reason, together with its northern aspect, the climate is humid and temperate, unlike that of the inland regions, which are exposed to great extremes of heat in summer and cold in winter. The position which was occupied by the Hellenic and medieval city is a sloping table of ground (whence the original name of the place, Trapezus, the "Table-land"), which falls in steep rocky precipices on the two sides, where two deep valleys, descending from the interior, run parallel at no great distance from one another down to the sea. The whole is still enclosed by the Byzantine walls, which follow the line of the cliffs and are carried along the sea-face, and the upper part of the level, which is separated from the lower by an inner cross wall, forms the castle; while at the highest point, where a sort of neck is formed between the two valleys, is the keep which crowns the whole. On each side, about half-way between the keep and the sea, these ravines are crossed by massive bridges, and on the farther side of the westernmost of these, away from the city, a large tower and other fortifications remain. The area of the ancient city is now called the Kalch, and is inhabited by the Turks; eastward of this is the extensive Christian quarter, and beyond this again a low promontory juts northward into the sea, partly covered with the houses of a well-built suburb, which is the principal centre of commerce. The harbour lies on the eastern side of this promontory, but it is an unsafe roadstead, being unprotected towards the north-east and having been much silted up, so that vessels cannot approach within a considerable distance of the shore. From here the caravans start for Persia, and at certain periods of the year long trains of camels may be seen, and Persian merchants conspicuous by their high black caps and long robes. The route which these caravans follow is a *chaussée* as far as Erzerum, but this is places is too much broken to admit of the transit of wheeled vehicles. The railway by Batoum to Baku by way of Tiflis has tended greatly to turn the channel of commerce from Trebizond into Russian territory, since it helps to open the route to Erivan, Tahriz and the whole of Persia. The total population of the place amounts to about 40,000, of whom 22,000 are Moslems and 18,000 Christians. Great Britain and all the larger European states have consulates there.

The vilayet, of which Trebizond is the chief town, consists of a long irregular strip of coast country, the eastern half of which is deeply indented and mountainous.

History.—The city of Trapezus was a colony of Sinope, but it first comes into notice at the time of the Retreat of the Ten Thousand, who found repose there. Notwithstanding its commercial importance, the remoteness of its position prevented it from being much known to fame either in the Hellenic or the early medieval period; its greatness dates from the time of the fourth crusade (1204), when the Byzantine Empire was dismembered and its capital occupied by the Latins. During the confusion that followed that event Alexius Comnenus escaped into Asia, and, having collected an army of Iberian mercenaries, entered Trebizond, where he was acknowledged as the legitimate sovereign, and assumed the title of Grand Comnenus. Though only twenty-two years of age, Alexius was a man of ability and resolute will, and he succeeded without difficulty in making himself master of the greater part of the southern coast of the Black Sea. The empire thus founded continued to exist until 1461, when the city was taken by Mahommed II. The cause of this long duration, and at the same time the secret of its history, is to be found in the isolated position of Trebizond and its district, between the mountains and the sea, which has already been described. By this means it was able to defy both the Seljuks and the Ottomans, and to maintain its independence against the emperors of Nicaea and Constantinople. But for the same reason its policy was always narrow, so that it never exercised any beneficial influence on the world at large. It was chiefly in the way of matrimonial alliances that it was brought into contact with other states. The imperial family were renowned for their beauty, and the princesses of this race were sought as brides by Byzantine emperors of the dynasty of the Palaeologi, by Western princes, and by Mahomedan princes; and the connexions thus formed originated a variety of

diplomatic relations and friendly or offensive alliances. The palace of Trebizond was famed for its magnificence, the court for its luxury and elaborate ceremonial, while at the same time it was frequently a hotbed of intrigue and immorality. The Grand Comneni were also patrons of art and learning, and in consequence of this Trebizond was resorted to by many eminent men, by whose agency the library of the palace was provided with valuable manuscripts and the city was adorned with splendid buildings. The writers of the time speak with enthusiasm of its lofty towers, of the churches and monasteries in the suburbs, and especially of the gardens, orchards and olive groves. It excited the admiration of Gonzales Clavijo, the Spanish envoy, when he passed through it on his way to visit the court of Timur at Samarkand (Clavijo, *Historia del gran Tamorlan*, p. 84); and Cardinal Bessarion, who was a native of the place, in the latter part of his life, when the city had passed into the hands of the Mahomedans, and he was himself a dignitary of the Roman Church, so little forgot the impression it had made upon him that he wrote a work entitled "The Praise of Trebizond" ("Ἐγκώμιον Τραπεζούντος"), which exists in manuscript at Venice. Little was known of the history of the empire of Trebizond until the subject was taken in hand by Professor Fallmerayer of Munich, who discovered the chronicle of Michael Panaretus among the books of Cardinal Bessarion, and from that work, and other sources of information which were chiefly unknown up to that time, compiled his *Geschichte des Kaiserthums von Trapezunt* (Munich, 1827). From time to time the emperors of Trebizond paid tribute to the Seljuk sultans of Iconium, to the grand khans of the Mongols, to Timur the Tatar, to the Turkoman chieftains, and to the Ottomans; but by means of skilful negotiations they were enabled practically to secure their independence. We find them also at war with many of these powers, and with the Genoese, who endeavoured to monopolize the commerce of the Black Sea. The city was several times besieged, the most formidable attack being that which occurred in the reign of Andronicus I., the second emperor, when the Seljuks, under the command of Melik, the son of the great sultan Ala-ed-din, first assaulted the northern wall in the direction of the sea, and afterwards endeavoured to storm the upper citadel by night. They failed, however, in both attempts; and in the latter, owing to the darkness, and to the occurrence of a violent storm which suddenly swelled the torrents in the ravines, their force was thrown into inextricable confusion, and they were compelled to abandon their camp and make the best of their escape from the country. So great was the strength of the fortifications that Mahommed II. might have experienced much difficulty in reducing it, had it not been for the pusillanimous conduct of David, the last emperor, who surrendered the place almost unconditionally.

Ancient Memorials.—Several interesting monuments of this period remain at Trebizond in the form of churches in the Byzantine style of architecture. One of these is within the area of the old city, viz. the church of the Panaghia Chrysokephalos, or Virgin of the Golden Head, a large and massive but excessively plain building, which is now the Orta-hissar mosque. On the farther side of the eastern ravine stands a smaller but very well proportioned structure, the church of St Eugenius, the patron saint of Trebizond, now the Yeni Djuma djami, or New Friday mosque. Still more important is the church of Haghia Sophia, which occupies a conspicuous position overlooking the sea, about 2 m. west of the city. The porches of this are handsomely ornamented, and about 100 ft. from it rises a tall campanile, the inner walls of which have been covered in parts with frescoes of religious subjects, though these are now much defaced. All the most remarkable memorial of the middle ages that exists in all this district is the monastery of Somelta, which is situated about 25 m. from Trebizond, at the side of a rocky glen, at a height of 4000 ft. above the sea. Its position is most extraordinary, for it occupies a cavern in the middle of the face of a perpendicular cliff 1000 ft. high, where the white buildings offer a marked contrast to the dark rocks which forms their setting. It is approached by a narrow path at the side of the cliff, from which a flight of stone

steps and a wooden staircase give access to the monastery. The valley below is filled with the richest vegetation, the undergrowth being largely composed of azaleas and rhododendrons. An antiquity of 1500 years is claimed for the foundation of the monastery, but it is certain that the first person who raised it to importance was the emperor Alexius Comnenus III. of Trebizond; he rebuilt it in 1360, and richly endowed it. The golden bull of that emperor, which became thenceforth the charter of its foundation, is still preserved; it is one of the finest specimens of such documents, and contains portraits of Alexius himself and his queen. The monastery also possesses the firman of Mahommed II. by which he accorded his protection to the monks when he became master of the country.

T.)

TREBLE (a doublet of "triple," three-fold, from Lat. *tripulus*, triple; cf. "double" from *duplus*), the term applied, in music, to the high or acute part of the musical system, as opposed to and distinguished from the "bass," the lower or grave part. The middle C is the practical division between the parts. The word is also used as equivalent to the "soprano" voice, the highest pitch or range of the human voice, but generally it is confined to a boy's voice of this quality, "soprano" being used of the corresponding female voice. The treble-clef is the G-clef on the second line. The origin of this application of the term "treble," *tripulus*, threefold, to the highest voice or part is due to the fact that in the early plain-song the chief melody was given to the tenor, the second part to the alto (*discantus*) and where a third part (*tripulum*) was added it was assigned to the highest voice, the soprano or treble.

TREBUCHET, a medieval siege engine, employed either to batter masonry or to throw projectiles over walls. It was developed from the post-classical Roman *onager* (wild ass), which derived its name from the kicking action of the machine. It consisted of a frame placed on the ground to which a vertical frame of solid timber was rigidly fixed at its front end; through the vertical frame ran an axle, which had a single stout spoke. On the extremity of the spoke was a cup to receive the projectile. In action the spoke was forced down, against the tension of twisted ropes or other springs, by a windlass, and then suddenly released. The spoke thus kicked the crosspiece of the vertical frame, and the projectile at its extreme end was shot forward. In the trebuchet the means of propulsion was a counter-weight. The axle which was near the top of a high strutted vertical frame served as the bridge of a balance, the shorter arm of which carried the counter-weight and the longer arm the carrier for the shot. An alternative name for the trebuchet is the mangonel (*mangonaca*).

TREBULA, the name of five ancient towns in Italy. (1) TREBULA in Samnium, a town of the Caraceni, on the left bank of the Sangro, some 20 m. below Castel di Sangro; the church of the Madonna degli Spinetti near Quadri marks the site. It appears to have been a *municipium*, but we only know of its existence in Hadrian's time. (2) TREBULA in Campania, between Satulica and Suessula. The site is probably identical with the hills bearing the modern name Tripaola (about 1000 ft. above sea level) above the entrance to the valley of Maddaloni. It is possibly this Trebula the citizens of which received Latin rights in 303 B.C. Its territory extended as far as the Via Appia, and its place was taken in imperial times by the Vicus Novanensis, on the road itself, near Suessula. (3) TREBULA BALLIENSIS (mod. Treglia), also in Campania, 22 m. north of Capua, in the mountains, about 1000 ft. above sea-level. It revolted to Hannibal and was reduced to obedience by Fabius. Remains of walls, aqueduct and tombs exist. Its territory was mentioned in the projected distributions of land in Cicero's time: and its wine was well thought of under Nero. It was a *municipium*. (4) TREBULA MUTULSCA in the Sabine country, 2 m.

east of the point where the Via Caecilia diverges from the Via Salaria. It lies about 1 m. south-west of the modern Monteleone, and an amphitheatre and other remains are visible. In a dedication made there by the consul Mummius in 146 B.C. it is spoken of as a *vicus*, but when the *praefecturae* were abolished it became a *municipium*. The post station of Vicus Novus on the Via Salaria (mod. Osteria Li Massacci) belonged to its territory (see N. Persichetti in *Römische Mitteilungen*, 1898, p. 193). (5) *TREBULA SUFFENAS* is generally placed 6 m. south of Reate (mod. *Rieti*) on the Via Quinciatia, but is with considerable probability identified with *Ciciliano*, 10 m. east of Tivoli, 2030 ft. above sea-level, by Q. Cuntz (*Jahreshefte des oesterr. arch. Instituts*, 1890, ii. 89), who combines the evidence of inscriptions and of the description in Martial (v. 71), with a new interpretation of the *litteraries*. There are remains of an ancient road, with substructures in rough polygonal work ascending to it in zigzags. (T. As.)

TREDEGAR, an urban district in the western parliamentary division of Monmouthshire, England, on the Sirhowy river, 24 m. north of Cardiff, on a joint line of the London & North-Western and the Rhymney railways. Pop. (1901), 18,497. It stands at an elevation of about 1000 ft., and owes its existence to the establishment in the beginning of the 19th century of the works of the Tredegar Iron and Coal Company, which employ most of the large industrial population. The place gave the title of Baron Tredegar (c. 1830) to Sir Charles Morgan Robinson Morgan, Bart. (1792-1875), whose grandfather, Sir Charles Gould, Bart., married the heiress of John Morgan of Tredegar and changed his name to Morgan. He was M.P. for Brecknock in 1835-1847. He married a granddaughter of the 1st Lord Rodney. His son Godfrey (b. 1830), who succeeded to the barony, was created Viscount Tredegar in 1905; he had served in the Crimea and taken part in the famous Balaclava charge.

TREGOLD, THOMAS (1788-1820), English engineer, was born at Brandon, near Durham, on the 22nd of August 1788, and at the age of fourteen was apprenticed to a carpenter. In 1808 he went to Scotland, and after working there as a journeyman for five years, obtained employment in London with an architect. He began to practice as a civil engineer on his own account in 1823, but much of his time was devoted to the preparation of his engineering text-books, which gained a wide reputation. They included *Elementary Principles of Carpentry* (1820), almost the first book of its kind in English; *Practical Treatise on the Strength of Cast Iron and other Metals* (1824); *Principles of Warming and Ventilating Public Buildings* (1824); *Practical Treatise on Railroads and Carriages* (1825); and *The Steam Engine* (1827). He died in London on the 28th of January 1829.

TREE, SIR HERBERT BEERBOHM (1853-), English actor and manager, was born in London, on the 17th of December 1853, the son of Julius Beerbohm, a London merchant of German parentage; his half-brother, Max Beerbohm (b. 1872), became well known as a dramatic critic, a miscellaneous writer and caricaturist. Taking the stage name of Beerbohm Tree he made his first professional appearance in London in 1876. After some years of varied experience he made a striking success in 1884 as the curate in *The Private Secretary*, but he was making himself well known meanwhile in dramatic circles as an admirable actor in many rôles. In September 1887 he became lessee and manager of the Haymarket theatre, London, where his representations of melodramatic "character" parts, as in *Jim the Penman*, *The Red Lamp*, and *A Man's Shadow*, were highly successful. His varied talents as an actor were displayed, however, not only in a number of modern dramas, such as H. A. Jones's *Dancing Girl*, but also in romantic parts such as Gringoire, and in the production of so essentially a literary play as Henley's *Beau Austin*; and in classic parts his ability as a comedian was shown in *The Merry Wives of Windsor*, in which he played Falstaff, and as a tragedian in *Hamlet*; his presentations of Shakespeare were notable too as carrying forward the methods of realistic staging inaugurated at the Lyceum under Irving. In 1897 Mr Tree moved to the new Her Majesty's (afterwards

His Majesty's) theatre, opening with Gilbert Parker's *Seats of the Mighty*; but his chief successes were in Stephen Phillips's poetical dramas, and in his splendid revivals of Shakespeare (especially *Richard II.* and the *Merchant of Venice*). The magnificence of the mounting, the originality and research shown in the "business" of his productions, and his own versatility in so many different types of character, made his management memorable in the history of the London stage; and on the death of Sir Henry Irving he was generally recognized as the leader in his profession. His wife (Maud Holt), an accomplished actress, and their daughter Viola, were also prominently associated with him. In 1907 he took his company to Berlin at the invitation of the German emperor, and gave a selection from his *répertoire* with great success. In the same year he established a school of dramatic art, for the training of actors, in London; and in this and other ways he was prominent in forwarding the interests of the stage. He was knighted in 1909.

TREE (O. Eng. *tréo*, *træow*, cf. Dan. *trœ*, Swed. *träd*, tree, *trä*, timber; allied forms are found in Russ. *дрво*, Gr. *δέν*, oak, and *δένον*, spear, Welsh *derw*, Irish *darog*, oak, and Skr. *dāru*, wood), the term, applied in a wide sense, to all plants which grow with a permanent single woody stem or trunk of some height, branching out at some distance from the ground. There is a somewhat vague dividing line, in popular nomenclature, between "shrubs" and "trees," the former term being usually applied to plants with several stems, of lower height, and bushy in growth. The various species to which the name "tree" can be given are treated under their individual titles, e.g. oak, ash, elm, &c.; the articles **FIR** and **PINE** treat of two large groups of conifers; general information is provided by the articles **PLANTS** and **GYMNOSPERMS**; tree cultivation will be found under **FORESTS** and **FORESTRY** and **HORTICULTURE**; and the various types of tree whose wood is useful for practical purposes under **TIMBER**. Apart from this general meaning of the word, the chief transferred use is that for a piece of wood used for various specific purposes, as a framework, bar, &c., such as the tree of a saddle, axle-tree, cross-tree, &c.

TREE-CREEPER, one of the smallest of British birds, and regard being had to its requirements, one very generally distributed. It is the *Certhia familiaris* of ornithology, and is remarkable for the stiffened shafts of its long and pointed tail-feathers, aided by which, and by its comparatively large feet, it climbs the trunks or branches of trees, invariably proceeding upwards or outwards and generally in a spiral direction, as it seeks the small insects that are hidden in the bark and form its chief food. When in the course of its search it nears the end of a branch or the top of a trunk, it flits to another, always alighting lower down than the place it has left, and so continues its work. Inconspicuous in colour—for its upper plumage is mostly of various shades of brown mottled with white, buff and tawny, and beneath it is of a silvery white—the tree-creeper is far more common than the incurious sapsucker; but, attention once drawn to it, it can be frequently seen and at times heard, for though a shy singer its song is loud and sweet. The nest is neat, generally placed in a cleft formed by a half-detached piece of bark, which secures it from observation, and a considerable mass of material is commonly used to stuff up the opening and give a sure foundation for the tiny cup, in which are laid from six to nine eggs of a translucent white, spotted or blotched with rust-colour.

The tree-creeper inhabits almost the whole of Europe as well as Algeria and has been traced across Asia to Japan. It is now recognized as an inhabitant of the greater part of North America, though for a time examples from that part of the world, which differed slightly in the tinge of the plumage, were accounted a distinct species (*C. americana*) and even those from Mexico and Guatemala (*C. mexicana*) have lately been referred to the same. It therefore occupies an area not exceeded in extent by that of many passerine birds and is one of the strongest witnesses to the close alliance of the so-called Nearctic and Palaearctic regions.

Allied to the tree-creeper, but without its lengthened and stiff tail-feathers, is the genus *Tichodroma*, the single member of which is the wall-creeper (*T. muraria*) of the Alps and some other mountainous parts of Europe and Asia. It is occasionally seen in Switzerland, fluttering like a big butterfly against the face of a rock conspicuous

from the scarlet-erimson of its wing-coverts and its white spotted primaries. Its bright hue is hardly visible when the bird is at rest, and it then presents a dingy appearance of grey and black. It is a species of wide range, extending from Spain to China, and though but seldom leaving its cliffs, it has wandered even so far as England. Merrett (*Pinnax*, p. 177) in 1667 included it as a British bird, and the correspondence between Marsham and Gilbert White (*Proc. Norfolk and North. Nat. Society*, ii. 180) proves that an example was shot in Norfolk, on the 30th of October 1792; while another is reported (*Zoologist*, 2nd series, p. 4839) to have been killed in Lancashire on the 8th of May 1872.

The passerine family Certhiidae contains a number of genera of birds to which the general name "creeper" is applied; they occur in North America, Europe and Asia, the greater part of Africa, and Australia and New Guinea. (A. N.)

TREE-FERN. In old and well-grown specimens of some of the familiar ferns of temperate climates the wide-spreading crown of fronds may be observed to rise at a distance often of a good many inches above the ground, and from a stem of considerable thickness. The common male fern *Lastraea* (*Filix-mas*) affords the commonest instance of this; higher and thicker trunks are, however, occasionally presented by the royal fern (*Osmunda regalis*), in which a height of 2 ft. may be attained, and this with very considerable apparent thickness, due, however, to the origin and descent of a new series of adventitious roots from the bases of each annual set of fronds. Some tropical members and allies of these genera become more distinctly tree-like, e.g. *Todea*; *Pteris* also has some sub-arboreal forms. *Oleandra* is branched and shrub-like, while *Angiopteris* and *Martalia* may also rise to 2 ft. or more. But the tree-ferns proper are practically included within the family Cyatheaceae. This includes seven genera (*Cyathea*, *Alsophila*, *Hemitelia*, *Dicksonia*, *Thysopteris*, *Cibotium* and *Balanium*) and nearly 300 species, of which a few are herbaceous, but the majority arboreal and palm-like, reaching frequently a height of 50 ft. or more. *Alsophila excelsa* of Norfolk Island having sometimes measured 60 to 80 ft. The fronds are rarely simple or simply pinnate, but usually tripinnate or decomposed, and may attain a length of 30 ft., thus forming a splendid crown of foliage. The stem may occasionally branch into many crowns.

The genera are of wide geographical range, mostly within the tropics; but South Australia, New Zealand, and the southern Pacific islands all possess their tree-ferns. In Tasmania *Alsophila australis* has been found up to the snow-level, and in the humid and mountainous regions of the tropics tree-ferns are also found to range up to a considerable altitude. The fronds may either contribute to the apparent thickness of the stem by leaving more or less of their bases, which become hardened and persistent, or they may be articulated to the stem and fall off, leaving characteristic scars in spiral series upon the stem. The stem is frequently much increased in apparent thickness by the downgrowth of aerial roots, forming a black coating several inches or even a foot in thickness, but its essential structure differs little in principle from that familiar in the rhizome of the common bracken (*Pteris*). To the ring or rather netted cylinder of fibrovascular bundles characteristic of all fernstems scattered internal as well as external bundles arising from these are superadded and in a tree-fern the outer bundles give off branches to the descending roots from the region where they pass into the leaves.

Tree-ferns are cultivated for their beauty alone; a few, however, are of some economic applications, chiefly as sources of starch. Thus the beautiful *Alsophila excelsa* of Norfolk Island is said to be threatened with extinction for the sake of its sago-like pith, which is greedily eaten by boga; *Cyathea medullaris* also furnishes a kind of sago to the natives of New Zealand, Queensland and the Pacific islands. A Javanese species of *Dicksonia* (*D. chrysotricha*) furnishes silky hairs, which have been imported as a styptic, and the long silky or rather woolly hairs, so abundant on the stem and frond-leaves in the various species of *Cibotium* have not only been put to a similar use, but in the Sandwich Islands furnish wool for stuffing mattresses and cushions, which was formerly an article of export. The "Tartarian lamb," or *Agave scripnicus* of old travellers' tales in China and Tartary, is simply the woolly stock of *Cibotium Barometris*, which, when dried and inverted, with all save four of its frond-stalks cut away, has a droll resemblance to a toy sheep.

TREE FROG. Many different groups of tailless Batrachians (see FROG) are adapted to arboreal life, which is indicated by expansions of the tips of the fingers and toes, adhesive disks which assist the animal in climbing on vertical smooth surfaces. These disks do not act as suckers, but adhere by rapid and intense pressure of the distal phalanx and special muscles upon the lower

surface, which is also provided with numerous glands producing a viscous secretion.

The best-known tree frog is the little *Hyla arborea* of continental Europe, *vivante* of the French, *Laubfrosch* of the Germans, often kept in glass cylinders provided with a ladder, which the frog is supposed to ascend or descend in prevision of the weather. But recent experiments conducted on scientific principles show that not much reliance can be placed on its prophecies. This frog is one of the smallest of European Batrachians, rarely reaching 2 in. in length; its upper parts are smooth and shiny, normally of a bright grass-green, which may change rapidly to yellow, brown, olive or black; some specimens, deprived of the yellow pigment which contributes to form the green colour, are sky-blue or turquoise blue; the lower parts are granulate and white.

The family Hylidae, of which the European tree frog is the type, is closely related to the Bufonidae or true toads, being distinguished from them by the presence of teeth in the upper jaw and by the claw-like shape of the terminal phalanx of the digits. It is a large family, represented by about three hundred species, two hundred and fifty of which belong to the genus *Hyla*, distributed over Europe, temperate Asia, North Africa, North and South America, Papua and Australia. Close allies of *Hyla* are the *Nolotrema* of Central and South America, in which the female develops a dorsal broad pouch in which the young undergo part or the whole of their metamorphoses. The genus *Phyllomedusa*, also from Central and South America, are quadrumanous; the inner finger and the toe being opposable to the others, and the foot being very similar to the hand. These frogs deposit their spawn between the leaves of branches overhanging water, into which the tadpoles drop and spend their larval life.

TREE KANGAROO. any individual of the diprotodont marsupial genus *Dendrolagus* (see MARSUPIALIA). Three species are inhabitants of New Guinea and the fourth is found in North Queensland. They differ greatly from all other members of the family (Macropodidae), being chiefly arboreal in their habits, and feeding on bark, leaves and fruit. Their hinder limbs are shorter than in the true kangaroos, and their fore limbs are longer and more robust, and have very strong curved and pointed claws. The best-known species, Lumbolts' tree kangaroo (*Dendrolagus lumholtzi*), is found in North Queensland. It was named by Professor Collett in honour of its discoverer, who described it as living on the highest parts of the mountains, in the densest scrub and most inaccessible places. It is hunted by the blacks with trained dingoes; the flesh is much prized by the blacks, but the presence of a worm between the muscles and the skin renders it less inviting to Europeans.

TREE-SHREW. any of the arboreal insectivorous mammals of the genus *Tupaia*. There are about a dozen species, widely distributed over the east. There is a general resemblance to squirrels. The species differ chiefly in the size and in colour and length of the fur. Nearly all have long bushy tails. Their food consists of insects and fruit, which they usually seek for in the trees. When feeding they often sit on their haunches, holding the food, after the manner of squirrels, between their fore paws. The pen-tailed tree-shrew (*Philocercus lawi*), from Borneo, Sumatra and the Malay Peninsula, is the second generic representative of the family Tupaiidae. The head and body, clothed in blackish-brown fur, are about 6 in. long; the tail, still longer, is black, scaled and sparsely haired for the upper two-thirds, while the lower third is fringed on each side with long hairs, mostly white. One shrew from Borneo and a second from the Philippines have been referred to a separate genus under the name *Urogale coeverti* and *U. cylindrica*, on account of their uniformly short-haired, in place of varied, tails. (See INSECTIVORA.)

TREE-WORSHIP. Primitive man, observing the growth and death of trees, the elasticity of their branches, the sensitiveness and the annual decay and revival of their foliage, anticipated in his own way the tendency of modern science to lessen the gulf between the animal and the vegetable world. When sober Greek philosophers (Aristotle, Plutarch) thought that trees had perceptions, passions and reason, less profound thinkers may be excused for ascribing to them human conceptions and supernatural powers, and for entertaining beliefs which were entirely rational and logical from primitive points of view. These beliefs were

part of a small stock of fundamental ideas into which scientific knowledge of causation did not enter, ideas which persist in one form or another over a large portion of the world, and have even found a place in the higher religions, inevitably conditioned as these positive faiths are by the soil upon which they flourish.¹ In fact, the evidence for tree-worship is almost unmanageably large, and since comparative studies do not as yet permit a concise and conclusive synopsis of the subject, this article will confine itself to some of the more prominent characteristics.

Numerous popular stories reflect a firmly rooted belief in an intimate connexion between a human being and a tree, plant or flower. Sometimes a man's life depends upon the

Trees and Human Life.

tree and suffers when it withers or is injured, and we encounter the idea of the *external soul*, already found in the Egyptian "Tale of the Two Brothers" of at least 3000 years ago. Here one of the brothers leaves his heart on the top of the flower of the acacia and falls dead when it is cut down. Sometimes, however, the tree is an *index*, a mysterious token which shows its sympathy with an absent hero by weakening or dying, as the man becomes ill or loses his life. These two features very easily combine, and they agree in representing a—to us—mysterious sympathy between tree and human-life, which, as a matter of fact, frequently manifests itself in recorded beliefs and customs of historical times.² Thus, sometimes the new-born child is associated with a newly planted tree with which its life is supposed to be bound up; or, on ceremonial occasions (betrothal, marriage, ascent to the throne), a personal relationship of this kind is instituted by planting trees, upon the fortunes of which the career of the individual depends. Sometimes, moreover, boughs or plants are selected and the individual draws omens of life and death from the fate of his or her choice. Again, a man will put himself into relationship with a tree by depositing upon it something which has been in the closest contact with himself (hair, clothing, &c.). This is not so unusual as might appear; there are numerous examples of the conviction that a sympathetic relationship continues to subsist between things which have once been connected (e.g. a man and his hair), and this may be illustrated especially in magical practices upon material objects which are supposed to affect the former owner.³ We have to start then with the recognition that the notion of a real inter-connexion between human life and trees has never presented any difficulty to primitive minds.

The custom of transferring disease or sickness from men to trees is well known.⁴ Sometimes the hair, nails, clothing, &c., of a sickly person are fixed to a tree, or they are forcibly inserted in a hole in the trunk, or the tree is split and the patient passes through the aperture. Where the tree has been thus injured, its recovery and that of the patient are often associated. Different explanations may be found of such customs which naturally take rather different forms among peoples in different grades of

civilization. Much depends upon the theory of illness. In India, for example, when the patient is supposed to be tormented by a demon, ceremonies are performed to provide it with a tree where it will dwell peacefully without molesting the patient so long as the tree is left unharmed.⁵ Such ideas do not enter, of course, when the rite merely removes the illness and selfishly endangers the health of those who may approach the tree.⁶ Again, sometimes it is clearly felt that the man's personality has been mystically united with some healthy and sturdy tree, and in this case we may often presume that such trees already possessed some peculiar reputation. The custom finds an analogy when hair, nail-clippings, &c., are hung upon a tree for safety's sake lest they fall into the hands of an enemy who might injure the owner by means of them.

In almost every part of the world travellers have observed the custom of hanging objects upon trees in order to establish some sort of a relationship between the offerer and the tree.

Such trees not infrequently adjoin a well or are accompanied by sacred buildings, pillars, &c. Throughout Europe, also, a mass of evidence has been collected testifying to the lengthy persistence of "superstitious" practices and beliefs concerning them. The trees are known as the scenes of pilgrimages, ritual ambulation, and the recital of (Christian) prayers. Wreaths, ribbons or rags are suspended to win favour for sick men or cattle, or merely for "good luck." Popular belief associates the sites with healing, bewitching, or mere "wishing"; and though now perhaps the tree is the object only of some vague respect, there are abundant allusions to the earlier vitality of coherent and systematic cults.⁷ Decayed or fragmentary though the features may be in Europe, modern observers have found in other parts of the world more organic examples which enable us, not necessarily to reconstruct the fragments which have survived in the higher religions and civilizations, but at least to understand their earlier significance. In India, for example, the Korwas hang rags on the trees which form the shrines of the village-gods. In Nebraska the object of the custom was to propitiate the supernatural beings and to procure good weather and hunting. In South America Darwin recorded a tree honoured by numerous offerings (rags, meat, cigars, &c.); libations were made to it, and horses were sacrificed.⁸ If, in this instance, the Gauchos regarded the tree, not as the embodiment or abode of Wallechu, but as the very god himself, this is a subtle but very important transference of thought, the failure to realize which has not been confined to those who have venerated trees.

Among the Arabs the sacred trees are haunted by angels or by *jinn*; sacrifices are made, and the sick who sleep beneath them receive prescriptions in their dreams. Here, as frequently elsewhere, it is dangerous to pull a bough.

This dread of damaging special trees is familiar; Cato instructed the woodman to sacrifice to the male or female deity before thinning a grove (*De re rustica*, 139), while in the Homeric poem to Aphrodite the tree nymph is wounded when the tree is injured, and dies when the trunk falls.⁹ Early Buddhism decided that trees had neither mind nor feeling and might lawfully be cut; but it recognized that certain spirits might reside in them, and this the modern natives of India firmly believe. Propitiation is made before the sacrilegious axe is laid to the holy trees; loss of life or of wealth and the failure of rain are feared should they be wantonly cut; and there are even trees which it is dangerous to climb.¹⁰ The Talein of Burma prays to the tree before he cuts it down, and the African woodman will place a fresh sprig upon the

¹ In this as in other subjects of comparative religion (see SERPENT-WORSHIP), the comparative and historical aspects of the problems should not be severed from psychology, which investigates the actual mental processes themselves. A naive rationalism or intellectualism which would ridicule or deplore the modern retention of "primitive" ideas has to reckon with the psychology of the modern average mental constitution; a more critical and more sympathetic attitude may recognize in religious and in other forms of belief and custom the necessary consequences of a continuous development linking together the highest and the lowest conceptions of life.

² See the evidence collected by E. S. Hartland, *The Legend of Perseus* (1894-1896), ii.; J. G. Frazer, *The Golden Bough* (1900), iii. 351 sqq.; 391; and in general, A. E. Crawley, *The Idea of the Soul* (1909).

³ There appears to be a fundamental confusion of association, likeness and identity, which on psychological grounds is quite intelligible. It is appropriate to notice the custom of injuring an enemy by simply beating a tree-stump over which his name had previously been pronounced (A. B. Ellis, *The Ewe-speaking Peoples of the Slave Coast of Africa*, 1896, p. 2). The folk-lore of the "name" is widespread in all ages, antiquity, and certain features of it show that a thing (and thing or object) and its name were not easily disconnected, and that what affected the one affected the other. In this case, by pronouncing the name the tree-stump for all intents and purposes, the psychology of

Veneration of Trees.

Embodiment of Spirits.

stamp as a new home for the spirit. In the Gold Coast the cotton and odum (poison) trees are especially sacred as the abode of the two deities, who are honoured by sacrifices—even of human victims; these indwelt trees must not be cut, and, since all trees of these species are under their protection, they can be felled only after certain purificatory ceremonies.¹ In general the evidence shows that sacred trees must not be injured unless they (i.e. their spirits) have been appeased, or means taken to provide the occupant with another abode. That the difference between the sacred *object* and the sacred *occupant* was not always clearly drawn is quite intelligible from those beliefs of much less rudimentary religions which confuse the unessential with the essential.

Again, when the jungle-races of India clear the forests, they leave behind certain trees which are carefully protected lest the sylvan gods should abandon the locality (Crooke ii. 90). These trees embody the local deities much in the same way as the north European homestead had a tree or a small grove for the guardian-spirit or "lord of the home," and they resemble the tree tutelary genius of old German villages and the Japanese trees which are the terrestrial dwelling-places of the guardian of the hamlets.² Such beliefs as these are more significant when trees are associated with the spirits of the dead. Trees were planted around graves in Greece, and in Roman thought groves were associated with the *manes* of the pious. The Baduyas of the central provinces of India worship the souls of their ancestors in groves of Śā trees, and this may be supplemented by various modern burial usages where the dead are buried in trees, or where the sacred tree of the village enshrines the souls of the dead forefathers. Thus among the natives of South Nigeria each village has a big tree into which the spirits of the dead are supposed to enter; when a woman wants a child or when a man is sick, sacrifice is made to it, and if the "Big God" Osowo who lives in the sky is favourable the request is granted.³

Often the tree is famous for oracles. Best known, perhaps, is the oak of Dodona tended by priests who slept on the ground. The tall oaks of the old Prussians were inhabited by gods who gave responses, and so numerous are the examples that the old Hebrew "terebinth of the teacher" (Gen. xii. 6), and the "terebinth of the diviners" (Judg. ix. 37) may reasonably be placed in this category. Important sacred trees are also the object of pilgrimage, one of the most noteworthy being the branch of the Bo tree at Ceylon brought thither before the Christian era.⁴ The tree-spirits will hold sway over the surrounding forest or district, and the animals in the locality are often sacred and must not be harmed. Thus, the pigeons at the grove of Dodona, and the beasts around the north European tree-sanctuaries, were left untouched, even as the modern Dyak would allow no interference with the snake by the side of the hush which enshrined a dead kinsman.⁵ Sacred fires burned before the Lithuanian Perkuno and the Roman Jupiter; both deities were closely associated with the oak, and, indeed, the oak seems to have been very commonly used for the perpetual holy fires of the Aryans.⁶ The powers of the tree-deities, though often especially connected with the elements, are not necessarily restricted, and the sacred trees can form the centre of religious, and sometimes, also, of national life. Such deities are not abstract beings, but are potent and immediate, and the cultus is primarily as utilitarian as the duties of life itself. They may have their proper ministrants: (a) the chief sanctuary of the old Prussians was a holy oak around which lived priests and a high priest known as "God's mouth"; (b) in Africa there are

sacred groves among the Euphrates, the scene of religious observances—of periodical (and British New Guinea) tree and a portion is laid invisible spirit naturally offerings is a belief which may be seen in the Punjab; it was Ocin's grave at Upsala. Prussian sacred groves and springs was atoned for by human popular custom and tradition, and from the writers, various grisly rites and acts of more advanced Hebrew prophets denounced) unusual features in the cults of trees and vegetation.

Although trees have played so prominent a part in the of religions, the utmost caution is necessary in any estimate the significance of isolated evidence and its relation to the contemporary thought. Let it suffice to notice that in West Equatorial Africa the death of the sacred tree near the temples leads to the abandonment of the village, that in Rome the withering of the sacred fig-tree of Romulus in the Forum caused the greatest consternation. One can now understand in some measure why so much importance should be attached to a venerated tree, but these examples will illustrate the different historical and religious conditions which require study in any investigation of tree-worship. Unfortunately one constantly reaches the point where the ancient writer or the modern observer has failed to record the required information. Moreover, we do not encounter tree-cults at their rise: in every case we arrest the evidence at a certain stage of development. It is often impossible to determine why certain trees are sacred; sometimes it may be that the solitary tree is the survivor of a forest or grove, or it has attracted attention from its curious or uncanny form, or again it stands on a spot which has an immemorial reputation for sanctity. The persistence of sacred localities is often to be observed in the East, where more rudimentary forms of tree-cult stand by the side of or outlive higher types of religion.⁷ The evolution of sacred trees and of religious beliefs and practices associated therewith have not always proceeded along parallel lines. As ideas advanced, the spirits associated with trees were represented by posts, idols, or masks; altars were added, and the trunk was roughly shaped to represent the superhuman occupant. There is reason to believe that the last-mentioned transformation has frequently happened in the development of iconography. Indeed, the natives of the Antilles suppose that certain trees instructed sorcerers to shape their trunks into idols, and to install them in temple-huts where they could be worshipped and could inspire their priests with oracles.⁸

⁴ So in Asia Minor where a tree hung with rags stands by a rock with an ancient "Hittite" representation of the god of vegetation (W. M. Ramsay, *The Expositor*, Nov., 1906, p. 461 seq.). "Hittite" religion has long passed away, but the locality preserves its sacred character and presents a form of cult older than the "Hittite" civilization itself (cf. also the persistence of the veneration of trees in Palestine in spite of some four thousand years of history). There has not been a reversion to ancient forms of cult in their organic entirety, but with the weakening and loss of the positive influences in the course of history, there has been no progression, and the communities live in simpler conditions and at a simpler stage of mental evolution and they are "childlike" rather than "senile" or "decadent."

⁵ Tylor, ii. 216. Here one may observe: (a) the virtues of the tree as a whole will be retained—as in the case of the relic of a medieval saint—in any part of it (cf. *ibid.* 217; the offshoots of the oak of

These words were sung by the men of Cornwall, who seem to have assembled during the bishop's short imprisonment in 1688. It is probable, however, that a similar threat was heard in 1628, when John Trelawny (1592-1665), grandfather of the bishop, was imprisoned by the House of Commons for opposing the election of Sir John Eliot to parliament. The "Song of the Western Men," which contains the above refrain, was composed in 1825 by R. S. Hawker.

TREMATODES, or flukes (as they are called from their fish-like shape), one of the three classes that compose the phylum Platyelminia (q.v.). They are flattened organisms provided with two or more suckers, hence their name (*tryparabōdys*, pierced with holes), and are exclusively parasitic both in their earlier and mature stages of life. Their structure has undergone little degeneration in connexion with this habit, and may be compared organ for organ with that of the Planarians (q.v.). The chief peculiarities that distinguish Trematodes from their free-living allies, the Turbellaria, are the development of adhering organs for attachment to the tissues of the host; the replacement of the primitively ciliated epidermis by a thick cuticular layer and deeply sunk cells to ensure protection against the solvent action of the host; and (in one large order) a prolonged and peculiar life-history. The only organs that exhibit any sign of degeneration are those of sense, but in the ectoparasitic Trematodes simple eye-like structures are present and perhaps serve as organs of temperature. The class as a whole is linked to the Turbellaria not only by its similarity of structure, but by the intermediation of the singular class the Temnocephaloidea (see PLANARIANS), which in habit and in organization form an almost ideal annectant group.

External Characters.—The body, which varies in length from a few millimetres to a couple of feet, is usually oval and flattened. In certain genera the margins are infolded either along their whole length (the male of *Schistosomum haematobium*; fig. 9, A) or anteriorly only (Holostomidae). The anterior third of the body is attenuated and sharply marked off from the bulbous trunk in *Didymozoon*. Trematodes never exhibit segmentation, though a superficial annulation may occur, e.g. in *Udonella*.

The ventral surface is characterized by one or more suckers and apertures. The mouth lies usually in the centre of the anterior

and sub-terminal sucker or between two adoral suckers, but in *Gasterostomum* and its allies it is mid-ventral. A second sucker of variable size and shape lies behind the oral one. In the ectoparasitic Trematodes this post-oral sucker is a complex disk placed near the hinder end and provided with suckertents, hooks and a musculature arising from a special skeleton. In the majority of endoparasitic forms it is merely a muscular disk just behind the mouth; but in the Aspidocotylea this sucker forms a muscular ribbed sole extending over the greater part of the ventral surface (fig. 7).

The anterior and posterior ends of the body are well defined. The former is specially modified in a few genera in a manner analogous to the "proboscis" of certain Rhabdocoel Turbellaria. Thus in the recently discovered arctic genus *Prosthorhynchus* the muscular and glandular extremity is protrusible, but in the allied *Gasterostomum* this organ is represented by a sucker with fimbriated or tentacular margins. Another form, *Rhopalophorus*, has two cephalic tentacles that are retractile and covered with hooks. The chief genital pore is placed anteriorly between the oral sucker and the ventral one, and is posterior only in Holostomidae, Gasterostomidae and a few Distomidae. Usually this aperture is median, but occasionally asymmetrical. Both male and female gonoducts open through a common atrium to the exterior by this pore, but in three bisexual genera the male and female ducts are developed in separate individuals (*Bilharzia*, *Didymozoon*, *Koelikeria*). A single or paired accessory gonopore is met with in many Trematodes just as in certain Turbellaria (e.g. *Cylindrostomum*, *Trigonopus*). This accessory pore is not of uniform significance. In ectoparasitic Trematodes it is paired and usually ventral (fig. 4, B, 5), but the two apertures may run into one, and may also open dorsally (*Hexacotyle*). In this group, the accessory gonopore is the opening of the "vagina," in contradistinction to the median and atrial opening of the uterus which is a "birth-pore." In most endoparasitic Trematodes the accessory gonopore is a median and dorsal structure. It is the opening of Laurer's canal and is homologous not with that of the "vagina" just mentioned, but with a totally distinct structure—the "yolk-receptacle"—which in ectoparasitic forms discharges into the gut instead of to the exterior (see fig. 3).

The excretory pore is terminal and posterior in endoparasitic forms; paired, anterior and dorsal in the ectoparasitic class.

Parasitic Habits.—The Trematodes with few exceptions select a vertebrate for their host. Speaking generally each species of parasite has a particular host, upon the blood of which it nourishes itself and matures its reproductive organs. This strange partiality is now to some extent intelligible. It has been shown in the mammals that blood-relationship, in the strict and literal sense, holds good. The blood of most species behaves differentially towards precipitants, and it is therefore conceivable that when blood is used as food and is elaborated into special compounds for the nutrition of the reproductive organs of a parasite, these specific or larger differences in the blood of animal hosts may prevent the ripening of the gonads of a widely diffused parasite and only one particular kind of blood prove suitable. It would seem that the Trematodes present various degrees of such adaptation, for whilst some—e.g. the common liver-fluke (*Distomum hepaticum*)—mature equally well in the bile-ducts of a man as in those of a sheep or rabbit, others and in fact the majority are restricted apparently to one host. It must, however, be borne in mind that a Trematode may develop in an "aberrant" manner in one host and "normally" in another; and unless we knew the initial stock, the two forms would be regarded as distinct species, each with its own host.

The position of the Trematode on its host is of far-reaching importance. If ectoparasitic and attached to the skin, apertures or gills, the Trematode adopts more elaborate adhesive organs and undergoes a less complex development than are required for the endoparasitic members of the class. The latter are almost invariably swallowed by their host in an immature state with its food, and from the stomach or intestine they work their way into the lungs, liver, body-cavity or blood vessels. These endoparasites have a peculiar larval development, the results of which are to increase their numbers and enhance the opportunity of their gaining the necessarily remote station in some fresh individual host. It is usual to consider the ectoparasitic habit as leading up to the endoparasitic one. From what we know of the Platyelminia, however, it is more probable that the two are quite independent and have been evolved separately.

The influence of Trematodes on their hosts is a varied one. Probably all of them secrete an active poison by the aid of their glands, but the effects of these substances are not readily perceptible. In addition to this, they constitute a drain upon the blood which may result in anaemia. If present in large numbers they may give rise to obstruction of the liver-ducts or to inflammation of other tissues. The most important of the Trematodes in its effect on man is *Schistosomum* (*Bilharzia*). This parasite is one of the plagues

(From Cambridge Natural History, vol. II, "Worms, &c.," by permission of Macmillan & Co., Ltd.)

FIG. 1.—A Group of Trematodes.

of Africa. In Egypt 30% of the natives are affected by haematuria which arises from congestion of the bladder consequent upon the attacks of this animal. The noxious influence of Trematodes is, moreover, not confined to their mature phase of life. The rapid multiplication that takes place in the larval stage of nearly all endoparasitic forms affects the tissues of the "intermediate" host in which they live. In most cases this is a mollusc, and the larvae bore their way into the most diverse organs, often accumulating to such an extent as to give a distinctly orange colour to an otherwise colourless tissue, and to cause the demolition of particular structures e.g. the liver and gonad. Perhaps the most remarkable of these effects is that produced by the larvae of *Gasterodromum*. These organisms live in cockles, oysters and other lamellibranchs and they so affect the gonads of these molluscs as to castrate and sterilize their host. A different but still more interesting result is produced by these Trematode larvae on certain lamellibranchs. The production of pearls by oysters and mussels is common knowledge, but it is only recently that the origin of pearls has been traced and admitted to be due to inflammation set up by a parasite. In the case of the pearl oyster this parasite is a cestode larva, but in the less valuable but no less genuine pearl produced by *Mytilus*, &c., the nucleus is a Trematode-larva (Jameson).

Structure.—The anatomical structure of the Trematodes is fairly uniform (Braun). The body is enveloped by a thick striated protective cuticle which is frequently raised into hooks or spines. In *Distomum acanthocephalum* the cuticle forms circlets of large and small hooks at the anterior end, somewhat as in Cestodes. The epidermis has lost its connected epithelial character and its cilia, and the isolated cells have become sunk inward retaining their

attachment to the innermost cuticular layer by slender processes. This layer also forms the attachment for the muscles, of which there are two enveloping coats, a circular and a longitudinal layer and also dorso-ventral fibres. The muscles are remarkable for two reasons. They occasionally exhibit striation and originate from large branched cells, the nucleus and unmodified part of which form conspicuous elements. The digestive system consists of a simple or bifurcated sac, opening through the mouth by means of a "pharynx bulbosus," adapted to act primarily as a sucker, and secondarily, when drawing blood, as an aspirator. Between the blind gut and the cuticle is a reticular branched tissue which forms the chief substance of the body. This is the mesenchyma. As in other Platyhelminths the elements of this tissue undergo the most varied differentiation. The main mass of it forms a spongy vacuolated matrix, but some of the cells become glandular and open by pores on the surface of the cuticle, others become "flame-cells" (fig. 2, D) and canaliculi of the excretory system as in Turbellaria, others again muscle-cells. Embedded in the matrix lies the complex genital apparatus composed usually of both male and female reproductive organs (fig. 2, B). The former consists of one pair or more of vesicular testes communicating by fine ducts with a vesicula seminalis. From this point a glandular tube runs to the genital atrium and during the last part of its course is converted into an eversible hooked "cirrus" or penis. The female organs consist of distinct ovaries and yolk-glands, the ducts of which unite in the neighbourhood of a "shell-gland" or "ootype." Here the two elements, ovum and yolk-cells, are surrounded by a shell of operculate or of spindle-capped types. Coincidentally, to allow of fertilization and the escape of excess of yolk, and of spermatozoa, other accessory ducts open at this point. Thus in ectoparasitic Trematodes, the paired vagina transmits spermatozoa to the egg; and a canal carries off yolk from this point of junction either to the gut for resorption or to the exterior for exudation. This duct (Laurer's canal) is sometimes rudimentary and ends blindly beneath the skin. The fertilized ova, provided with yolk and a shell, are next transferred to the "uterus" along which they travel to the exterior. In the endoparasitic trematodes the uterus is the only passage by which fertilization can be effected, and in cases of cross and self-impregnation this duct is physiologically a vagina. Lastly the nervous system is well developed and consists of a pair of well-marked and interconnected ganglia placed near the anterior end and dorsal to the oesophagus. From these ganglia, nerve-tracts provided with ganglion-cells are given off. Of these there are three on each side of the body; a large ventral tract, smaller lateral strands and dorsal ones. From these tracts a plexus of nerve-fibres is developed in connexion with the musculature and cuticle.

The Trematodes are divided into three orders, primarily distinguished by the character of their suckers, viz.: Heterocotylea, Aspidocotylea and Malacoctylea.

Order 1. Heterocotylea.—Ectoparasitic Trematodes, in which a large posterior adhesive apparatus is present and is usually accompanied by a pair of suckers placed anteriorly in relation to the mouth. The large posterior organ of attachment is usually wheel-shaped and provided with hooks; but the ridges may become separated

FIG. 2.

- B. anterior portion more highly magnified (from Marshall and Hurst, after Sommer); cs, cirrus sac; d, ductus ejaculatorius; f, female aperture; o, ovary; od, oviduct; p, penis; s, shell-gland; t, anterior testis; u, uterus; va, vp, vasa deferentia; vs, vesicula seminalis; y, yolk-gland; yd, its duct.
- C. genital sinus and neighbouring parts (from Sommer); a, ventral sucker; b, cirrus sac; c, genital pore; d, evaginated cirrus sac; e, end of vagina; f, vasa deferentia; g, vesicula seminalis; h, ductus ejaculatorius; i, accessory gland.
- D. a flame-cell from the excretory apparatus, highly magnified (from Fraipont).
- E. egg of *Fasciola hepatica*. (from Thomas).

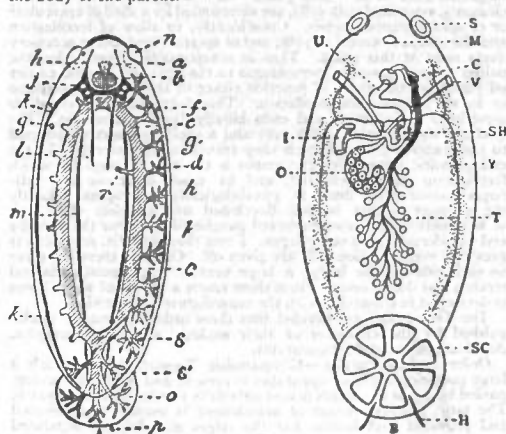

FIG. 3.—Diagrammatic projections to show the relations of the female reproductive ducts; A, in the Malacoctylea; B, in the Heterocotylea. The ovary (a) leads into (bb) the oviduct, which is joined at (g) by the duct of the yolk-glands (h). In B it is also joined by a paired vagina (kk) and by the "vitello-intestinal duct" (Laurer's canal), f. (c) Shell-glands; (d) ootype; (e) uterus; (g) median-vitello-duct; (i, j) intestine.

into a number of independent suckers set on a disc or "cotylophore." Eye-spots are general and the nervous system maintains a primitive diffused condition. The excretory system opens to the exterior by a pair of dorsal pores at the level of the pharynx. The eggs are comparatively few, and development is direct, the embryo after reaching its host remaining attached to it for life.

All the members of this order are parasitic on aquatic vertebrates and in rare cases derive their food from a vertebrate host indirectly by means of another invertebrate parasite (e.g. *Udonella* occurs on parasitic Crustacea). They are transparent leaf-like organisms and may often be found attached to the skin, mouth, nostrils or gills of fish; on the skin and bladder of Amphibia; and on those of certain Reptilia. *Polystomum integerrimum* (fig. 5) occurs commonly in the "bladder" of frogs and toads; *Diplozoon* on the skin of the minnow; *Gyrodactylus* (figs. 5, 6) on the gills of various fresh-water fish; and a large number of genera occur on the skin, cloaca and gills of Elasmobranchs and other marine fish. They ingest the mucus and, to some extent, the blood of their host by the aid of a sucking pharynx through which the food passes into the bifurcated alimentary sac and its branched caeca.

The life-history of this order offers many points of interest. The eggs are stalked and provided with chitinoid often operculate shell. Each shell contains a single ovum and a mass of yolk-cells. In most cases the eggs are attached to the host, but in *Polystomum* the eggs are laid in water. The egg of *Gyrodactylus* develops in the body of the parent.

(From Lankester's *Treatise on Zoology*, pt. IV.)

FIG. 4.—Schematic figures of a Heterocotylean Trematode to illustrate its structure (after Benham).

A, Dorsal view showing the nervous system and digestive system; a, mouth; b, pharynx; c, d, e, gut; f, post-genital union of two limbs of gut; g, excretory pore; h, vaginal pore; i, dorsal nerves; j, k, brain and nerves; l, dorsal nerves; m, ventral nerves; n, adoral sucker; o, posterior sucker; p, hooks on posterior sucker; q, vitello-intestinal duct.

B, Ventral view showing the reproductive system; C, Cirrus; H, hooks on the ventral sucker; I, small piece of the intestine to show its connexion with the reproductive organs by the narrow duct that passes from it to the union of the vagina; M, mouth; O, ovary; S, oral sucker; SC, sucker; SH, shell-gland; T, Testis; U, uterus; V, vaginal pore; Y, yolk-gland.

The further history of the animal is only known in a few cases. *Polystomum* hatches out six weeks after ovi-position as a minute (3 mm. long) larva capable of swimming freely for a short time by the aid of five girdles of ciliated cells. If in the course of the first twenty-four hours this larva meet with a tadpole it attaches itself at once and undergoes further development. If unsuccessful it dies. In the former case the larva creeps along the tadpole until it reaches the branchial opening into which it darts, fixes its sucker, and then throws off its cilia. Its further development takes place partly in the branchial chamber and partly in the bladder, which it reaches by travelling the whole length of the alimentary canal. In the former position the suckers are developed and growth proceeds for 8 to 10 weeks until the metamorphosis of its host. In the bladder it remains for three years before attaining maturity. Sometimes the *Polystomum*-larva attaches itself to a young tadpole, and in that case grows so rapidly as to become mature in five weeks. These *Polystomum* deposit their eggs in the branchial chamber and die at the metamorphosis of their host. They differ structurally

from the normal form in being capable of self-fertilization only, and in the shape and details of their spermatozoa

FIG. 5.

- A, *Diplozoon paradoxum*: two united specimens.
B, *Polystomum integerrimum*. (X about 100; after Zeller.)
C, *Microcotyle mormyri*.
D, E, Two views of the chitinous framework of a sucker of *Axis belones*; highly magnified (after Lorenz).
F, *Aspidogaster conchicola*. (X about 25; after Aubert.)
G, *Gyrodactylus elegans*. (X about 80; after Wagener.)

The life-history of *Diplozoon* (fig. 5) is remarkable in that two larvae (the so-called *Diporpa*) unite and fuse permanently into an X-shaped organism. Unless this occurs, the development of the larvae is soon arrested.

The ciliated stage is only capable of free life for five or six hours, and if at the end of that time it has not encountered and attached itself to a minnow, it dies. If successful, the larva throws off its cilia and develops a dorsal papilla, a median ventral sucker and an additional pair of lateral suckers. Then the *Diporpa* stage is attained. This stage is capable of isolated existence for two or three months but remains immature. Should it, however, encounter another *Diporpa*, the mid-ventral sucker of either is applied to the dorsal papilla of the other, and complete fusion takes place across the junction. The compound organism now develops two sets of inter-connected genitalia and becomes a *Diplozoon*.

Gyrodactylus produces only one large egg at a time and this develops *in situ* into an embryo; but within this embryo another appears before the first leaves the parent. This anomalous phenomenon is still obscure, for we do not yet know whether the second embryo is developed sexually or asexually from the first. Von Linstow has indeed suggested that *Gyrodactylus* is a larval form capable of reproduction by an asexual method.

Order 2. *Aspidocotyles*.—Endoparasitic Trematodes provided with a large ventral sucker which is almost co-extensive with the lower surface of the body and is divided into rectangular compartments. The alimentary sac is simple and devoid of caeca. The development is direct.

(After v. Nordmann. From Cambridge Natural History, vol. II. "Worms, &c." by permission of Macmillan & Co., Ltd.)

FIG. 6.—*Gyrodactylus elegans* from the fins of the Stickleback; emb. embryo.

These Trematodes occur in the alimentary canal and adjacent organs of Mollusca, the gall-bladder of *Chimaera*, and the intestine of *Chelonia* and of certain fish. *Aspidogaster conchicola* is a form not uncommon in *Anodum*, *Unio* and certain fresh-water Gastropods. When young it is found in the intestine, but becomes mature in "Keber's organ" and the pericardium. An allied form (*A. margaritiferae*) occurs in the pericardium of the Ceylon pearl-oyster (9).

After Monicelli. From Lankester's *Treatise on Zoology*, part iv.
FIG. 7.—*Aspidogaster conchicola*; ventral aspect; a, post-oral one at the other, thus resembling the members of the next order. Subsequently the body grows backwards and the ventral sucker comes to occupy a relatively more anterior position. Concomitantly its cavity is sub-divided by transverse ridges into a single row and later on into paired rows of compartments. A curious form (*Stichocotyle*) described in an immature condition by Cunningham from the lobster and Norway lobster probably belongs to this order.

