the addition of a demand for equal electoral districts.

In support of this programme a vigorous agitation began, the principal leader of which was Feargus O'Connor, whose irresponsible and erratic oratory produced a vast effect. Monster meetings were held, at which seditious language was occasionally used, and slight collisions with the military took place. Petitions of enormous size, signed in great part with fictitious names, were presented to parliament; and a great many newspapers were started, of which the *Northern Star*, conducted by Feargus O'Connor, had a circulation of 50,000. In November 1839 a Chartist mob consisting of miners and others made an attack on Newport, Mon. The rising was a total failure; the leaders, John Frost and two others, were seized, were found guilty of high treason, and were condemned to death. The sentence, however, was changed to one of transportation, and Frost spent over fourteen years in Van Diemen's Land. In 1854 he was pardoned, and from 1856 until his death on the 29th of July 1877 he lived in England. In 1840 the Chartist movement was still further organized by the inauguration at Manchester of the National

Charter Association, which rapidly became powerful, being the head of about 400 sister societies, which are said to have numbered 40,000 members. Some time after, efforts were made towards a coalition with the more moderate radicals, but these failed; and a land scheme was started by O'Connor, which prospered for a few years. In 1844 the uncompromising spirit of some of the leaders was well illustrated by their hostile attitude towards the Anti-Corn-Law League. O'Connor, especially, entered into a public controversy with Cobden and Bright, in which he was worsted. But it was not till 1848, during a season of great suffering among the working classes, and under the influence of the revolution at Paris, that the real strength of the Chartist movement was discovered and the prevalent discontent became known. Early in March disturbances occurred in Glasgow which required the intervention of the military, while in the manufacturing districts all over the west of Scotland the operatives were ready to rise in the event of the main movement succeeding. Some agitation, too, took place in Edinburgh and in Manchester, but of a milder nature; in fact, while there was a real and widespread discontent, men were indisposed to resort to decided measures.

The principal scene of intended Chartist demonstration was London. An enormous gathering of half a million was announced for the 10th of April on Kennington Common, from which they were to march to the Houses of Parliament to present a petition signed by nearly six million names, in order by this imposing display of numbers to secure the enactment of the six points. Probably some of the more violent members of the party thought to imitate the Parisian mob by taking power entirely into their own hands. The announcement of the procession excited great alarm, and the most decided measures were taken by the authorities to prevent a rising. The procession was forbidden. The military were called out under the command of the duke of Wellington, and by him concealed near the bridges and other points where the procession might attempt to force its way. Even the Bank of England and other public buildings were put in a state of defence, and special constables, to the number, it is said, of 170,000, were enrolled, one of whom was destined shortly after to be the emperor of the French. After all these gigantic preparations on both sides the Chartist demonstration proved to be a very insignificant affair. Instead of half a million, only about 50,000 assembled on Kennington Common, and their leaders, Feargus O'Connor and Ernest Charles Jones, shrank from the responsibility of braving the authorities by conducting the procession to the Houses of Parliament. The monster petition was duly presented, and scrutinized, with the result that the number of signatures was found to have been grossly exaggerated, and that the most unheard-of falsification of names had been resorted to. Thereafter the movement specially called Chartistism soon died out. It became merged, so far as its political programme is concerned, with the advancing radicalism of the general democratic movement.

**CHARTRES**, a city of north-western France, capital of the department of Eure-et-Loir, 55 m. S.W. of Paris on the railway to Le Mans. Pop. (1906) 19,433. Chartres is built on the left bank of the Eure, on a hill crowned by its famous cathedral, the spires of which are a landmark in the surrounding country. To the south-east stretches the fruitful plain of Beauce, "the granary of France," of which the town is the commercial centre. The Eure, which at this point divides into three branches, is crossed by several bridges, some of them ancient, and is fringed in places by remains of the old fortifications, of which the Porte Guillaume (14th century), a gateway flanked by towers, is the most complete specimen. The steep, narrow streets of the old town contrast with the wide, shady boulevards which encircle it and divide it from the suburbs. The Clos St Jean, a pleasant park, lies to the north-west, and squares and open spaces are numerous. The cathedral of Notre-Dame (see ARCHITECTURE: *Romanesque and Gothic Architecture in France*;) and CATHEDRAL), one of the finest Gothic churches in France, was founded in the 11th century by Bishop Fulbert on the site of an earlier church destroyed by fire. In 1194 another conflagration laid waste

the new building then hardly completed; but clergy and people set zealously to work, and the main part of the present structure was finished by 1240. Though there have been numerous minor additions and alterations since that time, the general character of the cathedral is unimpaired. The upper woodwork was consumed by fire in 1836, but the rest of the building was saved. The statuary of the lateral portals, the stained glass of the 13th century, and the choir-screen of the Renaissance are all unique from the artistic standpoint. The cathedral is also renowned for the beauty and perfect proportions of its western towers. That to the south, the Clocher Vieux (351 ft. high), dates from the 12th century; its upper portion is lower and less rich in design than that of the Clocher Neuf (377 ft.), which was not completed till the 16th century. In length the cathedral measures 440 ft., its choir measures 150 ft. across, and the height of the vaulting is 121 ft. The abbey church of St Pierre, dating chiefly from the 13th century, contains, besides some fine stained glass, twelve representations of the apostles in enamel, executed about 1547 by Léonard Limosin. Of the other churches of Chartres the chief are St Aignan (13th, 16th and 17th centuries) and St Martin-au-Val (12th century). The hôtel de ville, a building of the 17th century, containing a museum and library, an older hôtel de ville of the 13th century, and several medieval and Renaissance houses, are of interest. There is a statue of General F. S. Marceau-Desgravières (b. 1769), a native of the town.

The town is the seat of a bishop, a prefecture, a court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce, training colleges, a lycée for boys, a communal college for girls, and a branch of the Bank of France. Its trade is carried on chiefly on market-days, when the peasants of the Beauce bring their crops and live-stock to be sold and make their purchases. The game-pies and other delicacies of Chartres are well known, and the industries also include flour-milling, brewing, distilling, iron-founding, leather manufacture, dyeing, and the manufacture of stained glass, billiard requisites, hosiery, &c.

Chartres was one of the principal towns of the Carnutes, and by the Romans was called *Auricus*, from the river *Autara* (Eure), and afterwards *civitas Carnutum*. It was burnt by the Normans in 858, and unsuccessfully besieged by them in 911. In 1417 it fell into the hands of the English, from whom it was recovered in 1432. It was attacked unsuccessfully by the Protestants in 1568, and was taken in 1591 by Henry IV., who was crowned there three years afterwards. In the Franco-German War it was seized by the Germans on the 21st of October 1870, and continued during the rest of the campaign an important centre of operations. During the middle ages it was the chief town of the district of Beauce, and gave its name to a county which was held by the counts of Blois and Champagne and afterwards by the house of Châtillon, a member of which in 1286 sold it to the crown. It was raised to the rank of a duchy in 1528 by Francis I. After the time of Louis XIV. the title of duke of Chartres was hereditary in the family of Orleans.

See M. T. Bulteau, *Monographie de la cathédrale de Chartres* (1887); A. Pierval, *Chartres, sa cathédrale, ses monuments* (1896); H. J. L. J. Massé, *Chartres: ses cathédrales et Churches* (1900).

**CHARTREUSE**, a liqueur, so called from having been made at the famous Carthusian monastery, La Grande Chartreuse, at Grenoble (see below). In consequence of the Associations Law, the Chartreux monks left France in 1704, and now continue the manufacture of this liqueur in Spain. There are two main varieties of Chartreuse, the green and the yellow. The green contains about 57, the yellow about 43% of alcohol. There are other differences due to the varying nature and quantity of the flavouring matters employed, but the secrets of manufacture are jealously guarded. The genuine liqueur is undoubtedly produced by means of a distillation process.

**CHARTREUSE, LA GRANDE**, the mother house of the very severe order of Carthusian monks (see CARTHUSIANS). It is situated in the French department of the Isère, about 12½ m. N. of Grenoble, at a height of 3205 ft. above the sea, in the heart of a group of limestone mountains, and not far from the source

of the Guiers Mort. The original settlement here was founded by St Bruno about 1084, and derived its name from the small village to the S.E., formerly known as Cartusia, and now as St Pierre de Chartreuse. The first convent on the present site was built between 1132 and 1137, but the actual buildings date only from about 1676, the older ones having been often burnt. The convent stands in a very picturesque position in a large meadow, sloping to the S.W., and watered by a tiny tributary of the Guiers Mort. On the north, fine forests extend to the Col de la Ruchère, and on the west rise well-wooded heights, while on the east tower white limestone ridges, culminating in the Grand Som (6670 ft.). One of the most famous of the early Carthusian monks was St Hugh of Lincoln, who lived here from 1160 to 1181, when he went to England to found the first Carthusian house at Witham in Somerset; in 1186 he became bishop of Lincoln, and before his death in 1200 had built the angel choir and other portions of the wonderful cathedral there.

The principal approach to the convent is from St Laurent du Pont, a village situated on the Guiers Mort, and largely built by the monks—it is connected by steam tramways with Voiron (for Grenoble) and St Bérone (for Chambéry). Among the other routes may be mentioned those from Grenoble by Le Sappey, or by the Col de la Charmette, or from Chambéry by the Col de Couz and the village of Les Echelles. St Laurent is about 53 m. from the convent. The road mounts along the Guiers Mort and soon reaches the hamlet of Fourvoirie, so called from *forata via*, as about 1510 the road was first pierced hence towards the convent. Here are iron forges, and here was formerly the chief centre of the manufacture of the famed Chartreuse liqueur. Beyond, the road enters the "Désert" and passes through most delightful scenery. Some way farther the Guiers Mort is crossed by the modern bridge of St Bruno, the older bridge of Parant being still visible higher up the stream. Here begins the splendid carriage road, constructed by M. E. Viaud between 1854 and 1856. It soon passes beneath the bold pinnacle of the Oeillette or Aiguillette, beyond which formerly women were not allowed to penetrate. After passing through four tunnels the road bends north (leaving the Guiers Mort which flows past St Pierre de Chartreuse), and the valley soon opens to form the upland hollow in which are the buildings of the convent. These are not very striking, the high roofs of dark slate, the cross-surmounted turrets and the lofty clock-tower being the chief features. But the situation is one of ideal peace and repose. Women were formerly lodged in the old infirmary, close to the main gate, which is now a hôtel. Within the conventual buildings are four halls formerly used for the reception of the priors of the various branch houses in France, Italy, Burgundy and Germany. The very plain and unadorned chapel dates from the 15th century, but the cloisters, around which cluster the thirty-six small houses for the fully professed monks, are of later date. The library contained before the Revolution a very fine collection of books and MSS., now mostly in the town library at Grenoble.