Order 3. *Malacoctylea* (Distomae, Leuck: Digenea v. Ben.). Eudoparastic Trematodes with a variable adhesive apparatus. The oral sucker may alone be present (Monostomidae), more usually a second is developed on the under surface, but may be mid-ventral (Distomidae) or terminal. It is posterior (Amphistomidae), or anterior (Gasterostomidae). In addition to these suckers the sides of the anterior region may become infolded and give rise to an accessory adhesive organ (Holostomidae). In all these families spines and glandular papillae may be super-added. The intestinal sac has become bifid and is usually devoid of branches. The excretory system is highly developed; the larger collecting ducts are elaborately looped and open posteriorly by a single terminal aperture. A canal (Laurer's canal) leads from the oviduct or yolk-duct to the dorsal surface. The development is indirect. From the egg a larva arises. This enters a temporary host. Here it gives rise by a peculiar process to numerous individuals of a second larval form, and these usually produce a third form from which the minute immature Trematode is developed. In this manner a single egg may give rise to a large number of sexual individuals. The larvae usually live in Molluscs, the mature worm in vertebrates, and the immature but metamorphosed Trematode in either host and also in pelagic and littoral marine and fresh-water invertebrates.

The Malacoctylea occur in all classes of vertebrates. They are usually found in the alimentary canal or its appendages but occasionally work their way into the serous cavities, nervous system and blood vessels. Fourteen species belonging to five genera have been found in man, but only one [*Schistosomum* (*Bilharzia*) *haematobium*] is of serious medical importance, the others being rare and occasioned by want of cleanliness and close association with infected domestic animals. Domestic animals suffer periodically to a much greater extent. The liver-fluke (*Distomum hepaticum*) unlike most Trematodes flourishes in a wide range of hosts and infects man, horse, deer, oxen, sheep, pig, rabbit and kangaroo. Sheep, however, suffer most from this parasite and from the allied *D. magnum*. The former fluke is found in Europe, North Africa, Abyssinia, North Asia, South America, Australia and the Hawaiian Islands; the latter in the United States. Wet summers are followed by an acute outbreak of liver-pot amongst sheep and this, together with the effects of other diseases that accompany wet seasons, cause the death of vast numbers of sheep, the numbers from both sources being estimated in bad years at from 1½ to 3 millions in England alone. The anatomy of *Distomum hepaticum* is fully described in many accessible memoirs [Sommer (10), Marshall and Hurst, Braun (3)]. It has been shown that this parasite feeds upon the blood, not the bile of its host, though it occurs mainly in the bile ducts.

The life-histories of the Malacoctylea form the most interesting feature of the order. The majority of species are hermaphrodite and many are capable of self-impregnation. In these, the male organs ripen before the ova and spermatozoa may pass into the uterus before the external pore is formed (Looss). A few species, however, are bisexual, e.g. *Schistosomum* (*Bilharzia*) *haematobium* in which the male is larger than the female and encloses the latter in a ventral canal; *Koellikeria filicollis* Rud (*Distomum okentii*, Köll) which also occurs in pairs, a large female and a small male being found together encysted in the branchial chamber of *Brama raji*:

and *Didymozoon thynni* (*Monostomum bipartitum*) which occurs in pairs fused for the greater part of their length and only free anteriorly; the larger individual is the female.

The egg consists of a fertilized ovum and a mass of yolk-cells. Segmentation takes place during its passage down the uterus. The result of this process is a minute ovoid embryo consisting of a solid mass of cells surrounded by a follicle of flattened yolk-cells. The central mass soon becomes differentiated into an outer epidermal and a dermal layer of flat-cells. Some of the central cells remain in clumps as "germ-balls," others form a mesenchyma in which "flame-cells" arise; others again give rise to muscles; and at the thicker end of the body, rudiments of the brain and digestive system are observable. A pair of "eye-spots" develops immediately over the brain. If the egg with its contained embryo falls into water

(All from Marshall and Hurst, after Thomas.)

FIG. 8.—Five stages in the life-history of *Fasciola hepatica*; all highly magnified.

A, The free-swimming embryo. B, A sporocyst containing young rediae. C, A young redia, the digestive tract shaded. D, An adult redia, containing a daughter-redia, two almost mature cercariae, and germs. E, A free cercaria. The letters have the same significance throughout.
c, Nearly ripe cercariae; cc, cystogenous cells; dr, daughter-redia; dl, limbs of the digestive tract; f, head-papilla; h, eye-spots; h', same degenerating; k, germinal cell; l, cells of the anterior row; m, embryo in optical section, gastrula stage; n, pharynx of redia; o, digestive sac; oe, oesophagus.
p, Lips of redia; q, collar; r, processes serving as rudimentary feet; s, embryos; t, trabecula crossing body-cavity of redia; u, glandular cells; v, birth-opening; w, w', morulae; y, oral sucker; y', ventral sucker; z, pharynx.

with the faeces of the host the larva hatches out and swims freely for a time. In dry localities or in the absence of the intermediate host (usually a mollusc) this larva soon dies. If, however, it encounters the host the larva bores its way in, and attacks the liver, mouth or gonad in which it comes to rest. In all Malacoctylea except the Holostomidae the ensuing change is a degenerative one. The cilia are lost, the eye-spots disappear, the digestive sac vanishes and the larva becomes a sac or "sporocyst" full of germ-cells. The origin of these cells is a moot point. According to some writers (Leuckart) they are derived from undifferentiated blastomeres, other authorities (Thomas, Bichringer, Heckert) trace them to the parietal cells of the larva. These cells aggregated in masses become the bodies of another generation of larvae within the sporocyst. By a series of changes similar to those by which the primary larva arose from a segmented egg, so do these secondary larvae or "rediae" arise from the germ-cells or germ-balls within the sporocyst. The structure of a redia, however, is an advance on that of its parent. Though not possessing eyes or cilia, it has a pharynx and short straight digestive sac; and its mesenchymatous cavities are filled with germ-balls in various stages of development.

The movements and activity of the redia cause it to burst the wall of the sporocyst. It escapes into the adjacent tissue and there gives rise either to one or more generations of rediae or at once to a new type of organism—the cercaria. What determines the origin of the cercaria rather than a new generation of rediae is unknown. It originates from germ-balls by a differentiation similar in general to that already described, though profoundly different in detail. The cercaria is just visible to the naked eye and has an oval or discoidal body and usually a long tail of variable form. The tail may be a simple hollow muscular process or provided with stiff bristles set in transverse rows, or divided into two equally long processes, or finally it may form a large vesicular structure. The body contains in miniature all the organs of the adult fluke, including the gonads and in addition "eye-spots," a stylet, rod-cells and cystogenous cells. The latter structures are only employed for an interval before the final host is entered.

The number of cercariae produced by the pupulating rediae in a single water-snail is immense, and as they are emitted at a given period or a few successive periods, the snail at these times appears enclosed in a cloud of whitish flocculent matter. The cercaria swims freely for a time and either encysts directly on grass or weeds or it enters a second host which may be another mollusc, an insect, crustacean or fish, and then encysts. In this process it is aided by the stylet with which it actively bores its way, throws off its tail

through its larval stages in the water snail *Limnaea truncatula* in Europe; in *L. oahuensis* in the Hawaiian Islands; in *L. viator* in South America and in *L. humilis* in North America; and is eaten by sheep during its encysted stage attached to herbage. *Distomum macrostomum*, which occurs in various birds, produces a very curious sporocyst in the body of the snail *Succinea putris*. This sporocyst assumes a branched structure and penetrates into the tentacles of the snail (fig. 9, c, d). In this situation it becomes much swollen and banded with colours, and produces a large number of ecaudate cercariae. The attention of birds is speedily attracted to the snail by this appearance and by the peculiar movements which the worm executes, and the passage of the parasite into its final host is advantageously effected. In many cases it appears that only the brilliantly coloured tentacle is pecked off by the bird, and as the snail can easily regenerate a new one, this in turn becomes infected by a fresh branch of the sporocyst ramifying through the snail and thus a new supply of larvae is speedily provided (Hecker).

The life-history of *Schistosomum haematobium* is still unknown, but the difficulty in obtaining developmental stages in any of the numerous intermediate hosts that have been tried suggests that the ciliated larvae may develop directly in man and either gain access to him by the use of impure water for drinking or may perforate his skin when bathing. Experiments on monkeys have, however, given negative results.

The life-history of the Holostomidae differs from that of the Distomidae in an important regard. These Trematodes live chiefly in the intestine of aquatic birds or reptiles. The ciliated larva escapes from the egg into the water and enters an intermediate host (leech, mollusc, arthropod, batrachian or fish) where it undergoes a metamorphosis into a second stage in which most of the adult organs are present. In this condition they remain encysted as immature flukes until eaten by their final host.

The cycle of development taken by the Malacoecyotylea has been generally regarded as an alternation of one or more asexual generations with a sexual one. The question, however, is complicated by the uncertain nature of the germ-cells in the sporocysts and rediae. Some authors looking upon these as parthenogenetic ova regard the developmental cycle as one composed of an alternation of parthenogenetic and of sexual generations. Others again consider that the whole cycle is a metamorphosis which, beginning in the Heterocotyloea as a direct development, has become complicated in the Holostomidae by a larval history, and finally in the Malacoecyotylea has acquired additional complexity by the intercalation of two larval forms, and is thus spread over several generations.

W. GA.)

TREMOLITE, a member of the amphibole group of rock-forming minerals (see AMPHIBOLE). It is a calcium and magnesium metasilicate, $\text{CaMg}_2(\text{SiO}_3)_4$, crystallizing in the monoclinic system with an angle of $55^\circ 40'$ between the perfect prismatic cleavages. It occurs sometimes as distinct crystals, but more usually as long bladed and fibrous forms. The colour is white or grey, but when iron is present it is green, then forming a passage to actinolite. The hardness is 5½ and the specific gravity 3.0. Tremolite is a characteristic mineral of crystalline limestones, especially dolomitic limestones, but also occurs as an alteration-product of olivine in basic igneous rocks. Typical specimens have long been known from the white crystalline dolomite of Campolongo in the St Gotthard region, Switzerland, near to which is the Tremola Valley, after which the mineral was named in 1796. Fine crystals are found in crystalline limestone at Gouverneur, Pierrepont and other places in New York, and at several localities in Sweden. (L. J. S.)

TRENCH, RICHARD CHENEVIX (1807-1886), Anglican archbishop and poet, was born at Dublin on the 9th of September 1807. He went to school at Harrow, and graduated at Trinity College, Cambridge, in 1829. In 1830 he visited Spain. While incumbent of Curdridge Chapel near Bishops Waltham in Hampshire, he published (1835) *The Story of Justin Martyr and Other*

FIG. 9.

and then, surrounding itself with the secretion of its cystogenous cells, comes to rest. The further development of the cercaria is dependent on the weed or animal in which it lies being eaten by the final host which is usually a predaceous fish or one of the higher vertebrates. When that occurs, the cyst is dissolved and the minute fluke works its way down the alimentary canal into some part of which it inserts its suckers and commences to feed on the blood of its host. Occasionally the fluke migrates into the blood vessels and may reach the lungs, kidneys, urethra and bladder. In the course of a few months it attains full size and maturity and probably in most cases dies in the course of a year after having given rise to another generation of larvae.

A few special cases of this general description of the life-history may be mentioned. The liver-fluke (*Distomum hepaticum*) passes

Poems, which was favourably received, and was followed in 1838 by *Sabbatien, Honor Neale, and other Poems*, and in 1842 by *Poems from Eastern Sources*. These volumes revealed the author as the most gifted of the immediate disciples of Wordsworth, with a warmer colouring and more pronounced ecclesiastical sympathies than the master, and strong affinities to Tennyson, Keble and Monckton Milnes. In 1841 he resigned his living to become curate to Samuel Wilberforce, then rector of Alverstoke, and upon Wilberforce's promotion to the deanery of Westminster in 1845 he was presented to the rectory of Itchenstone. In 1845 and 1846 he preached the Hulsean lecture, and in the former year was made examining chaplain to Wilberforce, now bishop of Oxford. He was shortly afterwards appointed to a theological chair at King's College, London. In 1851 he established his fame as a philologist by *The Study of Words*, originally delivered as lectures to the pupils of the Diocesan Training School, Winchester. His purpose, as stated by himself, was to show that in words, even taken singly, "there are boundless stores of moral and historic truth, and no less of passion and imagination laid up"—a truth enforced by a number of most apposite illustrations. It was followed by two little volumes of similar character—*English Past and Present* (1855) and *A Select Glossary of English Words* (1859). All have gone through numerous editions and have contributed much to promote the historical study of the English tongue. Another great service to English philology was rendered by his paper, read before the Philological Society, "On some Deficiencies in our English Dictionaries" (1857), which gave the first impulse to the great Oxford *New English Dictionary*. His advocacy of a revised translation of the New Testament (1858) aided to promote another great national undertaking. In 1856 he published a valuable essay on Calderon, with a translation of a portion of *Life is a Dream* in the original metre. In 1841 he had published his *Notes on the Parables*, and in 1846 his *Notes on the Miracles*, popular works which are treasuries of erudite and acute illustration.

In 1856 Trench was raised to the deanery of Westminster, probably the position which suited him best. Here he instituted evening nave services. In January 1864 he was advanced to the more dignified but less congenial post of archbishop of Dublin. A. P. Stanley had been named, but rejected by the Irish Church, and, according to Bishop Wilberforce's correspondence, Trench's appointment was favoured neither by the prime minister nor the lord-lieutenant. It was, moreover, unpopular in Ireland, and a blow to English literature; yet the course of events soon proved it to have been most fortunate. Trench could do nothing to prevent the disestablishment of the Irish Church, though he resisted with dignity. But, when the disestablished communion had to be reconstituted under the greatest difficulties, it was found of the highest importance that the occupant of his position should be a man of a liberal and genial spirit. This was the work of the remainder of Trench's life; it exposed him at times to considerable misconstruction and obloquy, but he came to be appreciated, and, when in November 1884, he resigned his archbishopric from infirmity, clergy and laity unanimously recorded their sense of his "wisdom, learning, diligence, and munificence." He had found time for *Lectures on Medieval Church History* (1878); his poetical works were rearranged and collected in two volumes (last edition, 1885). He died in London, after a lingering illness, on the 28th of March 1886.

See his *Letters and Memorials* (2 vols., 1886).

TRENCHARD, SIR JOHN (1640-1695), English politician, belonged to an old Dorset family, his father being Thomas Trenchard (1615-1671), of Wolverton, and his grandfather Sir Thomas Trenchard (1582-1657), also of Wolverton, who was knighted by James I. in 1613. Born at Lytchett Matravers, near Poole, on the 30th of March 1640, and educated at New College, Oxford, John Trenchard entered parliament as member for Taunton in 1679, and associated himself with those who proposed to exclude the duke of York from the throne. He attended some of the meetings held by these malcontents and was possibly concerned in the Rye House plot; at all events he was arrested in July 1683, but no

definite evidence was brought against him and he was released. When Monmouth landed in the west of England in June 1685 Trenchard fled from England, but was pardoned through the good offices of William Penn and returned home two years later. Again he entered parliament, but he took no active part in the Revolution of 1688, although he managed to secure the good will of William III. He was knighted by the king and made chief justice of Chester, and in 1692 he was appointed a secretary of state. He and the government incurred much ridicule through their failure to prove the existence of a great Jacobite plot in Lancashire and Cheshire in which they had been led to believe. Sir John died on the 27th of April 1695. His wife was Philippa (d. 1743), daughter of George Speke (d. 1690) of White Lackington, Somerset.

Another member of the Trenchard family was the writer, JOHN TRENCHARD (1662-1723), erroneously referred to as Macaulay as a son of Sir John Trenchard. Educated at Trinity College, Dublin, Trenchard inherited considerable wealth and was thus able to devote the greater part of his life to writing on political subjects, his point of view being that of a Whig and an opponent of the High Church party. His chief works are *A Short History of Standing Armies in England* (1698 and 1731) and *The Natural History of Superstition* (1709). With Thomas Gordon (d. 1750) he produced a weekly periodical, *The Independent Whig*, and with the same colleague he wrote a number of letters to the *London Journal* and to the *British Journal* under the pseudonym of Cato. These letters were published in four volumes in 1724 and the collection has often been reprinted. Trenchard died on the 17th of December 1723.

TRENCHER (*M. Eng. trenchon, trenchere, &c.*, O. Fr. *trenchecoir trencher*, a place on which to cut up food, from *trencher*, mod. *trancher*, to cut, probably from Lat. *truncare*, lop, cut off, or from *transcære*, to cut across), a platter, being a flat piece of wood, in its earliest form square, later circular, on which food was carved or cut up and served. These wooden "trenchers" took the place of earlier ones which were thick slices of coarse bread; these, after being soaked with the gravy and juices from the meat and other food were eaten or thrown to the alms basket for the poor. The wooden trencher went out of use on the introduction of pottery and later of porcelain plates. At Winchester College, the old square beechwood trenchers are still in use. The potters of the 18th century made earthenware plates very flat and with a shallow rim; these were known as "trencher plates." "Trencher salt-cellars" were the small salts placed near each person for use, as opposed to the ornamental "standing" salts.

For "trench," a ditch, and "entrenchment," see FORTIFICATION AND SIEGE-CRAFT.

TRENCK, FRANZ, FREIHERR VON DER (1711-1749), Austrian soldier, was born on the 1st of January 1711, of a military family. Educated by the Jesuits at Oedenburg, he entered the Imperial army in 1728 but resigned in disgrace three years later. He then married and lived on his estates for some years. Upon the death of his wife in 1737 he offered to raise an irregular corps of "Pandours" for service against the Turks, but this offer was refused and he then entered the Russian army. But after serving against the Turks for a short time as captain and major of cavalry he was accused of bad conduct, brutality and disobedience and condemned to death, the sentence being commuted by Field Marschal Münnich to degradation and imprisonment. After a time he returned to Austria, where his father was governor of a small fortress, but there too he came into conflict with every one and actually "took sanctuary" in a convent in Vienna. But Prince Charles of Lorraine, interesting himself in this strange man, obtained for him an amnesty and a commission in a corps of irregulars. In this command, besides his usual truculence and robber manners, he displayed conspicuous personal bravery, and in spite of the general dislike into which his vices brought him his services were so valuable that he was promoted lieutenant-colonel (1743) and colonel (1744). But at the battle of Soor he and his irregulars plundered when they should have been fighting and Trenck was accused (probably falsely) of having allowed the king of Prussia himself to escape. After a time he

was brought before a court-martial in Vienna, which convicted him of having sold and withdrawn commissions to his officers without the queen's leave, punished his men without heed to the military code, and drawn pay and allowance for fictitious men. Munch was allowed to an irregular officer in all these respects, but Trenck had far outrun the admitted limits, and above all his brutalities and robberies had made him detested throughout Austria and Silesia. A death sentence followed, but the composition of the court-martial and its proceedings were thought to have been such as from the first forbade a fair trial, and the sentence was commuted by the queen into one of cashiering and imprisonment. The rest of his life was spent in mild captivity in the fortress of Spielberg, where he died on the 4th of October 1749.

His cousin, FRIEDRICH, FREIHERR VON DER TRENCK (1726-1794), the writer of the celebrated autobiography, was born on the 16th of February 1726 at Königsberg, his father being a Prussian general. After distinguishing himself for his quickness and imagination at the university of Königsberg, he entered the Prussian army in 1742, and soon became an orderly officer on Frederick's own staff. But within a year he fell into disgrace because of a love affair—whether real or imaginary—with the king's sister Princess Amalie, and when in 1743 his Austrian cousin presented him with a horse and opened a correspondence, Frederick had him arrested, a few days after the battle of Soor, and confined in the fortress of Glatz, whence in 1746 he escaped. Making his way home and thence to Vienna, in the vain hope of finding employment under his now disgraced cousin, he finally met a Russian general, who took him into the Russian service. But, receiving news that owing to his cousin's death he had become the owner of the family estates, he returned to Germany almost immediately. He was made a captain of Austrian cavalry, but never served, as his time was fully taken up with litigation connected with the inherited estates. In 1754 he visited Prussia, but was there arrested and confined in Magdeburg for ten years, making frequent attempts, of incredible audacity, to escape from the harshness of his gaolers. But after the close of the Seven Years' War, Maria Theresa requested that he should, as being a captain in her service, be at once released. Trenck then spent some years in Aix-la-Chapelle, managing an agency for Hungarian wines and publishing a newspaper, and on the failure of these enterprises he returned to his Hungarian estates. Here he composed his celebrated autobiography and many other writings. He visited England and France in 1774-1777, and was afterwards employed by the government in diplomatic or secret service missions. After the death of Frederick the Great he was allowed to enter Prussia, and stayed in Berlin for two years. In 1788 he visited Paris, where he was the hero of society for a moment; next year he returned to Hungary in order to collect his writings in a uniform edition, but in 1791 he returned to Paris to be a spectator of the Revolution, and after living in safety throughout the Terror he was at last denounced as an Austrian spy and guillotined on the 25th of July 1794.

His autobiography, which has been translated into several languages, first appeared in German at Berlin and Vienna (13 vols.) in 1787. Shortly afterwards a French version, by his own hand, was published at Strasburg. His other published works are in eight volumes and appeared shortly after the autobiography at Leipzig. A reprint of the autobiography appeared in 1910 in "Reclam's Universal Series."

See *Wahmann, Leben und Thaten des Frass, Freiherrn von der Trenck und Friedrich Freiherrn von der Trencks Leben, Kerker und Tod* (both published at Leipzig in 1837).

TRENDELENBURG, FRIEDRICH ADOLF (1802-1872), German philosopher and philologist, was born on the 30th of November 1802 at Eutin, near Lübeck. He was educated at the universities of Kiel, Leipzig and Berlin. He became more and more attracted to the study of Plato and Aristotle, and his doctor's dissertation (1826) was an attempt to reach through Aristotle's criticisms a more accurate knowledge of the Platonic philosophy (*Platonis de ideis et numeris doctrina ex Aristotele illustrata*). He declined the offer of a classical chair at Kiel,

and accepted a post as tutor to the son of an intimate friend of Altenstein, the Prussian minister of education. He held this position for seven years (1826-1833), occupying his leisure time with the preparation of a critical edition of Aristotle's *De anima* (1833; 2nd ed. by C. Belger, 1877). In 1833 Altenstein appointed Trendelenburg extraordinary professor in Berlin, and four years later he was advanced to an ordinary professorship. For nearly forty years he proved himself markedly successful as an academical teacher, during the greater part of which time he had to examine in philosophy and pedagogics all candidates for the scholastic profession in Prussia. In 1865 he became involved in an acrimonious controversy on the interpretation of Kant's doctrine of Space with Kuno Fischer, whom he attacked in *Kuno Fischer und sein Kant* (1866), which drew forth the reply *Anti-Trendelenburg* (1870). He died on the 24th of January 1872.

Trendelenburg's philosophizing is conditioned throughout by his loving study of Plato and Aristotle, whom he regards not as opponents but as building jointly on the broad basis of idealism. His own standpoint may almost be called a modern version of Aristotle thus interpreted. While denying the possibility of an absolute method and an absolute philosophy, as contended for by Hegel and others, Trendelenburg was emphatically an idealist in the ancient or Platonic sense; his whole work was devoted to the demonstration of the ideal in the real. But he maintained that the procedure of philosophy must be analytic, rising from the particular facts to the universal in which we find them explained. We divine the system of the whole from the part we know, but the process of reconstruction must remain approximative. Our position forbids the possibility of a final system. Instead, therefore, of constantly beginning afresh in speculation, it should be our duty to attach ourselves to what may be considered the permanent results of historic developments. The classical expression of these results Trendelenburg finds mainly in the Platonic-Aristotelian system. The philosophical question is stated thus: How are thought and being united in knowledge? how does thought get at being? and how does being enter into thought? Proceeding on the principle that like can only be known by like, Trendelenburg next reaches a doctrine peculiar to himself (though based upon Aristotle) which plays a central part in his speculations. Motion is the fundamental fact common to being and thought; the actual motion of the external world has its counterpart in the constructive motion which is involved in every instance of perception or thought. From motion he proceeds to deduce time, space and the categories of mechanics and natural science. These, being thus derived, are at once subjective and objective in their scope. It is true matter can never be completely resolved into motion, but the irreducible remainder may be treated like the *ὑπόκειν* of Aristotle as an abstraction which we asymptotically approach but never reach. The facts of existence, however, are not adequately explained by the mechanical categories. The ultimate interpretation of the universe can only be found in the higher category of End or final cause. Here Trendelenburg finds the dividing line between philosophical systems. On the one side stand those which acknowledge none but efficient causes—which make force prior to thought, and explain the universe, as it were, *a tergo*. This may be called, typically, Democritism. On the other side stands the "organic" or teleological view of the world, which interprets the parts through the idea of the whole, and sees in the efficient causes only the vehicle of ideal ends. This may be called in a wide sense Platonism. Systems like Spinozism, which seem to form a third class, neither sacrificing force to thought nor thought to force, yet by their denial of final causes inevitably fall back into the Democritic or essentially materialistic standpoint, leaving us with the great antagonism of the mechanical and the organic systems of philosophy. The latter view, which receives its first support in the facts of life, or organic nature as such, finds its culmination and ultimate verification in the ethical world, which essentially consists in the realization of ends. Trendelenburg's *Naturrecht* may, therefore, be taken as in a manner the completion of his system, his working out of the ideal as present in the real. The ethical end is taken to be the idea of humanity, not in the abstract as formulated by Kant, but in the context of the state and of history. Law is treated throughout as the vehicle of ethical requirements. In Trendelenburg's treatment of the state, as the ethical organism in which the individual (the potential man) may be said first to emerge into actuality, we may trace his nurture on the best ideas of Hellenic antiquity.

Trendelenburg was also the author of the following: *Elementa logicae Aristotelicae* (1836; 9th ed., 1892; Eng. trans., 1881), a selection of passages from the *Organon* with Latin translation and notes, containing the substance of Aristotle's logical doctrine, supplemented by *Erläuterungen zu den Elementen der Aristotelischen Logik* (1842; 3rd ed. 1876); *Logische Untersuchungen* (1840; 3rd ed. 1870), and *Die logische Frage in Hegels System* (1843), important factors in the reaction against Hegel; *Historische Beiträge zur Philosophie*

(1846-1867), in three volumes, the first of which contains a history of the doctrine of the Categories; *Das Naturrecht auf dem Grunde der Ethik* (1860); *Lücken im Völkerrecht* (1870), a treatise on the defects of international law, occasioned by the war of 1870. A number of his papers dealing with non-philosophical, chiefly national and educational subjects, are collected in his *Kleine Schriften* (1871). On Trendelenburg's life and work see H. Bonitz, *Zur Erinnerung an F. A. T.* (Berlin, 1872); P. Kleinert, *Grabrede* (Berlin, 1872); E. Bratuschek, *Adolf Trendelenburg* (Berlin, 1873); C. von Frantl, *Gedächtnissrede* (Munich, 1873); G. S. Morris in the *New Engländer* (1874), xxxiii.

TRENT (Lat. *Tridentum*; Ital. *Trento*; Ger. *Trient*), the capital of the south or Italian-speaking portion of the Austrian province of Tirol. It stands on the left bank of the Adige where this river is joined by the Fersina, and is a station on the Brenner railway, 35 m. S. of Botzen and 56½ m. N. of Verona. It has a very picturesque appearance, especially when approached from the north, with its embattled walls and towers filling the whole breadth of the valley. A conspicuous feature in the view is the isolated rocky citadel of Doss Trento (the Roman *Verruca*), that rises on the right bank of the Adige to a height of 308 ft. above the city and is now very strongly fortified, as are various other positions near Trent giving access to Trent from the east (Val Sugana) or the west (valley of the Sarca). With its numerous palaces, substantial houses, broad streets, and spacious squares, Trent presents the aspect of a thoroughly Italian city, and its inhabitants (24,868 in 1900, including a garrison of over 2000 men) speak Italian only—it is the centre of the region called *Italia Irredenta* by fervent Italian patriots. The Duomo or cathedral church (dedicated to San Vigilio, the first bishop) was built in four instalments between the 11th and 15th centuries, and was restored in 1887-1889. More interesting historically is the church of Santa Maria Maggiore, built in 1514-1539, and the scene of the sessions of the famous Ecumenical Council (as to which, see below) which lasted, with several breaks, from 1545 to 1563; near it, in the open, a column was erected in 1845, on the occasion of the three hundredth anniversary of the opening of the Council. To the east of the city rises the Castello del Buon Consiglio, for centuries the residence of the prince-bishops, but now used as barracks. There is a huge town hall, which also houses the museum and the very extensive town library. Trent lives rather on its historical souvenirs than on its industries, which are not very extensive, viticulture, silk-spinning and the preparation of salami (a strongly spiced kind of Italian sausage) being the chief. Ecclesiastically Trent is a suffragan see of the archbishopric of Salzburg. Opposite the railway station a statue of Dante was erected in 1896, for he is believed to have visited this region about 1304.

Trent was originally the capital of the Tridentini, and is mentioned in the *Antonine Itinerary* as a station on the great road from Verona to Veldidena (Innsbruck) over the Brenner. It was later ruled by the Ostrogoths (5th century) and the Lombards (6th century) after the conquest of whom by the Franks (774) Trent became part of the kingdom of Italy. But in 1027 the emperor Conrad II. bestowed all temporal rights in the region on the bishop (the see dates from the 4th century) and transferred it to Germany, an event which fixed all its later history. The Venetian attacks were finally repulsed in 1487, and the bishop retained his temporal powers till 1803 when they passed to Austria, to which (save 1805-1814, when first the Bavarians and then Napoleon held the region) they have ever since belonged, the Trentino being annexed formally to Tirol in 1814. (W. A. B. C.)

TRENT, COUNCIL OF. The Council of Trent (1545-1563) has a long antecedent history of great significance for the fortunes of the Catholic Church. During the 15th and the earlier half of the 16th century, the conception of an "ecumenical council" remained an ideal of which the realization was expected to provide a solution for the serious ecclesiastical difficulties which were then prevalent. True, the councils of Constance and Basel had fallen short of the desired goal; but confidence in the unknown quantity persisted and took deeper root as the

popes of the Renaissance showed themselves less and less inclined to undertake the reforms considered necessary in wide circles of the Church. The papacy indeed did not recognize the jurisdiction of the ecumenical council, and in 1459 Pius II. had prohibited any appeal to such a tribunal under penalty of excommunication. This, however, had no effect on public opinion, and the council continued to be invoked as the supreme court of Christianity. So in 1518, for instance, the university of Paris demanded the convocation of a general council, to which it referred its solemn protest against the papal encroachments on the privileges of the French Church. Thus, when Luther took this very step in the same year, and repeated it later, his action was not devoid of precedent. Again in 1529 the evangelical estates of Germany made a formal appeal in the Diet of Speire, and, in the preface to the Augsburg Confession of 1530, requested a "general, unfettered council of Christendom." The same demand was formulated by Charles V. The emperor indeed—though, as a statesman, he had found himself in frequent opposition to the papal policy of his day—had never entertained the slightest doubt as to the truth of Catholic doctrine, and had rendered inestimable services to the Church in the perilous years which followed the emergence of Protestantism. Still he could not blind himself to the fact that ecclesiastical life stood in urgent need of reform; and the only method of effecting an alteration in the existing régime was by means of a council. Consequently he declared himself in favour of convening a general assembly of the church—a project which he pursued with the greatest energy. True, the passive resistance of the Curia was so stubborn that the decisive step was postponed time and again. But the goal was finally attained, and this result was essentially the work of Charles. Actually, the meeting came too late: the Evangelical Church had gathered strength in the interim, and the council failed to exercise the decisive influence anticipated on the relations between Catholicism and Protestantism. In 1536 its convocation seemed imminent. Pope Paul III., who in the conclave had already admitted the necessity of a council, convened it on the 2nd of June 1536, for the 23rd of May 1537, at Mantua. He then altered the date to the 1st of November of the same year. Later it was summoned to meet at Vicenza on the 1st of May 1538, only to be postponed till the Easter of 1539. Finally, he adjourned the execution of the project *sine die*. Charles met this dilatory policy by arranging colloquies between Protestant and Catholic at Worms and Regensburg, the result being that the Curia became afraid that the emperor might take the settlement of the religious question into his own hands. This consideration forced Paul III. to compliance, and fresh writs were issued convoking the council, first for Whitsuntide, 1542, then for the 1st of November of the same year. In consequence, however, of the hostilities between Charles and the French king Francis I., the conference was so scantily attended that it was once more prorogued to the 6th of July 1543, before it had come into active existence. Not till the peace of Crespy, 1544, when the emperor showed some disposition to attempt an accommodation of the ecclesiastical feud in a German Diet, did the pope resolve to translate his numerous promises into deeds. The bull *Laetare Hierusalem* (November 19, 1544) fixed the meeting of the council for the 15th of March 1545, in Trent, and assigned it three tasks: (1) the pacification of the religious dispute by doctrinal decisions, (2) the reform of ecclesiastical abuses, (3) the discussion of a crusade against the infidels. The selection of the town of Trent, the capital of the Italian Tirol, and part of the empire had a two-fold motive: on the one hand it was a token of concession to the emperor, who wished the synod to be held in his dominions; on the other, there was no occasion to fear that an assembly, meeting on the southern border of Germany, would fall under the imperial influence.

The opening of the council was deferred once again. Towards the end of May 1545, twenty bishops were collected at Trent; but there was no sign of action, and the papal legates—Del Monte, Corvinus and Reginald Pole—delayed the inauguration. The cause of this procrastinating policy was that

the emperor and the pope were at cross purposes with regard to the mode of procedure. In the eyes of Paul III. the council was simply the means by which he expected to secure a condemnation of the Protestant heresy, in hopes that he would then be in a position to impose the sentence of the Church upon them by force. For him the question of ecclesiastical reform possessed no interest whatever. In contrast to this, Charles demanded that these very reforms should be given precedence, and the decisions on points of dogma postponed till he should have compelled the Protestants to send representatives to the council. The pope, however, alarmed by the threat of a colloquy in Germany, recognized the inadvisability of his dilatory tactics, and at last ordered the synod to be opened (December 13, 1545).

Since there was no definite method by which the deliberations of ecumenical councils were conducted, special regulations were necessary; and those adopted were of such a nature as to assure the predominance of the Roman chair from the first. As the voting was not to be by nations, as at Constance, but by individuals, the last word remained with the Italians, who were in the majority. In order to enhance this superiority the legates as a rule denied the suffrage to those foreign bishops who desired to be represented by procurators; and a number of Italian prelates were enabled to make their appearance at Trent, thanks to special allowances from the pope. The dispute as to the order of precedence among the subjects for deliberation was settled by a compromise, and the questions of dogma and ecclesiastical abuses were taken simultaneously, the consequence being that in the decisions of the council the doctrinal and reformatory decrees rank side by side. In pursuance of a precedent established by the last Lateran Council, the sessions were divided into two classes: those devoted to discussion (*congregationes generales*), and those in which the results of the discussion were put to the vote and formally enacted (*sessiones publicae*). To ensure a thorough consideration of every proposition, and also to facilitate the exercise of the papal influence on the proceedings, the delegates were split into three groups (*congregationes*), each group debating the same question at the same time. This arrangement, however, only endured till 1546. Since these sections were only brought into conjunction by the legates, and met under their presidency, the pontifical envoys in effect regulated the whole course of the deliberations. They claimed, moreover, the right of determining the proposals submitted, and were throughout in active and constant communication with Rome—a circumstance which provoked the *bon mot* of the French deputy (1563), that when the rivers were flooded and the Roman post delayed the Holy Ghost postponed his descent. These precautions nullified any possible disposition on the part of the council to enter on dangerous paths; and in addition the clause "under reservation of the papal authority" was affixed to all enactments dealing with ecclesiastical irregularities—thus leaving the pope a free hand with regard to the practical execution of any measures proposed. Contrary to the emperor's wish, the council began its labours in the region of dogma by defining the doctrines of the Church with reference to the most important controversial points—a procedure which frustrated all his projects for a reconciliation with the Protestants. On the 8th of April 1546 the doctrine of the Holy Scriptures and tradition (*sessio* iv.) was proclaimed; on the 17th of June 1546, the doctrine of original sin (*sessio* v.); on the 13th of January 1547, the doctrine of justification (*sessio* vi.); and on the 3rd of March 1547, the decree concerning the sacraments in general, and baptism and confirmation in particular (*sessio* vii.). On the 11th of March, however, the council was transferred to Bologna on the pretext that an epidemic was raging in Trent (*sessio* viii.), though, at the imperial command, part of the bishops remained behind. But on the 2nd of June the council of Bologna resolved (*sessio* x.) to adjourn its labours. The emperor's demands that the council should again be removed to Trent were vain, till on the 24th of April 1547, the battle of Mühlberg decided the struggle with the Schmalkaldic league, formed by the Evangelical princes of Germany.

were now free, and he utilized his military successes to balance his account with the Church. At the Diet of Augsburg he secured the enactment of a *modus vivendi*, leavened by the Catholic spirit, between the adherents of either religion; and this provisory settlement—the so-called *Interim* of Augsburg—was promulgated as a law of the empire (June 3, 1548), and declared binding till the council should reassemble. The Protestants, it is true, received certain concessions—the non-celibacy of the priesthood and the lay chalice—but the Roman hierarchy, the old ceremonial, the feast-days and the fasts, were reinstated. Since the bishops who had remained in Trent abstained, at the emperor's request, from any display of activity *qua* synod, the outbreak of a schism was avoided. But the confusion of ecclesiastical affairs had grown worse confounded through the refusal of the pope to continue the council, when the death of Paul III. (November 10, 1549) gave a new turn to events.

Pope Julius III., the former legate Del Monte, could not elude the necessity of convening the council again, and, though personally he took no greater interest in the scheme than his predecessor in office, caused it to resume its labours on the 1st of May 1551 (*sessio* xi.), under the presidency of the legate, Cardinal Crescenzio. The personnel of the synod was, for the most part, different; and the new members included the Jesuits, Laynez and Salmeron. More than this, the general character of the second period of the council was markedly distinct from that of its earlier stages. The French clergy had not a single delegate, while the Spanish bishops maintained an independent attitude under the aegis of the emperor, and Protestant deputies were on this occasion required to appear at Trent. The German Protestants who, in the first phase of the council, had held aloof from its proceedings, since to have sent representatives to this assemblage would have served no good purpose, had now no choice but to obey the imperial will. Charles V. was anxious to assure them not merely of a safe conduct, but also of a certain hearing. But in this he ran counter to the established facts: the Catholic Church had already defined its attitude to the dogmas above mentioned, and the Curia showed no inclination to question these results by reopening the debate. Thus the participation of the Protestants was essentially superfluous, for the object they had at heart—the discussion of these doctrines on the ground of Holy Writ—was from the Catholic standpoint an impossible aspiration. The Württemberg deputies had already submitted a creed, composed by the Swabian reformer Johann Brenz, to the council, and Melancthon was under way with a *confessio saxonica*, when there came the revolt of the Elector Maurice of Saxony (March 20, 1552), which compelled the emperor to a speedy flight from Innsbruck, and dissolved the conclave. Its dogmatic labours were confined to doctrinal decrees on the Lord's Supper (*sessio* xiii. October 11, 1552), and on the sacraments of penance and extreme unction (November 25, 1552, *sessio* xiv.). On the 28th of April 1552, the sittings were suspended on the news of the elector's approach.

Ten years had elapsed before the council reassembled for the third time in Trent; and on this occasion the circumstances were totally changed. During the intervening period, the religious problem in Germany had received such a solution as the times admitted by the peace of Augsburg (1555); and the equality there guaranteed between the Protestant estates and the Catholic estates had left the former nothing to hope from a council. Thus the motive which till then had governed the emperor's policy was now nullified, as there was no necessity for seeking a reconciliation of the two parties by means of a conference. The incitement to continue the council came from another quarter. It was no longer anxiety with regard to Protestantism that exercised the pressure, but a growing conviction of the imperative need of more stringent reforms within the Catholic Church itself. Pope Paul IV. (1555-1559), the protector of the Inquisition, and the opponent of Philip II. of Spain as well as of the emperor Ferdinand, turned a deaf ear to all requests for a revival of the synod. The regime of Pius IV. (1559-1566) was signalized by an absolute reversal of the papal policy: and it was high time. For in France and Spain—

the very countries where the Protestant heresy had been most vigorously combated—a great mass of discontent had accumulated; and France already showed a strong inclination to attempt an independent settlement of her ecclesiastical difficulties in a national council. Pius IV. saw himself constrained to take these circumstances into account. On the 29th of November 1560 he announced the convocation of the council; and on the 18th of January 1562 it was actually reopened (*sessio xvii.*). The presidency was entrusted to Cardinal Gonzaga, assisted by Cardinals Hosius, bishop of Ermeland, Seripando, Simonetta, and Marc de Akemps, bishop of Constance. The Protestants indeed were also invited but the Evangelical princes, assembled in Naumburg, withheld their assent—a result which was only to be expected. In order to enhance the synod's freedom of action, France and the emperor Ferdinand required that it should rank as a new council, and were able to adduce in support of their claim the fact that the resolutions of the two former periods had not yet been formally recognized. Pius IV., however, designated it a continuation of the earlier meetings. Ferdinand, in addition to regulations for the amendment of the clergy and the monastic system, demanded above all the legalization of the marriage of the priesthood and the concession of the "lay chalice," as he feared further defections to Protestantism. France and Spain laid stress on the recognition of the divine right of the episcopate, and its independence with regard to the pope. These episcopal tendencies were backed by a request that the bishops should reside in their sees—a position which Pius IV. acknowledged to be *de iure divino*; though, as it would have implied the annihilation of the Roman Curia, he refused to declare it as such. In consequence of these reformatory aspirations, the position of the pope and the council was for a while full of peril. But the papal diplomacy was quite competent to shatter an opposition which at no time presented an absolutely unbroken front, and by concessions, threats and the utilization of political and politico-ecclesiastical dissensions, to break the force of the attack. In the third period of the council, which, as a result of these feuds, witnessed no session from September 1562 to July 1563, doctrinal resolutions were also passed concerning the Lord's Supper *sub utraque specie* (*sessio xxi.*, July 16, 1562), the sacrifice of the Mass (*sessio xxiii.*, September 27, 1562), the sacrament of ordination (*sessio xxiii.*, July 15, 1563), the sacrament of marriage (*sessio xxiv.*, November 11, 1563), and Purgatory, the worship of saints, relics and images (December 3, 1563). On the 4th of December 1563 the synod closed.

The dogmatic decisions of the Council of Trent make no attempt at embracing the whole doctrinal system of the Roman Catholic Church, but present a selection of the most vital doctrines, partly chosen as a counterblast to Protestantism, and formulated throughout with a view to that creed and its objections. From the discussions of the council it is evident that pronounced differences of opinion existed within it even on most important subjects, and that these differences were not reconciled. Hence came the necessity for reticences, equivocations and temporizing formulæ. Since, moreover, the council issued its pronouncements without any reference to the decisions of earlier councils, and omitted to emphasize its relation to these, it in fact suppressed these earlier decisions, and posed not as continuing, but as superseding them.

The reformatory enactments touch on numerous phases of ecclesiastical life—administration, discipline, appointment to spiritual offices, the marriage law (*decretum de reformatione matrimonii "Tametsi," sessio xxiv.*), the duties of the clergy, and so forth. The resolutions include many that marked an advance; but the opportunity for a comprehensive and thorough reformation of the life of the Church—the necessity of which was recognized in the Catholic Church itself—was not embraced. No alteration of the abuses which obtained in the Curia was effected, and no annulment of the customs, so lucrative to that body and deleterious to others, was attempted. The question of the annates, for instance, was not so much as broached.

The Council of Trent in fact enjoyed only a certain appearance

of independence. For the freedom of speech which had been accorded was exercised under the supervision of papal legates, who maintained a decisive influence over the proceedings and could count on a certain majority in consequence of the overwhelming number of Italians. That the synod figured as the responsible author of its own decrees (*sacra oecumenica et generalis tridentina synodus in spiritu sancto legitime congregata*) proves very little, since the following clause reads *presidentibus apostolicæ sedis legatis*; while the legates and the pope expressly refused to sanction an application of the words of the Council of Constance—*universalem ecclesiam representans*. The whole course of the council was determined by the presupposition that it had no autonomous standing, and that its labours were simply transacted under the commission and guidance of the pope. This was not merely a claim put forward by the Roman see at the time: it was acknowledged by the attitude of the synod throughout. The legates confined the right of discussion to the subjects propounded by the pope, and their position was that he was in no way bound by the vote of the majority. In difficult cases the synod itself left the decision to him, as in the question of clandestine marriages and the administration of the Lord's Supper *sub utraque specie*. Further, at the close of the sessions a resolution was adopted, by the terms of which all the enactments of the council *de morum reformatione atque ecclesiastica disciplina* were subject to the limitation that the papal authority should not be prejudiced thereby (*sessio xv. cap. 21*). Finally, every doubt as to the papal supremacy is removed when we consider that the Tridentine Fathers sought for all their enactments and decisions the ratification (*confirmatio*) of the pope, which was conferred by Pius IV. in the bull *Benedictus Deus* (January 26, 1564). Again, in its last meeting (*sessio xxv.*), the synod transferred to the pope a number of tasks for which their own time had proved inadequate. These comprised the compilation of a catalogue of forbidden books, a catechism, and an edition of the missal and the breviary. Thus the council presented the Holy See with a further opportunity of extending its influence and diffusing its views. The ten rules *de libris prohibitis*, published by Pius IV. in the bull *Dominici gregis custodiæ* (March 24, 1564), became of great importance for the whole spiritual life of the Roman Catholic Church: for they were an attempt to exclude pernicious influences, and, in practice, led to a censorship which has been more potent for evil than good. These regulations were modified by Leo XIII. in his Constitution *Officiorum ac numerum* (January 24, 1897). Acting on a suggestion of the council (*sessio xxiv. c. 2; sessio xv. c. 2*), Pius IV. published a short conspectus of the articles of faith, as determined at Trent, in the bull *Injunctum nobis* (November 13, 1564). This so-called *Professio fidei tridentinæ*, however, goes beyond the doctrinal resolutions of the synod, as it contains a number of clauses dealing with the Church and the position of the pope within the Church—subjects which were deliberately ignored in the discussions at Trent. In 1877 this confession—binding on every Roman Catholic priest—was supplemented by a pronouncement on the dogma of papal infallibility.

The great and increasing need of a manual for the instruction of the people gave rise in the first half of the 16th century to numerous catechisms. At the period of the council, that composed by the Jesuit Peter Canisius, father-confessor of the emperor Ferdinand, enjoyed the widest vogue. It failed, however, to receive the sanction of the synod, which preferred to undertake the task itself; and, as that body left its labours unfinished, the pope was entrusted with the compilation of a textbook. Pius V. appointed a commission (Leonardo Marini, Egidio Foscarari, Francisco Fureiro and Murio Calini) under the presidency of three cardinals, among them Charles Borromeo; and this commission discharged its duties with such rapidity that the *Catechismus a decreto concilii tridentini ad parochos* was published in Rome as early as the year 1568. The book is designed for the use of the cleric, not the layman. The *Missale romanum*, moreover, underwent revision: also the *Breviarium romanum*, the daily devotional work of the Roman priest. The

Burton-upon-Trent, in this part of its course forming the boundary between Staffordshire and Derbyshire. The fall from Burton to the mouth, a distance of 109 m., is 148 ft. The valley opens out as the stream, dividing into several channels at Burton and receiving on the left the Dove, enters Derbyshire. It then separates that county from Leicestershire and Nottinghamshire, receives in quick succession the Derwent (left), Soar (right) and Erewash (left), enters Nottinghamshire, and passes Nottingham, 8½ m. from the mouth. The next important town is Newark, which, however, the main channel of the river passes at a considerable distance to the west; the Devon joins here on the right, and the fall from this point to the mouth, a distance of 57½ m., is only 18 ft. The valley becomes flat, though the river is rather deeply entrenched in some parts. Forming the boundary between Nottingham and Lincolnshire, the Trent passes Gainsborough (26½ m. from the mouth), receives the Idle on the left, and, entering Lincolnshire and skirting the Isle of Axholme, joins the Yorkshire Ouse near Fairfax. The lower part of the valley resembles the Fens in character, and is drained by many artificial channels. The northward turn at Newark is of interest inasmuch as it is considered that the river from this point formerly flowed towards Lincoln, and, following a depression in the escarpment there, passed down the valley at present occupied by the Witham to the Wash. It is suggested that the waters were diverted to the Humber by a stream within that system cutting back southward and tapping the Trent in the vicinity of Newark; and in high flood the Trent has been known to send water across the low parting to the Witham (see Avebury, *Scenery of England*, ch. xi.). The highest tides are felt about 40 m. up river, and the phenomenon of an "eagre" (bore or tidal wave) is seen rising on spring tides to a height of 4 or 5 ft., 15 m. above the mouth of the river.

The Trent is navigable for a distance of 94½ m. from its junction with the Ouse, to a point a short distance above the junction of the Derwent, the Trent Navigation Company having a general control of the navigation down to Gainsborough, the line of which passes through Nottingham by canals. On the river itself there are eight locks. Below Gainsborough the navigation is open, and vessels drawing 9 ft. can reach this point on spring tides. From the Derwent mouth the Trent and Mersey Canal follows the Trent valley upward, and gives connexion with the entire inland navigation system of the midlands and west of England. Short canals give access to Derby and the Erewash valley; the Leicester Navigation, following the Scar, connects with the Grand Junction canal; and the Grantham Canal carries little traffic between that town and Nottingham. The Fosdyke, distinguished as the oldest navigable waterway still in use in England, as it was originally of Roman construction, connects the Trent with Lincoln and the Witham, and lower down the Sheffield and South Yorkshire canal joins the river from the west at Keadby. There is also a canal, little used, to Chesterfield.

TRENTE ET QUARANTE (called also *Rouge et Noir*), a game of French origin played with cards and a special table. It is one of the two games played in the gambling rooms at Monte Carlo, roulette being the other. The diagram illustrates one half of the table, the other half precisely corresponding to it. Two croupiers sit on each side, one of them being the dealer; behind the two on the side opposite to the dealer a supervisor of the game has his seat. Six packs of fifty-two cards each are used; these are well shuffled, and the croupier asks any of the players to cut, handing him a blank card with which to divide the mixed packs. There are only four chances at trente et quarante: *rouge* or *noir*, known as the *grand tableau*; *coulour* or *inverse*, known as the *petit tableau*. At Monte Carlo the stakes are placed on the divisions indicated on the table, the maximum being 12,000 francs and the minimum 20 francs which must be staked in gold. The dealer, who has placed all the cards before him, separates a few with the blank card, takes them in his left hand and invites the players to stake with the formula, "Messieurs, faites votre jeu!" After a pause he exclaims "Le jeu est fait, rien ne va plus!" after which no stake can be made. He then deals the cards in a row until the aggregate stake on the top row is something more than thirty, upon which he deals the lower row, and that which comes nearest to thirty wins, the lower row being always distinguished as *noir*, and the lower

as *rouge*. In announcing the result the word *trente* is always omitted, the dealer merely announcing *un, trois, quatre*, as the case may be, though when forty is turned up it is described as *quarante*. The words *noir* and *inverse* are also never used, the announcement being *rouge gagne* or *rouge perd*, *coulour gagne* or *coulour perd*. Gain or loss over *coulour* and *inverse* depends upon the colour of the first card dealt. If this should be also the colour of the winning row, the player wins. Assuming, for example, that the first card dealt is red, and that the lower row of the cards dealt is nearest to thirty, the dealer will announce "Rouge gagne et le coulour." If the first card dealt is red, but the black or top row of cards is nearest to thirty, the dealer announces "Rouge perd et le coulour."

Diagram of Half of Trente et Quarante Table.
N, Noir. C, Grand tableau.
R, Rouge. J, Inverse.

It frequently happens that both rows of cards when added together give the same number. Should they both, for instance, add up to thirty-three, the dealer will announce "Trois après," and the deal goes for nothing except in the event of their adding up to thirty-one. *Un après* (i.e. thirty-one) is known as a *refait*; the stakes are put in prison to be left for the decision of the next deal, or if the player prefers it he can withdraw half his stake, leaving the other half for the bank. Assurance against a *refait* can be made by paying 1% on the value of the stake with a minimum of five francs. When thus insured against a *refait* the player is at liberty to withdraw his whole stake. It has been calculated that on an average a *refait* occurs once in thirty-eight coups. After each deal the cards are pushed into a metal bowl let into the table in front of the dealer. When he has not enough left to complete the two rows, he remarks "Les cartes passent"; they are taken from the bowl, reshuffled, and another deal begins.

TRENTON, a city and the county-seat of Grundy county, Missouri, U.S.A., on the E. fork of the Grand River, in the north central part of the state, about 100 m. N.E. of Leavenworth. Pop. (1890), 5039; (1900), 5396, including 192 foreign-born and 200 negroes; (1910), 5656. It is served by the Chicago, Rock Island & Pacific (which has repair shops here) and the Quincy, Omaha & Kansas City railways. It has a picturesque situation, and is laid out over a high uneven bluff. The city is a trading centre for a prosperous farming region, and coal is mined in the vicinity. Trenton was platted in 1841, became the county-seat in the same year, and was incorporated as a town in 1857. In 1893 it received a city charter under a general state law. In 1900-1903 it was the seat of Ruskin College, an institution founded by Walter Vrooman (b. 1866), a native of Missouri, and the organizer of the Ruskin Hall Workingmen's College, Oxford, England. The college was removed to Glen Ellyn, Illinois, in 1903 and after 1906 to Ruskin, Florida.

TRENTON, the capital of New Jersey, U.S.A., and the county-seat of Mercer county, on the eastern bank of the Delaware river, about 33 m. N.E. of Philadelphia, and about 59 m. S.W. of New York. Pop. (1890), 57,458; (1900), 73,307, of whom 16,793 were foreign-born (including 4114 Germans, 3621 English, 3292 Irish, and 1494 Hungarians), and 32,879 were of foreign parentage (both parents foreign-born), including 8873 of German parentage, 8324 of Irish parentage, 5513 of English parentage, and 2243 of Hungarian parentage; (1910 census), 96,815. Area, 9 sq. m. Trenton is served by the Pennsylvania (main line and Belvidere division) and the Philadelphia & Reading railway systems, by inter-urban electric railways, and by small freight and passenger steamers on the Delaware river; the Delaware & Raritan Canal connects with

the Raritan river at New Brunswick. Trenton is at the head of navigation on the Delaware river, which falls 8 ft. here. Riverside park extends along its water front for about 3 m., and on the outskirts of the city lies Cadwalader park (100 acres), containing a zoological garden. In the centre of the city, marking the spot where Washington planted his guns at the battle of Trenton, stands the Battle monument, a Roman-Doric column of granite, 150 ft. high, hollow and fluted, its cap forming an observatory, with a statue of Washington by William R. O'Donovan (h. 1844). In Perry Street, mounted on a granite pedestal, is the "Swamp Angel," the great gun used by Federal troops in the marshes near Charleston, South Carolina, during their attack on that city in August 1863. There are many buildings in the city which are rich in historic associations. Chief among these is the barracks, erected by the colony in 1758 to mitigate the evils of billeting, and occupied by British troops during the Seven Years' War, and at different times by British, Hessian and American troops during the War of Independence. Other interesting landmarks are "Woodland" (formerly called "Bloomsbury Court"), built early in the 18th century by William Trent, and said to have sheltered, at various times, Washington, Lafayette and Rochambeau; the "Hermitage," erected some time before the War of Independence; and "Bow Hill," in the suburbs of the city, a quaint old colonial mansion which for some time before 1822 was a home of Joseph Bonaparte. Among the public buildings are the state capitol, the post office building, the county court house, the city hall, the second regiment armoury, public library (containing about 42,000 volumes in 1909), and the building (1910) given by Henry C. Kelsey to the city for the school of industrial arts (founded in 1898). Here also are the state normal and model schools (1855), the state library, housed in the capitol, the state school for deaf mutes, the state home for girls, one of the two state hospitals for the insane (opened in 1848), the state arsenal—the building being the old state prison—the state prison (1836), St Francis hospital (1874), Mercer hospital (1892), the William McKinley memorial hospital (1887), the city hospital, two children's day nurseries, the Friends' home, the Union industrial home (for destitute children), the Florence Crittenton home (1895), the indigent widows' and single women's home (1854), the Har Sinai charity society, the home for friendless children, and the society of St Vincent de Paul. Trenton is the see of Protestant Episcopal and Roman Catholic bishops.

Trenton is an important industrial centre. Its proximity to the coal fields of Pennsylvania and to the great markets of New York and Philadelphia, and its excellent transportation facilities by rail and by water, have promoted the development of its manufactures. The city is the greatest centre for the pottery industry in the United States. In 1905 there were 40 establishments for the manufacture of pottery and terra-cotta, employing 4571 labourers; and their total product was valued at \$5,882,701—or 9.2% of the value of the pottery product of the United States, and 18% of the value of all the city's factory products, in this year. The chief varieties of this ware are vitrified china, belleck china, semi-porcelain, white granite and c. c. ware, vitrified porcelain for electrical supplies, porcelain bath tubs and tiles, and terra-cotta. Clay for the "saggers," or cases in which the wares are fired, is mined in the vicinity, but the raw materials for the fine grades of pottery are obtained elsewhere. Some pottery was made in Trenton by crude and primitive methods near the beginning of the 19th century, but the modern methods were not introduced until 1852, when yellow and Rockingham wares were first made here. In 1859 the manufacture of white granite and cream-coloured ware was successfully established. The fine exhibits from the Trenton potteries at the Centennial Exhibition in Philadelphia in 1876 greatly stimulated the demand for these wares and increased the competition among the manufacturers; and since that date there has been a marked development in both the quantity and the quality of the product. In Trenton, also, are manufactured iron, steel and copper wire, rope, cables

and rods—the John A. Roebling's Sons Company has an immense wire and cable manufactory here—iron and steel bridge building materials and other structural work, plumbers' supplies (manufactured by the J. L. Mott Company), and machinery of almost every character, much of it being exported to foreign countries. Much rubber ware is also manufactured. In 1905 Trenton contained 312 factories, employing 14,252 labourers, and the total value of the factory products was \$32,719,945.

The charter, as amended, provides for a mayor elected for two years and a common council of two members from each ward elected for two years. Other elected officers are: city clerk, comptroller, treasurer, counsel, receiver of taxes, engineer, inspector of buildings, overseer of poor, street commissioner and sealer of weights and measures. The municipality owns the water works and the sewer system; the water supply is obtained from the Delaware and is stored in a reservoir having a capacity of about 110,000,000 gallons.

The settlement of Trenton began in 1680 with the erection by Mahlon Stacy, a Quaker colonist of Burlington, of a mill at the junction of the Assanpink creek¹ with the Delaware river. By 1685 a number of colonists had settled at this point, which became known as "The Falls" on account of the rapids in the Delaware here. In 1714 Stacy sold his plantation at "The Falls" to William Trent (c. 1655-1724), speaker of the New Jersey Assembly (1723) and chief justice of the colony (1723-1724), in whose honour the place came to be called Trent-town or Trenton. In 1745 Trenton received a royal charter incorporating it as a borough, but in 1750 the inhabitants voluntarily surrendered this privilege, deeming it "very prejudicial to the interest and trade" of the community. In 1783 the New Jersey delegates in Congress proposed that Trenton be made the seat of the general government, but as this measure was opposed by the Southern delegates, it was agreed that Congress, pending a final decision, should sit alternately at Annapolis and Trenton. Congress accordingly met in Trenton in November 1784, but soon afterwards removed to New York, where better accommodation could be obtained. Trenton became the capital of the state in 1790, was chartered as a city in 1792, and received new charters in 1837, 1866, and 1874. The borough of South Trenton was annexed in 1850; the borough of Chambersburg and the township of Millham in 1888; the borough of Wilbur in 1898; and parts of the townships of Ewing and Hamilton in 1900.

See *The City of Trenton, N.J., a Bibliography* (1909), prepared by the Trenton Free Library; John O. Raum, *History of the City of Trenton* (Trenton, 1871); George A. Wolf, *Industrial Trenton* (Wilmington, Del., 1900); F. B. Lee, *History of Trenton* (Trenton, 1895).

TRENTON AND PRINCETON, BATTLES OF (1776-1777).

These battles in the War of American Independence are noted as the first successes won by Washington in the open field. Following close upon a series of defeats, their effect upon his troops and the population at large was marked. After the capture of Fort Mifflin on Manhattan Island, on the 16th of November 1776, the British general, Sir William Howe, forced the Americans to retreat through New Jersey and across the Delaware into Pennsylvania. Howe then went into winter quarters, leaving the Hessian general, Rahl, at Trenton on the river with a brigade of 1200 men. Although Washington's army had dwindled to a mere handful and was discouraged by the year's disasters, it could still be trusted for a promising exploit. Ascertaining that the Hessians at Trenton were practically unsupported, the American general determined to attempt their capture. On the night of the 25th of December 1776 he recrossed the Delaware through floating ice to a point 9 m. above the enemy, whom he expected to reach at dawn of the following day, the 26th. Dividing his force of 2200 men

¹ The name Assanpink is a corruption of an Indian word to mean "place of stone implements." In the neighbourhood near Trenton many stone implements of the Indians and of extinct animals have been discovered. See *AMERICAN ANTIQUARIAN*, vol. 1, p. 100.

into two divisions under Generals Sullivan and Greene, he approached the town by two roads, surprised the Hessian outposts, and then rushed upon the main body before it could form effectively. The charge of the American troops and the fire of their artillery and musketry completely disconcerted the enemy. All avenues of retreat being closed and their general mortally wounded, the latter to the number of 950 quickly surrendered and were marched back into Pennsylvania on the same day. The American loss was five or six wounded.

Elated by this success and eager to beat up the enemy's advanced posts at other points, Washington again crossed the Delaware on the 30th of December and occupied Trenton. Hearing of this move Lord Cornwallis at Princeton, 10 m. north of Trenton, marched down with about 7000 troops upon the Americans on the 2nd of January 1777, and drove them across the Assanpink, a stream running east of the town. The Americans, who encamped on its banks that night, were placed in a precarious position, as the Delaware, with no boats at their disposal at that point, prevented their recrossing into Pennsylvania, and all other roads led towards the British lines to the northward. Washington accordingly undertook a bold manoeuvre. Fearing an attack by Cornwallis on the next morning, he held a council of war, which confirmed his plan of quietly breaking camp that night and taking a by-road to Princeton, then cutting through any resistance that might be offered there and pushing on to the hills of northern New Jersey, thus placing his army on the flank of the British posts. His tactics succeeded. At Princeton (q.v.) he came upon three British regiments which for a time held him at bay. The 17th foot especially, under Colonel Mawhood, twice routed the American advanced troops, inflicting severe loss, but were eventually driven back toward Trenton. The other regiments retreated north toward New Brunswick, and Washington continued his march to Morristown, New Jersey. He had broken through Howe's lines and placed himself in an advantageous position for recruiting his army and maintaining a strong defensive in the next campaign. These two affairs of Trenton and Princeton put new life into the American cause, and established Washington in the confidence of his troops and the country at large.

See W. S. Stryker, *The Battles of Trenton and Princeton* (Boston, 1892).

TREPIDATION (from Lat. *trepidare*, to tremble), a term meaning, in general, fear or trembling, but used technically in astronomy for an imagined slow oscillation of the ecliptic, having a period of 7000 years, introduced by the Arabian astronomers to explain a supposed variation in the precession of the equinoxes. It figured in astronomical tables until the time of Copernicus, but is now known to have no foundation in fact, being based on an error in Ptolemy's determination of precession.

TRESCOT, WILLIAM HENRY (1822-1898), American diplomatist, was born in Charleston, South Carolina, on the 10th of November 1822. He graduated at Charleston College in 1840, studied law at Harvard, and was admitted to the bar in 1843. In 1852-1854 he was secretary of the U.S. legation in London. In June 1860 he was appointed assistant secretary of state, and he was acting secretary of state in June-October, during General Lewis Cass's absence from Washington, and for a few days in December after Cass's resignation. His position was important, as the only South Carolinian holding anything like official rank, because of his intimacy with President Buchanan, and his close relations with the secession leaders in South Carolina. He opposed the re-enforcement of Fort Sumter, used his influence to prevent the attack on the fort by South Carolina troops, and presided at the convention called to vote on the secession of South Carolina. He became the special envoy to Great Britain after the resignation of Cass. He was a member of the American Academy of Arts and Letters, and was elected to the American Academy of Arts and Letters in 1887. He was a member of the American Academy of Arts and Letters, and was elected to the American Academy of Arts and Letters in 1887. He was a member of the American Academy of Arts and Letters, and was elected to the American Academy of Arts and Letters in 1887.

tion from the state department in December. He returned to Charleston in February 1861; was a member of the state legislature in 1862-1866, and served as colonel on the staff of General Roswell S. Ripley during the Civil War; and later returned to Washington. He was counsel for the United States before the Halifax Fishery Commission in 1877; was commissioner for the revision of the treaty with China in 1880; was minister to Chile in 1881-1882; in 1882 with General U.S. Grant negotiated a commercial treaty with Mexico; and in 1889-1890 was a delegate to the Pan-American Congress in Washington. He died at Pendleton, South Carolina, his country place, on the 4th of May 1898.

His writings include *The Diplomacy of the Revolution* (1852), *An American View of the Eastern Question* (1854) and *The Diplomatic History of the Administrations of Washington and Adams* (1857).

TRESHAM, FRANCIS (c. 1567-1605), English Gunpowder Plot conspirator, eldest son of Sir Thomas Tresham of Rushton, Northamptonshire (a descendant of Sir Thomas Tresham, Speaker of the House of Commons, executed by Edward IV. in 1471), and of Muriel, daughter of Sir Thomas Throckmorton of Coughton, was born about 1567, and educated at Oxford. He was, like his father, a Roman Catholic, and his family had already suffered for their religion and politics. He is described as "a wild and unstayed man," was connected intimately with many of those afterwards known as the Gunpowder Plot conspirators, being cousin to Catesby and to the two Winters, and was implicated in a series of seditious intrigues in Elizabeth's reign. In 1596 he was arrested on suspicion together with Catesby and the two Wrights during an illness of Queen Elizabeth. In 1601 he took part in Essex's rebellion and was one of those who confined the Lord Keeper Egerton in Essex House on the 8th of February. He was imprisoned and only suffered to go free on condition of a fine of 3000 marks paid by his father. He was one of the promoters of the mission of Thomas Winter in 1602 to Madrid to persuade the king of Spain to invade England. On the death of Elizabeth, however, he, with several other Roman Catholics, joined Southampton in securing the Tower for James I.

Tresham was the last of the conspirators to be initiated into the Gunpowder Plot. According to his own account, which receives general support from Thomas Winter's confession, it was revealed to him on the 14th of October 1605. Inferior in zeal and character to the rest of the conspirators, he had lately by the death of his father, on the 11th of September 1605, inherited a large property and it was probably his financial support that was now sought. But Tresham, as the possessor of an estate, was probably less inclined than before to embark on rash and hazardous schemes. Moreover, he had two brothers-in-law, Lords Stourton and Monteaigle, among the peers destined for assassination. He expressed his dislike of the plan from the first, and, according to his own account, he endeavoured to dissuade Catesby from the whole project, urging that the Romanist cause would derive no benefit, even in case of success, from the attempt. His representations were in vain and he consented to supply money, but afterwards discovered that no warning was to be given to the Roman Catholic peers. All the evidence now points to Tresham as the betrayer of the plot, and it is known that he was in London within 24 hours of the despatch of the famous letter to Lord Monteaigle which revealed the plot (see GUNPOWDER PLOT). In all probability he had betrayed the secret to Monteaigle previously, and the method of discovery had been settled between them, for it bears the marks of a prearranged affair, and the whole plan was admirably conceived so as to save Monteaigle's life and inform the government, at the same time allowing the conspirators, by timely warning, opportunity to escape (see MONTEAGLE, WILLIAM PARKER, 4th baron). Tresham avoided meeting any of the conspirators as he had agreed to do at Barnet, on the 29th of October, but on the 31st he was visited by Winter in London, and summoned to Barnet on the following day. There he met Catesby and Winter, who were prepared to stab him for his betrayal, but were dissuaded by his protestations that he knew

nothing of the letter. His entreaties that they would give up the whole project and escape to Flanders were unavailing. After the arrest of Fawkes on the night of the 4th Tresham did not fly with the rest of the conspirators, but remained at court and offered his services for apprehending them. For some days he was not suspected, but he was arrested on the 12th. On the 13th he confessed his share in the plot, and on the 20th his participation and that of Father Garnet in the mission to Spain. Shortly afterwards he fell ill with a complaint from which he had long suffered. On the 5th of December a copy of the *Treatise of Equivocation*, in which the Jesuit doctrine on that subject was treated, was found amongst his papers by Sir Edward Coke (see GARNET, HENRY). From the lessons learnt here he had evidently profited. On the 9th of December he declared he knew nothing about the book, and shortly before his death, with the desire of saving his friend, he withdrew his statement concerning Garnet's complicity in the Spanish negotiations, and denied that he had seen him or communicated with him for 16 years. His death took place on the 22nd. His last transparent falsehoods had removed any thoughts of leniency in the government. He was now classed with the other conspirators, and though he had never been convicted of any crime or received sentence, his corpse was decapitated and he was attainted by act of parliament. Tresham had married Anne, daughter of Sir John Tufton of Holtfield in Kent, by whom he had two daughters. His estates passed, notwithstanding the attainder, to his brother, afterwards Sir Lewis Tresham, Bart.

TRESPASS (O. Fr. *trespas*, a crime, properly a stepping across, from Lat. *trans*, across, and *passus*, step, cf. "transgression," from *transgredi*, to step across), in law, any transgression of the law less than treason, felony or misprision of either. The term includes a great variety of torts committed to land, goods or person, distinguished generally by names drawn from the writs once used as appropriate to the particular transgression, such as *vi et armis*, *quare clausum fregit de bonis asportatis*, *de uxore abducta cum bonis viri*, *quare filium et heredem rapuit*, &c. Up to 1694 the trespasser was regarded, nominally at any rate, as a criminal, and was liable to a fine for the breach of the peace, commuted for a small sum of money, for which 5 Will. and Mar. c. 12 (1693) substituted a fee of 6s. 8d. recoverable as costs against the defendant. Trespass is not now criminal except by special statutory enactment, e.g. the old statutes against forcible entry, the game acts, and the private acts of many railway companies. When, however, trespass is carried sufficiently far it may become criminal, and be prosecuted as assault if to the person, as nuisance if to the land. At one time an important distinction was drawn between trespass general and trespass special or trespass on the case, for which see TORT. The difference between trespass and case was sometimes a very narrow one: the general rule was that where the injury was directly caused by the act of the defendant the proper remedy was trespass, where indirectly case. The difference is illustrated by the action for false imprisonment: if the defendant himself imprisoned the plaintiff the action was trespass; if a third person did so on the information of the defendant it was case. A close parallel is found in Roman law in the *actio directa* under the *lex Aquilia* for injury caused directly, the *actio utilis* for that caused indirectly. One of the reasons for the rapid extension of the action on the case, especially that form of it called *assumpsit*, was no doubt the fact that in the action on the case the defendant was not allowed to wage his law (see WAGER).

In its more restricted sense trespass is generally used for entry on land without lawful authority by either a man, his servants or his cattle. To maintain an action for such trespass the plaintiff must have possession of the premises. The quantum of possession necessary to enable him to bring the action is often a question difficult to decide. In most instances the tenant can bring trespass, the reversioner only case. Remedies for trespass are either judicial or extra-judicial. The most minute invasion of private right is trespass, though the damages

may be nominal if the injury was trivial. On the other hand, they may be exemplary if circumstances of aggravation were present. Pleading in the old action of trespass was of a very technical nature, but the old-fashioned terms *actio enormis*, *replicatio de injuria*, new assignment, &c., once of such frequent occurrence in the reports, are of merely historical interest since the introduction of a simpler system of pleading, unless in those American states where the old pleading has not been reformed. The venue in trespass was formerly local, in case transitory. In addition to damages for trespass, an injunction may be granted by the court. The principal instances of extra-judicial remedies are distress damage feasant of cattle trespassing, and removal of a trespasser without unnecessary violence, expressed in the terms of Latin pleading by *mollior manus imposuit*.

Trespass may be justified by exercise of a legal right, as to serve the process of the law, or by invitation or license of the owner, or may be excused by accident or inevitable necessity, as deviation from a highway out of repair. Where a man abuses an authority given by the law, his wrongful act relates back to his entry, and he becomes a trespasser *ab initio*, that is, liable to be treated as a trespasser for the whole time of his being on the land. Mere breach of contract, such as refusal to pay for wine in a tavern which a person has lawfully entered, does not constitute him a trespasser *ab initio*. A trespass of a permanent nature is called a continuing trespass; such would be the permitting of one's cattle to feed on another's land without authority.

In Scots law trespass is used only for torts to land. By the Trespass (Scotland) Act 1865 trespassers are liable on summary conviction to fine and imprisonment for encamping, lighting fires, &c., on land without the consent and permission of the owner.

TRES TABERNÆ (Three Taverns), an ancient village of Latium, Italy, a post station on the Via Appia, at the point where the main road was crossed by a branch from Antium. It is by some fixed some 3 m. S.E. of the modern village of Cisterna just before the Via Appia enters the Pontine marshes, at a point where the modern road to Ninfa and Norba diverges to the north-east, where a few ruins still exist (Grotte di Nottola), 33 m. from Rome. It is, however, more probable that it stood at Cisterna itself, where a branch road running from Antium by way of Satricum actually joins the Via Appia. Ulubrae, mentioned as a typical desert village by Roman writers, lay in the plain between Cisterna and Sermoneta. Tres Tabernæ is best known as the point to which St Paul's friends came to meet him on his journey to Rome (Acts xxviii. 15). It became an episcopal see, but this was united with that of Velettri in 502 owing to the desertion of the place.

The name occurs twice in other parts of Italy as the name of post stations.

TRESVIRI, or **TRIVIRI**, in Roman antiquities, a board of three, either ordinary magistrates or extraordinary commissioners.

1. *Tresviri capitales*, whose duty it was to assist the higher officials in their judicial functions, especially criminal, were first appointed about 280 B.C., unless they are to be identified with the *tresviri nocturni* (Livy ix. 40, 3), who were in existence in 304. They possessed no criminal jurisdiction or *ius prænominis* (right of arrest) in their own right, but acted as the representatives of others. They kept watch over prisoners and carried out the death sentence (e.g. the Catilinarian conspirators were strangled by them in the *Carcer Tullianum*); took accused or suspected persons into custody; and exercised general control over the city police. They went the rounds by night to maintain order, and had to be present at outbreaks of fire. Amongst other things they assisted the aediles in burning forbidden books. It is possible that they were entrusted by the praetor with the settlement of certain civil processes of a semi-criminal nature, in which private citizens acted as prosecutors (see G. Götz in *Rheinisches Museum*, xxx. 162). They also had to collect the *sacramenta* (deposit forfeited by the losing party in a suit) and examined the plea of exemption put forward by those who refused to act as jurymen. Caesar increased their number to four, but Augustus reverted to three. In the late Republic their functions passed into the hands

2. *Tresviri epulones*, a priestly body (open from its first institution to the plebeians), assisted at public banquets. Their number was subsequently increased to seven, and by Caesar to ten, although they continued to be called *septemviri*, a name which was still in use at the end of the 4th century A.D. They were first created in 106 B.C. to superintend the *epulum Jovis* on the Capitol, but their services were also requisitioned on the occasion of triumphs, imperial birthdays, the dedication of temples, games given by private individuals, and so forth, when entertainments were provided for the people, while the senate dined on the Capitol.

3. *Tresviri monetales* were superintendents of the mint. Up to the Social War they were nominated from time to time, but afterwards became permanent officials. Their number was increased by Caesar to four, but again reduced by Augustus. As they acted for the senate they only coined copper money under the empire, the gold and silver coinage being under the exclusive control of the emperor. The official title was "tresviri aere argento auro flando feriundo."

4. *Tresviri reipublicae constituendae* was the title bestowed upon Octavianus, Lepidus and Antony for five years by the lex Titia, 43 B.C. The coalition of Julius Caesar, Pompey and Crassus has also been wrongly called a "triumvirate," but they never had the title *tresviri*, and held no office under that name.

See T. Mommsen, *Römisches Staatsrecht* (1888), ii. 594-601, 638, 601, 718; J. Marquardt, *Römische Staatsverwaltung* (1885), iii. 347.

TREVELYAN, SIR GEORGE OTTO, BART. (1838-), British author and statesman, only son of Sir Charles Trevelyan, was born on the 20th of July 1838 at Rothley Temple, Leicestershire. His mother was Lord Macaulay's sister. He was educated at Harrow and at Trinity College, Cambridge, where he was second in the classical tripos. In 1861 he wrote his *Horace at the University of Athens*, a topical drama in verse, parts of which are said to have offended Whewell and lost Trevelyan a fellowship. The following year he went out as a civil servant to India, where he spent several years. During his stay he contributed "Letters of a Competition Wallah" to *Macmillan's Magazine* (republished 1864). *Campfire*, an account of that terrible tragedy, was published in 1865. During the same year he was elected to parliament for Tynemouth in the Liberal interest. In 1867 he wrote *The Ladies in Parliament*, a humorous political brochure in verse. At the general election of 1868 he was returned for the Hawick burghs, which he continued to represent until 1886. When the first Gladstone ministry was formed, in December 1868, Trevelyan was appointed civil lord of the Admiralty, but resigned in July 1870 on a point of conscience connected with the government Education Bill. He advocated a sweeping reform of the army, including the abolition of the purchase of commissions, and both in and out of parliament he was the foremost supporter for many years of the extension of the county franchise. In the session of 1874 he brought forward his Household Franchise (Counties) Bill, which was lost on the second reading; it was not till ten years later that the agricultural labourer was enfranchised. Among other causes which he warmly supported were women's suffrage, a thorough reform of metropolitan local government, and the drastic reform or abolition of the House of Lords. He was also in favour of the direct veto and other temperance legislation. In 1876 he published *The Life and Letters of Lord Macaulay*, one of the most admirable and most delightful of modern biographies; and in 1880 he published *The Early History of Charles James Fox*. In the latter year he was appointed parliamentary secretary to the Admiralty. This office he held until May 1882, when, after the assassination of Lord Frederick Cavendish, he became for two years chief secretary for Ireland. From November 1884 to June 1885 he was chancellor of the duchy of Lancaster. In February 1886 he became secretary for Scotland, but resigned on the 10th of March on account of his disagreement with some of Gladstone's Irish Home Rule proposals. The same year he succeeded his father in the baronetcy. At the general

election of 1886 Sir George Trevelyan lost his seat for Hawick. As a representative of the Unionist party he took part in the Round Table Conference, and, being satisfied with the modifications made by Mr Gladstone in his Home Rule scheme, he formally rejoined the Liberal party. In August 1887 he re-entered the House of Commons as member for the Bridgeton division of Glasgow; and from 1892 to 1895 he was secretary for Scotland. Early in 1897 he resigned his seat in parliament and retired into private life. In 1899 he published the first volume of a *History of the American Revolution*, which was completed (3 vols.) in 1905; in the latter year, as *Interludes in Prose and Verse*, he republished his early classical *jeux d'esprit* and Indian pieces. He had married in 1869 Caroline Philips, whose father was M.P. for Bury. His eldest son, Charles Philips Trevelyan (b. 1870), became Liberal M.P. for the Eiland division of Yorkshire in 1899, and in 1908 was appointed parliamentary secretary to the Board of Education. The third son, George Macaulay Trevelyan (b. 1876), became well known as a brilliant historical writer, notably with two books on Garibaldi (1907 and 1909).

TREVET (or TRIVET), **NICHOLAS** (c. 1258-c. 1328), English chronicler, was the son of Sir Thomas Trevet (d. 1283), a judge, and became a Dominican friar. After studying at Oxford and in Paris, he spent most of his subsequent years in writing and teaching, and died about 1328. His chief work is his *Annales sex regum Angliæ*, a chronicle of English history covering the period between 1135 and 1307; this is valuable for the later part of the reign of Henry III. and especially for that of Edward I., who was the author's contemporary. A member of the same family was Sir Thomas Trivet (d. 1383), a soldier of repute, who saw a good deal of service in France, and died in October 1383.

The *Annales* were published in Paris in 1668, in Oxford in 1719, and were edited by Thomas Hog for the English Historical Society in 1845. Manuscripts are at Oxford and in the British Museum. Trevet's other historical works are *Catalogus regum anglo-saxonum durante heptarchia*, and *Les Cronicles de frere N. Trevet escript a dame Marie* ("Marie" was Edward I.'s daughter Mary). From the latter Chaucer is believed to have obtained his *Man of Law's Tale*. Trevet also wrote a number of works of a theological and philological character.

TREVI (anc. *Trebiae*), a town of the province of Perugia, Italy, 30 m. S.E. of Perugia and 5 m. S. of Foligno by rail. Pop. (1901), 5708. The town stands on a steep hill 1355 ft. above sea-level. Several of its churches are architecturally interesting, especially the Madonna delle Lacrime (1487) outside the town, the elegant early Renaissance architecture of which resembles that of the Madonna del Calcinajo at Cortona, and most of them (and also the municipal picture gallery) contain paintings by artists of the Umbrian school—notably Lo Spagna, a pupil of Perugino. S. Emiliano has a group of three altars decorated with fine sculptures by Rocco da Vicenza (1521). The ancient town is believed to have been situated 1½ m. to the north-west, but little is known of it, and no remains save inscriptions exist.

TREVIGLIO, a town of Lombardy, Italy, in the province of Bergamo, 14 m. by rail S. by W. of that town, 410 ft. above sea-level. Pop. (1901), 5899 (town); 14,897 (commune). It has a fine church (S. Martino) containing pictures by Butinone and Zenale (1436-1526), both natives of the town, and having a lofty campanile of the 13th and 14th centuries. It has important silk works, wool-spinning, and other manufactures. It is a junction for Verona, Cremona and Bergamo, and steam tramways run to Monza, Lodi, &c.

TREVIRANUS, GOTTFRIED REINHOLD (1776-1837), German naturalist, was born at Bremen on the 4th of February 1776. He studied medicine at Göttingen, where he took his doctor's degree in 1796, and a year later he was appointed professor of medicine and mathematics in the Bremen lyceum. He died at Bremen on the 16th of February 1837.

In the first of his larger works, *Biologie; oder die Philosophie der lebenden Natur*, which appeared from 1802-1805, Treviranus gave clear expression to the theory of "descent with modification." He believed that simple forms (Protists), which he termed "zoophytes,"

were "the primitive types from which all the organisms of the higher classes had arisen by gradual development," and he laid down as a fundamental proposition "that all living forms are the results of physical influences which are still in operation, and vary only in degree and direction." Like many after him, he directed attention to the influence of the male elements in fertilization as a source of variation, but laid emphasis only on the intra-organismal power of adaptation to surroundings. Whatever opinion be entertained in regard to the priority and the importance of the contribution made by Treviranus to the theory of evolution, it is at least certain that he was a learned naturalist and an acute thinker. His most important later work of a synthetic nature was entitled *Erscheinungen und Gesetze des organischen Lebens* (1831).

His younger brother, LUDOLPH CHRISTIAN TREVIRANUS (1779-1864), studied medicine at Jena, and was successively professor of medicine at Bremen lyceum (1807), professor of natural history at Rostock (1812), professor of botany and director of the botanical garden at Breslau (1816), and professor of botany at Bonn (1830).

TREVISO (anc. *Tarvisium*), a town and episcopal see of Venetia, Italy, capital of the province of Treviso, 49 ft. above sea-level. Pop. (1901), 16,933 (town); 36,433 (commune). It is situated on the plain between the Gulf of Venice and the Alps, 18 m. by rail N. of Venice, at the confluence of the Sile with the Bottegina. The former flows partly round its walls, the latter through the town; and it has canal communication with the lagoons. It is an old town, with narrow irregular colonnaded streets and some interesting old frescoed houses. The cathedral of San Pietro, dating from 1141 and restored and enlarged in the 15th century by Pietro Lombardo, with a classical façade of 1836, has five domes. It contains a fine "Annunciation" by Titian (1510), an important "Adoration of the Shepherds" by Paris Bordone (born at Treviso in 1500), and frescoes by Pordenone. There are also sculptures by Lorenzo and Battista Bregno and others. The Gothic church of San Niccolò (1310-1352) contains a fine tomb by Tullio Lombardo, and a large altarpiece by Fra Marco Pensabene and others; in the church and adjoining chapter-house are frescoes by Tommaso da Modena (1352), some frescoes by whom (life of S. Ursula) are also in the Museo Civico. The Monte de Pietà contains an "Entombment" by an artist of the school of Pordenone (wrongly attributed to Giorgione). The churches of S. Leonardo, S. Andrea, S. Maria Maggiore, and S. Maria Maddalena also contain art treasures. The Piazza dei Signori contains picturesque brick battlemented palaces—the Salone del Gran Consiglio (1184) and the Palazzo del Comune (1268). Treviso is the seat of various manufactures—iron-works and pottery, macaroni, cotton-spinning and rice-husking, paper, printing, brushes, brickyards, flourmills—and is the centre of a fertile district.

The ancient *Tarvisium* was a *municipium*. It lay off the main roads, and is hardly mentioned by ancient writers, though Pliny speaks of the Sile as flowing "ex montibus Tarvisanis." In the 6th century it appears as an important place and was the seat of a Lombard duke. Charlemagne made it the capital of a marquisate. It joined the Lombard league, and was independent after the peace of Constance (1183) until in 1339 it came under the Venetian sway. From 1318 it was for a short time the seat of a university. In the 15th century its walls and ramparts (still extant) were renewed under the direction of Fra Giocondo, two of the gates being built by the Lombardi. Treviso was taken in 1797 by the French under Mortier (duke of Treviso). In March 1848 the Austrian garrison was driven from the town by the revolutionary party, but in the following June the town was bombarded and compelled to capitulate.

TREVITHICK, RICHARD (1771-1833), English engineer and inventor, was born on the 13th of April in the parish of Hlogan, Cornwall, and was the only son of Richard Trevithick (1735-1797), manager of the Dolcoath and other important Cornish mines. He attended his first and only school at Camborne, and was in general a slow and obstinate scholar, though he showed considerable aptitude for figures. He inherited more than the average strength for which his family was

famous; he stood 6 ft. 2 in. in height, and his feats in wrestling and in lifting and throwing weights were unexampled in the district. At the age of eighteen he began to assist his father, and, manifesting great fertility of mechanical invention, was soon recognized as the great rival of James Watt in improvements on the steam-engine (*q.v.*). His earliest invention of importance was his improved plunger pole pump (1797) for deep mining, and in 1798 he applied the principle of the plunger pole pump to the construction of a water-pressure engine, which he subsequently improved in various ways. Two years later he built a high-pressure non-condensing steam-engine, which became a successful rival of the low-pressure steam-vacuum engine of Watt. He was a precursor of George Stephenson in the construction of locomotive engines. On Christmas Eve 1801 his common road locomotive carried the first load of passengers ever conveyed by steam, and on the 24th of March 1802 he and Andrew Vivian applied for a patent for steam-engines in propelling carriages. In 1803 another steam vehicle made by him was run in the streets of London, from Leather Lane along Oxford Street to Paddington, the return journey being made by Islington. He next directed his attention to the construction of a steam locomotive for tramways, with such success that in February 1804 at Pen-y-darran in Wales he worked a tramroad locomotive which was able to haul twenty tons of iron; a similar engine was supplied to the Wylam colliery (Newcastle) in the following year. In 1808 he constructed a circular railway in London near Euston Square, on which the public were carried at the rate of twelve or fifteen miles an hour round curves of 50 or 100 ft. radius. Trevithick applied his high-pressure engine with great success to rock boring and breaking, as well as to dredging. In 1806 he entered into an engagement with the board of Trinity House, London, to lift ballast from the bottom of the Thames, at the rate of 500,000 tons a year, for a payment of 6d. a ton. A little later he was appointed to execute a driftway under the Thames, but the work was abandoned owing to the water breaking in. He then set up workshops at Limehouse, for the construction of iron tanks and buoys. He was the first to recognize the importance of iron in the construction of large ships, and in various ways his ideas also influenced the construction of steamboats. In the application of steam to agriculture his name occupies one of the chief places. A high-pressure steam threshing engine was erected by him in 1812 at Trewithen, while in the same year, in a letter to the Board of Agriculture, he stated his belief that every part of agriculture might be performed by steam, and that such a use of the steam-engine would "double the population of the kingdom and make our markets the cheapest in the world." In 1814 he entered on an agreement for the construction of engines for mines in Peru, and to superintend their working removed to Peru in 1816. Thence he went in 1822 to Costa Rica. He returned to England in 1827, and in 1828 petitioned parliament for a reward for his inventions, but without success. He died, penniless, at Dartford on the 22nd of April 1833.

A *Life of Richard Trevithick, with an account of his Inventions* was published in 1872 by his third son, Francis Trevithick (1812-1877).

TREVOR, SIR JOHN (1626-1672), English politician, was a son of Sir John Trevor (d. 1673) of Trevelyn, Denbighshire. His father was a member of parliament under James I. and Charles I., and sat also in the parliaments of Oliver and of Richard Cromwell, and was a member of the council of state during the Commonwealth. One of his uncles was Sir Sackville Trevor (d. c. 1640), a naval officer, who was knighted in 1604; and another was Sir Thomas Trevor (1586-1656), the judge who decided in favour of the Crown in the famous case about the legality of ship-money, and was afterwards impeached and fined. Sir John Trevor was returned in parliament in 1640 as member for Flintshire. After filling several parliaments he was elected to the Commonwealth and Protectorate. He was a member of the council of state appointed in 1653, and in 1654 he rose to a high secretary

towards the end of 1668, just after he had helped to arrange an important treaty between England and France. He married Ruth, daughter of the great John Hampden, and died on the 28th of May 1672.

His second son, Thomas, Baron Trevor (1658-1730), was knighted in 1692 as solicitor-general and in 1695 became attorney-general. In 1701 he was appointed chief justice of the common pleas, and in 1712 he was created a peer as Baron Trevor of Bromham. On the accession of George I. in 1714 he was deprived of the justiceship, but from 1726 to 1730 he was lord privy seal. Three of his sons succeeded in turn to his barony, and a fourth son, Richard Trevor (1707-1771), was bishop of St Davids from 1744 to 1752, and then bishop of Durham. Robert, 4th Baron Trevor and 1st Viscount Hampden (1706-1783), represented his country at the Hague from 1739 to 1746, during which time he maintained a regular correspondence with Horace Walpole. He took the additional name of Hampden in 1754, on succeeding to the estates of that family, and in 1776, twelve years after he had become Baron Trevor, he was created Viscount Hampden. From 1759 to 1765 he was joint postmaster-general. He wrote some Latin poems which were published at Parma in 1792 as *Poemata Hampdeniana*. His second son, John Hampden-Trevor (1740-1824), British minister at Munich from 1780 to 1783 and at Turin from 1783 to 1798, died only three weeks after he had succeeded his brother Thomas as 3rd Viscount Hampden, the titles becoming extinct.

Another member of this family was Sir John Trevor (1637-1717), Speaker of the House of Commons (1685). A partisan of James II., he was deprived of his office on the accession of William III., but in 1690 he was again a member of parliament, becoming Speaker for the second time in 1690 and master of the rolls in 1693. In 1695 he was found guilty of accepting a bribe and was expelled from the House of Commons, but he retained his judicial position until his death on the 20th of May 1717. Through his daughter Anne Sir John was the ancestor of the Hills, marquesses of Downshire, and of the family of Hill-Trevor, Viscounts Dungannon from 1766 to 1862.

TRÉVOUX, a town of eastern France, chief town of an arrondissement in the department of Ain, 16 m. N. of Lyons on the Paris-Lyons railway. Pop. (1906), 1034. The town is situated on the slope of the left bank of the Saône, which is here crossed by a suspension bridge and is dominated by two towers, remains of a feudal castle of the 12th century. The fortifications date from the 14th century, and the church from the same period. The law-court is a building of the 17th century, and was once the seat of the parlement of Dombes. Trévoux has a sub-prefecture and a tribunal of first instance. Gold and silver wire-drawing, introduced into the town by Jews in the 14th century, and the manufacture of apparatus for wire-drawing, are its chief industries.

Trévoux (Trevois) was hardly known before the 11th century, after which it was included in the domain of the lords of Thoire-Villars, from whom it acquired its freedom. It was bought by the Bourbons in 1402, became the capital of the Dombes, and had its own mint. In 1603 a well-known printing works was established there, from which in the 18th century the *Journal de Trévoux* and a universal dictionary known as the *Dictionnaire de Trévoux* were issued by the Jesuits.

TRIAL, in English law, the hearing by a court of first instance of the issues of fact and law involved in a civil or criminal cause. The term is inappropriate to rehearing by an appellate court. Trial follows upon the completion of the steps necessary to bring the parties before the court and to adjust the issues upon which the court is to adjudicate, which may be summed up in the term pleading (*q.v.*). In England the trial is usually in open court, and it is rare to try cases *in camera*, or to attempt

continental system the bulk of the proofs in civil cases are reduced to writing before the hearing.

The modes of trial have altered with legal development in English as in Roman law (see ACTION). Many forms of trial, notably those by ordeal, by wager of battle or of law (see ORDEAL and WAGER), and by grand assize, have become obsolete, and new forms have been created by legislation in order to meet altered circumstances of society. Up to a very recent date the tendency of the Roman and English systems was in opposite directions. In the former and in systems founded on it, such as the Scottish and French, trial by the judge became the rule, in the latter trial by judge and jury. In England the method of trial of issues of fact arising under the common law was by jury and a bench of judges. In truth the trials were the sittings of commissioners sent to inquire and report with the aid of the neighbourhood on questions of crime and civil wrongs in a county; the practice is summed up in the old phrase *ad questionem juris iudices respondeant, ad questionem facti juratores*. In courts which administered equity or derived their law or procedure from the civil or canon law no jury was used, and the judges determined both law and fact. The system of trial before a full bench of judges even with a jury is now used on the European continent, but has been superseded in England by trial before a single judge with a jury except in the rare cases of *trial at bar*. This latter mode of trial is a survival of the mode universal in the superior courts before the writ of *nisi prius*, and is now only used in the king's bench division, when claimed by the Crown as of right or in cases of unusual importance and difficulty. Recent instances are the trial in 1904 of Arthur Lynch for treason in South Africa, and in 1905 of questions raised on a petition of right in respect of a claim to make the Crown responsible on the conquest of the Transvaal for acts of the Transvaal government before or during the war.

The necessity for trial by jury has been removed in many cases by legislation and rules of court (see JURY; SUMMARY JURISDICTION), and the present English practice is summarized in the following statement.

In the High Court of Justice in England and Ireland several modes of trial are now used:—

1. Trial by judge with a jury used in the king's bench division and in probate and matrimonial cases. There is a right to have a jury as a matter of course in actions of defamation, false imprisonment, malicious prosecution, seduction and breach of promise of marriage. In other cases, subject to exceptions to be noted, a jury can be obtained on the application of either party.

2. Trial by a judge without a jury is invariable in the chancery division and now common in the other divisions. Cases in the chancery division are not tried with a jury unless a special order is made (Ord. 36, r. 3); and the High Court in cases in which trial without jury could be ordered without consent (1875) still retains the power of so trying them, and has also acquired power to direct trial without a jury of any issue requiring prolonged examination of documents or accounts or scientific or local investigation.

3. Trial with assessors, usual in admiralty cases (the assessors being nautical) but rare in other divisions.

4. Trial by an official referee in certain cases involving much detail (R.S.C.O. 36). In the county court the ordinary mode of trial is by the judge alone, but a jury of eight is allowed in certain cases on application, and in the admiralty jurisdiction marine assessors can be called in. In other local civil courts the trial is often by jury, as in the mayor's court of London, sometimes without, as in the vice-chancellor's court of the university of Oxford. In all civil cases the parties can by a proper submission have a trial before an arbitrator selected by or for them. As regards criminal cases the right to trial by due process of law before condemnation is given by art. 29 of Magna Carta; and the trial must be by jury unless a statute otherwise provides (see COURT-MARTIAL; SUMMARY JURISDICTION).

The parties may be represented by lawyers, solicitor or counsel or both, according to the court, in county courts by accredited lay agents, or may conduct their case in person. The trial is carried on by stating to the court the pleadings if any and by opening the plaintiff's case. This is followed by the evidence of the witnesses, who are sworn and examined and cross-examined. On the completion of the plaintiff's case and evidence, the defendant's case is stated and evidence adduced in support of it. The plaintiff or his lawyer has as a rule the reply or last word, though in some courts, described as single speech courts, no reply is given. At the conclusion the judge sums up the law and facts of the case to the jury, if there is one, and their verdict is returned, or if there is no jury

gives judgment, stating his conclusions on the law and facts involved.

There remain certain modes of trial not obsolete but rarely used. Such are impeachment of the House of Commons before the House of Lords; and in the case of a charge of treason or felony by a person having privilege of peerage, trial on indictment before the House of Lords, or in vacation before the court of the lord high steward. Trials by certificate, by inspection and by record, are obsolete.

The decisions on a trial at first instance are reviewed by appeal (g.s.), or in trial cases heard before a jury by application for a new trial, where the judge has not directed the jury correctly as to the law or has permitted them to consider inadmissible evidence, or the jurors have in their verdict acted without evidence or against the weight, i.e. the quality not the quantity of the evidence. Under the Criminal Appeal Act 1907 the decisions in criminal trials on indictment, whether on matters of law or of fact or on mixed questions of law or fact, are reviewable by the court of criminal appeal; but that court has no power to order a retrial of the case before a jury.

Scotland.—Jury trial was introduced into Scotland for certain classes of civil cases in the 19th century but is not much used. In criminal cases it is used where summary jurisdiction has not been conferred.

Ireland.—The law of Ireland as to trials is in substance the same as in England, except as to appeals in criminal cases.

United States.—In the United States the system of trial is that of the English common law as varied by Federal and state legislation.

(W. F. C.)

TRIANGLE, in geometry, a figure enclosed by three lines; if the lines be straight the figure is called a plane triangle; but if the figure be enclosed by lines on the surface of a sphere it is a spherical triangle. The latter are treated in TRIGONOMETRY; here we summarize the more important properties of plane triangles. In a plane triangle any one of the angular points can be regarded as the *vertex*; and the opposite side is called the *base*. The three sides and angles constitute the six elements of a triangle; it is customary to denote the angular points by capital letters and refer to the angles by these symbols; the sides are usually denoted by the lower case letter corresponding to that of the opposite angular point. Triangles can be classified according to the relative sizes of the sides or angles. An equilateral triangle has its three sides equal; an isosceles triangle has only two sides equal; whilst a scalene triangle has all its sides unequal. Also a right-angled triangle has one angle a right angle, the side opposite this angle being called the hypotenuse; an obtuse-angled triangle has one angle obtuse, or greater than a right angle; an acute-angled triangle has three acute angles, i.e. angles less than right angles. The triangle takes a prominent place in book i. of Euclid; whilst the relation of the triangle to certain circles is treated in book iv. (See GEOMETRY: § *Euclidean*.)

The following is a summary of the Euclidean results. The angles at the base of an isosceles triangle are equal and conversely; hence it follows that an equilateral triangle is also equiangular and conversely (i. 5, 6). If one side of a triangle be produced then the exterior angle is greater than either of the two interior opposite angles (i. 16), and equal to their sum (i. 32); hence the sum of the three interior angles equals two right angles. (In i. 17 it is shown that any two angles are less than two right angles.) The greatest angle in a triangle is opposite the greatest side (i. 18, 19). On the identical equality of triangles Euclid proves that two triangles are equal in all respects when the following parts are equal each to each (a) two sides, and the included angle (i. 4), three sides (i. 8, cor.), two angles and the adjacent side, and two angles and the side opposite one of them (i. 26). The mensuration is next treated. Triangles on the same base and between the same parallels, i.e. having the same altitude, are equal in area (i. 37); similarly triangles on equal bases and between the same parallels are equal in area (i. 38). If a parallelogram and triangle be on the same base and between the same parallels then the area of the parallelogram is double that of the triangle (i. 41). These propositions lead to the result that the area of a triangle is one half the product of the base into the altitude. The penultimate proposition (i. 47) establishes the beautiful theorem, named after Pythagoras, that in a right-angled triangle the square on the hypotenuse equals the sum of the squares on the other two sides. Two important propositions occur in book ii. viz. 12 and 13; these may be stated in the following forms: If ABC is an obtuse-angled triangle with the obtuse angle at C and a perpendicular be drawn from the angular point A cutting the base BC produced in D, then $AB^2 = AC^2 + BC \cdot CD$ (ii. 12); in any triangle (with the same construction but with the side AC subtending an acute angle) $B^2 = AC^2 + BC^2 - 2CB \cdot CD$ (ii. 13); in any triangle (with the same construction but with the side AC subtending an acute angle B, we have $AC^2 = AB^2 + BC^2 - 2CB \cdot BD$ (see TRIGONOMETRY).

Book iv. deals with the circles of a triangle. To inscribe a circle in a given triangle is treated in iv. 4; to circumscribe a circle to a given triangle in iv. 5. The centre of the first circle is the intersection of the bisectors of the interior angles; if the meet of the bisectors of two exterior angles be taken, a circle can be drawn with this point as centre to touch two sides produced and the third side; three such circles are possible and are called the escribed circles. The centre of the circum circle is the intersection of the perpendiculars from the middle points of the sides. Concerning the circum circle we observe that the feet of the perpendiculars drawn from any point on its circumference to the sides are collinear, the line being called Simson's line. We may here notice that the perpendiculars from the vertices of a triangle to the opposite sides are concurrent; their meet is called the orthocentre, and the triangle obtained by joining the feet of the perpendiculars is called the pedal triangle. Also the lines joining the middle point of the sides to the opposite vertices, or medians, are concurrent in the centroid or centre of gravity of the triangle. There are several other circles, points and lines of interest in connexion with the triangle. The most important is the "nine point circle," so called because it passes through (a) the middle points of the sides; (b) the feet of the perpendiculars from the vertices to the opposite sides; and (c) the middle points of the lines joining the orthocentre to the angular points. This circle touches the inscribed and escribed circles. For the Brocard points and circle, Tucker's circles—with the particular forms cosine circle, triplicate ratio (T.R.) circle, Taylor's circle, McCay's circles, &c., see W. J. McClelland, *Geometry of the Circle*; or Casey, *Sequel to Euclid*.

TRIANGLE, in music (Fr. *triangle*, Ger. *Triangel*, Ital. *triangolo*), an instrument of percussion of indefinite musical pitch, consisting of a triangular rod of steel, open and slightly curved at one corner. The triangle, suspended by a loop, is played by means of a steel stick with a wooden handle. Varied rhythmical effects and different grades of forte and piano can be obtained. A sort of tremolo or roll can be produced by striking each end of the triangle alternately in rapid succession. When the triangle is scored for on a separate staff, the treble clef is used, but it is more often included with the bass drum on the bass staff. The tone of the triangle is clear and ringing, but it should have no definite pitch. The small triangles are the best. Beethoven, Mozart, Weber and other great masters employed the instrument.

TRIASSIC SYSTEM, in geology, the lowest or youngest system of the Mesozoic era; it occupies a position above the Permian and below the Jurassic system of rocks. The principal formations of the type region, Germany, are the Bunter, Muschelkalk and Keuper; these were for the first time grouped together

under the systematic name "Trias" by F. von Alberti (1834). A description of the rocks in these formations will be found under their respective headings. For a long time this German development of the strata was regarded as typical of the period; later, however, the discovery of another more fossiliferous phase in the Alps and Mediterranean region, and subsequently in Asia and elsewhere, led geologists to take a different view of the system as a whole. It was clearly seen that there existed two distinct phases of Triassic rock-building, the one continental (terrestrial and lagoonal), the other marine (pelagic).

The original Trias of the "Germanic" area (including Great Britain) must be understood as a special local expression of the continental Trias, while the thoroughly marine type represents the normal aspect of sedimentation. Similarly, the fauna of the marine Trias is the standard for comparison with the life of other geological systems. The term Trias—indicative of the three-fold grouping in Germany—thus loses its original significance when applied to the world-wide deposits of the period; its use, however, is continued by general consent.

Continental Trias.—The records of the terrestrial and lagoonal conditions during this period are to be found in the coarse conglomerates, red and mottled sandstones, marls and clays with their accompanying beds of dolomite and limestone, and layers of gypsum, anhydrite, rock-salt and coal. The coarser breccias and conglomerates appear to represent ancient acres and shore deposits, and in part at least their formation may have been due to torrential action. The remarkable oblique bedding in many of the sandstones, coupled with the fact that the sand grains are often very perfectly rounded, points to the transporting action of wind. Even the pebbles occasionally exhibit the *dreikunter* form, familiar in our modern deserts. But the marls, muds and many sandy beds were certainly deposited in sheets of water, which were evidently shallow and subject to frequent periods of desiccation. Of this we have evidence in the great abundance of reptilian foot-prints, of rain pits, ripple marks, and sun cracks upon what were once surface muds and sands. That the drying-up of the water sheets repeatedly produced a highly saline condition is shown by the common occurrence of rock-salt, gypsum and anhydrite. In short, the physical conditions under which the continental Trias was formed appear to have been similar to those obtaining at the present day in the Caspian region.

In Europe the earlier deposits of the continental Trias occupy a compact area covering nearly the whole of Germany, whence they may be followed into central and northern England, Heligoland, Upper Silesia and the Vosges. Another tract lay over what are now the western Alps and south-east France; also in the Pyrenees, Balearic Islands, Sardinia, Sicily and southern Spain, and on to the south coast of Africa. In the Carpathians the same rocks appear, and they cover a large area in north-east Russia (Tartarian), and north-west Siberia. Later, the Muschelkalk limestones point to a temporary influx of the sea involving most of the above regions except Britain and Russia. Three encroachments of the sea are indicated, each followed by a period of excessive evaporation and contraction; these happened in the time of the Röh, the Lower and the Upper Muschelkalk. Finally the last influx, that of the Rhaetic Sea, not only spread much beyond the limits of the earlier incursions but remained as the forerunner of the succeeding Jurassic waters. In North America the continental Trias appears with a close resemblance to that of western Europe along the Atlantic coast, strip from Prince Edward's Island, through New Brunswick, Nova Scotia, Connecticut, New York, Pennsylvania, Virginia, to North Carolina. These are the rocks of the Newark series. Southwards it may be traced in Honduras, the Andes, Brazil, Argentina and Chile. Another large area in the western interior of Wyoming and New Mexico, is occupied by "red beds" (600-2000 ft. in part Permian) with gypsum and rock-salt. In southern Africa the upper part of the Karoo formation appears to represent Triassic time—the Stormberg beds (Permo-Trias) and the Beaufort beds (Rhaetic). In India the Panchet beds of the Gondwana system and in New South Wales the Hawkesbury series (Wianametta shales with coals and iron-stone, Hawkesbury sandstone, and at the base the Narraburra beds) belong to about the same horizon. In New Zealand the Otapiri, Waitoa and Oreti series appear to contain fossils indicating a transition from Permian to Rhaetic.

The Marine or Open-sea Trias.—This type of Triassic deposit is frequently referred to under the titles "Alpine," "Mediterranean" or "Pelagic." It first came into notice through the discovery of fossils in the neighbourhood of Recoaro and St Cassian on the southern side of the Alps, and these rocks were subsequently correlated with those at Hallstatt on the northern side. On both sides of the Alps rocks of this age flank the central core, but they are better developed, thicker and less altered towards the east than towards the west. In the western Alps Triassic beds can be only dimly recognized amongst the masses of schists called the *Schistes-lustrés* and *Bunderschiefer*. In the eastern Alps, however, although there are sandy and conglomeratic members, such as the Werfen beds and Lunz sandstone, yet the most striking feature, in contrast with the continental Trias, is the prevalence of calcareous and dolomitic strata, to which must be added the enormously greater abundance of organic remains. The Alpine Trias varies in lithological character so rapidly from point to point, and has furthermore been subjected to so much dislocation, that great difficulty has been experienced in correlating the beds in different areas and in placing them in their proper order of sequence. The result of this difficulty has been the production of a nomenclature so unwieldy that no attempt at a detailed exposition is possible in the space here available. The principal members of the Alpine Trias will be found in their correct

relative positions in the table. One of the most striking aspects of the Alpine Trias, on both the northern and southern sides, is the great development of dolomite which is so prominent a feature in the scenery of southern Tirol (Drei Zinnern, &c.). Some of these rocks contain the remains of corals, still more best seen in the fossils of calcareous algae, and although the views originally advanced by F. v. Richthofen that they represent Triassic coral reefs has been strongly opposed, it still seems to be the most reasonable explanation of their origin. The rocks of the marine Trias generally are argillaceous beds and dark limestones; in the Alpine regions many of the latter have been marmorized. The well-known white marble of Carrara in the Apuan Mountains is a metamorphosed Triassic limestone. The same type of Trias occurs also in south Italy (Longobardian), in Sicily, Barcelona, Balearic Islands, Crete, Bosnia, East Hungary, and the Carpathian Mountains by Bukovina and Dobruđja.

The Alpine-Mediterranean Trias sea evidently had a prolongation into Western Asia, for in Asia Minor, Armenia and Bokhara rocks with closely related fossils have been found. In Central Asia Triassic rocks are known in Afghanistan (sandstones with coal), Russian Turkestan, and in the Pamir. In India the lower Trias of the Salt Range presents the most typical example of the marine deposits of this stage. The Himalayan Trias more perfectly represents the upper portion of the system. Triassic limestones are found also in Kashmir and Hazara, and shales in Baluchistan. The marine Trias is known in Burma, Tongking, China and north-east Tibet; also in Japan, Siberia and in the arctic regions of Spitzbergen and Bear Island. In the Australasiatic region the marine Trias is found in the Sunda Islands, Sumatra, Roth and Timor and in New Caledonia.

Climate, Volcanism.—There seems little room for doubt that the climate of Triassic times was, over large tracts of the northern continental region, dry and arid in character, certain features in the flora tending to support this view. On the other hand, the southern continental deposits, with *Glossopteris* and its allies, is more suggestive of a moist climate. There is no evidence of the glacial condition of the preceding Permian period. The Triassic period was one of rest so far as crustal movements were concerned. Volcanic activity, however, was exhibited on a large scale in the north-western part of North America, the great batholith of the Coast Range being nearly 1000 m. long; in British Columbia and Alaska large bodies of igneous rock are supposed to belong to this period. On the eastern side of the continent the diabase and dolerite lava flows, veins and sills of the famous Palisades of the Hudson valley belong to the Newark system. In Europe and Asia igneous rocks are scarce, but tuffs, porphyries, &c., occur in the Schlern district (Upper Cassian age) and at Falzarego Strasse, Trarancenza (Wengen horizon), in the Alpine region.

Life of the Triassic Period.—The plant life of this period exhibits on the whole a closer relationship with the Jurassic than with the preceding Palaeozoic formations. Flowering plants are unknown in the Triassic deposits and the dominant forms are all gymnosperms, the prevailing types being ferns and fern-like plants, cycadeans, conifers and equisetums. The Palaeozoic calamites, sigillarias and lepidodendrons became extinct early in this period; but in the southern hemisphere the *Glossopteris* flora still held on in considerable force. Amongst the ferns were *Lepidopteris*, *Sagenopteris*, *Danaopteris*, with the Carboniferous genera *Sphenopteris*, *Pecopteris* and others. *Equisetites* and *Schizoneura* became common. Characteristic conifers were *Valtzia*, *Araucarites*, *Brachyphyllum*. The Cycadeans were represented by *Plesiopteris*, *Cycadites*, *Podocarpites*, &c. *Baiera* was the representative of the ginkgos. Calcareous algae were important track builders in some of the Triassic seas (*Gyrogonella*, *Diplopore*). Fish remains are not generally common in the Trias; teeth and scales are crowded together in the "bone beds" in the Rhaetic and between the Keuper and Muschelkalk; in the marine Trias of the Alpine region skeletons are much more common. They are abundant also in the bituminous shales of the Connecticut Valley and in the Hawkesbury series of New South Wales. Selachians are represented by species of *Hyodus*, *Acrodus* and *Palaeobates*; dipnoids by *Ceratodus* and *Gosfordia*. The ganoids, with Palaeozoic as well as younger forms, include *Gyroplepis*, *Semionotus*, *Diptychops*, *Graphurus*, *Belanorhynchus* and *Pholidoplepis*. Bony fish were very feebly represented. The amphibian labyrinthodonts (*Stegocephalia*) were numerous, their bones being found in the "bone beds" and in the Bunter and Keuper sandstones and their equivalents in North America, South Africa and India (*Labyrinthodont*, *Mastodonsaurus*, *Trematonsaurus*, *Captiosaurus*). Their footprints are often very abundant, e.g. *Cheirotherium*. The reptiles of the Triassic deposits, unlike the amphibians, which are Permian in character, show a closer relationship with Jurassic forms; one of the most interesting facts in the life-history of the group is the development during this period of sea-going forms such as at a later geological period played so prominent a part. Early crocodilian reptiles are represented by *Brilodon*, *Myristinosuchus*, *Stagonolepis*, *Parasuchus*; and *Rhynchocephalia* by *Tetrapeton* and *Hyperodapedon*. Ichthyopterygians were represented by *Mixosaurus*, *Nothosaurus*, *Cymalotarus*; early dinosaurs (carnivorous) by *Zanclodon*, *Achilsotherium*, *Tecodontosaurus*, *Palaeosaurus*; the remarkable theromorphs (anomodonts), by *Elginia*, *Diacyodon*, *Geikia*, *Gordonia*.

Turtles became well established during this period (*Psemmochelys*, *Chelys*). Of great interest is the discovery of the earliest traces of mammals in the Trias of Europe, South Africa and North America. The imperfect remains (teeth and jaw-bones) do not admit of any certainty in deciphering their relationships. *Microlestes* from the Rhaetic of England and Württemberg and *Dromatherium* from North America are perhaps the best known; *Tritylodon* from South Africa may also be added. Among the lower forms of marine life foraminifera and sponges play a subordinate part. Corals, which with the calcareous algae built considerable reefs in some regions, at this time began to assume a modern aspect, and henceforth the Hexacorallids took the place of the Palaeozoic Tetracorallid forms (*Stylophyllum*, *Pinacophyllum*, *Thecosmilia*). Crinoids were locally very numerous individually (*Encrinurus liliiformis*, *Dacocrinus gracilis*). Urchins were not very common, but an important change from the Palaeozoic to the Mesozoic type of shell took place about this time. Brachiopods were important; rostrate forms like *Terebratula* and *Rhynchonella* from this time onward became more prevalent than broad hinged genera. Pelecypods were abundant, *Myophoria*, *Halobia*, *Daonella*, *Pseudomonotis*, *Avicula*, *Gervillia* and many others. Gastropods also were numerous; at the beginning of the period, as in other groups, many Palaeozoic forms lingered on, but one of the main changes about this time was the development and expansion of siphonostomous forms with canalliculate shells. Quite the most important Mollusca were the Cephalopods. In the early Trias there still remained a few of the Palaeozoic genera, *Orhoceras*,

Hungarites, and forms which linked up the goniatites with the ammonites, which henceforth took the lead in numbers and variety. *Prionolobus*, *Aspidites*, *Colletes*, *Meekoceras*, *Tiroloites*, *Ptychites*, *Tropites*, *Ceratites*, *Avester*, *Psiloceras* and *Flemingites* are a few of the prominent Triassic genera. The nautiloids were fairly well represented, but they exhibit no such marked development from Palaeozoic to Mesozoic types as is shown among the ammonoids. In the tabulated synopsis of the Triassic system given below it has been impossible to include many of the names of groups and subordinate divisions. Some of these, such as the term "Noric" (Norian), have been used in a variety of ways. A clear account of the history of the study of the Trias will be found in K. A. von Zittel's *History of Geology and Palaeontology* (Eng. trans., London 1901).