The monks were expelled in 1793, but allowed to return in 1816, but then they had to pay rent for the use of the buildings and the forests around, though both one and the other were due to the industry of their predecessors. They were again expelled in 1904, and are dispersed in various houses in England, at Pinerolo (Italy) and at Tarragona (Spain). It is at the last-named spot that the various pharmaceutical preparations are now manufactured for which they are famous (though sold only since about 1840)—the *Elixir*, the *Boule d'acier* (a mineral paste or salve), and the celebrated *liqueur*. The magnificent revenues derived from the profits of this manufacture were devoted by the monks to various purposes of benevolence, especially in the neighbouring villages, which owe to this source their churches, schools, hospitals, &c., &c., built and maintained at the expense of the monks.

See *La Grande Chartreuse par un Chartreux* (Grenoble. 1898); H. Ferrand, *Guide à la Grande Chartreuse* (1889); and *Les Montagnes de la Chartreuse* (1899). (W. A. B. C.)

**CHARWOMAN**, one who is hired to do occasional household work. "Char" or "chare," which forms the first part of the

word, is common, in many forms, to Teutonic languages, meaning a "turn," and, in this original sense, is seen in "ajar," properly "on char," of a door "on the turn" in the act of closing. It is thus applied to a "turn of work," an odd job, and is so used, in the form "chore," in America, and in dialects of the south-west of England.

**CHASE, SALMON PORTLAND** (1808-1873), American statesman and jurist, was born in Cornish township, New Hampshire, on the 13th of January 1808. His father died in 1817, and the son passed several years (1820-1824) in Ohio with his uncle, Bishop Philander Chase (1775-1852), the foremost pioneer of the Protestant Episcopal Church in the West, the first bishop of Ohio (1819-1831), and after 1835 bishop of Illinois. He graduated at Dartmouth College in 1826, and after studying law under William Wirt, attorney-general of the United States, Washington, D.C., was admitted to the bar in 1829, and removed to Cincinnati, Ohio, in 1830. Here he soon gained a position of prominence at the bar, and published an annotated edition which long remained standard, of the laws of Ohio. At a time when public opinion in Cincinnati was largely dominated by Southern business connexions, Chase, influenced probably by James G. Birney, associated himself after about 1836 with the anti-slavery movement, and became recognized as the leader of the political reformers as opposed to the Garrisonian abolitionists. To the cause he freely gave his services as a lawyer, and was particularly conspicuous as counsel for fugitive slaves seized in Ohio for rendition to slavery under the Fugitive Slave Law of 1793—indeed, he came to be known as the "attorney-general of fugitive slaves." His argument (1847) in the famous *Van Zandt* case before the United States Supreme Court attracted particular attention, though in this as in other cases of the kind the judgment was against him. In brief he contended that slavery was "local, not national," that it could exist only by virtue of positive State Law, that the Federal government was not empowered by the Constitution to create slavery anywhere, and that "when a slave leaves the jurisdiction of a state he ceases to be a slave, because he continues to be a man and leaves behind him the law which made him a slave." In 1841 he abandoned the Whig party, with which he had previously been affiliated, and for seven years was the undisputed leader of the Liberty party in Ohio; he was remarkably skilful in drafting platforms and addresses, and it was he who prepared the national Liberty platform of 1843 and the Liberty address of 1845. Realizing in time that a third party movement could not succeed, he took the lead during the campaign of 1848 in combining the Liberty party with the Barnburners or Van Buren Democrats of New York to form the Free-Soilers. He drafted the famous Free-Soil platform, and it was largely through his influence that Van Buren was nominated for the presidency. His object, however, was not to establish a permanent new party organization, but to bring pressure to bear upon Northern Democrats to force them to adopt a policy opposed to the further extension of slavery.

In 1849 he was elected to the United States Senate as the result of a coalition between the Democrats and a small group of Free-Soilers in the state legislature; and for some years thereafter, except in 1852, when he rejoined the Free-Soilers, he classed himself as an Independent Democrat, though he was out of harmony with the leaders of the Democratic party. During his service in the Senate (1849-1855) he was pre-eminently the champion of anti-slavery in that body, and no one spoke more ably than he did against the Compromise Measures of 1850 and the Kansas-Nebraska Bill of 1854. The Kansas-Nebraska legislation, and the subsequent troubles in Kansas, having convinced him of the futility of trying to influence the Democrats, he assumed the leadership in the North-west of the movement to form a new party to oppose the extension of slavery. The "Appeal of the Independent Democrats in Congress to the People of the United States," written by Chase and Giddings, and published in the *New York Times* of the 24th of January 1854, may be regarded as the earliest draft of the Republican party creed. He was the first Republican governor of Ohio,

serving from 1855 to 1859. Although, with the exception of Seward, he was the most prominent Republican in the country, and had done more against slavery than any other Republican, he failed to secure the nomination for the presidency in 1860, partly because his views on the question of protection were not orthodox from a Republican point of view, and partly because the old line Whig element could not forgive his coalition with the Democrats in the senatorial campaign of 1849; his uncompromising and conspicuous anti-slavery record, too, was against him from the point of view of "availability." As secretary of the treasury in President Lincoln's cabinet in 1861-1864, during the first three years of the Civil War, he rendered services of the greatest value. That period of crisis witnessed two great changes in American financial policy, the establishment of a national banking system and the issue of a legal tender paper currency. The former was Chase's own particular measure. He suggested the idea, worked out all of the important principles and many of the details, and induced Congress to accept them. The success of that system alone warrants his being placed in the first rank of American financiers. It not only secured an immediate market for government bonds, but it also provided a permanent uniform national currency, which, though inelastic, is absolutely stable. The issue of legal tenders, the greatest financial blunder of the war, was made contrary to his wishes, although he did not, as he perhaps ought to have done, push his opposition to the point of resigning.

Perhaps Chase's chief defect as a statesman was an insatiable desire for supreme office. It was partly his ambition, and also temperamental differences from the president, which led him to retire from the cabinet in June 1864. A few months later (December 6, 1864) he was appointed chief justice of the United States Supreme Court to succeed Judge Taney, a position which he held until his death in 1873. Among his most important decisions were *Texas v. White* (7 Wallace, 700), 1869, in which he asserted that the Constitution provided for an "indestructible union composed of indestructible states," *Veasie Bank v. Fenno* (8 Wallace, 533), 1869, in defence of that part of the banking legislation of the Civil War which imposed a tax of 10% on state bank-notes, and *Heppburn v. Griswold* (8 Wallace, 603), 1869, which declared certain parts of the legal tender acts to be unconstitutional. When the legal tender decision was reversed after the appointment of new judges, 1871-1872 (*Legal Tender Cases*, 12 Wallace, 457), Chase prepared a very able dissenting opinion. Toward the end of his life he gradually drifted back toward his old Democratic position, and made an unsuccessful effort to secure the nomination of the Democratic party for the presidency in 1872. He died in New York city on the 7th of May 1873. Chase was one of the ablest political leaders of the Civil War period, and deserves to be placed in the front rank of American statesmen.

The standard biography is A. B. Hart's *Salmon Portland Chase in the "American Statesmen Series"* (1899). Less philosophical, but containing a greater wealth of detail, is J. W. Shuckers' *Life and Public Services of Salmon Portland Chase* (New York, 1874). R. B. Warden's *Account of the Private Life and Public Services of Salmon Portland Chase* (Cincinnati, 1874) deals more fully with Chase's private life.

**CHASE, SAMUEL** (1741-1811), American jurist, was born in Somerset county, Maryland, on the 17th of April 1741. He was admitted to the bar at Annapolis in 1761, and for more than twenty years was a member of the Maryland legislature. He took an active part in the resistance to the Stamp Act, and from 1774 to 1778 and 1784 to 1785 was a member of the Continental Congress. With Benjamin Franklin and Charles Carroll he was sent by Congress in 1776 to win over the Canadians to the side of the revolting colonies, and after his return did much to persuade Maryland to advocate a formal separation of the thirteen colonies from Great Britain, he himself being one of those who signed the Declaration of Independence on the 2nd of August 1776. In this year he was also a member of the convention which framed the first constitution for the state of Maryland. After serving in the Maryland convention which ratified for that state the Federal Constitution, and there

vigorously opposing ratification, though afterwards he was an ardent Federalist, he became in 1791 chief judge of the Maryland general court, which position he resigned in 1796 for that of an associate justice of the Supreme Court of the United States. His radical Federalism, however, led him to continue active in politics, and he took advantage of every opportunity, on the bench and off, to promote the cause of his party. His overbearing conduct while presiding at the trials of John Fries for treason, and of James Thompson Callender (d. 1813) for seditious libel in 1800, drove the lawyers for the defence from the court, and evoked the wrath of the Republicans, who were stirred to action by a political harangue on the evil tendencies of democracy which he delivered as a charge to a grand jury at Baltimore in 1803. The House of Representatives adopted a resolution of impeachment in March 1804, and on the 7th of December 1804 the House managers, chief among whom were John Randolph, Joseph H. Nicholson (1770-1817), and Caesar A. Rodney (1772-1842), laid their articles of impeachment before the Senate. The trial, with frequent interruptions and delays, lasted from the 2nd of January to the 1st of March 1805. Judge Chase was defended by the ablest lawyers in the country, including Luther Martin, Robert Goodloe Harper (1765-1825), Philip Barton Key (1757-1815), Charles Lee (1758-1815), and Joseph Hopkinson (1770-1842). The indictment, in eight articles, dealt with his conduct in the Fries and Callender trials, with his treatment of a Delaware grand jury, and (in article viii.) with his making "highly indecent, extra-judicial" reflections upon the national administration, probably the greatest offence in Republican eyes. On only three articles was there a majority against Judge Chase, the largest, on article viii., being four short of the necessary two-thirds to convict. "The case," says Henry Adams, "proved impeachment to be an impracticable thing for partisan purposes, and it decided the permanence of those lines of constitutional development which were a reflection of the common law." Judge Chase resumed his seat on the bench, and occupied it until his death on the 19th of June 1811.

See *The Trial of Samuel Chase* (2 vols. Washington, 1805), reported by Samuel H. Smith and Thomas Lloyd; an article in *The American Law Review*, vol. xxiii. (St Louis, Mo., 1899); and Henry Adams's *History of the United States*, vol. ii. (New York, 1889).

**CHASE, WILLIAM MERRITT** (1849- ), American painter, was born at Franklin, Indiana, on the 1st of November 1849. He was a pupil of B. F. Hays at Indianapolis, of J. O. Eaton in New York, and subsequently of A. Wagner and Piloty in Munich. In New York he established a school of his own, after teaching with success for some years at the Art Students' League. A worker in all mediums—oils, water-colour, pastel and etching—painting with distinction the figure, landscape and still-life, he is perhaps best known by his portraits, his sitters numbering some of the most important men and women of his time. Mr Chase won many honours at home and abroad, became a member of the National Academy of Design, New York, and for ten years was president of the Society of American Artists. Among his important canvases are "Ready for the Ride" (Union League Club, N.Y.), "The Apprentice," "Court-Jester," and portraits of the painters Whistler and Duveneck; of General Webb and of Peter Cooper.

**CHASE.** (1) (Fr. *chasse*, from Lat. *capere*, frequentative of *capere*, to take), the pursuit of wild animals for food or sport (see HUNTING). The word is used of the pursuit of anything, and also of the thing pursued, as, in naval warfare, of a ship. A transferred meaning is that of park land reserved for the breeding and hunting of wild animals, in which sense it appears in various place-names in England, as Cannock Chase. It is also a term for a stroke in tennis (*q.v.*). (2) (Fr. *châsse*, Lat. *capsa*, a box, cf. *caisse*, and "chest"), an enclosure, such as the muzzle-end of a gun in front of the trunnions, a groove cut to hold a pipe, and, in typography, the frame enclosing the "forme."

**CHASING**, or ENCHASING, the art of producing figures and ornamental patterns, either raised or indented, on metallic surfaces by means of steel tools or punches. It is practised

Fig. 2.—Chasuble of Pope Calixtus III. (15th century) preserved at Valencia.

Fig. 6.—Modern English Chasuble, used at St. Paul's Church, Knightsbridge, London.

Fig. 7. — Back of a Chasuble of Italian Brocaded Damask (Red) with Embroidered Orphreys. The Vestment is of the early 16th century, the Orphreys of the late 14th century. (English. In the Victoria and Albert Museum.)

extensively for the ornamentation of goldsmith and silversmith work, electro-plate and similar objects, being employed to produce bold flutings and bosses, and in another manner utilized for imitating engraved surfaces. Minute work can be produced by this method, perfect examples of which may be seen in the watch-cases chased by G. M. Moser, R.A. (1704-1783). The chaser first outlines the pattern on the surface he is to ornament, after which, if the work involves bold or high embossments, these are blocked out by a process termed "snarling." The snarling iron is a long iron tool turned up at the end, and made so that when securely fastened in a vise the upturned end can reach and press against any portion of the interior of the vase or other object to be chased. The part to be raised being held firmly against the upturned point of the snarling iron, the workman gives the shoulder or opposite end of the iron a sharp blow, which causes the point applied to the work to give it a percussive stroke, and thus throw up the surface of the metal held against the tool. When the blocking out from the interior is finished, or when no such embossing is required, the object to be chased is filled with molten pitch, which is allowed to harden. It is then fastened to a sandbag, and with hammer and a multitude of small punches of different outline the whole details of the pattern, lined, smooth or "matt," are worked out. Embossing and stamping from steel dies and rolled ornaments have long since taken the place of chased ornamentations in the cheaper kinds of plated works. (See EMBOSsing.)

**CHASLES, VICTOR EUPHÉMIEN PHILARÈTE** (1798-1873), French critic and man of letters, was born at Mainvilliers (Eure et Loir) on the 8th of October 1798. His father, Pierre Jacques Michel Chasles (1754-1826), was a member of the Convention, and was one of those who voted the death of Louis XVI. He brought up his son according to the principles of Rousseau's *Émile*, and the boy, after a régime of outdoor life, followed by some years' classical study, was apprenticed to a printer, so that he might make acquaintance with manual labour. His master was involved in one of the plots of 1815, and Philarète suffered two months' imprisonment. On his release he was sent to London, where he worked for the printer Valpy on editions of classical authors. He wrote articles for the English reviews, and on his return to France did much to popularize the study of English authors. He was also one of the earliest to draw attention in France to Scandinavian and Russian literature. He contributed to the *Revue des deux mondes*, until he had a violent quarrel, terminating in a lawsuit, with François Buloz, who won his case. He became librarian of the Bibliothèque Mazarine, and from 1841 was professor of comparative literature at the Collège de France. During his active life he produced some fifty volumes of literary history and criticism, and of social history, much of which is extremely valuable. He died at Venice on the 18th of July 1873. His son, Émile Chasles (b. 1827), was a philologist of some reputation.

Among his best critical works is *Dix-huitième Siècle en Angleterre* . . . (1846), one of a series of 20 vols. of *Études de littérature comparée* (1846-1875), which he called later *Trente ans de critique*. An account of his strenuous boyhood is given in his *Maison de mon père*. His *Mémoires* (1876-1877) did not fulfil the expectations based on his brilliant talk.

**CHASSE** (from the Fr., in full *chasse-café*, or "coffee-chaser"), a draught of spirit or liqueur, taken with or after coffee, &c.

**CHASSÉ** (Fr. for "chased"), a gliding step in dancing, so called since one foot is brought up behind or chases the other. The *chassé croisé* is a double variety of the step.

**CHASSELOUP-LAUBAT, FRANÇOIS, MARQUIS DE** (1754-1833). French general and military engineer, was born at St Sernin (Lower Charente) on the 18th of August 1754, of a noble family, and entered the French engineers in 1774. He was still a subaltern at the outbreak of the Revolution, becoming captain in 1791. His ability as a military engineer was recognized in the campaigns of 1792 and 1793. In the following year he won distinction in various actions and was promoted successively *chef de bataillon* and colonel. He was chief of engineers at the siege of Mainz in 1796, after which he was sent to Italy. He there conducted the first siege of Mantua, and reconnoitred the

positions and lines of advance of the army of Bonaparte. He was promoted general of brigade before the close of the campaign, and was subsequently employed in fortifying the new Rhine frontier of France. His work as chief of engineers in the army of Italy (1799) was conspicuously successful, and after the battle of Novi he was made general of division. When Napoleon took the field in 1800 to retrieve the disasters of 1799, he again selected Chasseloup as his engineer general. During the peace of 1801-1805 he was chiefly employed in reconstructing the defences of northern Italy, and in particular the afterwards famous Quadrilateral. His *chef-d'œuvre* was the great fortress of Alessandria on the Tanaro. In 1805 he remained in Italy with Masséna, but at the end of 1806 Napoleon, then engaged in the Polish campaign, called him to the *Grande Armée*, with which he served in the campaign of 1806-07, directing the sieges of Colberg, Danzig and Stralsund. During the Napoleonic domination in Germany, Chasseloup reconstructed many fortresses, in particular Magdeburg. In the campaign of 1809 he again served in Italy. In 1810 Napoleon made him a councillor of state. His last campaign was that of 1812 in Russia. He retired from active service soon afterwards, though in 1814 he was occasionally engaged in the inspection and construction of fortifications. Louis XVIII. made him a peer of France and a knight of St Louis. He refused to join Napoleon in the Hundred Days, but after the second Restoration he voted in the chamber of peers against the condemnation of Marshal Ney. In politics he belonged to the constitutional party. The king created him a marquis. Chasseloup's later years were employed chiefly in putting in order his manuscripts, a task which he had to abandon owing to the failure of his sight. His only published work was *Correspondance d'un général français, &c. sur divers sujets* (Paris, 1801, republished Milan, 1805 and 1811, under the title *Correspondance de deux généraux, &c., essais sur quelques parties d'artillerie et de fortification*). The most important of his papers are in manuscript in the Dépôt of Fortifications, Paris.

As an engineer Chasseloup was an adherent, though of advanced views, of the old bastioned system. He followed in many respects the engineer Bousmard, whose work was published in 1797 and who fell, as a Prussian officer, in the defence of Danzig in 1807 against Chasseloup's own attack. His front was applied to Alessandria, as has been stated, and contains many elaborations of the bastion trace, with, in particular, masked flanks in the tenaille, which served as extra flanks of the bastions. The bastion itself was carefully and minutely retrenched. The ordinary ravelin he replaced by a heavy casemated caponier after the example of Montalembert, and, like Bousmard's, his own ravelin was a large and powerful work pushed out beyond the glacis.

**CHASSEPOT**, officially "fusil modèle 1866," a military breech-loading rifle, famous as the arm of the French forces in the Franco-German War of 1870-71. It was so called after its inventor, Antoine Alphonse Chassepot (1833-1905), who, from 1857 onwards, had constructed various experimental forms of breech-loader, and it became the French service weapon in 1866. In the following year it made its first appearance on the battlefield at Mentana (November 3rd, 1867), where it inflicted severe losses upon Garibaldi's troops. In the war of 1870 it proved very greatly superior to the German needle-gun. The breech was closed by a bolt very similar to those of more modern rifles, and amongst the technical features of interest were the method of obturation, which was similar in principle to the de Bange obturator for heavy guns (see ORDNANCE), and the retention of the paper cartridge. The principal details of the chassepot are:—weight of rifle, 9 lb 5 oz.; length with bayonet, 6 ft. 2 in.; calibre, .433 in.; weight of bullet (lead), 386 grains; weight of charge (black powder), 86.4 grains; muzzle velocity, 1328 f.s.; sighted to 1312 yds. (1200 m.). The chassepot was replaced in 1874 by the Gras rifle, which had a metal cartridge, and all rifles of the older model remaining in store were converted to take the same ammunition (fusil modèle 1866/74).