REFERENCES.—The literature of the Trias is very voluminous. A full account, with full references as to date of publication, in *Lethaea Geognostica*, ed. by F. Frech, Theil II.: *Das Mesozoicum*, Bd. I. "Eileitung des Mesozoicum und der Trias" (F. Frech); "Continentale Trias" (E. Philipp and J. Wyszogorski), 1903; 2nd Lieferung, "Die asiatische Trias" (F. Noetting), 1905; 3rd Lieferung, "Die Alpine Trias des Mediterran-Gebietes" (G. von Hauthaber), Stuttgart, 1905. (J. A. H.)

the various units of the ring system being illustrated in the annexed formulae:—

Few simple derivatives of the α -series are known, those which have been prepared result by such reactions as the condensation of aminoguanidine or a similar type of compound (e.g. semicarbazide) with ortho-diketones (J. Thiele, *Ann.*, 1898, 302, p. 299):

Wolf has obtained a chloro-derivative by the action of potassium cyanide on diazoacetophenone and subsequent treatment with acid. The phen- α -triazines are more numerous, and are obtained either by the action of concentrated acids on the formyl compounds (E. Bamberger, *Ber.*, 1893, 26, p. 2786):—

by the reduction of symmetrical acyl-ortho-nitrophenyl hydrazines (e.g. $\text{NO}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{NH} \cdot \text{NH} \cdot \text{CHO}$); or in the form of dihydrazo derivatives by the condensation of aldehydes with ortho-aminoazo compounds (H. Goldschmidt and Y. Rosell, *Ber.*, 1890, 23, p. 487), or from the aminoazo compound and a mustard oil, the resulting thiocarbonyl derivative being heated with acetic acid (M. Busch, *Ber.*, 1899, 32, p. 2966):—

C. Harries (*Ber.*, 1895, 28, p. 1223) has also shown that α -phenylhydrazino-acetic esters, when heated with formamide and substituted formamides under pressure, yield dihydrazotriazines:—

The phen- α -triazines are yellow-coloured crystalline compounds of a somewhat basic character.

Derivatives of β -triazines are formed by the action of nitrous acid on ortho-aminobenzylamines (M. Busch, *Ber.*, 1892, 25, p. 445), or in small quantity by the action of nitrous acid on ortho-aminobenzoylphenylhydrazines (A. König and A. Reiser, *Ber.*, 1899, 32, p. 782), the chief product in this latter reaction being an isozadiazolone:

The best drawn series of the triazines is the symmetrical or cyanidine series, members of which result from the condensation of acid anhydrides with aromatic amidines (A. Pinner, *Ber.*, 1892, 25, p. 1624):

or by the condensation of aromatic nitriles with acid chlorides in the presence of aluminium chloride (Eitner and Kraft, *Ber.*, 1892, 25, p. 2263). In using benzoyl chloride in this reaction the condensation is found to proceed better if a little ammonium chloride be added:

The cyanidines behave as weak bases.

Mention may be made here of cyanuric acid, $\text{H}_2\text{C}_3\text{N}_3\text{O}_3$, which contains the same ring system as the cyanidines. It was first prepared by C. Scheele and is formed when urea is strongly heated or when cyanuric chloride is treated with water. It is usually represented by the inset formula and is closely related to cyanic acid and cyamelide, the relationships existing between the three compounds being shown in the diagram (see also A. Hantzsch, *Ber.*, 1906, 39, p. 139):

TRIAZOLES (pyrro- α and β -diazoles), in organic chemistry, a series of heterocyclic compounds containing the ring complex (annexed formula). Derivatives were obtained by J. A. Bladin ($\text{HC}=\text{N}$) (*Ber.*, 1892, 25, p. 183) by the action of acetic anhydride on dicyanophenylhydrazine (formed from cyanogen and phenylhydrazine), the resulting acetyl derivative losing water and yielding phenylmethylcyanotriazole, which, on hydrolysis, gives the free acid. By eliminating carbon dioxide, phenylmethyltriazole results. In a similar manner, formic acid and dicyanophenylhydrazine yields a phenyl-triazole carboxylic acid, in which the phenyl group may be nitrated, the nitro group reduced to the amino group, and the product oxidized to a triazole carboxylic acid, which, by elimination of carbon dioxide, yields the free triazole:

They also result when the acetylthiosemicarbazides are strongly heated, the mercapto-triazoles so formed being converted into triazoles on oxidation with hydrogen peroxide (M. Freund, *Ber.*, 1896, 29, p. 2483); by the condensation of hydrazides with acid amides; and by the distillation of the triazolones (see below) with phosphorus pentasulphide. The triazoles behave as weak bases, the imido-hydrogen being replaceable by metal.

The keto-dihydrotriazoles or triazolones are obtained by the action of hydrazines on acetyl urethane (A. Andreocci, *Ber.*, 1892, 25, p. 225). These compounds may be considered as 5-triazolones, a series of isomeric 3-triazolones resulting from the condensation of phenylsemicarbazide with aromatic aldehydes in the presence of an oxidant. The diketotetrahydrotriazoles, or urazoles, are formed by condensing urea derivatives with hydrazine salts, urazole itself resulting by the action of urea or biuret on hydrazine or its salts. It behaves as a strong acid and on treatment with phosphorus pentachloride at high temperatures gives triazole.

isomeric triazoles of the following constitutions are known:—

The osotriazoles are obtained by heating the osazones of orthodiketones with mineral acids; by the action of acetic anhydride on the hydrazoximes of orthodiketones, or by condensing diazo-methane with cyanogen derivatives (A. Peratoner and E. Azzarello, *R. Acad. Lincei*, 1907 [v.], 16, pp. 237, 318). They are feeble bases which distil unchanged. The ring is very stable to most reagents. The iminobiazoles are formed by conversion of diacylhydrazines into iminochlorides which with ammonia or bases yield the required triazoles (R. Stollé, *Journ. prak. Chem.*, 1906 [ii.], 74, pp. 1, 13). M. Busch (*Ber.*, 1905, 38, pp. 856, 4049) has isolated a series of bridged ring compounds which he describes as *endo*-iminodihydrotriazoles, the triphenyl derivative (annexed formula) being prepared by condensing triphenylaminoguanidine with formic acid. The nitrate of this base (known as *nitron*) is so insoluble that nitrates may be gravimetrically estimated with its help. These bases combine with the alkyl iodides to yield quaternary ammonium salts.

TRIBALLI, in ancient geography, a Thracian people whose earliest home was near the junction of the Angrus and Brongus (the east and west Morava), and included towards the south "the Triballian plain" (Herodotus iv. 49), which corresponds to the plain of Kossovo in Turkey. In 424 B.C. they were attacked by Sitalces, king of the Odrysae, who was defeated and lost his life in the engagement. On the other hand, they were overcome by the Autariatae, an Illyrian tribe; the date of

this event is uncertain (Strabo vii. 317). In 376 a large band of Triballi crossed Mt Haemus and advanced as far as Abdera; they were preparing to besiege the city, when Chabrias appeared off the coast with the Athenian fleet and compelled them to retire. In 339, when Philip II. of Macedon was returning from his expedition against the Scythians, the Triballi refused to allow him to pass the Haemus unless they received a share of the booty. Hostilities took place, in which Philip was defeated and nearly lost his life (Justin ix. 3), but the Triballi appear to have been subsequently subdued by him. After the death of Philip, the Triballi having taken up arms again, Alexander the Great in 334 crossed the Haemus and drove them to the junction of the Lyginus with the Danube. Their king Syrmus took refuge in Peuce (Peukè, an island in the Danube), whither Alexander was unable to follow him. The punishment inflicted by him upon the Getae, however, induced the Triballi to sue for peace (Arrian, *Anabasis*, i. 1, 4; 2, 2-4; 4, 6). About 280 a host of Gauls under Cerethrius defeated the Getae and Triballi (Justin xv. 1; Pausanias x. 19, 7). Nevertheless, the latter for some fifty years (135-84) caused trouble to the Roman governors of Macedonia. In the time of Ptolemy their territory is limited to the district between the Ciahrus (Tzibrizta) and Utus (Vid), in the modern Bulgaria, their chief town being Oescus (*Ὀίσκος Τριβαλλῶν*). Under Tiberius mention is made of Treballia in Moesia, and the Emperor Maximin (235-237) had been commander of a squadron of Triballi. The name occurs for the last time during the reign of Diocletian, who dates a letter from Triballis. The Triballi are described as a wild and warlike people (Isocrates, *Panathenaeus*, 227), and in Aristophanes (*Birds*, 1565-1693) a Triballian is introduced as a specimen of an uncivilized barbarian.

See W. Tomaschek, "Die alten Thraker" in *Sitzungsberichte der k. Akad. der Wissenschaften*, cxviii. (Vienna, 1893).

TRIBE (Lat. *tribus*, from *tres*, three), a word which is believed to have originally meant a "third part" of the people, in reference to the three patrician orders or political divisions of the people of Ancient Rome, the Ramnes, Tities and Luceres, representing the Latin, Sabine and Etruscan settlements. Its ethnological meaning has come to be any aggregate of families or small communities which are grouped together under one chief or leader, observing similar customs and social rules, and tracing their descent from one common ancestor. Examples of such "enlarged families" are the twelve tribes of Israel. In general the tribe is the earliest form of political organization, nations being gradually constituted by tribal amalgamation. (See FAMILY.)

TRIBERG, a town and health resort of Germany, in the grand duchy of Baden, in the Black Forest, pleasantly situated on the Gutach and surrounded by well-wooded hills, 2250 ft. above the sea, 35 m. by rail S.E. of Offenburg. Pop. (1905), 3717. It has four churches, one of them Anglican. Triberg is one of the chief centres of the Black Forest clock-making industry. Straw-plaiting, saw-milling, brewing, and the manufacture of wooden wares are also carried on, and the town has a permanent industrial exhibition. Triberg is what is called a *Luftkurst*, a place to which convalescents resort after a course of baths elsewhere. Near the town is the fine waterfall formed by the Gutach. Triberg came into the possession of Austria in 1654 and into that of Baden in 1806.

TRIBONIAN, the famous jurist and minister of Justinian, was born in Pamphylia in the latter part of the 5th century. Adopting the profession of an advocate, he came to Constantinople and practised in the prefectural courts there, reaching such eminence as to attract the notice of the emperor Justinian, who appointed him in 528 one of the ten commissioners directed to prepare the first *Codex* of imperial constitutions. In the edict creating this commission (known as *Haec quae*) Tribonian is named sixth, and is called "virum magnificentum, magisteria dignitate inter agentes decoratum" (see *Haec quae* and *Summa republicae*, prefixed to the *Codex*). When the commission of sixteen eminent lawyers was ordered in 529, he, far more

laborious and difficult duty of compiling a collection of extracts from the writings of the great jurists of the earlier empire, Tribonian was made president and no doubt general director of this board. He had already been raised to the office of quaestor, which at that time was a sort of ministry of law and justice, its holder being the assessor of the emperor and his organ for judicial purposes, something like the English lord chancellor of the later middle ages. The instructions given to these sixteen commissioners may be found in the constitution *Deo auctore* (*Cod.* i. 17, 1), and the method in which the work was dealt with in the constitution *Tanta* (*Cod.* i. 17, 2), great praise being awarded to Tribonian, who is therein called ex-quaestor and ex-consul, and also as magister officiorum. This last constitution was issued in December 533, when the *Digest* was promulgated as a law-book. During the progress of the work, in January 532, there broke out in Constantinople a disturbance in the hippodrome, which speedily turned to a terrible insurrection, that which goes in history by the name of Nika, the watchword of the insurgents. Tribonian was accused of having prostituted his office for the purposes of gain, and the mob searched for him to put him to death (Procop. *Pers.* i. 24-26). Justinian, yielding for the moment, removed him from office, and appointed a certain Basilides in his place. After the suppression of the insurrection the work of codification was resumed. A little earlier than the publication of the *Digest*, or *Pandects*, there had been published another but much smaller law-book, the *Institutes*, prepared under Justinian's orders by Tribonian, with Theophilus and Dorotheus, professors of law (see Preface to *Institutes*). About the same time the emperor placed Tribonian at the head of a fourth commission, consisting of himself as chief and four others—Dorotheus, professor at Beyrut, and three practising advocates, who were directed to revise and re-edit the first *Codex* of imperial constitutions. The new *Codex* was published in November 534 (see constitution *Cordi nobis* prefixed to the *Codex*). With it Tribonian's work of codification was completed. But he remained Justinian's chief legal minister. He was reinstated as quaestor some time after 534 (Procop. *Pers.* i. 25; *Anecd.* 20) and seems to have held the office as long as he lived. He was evidently the prime mover in the various changes effected in the law by the novels of Justinian (*Novellae constitutiones*), which became much less frequent and less important after death had removed the great jurist. The date of his death has been variously assigned to 545, 546 and 547. Procopius says (*Anecd.* 20) that, although he left a son and many grandchildren, Justinian confiscated part of the inheritance.

The above facts, which are all that we know about Tribonian, rest on the authority of his contemporary Procopius and of the various imperial constitutions already cited. There are, however, two articles in the *Lexicon* of Suidas under the name "Tribonianos." They appear to be different articles, purporting to refer to different persons, and have been generally so received by the editors of Suidas and by modern legal historians. Some authorities, however, as for instance Gibbon, have supposed them to refer to the same person. The first article is unquestionably meant for the jurist. It is based on Procopius, whose very words are to some extent copied, and indeed it adds nothing to what the latter tells us, except the statement that Tribonian was the son of Macedonianus, was ἀπό δικηγόρου τῶν βράρχων, and was a heathen and atheist, wholly averse to the Christian faith. The second article says that the Tribonian to whom it refers was of Side (in Pamphylia), was also ἀπό δικηγόρου τῶν βράρχων, was a man of learning and wrote various books, among which are mentioned certain astronomical treatises, a dialogue *On Happiness*, and two addresses to Justinian. None of these books relate to law; and the better opinion seems to be that there were two Tribonians, apparently contemporaries, though possibly some of the attributes of the jurist have been, by a mistake of the compilers or transcribers of the *Lexicon* of Suidas, extended to the man of letters of the same name.

The character which Procopius gives to the jurist, even if touched by personal spite, is entitled to some credence, because it is contained in the *Histories* and not in the scandalous and secret *Anecdota*. It is as follows: "Tribonian was a man of great natural powers, and had attained as high a culture as any one of his time; but he was greedy of money, capable of selling justice for gain, and every day he repealed or enacted some law at the instance of people who purchased this from him according to their several needs. . . . He

was pleasant in manner and generally agreeable, and able by the abundance of his accomplishments to cast into shade his faults of avarice" (*Pers.* i. 24, 25). In the *Anecdota* Procopius adds as an illustration of Justinian's vanity the story that he took in good faith an observation made to him by Tribonian, while sitting as assessor, that he (Tribonian) greatly feared that the emperor might some day, on account of his piety, be suddenly carried up into heaven. This agrees with the character for flattery which the minister seems to have enjoyed. The charge of heathenism we find in Suidas is probable enough; that is to say, Tribonian may well have been a crypto-pagan, like many other eminent courtiers and litterateurs of the time (including Procopius himself), a person who, while professing Christianity, was at least indifferent to its dogmas and rites, cherishing a sentimental recollection of the older and more glorious days of the empire.

In modern times Tribonian has been, as the master workman of Justinian's codification and legislation, charged with three offences—bad Latinity, a defective arrangement of the legal matter in the *Code* and *Digest*, and a too free handling of the extracts from the older jurists included in the latter compilation. The first of these charges cannot be denied; but it is hard to see why a lawyer of the 6th century, himself born in a Greek-speaking part of the empire, should be expected to write Latin as pure as that of the age of Cicero, or even of the age of Gaius and the Antonines. To the second charge also a plea of guilty must be entered. The *Code* and *Digest* are badly arranged according to our notions of scientific arrangement. These, however, are modern notions. The ancients generally cared but little for what we call a philosophic distribution of topics, and Tribonian seems to have merely followed the order of the Perpetual Edict which custom had already established, and from which custom would perhaps have refused to permit him to depart. He may more fairly be blamed for not having arranged the extracts in each title of the *Digest* according to some rational principle; for this would have been easy, and would have spared much trouble to students and practitioners ever since. As to the third complaint, that the compilers of the *Digest* altered the extracts they collected, cutting out and inserting words and sentences at their own pleasure, this was a process absolutely necessary according to instructions given them, which were to prepare a compilation representing the existing law, and to be used for the actual administration of justice in the tribunals. The so-called *Emblemata* (insertions) of Tribonian were therefore indispensable, though, of course, we cannot say whether they were always made in the best way. Upon the whole subject of the codification and legislation in which Tribonian bore a part, see JUSTINIAN.

Tribonian, from the little we know of him, would seem to have been a remarkable man, and in the front rank of the great ones of his time. There is nothing to show that he was a profound and philosophical jurist, like Papinian or Ulpian. But he was an energetic, clear-headed man, of great practical force and skill, cultivated, accomplished, agreeable, flexible, possibly unscrupulous, just the sort of person whom a restless despot like Justinian finds useful. His interest in legal learning is proved by the fact that he had collected a vast legal library, which the compilers of the *Digest* found valuable (see const. *Tanta*).

The usual criticisms on Tribonian may be found in the *Anti-Tribonianus* (1567) of Francis Hotman, the aim of which is shown by its alternative title, *Sive discursus in quo jurisprudentis Tribonianus stertilitas et legum patriarum excellentia exhibetur*; and an answer to them in J. P. von Ludewig, *Vita Justiniani et Theodorae, nec non Tribonianus* (J. Br.).

TRIBUNE (Lat. *tribunus*, connected with *tribus*, tribe), a name assigned to officers of several different descriptions in the constitution of ancient Rome. The original tribunes were no doubt the commanders of the several contingents of cavalry and infantry which were supplied to the Roman army by the early gentilian tribes—the *Tities*, the *Ramnes* and the *Luceres*. In the historical period the infantry in each legion were commanded by six tribunes, and the number six is probably to be traced to the doubling of the three tribes by the incorporation of the new elements which received the names of *Tities secundi*, *Ramnes secundi*, *Luceres secundi*. The *tribuni celerum* or commanders of the horsemen no longer existed in the later times of the republic, having died out with the decay of the genuine Roman cavalry.¹ So long as the monarchy lasted these tribunes were doubtless nominated by the commander-in-chief, the king; and the nomination passed over on the establishment of the republic to his successors, the consuls. But, as the army increased, the popular assembly insisted on having a voice in the appointments, and from 362 B.C. six tribunes were annually nominated by popular vote, while in 311 the number was raised

¹ In the legends of the foundation of the republic Brutus is represented as having exercised authority, when the king was banished, merely by virtue of holding the office of *tribunus celerum*.

to sixteen, and in 207 to twenty-four, at which figure it remained. The tribunes thus elected sufficed for four legions and ranked as magistrates of the Roman people, and were designated *tribuni militum a populo*, while those who owed their office to the consuls bore the curious title of *tribuni rufuli*. The name was traced to a commander Rutillius Rufus (Liv. 7, 5; and Fest. *Ep.* 260), but was more probably derived from the dress (Mommson, *Staatsrecht*, 1, 434). The rights of the assembly passed on to the emperors, and "the military tribunes of Augustus" were still contrasted with those nominated in the camp by the actual commanders. The obscure designation *tribunus aerarius* (tribune of the treasury) had also, in all probability, a connexion with the early organization of the army. The officer thus designated may have been the levier of the *tributum*, the original property tax, and was at any rate the paymaster of the troops. The soldier who was defrauded of his pay was allowed to exact it from this tribune by a very summary process. There was still another and important class of tribunes who owed their existence to the army. In the long struggle between the patrician and plebeian sections of the population, the first distinctions in the public service to which the plebeians forced their way were military, and the contest for admission to the consulate was, in large part, a contest for admission to the supreme command of the national forces. In 445 B.C., the year in which mixed marriages of patricians and plebeians were for the first time permitted, power was given to the senate (then wholly patrician) of determining from year to year whether consuls or military tribunes with consular authority (*tribuni militares consulari potestate et imperio*) should be appointed. But, even when the senate decided in favour of electing tribunes, no election was valid without the express sanction of the senate superadded to the vote of the centuriate assembly. If it happened to be too invidious for the senate openly to cancel the election, it was possible for the patricians to obtain a decision from the sacred authorities to the effect that some religious practice had not been duly observed, and that in consequence the appointment was invalid. According to tradition, recourse was had to this device at the first election, a plebeian having been successful. Forty-five years elapsed after the creation of the office before any plebeian was permitted to fill it, and it was held by very few down to the time at which it was abolished (367 B.C.) and the plebeians were fully admitted to the consulate. The number of consular tribunes elected on each occasion varied from three to six; there was no year without a patrician, and to the patrician members were probably confined the most highly esteemed duties, those relating to the administration of the law and to religion.

But by far the most important tribunes who ever existed in the Roman community were the tribunes of the commons (*tribuni plebis*). These were the most characteristic outcome of the long struggle between the two orders, the patrician and the plebeian. When in 494 B.C. the plebeian legionaries met on the Sacred Mount and bound themselves to stand by each other to the end, it was determined that the plebeians should by themselves annually appoint executive officers to stand over against the patrician officers—two tribunes (the very name commemorated the military nature of the revolt) to confront the two consuls, and two helpers called *aediles* to balance the two patrician helpers, the *quaestors*. The ancient traditions concerning the revolution are extremely confused and contradictory, and have caused endless discussions. The commonest story is that the masses assembled on the Sacred Mount bound themselves by a solemn oath to regard the persons of their tribunes and *aediles* as inviolable, and to treat as forfeited to Diana and Ceres, the plebeian divinities, the lives and property of those who offered them insult. That this purely plebeian oath was the real ultimate basis of the sanctity which attached to the tribunate during the whole time of its existence can hardly be believed. The revolution must have ended in something which was deemed by both the contending bodies to be a binding compact, although the lapse of time has blotted out its terms. The historian Dionysius may have been only technically wrong in supposing

that peace was concluded between the two parties by the fetial priests, and the forms adopted by Rome in making treaties with a foreign state. If this were fact, the "sacrosanctity" of the tribunes would be adequately explained, because all such formal *foedera* were "sacrosanct." But, notwithstanding that the plebeians may safely be assumed to have been conscious of having to a large extent sprung from another race than the patricians and their retainers, it is not likely that the feeling was sufficiently strong to permit of the compact taking the form of a treaty between alien powers. Yet there must have been a formal acceptance by the patricians of the plebeian conditions; and most probably the oath which was first sworn by the insurgents was afterwards taken by the whole community, and the "sacrosanctity" of the plebeian officials became a part of the constitution. There must also have been some constitutional definition of the powers of the tribunes. These rested at first on an extension of the power of veto which the republic had introduced. Just as one consul could invalidate an order of his colleague, so a tribune could invalidate an order of a consul, or of any officer inferior to him. There was no doubt a vague understanding that only orders which sinned against the just and established practice of the constitution should be annulled, and then only in cases affecting definite individuals. This was technically called *auxilium*. The cases which arose most commonly concerned the administration of justice and the levying of troops.

Although the revolution of 494 gave the tribunes a foothold in the constitution, it left them with no very definite resources against breaches of compact by the patricians. The traditional history of the tribunate from 494 to 451 B.C. is obscure, and, so far as details are concerned, nearly worthless; but there is a thread running through it which may well be truth. We hear of attacks by patricians on the newly won privileges, even of the assassination of a tribune, and of attempts on the part of the plebeians to bring patrician offenders to justice. The assembled plebeians attempt to set up a criminal jurisdiction for their own assembly parallel to that practised by the older centuriate assembly, in which the nobles possess a preponderating influence. Nay, more, the plebs attempts something like legislation; it passes resolutions which it hopes to force the patrician body to accept as valid. As to details, only a few are worth notice. In the first place, the number of tribunes is raised to ten, how we do not know; but apparently some constitutional recognition of the increase is obtained. Then an alteration is made in the mode of election. As to the original mode, the ancient authorities are hopelessly at variance. Some of them gravely assert that the appointment lay with the assembly of the *curiae*—the most ancient and certainly the most patrician in Rome, even if we allow the view, which, in spite of great names, is more than doubtful, that the plebeians were members of it at any time when it still possessed political importance. The opinion of Mommsen about the method of election is more plausible than the others. It was in accordance with the Roman spirit of order that the tribunes, in summoning their assemblies, should not ask the plebeians to come *en masse* as individuals, and vote by heads, but should organize their supporters in bands. The *curia* was certainly a territorial district, and the tribunes may have originally used it as the basis of their organization. If tribunes were elected by plebeians massed *curiatim*, such a meeting would easily be mistaken in later times for the *comitia curiata*. At any rate, a change was introduced in 471 by the Publilian Law of Volero, which directed that the tribunes should be chosen in an assembly organized on the basis of the Servian or local tribe, instead of the *curia*. This assembly was the germ of the *comitia tributa*. The question by what authority the Law of Volero was sanctioned is difficult to answer. Possibly the law was a mere resolution of the plebeians with which the patricians did not interfere, because they did not consider that the mode of election was any concern of theirs. In the first period of the tribunate the tribunes almost certainly agitated to obtain for their supporters a share in the benefits of the state domain. And, whatever view may be taken of the movement which led

to the decemvirate, an important element in it was of a certainty the agitation carried on by the tribunes for the reduction of the law of Rome to a written code. Until they obtained this it was impossible for them effectually to protect those who appealed against harsh treatment by the consuls in their capacity of judges.

During the decemvirate the tribunate was in abeyance. It was called into life again by the revolution of 449, which gave the tribunes a considerably stronger position. Their personal privileges and those of the aediles were renewed, while sacrosanctity was attached to a body of men called *judices decemviri*, who seem to have been the legal assistants of the tribunes. The road was opened up to valid legislation by the tribunes through an assembly summoned by them on the tribe-basis (*concilium plebis*), but in this respect they were submitted to the control of the senate. The growth of the influence of this assembly over legislation belongs rather to the history of the *comitia (q.v.)* than to that of the tribunate. After the Hortensian Law of 287 B.C. down to the end of the republic the legislation of Rome was mainly in the hands of the tribunes. The details of the history of the tribunate in its second period, from 449 to 367 B.C., are hardly less obscure than those which belong to the earlier time. There was, however, on the whole, undoubtedly an advance in dignity and importance. Gradually a right was acquired of watching and interfering with the proceedings of the senate, and even with legislation. Whether the absolute right of veto had been achieved before 367 may well be doubted. But the original *auxilium*, or right of protecting individuals, was, during this period, undergoing a very remarkable expansion. From forbidding a single act of a magistrate in relation to a single person, the tribunes advanced to forbidding by anticipation all acts of a certain class, whoever the persons affected by them might prove to be. It therefore became useless for the senate or the *comitia* to pass ordinances if a tribune was ready to forbid the magistrates to carry them out. Ultimately the mere announcement of such an intention by a tribune was sufficient to cause the obnoxious project to drop; that is to say, the tribunes acquired a right to stop all business alike in the deliberative assembly, the senate, and in the legislative assemblies, the *comitia*. The technical name for this right of veto is *intercessio*. To what extent the tribunes during the time from 449 to 367 took part in criminal prosecutions is matter of doubt. The XII Tables had settled that offenders could only be punished in person by the centuries, but tradition speaks of prosecutions by tribunes before the tribes where the penalty sought was pecuniary. The two main objects of the tribunes, however, at the time which we are speaking were the opening of the consulate to plebeians and the regulation of the state domain in the interests of the whole community. Both were attained by the Licinio-Sextian Laws of 367.

Then a considerable change came over the tribunate. From being an opposition weapon it became an important wheel in the regular machine of state. The senate became more and more plebeian, and a new body of nobility was evolved which comprised both orders in the state. The tribunes at first belonged to the same notable plebeian families which attained to the consulate. The old friction between senate and tribunes disappeared. It was found that the tribunate served to fill some gaps in the constitution, and its power was placed by common consent on a solid constitutional basis. From 367 to 134 B.C. (when Tiberius Gracchus became tribune) the tribunate was for the most part a mere organ of senatorial government. As the change made by the Gracchi was rather in the practice than in the theory of the tribunate, it will be convenient at this point to give a definite sketch of the conditions and privileges attaching to the office.

Even after the difference between patrician and plebeian birth had ceased to be of much practical consequence in other directions, the plebeian character was a necessity for the tribune. When the patricians P. Sulpicius Rufus and, later, P. Clodius (the antagonist of Cicero) desired to enter on a demagogic course, they were compelled to divest themselves of their patrician quality by a peculiar legal process. Even the patricians who became so by mere fiat of the emperors were excluded from the tribunate. The other necessary qualifications were for the most part such as attached to the other Roman magistracies—complete citizenship, absence of certain conditions regarded as disgraceful, fulfilment of military duties. The minimum age required for the office was, as in the case of the quaestorship, twenty-seven. The tribunate, however, stood outside the round of magistracies, the conditions of which were regulated by the Villian Law of 189 B.C. The election took place in a purely plebeian assembly, ranged by tribes, under the presidency of a tribune selected by lot. The tribune was bound by law to see a complete set of ten tribunes appointed. Technically, the tribunes were reckoned, not as magistrates of the Roman people, but as magistrates of the Roman plebs; they therefore had no special robe of office, no lictors, but only messengers (*subsellatores*), no official chair, like the curule seat, but only benches (*subsellia*). Their right to summon the plebs together, whether for the purpose of listening to a speech (in which case the meeting was a *contio*) or for passing ordinances (*comitia tributa*), was rendered absolute by the "laws under sacred sanction"

(*leges sacratæ*), which had been incorporated with the constitution on the abolition of the decemvirate. The right to summon the senate and to lay business before it was acquired soon after 367, but was seldom exercised, as the tribunes had abundant means of securing what they wanted by pressure applied to the ordinary presidents—the consuls or the praetor. When an *interregnum* came about and there were no "magistrates of the Roman people," the plebeian tribunes became the proper presidents of the senate and conductors of ordinary state business. At the end of the republic there were *interregna* of several months' duration, when the tribunes held a position of more than usual importance. A tenure of the tribunate did not, until a comparatively late period (probably about the time of the Second Punic War), confer a claim to a permanent seat in the senate. The candidates for the office were mainly young men of good family who were at the beginning of their political career, but the office was often filled by older men of ambition who were struggling upwards with few advantages. The plebeian aediles very soon after 367 became dissociated from the tribunes and associated with the curule aediles, so that in the political hierarchy they really ranked higher than those who were originally their superior officers.

The real kernel of the tribune's power consisted in his *intercessio*, or right of invalidating ordinances, whether framed by the senate or proposed by a magistrate to the *comitia*, or issued by a magistrate in pursuance of his office. From 367 B.C. down to the time of the Gracchi the power of veto in public matters was, on the whole, used in the interests of the aristocratic governing families to check opposition arising in their own ranks. A recalcitrant consul was most readily brought to obedience by an exercise of tribunician power. But, although modern readers of the ancient historians are apt to carry away the idea that the tribunate was an intensely political office, it is safe to say that the occasions on which tribunes found it possible to play a prominent part in politics were extremely few, even in the late republic. On the other hand, the tribunes found a field for constant activity in watching the administration of justice and in rendering assistance to those who had received harsh treatment from the magistrates. The tribunes were, in fact, primarily legal functionaries, and constituted in a way the only court of appeal in republican Rome. It was to this end that they were forbidden to pass a whole night away from the city, except during the Latin festival on the Alban Mount, and that they were expected to keep their doors open to suppliants by night as well as by day. They held court by day in the Forum close by the Porcian basilica, and frequently made elaborate legal inquiries into cases where their help was sought. Naturally this ordinary humdrum work of the tribunes has left little mark on the pages of the historians, but we hear of it not infrequently in Cicero's speeches and in other writings which deal with legal matters. According to the general principle of the constitution, magistrates could forbid the acts of magistrates equal to or inferior to themselves. For this purpose the tribunes were deemed superior to all other officers. If a tribune exercised his veto on another tribune could annul it, for the veto could not be itself vetoed, but it was possible for another tribune to protect a definite individual from the consequences of disobedience. The number of the tribunes (ten) made it always possible that one might balk the action of another, except at times when popular feeling was strongly roused. In any case it was of little use for a tribune to move in any important matter unless he had secured the co-operation or at least the neutrality of all his colleagues. The veto was not, however, absolute in all directions. In some it was limited by statute; thus the law passed by Gaius Gracchus about the consular provinces did not permit a tribune to veto the annual decree of the senate concerning them. When there was a dictator at the head of the state, the veto was of no avail against him. One of the important political functions of the tribunes was to conduct prosecutions of state offenders, particularly ex-magistrates. These prosecutions began with a sentence pronounced by the tribune upon the culprit, whereupon, exercising the right given him by the XII. Tables, the culprit appealed. If the tribune sought to inflict punishment on the culprit's person, the appeal was to the assembly of the centuries; if he wished for a large fine, the appeal was to the assembly of the tribes. As the tribune had no right to summon the centuries, he had to obtain the necessary meetings through the urban praetor. In the other event he himself called together the tribune assembly and proposed a bill for fining the culprit. But the forms of trial gone through were very similar in both cases.

It is commonly stated that a great change passed over the tribunate at the time of the Gracchi, and that from their day to the end of the republic it was used as an instrument for setting on foot political agitation and for inducing revolutionary changes. This view is an inversion of the facts. The tribunate did not create the agitation and the revolutions, but these found vent through the tribunate, which gave to the democratic leaders the hope that acknowledged evils might be cured by constitutional means, and in the desperate struggle to realize it the best democratic tribunes strained the theoretic powers of their office to their ruin. For the bad tribunes did not hesitate to use for bad ends the powers which had been strained in the attempt to secure what was good. But herein the tribunate only fared like all other parts of the republican constitution in its last period. The consuls and the senate were at least as guilty

as the tribunes. After a severe restriction of its powers by Sulla and a restoration by Pompey, which gave a twenty years' respite, the essential force of the tribunate was merged into the imperial constitution, of which indeed it became the principal constituent on the civil side. The ten tribunes remained, with very restricted functions. The emperors did not become tribunes, but took up into their privileges the essence of the office, the "tribunician authority." This distinction between the principle of the office and the actual tenure of the office was a creation of the late republic. Pompey, for example, when he went to the East, was not made proconsul of all the Eastern provinces, but he exercised in them a "proconsular authority" which was equal to that of the actual proconsuls—an authority which was the germ of the imperial authority on its military side. Similarly the emperor, as civil governor, without being tribune, exercised powers of like quality with the powers of the tribune, though of superior force. By virtue of his tribunician authority he acquired a veto on legislation, he became the supreme court of appeal for the empire, and to his person was attached the ancient sacrosanctity. Augustus showed the highest statesmanship in founding his power upon a metamorphosed tribunate rather than upon a metamorphosed dictatorship, upon traditions which were democratic rather than upon traditions which were patrician and optimate. The tribunes continued to exist till a late period, with gradually vanishing dignity and rights, but it is not necessary here to trace their decay in detail.

The name "tribune" was once again illuminated by a passing glory when assumed by Cola di Rienzi. The movement which he headed was in many respects extremely like the early movements of the plebeians against the patricians, and his scheme for uniting Italy in one free republic was strangely parallel with the greatest dream of the Gracchi.

The history of the tribunate is interwoven with that of Rome, and must, to a large extent, be sought for in the same sources. The principles attaching to the office are profoundly analysed by Mommsen in his *Staatsrecht*, and are clearly set forth by E. Herzog in his *Geschichte u. System der römischen Staatsverfassung* (Leipzig, 1884). (J. S. R.)

TRIBUNE (med. Lat. *tribuna*, from classical Lat. *tribunal*), in architecture, the term given to the semicircular apse of the Roman basilica, with a raised platform, where the presiding magistrate sat; subsequently applied generally to any raised structure from which speeches were delivered and to the private box of the emperor at the Circus Maximus. In Christian basilicas the term is retained for the semicircular recess behind the choir, as at S. Clemente in Rome, S. Apollinare in Classe, Ravenna, S. Zeno at Verona, S. Miniato near Florence, and other churches. The term is also loosely applied to various other raised spaces in secular as well as ecclesiastical buildings, in the latter sometimes in the place of "pulpit," as in that of the refectory of St Martin des Champs at Paris. It is also given to the celebrated octagon room of the Uffizi at Florence, and sometimes to a gallery or triforium.

TRIBUTE (Lat. *tributum*, a stated payment, contribution), a sum of money or other valuable thing paid by one state or person to another state or person, either as an acknowledgment of submission, or as the price of peace or protection. Hence, in a secondary sense, an offering to mark respect or gratitude. Revenue by means of tribute was one of the most characteristic forms of the financial systems of ancient states. In imperial Athens large revenues were derived from the states of the Delian league (*q.v.*), while in both Carthage and Rome inferior or dependent districts and races were laid under contribution to a very considerable extent (see FINANCE).

The word tribute was also applied in the Roman republic to (1) certain extraordinary taxes, as opposed to the ordinary vectigalia. Such, in particular, were certain property taxes, raised to meet the expenses of war. They were levied on all citizens alike, in proportion to the extent of a man's fortune, and varied according to the total amount of revenue to be raised. (2) To the ordinary *stipendium* or tax of fixed amount paid either in money or in kind, on property, trades, or as a poll-tax, raised in the Roman provinces (see PROVINCES).

TRICHINOPOLY, a city and district of British India, in the Madras presidency. The city is on the right bank of the river Cauvery, 250 m. by rail S.W. from Madras. Pop. (1901), 104,721. The fort which forms the nucleus of the city measures about 1 m. by $\frac{1}{2}$ m.; its defences have been removed. Within it rises the Rock of Trichinopoly, 273 ft. above the city, and so completely isolated as to provide a remarkable view over the surrounding plains. It is ascended by a covered stone staircase, entered by a carved gateway, and profusely ornamented. At

intervals up this stair are chambers connected with the temple on the rock. Buddhist inscriptions and carvings in some of them are attributed to the 5th or 6th century. Near the foot of the rock is a fine masonry tank called the Teppakulam, and the palace of the nawab, of which the fine domed audience hall is now used as a town-hall. In Trichinopoly is St Joseph's first-grade college, maintained by the Jesuit mission and occupying, among other buildings, a house formerly the residence of Clive. Another first-grade college is maintained by the Society for the Propagation of the Gospel; it has grown out of schools founded by the missionary Schwarz. The Roman Catholics have a fine cathedral. Trichinopoly is important as a trading centre, especially as being a railway junction. It has special industries in goldsmiths' work and modelling in pith, the well-known Trichinopoly cigars are chiefly manufactured from tobacco grown outside the district at Dindigul. Trichinopoly and its neighbourhood was the scene of much hard fighting between the English and the French during the Carnatic wars between 1749 and 1761.

The DISTRICT OF TRICHINOPOLY has an area of 3632 sq. m. The surface is generally flat, though diversified by masses of crystalline rock, of which the Trichinopoly Rock in the fort is a well-known example. The only mountains are the Pachamalais, which rise to 2500 ft. and extend into Salem district. The Cauvery and its branch, the Coleroon, are the only rivers of any importance. The climate is very hot and not liable to great variations; the annual average rainfall is about 34 in. The principal crops are rice, millets, other food-grains and oil-seeds, with a little cotton and tobacco. The main line of the South Indian railway traverses the district, with a branch to Erode. In 1901 the population was 1,444,770, showing an increase of 5% in the decade. The district came into the hands of the British along with the rest of the Carnatic in 1801.

See *Trichinopoly District Gazetteer* (Madras, 1907).

TRICHINOSIS, or **TRICHINIASIS**, a disease, in man and other animals, caused by infection by the parasite *trichina* or *trichinella spiralis*. The presence of encysted trichinae in the muscles was discovered by Sir James Paget (*q.v.*) in 1835, and they were named by Sir R. Owen; but it was not until some years after that the clinical characters of the acute disease caused by the invasion of the parasite were discovered. This discovery was made in 1860 by Friedrich von Zenker (1825-1898) on examining the abdominal muscles of a patient who died at Dresden with symptoms taken to be those of typhoid fever, the case being afterwards accounted one of trichinosis on the post mortem evidence. Epidemics of this disease occur from time to time, especially in north Germany, from the eating of uncooked swine's flesh, in which trichinae are not uncommon. Out of 6329 cases in Germany during the years 1881 to 1898, 5456 occurred in states where raw pork is a common article of food. And, from the point of view of public health, the hog is the animal which is the main source of infection, others—except rats—being only rarely infested with the parasite. The greatest care is now taken to examine the carcasses of swine for trichinae, a piece of the diaphragm of every animal being searched with the microscope by an inspector specially appointed, and the trichinous hogs being condemned. But it has not been found that this microscopic examination serves as an effective check, indeed it is apt to create a false feeling of security. Over 32% of the German cases of trichinosis between 1881 and 1898 were traced to meat so inspected and passed as free from trichinae. In America accordingly microscopic examination is not considered to give any guarantee of soundness from trichinae, in spite of a government mark "inspected and passed" (see B. H. Ransom, Circular 108 of U.S. Dep. of Agriculture, 1907). The symptoms in man are occasioned by the presence of the free parasites in the intestine, by the development of young trichinae from the eggs, and most of all by the migration of the parasites from the intestinal canal to the muscles, where they become quiescent. This cycle occupies from four to six weeks. Lime-salts become deposited in the capsule, the calcification rendering the cyst visible, and this change usually takes five or six months. When consumed in

small quantity, the parasites may give rise to no marked symptoms, and they are sometimes found accidentally in muscular fibre in the bodies of those who had probably experienced no definite symptoms from their invasion. In the more acute and serious cases, sometimes ending fatally, the early symptoms are nausea, failure of appetite, diarrhoea and fever, later, when the migration to the muscles begins, there is more fever, stiffness, pain and swelling in the limbs, swelling of the eyelids, continued exhausting diarrhoea, perspirations and sometimes delirium. During convalescence there is desquamation of the cuticle. The discovery by T. R. Brown of a marked leucocytosis with an extraordinary increase of eosinophiles now enables a diagnosis to be made in cases where the symptoms are obscure. If the diagnosis be made early in the case, brisk purgatives, particularly calomel, are the best treatment, if the parasites are already on their way to the muscles, the only thing left to do is to support the patient's strength. There need, however, be no fear of infection at all if the meat be thoroughly cooked and cured before eaten. This is the only effective precaution.

TRICK, a crafty or fraudulent device, deceitful artifice or stratagem, hence an exhibition of skill, especially in sleight of hand or jugglery, the term being also used of a peculiar trait or manner of speech, character or physical habit. A specific use is that for the cards played at a single round, which are taken up and count towards the winning of the game. The origin of the word is ultimately to be found in Lat. *tricae*, trifles, hindrances, wiles, whence *tricoli*, to delay, shuffle, play tricks, which has also given "intricate," "extricate," "intrigue." The M. Eng. *trichen*, to cheat or trick, was adapted from the O. Fr. *trichier*, *trechier*, whence came *trecherie*, Eng. "treachery," a betrayal of faith, perfidy or trickery of the grossest kind. There has been also a confusion, which has influenced the meaning and form of "trick," with the Dutch *trekken*, to pull, draw, cf. the South African Dutch *trek*, a journey, migration, properly the action of drawing a vehicle or travelling by ox-wagon. "Trick" or "tricking" is thus used, in heraldry, as the technical term for the drawing of a coat of arms in monochrome, giving the tinctures by the conventions of vertical, horizontal or diagonal lines, &c.

TRICLINIUM, in Roman antiquities, a set of three couches (*lecti*) arranged round a four-sided dining table, one side of which was left open to provide free access for the attendant slaves. These couches were distinguished as the highest (A, *lectus summus*), the middle (B, *lectus medius*) and the lowest (C, *lectus imus*); the guests who reclined on B had A on their left and C on their right. Each couch was usually occupied by three persons, whose left arm rested on a cushion, the right hand being thus disengaged for purposes of eating. The nine places were allotted in accordance with strict etiquette. A and B were reserved for the guests (B for the most distinguished), C for the host and his family. In A and C the chief place was 1; in B it was 3, which

was consequently the place of honour at the banquet. It was called *locus consularis* (*ὀψαριῶν*), probably as being next to the host. Another explanation is that, since it was on the open and unsupported side of the couch, it was chosen in order that, if a consul happened to be present among the guests, he might be able to receive communications, sign documents or transact business with the least inconvenience. It the *locus classicus* in Horace (*Satires*, ii. 8, 20-23), which describes the banquet given by Nasidienus in honour of Maecenas, the host appears

to have resigned his place to Nomentanus, as being more capable of entertaining the guest of the evening. In later republican times, after the introduction of round tables of citrus wood, the three couches were replaced by one of crescent shape (called *sigma* from the form C of the Greek letter; also *stibadium* and *ocubium*), which as a rule was only intended to hold five persons. The two corner seats (*cornse*) were the places of honour, that on the right being considered superior. The remaining seats were reckoned from left to right, so that the least important seat was on the left side of the most important. The use of the *sigma* continued till the middle ages. The dining-room itself was also called *triclinium*, and in the houses of wealthy Romans there were several *triclinia* suited to the different seasons of the year.

See Marquardt, *Das Privatleben der Römer* (1886), p. 302.

TRICOUPIS (or TRICOUPI), **CHARILAOS** (1832-1896), Greek statesman, was born at Nauplia in 1832. After studying law and literature in Athens and in Paris, he was sent to London in 1852 as an attaché of the Greek legation. By 1863 he had risen to be chargé d'affaires, but he aimed rather at a political than a diplomatic career. In 1865, therefore, after he had concluded the negotiations for the cession by Great Britain to Greece of the Ionian Islands, he entered the Greek chamber of deputies, and in the following year was made foreign minister, at the early age of thirty-four. In 1875 he became prime minister for a few months, but had no opportunity even to begin carrying out the policy which he had in mind. This policy was to develop the resources of his country so as to create an army and a fleet, and thus to give Greece the power to acquire a leading place among the nations of south-eastern Europe. It was not until 1882 that he was able to take measures to this end. In that year he became prime minister for the third time (his second period of office, two years earlier, had lasted only for a few months), and at once set about the task of putting Greek finance upon a firmer basis, and of increasing the prosperity of the country by making roads, railways and harbours. He was defeated at the general election in 1885, but in the following year he resumed office, and again took up the labour of economic and financial reform. His difficulties were now increased by the large expenditure which had been incurred for military preparations while he had been out of office as the result of the union effected between Bulgaria and eastern Rumeia. The Greeks had demanded from Turkey a compensation for this shifting of the balance of power, and had prepared to enforce their demand by an appeal to arms. The Great Powers, however, had interfered, and by blockading the Piræus had compelled Greece to remain quiet. Tricoupis, nevertheless, believed that he could in a few years raise the value of Greek paper currency to par, and upon that assumption all his calculations were based. Unfortunately for himself and his country, he was not able to make his belief good. His dexterity in finance called forth general admiration, and his schemes for the construction of roads and railways met with a certain amount of success. But at last he was obliged to recognize that the warnings offered to him had been sound. Greece could not meet her obligations. Tricoupis tried to make terms with the creditors of his nation, but he failed in this also. The first taxation which he proposed aroused great hostility, and in January 1895 he resigned. At the general election, four months later, he and his party were defeated. He at once retired from public life, and soon afterwards the disease declared itself which eventually proved fatal. He died at Cannes on the 11th of April 1896. The faults of excessive ambition and of a far too sanguine optimism, which marked Tricoupis' character, could not prevent him from being regarded, even during his lifetime, as the foremost Greek statesman of his time. He was not a favourite with the populace, nor was he beloved so much as respected by his followers. By nature he was reserved—his nickname was "the Englishman"—and he had no sympathy with the arts of the demagogue. But, both in the ranks of his own party and by the nation at large, his abilities and his force of character were unquestioned. It was his misfortune that the

circumstances of the time did not allow his wide schemes for the benefit of his country to be carried into effect. (H. H. F.)

TRICOUPIS, SPYRIDION (1788-1873), Greek author and statesman, son of the primate of Missolonghi, was born on the 20th of April 1788. After studying in Paris and London he became private secretary to the fifth earl of Guilford, who resided in the Ionian Islands. He was a friend of Lord Byron, and pronounced his funeral oration in the cathedral of Missolonghi (1824). During the Greek War of Independence he occupied several important administrative and diplomatic posts, being a member of the provisional government in 1826 and of the national convention at Troezen in 1827, and president of the council and minister of foreign affairs in 1832. He was three Greek minister in London (1835-1838, 1841-1843 and 1850-1861), and in 1850 envoy-extraordinary to Paris. After the Revolution he became minister of foreign affairs and of public instruction, and held portfolios in several subsequent short-lived ministries. He died on the 24th of February 1873.

A collection of his earlier religious and political orations was published in Paris in 1836. His chief work is a history of the Greek insurrection, *Ἱστορία τῆς ἀλλοτρίτης ἐπανάστασεως* (4 vols., London, 1853-1857; 2nd ed., 1862). He also wrote a martial poem, *Ὁ θῆρος. Ποίημα κλειστέον* (Paris, 1821).

TRICYCLE (from prefix *tri*, three, and Gr. *κύκλος*, circle, wheel). The tricycle, as a machine for pleasure riding, has steadily diminished in relative importance since the advent of the safety bicycle (see CYCLOC). In its modern form it is a chain-driven rear-driver. The driving axle is provided with a differential gear, which allows of both wheels being driven whether the tricycle is moving in a straight or in a curved path. There are four rows of balls, two near the middle resting the pull of the driving chain and two near the road wheels supporting the vertical load. Two types of driving axle are in use. In one the axle is supported from a parallel frame tube by four short brackets. In the other type, the Starley-Ahington axle, the frame tube is concentric with the axle, and the middle portion is enlarged to form a casing for the chain-wheel, with two apertures for the chain to pass through. The other mechanical details are nearly all similar to those on a bicycle.

Carrier tricycles, for tradesmen's delivery purposes, are made in two types, one with an extended wheel base and the carrier behind the rider, the other with a single rear driving wheel, the two steering wheels and the carrier being mounted in front on a transverse tube or frame which is jointed to the rear frame at the steering head. The second arrangement gives the simplest possible form of tricycle, but it is unsuited for touring purposes.

Tricars.—The tricar or motor tricycle was first made by removing the front wheel of a motor bicycle and replacing it by a frame carrying two side steering wheels and a seat. With a powerful engine this arrangement gives a light vehicle from which good performances are obtained on roads with easy gradients. On steeper gradients the power must be increased, and the belt drive with only one speed is inadequate. The modern tricar is on different lines, resembling a small motor car on three wheels. The engine is 6 to 10 h.p., preferably with two cylinders, air or water cooled, with clutch and gear-box giving two or three speeds, sometimes also a "reverse" speed. The transmission is usually by a chain from the engine shaft to the gear-box, thence by another chain to the rear road wheel. The frame or chassis is supported on the three road wheels by springs. The steering gear is on the same general lines as that of a motor car. The weight of a tricar of 7 to 10 h.p. is between 700 and 1000 lb. It is a much faster vehicle, especially uphill, than a small car of equal price. The rear tire, however, is subject to severer working conditions than the two driving wheel tires of a small car, and must be of adequate strength, or trouble will be frequent.

The tricar cannot be said to have attained to the same degree of trustworthiness and freedom from breakdown as the motor bicycle or motor car. The rear tire is difficult to remove, in case of puncture. The chain drive, direct from a small chain-wheel on the engine shaft, is faulty in principle. The engine shaft running often at 2000 revolutions per minute, the chain is necessarily noisy,

and is subject to continual gradual stretching, necessitating frequent readjustment. In all respects, except speed, the tricar is inferior to the small car. (A. Sp.)

TRIDENT (Lat. *tridens*, *tri-*, three and *dens*, tooth), a three-toothed or three-pronged fork or spear. It is and has been from primitive times the typical instrument for spearing fish, the Scottish "leister" (Norw. *høster*), and was thus taken as the badge or emblem of the Greek Poseidon, the god of the sea. In Homer (cf. *Il.* xii. 27; *Od.* lv. 506 seq.) Poseidon is armed with the *trifida* (another word is *tridobos*, cf. Pind. *Ol.* ix. 45). The trident as the symbol of the sovereignty of the sea is found as early as Archilochus (c. 700 B.C.); a more familiar example is to be found in Aristophanes (*Eg.* 839). The emblematic figure of Britannia holds the trident as mistress of the sea. In the gladiatorial shows of ancient Rome the *retiaris* was armed with a trident as a weapon.

TRIDYMITE, a mineral consisting of silicon oxide or silica, SiO₂, but differing from quartz in crystalline form. The crystals are small, thin hexagonal plates or scales, which are usually twinned together in groups of three; hence the name of the mineral, from Greek *τρίδυμος*, triplet. The apparent hexagonal plates are themselves pseudo-symmetric twins of optically biaxial material, and the exact crystalline form is doubtful. The plates are colourless and transparent and have a vitreous lustre. The hardness is 7 and the specific gravity 2.3 (that of quartz being 2.65). Unlike quartz, it is soluble in a boiling solution of sodium carbonate. Tridymite occurs in the cavities of acid volcanic rocks (rhyolite, trachyte and andesite); the best-known localities are Cerro San Cristobal near Pachuca in Mexico, the Euganean Hills near Padua, and the Siebengebirge on the Rhine. Probably identical with tridymite is the form of silica known as asmanite, found in the meteorite which fell at Breitenbach in the Erzgebirge, Bohemia. (L. J. S.)

TRIER (French *Tréves*), an ancient city of Germany, formerly the capital of an archbishopric and electorate of the empire, and now the seat of a Roman Catholic bishop and the chief town of a governmental department in the Prussian province of the Rhine. Pop. (1885) 33,019, (1905) 46,709 (86% Roman Catholics). It is situated on the right bank of the Moselle, about 6 m. from the frontier of Luxemburg and 69 m. S.W. of Coblenz, on the main lines of railway from Coblenz to Metz and from Cologne to Saarbrücken. The city lies in a fertile valley shut in by vine-clad hills, and the picturesque red sandstone buildings of the old town are interspersed with orchards and gardens. On the north, east and south boulevards with gardens follow the line of the medieval walls, which have mostly disappeared. The Roman city extended much farther south and east.

Trier contains more important Roman remains than any other place in northern Europe. Perhaps the oldest remains are some of the piers and buttresses of the bridge over the Moselle, which may date from about 28 B.C. The well-preserved amphitheatre just outside the modern town to the south-east was probably built in the reign of Trajan or Hadrian. Its eastern side is built into the hill, its longer diameter is 76 yds., and it accommodated seven or eight thousand spectators. In 306 the emperor Constantine the Great caused multitudes of Frankish prisoners to be thrown to the beasts here, and in 313 made a similar spectacle of the captive Bructeri. The most remarkable Roman building in Trier is the *Porta Nigra*, the north gate of the city, a huge fortified gateway, 115 ft. long, 75 to 93 ft. high and 29 ft. deep, built of sandstone blocks blackened with age (whence the name), and held together with iron clamps. The age of this building is very uncertain; it has been assigned to dates ranging from the 1st to the 4th century A.D. It is also called the *Simeonstator*, after a Greek hermit who inhabited it. On his death in 1035 Archbishop Poppo converted the gate into two churches, one above the other, but all the additions except the apse have now been removed. In the south-east corner of the city are the picturesque ruins of the Roman imperial palace, and near the bridge are the extensive substructures of the 3rd-century Roman baths, 660 ft. in length. On the Co

plate stands the magnificent brick basilica, probably of the age of Constantine, though the south and east walls are modern. Having been converted into a palace for the Frankish kings and their deputies, it passed in 1107 to the archbishops, and was restored (1846-1856) and turned into a Protestant church. The adjoining barracks were formerly the elector's palace. Another Roman basilica forms the nucleus of the cathedral. Built under the emperors Valentinian I. and Gratian as a quadrilateral hall with four huge granite columns (now removed) in the centre, it was converted into a church about the close of the 4th century, and restored by Bishop Nicetius about 550. It is the most important pre-Carolingian church in Germany. Archbishop Poppo and his successors in the 11th and 12th centuries extended the cathedral westwards and added an apse at each end. The vaulting of the nave and aisles and the beautiful cloisters were added in the 13th century. In the vaults are buried twenty-six archbishops and electors. Among the monuments are those of the electors Richard von Greiffenklau (d. 1537) and Johann von Metzhausen (d. 1540), fine examples of German Renaissance work. The most famous of the relics preserved in the cathedral is the "Holy Coat of Trier," believed by the devout to be the seamless robe of the Saviour, and said to have been discovered and presented to the city by the empress Helena. Since 1512 it has been periodically exhibited. The exhibition of 1844, which was attended by more than a million pilgrims, aroused protests, resulting in the formation of the sect of German Catholics (*q.v.*). In 1891 nearly two million pilgrims viewed the coat, and eleven miraculous cures were claimed.

The cloisters coalesce the cathedral with the church of Our Lady (*Liebfrauenkirche*), a beautiful building in the form of a circle intersected by a cross, with a lofty vault, built 1127-1143, and said to be the oldest Gothic church in Germany.

The earliest churches were without the walls. Of these St Matthias in the south, now represented by a 12th-century building, has a Christian cemetery of the Roman age.

In the market-place is the market cross, said to date from 958, and a beautiful Renaissance fountain, the *Petersbrunnen*, erected in 1595. Close by are the *Steipe* or *Rotes Haus*, formerly the town hall, of the 15th century, and the *Frankenturm* or *propugnaculum*, of the 10th century, said to be the oldest stone domestic building in Germany.

The Provincial Museum (1885-1889) contains many Roman and medieval antiquities. The town library contains about 100,000 volumes, including some valuable examples of early printing. Among its most treasured MSS. are the *codex aureus*, a copy of the gospels presented to the abbey of St Maximin by Ada, a reputed sister of Charlemagne, and the *codex Egberti* of the 10th century.

At Igel near Trier is a very remarkable Roman column, 83 ft. high, adorned with sculptures. It dates from the 2nd century, and was the family monument of the Secundini. At Nennig is a fine Roman mosaic pavement.

The industries of Trier include iron-founding, dyeing and the manufacture of machinery. There is a school of viticulture and a very considerable trade in Moselle wines, especially during the annual auctions.

History.—Trier had had two periods of greatness, firstly as the favourite residence of Constantine the Great and his successors in the west, and secondly as the capital of a powerful spiritual electorate.

The Treveri or Treviri, from whom the city derived its name, were one of the most powerful tribes among the Belgae, and according to Julius Caesar, who conquered them in 56 B.C., possessed the best cavalry in Gaul. Attempts have been made to show that they were of German origin (see BELGAE), but although they were doubtless subject to Germanic influences, they spoke a Celtic language. Their chiefs, Indutiomarus, who raised a rebellion against the Romans in 54 B.C., and his successor Ungeborix, the names of St Jerome, who had written the *De Virginitate* in his day (c. 370), and the *De Civitate Dei* under Julius

Florus in A.D. 31 was soon quelled. The Roman city, Augusta Treverorum, was probably fortified by Augustus about 14 B.C., and organized as a colony about A.D. 50 in the reign of Claudius, but is not mentioned before the war of Civilis in 69 (Tacitus, *Hist. iv.*). At first the Treveri resisted the appeal of Civilis and his Batavi to join the revolt, and built a defensive wall from Trier to Andernach, but soon after the two Treverans, Tutor and Classicus, led their fellow tribesmen, aided by the Lingones (Langres), in the attempt to set up a "Gallic empire." After a brief struggle the rebels were overthrown at Trier by Cerialis, and 113 senators emigrated to Germany (70). Towards the end of the 3rd century, the inroads of the Franks having been repelled by the emperor Probus, the city rapidly acquired wealth and importance. Mainly on account of its strategic position, Diocletian on his reorganization of the empire made Trier the capital not only of *Belgica Prima*, but of the whole "diocese" of Gaul. For a century, from Maximian to Maximus (286-388), it was (except under Julian, who preferred to reside in Paris) the administrative centre from which Gaul, Britain and Spain were ruled, so that the poet Ausonius could describe it as the second metropolis of the empire, or "Rome beyond the Alps." Constantine the Great, who generally resided here from 306 to 331, and his successors also, beautified the city with public works, and villas arose upon the hill-sides.

The Church added a lustre of a different kind. Legend associated Trier with the martyrdom of part of the Theban legion (c. 286) and with the relics found by St Helena in the Holy Land. St Agrius (d. 332) is the first historical bishop. Four great saints of the 4th century are connected with the city. It was the scene of the first banishment of St Athanasius in 336. A baseless legend relates that he composed the *Qui-cunque Vult* while hiding here in a cistern. St Amrose, one of the greatest sons of Trier, was born here about 340. St Jerome's mind was first seriously directed to religion while studying at Trier about 370, and St Martin of Tours came in 385 to plead with the tyrant Maximus for the lives of the heretic Priscillian and his followers.

The Franks, who had thrice previously sacked the city, gained permanent possession of it about 455. Although some Frankish kings resided here, it gradually yielded place to Metz as a Frankish capital. The great bishop St Nicetius (528-566), who was banished for rebuking the vices of king Clotaire I. and eulogized by the poet Venantius Fortunatus, repaired the cathedral, and built a splendid castle for himself. The city passed to Lorraine in 843, and to the East Frankish kingdom in 870. It was sacked by the Northmen in 881. Hetti, who occupied the see from 814 to 847, is said to have been the first archbishop of Trier, and Radbod acquired the rights of the counts of Trier in 803, thus founding the temporal power of the see. Robert claimed in vain the right to crown the German king Otto I. in 936, on the ground of the priority of his see, and in the 10th century Archbishop Dietrich I. obtained the primacy over Gaul and Germany.

The temporal power of the archbishops was not gained without opposition. The German kings Otto IV. and Conrad IV. granted charters to the city, which however admitted the jurisdiction of its archbishop, Baldwin of Luxemburg, in 1308. This prince, a brother of the emperor Henry VII., ruled from 1307 to 1354, and was the real founder of the power of Trier. His predecessor Diether III. of Nassau had left his lands heavily encumbered with debt. Baldwin raised them to great prosperity by his energy and foresight, and chiefly as a result of the active political and military support he rendered to the emperors Henry VII., Louis the Bavarian and Charles IV. He enlarged his dominions almost to their ultimate extent. He assumed the title of archchancellor of Gaul and Arles (or Burgundy), and in 1315 admitted the claim of the archbishop of Cologne to the highest place after the archbishop of Mainz among the spiritual princes of the empire. Thenceforward the archbishop of Trier held the third place in the electoral college.

Baldwin's death the prosperity of Trier was checked and disputes between rival claimants to the see, and in 1377 5 *

1456 the estates united for the purpose of restoring order, and secured the right of electing their archbishops.

Throughout the middle ages the *sancita civitas Treverorum* abounded in religious foundations and was a great seat of monastic learning. The university, founded in 1473, existed until 1797. The elector Richard von Greiffenklau (1467-1531) successfully opposed the Reformation, and inaugurated the exhibitions of the holy coat, which called forth the denunciations of Luther, but have continued since his day to bring wealth and celebrity to the city. In the latter half of the 16th century the direction of education fell into the hands of the Jesuits.

During the Thirty Years' War the elector Philip Christopher von Sötern favoured France, and accepted French protection in 1631. The French in the following year expelled both Spaniards and Swedes from his territories, but in March 1635 the Spaniards recaptured Trier and took the elector prisoner. He remained in captivity for ten years, but was reinstated by the French in 1645 and confirmed in his possessions by the peace of Westphalia. The French again temporarily took Trier in 1674 and 1688.

The last elector and archbishop, Clement Wenceslaus (1768-1802), granted toleration to the Protestants in 1782, established his residence at Coblenz in 1785, and fled from the French in 1794. By the peace of Lunéville in 1801 France annexed all the territories of Trier on the left bank of the Rhine, and in 1802 the elector abdicated. A new bishopric was created for the French department of the Sarre, of which Trier was the capital. The Treveran territories on the right bank of the Rhine were secularized and given to Nassau-Weilburg in 1803, and in 1814 nearly the whole of the former electoral dominions were given to Prussia. A bishopric was again founded in 1821, with nearly the same boundaries as the old archbishopric, but it was placed under Cologne. The area of the former electoral principality was 3210 sq. m., and its population in the 18th century was from 250,000 to 300,000. Roughly speaking, it was a broad strip of territory along the lower Saar and the Moselle from its confluence with that river to the Rhine, with a district on the right bank of the Rhine behind Ehrenbreitstein. The chief towns in addition to Trier were Coblenz, Cochem, Beilstein, Oberwesel, Lahnstein and Sayn. Far more extensive was the territory under the spiritual authority of the archbishop which included the bishoprics of Metz, Toul and Verdun, and after 1777 also those of Nancy and St Dié.

TRIESTE (Ger. *Triest*; Slav. *Trst*; the Roman *Tergeste*, 97), the principal seaport of Austria, 367 m. S.W. of Vienna by rail. Pop. (1900), 132,870, of which three-fourths are Italians, the remainder being composed of Germans, Jews, Greeks, English and French. Trieste is situated at the north-east angle of the Adriatic Sea, on the Gulf of Trieste, and is picturesquely built on terraces at the foot of the Karst hills. The aspect of the town is Italian rather than German. It is divided into the old and the new town, which are connected by the broad and handsome Via del Corso, the busiest street in the town. The old town, nestling round the Schlossberg, the hill on which the castle stands, consists of narrow, steep and irregular streets. The castle, built in 1680, is believed to occupy the site of the Roman capitol. The new town, which lies on the flat expanse adjoining the crescent-shaped bay, partly on ground that has been reclaimed from the sea, has large and regularly built streets, and several large squares adorned with artistic monuments. The cathedral of San Giusto was formed as it now stands by the union in the 14th century of three adjacent early Christian buildings of the 6th century;

nave of the cathedral or church, and being of less height gives more importance to the ground storey or nave arcade. In consequence of its less height it was usually divided into two arches, which were again subdivided into two smaller arches and these subdivisions increased the scale. On account of the richness of its mouldings and carved ornament in the sculpture introduced in the spandrels, it became the most highly decorated feature of the interior, the triforium at Lincoln being one of the most beautiful compositions of Gothic architecture. Even when reduced to a simple passage it was always a highly enriched feature. In the 15th-century churches in England, when the roof over the aisles was comparatively flat, more height being required for the clerestory windows, the triforium was dispensed with altogether. In the great cathedrals and abbeys the triforium was often occupied by persons who came to witness various ceremonies, and in early days was probably utilized by the monks and clergy for work connected with the church.

From the constructive point of view, the triforium sometimes served very important functions, as under its roof exist arches and vaults carried from the nave to the outer wall, to which they transmitted the thrust of the nave vault; even when the flying buttress was frankly adopted by the Gothic architect and emphasized by its architectural design as an important feature, other cross arches were introduced under the roof to strengthen it.

TRIGLYPH (Gr. $\tau\rho\acute{\iota}\lambda\iota\varsigma$, three, and $\gamma\lambda\upsilon\phi\acute{\eta}$, an incision or carving), an architectural term for the vertically channelled tablets of the Doric frieze, so called because of the angular channels in them, two perfect and one divided—the two chamfered angles or hemiglyphs being reckoned as one. The square sunk spaces between the triglyphs on a frieze are called metopes.

TRIGONOMETRY (from Gr. $\tau\rho\acute{\iota}\gamma\omega\mu\omicron\nu\alpha$, a triangle, $\mu\acute{\epsilon}\tau\rho\nu$, measure), the branch of mathematics which is concerned with the measurement of plane and spherical triangles, that is, with the determination of three of the parts of such triangles when the numerical values of the other three parts are given. Since any plane triangle can be divided into right-angled triangles, the solution of all plane triangles can be reduced to that of right-angled triangles; moreover, according to the theory of similar triangles, the ratios between pairs of sides of a right-angled triangle depend only upon the magnitude of the acute angles of the triangle, and may therefore be regarded as functions of either of these angles. The primary object of trigonometry, therefore, requires a classification and numerical tabulation of these functions of an angular magnitude; the science is, however, now understood to include the complete investigation not only of such of the properties of these functions as are necessary for the theoretical and practical solution of triangles but also of all their analytical properties. It appears that the solution of spherical triangles is effected by means of the same functions as are required in the case of plane triangles. The trigonometrical functions are employed in many branches of mathematical and physical science not directly concerned with the measurement of angles, and hence arises the importance of analytical trigonometry. The solution of triangles of which the sides are geodesic lines on a spheroidal surface requires the introduction of other functions than those required for the solution of triangles on a plane or spherical surface, and therefore gives rise to a new branch of science, which is from analogy frequently called spheroidal trigonometry. Every new class of surfaces which may be considered would have in this extended sense a trigonometry of its own, which would consist in an investigation of the nature and properties of the functions necessary for the measurement of the sides and angles of triangles drawn on such surfaces.

showing how to deduce
angle when other angles
the Greeks. It found
for the reduction of
problems connected

with astronomical science; and since spherical triangles specially occur, it happened that spherical trigonometry was developed before the simpler plane trigonometry. Certain theorems were invented and utilized by Hipparchus, but material progress was not recorded until Ptolemy collated, amended and developed the work of his predecessors. In book xi. of the *Almagest* the principles of spherical trigonometry are stated in the form of a few simple and useful lemmas; plane trigonometry does not receive systematic treatment although several theorems and problems are stated incidentally. The solution of triangles necessitated the construction of tables of chords—the equivalent of our modern tables of sines; Ptolemy treats this subject in book i., stating several theorems relating to multiple angles, and by ingenious methods successfully deducing approximate results. He did not invent the idea of tables of chords, for, on the authority of Theon, the principle had been stated by Hipparchus (see PROLEMY).

The Indians, who were much more apt calculators than the Greeks, availed themselves of the Greek geometry which came from Alexandria, and made it the basis of trigonometrical calculations. The principal improvement which they introduced consists in the formation of tables of half-chords or sines instead of chords. Like the Greeks, they divided the circumference of the circle into 360 degrees or 21,600 minutes, and they found the length in minutes of the arc which can be straightened out into the radius to be 3438. The value of the ratio of the circumference of the circle to the diameter used to make this determination is 62832:20000, or $\pi = 3.1416$, which value was given by the astronomer Aryabhata (476–530) in a work called *Aryabhatya*, written in verse, which was republished in Sanskrit by Dr Kern at Leiden in 1874. The relations between the sines and cosines of the same and of complementary arcs were known, and the formula $\sin 2a = 2 \sin a \cos a$ was applied to the determination of the sine of a half angle when the sine and cosine of the whole angle were known. In the *Sārya-Siddhānta*, an astronomical treatise which has been translated by Ebenezer Bourgeois in vol. vi. of the *Journal of the American Oriental Society* (New Haven, 1860), the sines of angles at an interval of $3^\circ 45'$ up to 90° are given; these were probably obtained from the sines of 60° and 45° by continual application of the dimidial formula given above and by the use of the complementary angle. The values $\sin 15^\circ = 890'$, $\sin 7^\circ 30' = 449'$, $\sin 3^\circ 45' = 225'$ were thus obtained. Now the angle $3^\circ 45'$ is itself $225'$; thus the arc and the sine of $\frac{1}{2}$ of the circumference were found to be the same, and consequently special importance was attached to this arc, which was called the right sine. From the tables of sines of angles at intervals of $3^\circ 45'$ the law expressed by the equation $\sin (n + 1.225^\circ) - \sin (n.225^\circ) = \sin (n.225^\circ)$

$$-\sin (n - 1.225^\circ) - \sin \frac{(n.225^\circ)}{225}$$

was discovered empirically, and used for the purpose of recalculation. Bhaskara (fl. 1150) used the method, to which we have now returned, of expressing sines and cosines as fractions of the radius; he obtained the more correct values $\sin 3^\circ 45' = 100/1529$, $\cos 3^\circ 45' = 466/467$, and showed how to form a table, according to degrees, from the values $\sin 1^\circ = 10/573$, $\cos 1^\circ = 6568/6569$, which are much more accurate than Ptolemy's values. The Indians did not apply their trigonometrical knowledge to the solution of triangles; for astronomical purposes they solved right-angled plane and spherical triangles by geometry.

The Arabs were acquainted with Ptolemy's *Almagest*, and they probably learned from the Indians the use of the sine. The celebrated astronomer of Batnas, Albatēgus (g.w.), who died in A.D. 929–930, and whose *Tables* were translated in the 12th century by Plato of Tivoli into Latin, under the title *De scientia stellarum*, employed the sine regularly, and was fully conscious of the advantage of the sine over the chord; indeed, he remarks that the continual doubling is saved by the use of the former. He was the first to calculate $\sin \phi$ from the equation $\sin \phi / \cos \phi = \tan \phi$, and he also made a table of the length of shadows of a vertical object of height 12 for altitudes $1^\circ, 2^\circ, \dots$ of the sun; this is a sort of cotangent table. He was acquainted not only with the triangle formulæ in the *Almagest*, but also with the formula $\cos a = \cos b \cos c + \sin b \sin c \cos A$ for a spherical triangle ABC. Abū Wāḥib of Bagdad (b. 940) was the first to introduce the tangent as an independent function; his "umbra" is the half of the tangent of the double arc, and the secant he defines as the "diameter umbrae." He employed the umbra to find the angle from a table and not merely as an abbreviation for \sin/\cos ; this improvement was, however, afterwards forgotten, and the tangent was reintroduced in the 15th century. Ibn Vānos of Cairo, who died in 1008, showed even more skill than Albatēgus in the solution of problems in spherical trigonometry and gave improved approximate formulæ for the calculation of sines. Among the West Arabs, Geber (g.w.), who lived

¹ See also vol. ii. of the *Asiatic Researches* (Calcutta).

at Seville in the 11th century, wrote an astronomy in nine books, which was translated into Latin in the 12th century by Gerard of Cremona and was published in 1534. The first book contains a trigonometry which is a considerable improvement on that in the *Almagest*. He gave proofs of the formulæ for right-angled spherical triangles, depending on a rule of four quantities, instead of Ptolemy's rule of six quantities. The formulæ $\cos B = \cos b \sin A$, $\cos c = \cot A \cot B$, in a triangle of which C is a right angle had escaped the notice of Ptolemy and were given for the first time by Geber. Strangely enough, he made no progress in plane trigonometry. Arrachel, a Spanish Arab who lived in the 12th century, wrote a work of which we have an analysis by Furbach, in which, like the Indians, he made the sine and the arc for the value $3^\circ 45'$ coincide.

Georg Furbach (1423-1461), professor of mathematics at Vienna, wrote a work entitled *Tractatus super propositionibus Ptolemaei de sinusibus et chordis* (Nuremberg, 1541). This treatise consists of a development of Arrachel's method of interpolation for the calculation of tables of sines, and was published by Regiomontanus at the end of one of his works. Johannes Müller (1436-1476), known as Regiomontanus, was a pupil of Furbach and taught astronomy at Padua; he wrote an exposition of the *Almagest*, and a more important work, *De triangulis planis et sphericis cum tabulis sinuum*, which was published in 1533, a later edition appearing in 1561. He reinvented the tangent and calculated a table of tangents for each degree, but did not make any practical applications of this table, and did not use formulæ involving the tangent. His work was the first complete European treatise on trigonometry, and contains a number of interesting problems; but his methods were in some respects behind those of the Arabs. Copernicus (1473-1543) gave the first simple demonstration of the fundamental formula of spherical trigonometry; the *Trigonometria Copernici* was published by Rheticus in 1542. George Joachim (1514-1576), known as Rheticus, wrote *Opus palatinum de triangulis* (see TABLES, MATHEMATICAL), which contains tables of sines, tangents and secants of arcs at intervals of $10'$ from 0° to 90° . His method of calculation depends upon the formulæ which give $\sin n\alpha$ and $\cos n\alpha$ in terms of the sines and cosines of $(n-1)\alpha$ and $(n-2)\alpha$; thus these formulæ may be regarded as due to him. Rheticus found the formulæ for the sines of the half and third of an angle in terms of the sine of the whole angle. In 1599 there appeared an important work by Bartholomew Pitiscus (1561-1613), entitled *Trigonometria seu De dimensionibus triangulorum*; this contained several important theorems on the trigonometrical functions of two angles, some of which had been given before by Finck, Landsberg (or Lansberghe de Meutebecke) and Adriaan van Roomen. François Viète or Vieta (1540-1603) employed the equation $(2 \cos \phi)^2 - (2 \cos \theta)^2 = 2 \cos \phi$ to solve the cubic $x^3 - 3ax^2 + a^2b(a + b)$; he obtained, however, only one root of the cubic. In 1593 Van Roomen proposed, as a problem for all mathematicians, to solve the equation

$$453 - 37953^2 + 956343^3 - \dots + 9453^m - 453^{m+1} + y^{m+1} = C.$$

Vieta gave $y = 2 \sin \frac{1}{2}\phi$, where $C = 2 \sin \phi$, as a solution, and also twenty-two of the other solutions, but he failed to obtain the negative roots. In his work *Ad angulares sectiones* Vieta gave formulæ for the chords of multiples of a given arc in terms of the chord of the simple arc.

A new start in the development of the science was commenced after John Napier's invention of logarithms in 1614. Napier also simplified the solution of spherical triangles by his well-known analogies and by his rules for the solution of right-angled triangles. The first tables of logarithmic sines and tangents were constructed by Edmund Gunter (1581-1626), professor of astronomy at Gresham College, London; he was also the first to employ the expressions cosine, cotangent and cosecant for the sine, tangent and secant of the complement of an arc. A treatise by Albert Girard (1590-1634), published at the Hague in 1626, contains the theorems which give areas of spherical triangles and polygons, and applications of the properties of the supplementary triangles to the reduction of the number of different cases in the solution of spherical triangles. He used the notation \sin , \tan , \sec for the sine, tangent and secant of an arc. In the second half of the 17th century the theory of infinite series was developed by John Wallis, Gregory, Mercator, and afterwards by Newton and Leibnitz. In the *Analysis per aequationes numero terminorum infinitas*, which was written before 1669, Newton gave the series for the arc in powers of its sine; from this he obtained the series for the sine and cosine in powers of the arc; but these series were given in such a form that the law of the formation of the coefficients was hidden. James Gregory discovered in 1670 the series for the arc in powers of the tangent and for the tangent and secant in powers of the arc. The first of these series was also discovered independently by Leibnitz in 1673, and published without proof in the *Acta eruditorum* for 1682. The series for the sine in powers of the arc he published in 1693; this he obtained by differentiation of a series with undetermined coefficients.

In the 18th century the science began to take a more analytical form: evidence of this is given in the works of Kress in 1720 and Mayer in 1727. Friedrich Wilhelm v. Oppel's *Analysis triangulorum* (1746) was the first complete work on analytical trigonometry. None of these mathematicians used the notation \sin , \cos , \tan , which is the more surprising case of Oppel, since Leonard Euler

had in 1744 employed it in a memoir in the *Acta eruditorum*. Jean Bernoulli was the first to obtain real results by the use of the symbol $\sqrt{-1}$; he published in 1712 the general formula for $\tan \phi$ in terms of $\tan \psi$, which he obtained by means of transformation of the arc into imaginary logarithms. The greatest advance was, however, made by Euler, who brought the science in all essential respects into the state in which it is at present. He introduced the present notation into general use, whereas until his time the trigonometrical functions had been, except by Girard, indicated by special letters, and had been regarded as certain straight lines the absolute lengths of which depended on the radius of the circle in which they were drawn. Euler's great improvement consisted in his regarding the sine, cosine, &c., as functions of the angle only, thereby giving to equations connecting these functions a purely analytical interpretation, instead of a geometrical one as heretofore. The exponential values of the sine and cosine, De Moivre's theorem, and a great number of other analytical properties of the trigonometrical functions are due to Euler, most of whose writings are to be found in the *Memoirs of the St Petersburg Academy*.

Plane Trigonometry.

1. Imagine a straight line terminated at a fixed point O , and initially coincident with a fixed straight line OA . to revolve round O , and finally to take up any position OB . We shall suppose that, when this revolving straight line is turning in one direction, say that

FIG. 1.

opposite to that in which the hands of a clock turn, it is describing a positive angle, and when it is turning in the other direction it is describing a negative angle. Before finally taking up the position OB the straight line may have passed any number of times through the position OB , making any number of complete revolutions round O in either direction. Each time that the straight line makes a complete revolution round O we consider it to have described four right angles, taken with the positive or negative sign, according to the direction in which it has revolved; thus, when it stops in the position OB , it may have revolved through any one of an infinite number of positive or negative angles any two of which differ from one another by a positive or negative multiple of four right angles, and all of which have the same bounding lines OA and OB . If OB' is the final position of the revolving line, the smallest positive angle which can have been described is that described by the revolving line making more than one-half and less than the whole of a complete revolution, so that in this case we have a positive angle greater than two and less than four right angles. We have thus shown how we may conceive an angle not restricted to be less than two right angles, but of any positive or negative magnitude, to be generated.

2. Two systems of numerical measurement of angular magnitudes are in ordinary use. For practical measurements the sexagesimal system is the one employed; the nineteenth part of a right angle is taken as the unit, and is called a degree; the degree is divided into sixty equal parts called minutes; and the minute into sixty equal parts called seconds; angles smaller than a second are usually measured as decimals of a second, the "thirds," "fourths," &c., not being in ordinary use. In the common notation an angle, for example, of 120 degrees, 17 minutes and 14.36 seconds is written $120^\circ 17' 14.36''$. The decimal system measurement of angles has never come into ordinary use. In analytical trigonometry the circular measure of an angle is employed. In this system the unit angle or radian is the angle subtended at the centre of a circle by an arc equal in length to the radius. The constancy of this angle follows from the geometrical propositions—(1) the circumferences of different circles vary as their radii; (2) in the same circle angles at the centre are proportional to the arcs which subtend them. It thus follows that the radian is an angle independent of the particular circle used in defining it. The constant ratio of the circumference of a circle to its diameter is a number incommensurable with unity, usually denoted by π . We shall indicate later on some of the methods which have been employed to approximate to the value of this number. Its value to 20 places is 3.14159265358979323846 ; its reciprocal to the same number of places is 0.31830988618379067153 . In circular measure every angle is measured by the ratio which it bears to the unit angle. Two right angles are measured by the number π , and, since the same angle is 180° , we see that the number of degrees in an angle of circular measure θ is obtained from the formula $180 \times \theta / \pi$. The value of the radian has been found to 41 places of decimals by Glaisher (*Proc. London Math. Soc. vol. iv.*); the value of $1/\pi$, from which the unit can easily be calculated, is given to 140 places of decimals in *Grunners Arithm.* (1841), vol. i. To 10 decimal places the value of the unit angle is $57^\circ 17' 44.806479964''$. The unit of circular measure is too large to be convenient for practical purposes, but its use introduces a simplification into the series in analytical trigonometry, owing to the fact that the sine of

on a straight line making an angle $\frac{1}{2}\pi$ with OD , and is therefore equal to $OF \sin B$; hence

$$OF \cos(A+B) = OE \cos A + EF \cos(\frac{1}{2}\pi + A) \\ = OF(\cos A \cos B - \sin A \sin B),$$

or $\cos(A+B) = \cos A \cos B - \sin A \sin B$.

The angles A, B are absolutely unrestricted in magnitude, and thus this formula is perfectly general. We may change the sign of B , thus

$$\cos(A-B) = \cos A \cos(-B) - \sin A \sin(-B),$$

or $\cos(A-B) = \cos A \cos B + \sin A \sin B$.

If we projected the sides of the triangle OEF on a straight line making an angle $\frac{1}{2}\pi$ with OA we should obtain the formulæ

$$\sin(A \pm B) = \sin A \cos B \pm \cos A \sin B,$$

which are really contained in the cosine formula, since we may put $\frac{1}{2}\pi - B$ for B . The formulæ

$$\tan(A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A \tan B}, \cot(A \pm B) = \frac{\cot A \cot B \pm 1}{\cot B \pm \cot A}$$

are immediately deducible from the above formulæ. The equations

$$\sin C + \sin D = 2 \sin \frac{1}{2}(C+D) \cos \frac{1}{2}(C-D), \\ \sin C - \sin D = 2 \cos \frac{1}{2}(C+D) \sin \frac{1}{2}(C-D), \\ \cos D + \cos C = 2 \cos \frac{1}{2}(C+D) \cos \frac{1}{2}(C-D), \\ \cos D - \cos C = 2 \sin \frac{1}{2}(C+D) \sin \frac{1}{2}(C-D),$$

may be obtained directly by the method of projections. Take two equal straight lines OC, OD , making angles C, D , with OA , and draw OE perpendicular to CD . The angle which OE makes with OA is $\frac{1}{2}(C+D)$ and that which DC makes is $\frac{1}{2}(C+D)$; and the angle COE is $\frac{1}{2}(C-D)$. The sum of the projections of OD and DE on OA is equal to that of OE , and the sum of the projections of OC and CE is equal to that of OE ; hence the sum of the projections of OC and OD is twice that of OE , or $\cos C + \cos D = 2 \cos \frac{1}{2}(C+D) \cos \frac{1}{2}(C-D)$. The difference of the projections of OD and OC on OA is equal to twice that of ED , hence we have the formula $\cos D - \cos C = 2 \sin \frac{1}{2}(C+D) \sin \frac{1}{2}(C-D)$. The other two formulæ will be obtained by projecting on a straight line inclined at an angle $\frac{1}{2}\pi$ to OA .

FIG. 4.

As another example of the use of projections, we will find the sum of the series $\cos \alpha + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \dots + \cos(\alpha+(n-1)\beta)$.

Suppose an unclosed polygon each angle α which is $\pi - \beta$ to be inscribed in a circle, and let $A, A_1, A_2, A_3, \dots, A_n$ be $n+1$ consecutive angular points; let D be the diameter of the circle; and suppose a straight line drawn making an angle α with AA_1 , then $\alpha + \beta, \alpha + 2\beta, \dots$ are the angles it makes with $A_1 A_2, A_2 A_3, \dots$ we have by projections $AA_n \cos(\alpha + \frac{1}{2}(n-1)\beta) = AA_1(\cos \alpha + \cos \alpha + \beta + \dots + \cos \alpha + (n-1)\beta)$, also $AA_1 = D \sin \frac{1}{2}\beta, AA_n = D \sin \frac{1}{2}n\beta$; hence the sum of the series of cosines is

$$\cos(\alpha + \frac{1}{2}(n-1)\beta) \sin \frac{1}{2}n\beta \operatorname{cosec} \frac{1}{2}\beta.$$

By a double application of the addition formulae we may obtain the formulæ

$$\begin{aligned} \sin(A_1 + A_2 + A_3) &= \sin A_1 \cos A_2 \cos A_3 \\ &+ \cos A_1 \sin A_2 \cos A_3 + \cos A_1 \cos A_2 \sin A_3 \\ &- \sin A_1 \sin A_2 \sin A_3; \\ \cos(A_1 + A_2 + A_3) &= \cos A_1 \cos A_2 \cos A_3 \\ &- \cos A_1 \sin A_2 \sin A_3 - \sin A_1 \cos A_2 \sin A_3 \\ &- \sin A_1 \sin A_2 \cos A_3. \end{aligned}$$

We can by induction extend these formulæ to the case of n angles. Assume

$$\sin(A_1 + A_2 + \dots + A_n) = S_n - S_{n-1} S_1 - \dots \\ \cos(A_1 + A_2 + \dots + A_n) = C_n - S_{n-1} S_1 - \dots$$

where S_n denotes the sum of the products of the sines of n of the angles and the cosines of the remaining $n-r$ angles; then we have

$$\sin(A_1 + A_2 + \dots + A_n + A_{n+1}) = \cos A_{n+1}(S_n - S_{n-1} S_1 - \dots) \\ + \sin A_{n+1}(S_{n-1} S_1 + S_{n-2} S_2 + \dots).$$

The right-hand side of this equation may be written

$$(S_1 \cos A_{n+1} + S_2 \sin A_{n+1}) - (S_2 \cos A_{n+1} + S_3 \sin A_{n+1}) + \dots$$

or where S'_n denotes the quantity which corresponds for $n+1$ angles to S_n for n angles; similarly we may proceed with the cosine formula. The theorems are true for $n=2$ and $n=3$; thus they are true generally. The formulæ

$$\begin{aligned} \cos 2A &= \cos^2 A - \sin^2 A = 2 \cos^2 A - 1 = 1 - 2 \sin^2 A, \\ \sin 2A &= 2 \sin A \cos A, \quad \tan 2A = \frac{2 \tan A}{1 - \tan^2 A}, \\ \sin 3A &= 3 \sin A - 4 \sin^3 A, \quad \cos 3A = 4 \cos^3 A - 3 \cos A, \end{aligned}$$

$$\sin nA = n \cos^{n-1} A \sin A - \frac{n(n-1)(n-2)}{3!} \cos^{n-3} A \sin^3 A + \dots \\ + (-1)^{\frac{n-1}{2}} \frac{n(n-1) \dots (n-2r)}{(2r+1)!} \cos^{n-2r-1} A \sin^{2r+1} A,$$

$$\cos nA = \cos^n A - \frac{n(n-1)}{2!} \cos^{n-2} A \sin^2 A + \dots \\ + (-1)^{\frac{n-1}{2}} \frac{n(n-1) \dots (n-2r+1)}{2r!} \cos^{n-2r} A \sin^{2r} A + \dots$$

may all be deduced from the addition formulæ by making the angles all equal. From the last two formulæ we obtain by division

$$\tan nA = \frac{n \tan A - \frac{n(n-1)(n-2)}{3!} \tan^3 A + \dots + (-1)^{\frac{n-1}{2}} \frac{n(n-1) \dots (n-2r+1)}{(2r+1)!} \tan^{2r+1} A + \dots}{1 - \frac{n(n-1)}{2!} \tan^2 A + \dots + (-1)^{\frac{n-1}{2}} \frac{n(n-1) \dots (n-2r)}{2r!} \tan^{2r} A + \dots}$$

In the particular case of $n=3$ we have $\tan 3A = \frac{3 \tan A - \tan^3 A}{1 - 3 \tan^2 A}$.

The values of $\sin \frac{1}{3}A, \cos \frac{1}{3}A, \tan \frac{1}{3}A$ are given in terms of $\cos A$ by the formulæ

$$\sin \frac{1}{3}A = (-1)^p \left(\frac{1 - \cos A}{2} \right)^{\frac{1}{3}}, \cos \frac{1}{3}A = (-1)^q \left(\frac{1 + \cos A}{2} \right)^{\frac{1}{3}},$$

$$\tan \frac{1}{3}A = (-1)^r \left(\frac{1 - \cos A}{1 + \cos A} \right)^{\frac{1}{3}},$$

where p is the integral part of $A/2\pi, q$ the integral part of $A/2\pi + \frac{1}{3}$, and r the integral part of $A/3$.

$\sin \frac{1}{3}A, \cos \frac{1}{3}A$ are given in terms of $\sin A$ by the formulæ

$$2 \sin \frac{1}{3}A = (-1)^p (1 + \sin A)^{\frac{1}{3}} + (-1)^q (1 - \sin A)^{\frac{1}{3}},$$

$$2 \cos \frac{1}{3}A = (-1)^p (1 + \sin A)^{\frac{1}{3}} - (-1)^q (1 - \sin A)^{\frac{1}{3}},$$

where p' is the integral part of $A/2\pi + \frac{1}{3}$ and q' the integral part of $A/3 - \frac{1}{3}$.

6. In any plane triangle ABC we will denote the lengths of the sides BC, CA, AB by a, b, c respectively, and the angles BAC, ABC, ACB by A, B, C respectively. The fact that the projections of b and c on a straight line perpendicular to the side a are equal to one another is expressed by the equation $b \sin C = c \sin B$; this equation and the one obtained by projecting c and a on a straight line perpendicular to a may be written $a \sin A = b \sin B = c \sin C$. The equation $a = b \cos C + c \cos B$ expresses the fact that the side a is equal to the sum of the projections of the sides b and c on itself; thus we obtain the equations

$$\begin{aligned} a &= b \cos C + c \cos B \\ b &= c \cos A + a \cos C \\ c &= a \cos B + b \cos A \end{aligned}$$

If we multiply the first of these equations by $-a$, the second by b , and the third by c , and add the resulting equations, we obtain the formula $b^2 + c^2 - a^2 = 2bc \cos A$ or $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$, which gives the cosine of an angle in terms of the sides. From this expression for $\cos A$ the formulæ

$$\sin \frac{1}{2}A = \left\{ \frac{(s-b)(s-c)}{bc} \right\}^{\frac{1}{2}}, \cos \frac{1}{2}A = \left\{ \frac{s(s-a)}{bc} \right\}^{\frac{1}{2}},$$

$$\tan \frac{1}{2}A = \left\{ \frac{(s-b)(s-c)}{s(s-a)} \right\}^{\frac{1}{2}}, \sin A = \frac{2}{bc} \{s(s-a)(s-b)(s-c)\}^{\frac{1}{2}},$$

where s denotes $\frac{1}{2}(a+b+c)$, can be deduced by means of the subsidiary formula.

From any general relation between the sides and angles of a triangle other relations may be deduced by various methods of transformation, of which we give two examples.

a. In any general relation between the sines and cosines of the angles A, B, C of a triangle we may substitute $pA + qB + rC, rA + pB + qC, qA + rB + pC$ for A, B, C respectively, where p, q, r are any quantities such that $p+q+r+1$ is a positive or negative multiple of 6, provided that we change the signs of all the sines. Suppose $p+q+r+1=6n$, then the sum of the three angles $2\pi n - (pA + qB + rC), 2\pi n - (rA + pB + qC), 2\pi n - (qA + rB + pC)$ is 2π , and, since the given relation follows from the condition $A+B+C = \pi$, we may substitute for A, B, C respectively any angles of which the sum is π ; thus the transformation is admissible.

β . It may easily be shown that the sides and angles of the triangle formed by joining the feet of the perpendiculars from the angular points A, B, C on the opposite sides of the triangle ABC are respectively $a \cos A, b \cos B, c \cos C, \pi - 2A, \pi - 2B, \pi - 2C$; we may therefore substitute these expressions for a, b, c, A, B, C respectively in any general formula. By drawing the perpendiculars of this second triangle and joining their feet as before, we obtain a triangle of which the sides are $-a \cos A \cos 2A, -b \cos B \cos 2B, -c \cos C \cos 2C$ and the angles are $4A - \pi, 4B - \pi, 4C - \pi$; we may therefore substitute these expressions for the sides and angles of the original triangle; for example, we obtain thus the formula

$$\cos 4A = \frac{a^2 \cos^2 A \cos^2 2A - b^2 \cos^2 B \cos^2 2B - c^2 \cos^2 C \cos^2 2C}{2bc \cos B \cos C \cos 2B \cos 2C}$$

This transformation obviously admits of further extension.

Solution of Triangles.

(1) The three sides of a triangle ABC being given, the angles can be determined by the formula

$$L \tan \frac{1}{2}A = 10 + \frac{1}{2} \log (s-b) - \frac{1}{2} \log (s-c) - \frac{1}{2} \log s - \frac{1}{2} \log (s-a)$$

and two corresponding formulæ for the other angles.

(2) The two sides a, b and the included angle C being given, the angles A, B can be determined from the formulæ

$$L \tan \frac{1}{2}(A-B) = \log \frac{(a-b)}{(a+b)} - \log(a+b) + L \cot \frac{1}{2}C,$$

and the side c is then obtained from the formula

$$\log c = \log a + L \sin C - L \sin A.$$

(3) The two sides a, b and the angle A being given, the value of side B may be found by means of the formula

$$L \sin B = L \sin A + \log b - \log a;$$

this gives two supplementary values of the angle B , if $b \sin A < a$. If $b \sin A > a$ there is no solution, and if $b \sin A = a$ there is one solution. In the case $b \sin A < a$, both values of B give solutions provided $b > a$, but the value of B is admissible if $b < a$.

The other side c can be then determined as in case (2).
 (4) If two angles A, B and a side a are given, the angle C is determined from the formula $C = \pi - A - B$ and the side b from the formula $\log b = \log a + L \sin B - L \sin A$.

The area of a triangle is half the product of a side into the perpendicular from the opposite angle on that side; thus we obtain the expressions $\frac{1}{2}bc \sin A, \frac{1}{2}c(s-a)(s-b)(s-c)$ for the area of a triangle. A large collection of formulæ for the area of a triangle are given in the *Annals of Mathematics* for 1885 by M. Baker.

Let a, b, c, d denote the lengths of the sides AB, BC, CD, DA respectively of any plane quadrilateral and $A+C=2\alpha$; we may obtain an expression for the area S of the quadrilateral in terms of the sides and the angle α .

We have

$$2S = ad \sin A + bc \sin(2\alpha - A)$$

$$\text{and } \frac{1}{2}(a^2 + d^2 - b^2 - c^2) = ad \cos A - bc \cos(2\alpha - A);$$

hence $4S^2 + \frac{1}{4}(a^2 + d^2 - b^2 - c^2)^2 = a^2d^2 + b^2c^2 - 2abcd \cos 2\alpha$.

If $2\alpha = a + b + c + d$, the value of S may be written in the form

$$S = \frac{1}{2}(s-a)(s-b)(s-c)(s-d) - abcd \cos^2 \frac{1}{2}C.$$

Let R denote the radius of the circumscribed circle, r of the inscribed, and r_1, r_2, r_3 of the escribed circles of a triangle ABC ; the values of these radii are given by the following formulæ—

$$R = \frac{abc}{4S} = \frac{a}{2 \sin A},$$

$$r = \frac{S}{s} = (s-a) \tan \frac{1}{2}A = 4R \sin \frac{1}{2}A \sin \frac{1}{2}B \sin \frac{1}{2}C,$$

$$r_1 = S/(s-a) = r \tan \frac{1}{2}A = 4R \sin \frac{1}{2}A \cos \frac{1}{2}B \cos \frac{1}{2}C.$$

Spherical Trigonometry.

7. We shall throughout assume such elementary propositions in spherical geometry as are required for the purpose of the investigation of formulæ given below.

A spherical triangle is the portion of the surface of a sphere bounded by three arcs of great circles of the sphere. If BC, CA, AB denote these arcs, the circular measure of the angles subtended by these arcs respectively at the centre of the sphere are the sides a, b, c of the spherical triangle ABC ; and, if the portions of planes passing through these arcs and the centre of the sphere be drawn, the angles between the portions of planes intersecting at A, B, C respectively are the angles A, B, C of the spherical triangle. It is not necessary to consider triangles in which a side is greater than π , since we may replace such a side by the remaining arc of the great circle to which it belongs. Since two great circles intersect each other in two points, there are eight triangles of which the sides are arcs of the same three great circles.

If we consider one of these triangles ABC as the fundamental one, then one of the others is equal in all respects to ABC , and the remaining six have each one side equal to, or common with, a side of the triangle ABC , the opposite angle equal to the corresponding angle of ABC , and the other sides and angles supplementary to the corresponding sides and angles of ABC . These triangles may be called the associated triangles of the fundamental one ABC . It follows that from any general formula containing the sides and angles of a spherical triangle we may obtain other formulæ by replacing two sides and the two angles opposite to them by their supplements, the remaining side and the remaining angle being unaltered, for such formulæ are obtained by applying the given formula to the associated triangles.

If A', B', C' are those poles of the arcs BC, CA, AB respectively which lie upon the same sides of them as the opposite angles A, B, C , then the triangle $A'B'C'$ is called the polar triangle of the triangle ABC . The sides of the polar triangle are $\pi - A, \pi - B, \pi - C$, and the angles $\pi - a, \pi - b, \pi - c$. Hence from any general formula connecting the sides and angles of a spherical triangle we may obtain another formula by changing each side into the supplement of the opposite angle and each angle into the supplement of the opposite side.

8. Let O be the centre of the sphere on which is the spherical triangle ABC . Draw AL perpendicular to OC and AM perpendicular to the plane

OBC . Then the projection of OA on OB is the sum of the projections of OL, LM, MA on the same straight line. Since AM has no projection on any straight line in the plane OBC , this gives angles.

$OA \cos c = OL \cos a + LM \sin a$.
 Now $OL = OA \cos b$, $LM = AL \cos c = OA \sin b \cos C$; therefore $\cos c = \cos a \cos b + \sin a \sin b \cos C$. We may obtain similar formulæ by interchanging the letters a, b, c , thus

$$\left. \begin{aligned} \cos a &= \cos b \cos c + \sin b \sin c \cos A \\ \cos b &= \cos c \cos a + \sin c \sin a \cos B \\ \cos c &= \cos a \cos b + \sin a \sin b \cos C \end{aligned} \right\} \quad (1)$$

These formulæ (1) may be regarded as the fundamental equations connecting the sides and angles of a spherical triangle; all the other relations which we shall give below may be deduced analytically from them; we shall, however, in most cases give independent proofs. By using the polar triangle transformation we have the formulæ

$$\left. \begin{aligned} \cos A &= -\cos B \cos C + \sin B \sin C \cos a \\ \cos B &= -\cos C \cos A + \sin C \sin A \cos b \\ \cos C &= -\cos A \cos B + \sin A \sin B \cos c \end{aligned} \right\} \quad (2)$$

In the figures we have $AM = AL \sin C = r \sin b \sin C$, where r denotes the radius of the sphere. By drawing a perpendicular from A on OB , we may in a similar manner show that $AM = r \sin c \sin B$, therefore

$$\sin B \sin c = \sin c \sin b,$$

By interchanging the sides we have the equation

$$\frac{\sin A}{\sin a} = \frac{\sin B}{\sin b} = \frac{\sin C}{\sin c} = k \quad (3)$$

we shall find below a symmetrical form for k . If we eliminate $\cos b$ by the first two formulæ of (1) we have

$$\cos a \sin c = \sin b \sin c \cos a + \sin c \cos c \sin a \cos B;$$

therefore $\cot a \sin c = (\sin b/\sin a) \cos A + \cos c \cos B$.

We thus have the six equations

$$\left. \begin{aligned} \cot a \sin b &= \cot A \sin C + \cos b \cos C \\ \cot a \sin c &= \cot B \sin C + \cos a \cos C \\ \cot b \sin c &= \cot B \sin A + \cos c \cos A \\ \cot c \sin b &= \cot C \sin A + \cos b \cos A \\ \cot c \sin a &= \cot C \sin B + \cos a \cos B \\ \cot a \sin c &= \cot A \sin B + \cos c \cos B \end{aligned} \right\} \quad (4)$$

When $C = \frac{1}{2}\pi$ formula (1) gives

$$\cos c = \cos a \cos b \quad (a)$$

and (3) gives

$$\sin b = \sin B \sin c \quad (b)$$

$$\sin a = \sin A \sin c \quad (c)$$

from (4) we get

$$\tan a = \tan A \sin b = \tan c \cos B \quad (d)$$

$$\tan b = \tan B \sin a = \tan c \cos A \quad (e)$$

The formulæ

$$\cos c = \cot A \cot B \quad (f)$$

and

$$\cos A = \cot A \cot B \quad (g)$$

$$\cos B = \cot A \cot B \quad (h)$$

follow at once from (a), (b), (c). These are the formulæ which are used for the solution of right-angled triangles. Napier gave mnemonical rules for remembering them.

The following proposition follows easily from the theorem in equation (3): If AD, BE, CF are three arcs drawn through A, B, C to meet the opposite sides in D, E, F respectively, and if these arcs pass through a point, the segments of the sides satisfy the relation $\sin BD \sin CE \sin AF = \sin CD \sin AE \sin BF$; and conversely if this relation is satisfied the arcs pass through a point. From this theorem it follows that the three perpendiculars from the angles on the opposite sides, the three bisectors of the angles, and the three arcs from the angles to the middle points of the opposite sides, each pass through a point.

FIG. 6.

9. If D be the point of intersection of the three bisectors of the angles A, B, C , and if DE be drawn perpendicular to BC , it may be shown that BE and CE are angles $\frac{1}{2}(a+c-b)$ and $\frac{1}{2}(a+b-c)$, and that the angles BDE, ADC are supplementary. We have also

$$\frac{\sin c}{\sin BD} = \frac{\sin ADB}{\sin AD} = \frac{\sin B}{\sin AD};$$

therefore $\sin^2 \frac{1}{2}A = \frac{\sin BD \sin CD \sin CDE \sin BDE}{\sin b \sin c}$. But $\sin BD \sin BDE = \sin BE = \sin \frac{1}{2}(a+c-b)$, and $\sin CD \sin CDE = \sin CE = \sin \frac{1}{2}(a+b-c)$; therefore

$$\sin^2 \frac{1}{2}A = \frac{\sin \frac{1}{2}(a+c-b) \sin \frac{1}{2}(a+b-c)}{\sin b \sin c} \quad (5)$$

Apply this formula to the associated triangle of which $\pi - A, \pi - B, C$ are the angles and $\pi - a, \pi - b, c$ are the sides; we obtain the formula

$$\cos^2 \frac{1}{2}A = \frac{\sin \frac{1}{2}(b+c-a) \sin \frac{1}{2}(a+b-c)}{\sin b \sin c} \quad (6)$$

FIG. 5.

Formula for Sine and Cosine of Half Angles.

By division we have

$$\tan \frac{A}{2} = \left\{ \frac{\sin \frac{1}{2}(a+c-b) \sin \frac{1}{2}(a+b-c)}{\sin \frac{1}{2}(b+c-a) \sin \frac{1}{2}(a+b+c)} \right\} \quad (7)$$

and by multiplication

$$\sin A = 2 \sin \frac{1}{2}(a+b+c) \sin \frac{1}{2}(b+c-a) \sin \frac{1}{2}(c+a-b) \sin \frac{1}{2}(a+b-c) \quad (8)$$

$$\sin b \sin c = \{1 - \cos^2 a - \cos^2 b - \cos^2 c + 2 \cos a \cos b \cos c\} \sin b \sin c$$

Hence the quantity k in (3) is $\{1 - \cos^2 a - \cos^2 b - \cos^2 c + 2 \cos a \cos b \cos c\} / \sin a \sin b \sin c$. (8)

Of Half-sides. Apply the polar triangle transformation to the formulae (5), (6), (7) (8) and we obtain

$$\cos \frac{a}{2} = \left\{ \frac{\cos \frac{1}{2}(A+C-B) \cos \frac{1}{2}(A+B-C)}{\sin B \sin C} \right\} \quad (9)$$

$$\sin \frac{a}{2} = \left\{ \frac{-\cos \frac{1}{2}(B+C-A) \cos \frac{1}{2}(A+B+C)}{\sin B \sin C} \right\} \quad (10)$$

$$\tan \frac{a}{2} = \left\{ \frac{-\cos \frac{1}{2}(B+C-A) \cos \frac{1}{2}(A+B+C)}{\cos \frac{1}{2}(A+C-B) \cos \frac{1}{2}(A+B-C)} \right\} \quad (11)$$

If $k' = \{1 - \cos^2 A - \cos^2 B - \cos^2 C - 2 \cos A \cos B \cos C\} / \sin A \sin B \sin C$, we have $kk' = 1$. (12)

10. Let E be the middle point of AB ; draw ED at right angles to AB to meet A in D ; then DE bisects the angle ADB . Let CF bisect the angle ACB . Draw FG perpendicular to BC , then $CG = \frac{1}{2}(a-b)$, $\angle FBE = \frac{1}{2}(A+B)$, $\angle FCG = 90^\circ - \frac{1}{2}C$.

From the triangle CFG we have $\cos CFG = \cos CG \sin FCG$, and from the triangle FEB $\cos FEB = \cos EB \sin FBE$. Now the angles CFG , FEB are each supplementary to the angle DFB , therefore

$$\cos \frac{1}{2}(a-b) \cos C = \sin \frac{1}{2}(A+B) \cos C \quad (13)$$

Also $\sin CG = \sin CF \sin CFG$ and $\sin EB = \sin BF \sin FEB$; therefore $\sin \frac{1}{2}(a-b) \cos C = \sin \frac{1}{2}(A+B) \sin C$. (14)

Apply the formulae (13), (14) to the associated triangle of which $a, \pi-b, \pi-c, A, \pi-B, \pi-C$ are the sides and angles, we then have

$$\sin \frac{1}{2}(a+b) \sin C = \cos \frac{1}{2}(A-B) \cos C \quad (15)$$

$$\cos \frac{1}{2}(a+b) \sin C = \cos \frac{1}{2}(A+B) \cos C \quad (16)$$

The four formulae (13), (14), (15) (16) were first given by Delambre in the *Connaissance des Temps* for 1809. Formulae equivalent to these were given by Mollweide in Zach's *Monatliche Correspondenz* for November 1808. They were also given by Gauss (*Theoria motus*, 1809), and are usually called after him.

11. From the same figure we have $\tan FG = \tan FCG \sin CG = \tan FBG \sin BG$; therefore $\cot \frac{1}{2}C \sin \frac{1}{2}(a-b) \tan \frac{1}{2}(A-B) \sin \frac{1}{2}(a+b)$, Napier's Analogies.

$$\tan \frac{1}{2}(A-B) = \frac{\sin \frac{1}{2}(a-b)}{\sin \frac{1}{2}(a+b)} \cot \frac{1}{2}C \quad (17)$$

Apply this formulae to the associated triangle ($\pi-a, b, \pi-c, \pi-A, B, \pi-C$), and we have

$$\cot \frac{1}{2}(A+B) = \frac{\cos \frac{1}{2}(a+b)}{\cos \frac{1}{2}(a-b)} \tan \frac{1}{2}C \quad (18)$$

$$\tan \frac{1}{2}(A+B) = \frac{\cos \frac{1}{2}(a-b)}{\cos \frac{1}{2}(a+b)} \cot \frac{1}{2}C \quad (18)$$

If we apply these formulae (17), (18) to the polar triangle, we have

$$\tan \frac{1}{2}(a-b) = \frac{\sin \frac{1}{2}(A-B)}{\sin \frac{1}{2}(A+B)} \tan \frac{1}{2}c \quad (19)$$

$$\tan \frac{1}{2}(A+B) = \frac{\cos \frac{1}{2}(A-B)}{\cos \frac{1}{2}(A+B)} \tan \frac{1}{2}c \quad (20)$$

The formulae (17), (18), (19), (20) are called Napier's "Analogies"; they were given in the *Miris Jogar canonis descriptio*.

12. If we use the values of $\sin \frac{1}{2}a, \sin \frac{1}{2}b, \sin \frac{1}{2}c, \cos \frac{1}{2}a, \cos \frac{1}{2}b, \cos \frac{1}{2}c$, given by (9), (10) and the analogous formulae obtained by interchanging the letters we obtain by multiplication Schmeisser's Formulae.

$$\cos \frac{1}{2}a \cos \frac{1}{2}b \sin C = \cos \frac{1}{2}c \cos \frac{1}{2}(A+B-C)$$

$$\sin \frac{1}{2}a \sin \frac{1}{2}b \sin C = \cos \frac{1}{2}c \cos \frac{1}{2}(A+B+C)$$

These formulae were given by Schmeisser in *Crelle's Journ.*, vol. x. The relation $\sin b \sin c + \cos b \cos c \cos A = \sin B \sin C - \cos B \cos C \cos a$ was given by Cagnoli in his *Trigonometry* (1786), and was rediscovered by Cayley (*Phil. Mag.*, 1859).

Cagnoli's Formulae. It follows from (3), (2) and (1) thus: the right-hand side of the equation equals $\sin B \sin C + \cos a \cos A (\cos A - \sin B \sin C \cos a) = \sin B \sin C \cos a + \sin B \sin C \cos A (\cos A - \sin B \sin C \cos a)$ and this is equal to $\sin b \sin c + \cos b \cos c \cos A$.

13. The formulae we have given are sufficient to determine three parts of a triangle when the other three parts are given; moreover such formulae may always be chosen as are adapted to logarithmic calculation. The solutions will be unique except in the two cases (1) where two sides and the angle opposite one of them are the given parts, and (2) where two angles and the side opposite one of them are given.

Suppose a, b, A are the given parts. We determine B from the formula $\sin B = \sin b \sin A / \sin a$; this gives two supplementary values of B , one acute and the other obtuse. Then C and c are determined from the equations

$$\tan \frac{1}{2}C = \frac{\sin \frac{1}{2}(a-b)}{\sin \frac{1}{2}(a+b)} \cot \frac{1}{2}(A-B), \tan \frac{1}{2}c = \frac{\sin \frac{1}{2}(A+B)}{\sin \frac{1}{2}(A-B)} \tan \frac{1}{2}(a-b)$$

Now $\tan \frac{1}{2}C, \tan \frac{1}{2}c$, must both be positive; hence $A-B$ and $a-b$ must have the same sign. We shall distinguish three cases. First, suppose $\sin b < \sin a$; then we have $\sin B < \sin A$. Hence A lies between the two values of B , and therefore only one of these values is admissible, the acute or the obtuse value according as a is greater or less than b ; there is therefore in this case always one solution. Secondly, if $\sin b > \sin a$, there is no solution when $\sin b \sin A > \sin a$; but if $\sin b \sin A < \sin a$ there are two values of B , both greater or both less than A . If a is acute, $a-b$, and therefore $A-B$, is negative; hence there are two solutions if A is acute and none if A is obtuse. These two solutions fall together if $\sin b \sin A = \sin a$. If a is obtuse there is no solution unless A is obtuse, and in that case there are two, which coincide as before if $\sin b \sin A = \sin a$. Hence in this case there are two solutions if $\sin b \sin A < \sin a$ and the two parts A, a are both acute or both obtuse, these being coincident in case $\sin b \sin A = \sin a$; and there is no solution if one of the two A, a , is acute and the other obtuse, or if $\sin b \sin A > \sin a$. Thirdly, if $\sin b = \sin a$ then $B = A$ or $\pi - A$. If a is acute, $a-b$ is zero or negative, hence $A-B$ is zero or negative; thus there is no solution unless A is acute, and then there is one. Similarly, if a is obtuse, A must be so too in order that there may be a solution. If $a = b = \pi$, there is no solution unless $A = \pi$, and then there are an infinite number of solutions, since the values of C and c become indeterminate.

The other case of ambiguity may be discussed in a similar manner, or the different cases may be deduced from the above by the use of the polar triangle transformation. The method of classification

according to the three cases $\sin b \geq \sin a$ was given by Professor

Lloyd Tanner (*Messenger of Math.*, vol. xiv.).

14. If r is the angular radius of the small circle inscribed in the triangle ABC , we have at once $\tan r = \tan \frac{1}{2}A \sin \frac{1}{2}(s-a)$, where $2s = a+b+c$; from this we can derive the formulae $\tan r = N \cos s = \frac{1}{2}N \sec \frac{1}{2}A \sec \frac{1}{2}B \sec \frac{1}{2}C$ where N, N denote the expressions

$$\left[\frac{\sin s \sin (s-a) \sin (s-b) \sin (s-c)}{[\cos S \cos (S-A) \cos (S-B) \cos (S-C)]} \right]$$

The escribed circles are the small circles inscribed in three of the associated triangles; thus, applying the above formulae to the triangle ($a, \pi-b, \pi-c, A, \pi-B, \pi-C$), we have for r_1 , the radius of the escribed circle opposite to the angle A , the following formulae $\tan r_1 = \tan \frac{1}{2}A \sin s = N \cos (s-a) = \frac{1}{2}N \sec \frac{1}{2}A \cos \frac{1}{2}B \cos \frac{1}{2}C = \sin a \cos \frac{1}{2}B \cos \frac{1}{2}C \sec \frac{1}{2}A$ (22)

The pole of the circle circumscribing a triangle is that of the circle inscribed in the polar triangle, and the radii of the two circles are complementary; hence, if R be the radius of the circumscribed circle of the triangle, and R_1, R_2, R_3 the radii of the circles circumscribing the associated triangles, we have by writing $\pi - R$ for $r, \pi - R_1$ for $r_1, \pi - a$ for A , &c., in the above formulae $\cot R = \cot \frac{1}{2}a \cos (S-A) = \frac{1}{2}N \cos c \cos \frac{1}{2}b \cos \frac{1}{2}c \sec \frac{1}{2}c = N \sec S \sin a \cos \frac{1}{2}b \cos \frac{1}{2}c \sec \frac{1}{2}a$ (23)

$$\cot R_1 = -\cot \frac{1}{2}a \cos S = \frac{1}{2}N \cos c \cos \frac{1}{2}b \sec \frac{1}{2}c \sec \frac{1}{2}a = N \sec (S-A) \sin a \sin \frac{1}{2}b \sin \frac{1}{2}c \sec \frac{1}{2}a \quad (24)$$

The following relations follow from the formulae just given:—

$$2 \tan R \cos r = \cot r_1 + \cot r_2 + \cot r_3 - \cot r$$

$$2 \tan R_1 \cos r_1 = \cot r + \cot r_2 + \cot r_3 - \cot r_1$$

$$\tan r \tan r_1 \tan r_2 \tan r_3 = \sin^2 s \cot r \tan r_1 \tan r_2 \tan r_3$$

$$\sin^2 (s-a) = \tan r \cot r_1 \tan r_2 \tan r_3$$

15. If $E = A+B+C-\pi$, it may be shown that E multiplied by the square of the radius is the area of the triangle. We give some of the more important expressions for the quantity E , which is called the spherical excess. We have

$$\frac{\cos \frac{1}{2}(A+B)}{\sin \frac{1}{2}C} = \frac{\cos \frac{1}{2}(a+b)}{\cos \frac{1}{2}c} \text{ and } \frac{\sin \frac{1}{2}(A+B)}{\cos \frac{1}{2}C} = \frac{\cos \frac{1}{2}(a-b)}{\cos \frac{1}{2}c}$$

$$\text{or } \frac{\sin \frac{1}{2}(C-E)}{\sin \frac{1}{2}C} = \frac{\cos \frac{1}{2}(a+b)}{\cos \frac{1}{2}c} \text{ and } \frac{\cos \frac{1}{2}(C-E)}{\cos \frac{1}{2}C} = \frac{\cos \frac{1}{2}(a-b)}{\cos \frac{1}{2}c}$$

hence $\frac{\sin \frac{1}{2}C - \sin \frac{1}{2}(C-E)}{\sin \frac{1}{2}C + \sin \frac{1}{2}(C-E)} = \frac{\cos \frac{1}{2}c - \cos \frac{1}{2}(a+b)}{\cos \frac{1}{2}c + \cos \frac{1}{2}(a+b)}$

Solution of Triangles.