**CHASSÉRIAU, THÉODORE** (1819-1856), French painter, was born in the Antilles, and studied under Ingres at Paris and

at Rome, subsequently falling under the influence of Paul Delaroche. He was a well-known painter of portraits and historical pieces, his "Tepidarium at Pompeii" (1853) being now in the Louvre.

**CHASSIS** (Fr. *chassis*, a frame, from the Late Lat. *capsum*, an enclosed space), properly a window-frame, from which is derived the word "sash"; also the movable traversing frame of a gun, and more particularly that part of a motor vehicle consisting of the wheels, frame and machinery, on which the body or carriage part rests.

**CHASTELARD, PIERRE DE BOCZOZEL DE** (1540-1563), French poet, was born in Dauphiné, a scion of the house of Bayard. His name is inseparably connected with Mary, queen of Scots. From the service of the Constable Montmorency, Chastelard, then a page, passed to the household of Marshal Damville, whom he accompanied in his journey to Scotland in escort of Mary (1561). He returned to Paris in the marshal's train, but left for Scotland again shortly afterward, bearing letters of recommendation to Mary from his old protector, Montmorency, and the *Regrets* addressed to the ex-queen of France by Pierre Ronsard, his master in the art of song. He undertook to transmit to the poet the service of plate with which Mary rewarded him. But he had fallen in love with the queen, who is said to have encouraged his passion. Copies of verse passed between them; she lost no occasion of showing herself partial to his person and conversation. The young man hid himself under her bed, where he was discovered by her maids of honour. Mary pardoned the offence, and the old familiar terms between them were resumed. Chastelard was so rash as again to violate her privacy. He was discovered a second time, seized, sentenced and hanged the next morning. He met his fate valiantly and consistently, reading, on his way to the scaffold, his master's noble *Hymne de la mort*, and turning at the instant of doom towards the palace of Holyrood, to address to his unseen mistress the famous farewell—"Adieu, toi si belle et si cruelle, qui me tues et que je ne puis cesser d'aimer." This at least is the version of the *Mémoires* of Brantôme, who is, however, notoriously untrustworthy. But for his madness of love, it is possible that Chastelard would have left no shadow or shred of himself behind. As it is, his life and death are of interest as illustrating the wild days in which his lot was cast.

**CHASTELLAIN, GEORGES** (d. 1475), Burgundian chronicler, was a native of Alost in Flanders. He derived his surname from the fact that his ancestors were burghers or châtelains of the town; his parents, who belonged to illustrious Flemish families, were probably the Jean Chastellain and his wife Marie de Massines mentioned in the town records in 1425 and 1432. A copy of an epitaph originally at Valenciennes states that he died on the 20th of March 1474-5 aged seventy. But since he states that he was so young a child in 1430 that he could not recollect the details of events in that year, and since he was "écolier" at Louvain in 1430, his birth may probably be placed nearer 1415 than 1405. He saw active service in the Anglo-French wars and probably elsewhere, winning the surname of *L'adventurous*. In 1434 he received a gift from Philip the Good, duke of Burgundy, for his military services, but on the conclusion of the peace of Arras in the next year he abandoned soldiering for diplomacy. The next ten years were spent in France, where he was connected with Georges de la Trémoille, and afterwards entered the household of Pierre de Brézé, at that time seneschal of Poitou, by whom he was employed on missions to the duke of Burgundy, in an attempt to establish better relations between Charles VII. and the duke. During these years Chastellain had ample opportunity of obtaining an intimate knowledge of French affairs, but on the further breach between the two princes, Chastellain left the French service to enter Philip's household. He was at first pantler, then carver, titles which are misleading as to the nature of his services, which were those of a diplomatist; and in 1457 he became a member of the ducal council. He was continually employed on diplomatic errands until 1455, when, owing apparently to ill-health, he received apartments in the palace of the counts of Hainaut at Salle-le-Comte, Valenciennes, with a con-

siderable pension, on condition that the recipient should put in writing "*choses nouvelles et morales*," and a chronicle of notable events. That is to say, he was appointed Burgundian historiographer with a recommendation to write also on other subjects not strictly within the scope of a chronicler. From this time he worked hard at his *Chronique*, with occasional interruptions in his retreat to fulfil missions in France, or to visit the Burgundian court. He was assisted, from about 1463 onwards, by his disciple and continuator, Jean Molinet, whose rhetorical and redundant style may be fairly traced in some passages of the *Chronique*. Charles the Bold maintained the traditions of his house as a patron of literature, and showed special favour to Chastellain, who, after being constituted *idicidaire* or chronicler of the order of the Golden Fleece, was himself made a knight of the order on the 2nd of May 1473. He died at Valenciennes on the 13th of February (according to the treasury accounts), or on the 20th of March (according to his epitaph) 1475. He left an illegitimate son, to whom was paid in 1524 one hundred and twenty livres for a copy of the *Chronique* intended for Charles V.'s sister Mary, queen of Hungary. Only about one-third of the whole work, which extended from 1419 to 1474, is known to be in existence, but MSS. carried by the Habsburgs to Vienna or Madrid may possibly yet be discovered.

Among his contemporaries Chastellain acquired a great reputation by his poems and occasional pieces now little considered. The unfinished state of his *Chronique* at the time of his death, coupled with political considerations, may possibly account for the fact that it remained unprinted during the century that followed his death, and his historical work was only disinterred from the libraries of Arras, Paris and Brussels by the painstaking researches of M. Buchon in 1825. Chastellain was constantly engaged during the earlier part of his career in negotiations between the French and Burgundian courts, and thus had personal knowledge of the persons and events dealt with in his history. A partisan element in writing of French affairs was inevitable in a Burgundian chronicler. This defect appears most strongly in his treatment of Joan of Arc; and the attack on Agnes Sorel seems to have been dictated by the dauphin (afterwards Louis XI.), then a refugee in Burgundy, of whom he was afterwards to become a severe critic. He was not, however, misled, as his more picturesque predecessor Froissart had been, by feudal and chivalric tradition into misconception of the radical injustice of the English cause in France; and except in isolated instances where Burgundian interests were at stake, he did full justice to the patriotism of Frenchmen. Among his most sympathetic portraits are those of his friend Pierre de Brézé and of Jacques Cœur. His French style, based partly on his Latin reading, has, together with its undeniable vigour and picturesqueness, the characteristic redundancy and rhetorical quality of the Burgundian school. Chastellain was no mere annalist, but proposed to fuse and shape his vast material to his own conclusions, in accordance with his political experience. The most interesting feature of his work is the skill with which he pictures the leading figures of his time. His "characters" are the fruit of acute and experienced observation, and abound in satirical traits, although the 42nd chapter of his second book, devoted expressly to portraiture, is headed "*Comment Georges escrit et mentionne les louanges vertueuses des princes de son temps*."

The known extant fragments of Chastellain's *Chroniques* with his other works were edited by Kervyn de Lettenhove for the Brussels Academy in 1863-1866 (8 vols., Brussels) as *Œuvres de Georges Chastellain*. This edition includes all that had been already published by Buchon in his *Collection de chroniques* and *Choix de chroniques* (material subsequently incorporated in the *Pantheon Littéraire*), and portions printed by Renard in his *Trésor national*, vol. i. and by Quicherat in the *Procès de la Pucelle* vol. iv. Kervyn de Lettenhove's text includes the portions of the chronicle covering the periods September 1419, October 1422, January 1430 to December 1431, 1451-1452, July 1454 to October 1458, July 1461 to July 1463, and, with omissions, June 1467 to September 1470; and three volumes of minor pieces of considerable interest, especially *Le Temple de Boccace*, dedicated to Margaret of Anjou, and the *Déprication* for Pierre Brézé, imprisoned by Louis XI. In the case of these minor works the attribution to Chastellain is in some cases erroneous, notably in the case of the *Livre des faits de Jacques de Lalain*, which

is the work of Lefèvre de Saint-Remi, herald of the Golden Fleece. In the allegorical *Oultré d'amour* it has been thought a real romance between Brézé and a lady of the royal house is concealed.

See A. Molinier, *Les Sources de l'histoire de France*; as well as notices by Kervyn de Lettenhove prefixed to the *Œuvres* and in the *Biographie nationale de Belgique*; and an article (three parts) by Vallet de Virville in the *Journal des sçavants* (1867).

**CHASUBLE** (Fr. *chasuble*, Ger. *Kasel*, Span. *casulla*; Lat. *casula*, a little house, but, from *casa*), a liturgical vestment of the Catholic Church. It is the outermost garment worn by bishops and priests at the celebration of the Mass, forming with the alb (*q.v.*) the most essential part of the eucharistic vestments. Since it is only used at the Mass, or rarely for functions intimately connected with the sacrament of the altar, it may be regarded as the Mass vestment *par excellence*. The chasuble is thus in a special sense the sacerdotal vestment, and at the ordination of priests, according to the Roman rite, the bishop places on the candidate a chasuble rolled up at the back (*planeta plicata*), with the words, "Take the sacerdotal robe, the symbol of love," &c.; at the end of the ordination Mass the vestment is unrolled.

From Braun's *Liturgische Gewandung*, by permission of the publisher, B. Herder.

FIG. 1.—Comparative shape and size of Chasubles as now in use in various countries. a, b, German. c, Roman. d, Spanish.

The chasuble or *planeta* (as it is called in the Roman missal), according to the prevailing model in the Roman Catholic Church, is a scapular-like cloak, with a hole in the middle for the head, falling down over breast and back, and leaving the arms uncovered at the sides. Its shape and size, however, differ considerably in various countries (see fig. 1), while some churches—e.g. those of certain monastic orders—have retained or reverted to the earlier "Gothic" forms to be described later.

According to the decisions of the Congregation of Rites chasubles must not be of linen, cotton or

woollen stuffs, but of silk; though a mixture of wool (or linen and cotton) and silk is allowed if the silk completely cover the other material on the outer side; spun glass thread, as a substitute for gold or silver thread, is also forbidden, owing to the possible danger to the priest's health through broken fragments falling into the chalice.