Ambiguous Cases.

Radius of Circles Related to Triangles.

Formulae for Spherical Excess.

therefore $\frac{\tan \frac{1}{2} E}{\tan \frac{1}{2} (C-E)} = \tan \frac{1}{2} s \tan \frac{1}{2} (s-c)$.
 Similarly $\tan \frac{1}{2} E \tan \frac{1}{2} (C-E) = \tan \frac{1}{2} (s-a) \tan \frac{1}{2} (s-b)$;
 therefore $\tan \frac{1}{2} E = \tan \frac{1}{2} s \tan \frac{1}{2} (s-a) \tan \frac{1}{2} (s-b) \tan \frac{1}{2} (s-c) \frac{1}{\tan \frac{1}{2} (C-E)}$ (25)
 This formula was given by J. Lhuillier.

Also $\sin \frac{1}{2} C \cos \frac{1}{2} E - \cos \frac{1}{2} C \sin \frac{1}{2} E = \frac{\cos \frac{1}{2} (a+b)}{\cos \frac{1}{2} c} \sin \frac{1}{2} C$;
 $\cos \frac{1}{2} C \cos \frac{1}{2} E + \sin \frac{1}{2} C \sin \frac{1}{2} E = \frac{\cos \frac{1}{2} (a-b)}{\cos \frac{1}{2} c} \cos \frac{1}{2} C$;
 whence, solving for $\cos \frac{1}{2} E$, we get

$$\cos \frac{1}{2} E = \frac{1 + \cos a + \cos b + \cos c}{4 \cos \frac{1}{2} a \cos \frac{1}{2} b \cos \frac{1}{2} c} \quad (26)$$

This formula was given by Euler (*Nova acta*, vol. x.). If we find $\sin \frac{1}{2} E$ from this formula, we obtain after reduction

$$\sin \frac{1}{2} E = \frac{\pi}{2 \cos \frac{1}{2} a \cos \frac{1}{2} b \cos \frac{1}{2} c}$$

a formula given by Lexell (*Acta Petrop.*, 1782).
 From the equations (21), (22), (23), (24) we obtain the following formulae for the spherical excess:—
 $\sin^2 \frac{1}{2} E = \tan R \cot R_1 \cot R_2 \cot R_3$

$$= \frac{4(\cot r_1 + \cot r_2 + \cot r_3)}{(\cot r - \cot r_1 + \cot r_2 + \cot r_3)(\cot r + \cot r_1 - \cot r_2 + \cot r_3) \times (\cot r + \cot r_1 + \cot r_2 + \cot r_3)}$$

The formula (26) may be expressed geometrically. Let M, N be the middle points of the sides AB, AC . Then we find $\cos MN$

$$= \frac{1 + \cos a + \cos b + \cos c}{4 \cos \frac{1}{2} b \cos \frac{1}{2} c}$$
; hence $\cos \frac{1}{2} E = \cos MN \sec \frac{1}{2} a$.

A geometrical construction has been given for E by Gudermann (*in Crelle's Journ.*, vi. and viii.). It has been shown by Cornelius Keogh that the volume of the parallelepiped of which the radii of the sphere passing through the middle points of the sides of the triangle are edges is $\sin^2 \frac{1}{2} E$.

16. Let $ABCD$ be a spherical quadrilateral inscribed in a small circle; let a, b, c, d denote the sides AB, BC, CD, DA respectively, and x, y the diagonals AC, BD . It can easily be shown by joining the angular points of the quadrilateral to the pole of the circle that $A+C=B+D$. If we use the last expression in (23) for the radii of the circles circumscribing the triangles BAD, BCD , we have

$$\sin A \cos \frac{1}{2} a \cos \frac{1}{2} d \operatorname{cosec} \frac{1}{2} y = \sin C \cos \frac{1}{2} b \cos \frac{1}{2} c \operatorname{cosec} \frac{1}{2} y$$
;

whence $\frac{\sin A}{\cos \frac{1}{2} b \cos \frac{1}{2} c} = \frac{\sin C}{\cos \frac{1}{2} a \cos \frac{1}{2} d}$

This is the proposition corresponding to the relation $A+C=\pi$ for a plane quadrilateral. Also we obtain in a similar manner the theorem

$$\frac{\sin \frac{1}{2} x}{\sin B \cos \frac{1}{2} b} = \frac{\sin \frac{1}{2} y}{\sin A \cos \frac{1}{2} d}$$

analogous to the theorem for a plane quadrilateral, that the diagonals are proportional to the sines of the angles opposite to them. Also the chords AB, BC, CD, DA are equal to $2 \sin \frac{1}{2} a, 2 \sin \frac{1}{2} b, 2 \sin \frac{1}{2} c, 2 \sin \frac{1}{2} d$ respectively, and the plane quadrilateral formed by these chords is inscribed in the same circle as the spherical quadrilateral; hence by Ptolemy's theorem for a plane quadrilateral we obtain the analogous theorem for a spherical one

$$\sin \frac{1}{2} x \sin \frac{1}{2} y = \sin \frac{1}{2} a \sin \frac{1}{2} c + \sin \frac{1}{2} b \sin \frac{1}{2} d$$
.

It has been shown by Remy (*in Crelle's Journ.*, vol. iii.) that for any quadrilateral, if g be the spherical distance between the middle points of the diagonals,

$$\cos a + \cos b + \cos c + \cos d = 4 \cos \frac{1}{2} x \cos \frac{1}{2} y \cos \frac{1}{2} g$$
.

This theorem is analogous to the theorem for any plane quadrilateral, that the sum of the squares of the sides is equal to the sum of the squares of the diagonals, together with twice the square on the straight line joining the middle points of the diagonals.

A theorem for a right-angled spherical triangle, analogous to the Pythagorean theorem, has been given by Gudermann (*in Crelle's Journ.*, vol. xlii.).

Analytical Trigonometry.

17. Analytical trigonometry is that branch of mathematical analysis in which the analytical properties of the trigonometrical functions are investigated. These functions derive their importance in analysis from the fact that they are the simplest singly periodic functions, and are therefore adapted to the representation of undulating magnitude. The sine, cosine, secant and cosecant have the single real period 2π ; i.e. each is unaltered in value by the addition of 2π to the variable. The tangent and cotangent have the period π . The sine, tangent, cosecant and cotangent belong to the class of odd functions; that is, they change sign when the sign of the variable is changed. The cosine and secant are even functions, since they remain unaltered when the sign of the variable is reversed.

The theory of the trigonometrical functions is intimately connected with that of complex numbers—that is, of numbers of the form $x+iy$ ($i=\sqrt{-1}$). Suppose we multiply together, by the rules of ordinary algebra, two such numbers we have

$(x_1+iy_1)(x_2+iy_2) = (x_1x_2-y_1y_2) + i(x_1y_2+x_2y_1)$. We observe that the real part and the real factor of the imaginary part of the expression on the right-hand side of this equation are similar in form to the expressions which occur in the addition formulae for the cosine and sine of the sum of two angles; in fact, if we put $x_1 = r_1 \cos \theta_1, y_1 = r_1 \sin \theta_1, x_2 = r_2 \cos \theta_2, y_2 = r_2 \sin \theta_2$, the above equations becomes

$$r_1(\cos \theta_1 + i \sin \theta_1) \times r_2(\cos \theta_2 + i \sin \theta_2) = r_1 r_2 (\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2))$$
.

We may now, in accordance with the usual mode of representing complex numbers, give a geometrical interpretation of the meaning of this equation. Let P_1 be the point whose co-ordinates referred to rectangular axes Ox, Oy are x_1, y_1 ; then the point P_2 is employed to represent the number x_2+iy_2 . In this mode of representation real numbers are measured along the axis of x and imaginary ones along the axis of y , additions being performed according to the parallelogram law. The points A, A_1 represent the numbers ± 1 , the points a, a_1 the numbers $\pm i$. Let P_3 represent the expression x_1+iy_1 and P' the expression $(x_1+iy_1)(x_2+iy_2)$. The quantities $r_1, \theta_1, r_2, \theta_2$ are the polar coordinates of P_1 and P_2 respectively, referred to O as origin and Ox as initial line; the above equation shows that $r_1 r_2$ and $\theta_1 + \theta_2$ are the polar co-ordinates of P' ; hence $OA' : OP_1 :: OP_2 : OP'$ and the angle POP_2 is equal to the angle P_1OA' . Thus we have the following geometrical construction for the determination of the point P' . On OP_2 draw a triangle similar to the triangle OAP_1 so that the sides OP_2, OP' are homologous to the sides OA, OP_1 , and so that the angle POP_2 is positive; then the vertex P' represents the product of the numbers represented by P_1, P_2 . If x_2+iy_2 were to be divided by x_1+iy_1 the triangle $OP'P_2$ would be drawn on the negative side of P_2 , similar to the triangle OAP_1 and having the sides OP', OP_2 homologous to OA, OP_1 , and P' would represent the quotient.

FIG. 8.

18. If we extend the above to n complex numbers by continual repetition of a similar operation, we have—
 $(\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2) \dots (\cos \theta_n + i \sin \theta_n)$ De Moivre's Theorem.
 $= \cos(\theta_1 + \theta_2 + \dots + \theta_n) + i \sin(\theta_1 + \theta_2 + \dots + \theta_n)$
 If $\theta_1 = \theta_2 = \dots = \theta_n = \theta$, this equation becomes $\cos \theta + i \sin \theta = \cos n\theta + i \sin n\theta$; this shows that $\cos \theta + i \sin \theta$ is a value of $(\cos n\theta + i \sin n\theta)^{\frac{1}{n}}$. If now we change θ into θ/n , we see that $\cos \theta/n + i \sin \theta/n$ is a value of $(\cos \theta + i \sin \theta)^{\frac{1}{n}}$; raising each of these quantities to any positive integral power m , $\cos m\theta/n + i \sin m\theta/n$ is one value of $(\cos \theta + i \sin \theta)^{\frac{m}{n}}$. Also

$$\cos(-m\theta/n) + i \sin(-m\theta/n) = \frac{1}{\cos m\theta/n + i \sin m\theta/n}$$
;

hence the expression of the left-hand side is one value of $(\cos \theta + i \sin \theta)^{-m/n}$. We have thus De Moivre's theorem that $\cos k\theta + i \sin k\theta$ is always one value of $(\cos \theta + i \sin \theta)^k$, where k is any rational number. This theorem can be extended to the case in which k is irrational, if we postulate that a value of $(\cos \theta + i \sin \theta)^k$ denotes the limit of a sequence of corresponding values of $(\cos \theta + i \sin \theta)^{k_n}$, where $k_1, k_2, \dots, k_n, \dots$ is a sequence of rational numbers of which k is the limit, and further observe that as $\cos k\theta + i \sin k\theta$ is the limit of $\cos k_n\theta + i \sin k_n\theta$.

The principal object of De Moivre's theorem is to enable us to find all the values of an expression of the form $(a+ib)^m$, where m and n are positive integers prime to each other. If $a = r \cos \theta, b = r \sin \theta$, we require the values of $r^m (\cos \theta + i \sin \theta)^m$. One value is immediately furnished by the theorem; but we observe that since the expression $\cos \theta + i \sin \theta$ is unaltered by adding any multiple of 2π to θ , the m th power of $r^m (\cos m\theta + 2\pi i/n + i \sin m\theta + 2\pi i/n)$ is $a+ib$, if n is any integer; hence this expression is one of the values required. Suppose that for two values s_1 and s_2 of i the values of this expression are the same; then we must have $m\theta + 2\pi i/n = m\theta + 2\pi i/n + 2\pi i s_1$, a multiple of 2π , or $s_1 - s_2$ must be a multiple of n . Therefore, if we give i the values $0, 1, 2, \dots, n-1$ successively, we shall get n different values of $(a+ib)^m$, and these will be repeated if we give i other values; hence all the values of

$(a+b)^n$ are obtained by giving s the values $0, 1, 2, \dots, n-1$ in the expression $r^{n-s} (\cos s \cdot \theta + 2s\pi/n + i \sin s \cdot \theta + 2s\pi/n)$, where $r = (a^2 + b^2)^{1/2}$ and $\theta = \arccos a/b$.

We now return to the geometrical representation of the complex numbers. If the points $B_1, B_2, B_3, \dots, B_n$ represent the expression $x+y, (x+y)^2, (x+y)^3, \dots, (x+y)^n$ respectively, the triangles $OAB_1, OB_1B_2, \dots, OB_{n-1}B_n$ are all similar. Let $(x+y)^n = a+b$, then the converse problem of finding the n th root of $a+b$ is equivalent to the geometrical problem of describing such a series of triangles that OA is the first side of the first triangle and OB_n the second side of the n th.

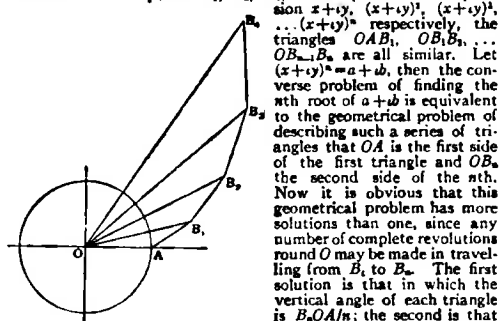

FIG. 9.

Now it is obvious that this geometrical problem has more solutions than one, since any number of complete revolutions round O may be made in travelling from B_1 to B_n . The first solution is that in which the vertical angle of each triangle is B_nOA/n ; the second is that in which each is $(B_nOA + 2\pi)/n$, in this case one complete revolution being made round O ; the third has $(B_nOA + 4\pi)/n$ for the vertical angle of each triangle; and so on. There are n sets of triangles which satisfy the required conditions. For simplicity we will take the case of the determination of the values of $(\cos \theta + i \sin \theta)^{1/n}$.

FIG. 10.

Suppose B to represent the expression $\cos \theta + i \sin \theta$. If the angle AOP_1 is θ , P_1 represent the root $\cos \theta + i \sin \theta$; the angle AOB is filled up by the angles of the three similar triangles AOP_1, P_1OP_2, P_2OB . Also, if P_2, P_3 be such that the angles P_1OP_2, P_2OP_3 are $\frac{1}{n}\pi, \frac{1}{n}\pi$ respectively, the two sets of triangles AOP_1, P_1OP_2, P_2OB and AOP_2, P_2OP_3, P_3OB satisfy the conditions of similarity and of having OA, OB for the bounding sides; thus P_2, P_3 represent the roots $(\cos \theta + i \sin \theta)^2, (\cos \theta + i \sin \theta)^3$ respectively. If B coincides with A , the problem is reduced to that of finding the three cube roots of unity. One will be represented by A and the others by the two angular points of an equilateral triangle, with A as one angular point, inscribed in the circle.

The problem of determining the values of the n th roots of unity is equivalent to the geometrical problem of inscribing a regular polygon of n sides in a circle. Gauss has shown in his *Disquisitiones arithmeticae that this can always be done by the compass and ruler only when n is a prime of the form $2^k + 1$. The determination of the n th root of any complex number requires in addition, for its geometrical solution, the division of an angle into n equal parts.*

19. We are now in a position to factorize an expression of the form $x^n - (a+ib)$. Using the values which we have obtained above for $(a+ib)^{1/n}$, we have

$$x^n - (a+ib) = \prod_{s=0}^{n-1} \left[x - r^{1/n} \left(\cos \frac{\theta + 2s\pi}{n} + i \sin \frac{\theta + 2s\pi}{n} \right) \right]. \quad (1)$$

If $\theta = 0, a = 1$, this becomes

$$\begin{aligned} x^n - 1 &= \prod_{s=0}^{n-1} \left[x - \cos \frac{2s\pi}{n} - i \sin \frac{2s\pi}{n} \right] \\ &= (x-1)(x+1) \prod_{s=1}^{n-1} \left(x - \cos \frac{2s\pi}{n} - i \sin \frac{2s\pi}{n} \right) \\ &= (x-1)(x+1) \prod_{s=1}^{n-1} \left(x^2 - 2x \cos \frac{2s\pi}{n} + 1 \right) \quad (\text{\textit{n} even}). \quad (2) \end{aligned}$$

$$x^n - 1 = (x-1) \prod_{s=1}^{n-1} \left(x^2 - 2x \cos \frac{2s\pi}{n} + 1 \right) \quad (\text{\textit{n} odd}). \quad (3)$$

If in (1) we put $a = -1, \theta = 0$, and therefore $\theta = \pi$, we have

$$\begin{aligned} x^n + 1 &= \prod_{s=0}^{n-1} \left[x - \cos \frac{2s+1\pi}{n} - i \sin \frac{2s+1\pi}{n} \right] \\ &= \prod_{s=0}^{n-1} \left(x^2 - 2x \cos \frac{2s+1\pi}{n} + 1 \right) \quad (\text{\textit{n} even}). \quad (4) \end{aligned}$$

$$x^n + 1 = (x+1) \prod_{s=0}^{n-1} \left(x^2 - 2x \cos \frac{2s+1\pi}{n} + 1 \right) \quad (\text{\textit{n} odd}). \quad (5)$$

$$\begin{aligned} \text{Also } x^n - 2xy \cos \theta + y^n &= (x^n - y^n \cos \theta + i \sin \theta)(x^n - y^n \cos \theta - i \sin \theta) \\ &= \prod_{s=0}^{n-1} \left(x - y \cos \frac{\theta + 2s\pi}{n} + i \sin \frac{\theta + 2s\pi}{n} \right) \\ &= \prod_{s=0}^{n-1} \left[x^2 - 2xy \cos \theta + \frac{2s\pi}{n} + y^2 \right]. \quad (6) \end{aligned}$$

Airy and Adams have given proofs of this theorem which do not involve the use of the symbol i (see *Cambr. Phil. Trans.*, vol. xi).

A large number of interesting theorems may be derived from De Moivre's theorem and the factorizations which we have deduced from it; we shall notice one of them.

In equation (6) put $y = 1/x$, take logarithms, and then differentiate each side with respect to x , and we get

$$\frac{2n(x^{2n-1} - x^{n-1})}{x^{2n} - 2 \cos \theta + x^{-2n}} = \sum_{s=0}^{n-1} \frac{2(x - x^{-1})}{x^2 - 2 \cos \theta + \frac{2s\pi}{n} + x^{-2}}$$

Put $x^2 = a/b$, then we have the expression

$$\frac{(a^2 - b^2)(a^{2n} - 2a^n b^n \cos \theta + b^{2n})}{\sum_{s=0}^{n-1} \frac{1}{a^2 - 2ab \cos \theta + \frac{2s\pi}{n} + b^2}}$$

20. Denoting the complex number $x+iy$ by z , let us consider the series $1+z+z^2/2!+\dots+z^n/n!+\dots$. This series converges uniformly and absolutely for all values of z whose moduli do not exceed an arbitrarily chosen positive number R . Consequently the function $E(z)$, defined as the limiting sum of the above series, is continuous in every finite domain. The two series representing $E(x)$ and $E(iz)$, when multiplied together give the series represented by $E(x+iz)E(x-iz)$. In accordance with a known theorem, since the series for $E(x)E(x)$ are absolutely convergent, we have $E(x) \times E(x) = E(x^2)$. From this fundamental relation, we deduce at once that $\{E(z)\}^n = E(nz)$, where n is any positive integer. The number $E(1)$, the sum of the convergent series $1+1/2!+1/3!+\dots$ is usually denoted by e ; its value can be shown to be $2.718281828459\dots$. It is known to be a transcendental number, i.e., it cannot be the root of any algebraical equation with rational coefficients; this was first established by Hermite. Writing $s = 1$, we have $E(n) = e^n$, where n is a positive integer. If s has as a value a positive fraction p/q , we find that $\{E(p/q)\}^q = E(p)$; hence $E(p/q)$ is the real positive value of $e^{p/q}$. Again $E(-p/q) \times E(p/q) = E(0) = 1$, hence $E(-p/q)$ is the real positive value of $e^{-p/q}$. It has been thus shown that for any real and rational number x , the value of $E(x)$ is the principal value of e^x . This result can be extended to irrational values of x . If we assume that e^x is for such a value of x defined as the limit of the sequence e^{x_1}, e^{x_2}, \dots , where x_1, x_2, \dots is a sequence of rational numbers of which x is the limit, since $E(x_1), E(x_2), \dots$ then converges to $E(x)$.

Next consider $(1+z/m)^m$, where m is a positive integer. We have by the binomial theorem,

$$\left(1 + \frac{z}{m}\right)^m = 1 + z + \left(\frac{1}{m}\right) \frac{z^2}{2!} + \left(\frac{1}{m}\right) \left(\frac{1}{m}\right) \frac{z^3}{3!} + \dots + \left(\frac{z}{m}\right)^m$$

$$\text{Also } \left(1 - \frac{1}{m}\right) \left(1 - \frac{2}{m}\right) \dots \left(1 - \frac{m-1}{m}\right)$$

lies between 1 and $1 + \frac{z}{m} + \frac{z^2}{2m} + \dots + \frac{z^{m-1}}{m}$;

hence the product equals $1 - \theta z, 1 - 1/2m$ where θ , is that which $0 < \theta < 1$.

$$\left(1 + \frac{z}{m}\right)^m = 1 + z + \left(\frac{1}{m}\right) \frac{z^2}{2!} + \dots + \left[1 - \theta \frac{z - 1}{2m}\right] \frac{z}{1!} + \dots$$

$$\begin{aligned} &= 1 + z + z^2/2! + \dots + z^m/m! + R_n \\ \text{where} \\ R_n &= \frac{z^{m+1}}{(s+1)!} + \dots + \frac{z^m}{m!} - \frac{z^m}{2m} \left\{ 1 + \theta \frac{z}{1!} + \dots + \theta \frac{z^{m-2}}{(m-2)!} \right\}. \end{aligned}$$

Since the series for $E(z)$ converges, s can be fixed so that for all values of $m > s$ the modulus of $z^{m+1}/(s+1)! + \dots + z^m/m!$ is less than an arbitrarily chosen number ϵ . Also the modulus of $1 + \theta z/1! + \dots + \theta z^{m-2}/(m-2)!$ is less than that of $1 + |z|/1! + |z|^2/2! + \dots$, or of $e^{\text{mod } z}$, hence $\text{mod } R_n < \epsilon + (1/2m) \cdot \text{mod } (z^m) < \epsilon$, if m be chosen sufficiently great. It follows that $\lim_{m \rightarrow \infty} (1+z/m)^m = E(z)$, where s is any complex number. To evaluate $E(z) = \text{write } 1+z/m = \rho \cos \phi, y/m = \rho \sin \phi$, then

$E(\rho) = \lim_{m \rightarrow \infty} \left[\rho^m (\cos m\theta + i \sin m\theta) \right]$, by De Moivre's theorem. Since $\rho^m = \left(1 + \frac{x}{m} \right)^m \left\{ 1 + \frac{y}{m(\sqrt{m+x}\sqrt{m})} \right\}^{2m}$, we have $\lim_{m \rightarrow \infty} \rho^m = e^x \cdot \lim_{m \rightarrow \infty} \left\{ 1 + \frac{y}{m(\sqrt{m+x}\sqrt{m})} \right\}^{2m}$. Let r be a fixed number less than $\sqrt{m+x}/\sqrt{m}$, then $\lim_{m \rightarrow \infty} \left\{ 1 + \frac{y}{m(\sqrt{m+x}\sqrt{m})} \right\}^{2m}$ lies between 1 and $\lim_{m \rightarrow \infty} \left\{ 1 + \frac{y}{mr} \right\}^{2m}$, or between 1 and e^{2ry} ; hence

since r can be taken arbitrarily large, the limit is 1. The limit of $m\theta$ or $m \tan^{-1} \left\{ \frac{y}{x+m} \right\}$ is the same as that of $m y / (x+m)$ which is y . Hence we have shown that $E(\rho) = e^{x+iy}$ (that is $e^x \cos y + i e^x \sin y$).

21. Since $E(x+iy) = e^x (\cos y + i \sin y)$, we have $\cos y + i \sin y = E(x+iy)$, and $\cos y - i \sin y = E(-iy)$. Therefore $\cos y = \frac{1}{2} [E(x+iy) + E(-iy)]$, and $\sin y = \frac{1}{2i} [E(x+iy) - E(-iy)]$; and using the series defined by $E(x)$ and $E(-iy)$, we find that $\cos y = 1 - \frac{y^2}{2!} + \frac{y^4}{4!} - \dots$, $\sin y = y - \frac{y^3}{3!} + \frac{y^5}{5!} - \dots$ where y is any real number. These are the well-known expansions of $\cos y$, $\sin y$ in powers of the circular measure y . Where z is a complex number, the symbol e^z may be defined to be such that its principal value is $E(z)$; thus the principal values of e^z , e^{-z} are $E(z)$, $E(-z)$. The above expressions for $\cos y$, $\sin y$ may then be written $\cos y = \frac{1}{2} (e^{iy} + e^{-iy})$, $\sin y = \frac{1}{2i} (e^{iy} - e^{-iy})$. These are known as the exponential values of the cosine and sine. It can be shown that the symbol e^z as defined here satisfies the usual laws of combination for exponents.

22. The two functions $\cos s$, $\sin s$ may be defined for all complex real values of s by means of the equations $\cos s = \frac{1}{2} [E(s) + E(-s)]$, $\sin s = \frac{1}{2i} [E(s) - E(-s)]$, where $E(s)$ represents the sum-function of $1 + s + \frac{s^2}{2!} + \dots + \frac{s^n}{n!} + \dots$. For real values of s this is in accordance with the ordinary definitions, as appears from the series obtained above for $\cos y$, $\sin y$. The fundamental properties of $\cos s$, $\sin s$ can be deduced from this definition. Thus $\cos s + i \sin s = E(s)$, $\cos s - i \sin s = E(-s)$; therefore $\cos^2 s + \sin^2 s = E(s)E(-s) = 1$. Again $\cos(s_1 + s_2)$ is given by $\frac{1}{2} [E(s_1 + i s_2) + E(-s_1 - i s_2)] = \frac{1}{2} [E(s_1)E(i s_2) + E(-s_1)E(-i s_2)]$ or $\frac{1}{2} [E(s_1) + E(-s_1)] [E(i s_2) + E(-i s_2)] + \frac{1}{2} [E(i s_1) - E(-i s_1)] [E(i s_2) - E(-i s_2)]$, whence we have $\cos(s_1 + s_2) = \cos s_1 \cos s_2 - \sin s_1 \sin s_2$. Similarly, we find that $\sin(s_1 + s_2) = \sin s_1 \cos s_2 + \cos s_1 \sin s_2$. Again the equation $E(s)^2 = 1$ has no real roots except $s=0$, for $e^s > 1$, if s is real and > 0 . Also $E(s) = 1$ has no complex root $a + i\theta$, for $a - i\theta$ would then also be a root, and $E(2a) = E(a + i\theta)E(a - i\theta) = 1$, which is impossible unless $a=0$. The roots of $E(s) = 1$ are therefore purely imaginary (except $s=0$); the smallest numerically we denote by $2\pi i$, so that $E(2\pi i) = 1$. We have then $E(2\pi i r) = [E(2\pi i)]^r = 1$, if r is any integer; therefore $2\pi i r$ is a root. It can be shown that no root lies between $2\pi i r$ and $2\pi i(r+1)$; and thus that all the roots are given by $s = 2\pi i r$. Since $E(y + 2\pi i r) = E(y)E(2\pi i r) = E(y)$, we see that $E(s)$ is periodic, of period $2\pi i$. It follows that $\cos s$, $\sin s$ are periodic, of periods 2π . The number here introduced may be identified with the ratio of the circumference to the diameter of a circle by considering the case of real values of s .

23. Consider the binomial theorem

$$(a+b)^n = a^n + n a^{n-1} b + \frac{n(n-1)}{2!} a^{n-2} b^2 + \dots + \frac{n(n-1)\dots(n-r+1)}{r!} a^{n-r} b^r + \dots + b^n$$

Putting $a = e^{i\theta}$, $b = e^{-i\theta}$, we obtain

$$(2 \cos \theta)^n = 2 \cos n\theta + n 2 \cos^{n-2} \theta + \dots + \frac{n(n-1)}{2!} 2 \cos^{n-4} \theta + \dots + \frac{n(n-1)\dots(n-r+1)}{r!} 2 \cos^{n-2r} \theta + \dots$$

When n is odd the last term is $2 \frac{n(n-1)\dots(n+3)}{(n-1)!} \cos \theta$, and when n is even it is $\frac{n(n-1)\dots(n+1)}{(n-1)!}$

If we put $a = e^{i\theta}$, $b = -e^{-i\theta}$, we obtain the formula

$$(-1)^n (2 \sin \theta)^n = 2 \cos n\theta - 2n \cos^{n-2} \theta + \frac{n(n-1)}{2!} 2 \cos^{n-4} \theta - \dots + (-1)^n \frac{n(n-1)\dots(n-r+1)}{r!} 2 \cos^{n-2r} \theta - \dots + (-1)^n \frac{n(n-1)\dots(n+1)}{(n-1)!} \sin \theta$$

When n is even, and

$$(-1)^{n/2} (2 \sin \theta)^n = 2 \sin n\theta - 2n \sin^{n-2} \theta + \frac{n(n-1)}{2!} 2 \sin^{n-4} \theta - \dots + (-1)^{n/2} \frac{n(n-1)\dots(n+3)}{(n-1)!} \sin \theta$$

when n is odd. These formulae enable us to express any positive integral power of the sine or cosine in terms of sines or cosines of multiples of the argument. There are corresponding formulae when n is not a positive integer.

Consider the identity $\log(1-px) + \log(1-qx) = \log(1-p+qx+px^2)$. Expand both sides of this equation in powers of x , and equate the coefficients of x^n , we then get

$$\rho^n + q^n = (\rho+q)^n - n(\rho+q)^{n-2} \rho q + \frac{n(n-3)}{2!} (\rho+q)^{n-4} \rho^2 q^2 + \dots + (-1)^n \frac{n(n-r-1)(n-r-2)\dots(n-2r+1)}{r!} (\rho+q)^{n-2r} \rho^r q^r + \dots$$

If we write this series in the reverse order, we have

$$\rho^n + q^n = 2(-1)^n \left[(\rho q)^{\frac{n}{2}} - \frac{n^2}{2!} (\rho q)^{\frac{n-2}{2}} \left(\frac{\rho+q}{2} \right) + \frac{n^2(n^2-2^2)}{4!} (\rho q)^{\frac{n-4}{2}} \left(\frac{\rho+q}{2} \right)^2 - \dots + (-1)^{\frac{n}{2}} \frac{1}{2} (\rho+q)^n \right]$$

when n is even, and

$$\rho^n + q^n = 2(-1)^{\frac{n-1}{2}} \left[n(\rho q)^{\frac{n-1}{2}} \left(\frac{\rho+q}{2} \right) - \frac{n(n^2-1^2)}{3!} (\rho q)^{\frac{n-3}{2}} \left(\frac{\rho+q}{2} \right)^2 + \frac{n(n^2-1^2)(n^2-3^2)}{5!} (\rho q)^{\frac{n-5}{2}} \left(\frac{\rho+q}{2} \right)^3 + \dots + (-1)^{\frac{n-1}{2}} \frac{1}{2} (\rho+q)^n \right]$$

when n is odd. If in these three formulae we put $\rho = e^{i\theta}$, $q = e^{-i\theta}$, we obtain the following series for $\cos n\theta$:-

$$2 \cos n\theta = (2 \cos \theta)^n - n(2 \cos \theta)^{n-2} + \frac{n(n-3)}{2!} (2 \cos \theta)^{n-4} - \dots + (-1)^n \frac{n(n-r-1)(n-r-2)\dots(n-2r+1)}{r!} (2 \cos \theta)^{n-2r} + \dots (7)$$

when n is any positive integer;

$$(-1)^{\frac{n-1}{2}} 2 \cos n\theta = 1 - \frac{n^2}{2!} \cos^2 \theta + \frac{n^2(n^2-2^2)}{4!} \cos^4 \theta - \frac{n^2(n^2-2^2)(n^2-4^2)}{6!} \cos^6 \theta + \dots + (-1)^{\frac{n-1}{2}} 2 \cos^2 \theta \cos n\theta (8)$$

when n is an even positive integer;

$$(-1)^{\frac{n-1}{2}} 2 \cos n\theta = n \cos \theta - \frac{n(n^2-1^2)}{3!} \cos^3 \theta + \frac{n(n^2-1^2)(n^2-3^2)}{5!} \cos^5 \theta - \dots + (-1)^{\frac{n-1}{2}} 2 \cos^3 \theta \cos n\theta (9)$$

when n is odd. If in the same three formulae we put $\rho = e^{i\theta}$, $q = -e^{-i\theta}$, we obtain the following four formulae:-

$$(-1)^{\frac{n}{2}} 2 \cos n\theta = (2 \sin \theta)^n - n(2 \sin \theta)^{n-2} + \frac{n(n-3)}{2!} (2 \sin \theta)^{n-4} - \dots + (-1)^{\frac{n}{2}} \frac{n(n-r-1)\dots(n-2r-1)}{r!} (2 \sin \theta)^{n-2r} + \dots (n \text{ even}); (10)$$

$$(-1)^{\frac{n-1}{2}} 2 \sin n\theta = \text{the same series (n odd); (11)}$$

$$\cos n\theta = 1 - \frac{n^2}{2!} \sin^2 \theta + \frac{n^2(n^2-2^2)}{4!} \sin^4 \theta - \frac{n^2(n^2-2^2)(n^2-4^2)}{6!} \sin^6 \theta + \dots + (-1)^{\frac{n}{2}} \sin^2 \theta \cos n\theta (n \text{ even}); (12)$$

$$\sin n\theta = n \sin \theta - \frac{n(n^2-1^2)}{3!} \sin^3 \theta + \frac{n(n^2-1^2)(n^2-3^2)}{5!} \sin^5 \theta - \dots + (-1)^{\frac{n-1}{2}} \frac{n-1}{2} \sin^2 \theta \cos n\theta (n \text{ odd}). (13)$$

Next consider the identity $\frac{1}{1-px} - \frac{1}{1-qx} = \frac{p-q}{1-(p+q)x + pqx^2}$

Expand both sides of this equation in powers of x , and equate the coefficients of x^n , then we obtain the equation

$$\frac{p^n - q^n}{p - q} = (\rho+q)^{n-1} - (n-2)(\rho+q)^{n-3} \rho q + \frac{(n-3)(n-4)}{2!} (\rho+q)^{n-5} \rho^2 q^2 - \dots + (-1)^n \frac{(n-r-1)(n-r-2)\dots(n-2r)}{r!} (\rho+q)^{n-2r-1} \rho^r q^r + \dots$$

If, as before, we write this in the reverse order, we have the series

$$(-1)^{\frac{n-1}{2}} \left[n \left(\frac{\rho+q}{2} \right) (\rho q)^{\frac{n-1}{2}} - \frac{n(n^2-2^2)}{3!} \left(\frac{\rho+q}{2} \right)^2 (\rho q)^{\frac{n-3}{2}} + \frac{n^2(n^2-2^2)(n^2-4^2)}{5!} \left(\frac{\rho+q}{2} \right)^3 (\rho q)^{\frac{n-5}{2}} + \dots + (-1)^{\frac{n-1}{2}} \frac{1}{2} (\rho+q)^{n-1} \right]$$

Expansion of Sines and Cosines of Multiple Arcs in Powers of Sines and Cosines of Arc.

when n is even, and

$$(-1)^{\frac{n-1}{2}} \left[(\rho q)^{\frac{n-1}{2}} - \frac{n-1}{2!} (\frac{\rho+q}{2})^2 (\rho q)^{\frac{n-3}{2}} + \frac{(n-1)(n-3)}{4!} (\frac{\rho+q}{2})^4 (\rho q)^{\frac{n-5}{2}} + \dots + (-1)^{\frac{n-1}{2}} (\rho+q)^{n-1} \right]$$

when n is odd. If we put $p=e^{\theta}$, $q=e^{-\theta}$, we obtain the formulæ

$$\sin n\theta = \sin \theta \left\{ (2 \cos \theta)^{n-1} - (n-2)(2 \cos \theta)^{n-3} + \frac{(n-3)(n-4)}{2!} (2 \cos \theta)^{n-5} + (-1)^{\frac{n-1}{2}} \frac{(n-1)(n-2) \dots (n-2r)}{r!} (2 \cos \theta)^{n-2r-1} + \dots \right\} \quad (14)$$

where n is any positive integer;

$$(-1)^{\frac{n-1}{2}} \sin n\theta = \sin \theta \left\{ n \cos \theta - \frac{n(n-2)}{3!} \cos^3 \theta + \frac{n(n-2)(n-4)}{5!} \cos^5 \theta - \dots + (-1)^{\frac{n-1}{2}} (2 \cos \theta)^{n-1} \right\} \quad (15)$$

$$(-1)^{\frac{n-1}{2}} \sin n\theta = \sin \theta \left\{ 1 - \frac{n^2-1}{2!} \cos^2 \theta + \frac{(n^2-1)(n^2-3^2)}{4!} \cos^4 \theta - \dots + (-1)^{\frac{n-1}{2}} (2 \cos \theta)^{n-1} \right\} \quad (16)$$

If we put in the same three formulæ $p=e^{\theta}$, $q=e^{-\theta}$, we obtain the series

$$(-1)^{\frac{n-2}{2}} \sin n\theta = \cos \theta \left[\sin^{n-2} \theta - (n-2) \sin^{n-4} \theta + \frac{(n-3)(n-4)}{2!} \sin^{n-6} \theta - \dots + (-1)^{\frac{n-2}{2}} \frac{(n-1)(n-2) \dots (n-2r)}{r!} \sin^{n-2r} \theta + \dots \right] \quad (n \text{ even}); \quad (17)$$

$$(-1)^{\frac{n-1}{2}} \cos n\theta = \text{the same series } (n \text{ odd}); \quad (18)$$

$$\sin n\theta = \cos \theta \left\{ n \sin \theta - \frac{n(n-2)}{3!} \sin^3 \theta + \frac{n(n-2)(n-4)}{5!} \sin^5 \theta - \dots + (-1)^{\frac{n-1}{2}} (2 \sin \theta)^{n-1} \right\} \quad (n \text{ even}); \quad (19)$$

$$\cos n\theta = \cos \theta \left\{ 1 - \frac{n^2-1}{2!} \sin^2 \theta + \frac{(n^2-1)(n^2-3^2)}{4!} \sin^4 \theta - \dots + (2 \sin \theta)^{n-1} \right\} \quad (n \text{ odd}). \quad (20)$$

We have thus obtained formulæ for $\cos n\theta$ and $\sin n\theta$ both in ascending and in descending powers of $\cos \theta$ and $\sin \theta$. Vieta obtained formulæ for chords of multiple arcs in powers of chords of the simple or complementary arcs equivalent to the formulæ (13) and (19) above. These are contained in his work *Theoremata ad angulares sectiones*. Jacques Bernoulli found formulæ equivalent to (12) and (13) (*Mém. de l'Académie des Sciences*, 1702), and transformed these series into a form equivalent to (10) and (11). Jean Bernoulli published in the *Acta eruditorum* for 1701, among other formulæ already found by Vieta, one equivalent to (17). These formulæ have been extended to cases in which n is fractional, negative or irrational; see a paper by D. F. Gregory in *Camb. Math. Journ.* vol. iv., in which the series for $\cos n\theta$, $\sin n\theta$ in ascending powers of $\cos \theta$ and $\sin \theta$ are extended to the case of a fractional value of n . These series have been considered by Euler in a memoir in the *Novæ acta*, vol. ix., by Lagrange in his *Calcul des fonctions* (1806), and by Poinsot in *Recherches sur l'Analyse des sections angulaires* (1825).

24. The general definition of Napierian logarithms is that, if $e^{x+y} = a+b$, then $x+y = \log(a+b)$. Now we know that $\text{Theory of } e^{x+y} = e^x e^y = \cos x + i \sin x \cdot (\cos y + i \sin y) = e^{ix} e^{iy} = e^{i(x+y)}$, $y = \arctan b/a = \arctan \frac{b}{a}$, where m is an integer. If $b=0$, then m must be even or odd according as a is positive or negative; hence

$$\log_e(a+ib) = \log_e(a^2+b^2) \frac{1}{2} + i \cdot (\arctan b/a = \arctan \frac{b}{a})$$

or $\log_e(a+ib) = \log_e(a^2+b^2) \frac{1}{2} + i \cdot (\arctan b/a = \arctan \frac{b}{a})$, according as a is positive or negative. Thus the logarithm of any complex or real quantity is a multiple-valued function, the difference between successive values being $2\pi i$; in particular, *Hyperbolic Trigonometry* the most general form of the logarithm of a real positive quantity is obtained by adding positive or negative multiples of $2\pi i$ to the arithmetical logarithm. On this subject, see De Morgan's *Trigonometry and Double Algebra*, ch. iv., and a paper by Professor Cayley in vol. ii. of *Proc. London Math. Soc.*

25. We have from the definitions given in § 21, $\cos iy = \frac{1}{2}(e^{i+iy} + e^{-i-iy})$ and $\sin iy = \frac{1}{2i}(e^{i+iy} - e^{-i-iy})$. The expressions, $\frac{1}{2}(e^{i+iy} + e^{-i-iy})$ are said to define the hyperbolic cosine and sine of y and are written $\cosh y$, $\sinh y$; thus $\cosh iy = \cos y$, $\sinh iy = i \sin y$. The functions $\cosh y$, $\sinh y$ are connected with the rectangular hyperbola in a manner analogous to which the cosine and

sine are connected with the circle. We may easily show from the definitions that

$$\begin{aligned} \cosh^2(x+iy) + \sinh^2(x+iy) &= 1, \\ \cosh^2 y - \sinh^2 y &= 1, \\ \cosh(x+iy) &= \cos x \cosh y - i \sin x \sinh y, \\ \sinh(x+iy) &= i \cos x \sinh y + \sin x \cosh y, \\ \cosh(a+iy) &= \cosh a \cosh y - i \sinh a \sinh y, \\ \sinh(a+iy) &= i \cosh a \sinh y + \sinh a \cosh y. \end{aligned}$$

These formulæ are the basis of a complete hyperbolic trigonometry. The connexion of these functions with the hyperbola was first pointed out by Lambert.

26. If we equate the coefficients of n on both sides of equation (13), this process requiring, however, a justification of its validity, we get

$$\theta = \sin \theta + \frac{1}{2} \frac{\sin^3 \theta}{3} + \frac{1 \cdot 3}{2 \cdot 4} \frac{\sin^5 \theta}{5} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} \frac{\sin^7 \theta}{7} + \dots; \quad (21)$$

θ must lie between the values $\pm \frac{\pi}{2}$. This equation of *Its Sine*, may also be written in the form

$$\arcsin x = x + \frac{1}{2} \frac{x^3}{3} + \frac{1 \cdot 3}{2 \cdot 4} \frac{x^5}{5} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} \frac{x^7}{7} + \dots$$

when x lies between ± 1 .

By equating the coefficients of n^3 on both sides of equation (12) we get

$$\theta^3 = \sin^3 \theta + \frac{2}{3} \frac{\sin^5 \theta}{2} + \frac{2 \cdot 4}{3 \cdot 5} \frac{\sin^7 \theta}{3} + \frac{2 \cdot 4 \cdot 6}{3 \cdot 5 \cdot 7} \frac{\sin^9 \theta}{4} + \dots \quad (22)$$

which may also be written in the form

$$(\arcsin x)^3 = x^3 + \frac{2}{3} \frac{x^5}{2} + \frac{2 \cdot 4}{3 \cdot 5} \frac{x^7}{3} + \frac{2 \cdot 4 \cdot 6}{3 \cdot 5 \cdot 7} \frac{x^9}{4} + \dots$$

when x is between ± 1 . Differentiating this equation with regard to x , we get

$$\frac{\arcsin x}{\sqrt{1-x^2}} = x + \frac{2}{3} \frac{x^3}{2} + \frac{2 \cdot 4}{3 \cdot 5} \frac{x^5}{3} + \frac{2 \cdot 4 \cdot 6}{3 \cdot 5 \cdot 7} \frac{x^7}{4} + \dots;$$

if we put $\arcsin x = \arctan y$, this equation becomes

$$\arctan y = \frac{y}{1+y^2} \left\{ 1 + \frac{2}{3} \frac{y^2}{1+y^2} + \frac{2 \cdot 4}{3 \cdot 5} \left(\frac{y^2}{1+y^2} \right)^2 + \dots \right\} \quad (23)$$

This equation was given with two proofs by Euler in the *Novæ acta* for 1793.

It can be shown that if $\text{mod } x < 1$, then for any such real or complex value of x , value of $\log_e(x+i\pi)$ is given by the sum of the series $x^2 - x^4/2 + x^6/3 - \dots$

We then have

$$\frac{1}{2} \log \frac{1+x}{1-x} = x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \dots; \quad \text{Gregory's Series.}$$

put iy for x , the left side then becomes $\frac{1}{2} \log(1+iy) - \log(1-iy)$ or $i \arctan y = i\pi x$;

$$\text{hence } \arctan y = \pi x = y - \frac{y^3}{3} + \frac{y^5}{5} - \frac{y^7}{7} + \dots$$

The series is convergent if y lies between $\pm \pi$; if we suppose $\arctan y$ restricted to values between $\pm \frac{\pi}{2}$, we have

$$\arctan y = y - \frac{y^3}{3} + \frac{y^5}{5} - \dots \quad (24)$$

which is Gregory's series.

Various series derived from (24) have been employed to calculate the value of π . At the end of the 17th century π was calculated to 72 places of decimals by Abraham Sharp, by means of the series obtained by putting $\arctan y = \pi/6$, $y = 1/\sqrt{3}$ in (24). The calculation is to be found in Sherwin's *Mathematical Tables* (1742). About the same time J. Machin employed the series obtained from the equation $4 \arctan \frac{1}{5} - \arctan \frac{1}{239} = \pi/4$ to calculate π to 100 decimal places. Long afterwards Euler employed the series obtained from $\frac{\pi}{4} = \arctan \frac{1}{2} + \arctan \frac{1}{7} + \arctan \frac{1}{26}$, which, however, gives less rapidly converging series (Introd., *Anal. infin.* vol. i.). T. F. de Lagny employed the formula $\arctan 1/\sqrt{3} = \pi/6$ to calculate π to 127 places; the result was communicated to the Paris Academy in 1719. C. Vega calculated π to 140 decimal places by means of the series obtained from the equation $\frac{\pi}{4} = 5 \arctan \frac{1}{7} + 2 \arctan \frac{1}{239}$. The formula $\frac{\pi}{4} = \arctan \frac{1}{2} + \arctan \frac{1}{7} + \arctan \frac{1}{26}$ was used by J. M. Z. Dase to calculate π to 200 decimal places. W. Rutherford used the equation $\pi = 4 \arctan \frac{1}{5} - \arctan \frac{1}{239} + \arctan \frac{1}{673}$.

If in (23) we put $y = \frac{1}{2}$ and $\frac{1}{2}$, we have

$$\pi = 8 \arctan \frac{1}{2} + 4 \arctan \frac{1}{239} = 2 \cdot 4 \left\{ 1 + \frac{2}{3} \frac{1}{10} + \frac{2 \cdot 4}{3 \cdot 5} \frac{1}{10^2} + \dots \right\} + 56 \left\{ 1 + \frac{2}{3} \frac{1}{100} + \frac{2 \cdot 4}{3 \cdot 5} \left(\frac{2}{100} \right)^2 + \dots \right\}$$

a rapidly convergent series for π which was first given by Hutton in *Phil. Trans.* for 1776, and afterwards by Euler in *Novæ acta* for 1793. Euler gives an equation deduced in the same manner from the identity $\pi = 20 \arctan \frac{1}{239} + 8 \arctan \frac{1}{673}$. The calculation of π has been carried out to 707 places of decimals; see *Proc. Roy. Soc.* vols. xxi. and xxii.; also CIRCLE.

27. We shall now obtain expressions for $\sin x$ and $\cos x$ as infinite products of rational factors. We have

$$\text{Factorization of Sine and Cosine.} \quad \sin x = 2 \sin \frac{x}{2} \cos \frac{x}{2} = 2^2 \sin \frac{x}{4} \cos \frac{x}{4} \cos \frac{x}{2} = 2^3 \sin \frac{x}{8} \cos \frac{x}{8} \cos \frac{x}{4} \cos \frac{x}{2} = \dots$$

proceeding continually in this way with each factor, we obtain

$$\sin x = 2^{n-1} \sin \frac{x}{n} \cos \frac{x}{n} \cos \frac{x}{2n} \dots \cos \frac{x}{(n-1)} \cos \frac{x}{n}$$

where n is any positive integral power of 2. Now

$$\sin \frac{x+rx}{n} \sin \frac{x-nr}{n} = \sin \frac{x+rx}{n} \sin \frac{x-rx}{n} = \sin^2 \frac{x}{n} - \sin^2 \frac{rx}{n}$$

and $\sin^2 \frac{x+\frac{1}{2}rx}{n} = \cos^2 \frac{rx}{2n}$

Hence the above may be written

$$\sin x = 2^{n-1} \sin^2 \frac{x}{n} \left(\sin^2 \frac{2r}{n} - \sin^2 \frac{x}{n} \right) \left(\sin^2 \frac{2r}{n} - \sin^2 \frac{x}{n} \right) \dots \left(\sin^2 \frac{2r}{n} - \sin^2 \frac{x}{n} \right) \cos^2 \frac{rx}{2n}$$

where $k = \frac{1}{2}n - 1$. Let x be indefinitely small, then we have

$$1 = \frac{2^{n-1}}{n} \sin^2 \frac{x}{n} \sin^2 \frac{2r}{n} \dots \sin^2 \frac{kr}{n};$$

hence

$$\sin x = n \sin^2 \frac{x}{n} \cos \frac{x}{n} \left(1 - \frac{\sin^2 x/n}{\sin^2 2r/n} \right) \left(1 - \frac{\sin^2 x/n}{\sin^2 2r/n} \right) \dots \left(1 - \frac{\sin^2 x/n}{\sin^2 kr/n} \right)$$

We may write this

$$\sin x = n \sin^2 \frac{x}{n} \cos \frac{x}{n} \left(1 - \frac{\sin^2 x/n}{\sin^2 2r/n} \right) \dots \left(1 - \frac{\sin^2 x/n}{\sin^2 kr/n} \right) R,$$

where R denotes the product

$$\left(1 - \frac{\sin^2 x/n}{\sin^2 m+1/n} \right) \left(1 - \frac{\sin^2 x/n}{\sin^2 m+2/n} \right) \dots \left(1 - \frac{\sin^2 x/n}{\sin^2 m/n} \right)$$

and m is any fixed integer independent of n . It is necessary, when we make n infinite, to determine the limiting value of the quantity

R ; then, since the limit of $\frac{\sin x}{n \sin x/n \cos x/n}$ is $\frac{\sin x}{x}$, and that of $\frac{\sin m\pi/n}{m\pi/n}$ is unity, we have

$$\lim_{n \rightarrow \infty} \frac{\sin x}{x} = \left(1 - \frac{x^2}{2n^2} \right) \left(1 - \frac{x^2}{3n^2} \right) \dots \left(1 - \frac{x^2}{m^2 n^2} \right) \lim_{n \rightarrow \infty} \frac{R}{m}$$

The modulus of $R-1$ is less than

$$\left(1 + \frac{\rho^2}{\sin^2 m+1/n} \right) \left(1 + \frac{\rho^2}{\sin^2 m+2/n} \right) \dots \left(1 + \frac{\rho^2}{\sin^2 m/n} \right) - 1,$$

where $\rho = \text{mod. } \sin x/n$. Now $e^{\rho^2} > 1 + \rho^2$, if A is positive; hence $\text{mod. } (R-1)$ is less than $\text{exp. } \left\{ \rho^2 \left(\cos^2 \frac{m+1}{n} + \cos^2 \frac{m+2}{n} + \dots + \cos^2 \frac{m}{n} \right) - 1 \right\}$, or than $\text{exp. } \frac{1}{2} \rho^2 \left\{ 1/(m+1)^2 + \dots + 1/m^2 \right\} - 1$, or than $\text{exp. } \frac{1}{2} \rho^2 / (m^2) - 1$. Now $\rho^2 = \sin^2 x/n \cdot \cos^2 \beta/n + \cos^2 x/n \cdot \sin^2 \beta/n$, if $x = a + i\beta$; or $\rho^2 = \sin^2 a/n + \sin^2 \beta/n + \cos^2 a/n \cdot \sin^2 \beta/n$. Hence $\lim_{n \rightarrow \infty} \rho^2 = a^2 + \beta^2$, $\lim_{n \rightarrow \infty} \rho = \text{mod. } x$. It follows that $\text{mod. } (R-1)$ is between 0 and $\text{exp. } \left\{ (\text{mod. } x)^2 / x^2 \right\} - 1$, and the latter may be made arbitrarily small by taking m large enough. It has now been shown that $\sin x = x \left(1 - \frac{x^2}{2n^2} \right) \left(1 - \frac{x^2}{3n^2} \right) \dots \left(1 - \frac{x^2}{m^2 n^2} \right) (1 + \epsilon_n)$, where $\text{mod. } \epsilon_n$ decreases indefinitely as m is increased indefinitely. When m is indefinitely increased this becomes

$$\sin x = x \left(1 - \frac{x^2}{2^2} \right) \left(1 - \frac{x^2}{3^2} \right) \dots = x P_{n=1}^{\infty} \left(1 - \frac{x^2}{n^2} \right). \quad (25)$$

This has been shown to hold for any real or complex value of x . The expression for $\cos x$ in factors may be found in a similar manner

by means of the equation $\cos x = 2 \sin \frac{x-2x}{4} \cos \frac{3x-2x}{4}$, or may be deduced thus

$$\cos x = \frac{\sin 2x}{2 \sin x} = \frac{P \left(1 - \frac{4x^2}{n^2} \right)}{P \left(1 - \frac{x^2}{n^2} \right)} = \left(1 - \frac{4x^2}{n^2} \right) \left(1 - \frac{4x^2}{3^2} \right) \left(1 - \frac{4x^2}{5^2} \right) \dots = P_{n=0}^{\infty} \left(1 - \frac{4x^2}{(2n+1)^2} \right). \quad (26)$$

If we change x into $i\alpha$, we have the formulae for $\sinh \alpha$, $\cosh \alpha$ as infinite products—

$$\sinh \alpha = x P_{n=0}^{\infty} \left(1 + \frac{\alpha^2}{n^2} \right), \quad \cosh \alpha = P_{n=0}^{\infty} \left(1 + \frac{4\alpha^2}{(2n+1)^2} \right).$$

In the formula for $\sin x$ as an infinite product put $x = \frac{1}{2}\pi$, we then get $1 = \frac{\pi}{2} \cdot \frac{1 \cdot 3 \cdot 5 \cdot 7 \dots}{2 \cdot 2 \cdot 4 \cdot 6 \dots}$; if we stop after $2n$ factors in the numerator and denominator, we obtain the approximate equation

$$1 = \frac{\pi^2 \cdot 1^2 \cdot 3^2 \cdot 5^2 \dots (2n-1)^2}{2^2 \cdot 2^2 \cdot 4^2 \cdot 6^2 \dots (2n)^2} \cdot (2n+1)$$

or $\frac{2 \cdot 4 \cdot 6 \dots 2n}{1 \cdot 3 \cdot 5 \dots 2n-1} = \sqrt{2n}$, where n is a large integer. This expression was obtained in a quite different manner by Wallis (*Arithmetica Infinitorum*, vol. i. of *Opp.*).

28. We have

$$\frac{\sin(x+y)}{\sin x} = \frac{(x+y)P \left(1 + \frac{x+y}{n} \right)}{xP \left(1 + \frac{x}{n} \right)}, \quad \text{Series for Cot, Cosec, Tan and Sec.}$$

or $\cos y + \sin y \cot x$

$$= \left(1 + \frac{y}{x} \right) \left(1 + \frac{y}{x+y} \right) \left(1 + \frac{y}{x+2y} \right) \left(1 + \frac{y}{x+3y} \right) \dots$$

Equating the coefficients of the first power of y on both sides we obtain the series

$$\cot x = \frac{1}{x} + \frac{1}{x+y} + \frac{1}{x+2y} + \frac{1}{x+3y} + \dots \quad (27)$$

From this we may deduce a corresponding series for $\text{cosec } x$, for, since $\text{cosec } x = \cot \frac{1}{2}x - \cot x$, we obtain

$$\text{cosec } x = \frac{1}{x} - \frac{1}{x+y} + \frac{1}{x+2y} - \frac{1}{x+3y} + \dots \quad (28)$$

By resolving $\frac{\cos(x+y)}{\cos x}$ into factors we should obtain in a similar manner the series

$$\tan x = \frac{x}{2-2x} - \frac{x}{x+2x} + \frac{x}{3x-2x} - \frac{x}{3x+2x} + \frac{x}{5x-2x} - \frac{x}{5x+2x} + \dots \quad (29)$$

and thence

$$\sec x = \tan \left(\frac{x}{4} + \frac{x}{2} \right) - \tan x = \frac{x}{x-2x} + \frac{x}{x+2x} - \frac{x}{3x-2x} - \frac{x}{3x+2x} + \dots \quad (30)$$

These four formulae may also be derived from the product formulae for $\sin x$ and $\cos x$ by taking logarithms and then differentiating. Glaisher has proved them by resolving the expressions for $\cos x/n$ and $1/\sin x$ into products into partial fractions (see *Quart. Journ. Math.*, vol. xvii.). The series for $\cot x$ may also be obtained by a continued use of the equation $\cot \frac{1}{2}x + \cot \frac{1}{4}x = \cot x$ (see a paper by Dr Schröter in Schlämilch's *Zeitschrift*, vol. xiii.).

Various series for π may be derived from the series (27), (28), (29), (30), and from the series obtained by differentiating them one or more times. For example, in the formulae (27) and (28), by putting $x = \pi/n$ we get

$$\pi = n \tan \frac{\pi}{n} \left\{ 1 - \frac{1}{n-1} + \frac{1}{n+1} - \frac{1}{2n-1} + \frac{1}{2n+1} \dots \right\}, \quad \text{Series for } \pi \text{ derived from Series for Cot and Cosec.}$$

$$\pi = n \sin \frac{\pi}{n} \left\{ 1 + \frac{1}{n-1} - \frac{1}{n+1} + \frac{1}{2n-1} - \frac{1}{2n+1} \dots \right\};$$

If we put $n=3$, these become

$$\pi = 3\sqrt{3} \left(1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{5} + \frac{1}{7} - \frac{1}{8} + \dots \right),$$

$$\pi = 3\sqrt{3} \left(1 + \frac{1}{2} - \frac{1}{4} - \frac{1}{5} + \frac{1}{7} + \frac{1}{8} \dots \right).$$

By differentiating (27) we get

$$\text{cosec}^2 x = \frac{1}{x^2} + \frac{1}{(x+y)^2} + \frac{1}{(x+2y)^2} + \frac{1}{(x+3y)^2} + \dots;$$

put $x = \frac{\pi}{6}$, and we get $\pi^2 = 9 \left\{ 1 + \frac{1}{3^2} + \frac{1}{7^2} + \frac{1}{11^2} + \dots \right\}$.

These series, among others, were given by Glaisher (*Quart. Journ. Math.*, vol. xii.).

29. We have $\sinh \pi x = x P \left(1 + \frac{x^2}{n^2} \right)$, $\cosh \pi x = P \left(1 + \frac{x^2}{(2n+1)^2} \right)$. If we differentiate these formulae after taking logarithms we obtain the series

$$\frac{\pi}{2x} \coth \pi x = \frac{1}{2x^2} = \frac{1}{1^2+x^2} + \frac{1}{2^2+x^2} + \frac{1}{3^2+x^2} + \dots$$

$$\frac{\pi}{2x} \tanh \pi x = \frac{1}{x^2} = \frac{1}{1^2+x^2} + \frac{1}{3^2+x^2} + \frac{1}{5^2+x^2} + \dots$$

These series were given by Kummer (in *Crelle's Journ.*, vol. xvii.).

The sum of the more general series $\frac{1}{1^2+x^2} + \frac{1}{2^2+x^2} + \frac{1}{3^2+x^2} + \frac{1}{4^2+x^2} + \dots$, has been found by Glaisher (*Proc. Lond. Math. Soc.*, vol. vii.).

If U^n denotes the sum of the series $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots$, V^n that

of the series $\frac{1}{1} + \frac{1}{3} + \frac{1}{5} + \dots$, and W^n that of the series

Sums of Powers of Reciprocals of Natural Numbers. $\frac{1}{1} - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots$, we obtain by taking logarithms the formulae (25) and (26)

$$\log (\operatorname{cosec} x) = U_1 \left(\frac{x}{\pi}\right)^2 + \frac{1}{2} U_2 \left(\frac{x}{\pi}\right)^4 + \frac{1}{3} U_3 \left(\frac{x}{\pi}\right)^6 + \dots$$

$$\log (\sec x) = V_1 \left(\frac{2x}{\pi}\right)^2 + \frac{1}{2} V_2 \left(\frac{2x}{\pi}\right)^4 + \frac{1}{3} V_3 \left(\frac{2x}{\pi}\right)^6 + \dots$$

and differentiating these series we get

$$\frac{1}{2} \cot x = \frac{1}{2x} - \frac{U_1}{x^3} - \frac{U_2}{x^5} - \frac{U_3}{x^7} - \dots \quad (31)$$

$$\frac{1}{2} \tan x = \frac{V_1}{x^3} + \frac{V_2}{x^5} + \frac{V_3}{x^7} + \dots \quad (32)$$

In (31) x must lie between $-\pi$ and π and in (32) between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$. Write equation (30) in the form

$$\sec x = \Sigma (-1)^n \frac{(2n+1)x}{(2n+1)! x^{2n+1}}$$

and expand each term of this series in powers of x^2 , then we get

$$\sec x = \frac{2^2 W_1}{x^2} + \frac{2^4 W_2}{x^4} + \frac{2^6 W_3}{x^6} + \dots \quad (33)$$

where x must lie between $-\pi$ and π . By comparing the series (31), (32), (33) with the expansions of $\cot x$, $\tan x$, $\sec x$ obtained otherwise, we can calculate the values of $U_1, U_2, \dots, V_1, V_2, \dots$ and W_1, W_2, \dots . When U_n has been found, V_n may be obtained from the formula $2^n V_n = (2^n - 1) U_n$.

For Lord Brounker's series of π , see CIRCLE. It can be got at once Continued Fractions by putting $a=1, b=3, c=5, \dots$ in Euler's

Factored theorem $\frac{1}{a} - \frac{1}{b} + \frac{1}{c} - \dots = \frac{a^2}{a^2 - b^2} + \frac{b^2}{a^2 - b^2 + c^2} + \dots$

Sylvester gave (*Phil. Mag.*, 1869) the continued fraction

$$\frac{\pi}{2} = 1 + \frac{1}{1 + \frac{1}{1 + \frac{2}{1 + \frac{2}{1 + \frac{3}{1 + \frac{3}{1 + \dots}}}}}}$$

which is equivalent to Wallis's formula for π . This fraction was originally given by Euler (*Comm. Acad. Petropol.* vol. xi.); it is also given by Stern (*in Crelle's Journ.* vol. x.).

30. It may be shown by means of a transformation of the series

Continued Fractions for Trigonometrical Functions. Continued for $\cos x$ and $\frac{\sin x}{x}$ that $\tan x = \frac{x}{1 - \frac{x^2}{3} - \frac{x^4}{5} - \frac{x^6}{7} - \dots$

This may be also easily shown as follows. Let $y = \cos \sqrt{x}$, and let y', y'', \dots denote the differential coefficients of y with regard to x , then by forming these we can show that $4xy'^2 + 2y'' + y''' = 0$, and thence by Leibnitz's theorem we have

$$4xy^{(n+1)} + (4n+2)y^{(n+1)} + y^{(n+2)} = 0.$$

Therefore $\frac{y''}{y'} = -2 - \frac{4x}{y'}$, $\frac{y'''}{y''} = -2(2n+1) - \frac{4x}{y''}$

hence $-2\sqrt{x} \cot \sqrt{x} = -2 - \frac{4x}{6} - \frac{4x}{10} - \frac{4x}{14} - \dots$

Replacing \sqrt{x} by x we have $\tan x = \frac{x}{1 - \frac{x^2}{3} - \frac{x^4}{5} - \dots}$

Euler gave the continued fraction

$$\tan nx = \frac{\pi \tan x (n^2 - 1) \tan^2 x (n^2 - 4) \tan^4 x (n^2 - 9) \tan^6 x \dots}{3 - 5 - 7 - \dots}$$

this was published in *Mém. de l'Acad. de St Pétersb.* vol. vi. Glaisher has remarked (*Mess. of Math.* vols. iv.) that this may be derived by forming the differential equation

$$(1-x^2)y^{(n+1)} - (2n+1)xy^{(n+1)} + (n^2 - n^2)y^{(n)} = 0,$$

where $y = \cos (\pi \arccos x)$, then replacing x by $\cos x$, and proceeding as in the former case. If we put $n=0$, this becomes

$$x = \frac{\tan x}{1} + \frac{\tan^3 x}{3} + \frac{4 \tan^5 x}{5} + \frac{9 \tan^7 x}{7} + \dots$$

whence we have

$$\arctan x = \frac{x}{1} + \frac{x^3}{3} + \frac{4x^5}{5} + \frac{9x^7}{7} + \dots + \frac{n^2 x^{2n+1}}{2n+1} + \dots$$

31. It is possible to make the investigation of the properties of the simple circular functions rest on a purely analytical basis other than the one indicated in § 22. The sine of x would be

Purely Analytical Treatment of Circular Functions. defined as a function such that, if $x = \int_0^x \frac{dy}{\sqrt{1-y^2}}$

then $y = \sin x$; the quantity $\frac{2}{\pi}$ would be defined to be the complete integral $\int_0^1 \frac{dy}{\sqrt{1-y^2}}$. We should then have

$$\frac{2}{\pi} - x = \int_0^1 \frac{dy}{\sqrt{1-y^2}}$$

Now change the variable in the integral to z , where $y^2 + z^2 = 1$, we then have $\frac{2}{\pi} - x = \int_0^1 \frac{dz}{\sqrt{1-z^2}}$ and

x must be defined as the cosine of x , and is thus equal to $\sin (\frac{\pi}{2} - x)$, satisfying the equation $\sin^2 x + \cos^2 x = 1$.

Next consider the differential equation

$$\frac{dy}{\sqrt{(1-y^2)}} + \frac{dx}{\sqrt{(1-x^2)}} = 0.$$

This is equivalent to

$$d[y\sqrt{(1-x^2)} + x\sqrt{(1-y^2)}] = 0;$$

hence the integral is

$$y\sqrt{(1-x^2)} + x\sqrt{(1-y^2)} = \text{a constant.}$$

The constant will be equal to the value u of y when $x=0$;

whence $y\sqrt{(1-x^2)} + x\sqrt{(1-y^2)} = u.$

The integral may also be obtained in the form

$$y^2 - \sqrt{(1-y^2)}\sqrt{(1-x^2)} = \sqrt{(1-x^2)}.$$

Let $a = \int_0^x \frac{dy}{\sqrt{(1-y^2)}}$, $\beta = \int_0^z \frac{dz}{\sqrt{(1-z^2)}}$, $\gamma = \int_0^u \frac{du}{\sqrt{(1-u^2)}}$;

we have $a + \beta = \gamma$, and $\sin \gamma = \sin a \cos \beta + \cos a \sin \beta$, $\cos \gamma = \cos a \cos \beta - \sin a \sin \beta$.

the addition theorems. By means of the addition theorems and the values $\sin \frac{\pi}{2} = 1$, $\cos \frac{\pi}{2} = 0$ we can prove that $\sin (\frac{\pi}{2} + x) = \cos x$, $\cos (\frac{\pi}{2} + x) = -\sin x$; and thence, by another use of the addition theorems, that $\sin (x + x) = \sin x \cos x + \cos x \sin x = 2 \sin x \cos x$, from which the periodicity of the functions $\sin x$, $\cos x$ follows:—

We have also $\int \frac{dy}{\sqrt{(1-y^2)}} = -\log \{ \sqrt{(1-y^2)} + y \}$;

whence $\log \{ \sqrt{(1-y^2)} + y \} + \log \{ \sqrt{(1-x^2)} + x \} = \text{a constant.}$

Therefore $\{ \sqrt{(1-y^2)} + y \} \{ \sqrt{(1-x^2)} + x \} = \sqrt{(1-u^2)} + u$,

since $u=y$ when $x=0$; whence we have the equation

$$(\cos a + \sin a)(\cos \beta + \sin \beta) = \cos (a + \beta) + \sin (a + \beta),$$

from which De Moivre's theorem follows.

REFERENCES.—Further information will be found in Hobson's *Plane Trigonometry*, and in Chrystal's *Algebra*, vol. ii. For further information on the history of the subject, see Braunnühl's *Vorlesungen über Geschichte der Trigonometrie* (Leipzig, 1900). (E. W. H.)

TRIGONON, a small triangular harp, occasionally used by the ancient Greeks and probably derived from Assyria or Egypt. The trigonon is thought to be either a variety of the sambuca or identical with it. A trigonon is represented on one of the Athenian red-figured vases from Cameiros in the island of Rhodes, dating from the 5th century B.C., which are preserved in the British Museum. The triangle is here an irregular one, consisting of a narrow base to which one end of the string was fixed, while the second side, forming a slightly obtuse angle with the base, consisted of a wide and slightly curved sound-board pierced with holes through which the other end of the strings passed, being either knotted or wound round pegs. The third side of the triangle was formed by the strings themselves, the front pillar, which in modern European harps plays such an important part, being always absent in these early Oriental instruments. A small harp of this kind having 20 strings was discovered at Thebes in 1823. (K. S.)

TRIKKALA (anc. *Trika*), a town of Greece, capital of the department of Trikkala, and the see of an archbishop, 38 m. W. of Larissa. In winter, when great numbers of Vlach herdsmen take up their quarters in the town, its population exceeds that of Larissa. It has the appearance of a Mussulman town on account of its mosques (only two of which are in use) and it is a centre of trade in wheat, maize, tobacco and cocoons. The town was in ancient times a celebrated seat of the worship of Aesculapius. Pop. (1889), 14,820; (1907) 17,809; of the department, 90,548.

TRILEMMA (Gr. τρεῖς, three, λήμμα, something taken), in logic, an argument akin to the dilemma (*q.v.*), in which there are three possibilities. By getting rid of two, the third is proved, provided the original three exhaust the number. The terms "tetralemma" (four possibilities) and "polylemma" (many) have also been used.

TRILOBITES, extinct Arthropoda, formerly classified with the Crustacea, but of late years relegated to the Arachnida (*q.v.*), which occurred abundantly in seas of the Cambrian and Silurian periods, but disappeared entirely at the close of the Palaeozoic epoch. Both their origin and the causes which led to their extinction are quite unknown. Widely divergent forms make their appearance suddenly in the Cambrian period amongst the earliest known fossils, and the high perfection of structure to which they had at that time attained

implies the antecedent existence of much simpler types, and refers the origin of life to a date immeasurably distant from that at which we have actual proof of the existence of animal and vegetable organisms.

However different in structure Trilobites may be, they all agree in possessing a head-shield usually semi-circular in shape, which results from the fusion of apparently five segments, and bears, except in some blind forms, a pair of large reniform compound eyes like those of the king-crab (*Kyphosura*). This head-shield is succeeded by a varying number of free segments, each of which consists of a medium convex tergal piece and a pair of arched lateral plates, the pleura, of which there is one on each side. The terga and pleura of each individual segment overlap those of the segment that serially succeeds it. The mid-region of the body, composed of jointed segments, is followed by a larger or smaller region consisting of fused segments and termed the pygidium or caudal shield, which in some cases is as large as the head-shield itself, in other cases much smaller. When the pygidium is large and composed of many segments, the number of free body segments is correspondingly reduced, and vice versa. It is with respect to this number of segments that respectively constitute the pygidium and the mid-region of the body that Trilobites differ most markedly from each other; and it is a singular fact that the extremes in structural organization in this particular to be met with in the Trilobita are found side by side in strata of Cambrian age. In *Paradoxides*, for example, there are about twenty freely movable segments followed by a very short and small pygidium, whereas in *Agnostus* the freely movable segments are reduced to two and the pygidium is as large as the cephalic shield. In this genus the number of segments composing the pygidium is obscured, as also it is in the genus *Iliaenus*, which has as many as ten movable segments preceding the large semi-circular pygidium; but in such forms as *Orygia* and *Asaphus*, which have about eight free segments, the sutural lines on the pygidium indicate that it is composed of about a dozen or more segments. Some that resembling *Agnostus* is *Microdiscus*, with four movable segments and a large pygidium consisting of about five fused segments, the lines of union between the latter being clearly indicated.

The tergal and pleural elements of the pygidium are generally well marked. They are also well marked on the cephalic shield, the tergal elements being represented by a median axial elevated area showing indistinct signs of segmentation, and a lateral unsegmented plate, the gena, which carries the eyes. The postero-lateral angles of the gena are commonly produced into spiniform processes, which may project backwards beyond the middle of the body as in *Paradoxides*, or considerably beyond its posterior termination as in *Trinucleus* or *Ampyx*. The latter is further remarkable for having the median area of the head-shield, the *labellum*, produced into an anteriorly directed spine.

For many years only the dorsal surface of Trilobites was known, nothing having been ascertained of the ventral surface and appendages. Comparatively recently, however, specimens have been obtained with the ventral surface exposed, revealing the number and structure of the limbs. A pair of the latter was articulated to the sides of a moderately wide dorsal plate on each segment of the body, and similar limbs were attached to the ventral surface of the head-shield behind the mouth. Each of these limbs was two-branched, the external branch consisting of a slender fringed flagellum possibly respiratory in function, and the inner of a normal jointed ambulatory leg. These two branches arose from a common basal segment or coxa, the inner surface of which was produced into a strong process underlying the external art. In the region of the mouth the basal segments were armed with teeth and subserved the purpose of mastication. As in all Arachnida there is only a single pair of appendages in front of the mouth, and these were one-branched, long and filiform and acted as antennae. Under the pygidium or caudal shield the appendages were much shortened, and their main branch consisted of broader and flatter segments than those of the preceding limbs.

Such was the structure of the appendages in Trilobites belonging to the genus *Triarthrus*; but considering the great structural differences that obtain between *Triarthrus* and many other genera, it would be rash to assume that there were not corresponding differences in the structure of the limbs. It must not indeed be assumed that those of the first pair were in all cases antenniform.

It is probable that no satisfactory classification of the Trilobites will be proposed until the limbs of most of the genera have been examined. Up to the present time all attempts to arrange the genera in natural and definable groups have failed to meet with general approval; and this criticism must be extended to Beecher's subdivision of the class into three orders, named Hypoparia, Proparia and Opisthoparia, based upon the form and position of a groove, the so-called *genal suture*, which marks the lateral portion of the head-shield. In the majority of Trilobites this groove passes backwards from the anterior or anterolateral edge of this plate to its posterior or postero-lateral border, dividing it into an inner portion continuous with the *labellum* and fused tergal regions, and an outer portion bearing the eye. Those genera, like

Paradoxides, *Olenus*, *Asaphus*, *Phillipsia* and others, in which this groove cuts the posterior edge of the head-shield on the inner side of its angle are referred to the Opisthoparia; those, like *Dalmanites* and *Phacops*, in which it cuts the lateral border in front of the posterior angle, belong to the Proparia. But in certain genera, like *Conocoryphe*, *Calymene* and *Triarthrus*, it cuts the margin of the head-shield so close to the posterior angle that the distinction between the two groups practically breaks down. To the Hypoparia belongs a comparatively small number of genera, like *Trinucleus* and *Agnostus*, in which this groove or genal suture is beneath the margin of the head-shield and does not appear upon its upper surface.

In external form Trilobites are not unlike Isopod Crustaceans, especially the terrestrial species commonly called "woodlice", and until the nature of their appendages was known, it was thought by some authorities that the two groups might be related. Like the woodlice they were capable of rolling themselves up into a ball, many specimens having been found fossilized in this state, with the pygidium pressed tightly against the head-shield. There is very little doubt that they lived at the bottom of the sea, feeding upon worms or other soft marine organisms, crawling slowly about the sandy or muddy bottom and burying themselves beneath its surface when danger threatened. That these animals were widely distributed in former times is proved by their occurrence at the present day in palaeozoic fossiliferous strata both of the northern hemisphere and of Australia; and despite the fact that their remains have not been found in rocks of the Mesozoic or Kainozoic epochs, it was conceived to be possible that living specimens might be dredged from the sea-floor during the exploration of the ocean depths undertaken by the "Challenger" expedition. Needless to say this faint hope was not borne out by results. (R. I. P.)

TRIM, a market town and the county town of Co. Meath, Ireland, on the upper waters of the Boyne, 30 m. N.W. by W. from Dublin on a branch of the Midland Great Western railway. Pop. (1901), 1573. The county buildings are here; monthly fairs are held, and there is considerable trade in corn and flour; but the chief interest of the town lies in its historical associations and remains, enhanced by a beautiful situation. It was the seat of a very early bishopric. A Norman tower, called the Yellow Steeple, is supposed to mark the site of St Patrick's Abbey of St Mary. Two gates remain from the old town walls. King John's Castle (incorrectly so called, as this monarch only resided here on the occasion of a visit) was originally founded by Hugh de Lacy in 1173, but a later date is assignable to the greater part of the magnificent moated building, of which the keep, flanking turrets, drawbridge, portcullis and barbican, still testify to its former strength, which was augmented by its frontage to the river. Other smaller fortified buildings are Talbot's and Scurlougstown Castles; the former erected by Sir John Talbot, lord lieutenant of Ireland in 1415—afterwards earl of Shrewsbury, the latter dating from 1180. About a mile east of the town, the ruins of the abbey of St Peter and St Paul occupy both banks of the river. These include the transitional-Norman cathedral on the north bank, and a castle, guarding the crossing of the river, on the south, together with a chapel and other remains. North of the town ruins may be seen of a Dominican friary of the 13th century. The tower of the old parish church dates from 1449. In the annals of Trim many famous names have a place, Humphrey of Gloucester and Henry of Lancaster were imprisoned here by Richard II before Henry came to the throne; and Richard, duke of York, and father of Edward IV held court at the castle, where also several Irish parliaments met until the middle of the 15th century, and a mint was established in 1469. The residence in a house in Dublingate Street of the famous duke of Wellington is commemorated by a Corinthian column and statue. Trim is governed by an urban district council. It was incorporated by Edward III, and returned two members to the Irish parliament until the Union in 1800.

TRIMMER, JOSHUA (1795-1857), English geologist, was born at North Cray in Kent, on the 11th of July 1795. He was son of Joshua Kirby Trimmer of Brentford, and grandson

of Mrs Sarah Trimmer (1741-1810), authoress of the *Story of the Robins* (1786). At the age of nineteen he was sent to North Wales to manage a copper-mine for his father, subsequently he was placed in charge of a farm in Middlesex, where he acquired a knowledge of and an interest in soils; in 1825 he became manager (for his father) of slate quarries near Bangor and Carnarvon, and in this district he remained for many years. He discovered the marine shells in the drift of Moel Tryfaen. During the years 1850-1854 he was engaged on the Geological Survey, and surveyed parts of the New Forest in Hampshire. He died in London on the 16th of September 1857.

He published memoirs on the *Origin of the Soils which cover the Chalk of Kent, On the Geology of Norfolk, as Illustrating the Laws of the Distribution of Soils* (1847); and *Proposals for a Geological Survey, specially directed to Agricultural Objects* (1850); in this respect he was a pioneer in agricultural geology. He was author also of a useful work *Practical Geology and Mineralogy* (1841). Obituary by J. E. Portlock, in *Quart. Journ. Geol. Soc.* (1858).

TRIMONTIUM, the name of a Roman fort at Newstead, near Melrose, Scotland, close under the three Eildon Hills (whence the name *trium montium*). It was an advanced post of the Romans towards Scotland both about 80 A.D. and after, and again (after an interval of evacuation) from about A.D. 140-180. Excavations during the last four years have yielded finds of almost unique importance. These include the foundations of several successive forts, one above the other, which throw much light on the character of the Roman military post; an unparalleled collection of Roman armour, including ornate helmets, and a good series of coins and datable pottery. The whole illustrate the history of the Roman army and that of Roman Scotland very remarkably and to an extent equalled by no Scottish site as yet explored.

See the report published for the Society of Antiquaries of Scotland by the excavator Mr James Curle. (F. J. H.)

TRINCOMALEE, a town and former naval station on the north-east coast of Ceylon, 100 m. N.E. by N. of Kandy. Pop. (1901), 11,295. It is built on the north side of the bay of Trincomalee, on the neck of a bold peninsula separating the inner from the outer harbour. There is a lighthouse on the extremity of Foul Point at the southern side of the bay, and another on the summit of Round Island. The inner harbour is landlocked, with a safe anchorage and deep water close to the principal wharves; the outer harbour has an area of about 4 sq. m. with a depth of about 70 fathoms. With its magnificent harbour—one of the five or six greatest natural harbours in the world—it used to be the headquarters of the admiral commanding on the East Indian station, with a garrison of infantry and British artillery. The breadth of the streets and esplanades somewhat atones for the mean appearance of the houses, but the town generally has a gloomy and impoverished aspect. Pearl oysters are found in the lagoon of Tambalagam to the west of the bay. A steamer from Colombo calls weekly with and for passengers and cargo. Average annual rainfall, 62½ in.; average temperature, 81.2° F. Some tobacco, rice, and palm are grown in the district.

Attention was directed to the importance of Trincomalee as a naval base in 1806, when a commission of officers recommended its being turned into a modern fortress. The work was commenced in 1808 and finished in 1904. All the batteries were rebuilt and fitted with modern appliances. The whole area was connected with cable and telephone communication, and armed with the latest type of guns; and the fortress was supposed to be impregnable; but in the following year the station was abandoned, the naval yard closed, and the military garrison withdrawn. A man-of-war is still kept in Trincomalee Harbour, to work the defences.

The town was one of the first settlements of the Tamil race in Ceylon, who at a very early period erected on a height at the extremity of the peninsula, now crowned by Fort Frederick, a temple dedicated to Konatha, or Konasir, named the "temple of a thousand columns." The building was desecrated and destroyed in 1622, when the town was taken by the Portuguese, who made use of the materials for the erection of the fort. The

town was successively held by the Dutch (1630), the French (1673), the Dutch (1674), the French (1782), and the Dutch (1783). After a siege of three weeks it surrendered to the British fleet in 1795, and with other Dutch possessions in Ceylon was formally ceded to Great Britain by the Treaty of Amiens in 1802.

TRING, a market town in the Watford parliamentary division of Hertfordshire, England, 3¼ m. N.W. by W. from London by the London and North Western railway. Pop. of urban district (1901), 4349. It lies on the western slope of the Chiltern Hills, close to the entrance to a narrow valley which pierces them, and forms one of the highways through them to London, carrying the railway, the Grand Junction Canal, and a main road. The church of St Peter and St Paul shows fine Perpendicular work, especially in the ornate interior of the nave. Industries include straw-plaiting and the weaving of canvas and silk. The Rothschild Museum, erected in 1889, contains an extensive natural history collection. Living wild animals are also kept in a neighbouring paddock and cages. The road which passes through Tring and along the face of the hills represents the ancient Icknield Way, and there may have been a Romano-British village on the site of Tring.

TRINIDAD, the most southerly and, with the exception of Jamaica, the largest of the British West Indian Islands. Pop. (1901), 236,397. It is situated 6 m. E. of the coast of Venezuela, between 10° 3' and 10° 50' N. and 60° 39' and 62° W. Its average length is 48 m., its breadth 35 m. and its area 1754 sq. m. In shape it is almost square, but it throws off two peninsulas westward from its north and south corners. Coroaz Point projecting from its north-western and Icacos Point from its south-western extremity enclose the Gulf of Paria. To the west of Coroaz Point lie several islands, of which Chacacacare, Huevos Monos and Monos Gaspar Grande are the most important. The surface is level or undulating, excepting in the north and south where there are ranges of hills, with eastern and western axes, prolongations of the Venezuelan coast ranges. Of these the northern is the more elevated ridge, its highest point being Tucuche Peak (3100 ft.). The southern hills attain an elevation of 600 ft. A small ridge runs east to west by south through the centre of the island, from Manzanilla Point to San Fernando, having an isolated elevation in Mt Tamana (1028). The hills of the northern and southern ranges are furrowed by innumerable ravines, and are clad to their summits with dense forests. There are numerous small streams, none navigable, and all flowing either east or west.

In its geology, as well as in its flora and fauna Trinidad differs little from the mainland, with which it was probably at one time connected. There are four mineral springs and several mud volcanoes, but the two most striking natural features are the Maracas Falls, and the Pitch Lake. The Maracas Falls are situated at the head of a valley of the same name, to the north-east of Port of Spain, where the river leaps in a foaming torrent over a sheer wall of rock, 312 ft. high. The Pitch Lake lies some 38 m. by water south-east of the capital, in the ward of La Brea. It is circular in form, about 3 m. in circumference, and 104 acres in extent. Underground forces acting on the pitch cause it to rise in unequal masses, which are rounded off like huge mushrooms, separated from one another by narrow fissures, in which the rainwater collects and forms pools. Near the centre of the lake the pitch is always soft and can be observed bubbling up in a liquid state. When the sun is hot the lightest footfall leaves an impression and the pitch emits an unpleasant odour. The soil of the surrounding district is charged with asphalt, but is very fertile, while the road to the neighbouring port of La Brea, running on a bed of asphalt, moves slowly towards the sea like a glacier. The lake is worked by a company which exports the asphalt to the United States, paying royalty to the local government on every ton exported.

The mountain range which runs along the north coast is formed of clay-slates, micaceous and talcose schists, and crystalline and compact limestones, constituting the group called the Caribbean series, the age of which is unknown. The rest of the island is composed of Cretaceous, Tertiary and Quaternary strata. The Cretaceous beds rise to the surface in the centre and are flanked to north and south by the later deposits. Owing to the rarity of satisfactory sections the relations of the various divisions of the Tertiary formation are still somewhat obscure; but they are grouped by J. B. Harrison into (1) Nariva and San Fernando beds, = Eocene

and Oligocene; (2) Naparima marls—Miocene and (3) Moruga series—Pliocene and Pleistocene. The Naparima marls consist of a lower division containing *Globigerina* and an upper division with *Radiolaria* and diatoms and are clearly of deep-sea origin. The bitumen of the Pliocene and Pleistocene deposits appears to have been formed by the decomposition of vegetable matter. Salses or mud volcanoes occur upon the island, but there is no evidence of true volcanic action in Tertiary or recent times, except the presence of occasional bands of pumiceous earth in some of the Tertiary deposits, and the pumice in these cases was probably derived from a distance.

The presence of oil in large quantities in Trinidad had been suspected for many years, and early in the 20th century the government undertook a geological survey to determine the probabilities of an industry. This survey revealed the presence of a series of anticlines at payable depths in the southern division of the island, and experimental borings by three companies at La Brea and Point Fortin in the south-west and Guayaguayare in the south-east proved the presence of oil in large quantities. In 1910 the commercial exploitation of Trinidad oil was being rapidly pushed forward.

The soil of the island is exceedingly rich, and well adapted to the growth of tropical products, especially of sugar and cocoa, which are its staples. The planting of new lands is rapidly progressing, the greater part of the unsold crown lands (various blocks of which have been formed into forest or water reserves) being covered with forests, containing a valuable supply of timber. Poisonous and medicinal herbs grow everywhere. Owing to the variety of its resources, Trinidad has suffered less from general depression than the other islands in the British West Indies. It exports cocoa, sugar, rum, molasses, coffee, tobacco, coco-nuts, fruit, timber, dyeswoods, balata gum, india-rubber and asphalt. Large quantities of toona-beans, the produce of the mainland, are cured in bond at Port of Spain. The manufacture of bitters (Angostura and others) is an important industry, as is also the raising of stock. In addition Trinidad has a large carrying trade with the neighbouring republics, and rivals St Thomas (g.s.) as a centre of distribution for British and American merchandise through the West Indies and Venezuela.

Lying in the tract of the trade winds and being practically a part of the mainland, Trinidad is immune from the vicissitudes of climate to which the other Antilles are exposed. It is never visited by hurricanes and its seasons are regular, wet from May to January, with a short dry season in October known as the Indian summer and lasting usually about four weeks, and dry from end of January to middle of May. The average annual rainfall is 66.26 in. and the mean temperature is 78.6° F. A volunteer force was established in 1879, and now consists of infantry, garrison artillery and three companies of Light Horse stationed in Port of Spain, San Fernando and St. Joseph. Elementary education is given chiefly in the state-aided schools of the different denominations, but there are a number of entirely secular schools managed by the government. The Presbyterian schools are conducted by a Canadian mission. Instruction is free, but in some few schools fees are paid. Agriculture is a compulsory subject in all the primary schools. Higher education is provided by the Queen's Royal College, a secular institution, to which the Presbyterian Naparima College and the Roman Catholic St Mary's College are affiliated. Attached to these colleges are four scholarships of the annual value of £150 for four years, tenable at any British university. The religious bodies, both Christian and pagan are exceedingly numerous. The Roman Catholics (with an archbishop at Port of Spain) and the Anglicans, with the bishop of Trinidad at their head, are the more powerful bodies. Of the inhabitants of the island, one-third are East Indians. Immigration from India is conducted under government control, and the prosperity of Trinidad is largely due to the contract labour obtained under this system. Of the rest the upper classes are creoles of British, French and Spanish blood, while the lower classes are of pure or mixed negro origin, with a few Chinese. English is spoken in the towns and in some of the country districts, but in the north and generally in the cocoa-growing areas a French patois prevails, and in several districts Spanish is still in use. English money is legal tender, as also is the United States gold currency. Accounts are kept in dollars by the general public, but in sterling by the government. There is a complete system of main and local roads constructed or under construction; there are about 90 m. of railways, and practically all the towns of any size can be reached from Port of Spain by rail. Steamers ply daily between Port of Spain and the islands at the northern entrance to the Gulf of Paria and between San Fernando (the southern terminus of the railway) and the south-western ports of the island, while two steamers of the Royal Mail Company under contract connect Port of Spain with the other parts of Trinidad and Tobago. Port of Spain is also in direct communication with Southampton.

The colony (Trinidad and Tobago) is administered by a governor assisted by an executive council and a legislative council of twenty members of whom ten are officials sitting by virtue of office and ten are unofficials nominated by the Crown. Port of Spain, the capital, is situated on the west coast on the shores of the Gulf of Paria. It is considered one

of the finest towns in the West Indies, its streets are regular and well shaded, its water supply abundant, and an excellent service of tramways connects the various quarters of the town. It has two cathedrals, a fine block of public buildings containing the principal government departments, the courts of justice and the legislative council chamber, many other large government buildings, a public library, and many good shops, while one of its most beautiful features is its botanical garden, in which the residence of the governor is situated. The harbour is an open roadstead, safe and sheltered, but so shallow that large ships have to lie at anchor half a mile from the jetties. It is, nevertheless, the place of shipment not only for the produce of the entire island but also for that of the Orinoco region. The population is about 55,000. The other towns are San Fernando (pop. 7613), also on the Gulf of Paria, about 30 m. south of the capital; and Arima (pop. 4076), an inland town 16 m. by rail east of Port of Spain.

Trinidad was discovered by Columbus in 1496. It remained in Spanish possession (although its then capital, San José de Oruna, was burned by Sir Walter Raleigh in 1595) until 1707, when a British expedition from Martinique caused its capitulation. It was finally ceded to Great Britain by the Treaty of Amiens in 1802.

See F. Eversley, *The Trinidad Reviewer* (London, 1900); Stark's *Guide-book and History of Trinidad* (London); the *Journal of the Royal Colonial Institute*, passim; and for geology, G. P. Wall and J. G. Sawkins, *Report on the Geology of Trinidad* (London, 1860); J. B. Harrison and A. J. Jukes-Browne, "The Oceanic Deposits of Trinidad" (*British West Indies, Quart. Journ. Geol. Soc.* (London, 1899), iv. 177-189; R. J. L. Guppy, "The Growth of Trinidad," *Trans. Canadian Inst.* (1905), viii. 137-149, with plate. The last paper gives a list of all the more important works and papers on the geology of the island.

TRINIDAD, an uninhabited island in the South Atlantic, 680 m. E. of the coast of Espirito Santo, Brazil, in 20° 30' S. 29° 30' W., 4 m. long by 2 broad. It is of volcanic formation, and has springs of fresh water. As a possible coaling and telegraph station in mid-ocean, it formed a subject of contention between Brazil and Great Britain in 1895. The dispute was settled in favour of Brazil, which claimed on the ground of its discovery by Tristan da Cunha early in the 16th century, while Great Britain relied on its occupation by the astronomer Halley in the name of England in the year 1700. About 30 m. east are the three islets of Martin Vaz so named from the Portuguese mariner who discovered them about 1510.

TRINIDAD, a city and the county-seat of Las Animas county, Colorado, U.S.A., in the south part of the state, about 100 m. S. of Pueblo. Pop. (1890) 5523; (1900) 5345 (650 foreign-born); (1910) 10,204. Trinidad is served by the Denver & Rio Grande, the Colorado & Southern, the Colorado & Wyoming, and the Atchison, Topeka & Santa Fé railways and by electric railways to the neighbouring coal-mining towns. The city is regularly laid out on a hilly site, on both sides of the Purgatory (or Las Animas) river, near a picturesque canyon and mountain district, including the Stonewall Valley, and at the foot of the Raton Mountains, of which the highest peak, Fisher's (or Raton) Peak (9586 ft.), is 10 m. south of Trinidad. The city has a Carnegie library, a Federal building, an opera house, an amusement park, and the San Rafael hospital, under the charge of the Sisters of Charity. A steam heating plant pipes heat to many shops, offices and residences. Trinidad is in a coal and coke and stock-raising region, and alfalfa, frijole and sugar beets are produced in large quantities in the surrounding region, much of which is irrigated. Dry farming has been successfully carried on at an experiment farm, established in 1906, 12 m. north of the city. Trinidad has railway shops, foundry and machine shops, and coking ovens, ships large quantities of coal, has a wool-scouring mill, and various manufactures. The municipality owns and operates the waterworks. Trinidad was incorporated as a town in 1876, and in 1879 became a city of the second class.

TRINIDAD, a town near the southern coast of Cuba, in Santa Clara Province, about 45 m. south-east of Cienfuegos, and 3 m. from its seaport, Casilda, which lies due south.

Pop. (1907), 11,197. There is a small local railway, not connected (in 1909) with the central trunk line of the island. The city lies on the slope of La Vigia hill (900 ft.) amid higher mountains, and on the banks of the Jayoba (San Juan) river. The streets are narrow, broken and tortuous, and the general aspect of the town is medieval. There are some attractive buildings and a very fine market square. The fine scenery in the neighbourhood, and the climate, which is possibly the healthiest in Cuba, make the place a favourite resort for natives and foreigners. Casilda (pop. in 1907, 1246) has a landlocked, shallow harbour; but Masio Bay, a trifle farther distant, accommodates larger craft; and there are excellent deep-water anchorages among the quays off the coast. The Manati river is navigable for about 7 m. inland, and is used as an outlet for sugar and molasses crops. These and honey are the chief exports; tobacco and various vegetables and fruits are of minor importance. Trinidad is one of the seven original cities of Cuba established by Diego Velasquez. It was founded in 1514 on the coast, but after being attacked by pirates was removed inland. It was thrice sacked by English buccaneers—in 1642, 1654 and 1702; and in the following years, up to and for a time after the peace of Utrecht (1713), it maintained ships and soldiers. Indeed, throughout the first half of the 18th century it was on a continuous war footing against English corsairs, making reprisals on British ships and thriving at the same time on a large contraband trade with Jamaica and other foreign colonies. In 1818 Casilda was opened to legal commerce under the national and foreign flags.

TRINITARIANS, a religious order founded in 1198 by St John of Matha and St Felix of Valois, for the liberation of Christian prisoners and slaves from captivity under the Moors and Saracens. The two founders went to Rome and there obtained the approbation of Innocent III., 1198. The rule was the Augustinian, supplemented by regulations of an austere character. The habit was white, with a red and blue cross on the breast. The Trinitarians are canons regular, but in England they were often spoken of as friars. The first monastery and head house of the order was at Cerfroy near Soissons. Among the earliest recruits were some Englishmen, and the first to go on the special mission of the order were two Englishmen, who in 1200 went to Morocco and returned thence to France with 186 liberated Christian captives. This success excited great enthusiasm and led to the diffusion of the order all over Western Christendom. At the beginning of the 18th century there were still 250 houses, and it is stated that there had been 800; this, however, includes 43 in England, where Dugdale says he could find traces only of a dozen; so that the high figures are probably apocryphal. The first house in England was at Mottenden, in Kent, founded in 1224. The ordinary method of freeing captives was by paying their ransom and for this purpose vast sums of money were collected by the Trinitarians; but they were called upon, if other means failed, to offer themselves in exchange for Christian captives. Many thousands were liberated by their efforts. In the 17th century a reform called the Barefooted Trinitarians was initiated, which became a distinct order and is the only one that survives. There are now less than 500 members. Their headquarters are at San Crisogono in Rome. They devote themselves to the ransoming of negro slaves, especially children, and a great district in Somaliland has been since 1904 entrusted to them as a field for missionary work. There were Trinitarian nuns and a Third Order.

The chief modern book on the Trinitarians is Deslandres, *L'Ordre français des Trinitaires* (2 vols. 1903). Sufficient information will be found in Hélyot, *Histoire des ordres religieux* (1714), vol. ii. chs. 45-50; and in Max Heimbucher, *Orden u. Kongregationen* (1907), ii. 557. (E. C. B.)

TRINITY HOUSE, CORPORATION OF, an association of English mariners which originally had its headquarters at Deptford in Kent. In its first charter, received from Henry VIII. in 1514, it was described as the "guild or fraternity of the most glorious and undividable Trinity of St Clement." The first

master appointed was the founder of the corporation, Sir Thomas Spert, comptroller of the navy to the king, and commander of the "Harry Grace de Dieu." Deptford having been made a royal dockyard by Henry VIII., and being the station where outgoing ships were supplied with pilots, the corporation rapidly developed its influence and usefulness. By Henry VIII. it was entrusted with the direction of the new naval dockyard. From Elizabeth, who conferred on it a grant of arms in 1573, it received authority to erect beacons and other marks for the guidance of navigators along the coasts of England. In 1604 a select class, was constituted called Elder Brethren, the other members being called Younger Brethren. By the charter of 1609 the sole management of affairs was conferred on the Elder Brethren; the Younger Brethren, however, having a vote in the election of master and wardens. The practical duties of the fraternity are discharged by the acting Elder Brethren, 13 in number, of whom 2 are elected from the royal navy and 11 from the merchant service; but as a mark of honour persons of rank and eminence are admitted as honorary Elder Brethren. In 1647 the corporation was dissolved by parliament, but it was reconstructed in 1660, and the charter was renewed by James II. in 1685. In 1687 a by-law of the Trinity House for the first time required an agreement in writing between the master and crew of a ship. A new hall and almshouses were erected at Deptford in 1765; but for some time the offices of the corporation had been transferred to London, where for a while they had a house in Water Lane, Lower Thames Street, and in 1795 their headquarters were removed to Trinity House, Tower Hill, built from the designs of Samuel Wyatt. By an act of 1836 they received powers to purchase from the Crown, as well as from private proprietors, all interests in coast lights. For the maintenance of lights, buoys, &c., they had power to raise money by tolls, the surplus being devoted to the relief of old and indigent mariners or their near relatives. In 1853 the control of the funds collected by the corporation was transferred to the board of trade, and the money over which the brethren were allowed independent control was ultimately reduced to the private income derived from funded and trust property. Their practical duties in erection and maintenance of lighthouses, buoys and beacons remain as important as ever. Similar functions are carried out by the Northern Lighthouse Board and the Irish Lighthouse Board, for Scotland and Ireland respectively. They have also the care and supervision of pilots. Other Trinity Houses established under charter or act of parliament for the appointment and control of pilots are at Hull and Newcastle. The Elder Brethren of Trinity Masters also act as nautical assessors in the high court of admiralty. The corporation has a large wharf and repair shop at the mouth of the river Lea, where most of the work in connexion with buoying the Thames is carried out.

See W. H. Mayo, *Trinity House, London, Past and Present* (London, 1905); C. R. B. Barrett, *The Trinity House of Deptford Strand* (1893).

TRINITY SUNDAY, the Sunday next after Whitsunday. A festival in honour of the Trinity had been celebrated locally at various dates before Pope John XXII. in 1334 ordered its general observance on the octave of Whitsunday. According to Gervase of Canterbury, it had been introduced into England by Thomas Becket, archbishop of Canterbury, in 1162. It has, however, never been reckoned among the great festivals of the Church. From Trinity Sunday onwards all Sundays until the close of the ecclesiastical year are reckoned as "after Trinity." In the Roman Church these Sundays are also reckoned as "after Pentecost." In the latter case they are described as *dominica trinitatis*, not to be confused with *dominica post trinitatis*; e.g. *Dominica sexta post trinitatis* is the same as *Dominica septima trinitatis*.

TRINODA NECESSITAS, the name used by modern historians to describe the threefold obligation of serving in the host (*fyrd*), repairing and constructing bridges (*bryc-geworc*), and the construction and maintenance of fortresses (*burhbot*), to

which all freeholders were subject in Anglo-Saxon times. The obligations are usually mentioned in charters as the sole exceptions to grants of immunities; sometimes, however, a fourth obligation (*singulare proetium contra alium*) is reserved, as in the charter granted by Wiglaf of Mercia on the 28th of December 831 (*Cod. dip. i. 294*). Ceolwulf's charter of 822 to Archbishop Willred is remarkable, as the military service is there restricted to *expeditiones contra paganos astes* (*ibid. i. 272*). The threefold obligation is first mentioned in a Latin charter (*expeditione pontis arcisue constructione*) of doubtful authenticity, which professes to have been granted by Eadbald of Kent in A.D. 616 (*Cod. dip. v. 2*), but it is not until the 8th century that it appears in documents which are generally admitted to be genuine. Although there were corresponding obligations in the Frankish Empire which were called by Charles the Bald (*antiquam et aliarum gentium consuetudinem*), Stubbs held that the arguments which refer them to a Roman origin want both congruity and continuity.

The phrase "trínoda necessitas" is not to be found in the Anglo-Saxon laws and charters; and Selden was probably the first historian of eminence who used it. "These three exceptions," he says, "are noted by the term of a three-knotted necessity in an old charter wherein King Cedwalla granted to Willrid, the first bishop of Shelsey in Sussex, the village of Paganham." This charter is an 11th-century copy of a lost original, but the words to which Selden referred are plainly written as *trínoda necessitas* not *trínoda necessitas*. Du Cange gives two examples of the word (*trínoda* in medieval Latin, in which language it meant "triple"; but he cites no medieval example of *trínoda*; and in classical Latin the form is unknown, while *trínodis* (*ter-nodus*, "triple-knotted") occurs only rarely (*Ovid. Her. iv. 112; Fast. i. 578*).

See Du Cange, *Glossarium*; W. Stubbs, *The Constitutional History of England*, i. 86, 87; J. M. Kemble, *Codex anglo-saxonicus*, passim; Selden, *English Jaus* (London, 1682), p. 43; Walter de Gray Birch, *Carularium saxonicum*, passim; Facsimiles of Ancient Charters in the British Museum, pt. iv. Cotton MS. Augustus, ii. 86. (G. J. T.)

TRINOVANTES (commonly *Trinovantes*), a powerful British tribe about 50 B.C.—A.D. 50 dwelling north and north-east of London, rivals and neighbours of the Catuvellauni. When Caesar invaded Britain 54 B.C. they joined him against their domestic rivals and it is possible (though not certain) that half a century after Caesar's departure they succumbed to them. Certainly they were conquered by Rome in A.D. 43 and joined in Boadicea's revolt in 61. In the tribal division of Roman Britain given by Ptolemy their land included Camulodunum (Colchester), but nothing more is known of them. But their name plays a part in medieval legends and romances. There it was interpreted as Troy Novant, the "new Troy," and connected with the names of the Trojans Brutus and Corineus who were reputed to have given their names to Britain and Cornwall. (F. J. H.)

TRIOLET, one of the fixed forms of verse invented in medieval France, and preserved in the practice of many modern literatures. It consists of eight short lines on two rhymes, arranged a b a a b a b, and in French usually begins on the masculine rhyme. The first line reappears as the fourth line, and the seventh and eighth lines repeat the opening couplet; the first line, therefore, is repeated three times, and hence the name. No more typical specimen of the triolet could be found than the following, by Jacques Ranchin (c. 1690):—

"Le premier jour du mois de mai
Fut le plus heureux de ma vie:
Le beau dessin que je formais,
Le premier jour du mois de mai !
Je vous vis et je vous aimais.
Si ce dessin vous plut, Sylvie,
Le premier jour du mois de mai
Fut le plus heureux de ma vie."

This poem was styled by Ménage "the king of triolets." The great art of the triolet consists in using the refrain-line with such naturalness and ease that it should seem inevitable, and yet in each repetition slightly altering its meaning, or at least its relation to the rest of the poem. The triolet seems to have been invented in the 13th century. The earliest example known occurs in the *Clomades* of Adentz-le-Roi

(1258—1297). The medieval triolet was usually written in lines of ten syllables, and the lightness of touch in the modern specimens was unknown to these perfectly serious examples. One of the best-known is that of Froissart, "Mon cœur s'ébat en odorant la rose." The rules are laid down in the *Art et Science de Rhétorique* (1493) of Henry de Croi, who quotes a triolet written in words of one syllable. According to Sarrasin, who introduces the triolet as a mourner in his *Pompe funèbre de Voiture*, it was that writer who "remis en vogue" the ancient precise forms of verse, "par ses balades, ses triolets et ses rondeaux, qui par sa mort (1648) retournaient dans leur ancien décri." Boileau threw scorn upon the delicate art of these pieces, and mocked the memory of Clément Marot because he "tourna des triolets," but Marmontel recognized the neatness and charm of the form. They continued to be written in France, but not by poets of much pretension, until the middle of the 19th century, when there was a great revival of their use.

The earliest triolets in English are those of a devotional nature composed in 1651 by Patrick Carey, a Benedictine monk at Douai, where he probably had become acquainted with what Voiture had made a fashionable French pastime. In modern times, the triolet was re-introduced into English by Robert Bridges, in 1873, with his—

"When first we met, we did not guess
That Love would prove so hard a master;
Of more than common friendliness
When first we met we did not guess.
Who could foretell the sore distress,
This irretrievable disaster.
When first we met?—we did not guess
That Love would prove so hard a master."

Since then the triolet has been cultivated very widely in English, most successfully by Austin Dobson, whose "Rose kissed me to-day," "I intended an Ode" and "In the School of Coquettes" are masterpieces of ingenuity and easy grace. In later French literature, triolets are innumerable; perhaps the most graceful cycle of them is "Les Prunes," attached by Alphonse Daudet to his *Les Amoureux* in 1858; and there are delightful examples by Théodore de Banville. In Germany the triolet has attracted much attention. Those which had been written before his day were collected by Friedrich Rassmann, in 1815 and 1817. But as early as 1795 an anthology of triolets had been published at Halberstadt, and another at Brunswick in 1796. Rassmann distinguished three species of triolet, the legitimate form (which has been described above), the loose triolet, which only approximately abides by the rules as to number of rhymes and lines, and single-strophe poems which more or less accidentally approach the true triolet in character. The true triolet was employed by W. Schlegel, Hagedorn, Rückert, Platen and other romantic poets of the early 19th century. In many languages the triolet has come into very frequent use to give point and brightness to a brief stroke of satire; the French newspapers are full of examples of this. The triolet always, or at least since medieval times, has laboured under a suspicion of frivolity, and Rivarol, in 1788, found no more cutting thing to say of Conjon de Bayeux than that he was "si recherché pour le triolet." But in the hands of a genuine poet who desires to record and to repeat a mood of graceful reverie or pathetic humour, the triolet possesses a very delicate charm.

See Friedrich Rassmann, *Sammlung triolettischer Spiele* (Leipzig, 1817). (E. G.)

TRIPHENYLMETHANE, (C₆H₅)₃CH, a hydrocarbon, important as being the parent substance of several series of exceedingly valuable dyestuffs, e.g. rosanillines and malachite greens derived from aminotriphenylmethanes, and aurins and phthaleins derived from oxytriphenylmethanes. It is obtained by condensing benzal chloride with mercury diphenyl (Kekulé and Franchimont, *Ber.*, 1872, 5, p. 907): from benzal chloride or benzotrifluoride and zinc dust or aluminium chloride; from chloroform or carbon tetrachloride and benzene in the presence of aluminium chloride; and deamidating di- and tri-aminotriphenylmethane

with nitrous acid and alcohol (O. and E. Fischer, *Ann.*, 1881, 206, p. 152). The last reaction is most important, for it established the connexion between this hydrocarbon and the rosanilines. Triphenylmethane is a white crystalline solid, melting at 92° and boiling at 358°. It separates from benzene and thiophene with one molecule of the "solvent of crystallization." On oxidation it gives triphenylcarbinol, $(C_6H_5)_3C \cdot OH$, and reduction with hydriodic acid and red phosphorus gives benzene and toluene. It combines with potassium to give $(C_6H_5)_3CK$, which with carbon dioxide gives potassium triphenylacetate, $(C_6H_5)_3C \cdot CO_2K$. Fuming nitric acid gives a paratrinilro substitution derivative which on reduction gives paraleucaniline; the salt of the carbinol formed on oxidizing this substance is the valuable dye rosaniline.

Considerable interest is attached to the remarkable series of hydrocarbons obtained by Gomberg (*Ber.*, 1900, 33, p. 3159, et seq.) by acting on triphenylmethane chloride (from triphenylmethane carbinol and phosphorus pentachloride, or from carbon tetrachloride and benzene in the presence of aluminium chloride) and its homologues with zinc, silver or mercury. Triphenylmethane chloride yields triphenylmethyl, ditolylphenylmethyl and tritolylmethyl have also been prepared. They behave as unsaturated compounds, combining with oxygen to form peroxides and with the halogens to form triarylmethane halides. Triphenylmethyl also combines with ethers and esters, but the compounds so formed are unsaturated. In the solid state triphenyl is colourless, crystalline and bimolecular. It was thought that it might be identical with hexaphenylethane, but the supposed synthesis of this substance by Ullmann and Borsum (*Ber.*, 1902, 35, p. 2877) appeared to disprove this, although it showed that triphenylmethyl readily isomerized into their product, under the influence of catalysts. A.E. Tschitschibabin (*Ber.*, 1908, 41, p. 2421), however, has shown that Ullmann and Borsum's preparation was para-benzhydryl-tetraphenylmethane $(C_6H_5)_2CH \cdot C_6H_4 \cdot C(C_6H_5)_2$; and the view that solid triphenylmethyl is hexaphenylethane has much in its favour. Another remarkable fact is that these substances yield coloured solutions in organic solvents; triphenylmethyl gives a yellow solution, whilst ditolylphenyl and tritolylmethyls give orange solutions which on warming turn to a violet and to a magenta, the changes being reversed on cooling. Several views have been published to explain this fact. A summary is given by Tschitschibabin (*Journ. prakt. Chem.*, 1907 (ii.), 74, p. 340). It appears probable that the solutions contain a quinonoid modification (see Gomberg and Cone, *Ann.*, 1909, 370, p. 142).

TRIPOD (Gr. *τρίπους*, Lat. *tripus*), in classical antiquities, any "three-footed" utensil or article of furniture. The name is specially applied to the following: (1) A seat or table with three legs. (2) A stand for holding the caldron used for boiling water or cooking meat; when caldron and stand were made in one piece, the name was given to the complete apparatus. (3) A sacrificial tripod, or altar, the most famous of which was the Delphic tripod, on which the Pythian priestess took her seat to deliver the oracles of the god, the seat being formed by a circular slab on the top, on which a branch of laurel was deposited when it was unoccupied by the priestess. Another well-known tripod was the "Plataean," made from a tenth part of the spoils taken from the Persian army after the battle of Plataea. This consisted of a golden basin, supported by a bronze serpent with three heads (or three serpents intertwined), with a list of the states that had taken part in the war inscribed on the coils of the serpent. The golden bowl was carried off by the Phocians during the Sacred War; the stand was removed by the emperor Constantine to Constantinople, where it is still to be seen in the Atmeidan (hippodrome), but in a damaged condition, the heads of the serpents having disappeared. The inscription, however, has been almost entirely restored (see Frazer on Pausanias, v. 299 seq.). Such tripods were usually of bronze and had three "ears" (rings which served as handles). They also frequently had a central upright as support in addition to the three legs. Tripods are frequently mentioned in Homer as prizes in athletic games and as complimentary gifts, and in later times, highly decorated and bearing inscriptions, they served the same purpose. They were also used as dedicatory offerings to the gods, and in the dramatic contests at the Dionysia the victorious *choregus* (a wealthy citizen who bore the expense of equipping and training the chorus) received a crown and a tripod, which he either dedicated to some god or set upon the top of a

marble structure erected in the form of a small circular temple in a street in Athens, called the "street of tripods," from the large number of memorials of this kind. One of these, the "monument of Lysicrates," erected by him to commemorate his victory in a dramatic contest in 335 B.C. is still in existence (see Frazer, ii. 207).

See C. O. Müller, *De tripode delphico* (1820); F. Wieseler, *Ueber den delphischen Dreifuss* (1871); E. Reisch, *Griechische Weibgeschenke* (1890) and his article "Dreifuss" in Pauly-Wisowa, *Realencyclopädie der classischen Altertumswissenschaft*, v. p. 2 (1905).

TRIPOLI, a Turkish vilayet (regency) of North Africa. It is bounded N. by the Mediterranean (between 11° 40' and 25° 12' E.) and has a coast-line of over 1100 m. Tripoli comprises at least five distinct regions—Tripoli proper, the Barca plateau (*Cyrenaica*), the Ajulja oases, Fezzan (*q.v.*) and the oases of Ghadames and Ghat—which with the intervening sandy and stony wastes occupy the space between Tunisia and Egypt, extend from the Mediterranean southwards to the Tropic of Cancer, and have a collective area of about 400,000 sq. m., with a population estimated at from 800,000 to 1,300,000. Towards the south and east the frontiers are undefined. But on the west side the conventional line laid down by agreement with France in 1886 was more accurately determined in 1892, when the terminal point on the Mediterranean was shifted from Borj-el-Biban to Ras Ajir, 18 m. to the south-east, in 33° 12' N. 11° 40' E. From this point the line passes along the Wad Magla and across the Erg (sand) dunes in such a way as to leave Ghadames to Turkey. In consequence of frontier collisions the boundary as far as Ghadames was precisely defined in 1910. South of that point the rival claims of France and Turkey remained in dispute.