The chasuble, like the kindred vestments (the *φελώνιον*, &c.) in the Eastern Churches, is derived from the Roman *pænula* or *planeta*, a cloak worn by all classes and both sexes in the Graeco-Roman world (see *VESTMENTS*). Though early used in the celebration of the liturgy it had for several centuries no specifically liturgical character, the first clear instances of its ritual use being in a letter of St Germanus of Paris (d. 576), and the next in the twenty-eighth canon of the Council of Toledo (633). Much later than this, however, it was still an article of everyday clerical dress, and as such was prescribed by the German council convened by Carloman and presided over by St Boniface in 742. Amalarius of Metz, in his *De ecclesiasticis officiis* (ii. 19), tells us in 816 that the *casula* is the *generale indumentum sacrorum ducum* and "is proper generally to all the clergy." It was not until the 11th century, when the cope (*q.v.*) had become established as a liturgical vestment, that the chasuble began to be reserved as special to the sacrifice of the Mass. As illustrating

this process Father Braun (p. 170) cites an interesting correspondence between Archbishop Lanfranc of Canterbury and John of Avranches, archbishop of Rouen, as to the propriety of a bishop wearing a chasuble at the consecration of a church, Lanfranc maintaining as an established principle that the vestment should be reserved for the Mass. By the 13th century, with the final development of the ritual of the Mass, the chasuble became definitely fixed as the vestment of the celebrating priest; though to this day in the Roman Church relics of the earlier general use of the chasuble survive in the *planeta plicata* worn by deacons and subdeacons in Lent and Advent, and other penitential seasons.

At the Reformation the chasuble was rejected with the other vestments by the more extreme Protestants. Its use, however, survived in the Lutheran churches; and though in those of Germany it is no longer worn, it still forms part of the liturgical costume of the Scandinavian Evangelical churches. In the Church of England, though it was prescribed alternatively with the cope in the First Prayer-Book of Edward VI., it was ultimately discarded, with the other "Mass vestments," the cope being substituted for it at the celebration of the Holy Communion in cathedral and collegiate churches; its use has, however, during the last fifty years been widely revived in connexion with the reactionary movement in the direction of the pre-Reformation doctrine of the eucharist. The difficult question of its legality is discussed in the article *VESTMENTS*.

**Form.**—The chasuble was originally a tent-like robe which fell in loose folds below the knee (see Plate I. fig. 4). Its obvious inconvenience for celebrating the holy mysteries, however, caused its gradual modification. The object of the change was primarily to leave the hands of the celebrant freer for the careful performance of the manual acts, and to this end a process of cutting away at the sides of the vestment began, which continued until the tent-shaped chasuble of the 12th century had developed in the 16th into the scapular-like vestment at present in use. This process was, moreover, hastened by the substitution of costly and elaborately embroidered materials for the simple stuffs of which the vestment had originally been composed; for, as it became heavier and stiffer, it necessarily had to be made smaller. For the extremely exiguous proportions of some chasubles actually in use, which have been robbed of all the beauty of form they ever possessed, less respectable motives have sometimes been responsible, viz. the desire of their makers to save on the materials. The most beautiful form of the chasuble is undoubtedly the "Gothic" (see the figure of Bishop Johannes of Lübeck in the article *VESTMENTS*), which is the form most affected by the Anglican clergy, as being that worn in the English Church before the Reformation.

**Decoration.**—Though *planetæ* decorated with narrow orphreys are occasionally met with in the monuments of the early centuries, these vestments were until the 10th century generally quite plain, and even at the close of this century, when the custom of decorating the chasuble with orphreys had become common, there was no definite rule as to their disposition; sometimes they were merely embroidered borders to the neck-opening or hem, sometimes a vertical strip down the back, less often a forked cross, the arms of which turned upwards over the shoulders. From this time onward, however, the embroidery became ever more and more elaborate, and with this tendency the orphreys were broadened to allow of their being decorated with figures. About the middle of the 13th century, the cross with horizontal arms begins to appear on the back of the vestment, and by the 15th this had become the most usual form, though the forked cross also survived—e.g. in England, where it is now considered distinctive of the chasuble as worn in the Anglican Church. Where the forked cross is used it is placed both on the back and front of the vestment; the horizontal-armed cross, on the other hand, is placed only on the back, the front being decorated with a vertical strip extending to the lower hem (fig. 1, b, d). Sometimes the back of the chasuble has no cross, but only a vertical orphrey, and in this case the front, besides the vertical stripe, has a horizontal orphrey just below

the neck opening (see Plate I. fig. 2). This latter is the type used in the local Roman Church, which has been adopted in certain dioceses in South Germany and Switzerland, and of late years in the Roman Catholic churches in England, e.g. Westminster cathedral (see Plate I. figs. 3 and 5).

It has been widely held that the forked cross was a conscious imitation of the archiepiscopal pallium (F. Bock, *Gesch. der liturg. Gewänder*, ii. 107), and that the chasuble so decorated is proper to archbishops. Father Braun, however, makes it quite clear that this was not the case, and gives proof that this decoration was not even originally conceived as a cross at all, citing early instances of its having been worn by laymen and even by non-Christians (p. 210). It was not until the 13th century that the symbolical meaning of the cross began to be elaborated, and this was still further accentuated from the 14th century onward by the increasingly widespread custom of adding to it the figure of the crucified Christ and other symbols of the Passion. This, however, did not represent any definite rule; and the orphreys of chasubles were decorated with a great variety of pictorial subjects, scriptural or drawn from the stories of the saints, while the rest of the vestment was either left plain or, if embroidered, most usually decorated with arabesque patterns of foliage or animals. The local Roman Church, true to its ancient traditions, adhered to the simpler forms. The modern Roman chasuble pictured in Plate I. fig. 5, besides the conventional arabesque pattern, is decorated, according to rule, with the arms of the archbishop and his see.

*The Eastern Church.*—The original equivalent of the chasuble is the phelonion (φελόνιον, φελώνης, φανώλιον, from *paenula*). It is a full vestment of the type of the Western bell chasuble; but, instead of being cut away at the sides, it is for convenience' sake either gathered up or cut short in front. In the Armenian, Syrian, Chaldaean and Coptic rites it is copeshaped. There is some difference of opinion as to the derivation of the vestment in the latter case; the Five Bishops (Report to Convocation, 1908) deriving it, like the cope, from the *birrus*, while Father Braun considers it, as well as the cope, to be a modification of the *paenula*.<sup>1</sup> The phelonion (Arm. *shurts'har*, Syr. *phaina*, Chald. *maophra* or *phaina*, Copt. *burnos*, *scionion*, *kuklion*) is confined to the priests in the Armenian, Syrian, Chaldaean and Coptic rites; in the Greek rite it is worn also by the lectors. It is not in the East so specifically a clerical vestment as in the West, but is worn at other solemn functions besides the liturgy, e.g. marriages, processions, &c.

Until the 11th century the phelonion is always pictured as a perfectly plain dark robe, but at this period the custom arose of decorating the patriarchal phelonion with a number of crosses, whence its name of *πολυσταύριον*. By the 14th century the use of these polystauria had been extended to metropolitans and later still to all bishops. The purple or black phelonion, however, remained plain in all cases. The Greeks and Greek Melchite metropolitans now wear the *sakkos* instead of the phelonion; and in the Russian, Ruthenian, Bulgarian and Italo-Greek churches this vestment has superseded the phelonion in the case of all bishops (see DALMATIC and VESTMENTS).

See J. Braun, S.J., *Die liturgische Gewandung* (Freiburg im Breisgau, 1907), pp. 149-247, and the bibliography to the article VESTMENTS. (W. A. P.)

<sup>1</sup> The writer is indebted to the courtesy of Father Braun for the following note:—"That the Syrian *phaina* was formerly a closed mantle of the type of the bell chasuble is clearly proved by the evidence of the miniatures of a Syrian pontifical (dated 1239) in the Bibliothèque Nationale at Paris (cf. Bild 16, 112, 284, in *Die liturgische Gewandung*). The liturgical vestments of the Armeians are derived, like their rite, from the Greek rite; so that in this case also there can be no doubt that the *shurts'har* was originally closed. The Coptic rite is in the same relation to the Syrian. Moreover, it would be further necessary to prove that the *birrus*, in contradistinction to the *paenula*, was always open in front; whereas, *per contra*, the *paenula*, both as worn by soldiers and in ordinary life, was, like the modern Arab *burnos*, often slit up the front to the neck. For the rest, it is obvious that if the Syrian *phaina* was still quite closed in the 13th century, and was only provided with a slit since that time, the same is very probable in the case of the Armenian chasuble. The absence of the hood might also be taken as additional proof of

CHÂTEAU (from Lat. *castellum*, fortress, through O. Fr. *chastel*, *chasteau*), the French word for castle (q.v.). The development of the medieval castle, in the 15th and 16th centuries, into houses arranged rather for residence than defence led to a corresponding widening of the meaning of the term *château*, which came to be applied to any seigniorial residence and so generally to all houses, especially country houses, of any pretensions (cf. the Ger. *Schloss*). The French distinguish the fortified castle from the residential mansion by describing the former as the *château fort*, the latter as the *château de plaisance*. The development of the one into the other is admirably illustrated by surviving buildings in France, especially in the *châteaux* scattered along the Loire. Of these Langeais, still in perfect preservation, is a fine type of the *château fort*, with its 10th-century keep and 13th-century walls. Amboise (1490), Blois (1500-1540), Chambord (begun 1526), Chenonceaux (1515-1560), Azay-le-Rideau (1521), may be taken as typical examples of the *château de plaisance* of the transition period, all retaining in greater or less degree some of the architectural characteristics of the medieval castle. Some description of these is given under their several headings. In English the word *château* is often used to translate foreign words (e.g. *Schloss*) meaning country house or mansion.

For the Loire *châteaux* see Theodore Andrea Cook, *Old Touraine* (1892).

CHATEAUBRIAND, FRANÇOIS RENÉ, VICOMTE DE (1768-1848), French author, youngest son of René Auguste de Chateaubriand, comte de Combourg,<sup>2</sup> was born at St Malo on the 4th of September 1768. He was a brilliant representative of the reaction against the ideas of the French Revolution, and the most conspicuous figure in French literature during the First Empire. His naturally poetical temperament was fostered in childhood by picturesque influences, the mysterious reserve of his morose father, the ardent piety of his mother, the traditions of his ancient family, the legends and antiquated customs of the sequestered Breton district, above all, the vagueness and solemnity of the neighbouring ocean. His closest friend was his sister Lucile,<sup>3</sup> a passionate-hearted girl, divided between her devotion to him and to religion. François received his education at Dol and Rennes, where Jean Victor Moreau was among his fellow-students. From Rennes he proceeded to the College of Dinan, and passed some years in desultory study in preparation for the priesthood. He finally decided, after a year's holiday at the family *château* of Combourg, that he had no vocation for the Church, and was on the point of proceeding to try his fortune in India when he received (1786) a commission in the army. After a short visit to Paris he joined his regiment at Cambrai, and early in the following year was presented at court. In 1788 he received the tonsure in order to enter the order of the Knights of Malta. In Paris (1787-1789) he made acquaintance with the Parisian men of letters. He met la Harpe, Evariste Parny, "Pindare" Lebrun, Nicolas Chamfort, Pierre Louis Ginguené, and others, of whom he has left portraits in his memoirs.

Chateaubriand was not unfavourable to the Revolution in its first stages, but he was disturbed by its early excesses; moreover, his regiment was disbanded, and his family belonged to the party of reaction. His political impartiality, he says, pleased no one. These causes and the restlessness of his spirit induced him to take part in a romantic scheme for the discovery of the North-West Passage, in pursuance of which he departed for America in the spring of 1791. The passage was not found or even attempted, but the adventurer returned enriched with the—to him—more important discovery of his own powers and vocation, conscious of his marvellous faculty for the delineation of nature, and stored with the new ideas and new imagery, the derivation of the *phaina* from the *paenula*, but I should not lay particular stress upon it. The question is settled by the above-mentioned miniatures.

<sup>2</sup> For full details of the Chateaubriand family see R. Kervick, *Essai d'une bio-bibliographie de Chateaubriand et de sa famille* (Vannes, 1895).

<sup>3</sup> Her *Œuvres* were edited in 1879, with a memoir, by Anatole France.

derived from the virgin forests and magnificent scenery of the western continent. That he actually lived among the Indians, however, is shown by Bedier to be doubtful, and the same critic has exposed the untrustworthiness of the autobiographical details of his American trip. His knowledge of America was mainly derived from the books of Charlevoix and others.

The news of the arrest of Louis XVI. at Varennes in June 1791 recalled him to France. In 1792 he married Mlle Cécile Buisson de Lavigne, a girl of seventeen, who brought him a small fortune. This enabled him to join the ranks of the emigrants, a course practically imposed on him by his birth and his profession as a soldier. After the failure of the duke of Brunswick's invasion he contrived to reach Brussels, where he was left wounded and apparently dying in the street. His brother succeeded in obtaining some shelter for him, and sent him to Jersey. The captain of the boat in which he travelled left him on the beach in Guernsey. He was once more rescued from death, this time by some fishermen. After spending some time in the Channel Islands under the care of an emigrant uncle, the comte de Bédée, he made his way to London. In England he lived obscurely for several years, gaining an intimate acquaintance with English literature and a practical acquaintance with poverty. His own account of this period has been exposed by A. le Braz, *Au pays d'exil de Chateaubriand* (1909), and by E. Dick, *Revue d'histoire littéraire de la France* (1908), i. From his English exile dates the *Natches* (first printed in his *Œuvres complètes*, 1826-1831), a prose epic designed to portray the life of the Red Indians. Two brilliant episodes originally designed for this work, *Atala* and *René*, are among his most famous productions. Chateaubriand's first publication, however, was the *Essai historique, politique et moral sur les révolutions* . . . (London, 1797), which the author subsequently retracted, but took care not to suppress. In this volume he appears as a mediator between royalist and revolutionary ideas, a free-thinker in religion, and a philosopher imbued with the spirit of Rousseau. A great change in his views was, however, at hand, induced, according to his own statement, by a letter from his sister Julie (Mme de Farcy), telling him of the grief his views had caused his mother, who had died soon after her release from the Conciergerie in the same year. His brother had perished on the scaffold in April 1794, and both his sisters, Lucile and Julie, and his wife had been imprisoned at Rennes. Mme de Farcy did not long survive her imprisonment.

Chateaubriand's thoughts turned to religion, and on his return to France in 1800 the *Génie du christianisme* was already in an advanced state. Louis de Fontanes had been a fellow-exile with Chateaubriand in London, and he now introduced him to the society of Mme de Staël, Mme Récamier, Benjamin Constant, Lucien Bonaparte and others. But Chateaubriand's favourite resort was the salon of Pauline de Beaumont, who was destined to fill a great place in his life, and gave him some help in the preparation of his work on Christianity, part of the book being written at her house at Savigny. *Atala*, ou les amours de deux sauvages dans le désert, used as an episode in the *Génie du christianisme*, appeared separately in 1801 and immediately made his reputation. Exquisite style, impassioned eloquence and glowing descriptions of nature gained indulgence for the incongruity between the rudeness of the personages and the refinement of the sentiments, and for the distasteful blending of prudery with sensuousness. Alike in its merits and defects the piece is a more emphatic and highly coloured *Paul et Virginie*; it has been justly said that Bernardin Saint-Pierre models in marble and Chateaubriand in bronze. Encouraged by his success the author resumed his *Génie du christianisme*, ou *beautés de la religion chrétienne*, which appeared in 1802, just upon the eve of Napoleon's re-establishment of the Catholic religion in France, for which it thus seemed almost to have prepared the way. No coincidence could have been more opportune, and Chateaubriand came to esteem himself the counterpart of Napoleon in the intellectual order. In composing his work he had borne in mind the admonition of his friend Joseph Joubert, that the public would care very little for his erudition and very much

for his eloquence. It is consequently an inefficient production from the point of view of serious argument. The considerations derived from natural theology are but commonplaces rendered dazzling by the magic of style; and the parallels between Christianity and antiquity, especially in arts and letters, are at best ingenious sophistries. The less polemical passages, however, where the author depicts the glories of the Catholic liturgy and its accessories, or expounds its symbolical significance, are splendid instances of the effect produced by the accumulation and judicious distribution of particulars gorgeous in the mass, and treated with the utmost refinement of detail. The work is a masterpiece of literary art, and its influence in French literature was immense. The *Éloa* of Alfred de Vigny, the *Harmonies* of Lamartine and even the *Légende des siècles* of Victor Hugo may be said to have been inspired by the *Génie du christianisme*. Its immediate effect was very considerable. It admirably subserved the statecraft of Napoleon, and Talleyrand in 1803 appointed the writer *attaché* to the French legation at Rome, whither he was followed by Mme de Beaumont, who died there.

When his insubordinate and intriguing spirit compelled his recall he was transferred as envoy to the canton of the Valais. The murder of the duke of Enghien (21st of March 1804) took place before he took up this appointment. Chateaubriand, who was in Paris at the time, showed his courage and independence by immediately resigning his post. In 1807 he gave great offence to Napoleon by an article in the *Mercur de France* (4th of July), containing allusions to Nero which were rightly taken to refer to the emperor. The *Mercur*, of which he had become proprietor, was temporarily suppressed, and was in the next year amalgamated with the *Décade*. Chateaubriand states in his *Mémoires* that his life was threatened, but it is more than possible that he exaggerated the danger. Before this, in 1806, he made a pilgrimage to Jerusalem, undertaken, as he subsequently acknowledged, less in a devotional spirit than in quest of new imagery. He returned by way of Tunis, Carthage, Cadiz and Granada. At Granada he met Mme de Mouchy, and the place and the meeting apparently suggested the romantic tale of *Le Dernier Abencérage*, which, for political reasons, remained unprinted until the publication of the *Œuvres complètes* (1826-1831). The journey also produced *L'Itinéraire de Paris à Jérusalem* . . . (3 vols., 1811), a record of travel distinguished by the writer's habitual picturesqueness; and inspired his prose epic, *Les Martyrs*, ou le triomphe de la religion chrétienne (2 vols., 1809). This work may be regarded as the argument of the *Génie du christianisme* thrown into an objective form. As in the *Épiqueur* of Thomas Moore, the professed design is the contrast between Paganism and Christianity, which fails of its purpose partly from the absence of real insight into the genius of antiquity, and partly because the heathen are the most interesting characters after all. *René* had appeared in 1802 as an episode of the *Génie du christianisme*, and was published separately at Leipzig without its author's consent in the same year. It was perhaps Chateaubriand's most characteristic production. The connecting link in European literature between *Werther* and *Childe Harold*, it paints the misery of a morbid and dissatisfied soul. The representation is mainly from the life. Chateaubriand betrayed amazing egotism in describing his sister Lucile in the *Amélie* of the story, and much is obviously descriptive of his own early surroundings. With *Les Natches* his career as an imaginative writer is closed. In 1831 he published his *Études ou discours historiques* . . . (4 vols.) dealing with the fall of the Roman Empire.

As a politician Chateaubriand was equally formidable to his antagonists when in opposition and to his friends when in office. His poetical receptivity and impressionableness rendered him no doubt honestly inconsistent with himself; his vanity and ambition, too morbidly acute to be restrained by the ties of party allegiance, made him dangerous and untrustworthy as a political associate. He was forbidden to deliver the address he had prepared (1811) for his reception to the Academy on M. J. Chénier on account of the bitter allusions to Napoleon contained in it. From this date until 1814 Chateaubriand lived in seclusion at

the Vallée-aux-loups, an estate he had bought in 1807 at Aulnay. His pamphlet *De Bonaparte, des Bourbons, et de la nécessité de se rallier à nos princes légitimes*, published on the 31st of March 1814, the day of the entrance of the allies into Paris, was as opportune in the moment of its appearance as the *Génie du christianisme*, and produced a hardly less signal effect. Louis XVIII. declared that it had been worth a hundred thousand men to him. Chateaubriand, as minister of the interior, accompanied him to Ghent during the Hundred Days, and for a time associated himself with the excesses of the royalist reaction. Political higotry, however, was not among his faults; he rapidly drifted into liberalism and opposition, and was disgraced in September 1816 for his pamphlet *De la monarchie selon la charte*. He had to sell his library and his house of the Vallée-aux-loups.

After the fall of his opponent, the duc Decazes, Chateaubriand obtained the Berlin embassy (1821), from which he was transferred to London (1822), and he also acted as French plenipotentiary at the Congress of Verona (1822). He here made himself mainly responsible for the iniquitous invasion of Spain—an expedition undertaken, as he himself admits, with the idea of restoring French prestige by a military parade. He next received the portfolio of foreign affairs, which he soon lost by his desertion of his colleagues on the question of a reduction of the interest on the national debt. After another interlude of effective pamphleteering in opposition, he accepted the embassy to Rome in 1827, under the Martignac administration, but resigned it at Prince Polignac's accession to office. On the downfall of the elder branch of the Bourbons, he made a brilliant but inevitably fruitless protest from the tribune in defence of the principle of legitimacy. During the first half of Louis Philippe's reign he was still politically active with his pen, and published a *Mémoire sur la captivité de madame la duchesse de Berry* (1833) and other pamphlets in which he made himself the champion of the exiled dynasty; but as years increased upon him, and the prospect of his again performing a conspicuous part diminished, he relapsed into an attitude of complete discouragement. His *Congrès de Vérone* (1838), *Vie de Rancé* (1844), and his translation of Milton, *Le Paradis perdu de Milton* (1836), belong to the writings of these later days. He died on the 4th of July 1848, wholly exhausted and thoroughly discontented with himself and the world, but affectionately tended by his old friend Madame Récamier, herself deprived of sight. For the last fifteen years of his life he had been engaged on his *Mémoires*, and his chief distraction had been his daily visit to Madame Récamier, at whose house he met the European celebrities. He was buried in the Grand Bé, an islet in the bay of St Malo. Shortly after his death his memory was revived, and at the same time exposed to much adverse criticism, by the publication, with sundry mutilations as has been suspected, of his celebrated *Mémoires d'outre-tombe* (12 vols., 1849-1850). These memoirs undoubtedly reveal his vanity, his egotism, the frequent hollowness of his professed convictions, and his incapacity for sincere attachment, except, perhaps, in the case of Madame Récamier. Though the book must be read with the greatest caution, especially in regard to persons with whom Chateaubriand came into collision, it is perhaps now the most read of all his works.

Chateaubriand ranks rather as a great rhetorician than as a great poet. Something of affectation or unreality commonly interferes with the enjoyment of his finest works. The *Génie du christianisme* is a brilliant piece of special pleading; *Atala* is marred by its unfaithfulness to the truth of uncivilized human nature, *René* by the perversion of sentiment which solicits sympathy for a contemptible character. Chateaubriand is chiefly significant as marking the transition from the old classical to the modern romantic school. The fertility of ideas, vehemence of expression and luxury of natural description, which he shares with the romanticists, are controlled by a discipline learnt in the school of their predecessors. His palette, always brilliant, is never gaudy; he is not merely a painter but an artist. He is also a master of epigrammatic and incisive sayings. Perhaps, however, the most truly characteristic feature of his genius is the peculiar magical touch which Matthew Arnold indicated as a

note of Celtic extraction, which reveals some occult quality in a familiar object, or tinges it, one knows not how, with "the light that never was on sea or land." This incommunicable gift supplies an element of sincerity to Chateaubriand's writings which goes far to redeem the artificial effect of his calculated sophistry and set declamation. It is also fortunate for his fame that so large a part of his writings should directly or indirectly refer to himself, for on this theme he always writes well. Egotism was his master-passion, and beyond his intrepidity and the loftiness of his intellectual carriage his character presents little to admire. He is a signal instance of the compatibility of genuine poetic emotion, of sympathy with the grander aspects both of man and nature, and of munificence in pecuniary matters, with absorption in self and general sterility of heart.

**BIBLIOGRAPHY.**—The *Œuvres complètes* of Chateaubriand were printed in 28 vols., 1826-1831; in 20 vols., 1829-1831; and in many later editions, notably in 1858-1861, in 20 volumes, with an introductory study by Sainte-Beuve. The principal authority for Chateaubriand's biography is the *Mémoires d'outre-tombe* (1849-1850), of which there is an English translation, *The Memoirs of Chateaubriand* (6 vols., 1902), by A. Teixeira de Mattos, based on the admirable edition (4 vols., 1899-1901) of Edmond Biré. This work should be supplemented by the *Souvenirs et correspondances tirés des papiers de M<sup>me</sup> Récamier* (2 vols., 1859, ed. Mme Ch. Lenormant). See also Comte de Marcellus, *Chateaubriand et son temps* (1859); the same editor's *Souvenirs diplomatiques; correspondance intime de Chateaubriand* (1858); C. A. Sainte-Beuve, *Chateaubriand et son groupe littéraire sous l'empire* (2 vols., 1861, new and revised ed., 3 vols., 1872); other articles by Sainte-Beuve, who was in this case a somewhat prejudiced critic, in the *Portraits contemporains*, vols. i. and ii.; *Causeries du lundi*, vols. i., ii. and x.; *Nonneaux Lundis*, vol. iii.; A. Vinet, *Études sur la litt. française au XIX<sup>e</sup> siècle* (1849); M. de Lescure, *Chateaubriand (1802) in the Grands écrivains français*; Émile Faguet, *Études littéraires sur le XIX<sup>e</sup> siècle* (1887); and *Essai d'une biographie de Chateaubriand et de sa famille* (Vannes, 1896), by René Kerviler. Joseph Bedier, in *Études critiques* (1903), deals with the American writings. Some correspondence with Sainte-Beuve was edited by Louis Thomas in 1904, and some letters to Mme de Staël appeared in the *Revue des deux mondes* (Oct. 1903).

**CHÂTEAUBRIANT**, a town of western France, capital of an arrondissement in the department of Loire-Inférieure, on the left bank of the Chère, 40 m. N.N.E. of Nantes by rail. Pop. (1906) 5969. Châteaubriant takes its name from a castle founded in the 11th century by Brient, count of Penthièvre, remains of which, consisting of a square donjon and four towers, still exist. Adjoining it is another castle, built in the first half of the 16th century by Jean de Laval, and famous in history as the residence of Françoise de Foix, mistress of Francis I. Of this the most beautiful feature is the colonnade running at right angles to the main building, and connecting it with a graceful pavilion. It is occupied by a small museum and some of the public offices. There is also an interesting Romanesque church dedicated to St Jean de Béré. Châteaubriant is the seat of a subprefect and has a tribunal of first instance. It is an important centre on the Ouest-État railway, and has trade in agricultural products. The manufacture of leather, agricultural implements and preserved angelica are carried on. In 1551 Henry II. signed an edict against the reformed religion at Châteaubriant.

**CHÂTEAUDUN**, a town of north central France, capital of an arrondissement in the department of Eure-et-Loir, 28 m. S.S.W. of Chartres by rail. Pop. (1906) 5805. It stands on an eminence near the left bank of the Loire. The streets, which are straight and regular, radiate from a central square, a uniformity due to the reconstruction of the town after fires in 1723 and 1870. The château, the most remarkable building in the town, was built in great part by Jean, count of Dunois, and his descendants. Founded in the 10th century, and rebuilt in the 12th and 15th centuries, it consists of a principal wing with a fine staircase of the 16th century, and, at right angles, a smaller wing adjoined by a chapel. To the left of the courtyard thus formed rises a lofty keep of the 12th century. The fine apartments and huge kitchens of the château are in keeping with its imposing exterior. The church of La Madeleine dates from the 12th century; the buildings of the abbey to which it belonged are occupied by the subprefecture, the law court and the hospital. The medieval churches of St Valérien and St Jean

and the ruined chapel of Notre-Dame du Champdé, of which the façade in the Renaissance style now forms the entrance to the cemetery, are other notable buildings. The public institutions include a tribunal of first instance and a communal college. Flour-milling, tanning and leather-dressing, and the manufacture of blankets, silver jewelry, nails and machinery are the prominent industries. Trade is in cattle, grain, wool and hemp. Château-dun (*Castro-dunum*), which dates from the Gallo-Roman period, was in the middle ages the capital of the countship of Dunois.

**CHÂTEAU-GONTIER**, a town of western France, capital of an *arrondissement* in the department of Mayenne, on the Mayenne, 18 m. S. by E. of Laval by road. Pop. (1906) 6871. Of its churches, that of St Jean, a relic of the castle, dates from the 11th century. Château-Gontier is the seat of a sub-prefect and has a tribunal of first instance, a communal college for boys and a small museum. It carries on wool- and cotton-spinning, the manufacture of serge, flannel and oil, and is an agricultural market. There are chalybeate springs close to the town. Château-Gontier owes its origin and its name to a castle erected in the first half of the 11th century by Gunther, the steward of Fulk Nerra of Anjou, on the site of a farm belonging to the monks of St Aubin d'Angers. On the extinction of the family, the lordship was assigned by Louis XI. to Philippe de Comines. The town suffered severely during the wars of the League. In 1793 it was occupied by the Vendéans.

**CHÂTEAUNEUF, LA BELLE**, the name popularly given to RENÉE DE RIEUX, daughter of Jean de Rieux, seigneur de Châteauneuf, who was descended from one of the greatest families of Brittany. The dates both of her birth and death are not known. She was maid of honour to the queen-mother Catherine de' Medici, and inspired an ardent passion in the duke of Anjou, brother of Charles IX. This intrigue deterred the duke from the marriage which it was desired to arrange for him with Elizabeth of England; but he soon abandoned La Belle Châteauneuf for Marie of Cleves (1571). The court then wished to find a husband for Renée de Rieux, whose singular beauty gave her an influence which the queen-mother feared, and matches were in turn suggested with the voivode of Transylvania, the earl of Leicester, with Du Prat, provost of Paris, and with the count of Brienne, all of which came to nothing. Ultimately, on the ground that she had been lacking in respect towards the queen, Louise of Lorraine-Vaudémont, Renée was banished from the court. She married a Florentine named Antinotti, whom she stabbed in a fit of jealousy (1577); then she remarried, her husband being Philip Altoviti, who in 1586 was killed in a duel by the Grand Prior Henry of Angoulême, who was himself mortally wounded.

**CHÂTEAU-RENAULT, FRANÇOIS LOUIS DE ROUSSELET**, MARQUIS DE (1637-1716), French admiral, was the fourth son of the third marquis of Château-Renault. The family was of Breton origin, but had been long settled near Blois. He entered the army in 1658, but in 1661 was transferred to the navy, which Louis XIV. was eager to raise to a high level of strength. After a short apprenticeship he was made captain in 1666. His early services were mostly performed in cruises against the Barbary pirates (1672). In 1673 he was named *chef d'escadre*, and he was promoted *lieutenant général des armées navales* in 1687. During the wars up to this date he had few chances of distinction, but he had been wounded in action with the pirates, and had been on a cruise to the West Indies. When war broke out between England and France after the revolution of 1688, he was in command at Brest, and was chosen to carry the troops and stores sent by the French king to the aid of James II. in Ireland. Although he was watched by Admiral Herbert (Lord Torrington, *q.v.*), with whom he fought an indecisive action in Bantry Bay, he executed his mission with success. Château-Renault commanded a squadron under Tourville at the battle of Beachy Head in 1690. He was with Tourville in the attack of the Smyrna convoy in 1693, and was named grand cross of the order of Saint Louis in the same year. Though in constant service, the reduced state of the French navy (owing to the

financial embarrassments of the treasury) gave him few openings for fighting at sea during the rest of the war.

On the death of Tourville in 1701 he was named to the vacant post of vice-admiral of France. On the outbreak of the War of the Spanish Succession he was named for the difficult task of protecting the Spanish ships which were to bring the treasure from America. It was a duty of extreme delicacy, for the Spaniards were unwilling to obey a foreigner, and the French king was anxious that the hullion should be brought to one of his own ports, a scheme which the Spanish officials were sure to resent if they were allowed to discover what was meant. With the utmost difficulty Château-Renault was able to bring the galleons as far as Vigo, to which port he steered when he learnt that a powerful English and Dutch armament was on the Spanish coast, and had to recognize that the Spanish officers would not consent to make for a French harbour or for Passages, which they thought too near France. His fleet of fifteen French and three Spanish war-ships, having under their care twelve galleons, had anchored on the 22nd of September in Vigo Bay. Obstacles, some of an official character, and others due to the poverty of the Spanish government in resources, arose to delay the landing of the treasure. There was no adequate garrison in the town, and the local militia was untrustworthy. Knowing that he would probably be attacked, Château-Renault strove to protect his fleet by means of a boom. The order to land the treasure was delayed, and until it came from Madrid nothing could be done, since according to law it should have been landed at Cadiz, which had a monopoly of the trade with America. At last the order came, and the bullion was landed under the care of the Gallician militia which was ordered to escort it to Lugo. A very large part, if not the whole, was plundered by the militiamen and the farmers whose carts had been commandeered for the service. But the bulk of the merchandise was on board of the galleons when the allied fleet appeared outside of the bay on the 22nd of October 1702. Sir George Rooke and his colleagues resolved to attack. The fleet was carrying a body of troops which had been sent out to make a landing at Cadiz, and had been beaten off. The fortifications of Vigo were weak on the sea side, and on the land side there were none. There was therefore nothing to offer a serious resistance to the allies when they landed soldiers. The fleet of twenty-four sail was steered at the boom and broke through it, while the troops turned the forts and had no difficulty in scattering the Gallician militia. In the bay the action was utterly disastrous to the French and Spaniards. Their ships were all taken or destroyed. The booty gained was far less than the allies hoped, but the damage done to the French and Spanish governments was great.

Château-Renault suffered no loss of his master's favour by his failure to save the treasure. The king considered him free from blame, and must indeed have known that the admiral had been trusted with too many secrets to make it safe to inflict a public rebuke. The Spanish government declined to give him the rank of grandee which was to have been the reward for bringing home the bullion safe. But in 1703 he was made a marshal of France, and shortly afterwards lieutenant-general of Brittany. The fight in Vigo Bay was the last piece of active service performed by Château-Renault. In 1708 on the death of his nephew he inherited the marquise, and on the 15th of November 1716 he died in Paris. He married in 1684 Marie-Anne-Renée de la Porte, daughter and heiress of the count of Crozon. His eldest son was killed at the battle of Malaga 1704, and another, also a naval officer, was killed by accident in 1708. A third son, who too was a naval officer, succeeded him in the title.

A life of Château-Renault was published in 1903 by M. Calmon-Maison. There is a French as well as an English account of the part played by him at Bantry Bay and Beachy Head, and the controversy still continues. For the French history of the navy under Louis XIV. see Léon Guérin, *Histoire maritime de la France* (1863), vols. iii. iv.; and his *Les Marins illustres* (1861). Also the naval history by Charles Bouzel de la Roncière. (D. H.)

**CHÂTEAURoux, MARIE ANNE DE MAILLY-NESELE**, DUCHESS DE (1717-1744), mistress of Louis XV. of France, was the fourth daughter of Louis, marquis de Nesle, a descendant

of a niece of Mazarin. In 1740, upon the death of her husband, the marquis de la Tournelle, she attracted the attention of Louis XV.; and by the aid of the duc de Richelieu, who, dominated by Madame de Tencin, hoped to rule both the king and the state, she supplanted her sister, Madame de Mailly, as titular mistress in 1742. Directed by Richelieu, she tried to arouse the king, dragging him off to the armies, and negotiated the alliance with Frederick II. of Prussia, in 1744. Her political rôle, however, has been exaggerated. Her triumph after the passing disgrace provoked by the king's illness at Metz did not last long, for she died on the 8th of December 1744.

(See Ed. and J. de Goncourt, *La Duchesse de Châteauroux et ses sœurs* (Paris, 1879).

**CHÂTEAUXROUX**, a town of central France, capital of the department of Indre, situated in a plain on the left bank of the Indre, 88 m.S. of Orleans on the main line of the Orleans railway. Pop. (1906) 21,048. The old town, close to the river, forms a nucleus round which a newer and more extensive quarter, bordered by boulevards, has grown up; the suburbs of St Christophe and Déols (*q.v.*) lie on the right bank of the Indre. The principal buildings of Châteauroux are the handsome modern church of St André, in the Gothic style, and the Château Raoul, of the 14th and 15th centuries; the latter now forms part of the prefecture. The hôtel de ville contains a library and a museum which possesses a collection of paintings of the Flemish school and some interesting souvenirs of Napoleon I. A statue of General Henri Bertrand (1773-1844) stands in one of the principal squares. Châteauroux is the seat of a prefect and of a court of assizes. It has tribunals of first instance and of commerce, a board of trade-arbitrators, a branch of the Bank of France, a chamber of commerce, a lycée, a college for girls and training colleges. The manufacture of coarse woollens for military clothing and other purposes, and a state tobacco-factory, occupy large numbers of the inhabitants. Wool-spinning, iron-founding, brewing, tanning, and the manufacture of agricultural implements are also carried on. Trade is in wool, iron, grain, sheep, lithographic stone and leather. The castle from which Châteauroux takes its name was founded about the middle of the 10th century by Raoul, prince of Déols, and during the middle ages was the seat of a seignior, which was raised to the rank of countship in 1497, and in 1616, when it was held by Henry II., prince of Condé, to that of duchy. In 1736 it returned to the crown, and was given by Louis XV. in 1744 to his mistress, Marie Anne de Mailly-Nesle, duchess of Châteauroux.

**CHÂTEAU-THIERRY**, a town of northern France, capital of an arrondissement in the department of Aisne, 59 m. E.N.E. of Paris on the Eastern railway to Nancy. Pop. (1906) 6872. Château-Thierry is built on rising ground on the right bank of the Marne, over which a fine stone bridge leads to the suburb of Marne. On the quay stands a marble statue erected to the memory of La Fontaine, who was born in the town in 1621; his house is still preserved in the street that bears his name. On the top of a hill are the ruins of a castle, which is said to have been built by Charles Martel for the Frankish king, Thierry IV.,

and is plainly the origin of the name of the town. The chief relic is a gateway flanked by massive round towers, known as the Porte Saint-Pierre. A belfry of the 15th century and the church of St Crépin of the same period are of some interest. The town is the seat of a sub-prefect and has a tribunal of first instance and a communal college. The distinctive industry is the manufacture of mathematical and musical instruments. There is trade in the white wine of the neighbourhood, and in sheep, cattle and agricultural products. Gypsum, millstone and paving-stone are quarried in the vicinity. Château-Thierry was formerly the capital of the district of Brié Pouilleuse, and received the title of duchy from Charles IX. in 1566. It was captured by the English in 1421, by Charles V. in 1544, and sacked by the Spanish in 1591. During the wars of the Fronde it was pillaged in 1652; and in the campaign of 1814 it suffered severely. On the 12th of February of the latter year the Russo-Prussian forces were beaten by Napoleon in the neighbourhood.

**CHÂTELAINE** (Med. Lat. *castellanus*, from *castellum*, a castle), in France originally merely the equivalent of the English castellan, *i.e.* the commander of a castle. With the growth of the feudal system, however, the title gained in France a special significance which it never acquired in England, as implying the jurisdiction of which the castle became the centre. The *châtelain* was originally, in Carolingian times, an official of the count; with the development of feudalism the office became a *fief*, and so ultimately hereditary. In this as in other respects the *châtelain* was the equivalent of the viscount (*q.v.*); sometimes the two titles were combined, but more usually in those provinces where there were *châtelains* there were no viscounts, and vice versa. The title *châtelain* continued also to be applied to the inferior officer, or *concierge châtelain*, who was merely a castellan in the English sense. The power and status of *châtelains* necessarily varied greatly at different periods and places. Usually their rank in the feudal hierarchy was equivalent to that of the simple *sire* (*dominus*), between the baron and the *chevalier*; but occasionally they were great nobles with an extensive jurisdiction, as in the Low Countries (see *BURGRAVE*). This variation was most marked in the cities, where in the struggle for power that of the *châtelain* depended on the success with which he could assert himself against his feudal superior, lay or ecclesiastical, or, from the 12th century onwards, against the rising power of the communes. The *châtellenie* (*castellania*), or jurisdiction of the *châtelain*, as a territorial division for certain judicial and administrative purposes, survived the disappearance of the title and office of the *châtelain* in France, and continued till the Revolution.

See Achille Luchaire, *Manuel des institutions françaises* (Paris, 1892): Du Cange, *Glossarium*, s. "Castellanus."

**CHATELAINE** (Fr. *châtellaine*, the feminine form of *châtelain*, a keeper of a castle), the mistress of a castle. From the custom of a chatelaine to carry the keys of the castle suspended from her girdle, the word is now applied to the collection of short chains, often worn by ladies, to which are attached various small articles of domestic and toilet use, as keys, penknife, needlecase, scissors, &c.