For some distance east of Tunisia the seaboard is low and sandy, and is often regarded as a part of the Sahara, which, however, begins only some 80 m. farther south, beyond the Jebels Nefusi, Yefren and Ghurian (*Physical Features*). The "Jebel," as this system is locally called, terminates eastwards in the Tarhona heights of the Homs (Khoms) coast district, has a mean altitude of about 2000 ft. and culminates in the Takut (Tekuk) volcano (2800 ft.) nearly due south of the capital. It is not a true mountain range, but rather the steep scarp of the Saharan plateau, which encloses southwards the Jefara coast plains, and probably represents the original coast-line. The Ghurian section is scored in places by the beds of intermittent coast streams, and on its lower slopes is clothed with a rich sub-tropical vegetation. South of these escarpments, the vast Hammada el-Homra, the "Red Hammada," an interminable stony table-land covering some 40,000 sq. m., occupies the whole space between Tripoli proper and the Fezzan depression. The now uninhabited and waterless Hammada formerly drained through several large rivers, such as the Wadis Targelat (Uani, Kseia), Terrgurt, Sofejin, Zemzem and Bel, north-eastwards to the Gulf of Sidra (*Syrtis major*). Southwards the table-land is skirted by the Jebel Welad Hassan, the Jebel es-Suda, the Jebel Morai-Yeh, and other detached ranges, which have a normal west to east trend in the direction of the Ajulja oases, rising a little above the level of the plateau, but falling precipitously towards Fezzan. The Jebel es-Suda (Black Mountains), most conspicuous of these ranges, with a mean altitude of 2800 ft., takes its name from the blackened aspect of its limestone and sandstone rocks, which have been subjected to volcanic action, giving them the appearance of basalt. Eastwards this range ramifies into the two crescent-shaped chains of the Harj el-Aswad and Harj el-Abiad ("Black" and "White" Harj), which rise some 700 ft. above the Red Hammada, and enclose an extensive Cretaceous plateau. Rocks of Cretaceous age cover, indeed, an immense area of the northern part of the vilayet, recent eruptive rocks being represented by the lavas and ashes of the craters of Takut and Manterus. The later palaeozoic formations occur in Fezzan.

Beyond the barren Ghadama district in the north of the Hammada the dreary aspect of the wilderness is broken by

several tracts under grass, corn and date-palms, and containing some permanent reservoirs in the beds of the Wadis Sofejin and Zemzem, where the plateau falls from a mean height of 2000 ft. to 1000 and 530 ft. respectively. But it again rises rapidly southwards to a somewhat uniform level of 1600 or 1700 ft., and here the main caravan route from Tripoli to Murzuk and Lake Chad traverses for a distance of fully 130 m. a monotonous region of sandstone, underlying clays, marls, gypsum and fossiliferous silicious deposits. In its northern section this part of the Hammada, as it is locally called in a pre-eminent sense, is relieved by a few patches of herbage, scrub and brushwood, with a little water left in the rocky cavities by the heavy showers which occasionally fall.

North-eastwards the Neddik pass over the Jebel Morai-Yeh leads down to the remarkable chain of low-lying oases, which, from the chief member of the group, is commonly called the Ajulja depression. Collectively the oases present the aspect of a long winding valley, which is enclosed on the north side by the southern escarpments of the Barca plateau, expands at intervals into patches of perennial waters and shallow saline basins, and extends from the Wadi el-Fares near the Gulf of Sidra, through the Bir Rassam, Ajulja, Jalo, Faredgha, and Siwa oases, to the Natron lakes and the dried-up branch of the Nile delta known as the Bahr bilâ-Mâ (waterless river). The whole region presents the aspect of a silted-up marine inlet, which perhaps in Pliocene times penetrated some 300 m. south-eastwards in the direction of the Nile. Nearly all the fossil shells found in its sands belong to the fauna now living in the Mediterranean, and Siwa is 98 ft. below sea-level. This is true also of its eastern extensions, Sitra (80) and the Birket el-Keran in the Fayum (141). But Ajulja and Jalo stand 130 and 296 ft. respectively above sea-level, so that the idea entertained by the explorer Gerhard Rohlfs of transforming the chain of oases into a marine gulf, and thus converting the Barca plateau into an island or peninsula in the midst of the Mediterranean waters, and in fact flooding the Libyan desert, must share the fate of Colonel François Roudaire's equally visionary scheme in respect of the Western Sahara.

The Barca plateau, which consists largely of strata of tertiary formation, falls in terraces down to the Ajulja depression, and presents an unbroken rampart of steep cliffs towards the Mediterranean, as by far the most favoured region of the valley. Its many natural advantages of climate, soil and vegetation led to the establishment of several Greek colonies, the oldest and most famous of which was that of *Cyrene* (q.v.), dating from about 630 B.C. From this place the whole region took the name of *Cyrenaica* (q.v.) and was also known as *Pentapolis*, from its "five cities" of Cyrene, Apollonia, Arsinoe, Berenice and Barca. The elevated plateau of Cyrenaica, which encloses the Gulf of Sidra on the west, is separated southwards by the Ajulja depression from the Libyan desert, and projects northwards far into the Mediterranean, might seem, like the Atlas region in the west, to belong geologically rather to the European than to the African mainland. It has a mean altitude of considerably over 2000 ft., and in the Jebel Akhdar (Green Mountains) attains a height of nearly 3500 ft. Eastwards the Barca uplands merge gradually in the less elevated Marmarica plateau, which nowhere rises more than 1800 ft. above sea-level, and disappears altogether in the direction of the Nile delta. The most easterly spot on the coast belonging to Tripoli is the head of the Gulf of Solum; from this point the frontier line separating the regency from the Egyptian dominions runs south so as to leave the Siwa oasis on the Egyptian side of the line.

South of the Ajulja depression the land rises steadily to a height of nearly 1200 feet in the *Kufra* oases, which lie between 21° and 24° E., north of the Tropic of Cancer and due east of Fezzan. The group consists of five distinct oases in the heart of the "Libyan" desert—Tazerbo, Zighen, Bu-Zeima, Erbens and Kebabâ—which extend for a distance of 200 m. north-west and south-east, and have a collective area of 7000 sq. m. and a population of 6000 or 7000 Arabo-Berber nomads. Good water is obtained in abundance from the underground reservoirs, which lie within a few feet of the surface, and support over a million date-palms. *Kufra*, that is, "Infidels" (a reference to the now extinct pagan Tibu aborigines), is a centre of the Senûssite brotherhood, whose *araya* (convent) at Jof, in Kebabâ, ranks in importance with that of Jarabub, their chief station in Cyrenaica. This circumstance, together with the great fertility of the group and its position midway on the caravan route between Cyrenaica and Wadai, imparts exceptional importance to these oases. Formerly the Turks did not exercise authority in *Kufra*, the influence of the Senûssite being paramount. *Kufra*, moreover, is outside the limits usually assigned to Tripoli. But in 1910 Ottoman troops were in occupation of the oases.

Ghat stands 2400 feet above the sea, on the Wadi Aghehal in the Igharghar basin, and consequently belongs, not to the Fezzan depression, but to the Saharan plateau. The Aghehal, or "Passage," trends north to the Issawan valley along the east foot of the Tassili plateau, that is, the divide between the waters

which formerly flowed north to the Mediterranean, west to the Atlantic, and south to the Niger and Chad basins. Ghat, which is skirted eastwards by the Akakus range, is a sandy plain dotted over with clumps or groves of date-palms. In the centre is an open space where is held a great annual fair, and to this, combined with its position on one of the caravan routes across the desert, the oasis owes all its importance. For several years, at the end of the 19th and beginning of the 20th centuries, the only caravan route used from the Niger countries to Tripoli was by way of Ghat, disturbances in Bornu and raids by Tuareg having closed all other routes. There is, in the oasis, a population of perhaps 10,000, nearly all Ighajenen Tuareg, about half of whom live in the town of Ghat (350 m. south of Ghadames and 250 south-west of Murzuk), which appears to be a relatively modern place, successor to *Rapsa*, a great commercial centre and military station under the Roman Empire.

Ghadames, on the contrary, is ancient, being the *Cydamus* of the Garamantes, the capture of which by L. Cornelius Balbus Minor led to the overthrow of their empire. The oasis, *Abudames*, which stands on the cretaceous Tingher plateau 300 m. south-west of Tripoli, and 1200 ft. above the sea, is enclosed by a circular rampart over 3 m. in circumference. The town, which occupies the south-west corner of the enclosure, has a population of about 7000. Owing to its perennial springs and artesian wells, the oasis yields an abundance of dates, figs, apricots and vegetables, besides some wheat, barley and millet. It occupies a highly advantageous position at the converging-point of several caravan routes, and has extensive trading relations with the markets of Tripoli, Tunisia and the Sudan.

Climate.—The climate of Tripoli is very variable; cold nights often succeed warm days. The rainfall in the northern regions varies from 5 in. to 15 in. a year—December, January and February being the rainy season. The mean temperature on the coast lands is 68°; it is very much higher in the Hammada, where rain seldom falls.

Flora and Fauna.—The flora in the greater part of the regency is Saharan, the date-palm being the characteristic tree. The gum-yielding acacia, the tamarisk, sapan, mastic and pistachio are found in the wadis, and *shi* (wormwood) grows in clusters on the stony plateaus. In the Barca plateau and in parts of the coast belt the flora is more varied, resembling that of the Mediterranean countries generally. In these regions the laurel, myrtle and other evergreens are fairly common, and the oak, cypress, pine, carob and other trees occur, notably the olive, found also in the oases. Other fruit trees are the almond, fig, pomegranate, quince and apricot. Vines flourish in a few districts.

The larger wild animals are scarcely represented in Tripoli. The wild boar is found in Jebel Akhdar, the hyena, fox and jackal in the deserts. The moulton, gazelle, hares, rabbits and marmots are among the commoner animals. Reptiles include the horned viper and the gecko. The characteristic animal is the camel, found only in the domesticated state. Horses and cattle are bred, but the horses are not numerous; goats and a fat-tailed variety of sheep are kept in large numbers. Birds include the ostrich, vultures, hoopoe, wood pigeons and doves. Bees are numerous and honey forms an article of export.

The explorations of Henri Duveyrier, Victor Largeau, Erwin von Bary and H. S. Cowper during the second half of the 19th century showed that Tripoli was not only inhabited by primitive man, but was the seat of a flourishing Neolithic culture, comparable to and in many respects resembling that of Iberia, Brittany and the British Isles. As in other parts of Mauretania, many now arid and uninhabitable wastes are strewn with monolithic and other remains, which occur in great variety of form and in vast numbers, as many as 10,000, chiefly of the menhir type, having been enumerated in the Mejana steppe alone. All kinds of megalithic structures are found—dolmens and circles like Stonehenge, cairns, underground cells excavated in the live rock, barrows topped with huge slabs, cup stones, mounds in the form of step pyramids, and sacrificial altars. Most remarkable are the "Senams," or trilithons of the Jebel Maïd and other districts, some still standing, some in ruins, the purpose of which has not been determined. They occur either singly or in rows, and consist of two square uprights 10 ft. high standing on a common pedestal and supporting a huge transverse beam. In the Tergurt valley "there had been originally no less than eighteen or twenty megalithic trilithons, in a line, each with its massive altar placed before it" (Cowper). There is reason to believe that the builders of these prehistoric monuments are represented by the Berber people, who still form the substratum, and in some places the bulk, of the inhabitants of Tripoli proper. But even here the Berbers have for the most part been driven to the Ghurian and Tarhona uplands by the Arab nomads, who now occupy the Jefara flats

about the capital, and are in almost exclusive possession of Cyrenaica, Marmarica, and the Aujila oases. In Fezzan the Saharan Berbers (Tinyilkum Tuareg) are dominant, but are here largely intermingled with Negro or Negroid intruders from the Sudan. But even in the uplands many of the Berbers have been Arabized, and Cowper describes the people of the Tarbona heights as "pure-bred Araba." Other early intruders are the Jews, some of whom arrived from Egypt in the time of the Ptolemies, and still lead the life of troglodytes in the limestone caves of the Ghurian escarpments. They are also numerous in the large towns, where there are also colonies of Turks, and Maltese, Italian, Cretan and other South European traders and artisans.

On the other hand, no trace can be now detected either of the Greeks who colonized Cyrenaica in the 7th century B.C., or of the Phoenicians who at a still earlier date founded the three great cities of Oea, Sabrata and Leptis Magna (q.v.), from which the western region projecting seawards between the two Syrtes took the name of Tripolitana. Later, when Oea, which stood between the two others, was made the capital of the province it was called Tripolis, the "Three Cities," as it were, rolled into one, and this name it has retained since Roman times, being now distinguished from the Tripolis of Syria as West Tripolis, the *Tarabulus el-Gharb* of the Turks and Arabs. Tripoli (q.v.), the capital of the province, is thus one of the oldest places in the world, and no doubt owes its stability in large measure to its position over against Sicily at the northern terminus of three great historic caravan routes, one of which runs due south to Lake Chad through Fezzan and Bilma, that is, across the narrowest part of the Sahara; another runs south-west through Ghadames and Ghat to Timbuktu and Kano, and the third south by east through Sokna to Wadai and Darfur. East of Tripoli are the small seaports of Homs (Khoms) and Lebda.

In Barca the largest town is Bengazi (q.v.), the ancient Berenice, at the southern extremity of a headland which formerly enclosed a spacious natural haven on the north-east side of the Gulf of Sidra. But the harbour has been partly filled up by the ruins of a large fortress, and is inaccessible to vessels drawing over 6 or 7 ft. East of Bengazi are Merj, the ancient Barca (q.v.), and the exposed roadstead of Derna (q.v.). Marsa-Susa, the ancient Apollonia, lies under the Ras Sem headland, and was the emporium of the neighbouring city of Cyrene (Ain Shabat-Grenna). The Turkish government displayed much activity in this fertile and healthy district in the period 1897-1903. To it were removed many of the Moslem inhabitants of Crete dissatisfied with the autonomous régime established in that island in 1898.

Agriculture and Trade.—Tripoli proper is purely an agricultural and trading country; it possesses no manufactures of importance, nor exploited mineral wealth save salt. The uncertainty of the rainfall, the apparent increasing poverty of the soil and the heavy taxation of the peasants reduced agriculture at the close of the 19th century to a lower point than theretofore recorded. The cultivation of wheat was largely supplanted by that of barley—the staple food of the peasantry, whilst esparto grass, a fibre growing wild in the rural districts within the cereal zone, acquired the chief place among local exports. The importation of foreign flour, begun in 1881, assumed large dimensions in providing for the deficiencies occasioned by ever-recurring failures of the wheat and barley harvests. Besides wheat and barley the principal products of the country are esparto grass, olives, saffron, figs and dates—these last being perhaps the finest in North Africa. Fruit also is abundant in certain parts, including oranges and lemons, and so are many kinds of vegetables. There is a lucrative sponge fishery, a monopoly of Greek traders, over 100 barques being engaged in the industry.

Trade, before the suppression of the oversea slave traffic, was largely in negroes, brought across the Sahara with other Sudan produce, for the Turkish market. It now consists chiefly in the export of esparto, barley in years of plenty, eggs, cattle, sponges, mats and henna, all articles of local production, and, from Central Africa, ivory, ostrich feathers, tanned goat-skins and a little gold dust. The cattle go mainly to Malta, the esparto, barley, eggs and ivory mostly to England, the feathers to Paris and London, and the skins to New York. The henna and mats are sent to Turkey, Egypt, Tunis and Malta. The exports of esparto grass vary with

the success or failure of the cereal crops; thus in 1903 the value of barley exported was £70,800, and of esparto £76,400. In 1904 the exports of barley fell to £3,200 and those of esparto rose to £126,000. From Bengazi hundreds of thousands of sheep are exported to Egypt, Malta and Crete. With Egypt there is an overland as well as sea trade. The caravan trade, which in the forty years ending 1901 had an annual average value of £114,000, is so costly that only articles yielding considerable profit can be carried; the desert trade is, moreover, being deflected to the Niger and the Guinea coast. Tripoli imports, chiefly, food-stuffs (flour, rice, sugar, tea) cotton goods, tobacco, metals and hardware. About two-thirds of the imports are from Great Britain. Exclusive of Bengazi the value of trade, imports and exports combined, was for the last thirty years of the 19th century some £770,000 per annum. The trade of Bengazi and Derna, chiefly with Great Britain and Malta, largely increased at the beginning of the 20th century. For the five years 1902-1906 the average annual value of imports was £214,000, of exports £455,700. From these ports the chief exports are sheep and goats, oxen, wool and skins, barley and camels—the last sent overland to Alexandria. Food-stuffs, tea, olive oil and cotton goods are the chief imports. There is an active contraband trade with Greece and Malta in firearms and gunpowder.

Barley is the chief food of the people both in Tripoli proper and in Bengazi. The nomad Arabs possess thousands of camels, cattle and sheep. They weave rough woollen garments, make reed matting, carpets of alternative strips of woven goat and woven camel hair, and manufacture butter. Olive and date-palm trees are cultivated in large numbers. Tea has become a favourite beverage both in the regency and with the Sudanese. Tea, sugar and cottons form the staple articles of exchange with the Sudanese for their produce. **Communications.**—The town of Tripoli is connected by telegraph cable with Malta, and telegraph lines run inland from that town to Murzuk, Bengazi, Derna and other towns in the regency, and to Gabes in Tunisia. A wireless telegraphic apparatus connects Derna and Rhodes. There are regular sailings between Malta and Tripoli and between Tunis and Tripoli. Italian vessels also call regularly at Bengazi and Derna. The shipping trade is mostly in the hands of Italians—who have more than half the total tonnage—and French, British shipping coming third. Inland communication is almost entirely by camel caravans.

Administration.—The wali or governor-general, who exercises chief authority both civil and military, is appointed by the sultan of Turkey and holds office at his majesty's pleasure. The system of government, executive and judicial, resembles that of other Turkish provinces, but with some modifications in the direction of local autonomy. Bengazi or Barca is a separate sub-province with an administration responsible direct to Constantinople. Revenue is derived chiefly from customs, tithes and a poll tax called *warghi*. Owing to expenditure on the army, some 10,000 Turkish troops being stationed in the regency, the receipts from revenue are generally below the cost of administration. The receipts in the period 1900-1905 averaged about £150,000 a year and the expenditure £170,000, of which amount some £100,000 was on military requirements.

History.—The early history of Cyrenaica and Tripoli is distinct though similar. Cyrenaica was first colonized by Greeks, afterwards it fell under the sway of the Ptolemies and from them passed to the Romans (see CYRENAICA). Tripoli, on the other hand, was originally a Phoenician colony (*vide ante, Towns*). Later it was dependent on Carthage and followed its fortunes. From the Romans the province received its present name. In the 5th century both Tripoli and Cyrenaica were conquered by the Vandals, whose power was destroyed by the Byzantine general Belisarius in the following century. In the middle of the 7th century the whole country was overrun by the Arabs, and Christianity gave place to Islam. From this period, for many centuries, Tripoli was subject to the successive rulers of Tunisia. It was pillaged in 1146 by the Normans of Sicily. In 1321 the Beni Ammar established an independent dynasty, which lasted with an interval (1354-1360), during which two sovereigns of the Beni Mekki reigned, until 1401 when Tripoli was reconquered by the Tunisians. In 1510 Ferdinand the Catholic of Spain took Tripoli, and in 1528 it was given to the knights of St John, who were expelled in 1553 by the Turkish corsairs Dragut and Sinan. Dragut, who afterwards fell in Malta, lies buried in a much venerated *shabba* close to one of the mosques. After his decease the connexion between Tripoli and Constantinople seems to have been considerably weakened. But the Tripolitan pirates soon became the terror and scourge of the Mediterranean; half the states of Europe seem at one time or other to have sent their fleets to bombard the capital. In 1714 Ahmed Pasha Caramanli achieved practical independence and he and his descendants

governed Tripoli as a regency, the claims of the Porte being recognized by the payment of tribute, or "resents." In the early part of the 19th century the regency, owing to its piratical practices, was twice involved in war with the United States. In May 1801 the pasha demanded from America an increase in the tribute (\$83,000) which the government of that country had paid since 1796 for the protection of their commerce from piracy. The demand was refused and a naval force was sent from America to blockade Tripoli. The war dragged on for four years, the Americans in 1803 losing the frigate "Philadelphia," the commander (Captain William Bainbridge) and the whole crew being made prisoners. The most picturesque incident in the war was the expedition undertaken by William Eaton (q.v.), with the object of replacing upon the Tripolitan throne an exiled pasha, elder brother of the reigning sovereign, who had promised to accede to all the wishes of the United States. Eaton at the head of a motley assembly of 500 men marched across the desert from Alexandria, and with the aid of American ships succeeded in capturing Derna. Soon afterwards (June 3, 1805) peace was concluded, the reigning pasha relinquishing his demands but receiving \$60,000 (about £12,000) as ransom for the "Philadelphia" prisoners. In 1815, in consequence of further outrages, Captains Bainbridge and Stephen Decatur, at the head of an American squadron, again visited Tripoli and forced the pasha to comply with the demands of America. In 1835 the Turks took advantage of a civil war to reassert their direct authority, and since that date Tripoli has been an integral part of the Ottoman Empire, rebellions in 1842 and 1844 being unsuccessful. After the occupation of Tunisia by the French (1881) the Turks increased their garrison in Tripoli considerably. After the Anglo-French agreement of 1889 recognizing the central Sahara as within the French sphere, various disputes arose as to the extent of the Tripolitan hinterland, which the French endeavoured to circumscribe (see TUNISIA). The French, on their part, believed that their opponents in Wadai and elsewhere in the central Sudan received support from the Turks.

The *khawan* (*ikhwadn*) or semi-religious semi-political Moslem fraternities are powerful in Tripoli. The most remarkable is that of the Senussites. The explorers Rohlfs, Nachtigal and Duveyrier found their passage barred by Senussite agents. (See SENUSSI.)

TRIPOLI (*Tarabulus el-Charb*, i.e. Tripoli of the West), capital of the Turkish vilayet of Tripoli, North Africa, situated in 32° 53' 40" N. and 13° 11' 32" E. on a promontory stretching out into the Mediterranean and forming a small crescent-shaped bay which shelters the harbour from the north winds. Its crenellated enceinte wall has the form of an irregular pentagon. A line of small ancient forts is supposed to protect one side of the harbour, and the citadel the other. This citadel, dating from the time of the Spanish occupation, now serves as the residence of the governor. The harbour has a depth of water

varying from 15 to 24 ft.; steamers drawing 21 ft. can anchor inside, but shoals render the entry difficult. At the quayside the depth of water is from 2 to 5 ft. only. The desert almost touches the western side of the city, while on the east is the verdant oasis of Meshia, where are still to be seen the tombs of the Caramanlian sultans and the twelve-domed *hubbbs* of Sidi Hamonda. The aspect of the city is picturesque; the houses (many possessing beautiful gardens) rise in terraces from the seashore. The Turkish quarter contains numerous mosques whose minarets and cupolas break the monotony of the flat-roofed and whitewashed houses. The Grand mosque and the Pasha mosque (originally a church built by the Spaniards) both have octagonal minarets. By the harbour are several houses built in European style, but the general aspect of the city is Oriental. Many of the streets are arcaded; the *suks* or markets are the scene of much animation. Near the port stands a Roman triumphal arch. This arch, quadrifrontal in form, is made entirely of white marble, the blocks being held together with cramps, and is richly embellished with sculpture. It was begun in the reign of the emperor Antoninus, according to a still un mutilated dedicatory inscription, and finished in that of Marcus Aurelius. In the arch, now partly buried in débris, a cabaret has been installed.

A few small manufactures of carpets and silks as well as "Cordova leather" are carried on, but Tripoli is essentially a trading town, being the chief Mediterranean gateway to the Sahara. The population, about 60,000, is very mixed—Berber, Arab, Turk, Jew, Maltese, Italian and Negro. The Maltese inhabitants number about 4,000, the Italians 1,000 and the Jews 800. The local trade is almost entirely in the hands of the Jews and Maltese; the shipping in the port is largely Italian.

See H. M. de Mathuisieulx, *A travers la Tripolitaine* (Paris, 1903).

TRIPOLI, or **TARABULUS** (anc. *Tripolis*), the chief town of a sanjak of the same name in the Beirut vilayet of Syria, situated about 2 m. inland from its port, al-Mina. The ancient Phœnician city, which we know only by its Greek name of Tripolis, was the seat in Persian times of the federal council of Sidon, Tyre and Aradus, each of which cities had its separate quarter in the "triple town." In the 2nd and 1st centuries B.C., under Seleucid and Roman influences successively, it struck autonomous coins. These are succeeded by imperial coins ranging from 32 B.C. to A.D. 221. About 450, and again in 550, it was destroyed by earthquake. The Arabs took it in 638 after a prolonged siege, the inhabitants withdrawing by sea. Moawiya recruited the population by a colony of Jews and gave it fortifications and a garrison against the naval attacks of the Greeks, who, notwithstanding, retook it for a brief space in the time of Abdalmalik. It was again taken by the Greeks in the war of 966-69 and was besieged by Basil II. in 995, after which date it was held by a garrison in the pay of the Fatimite caliphs of Egypt, who treated the city with favour and maintained in it a trading fleet. At this time, according to the description of Nâsir Khosrau, who visited it in 1047, it lay on the peninsula of Al-Minâ, bathed on three sides by the sea, and had about 20,000 inhabitants and important industries of sugar and paper-making. Of the great sea-walls and towers there are still imposing remains. From this date till it was taken by the crusaders, after a five years' siege, in 1109, the ruling family was that of 'Ammâr, which founded a library of over 100,000 volumes. Under the crusaders Tripoli continued to flourish, exported glass to Venice, and had 4,000 looms. In 1289 it was taken and destroyed by the sultan Kola'ün of Egypt, and a new city was begun on the present site, which rapidly rose to importance. Its medieval prosperity has obliterated most relics of remoter antiquity. Tripoli had a troubled existence during the period of Ottoman weakness (the 18th and early 19th centuries), being frequently in dispute between the pasha of Aleppo and the rebel pashas of Acra. After the Egyptian conquest of Syria it was made the capital of a province in 1834; but in 1840 it reverted to the minor position which it now holds. It is connected by a

carriage road with Homs and by a steam tramway with Beirut, and is the natural outlet of the upper Orontes valley; but its inland trade has been greatly damaged by the Homs-Aleppo railway. From its own district, however, it exports silk, tobacco, oil, soap, sponges, eggs and fruit, and is a prosperous and growing place with a large Christian element in its population (about 30,000, the port-town included). It is served regularly by the Levantine lines of steamers. (D. G. H.)

TRIPOLITIS, officially *Tripolis*, a town of Greece, capital of the nomarchy of Arcadia, and the seat of an archbishop, situated in a plain over 2,000 ft. above sea-level, 22 m. S.W. of Argos. The name has reference to the three ancient cities of Mantinea, Pallantium and Tegea, of which Tripolitza is the modern representative. It does not stand on any ancient site. Before the war of independence it was the capital of the Morea and the seat of a pasha, with about 20,000 inhabitants; but in 1821 it was taken and sacked by the insurgents, and in 1825 its ruin was completed by Ibrahim Pasha. The town has since been rebuilt, and contains 10,789 inhabitants (1907).

TRIPTOLEMUS, in Greek mythology, the inventor of agriculture, first priest of Demeter, and founder of the Eleusinian mysteries. His name is probably connected with the "triple ploughing" (τρίπλη, πολεῖν), recommended in Hesiod's *Works and Days* and celebrated at an annual festival. It may be noted that in some traditions he is called the son of Dysaulus (possibly identical with *dialulos*, the "double furrow" traced by the ox), and that, according to the Latin poets (e.g. Virgil, *Georgics*, i. 19), he is the inventor of the plough. Later, as the god of ploughing, he is confounded with Osiris, and on a vase-painting at St Petersburg he is represented leaving Egypt in his dragon-drawn chariot on his journey round the world. According to the best known Attic legend (Apollodorus, i. 5, 2) Triptolemus was the son of Celeus, king of Eleusis, and Metaneira. Demeter, during her search for her daughter Persephone, arrived at Eleusis in the form of an old woman. Here she was hospitably received by Celeus, and out of gratitude would have made his son Demophon immortal by anointing him with ambrosia and destroying his mortal parts by fire; but Metaneira, happening to see what was going on, screamed out and disturbed the goddess. Demophon was burnt to death, and Demeter, to console his parents, took upon herself the care of Triptolemus, instructed him in everything connected with agriculture, and presented him with a wonderful chariot, in which he travelled all over the world, spreading the knowledge of the precious art and the blessings of civilization. In another account (Hyginus, *Fab.* 147) Triptolemus is the son of Eleusius, and takes the place of Demophon in the above narrative. Celeus endeavoured to kill him on his return, but Demeter intervened and forced him to surrender his country to Triptolemus, who named it Eleusis after his father and instituted the festival of Demeter called Thesmophoria. In the Homeric hymn to Demeter, Triptolemus is simply one of the nobles of Eleusis, who was instructed by the goddess in her rites and ceremonies. The Attic legend of Eleusis also represented him as one of the judges of the underworld. His adventures on his world-wide mission formed the subject of a play of the same name by Sophocles. In works of art Triptolemus appears mounted on a chariot (winged or drawn by dragons, symbols of the fruitfulness of the earth), with Demeter and Persephone handing him the implements of agriculture. His attributes were a sceptre of ears of corn, sometimes a drinking-cup, which is being filled by Demeter. His altar and threshing-floor were shown on the Rarian plain near Eleusis, hence he is sometimes called the son of Karus.

See the Homeric hymn to Demeter, 153, 474; Ovid, *Metam.* v. 642-661; Virgil, *Georgics*, i. 19, and Servius *ad loc.*; Hyginus, *Astronom.* ii. 14; Dion Halic. i. 12; Preller, *Griechische Mythologie* (4th ed., 1894).

TRIPTYCH (Gr. τριπtyχος, three-fold, made in three layers, τρι-, τρεῖς, three; πtyχή, a fold, πtyσσεν, to fold, double over),

either suggested derivations are from τριπtyχον, μάλα (δαι), the "grain crusher," or from τριπtyχος (= "triple-fighter," see DEMETER).

a painting, carving or other decorative design, executed on three compartments or panels, so constructed that the two wings may fold on hinges over the centre-piece; the backs of the wing-pieces are often also painted, carved or otherwise decorated. The subject of the side-pieces are usually appropriate and subsidiary to that of the centre. The triptych is most frequently designed as an altar-piece. An earlier use of the term is for a set of three wooden or ivory writing-tablets, hinged or otherwise fastened together, the central tablet being waxed on both sides for the impression of the *stilus* or writing implement, the outer tablets only on the inside. The three tablets thus formed a small book.

TRISECTRIX, a curve which is a variety of the limaçon (q.v.) of Pascal, and named from its property of trisecting an angle. The polar equation is $r=1+2 \cos \theta$ and the form of the curve is shown in the figure. To trisect an angle by means of this curve, describe a circle with centre O and radius OE, and let the given angle which is to be trisected be laid off from OE and cut the circle at S; let the chord ES cut the trisectrix in J. Then OJ trisects the given angle.

TRISTAN, or **TRISTRAM**, one of the most famous heroes of medieval romance. In the earlier versions of his story he is the son of Rivalin, a prince of North West Britain, and Blanchefer, sister to King Mark of Cornwall. Rivalin is killed in battle, and Blanchefer, after giving birth to a son, dies of grief. The boy is brought up as his own by Roald, or Rual, seneschal of the kingdom, who has him carefully trained in all chivalric and courtly arts. With the possible exception of Horn, Tristan is by far the most accomplished hero in the whole range of knightly romance; a finished musician, linguist and chess-player, no one can rival him in more knightly arts, in horsemanship or fencing. He has, besides, the whole science of "venerie" at his finger-tips; in fact Tristan is the "Admirable Crichton" of medieval romance, there is nothing he cannot do, and that superlatively well—it must be regretfully admitted that he is also a most accomplished liar! Attracted by his gifts, pirates from the North Sea kidnap the boy, but terrified by the storms which subsequently beset them, put him ashore on the coast of Cornwall, whence he finds his way to the court of his uncle King Mark. Here we have a first proof of his talent for romancing; for alike to two pilgrims who show him the road and to the huntsmen of Mark's court (whom he instructs in the rightful method of cutting up and disposing the quarry), Tristan invents different, and most detailed, fictions of his land and parentage. He becomes a great favourite at court, and when Roald, who has sought his young lord far and wide, at last reaches Tintagel, Mark welcomes the revelation of Tristan's identity with joy. Cornwall is at this time in subjection to the king of Ireland, Gormond, and every third year must pay tribute; the Irish champion, Morolt, brother to the queen, arrives to claim his toll of thirty youths and as many maidens. The Cornish knights (who in Arthurian romance are always represented as hopeless cowards), dare not contest his claim but Tristan challenges him to single combat, slays him and frees Cornwall from tribute. Unfortunately he himself has been wounded in the fight, and that by a poisoned weapon; and none but the queen of Ireland, Isolt, or Iseult, possessed the secret of healing. Tristan causes himself to be placed in a boat with his harp, and committed to the waves, which carry him to the shores of Ireland. There he gives himself out for a minstrel, Tantris, and as such is tended and healed by Queen Iseult and her daughter of the same name. When recovered he makes a plausible excuse for leaving Ireland (pretending he has left a wife in his native land, and returns to Cornwall. His uncle receives him with joy, but the barons of the court are bitterly jealous and plot his destruction. They persuade Mark that he should marry, and Tristan, who has sung the praises of the princess Iseult, is despatched to Ireland to demand her hand, a most dangerous errand, as Gormond, incensed at

the death of Morolt, has sworn to slay any Cornish knight who sets foot in Ireland. Tristan undertakes the mission, though he stipulates that he shall be accompanied by twenty of the barons, greatly to their disgust. His good fortune, however, does not forsake him; he lands in Ireland just as a fierce dragon is devastating the country, and the king has promised the hand of the princess to the slayer of the monster. Tristan achieves this feat, but, overcome by the venom exhaled from the dragon's tongue, which he has cut out, falls in a swoon. The seneschal of the court, a coward who has been watching for such an opportunity, cuts off the dragon's head, and, presenting it to the king, claims the reward, much to the dismay of Iseult and her mother. Suspecting that the seneschal is not really the slayer of the dragon, mother and daughter go secretly to the scene of the combat, find Tristan, whom they recognize as the minstrel, Tantris, and bring him back to the palace. They tend him in secret, but one day, through the medium of a splinter from his sword, which had remained fixed in Morolt's skull, and been preserved by the queen, the identity of Tantris and Tristan is made clear. The princess would slay him, but is withheld by her mother, who sees they have need of Tristan's aid to unmask the seneschal. This is done in the presence of the court; Tristan is pardoned, formally declares his errand, and receives the hand of Iseult for his uncle King Mark.

Tristan and Iseult set sail for Cornwall, Iseult accompanied by her waiting-woman, Brangaene (who, in some versions, is also a kinswoman), to whose care the queen, skilled in magic arts, confides a love-potion. This is intended to be drunk by king and queen on their bridal night and will ensure their undying love for each other. Unhappily, on the voyage, by some mistake (accounted for in different ways), Tristan and Iseult drink the love drink, and are forthwith seized with a fatal passion each for the other. From this moment begins a long-drawn-out series of tricks and subterfuges, undertaken with the view of deceiving Mark, whose suspicions, excited by sundry of his courtiers, from time to time get beyond his control, and are as often laid to rest by some clever ruse on the part of his nephew, or his wife, ably seconded by Brangaene. In the poems, Mark is, as a rule, represented in a favourable light, a gentle, kindly man, deeply attached to both Tristan and Iseult, and only too ready to allow his suspicions to be dispelled by any plausible explanation they may choose to offer. At the same time the fact that the lovers are the helpless victims of the fatal force of a magic spell is insisted upon, in order that their career of falsehood and deception may not deprive them of sympathy.

One episode, in especial, has been most charmingly treated by the poets. Mark, in one of his fits of jealousy, banishes Tristan and Iseult from the court; the two fly to the woods, where they lead an idyllic life, blissfully happy in each other's company. Mark, hunting in the forest, comes upon them sleeping in a cave, and as Tristan, who knows that the king is in the neighbourhood, has placed his sword between them, is convinced of their innocence. Through a cleft in the rock a ray of light falls upon Iseult's face, Mark stops up the crevice with his glove (or with grass and flowers), and goes his way, determined to recall his wife and nephew. He does so, and the same drama of plot and counter-plot is resumed. Eventually Mark surprises the two under circumstances which leave no possible room for doubt as to their mutual relation; Tristan flies for his life and takes refuge with Hoel, duke of Brittany. After some time, hearing nothing of Queen Iseult, and believing himself forgotten, he weds the duke's daughter, Iseult of the white hand, but weds her only in name, remaining otherwise faithful to Iseult of Ireland. Later on he returns to Cornwall in disguise, and has more than one interview with his mistress. Ultimately, while assisting his brother-in-law in an intrigue with the wife of a neighbouring knight, Tristan is wounded by a poisoned arrow; unable to find healing, and being near to death, he sends a messenger to bring Queen Iseult to his aid; if successful the ship which brings her is to have a white

sail, if she refuses to come, a black. Iseult of the white hand overhears this, and when the ship returns, bringing Iseult to her lover's aid, either through jealousy or by pure inadvertence (both versions are given), she tells Tristan that the sail is black, whereon, despairing of seeing his love again, the hero turns his face to the wall and dies. Iseult of Ireland lands to find the city in mourning for its lord; hastening to the bier, she lays herself down beside Tristan, and with one last embrace expires. (One dramatic version represents her as finding the wife seated by the bier, and ordering her away, "Why sit ye there, ye who have slain him? Arise, and begone!") The bodies are sent to Cornwall, and Mark, learning the truth, has a fair chapel erected and lays them in tombs, one at each side of the building, when a sapling springs from the heart of Tristan, and reaching its boughs across the chapel, makes its way into the grave of Iseult. However often the tree may be cut down it never fails to grow again. (In some versions it is respectively a vine and a rose which grow from either tomb and interlace midway.)

We need have little wonder that this beautiful love-story was extremely popular throughout the middle ages. Medieval literature abounds in references to Tristan and Iseult, and their adventures were translated into many tongues and are found depicted in carvings and tapestries. Probably the story was first told in the form of short *lais*, each recounting some special episode, such as the *lai* known as the *chêvefeuille*; how old these may be it is impossible to say. Professor Zimmer, in his examination of the story, sees reason to believe that the main incidents may repose on a genuine historic tradition, dating back to the 9th or 10th century, the period of Viking rule in Ireland. The name of Iseult's father, Gormond, is distinctly Scandinavian; she, herself, is always noted for her golden hair, and it is quite a misrendering of the tradition to speak of her as a dark-haired Irish princess. In the German tradition she is *die Heide*, Iseult of Brittany *die schwarze Isolt*; it is this latter who is the Celtic princess. The name Tristan is now generally admitted to be the equivalent of the Pictish *Dróstan*, and on the whole, the story is now very generally allowed to be of insular, probably of British, origin.

Some time in the 12th century the story was wrought into consecutive poems. The latest theory, championed with great skill by M. Bédier, is that there was one poem, and one only, at the root of the various versions preserved to us, and that that poem, composed in England, probably by an Anglo-Norman, was a work of such force and genius that it determined for all time the form of the *Tristan* story. The obvious objection to this view is that a work of such importance, composed at so comparatively late a date, is scarcely likely to have perished so completely as to leave no trace; if there were one poet held as an authority, the name of that poet would surely have been mentioned. Moreover the evidence of the author of the principal *Tristan* poem preserved to us points in another direction. This poet was an Anglo-Norman named Thomas; and, although little over 3000 lines of his poem have been preserved, we have three translations; a German, by Gottfried von Strassburg; a Scandinavian, by a certain Brother Robert; and an English, by Thomas, sometimes identified with Thomas of Erildoune, though this is doubtful. With the help of the extant fragments and these translations we can form a very good idea of the character and content of Thomas's work, a task now rendered far more easy by M. Bédier's skilful reconstruction (cf. vol. i. of his edition of Thomas). It was certainly a work of great merit and charm. As authority Thomas cites a certain Bréri, who has now been identified with the Bleheris quoted as authority for the *Graail* and *Gawain* stories, and the Blehericus referred to by Giraldus Cambrensis as *famosus ille fabulator*. This is what Thomas says:—

"Seignurs, cest cunte est mult divers,
E pur ço l'uni par mes vers
E di en tant cum est mester
E le surplus voil lesser.
Ne vol pas trop en uni direl
Ici diverse la matyre.

Entre ceus qui solent cunter
 E del cunte Tristran parler,
 Il en cuntent diversement:
 Of en ai de plusur gent.
 Asez sai que cheucun en dit
 E co qu'il unt mis en escrit,
 Mes sulun qo que j'ai of
 Nel dient pas sulun Bréri
 Ky solt les geates e les cuntés
 De tuz les reis, de tuz les ceutes,
 Ki orent este en Breitaigne.

(THOMAS, i. 377).

These are not the words of a man who is following a complete and authoritative poem; judging from the context of the other references to Bleheris he was rather a collector and versifier of short episodic tales, and it seems far more natural to understand Thomas as having wrought into one complete and consecutive form the various poems with which the name of Bréri was associated, than to hold that that, or a similar, work had already been achieved by another.

Thomas's work, fortunately, fell into the hands of a true poet in the person of Gottfried von Strassburg, whose *Tristan und Isolde* is, from a literary point of view, the gem of medieval German literature. Gottfried is a far greater master of style than Wolfram von Eschenbach, and his treatment of some of the episodes, notably the sojourn in the woods, is most exquisite. He did not live to complete his poem, but happily he carried it up to the point where the original fragments begin, so that we can judge very fairly what must have been the effect of the whole, the style of the two poets being very similar. Inspiring as the Tristan story is, it seems improbable that it should have been handled, and that within a comparatively short period, by three writers of genius, and that of these three the first, and greatest, should have utterly disappeared! The translators of Thomas do not fail to quote him as their source, why then has no one quoted the original poet?

Besides the version of Thomas, we have a fragment by a certain Béroul, also an Anglo-Norman, and a German poem by Eilhart von Oberge, both of which derive from a common source. There also exists in two manuscripts a short poem, *La Folie Tristan*, relating how Tristan, disguised as a fool, visits the court of King Mark. This poem is valuable, as, presuming upon the sufficiency of his disguise, Tristan audaciously gives a resumé of his feats and of his relations with Isoult, in this agreeing with the version of Thomas. The "Gerbert" continuation of the *Perceval* contains the working over of one of two short Tristan poems, called by him the *Lute Tristan*; the latter part, probably a distinct poem, shows Tristan, in the disguise of a minstrel, visiting the court of Mark. Here the tradition is more in accordance with Béroul.

Besides the poems, we possess the prose *Tristan*, an enormous compilation, akin to the prose *Lancelot*, where the original story, though still to be traced, is obscured by a mass of later Arthurian adventures. The interest here centres in the rivalry between Tristan and Lancelot, alike as knights and lovers, and in the later redaction, ascribed to Hélie de Borron, the story is spun out to an interminable length.

Certain points of difference between the poetical and the prose versions should be noted. Tristan is here the son of Meliadus, king of Loonoi; his father does not die, but is decoyed away by an enchantress, and the mother, searching for her husband, gives birth to her child in the forest and dies. Meliadus marries again, and the second wife, jealous of Tristan, tries to kill him. Mark has another nephew, Andret, who is Tristan's enemy throughout the romance. Mark himself is a cowardly, treacherous and vindictive character. Some of the early printed editions follow the original version of Tristan's death, now found in one manuscript only (B.N. 103), the majority represent him as having been stabbed in the back by Mark in the presence of the queen, as we find in Malory, who drew the larger portion of his compilation from the prose *Tristan*. It should be noted that Tristan is never more than superficially connected with Arthur, an occasional visitor at his court; though in its later form ranked among the

Arthurian romances, the *Tristan* is really an independent story, and does not form a part of the ordinary cyclic redaction.

The Italian prose text, *La Travoia ritonda* differs from the French in adhering to the original version, and is classed by N. Bédier among the derivatives from Thomas. Like the story of Perceval that of Tristan has been made familiar to the present generation by Richard Wagner's noble music drama, *Tristan und Isolde*, founded upon the poem of Gottfried von Strassburg; though, being a drama of feeling rather than of action, the story is reduced to its simple elements; the drinking of the love-potion, the passion of the lovers, their discovery by Mark and finally their death.

BIBLIOGRAPHY.—Thomas, *Roman de Tristan*, ed. J. Bédier (2 vols., *Société des anciens textes français*, 1902, 1905); Béroul, *Roman de Tristan* (ed. E. Muret, same series, 1903); E. Kölbinger, *Die nordische und die englische Version der Tristansaga* (1877, 1883), pt. i., *Tristrans Saga*, pt. ii., *Sir Tristrem*. "La Folie Tristan" was published by F. Michel in his *Tristan* (1895), a collection of all the extant fragments of Tristan poems; "Tristan Menestrel" from the *Perceval*, ed. J. L. Weston and J. Bédier (*Romania*, vol. xxxv., Oct. 1906). Gottfried's *Tristan und Isolde* has been several times published; the best editions are those of Bechstein (1890) and Golther (1889); modern German versions by Kurz, Simrock and Hertz; English prose rendering, J. L. Weston, 2 vols. (*Arthurian Romances*, No. ii.). Cf. also Piquet, *L'Originalité de Gottfried de Strassburg* (1906). Eilhart von Oberge, *Tristan*, ed. Lichtenstein (1877); *La Travoia ritonda*, ed. Poldoski, (3 vols., 1864-1865). There is no modern edition of the prose romance, but a detailed analysis of the contents, compiled from the numerous manuscripts in the Paris Library, was published by E. Læseth in *Le Roman en prose de Tristan* (1890). The general reader will find Gaston Paris's study of the legend in *Poèmes et légendes du moyen âge* most interesting; also Joseph Bédier's popular retelling of the tale *Tristan et Isoult*. For Wagner's version cf. J. L. Weston, *Legends of the Wagner Drama*. For an exhaustive study of the Tristan legend and literature, see the recent work by Professor Golther; also an examination of the Welsh fragments by Ivor John (J. L. W.).

TRISTAN DA CUNHA, the general name for a group of three small volcanic islands belonging to Great Britain, situated in the South Atlantic, the summit of the largest being in 37° 5' 50" S., 12° 16' 40" W. They are about 2000 m. W. of the Cape of Good Hope and about 4000 m. N.E. of Cape Horn and lie somewhat north of a line drawn between the two capes. St Helena lies about 1500 m. N.N.E. of the group. The islands rise from the submarine elevation which runs down the centre of the Atlantic and on which are likewise situated Ascension, St Paul's Rocks and the Azores; the average depth on this ridge is from 1600 to 1700 fathoms, while depths of 3000 fathoms are found on each side of it. The depth between the islands is in some places over 1000 fathoms.

Tristan, the largest and northernmost island, has an area of 16 sq. m., is nearly circular in form, about 7 m. in diameter, and has a volcanic cone (7640 ft.), usually capped with snow, in the centre. Precipitous cliffs, 1000 to 2000 ft. in height, rise directly from the ocean on all sides, except on the north-west, where there is an irregular plain, 100 ft. above the sea, and 2½ m. in length and ½ m. in breadth. A stream crosses the northern end of the plateau, falling over the cliff edge in a fine cascade. The crater of the central cone contains a fresh-water lake about 150 yds. in diameter. This and other crater lakes are said never to be frozen over.

Inaccessible Island, the westernmost of the group, is about 20 m. from Tristan. It is quadrilateral in form, the sides being about 2 m. long, and its area is about 4 sq. m. The highest point (1840 ft.) is on the west side; all round there are perpendicular cliffs about 1000 ft. in height. At the base of the cliffs in some places are narrow fringes of beach a few feet above the sea-level.

Nightingale Island, the smallest and most southern of the group, is 10 m. from Inaccessible Island. Its area is not more than 1 sq. m. Its coasts, unlike those of the other two islands, are surrounded by low cliffs, from which there is a gentle slope up to two peaks, the one 1100 ft., the other 960 ft. high. There are two small islets—Stoltenkoff (325 ft.) and Middle (150 ft.)—and several rocks adjacent to the coast.

The rocks of Tristan da Cunha are felsipathic basalt, dolerite, augite-andesite, sideromelane and palagonite; some specimens of the basalt have porphyritic augite. The caves in Nightingale Island indicate that it has been elevated several feet. On almost

¹ On the occurrence in Tristan da Cunha of rock of continental type (gneiss) see E. H. L. Schwarz of the Geological Survey, Cape Colony, in the *Transactions South African Philosoph. Soc.*, No. 16 of 1905.

all sides the islands are surrounded by a broad belt of kelp, the gigantic southern seaweed (*Macrocystis pyrifera*), through which a boat may approach the rocky shores even in stormy weather. There is no good anchorage in rough weather.

The beaches and lower lands are covered with a dense growth of tussock grass (*Spartina arundinacea*), 8 to 10 ft. in height. It shelters vast numbers of penguins (*Eudyptes chrysoloma*), which there form their rookeries. There is one small tree (*Phyllica nitida*), which grows in detached patches on the lower grounds. Independently of introduced plants, fifty-five species have been collected in the group, twenty-nine being flowering plants and twenty-six ferns and lycopods. A majority of the species are characteristic of the present general flora of the south temperate zone rather than any particular part of it: botanically the group is generally classed with the islands of the Southern Ocean. A finch (*Nesospiza acunhae*), a thrush (*Nesocichla eremita*), and a water-hen (*Gallinula nesiotis*) are the only land birds—the first two being peculiar to the islands. In addition to the penguins numerous other sea birds nest on the islands, as petrels, albatrosses, terns, skuas and prions. One or two land shells, a few spiders, several *Coleoptera*, a small lepidopter and a few other insects are recorded, but no *Orthoptera* or *Hymenoptera*. There appear to have been no indigenous mammals or reptiles. Seals frequent Nightingale and Inaccessible Islands, and the whale (*Balaena australis*) is found in the adjacent waters.

The prevailing winds are westerly. December to March is the fine season. The climate is mild and on the whole healthy, the temperature averaging 68° Fahr. In summer, 55° in winter—sometimes falling to 40°. Rain is frequent; hail and snow fall occasionally on the lower grounds. The sky is usually cloudy. The islands have a cold and barren appearance. The tide rises and falls about 4 ft.

History.—The islands were discovered in 1506 by the Portuguese admiral Tristan, or more correctly Tristão da Cunha, after whom they are named, during a voyage to India. Thereafter the islands (which were uninhabited) were occasionally visited by outward bound ships to the Indies. Dutch vessels brought back reports on the islands in 1643, and in 1656 Van Riebeeck, the founder of Cape Town, sent a ship from Table Bay to Tristan to see if it was suitable for a military station, but the absence of a harbour led to the project being abandoned. Later in the 17th century ships were sent from St Helena by the English East India Company to Tristan to report on a proposed settlement there, but that project also came to naught. A British naval officer who visited the group in 1760 gave his name to Nightingale Island. John Patten, the master of an English merchant ship, and part of his crew lived on Tristan from August 1790 to April 1791, during which time they captured 5600 seals; but the first permanent inhabitant was one Thomas Currie, who landed on the island in 1810. At this time American whalers frequented the neighbouring waters and, in the same year, an American named Lambert "late of Salem, mariner and citizen thereof" and a man named Williams made Tristan their home. Lambert declared himself sovereign and sole possessor of the group (which he renamed Islands of Refreshment) "grounding my right and claim on the rational and sure ground of absolute occupancy." Lambert's sovereignty was short lived, as he and Williams were drowned while out fishing in May 1812. Currie was joined, however, by two other men and they busied themselves in growing vegetables, wheat and oats, and in breeding pigs. War having broken out in this year between the United States and Great Britain the islands were largely used as a base by American cruisers sent to prey on British merchant ships. This and other considerations urged by Lord Charles Somerset, then governor of Cape Colony, led the British government to authorize the islands being taken possession of as dependencies of the Cape. The formal proclamation of annexation was made on the 14th of August 1816. A small garrison was maintained on Tristan until

November of the following year. At their own request William Glass (d. 1853), a corporal in the Royal Artillery, with his wife and two children and two masons were left behind, and thus was begun the present settlement. From time to time additional settlers arrived or shipwrecked mariners decided to remain; in 1827 five coloured women from St Helena were induced to migrate to Tristan to become the wives of the five bachelors then on the island. Later coloured women from Cape Colony married residents in the island. Other settlers are of Dutch, Italian and Asiatic origin. Thus the inhabitants are of mixed blood, but the British strain greatly predominates. Over the little community Glass (1817-1853) ruled in patriarchal fashion. Besides raising crops, the settlers possessed numbers of cattle, sheep and pigs, but their most lucrative occupation was seal fishing. The island was still frequented by American whalers, and in 1856 out of a total population of about 100 twenty-five emigrated to the United States. The next year forty-five of the inhabitants removed to Cape Colony; whether the younger or more restless members of the community have since gone—or else taken to a seafaring life. The inhabitants had of necessity made their settlement on the plain on the north-west of Tristan; here a number of substantial stone cottages and a church were built. It is named Edinburgh in memory of a visit in 1867 by the duke of Edinburgh. In October 1873 the islands were carefully surveyed by the "Challenger," which removed to Cape Town two Germans, brothers named Stoltenhoff, who had been living on Inaccessible Island since November 1871. This was the only attempt at colonization made on any save the main island of the group.

After the death of Glass the head of the community for some time was an old man-of-war's man named Cotton, who had been for three years guard over Napoleon at St Helena; Cotton was succeeded by Peter William Green, a native of Amsterdam who settled in the island in 1836. During Green's "reign" the economic condition of Tristan was considerably affected by the desertion of the neighbouring seas by the whalers; this was largely due to the depredations of the Confederate cruisers "Alabama" and "Shenandoah" during the American Civil War, many whaling boats being captured and burnt by them. As a result the number of ships calling at Tristan considerably diminished and trade languished. In 1880 the population appears to have attained its maximum—109. In 1885 a serious disaster befell the islanders, a lifeboat which went to take provisions to a ship in the offing was lost with all hands—fifteen men—and only four adult males were left on the island. At the same time a plague of rats—survivors of a shipwrecked vessel—wrought much havoc among the crops. Plans were made for the total removal of the inhabitants to the Cape, but the majority preferred to remain. Stores and provisions were sent out to them by the British government. The ravages of the rats have rendered impossible the growing of wheat; the wealth of the islanders now consists in their cattle, sheep, potatoes and apple and peach trees. The population in 1897 was only 64; in 1901 it was 74, and in 1900, 95. They manage their own affairs without any written laws, the project once entertained of providing them with a formal constitution being deemed unnecessary. The inhabitants are described as moral, religious, hospitable to strangers, well-mannered and industrious, healthy and long lived. They are without intoxicating liquors and are said to commit no crimes. They are daring sailors, and in small canvas boats of their own building voyage to Nightingale and Inaccessible islands. They knit garments from the wool of their sheep; are good carpenters and make serviceable carts. From time to time ministers of the Church of England have lived on the island and to their efforts is mainly due the education of the children. In 1906 the islanders passed through a period of distress owing to great mortality among the cattle and the almost total failure of the potato crop. The majority again refused, however, to desert the island, though offered allotments of land in Cape Colony. Similar proposals had been made and declined several times since the question was first mooted in 1886. In 1905 a lease of

¹ Tristan da Cunha (fl. 1460-1540) was nominated first viceroy of Portuguese India in 1504, but was unable to serve owing to temporary blindness; in 1506 he was placed in command of a fleet which operated on the east coast of Africa and in the Indies. Alphonso d'Albuquerque (q.v.) having charge of a squadron under da Cunha. After discovering the islands which now bear his name, da Cunha landed in Madagascar, subsequently visiting Mozambique, Brava (where he reduced the Arab power) and Sokotra, which he conquered. He also distinguished himself in the Indies in various actions. In 1514 he was ambassador to Pope Leo X. to pay homage for the new conquests of Portugal, and was, later on, made a member of the Portuguese privy council.

Nightingale, Inaccessible and Gough islands, for the purpose of working the guano deposits, was granted by the British government.

Gough Island.—Gough Island or Diego Alvarez lies in the South Atlantic in 40° 20' S., 9° 44' W., and is 250 m. S.S.E. of Tristan da Cunha and some 1500 m. west by south of Cape Town. It is of volcanic origin, is rugged and mountainous, the highest peak rising to 4380 ft. The island is about 8 m. long by 4 m. broad and has an area of 40 sq. m. Precipitous cliffs, from 200 to 1000 ft. high, characterize the coast. They are divided by picturesque valleys, which, in some instances, have been cut down to sea-level and afford landing-places. Streams fall over the cliffs into the sea in fine cascades. The island is visited by vast numbers of penguins and contains valuable guano deposits. It is also the home of numerous seals. The rainfall is heavy and vegetation abundant. The island is believed to have been discovered by the Portuguese in the 16th century. Originally called Diego Alvarez, it derives its other name from a Captain Gough, the commander of a British ship which visited it in 1731. It has been claimed as a British possession since the annexation of Tristan da Cunha. In 1904 Gough Island was visited by the Antarctic exploring ship "Scotia" of the Bruce expedition, which discovered a rich marine fauna, two new buntings and three new species of plants. It has no permanent population.

A comprehensive account of Tristan da Cunha appeared in *The Cape Times* (January-March 1906), in a series of articles by W. Hammond Tooke, the commissioner sent to the islands by the Cape government in 1904. See also *Transactions of the Linnean Society* for 1819 (contains a report of an ascent of the summit by Captain Dugald Carmichael in 1817); A. Earle, *Narrative of a . . . Residence in New Zealand . . . together with a Journal of a Residence in Tristan da Cunha* (London, 1832); Mrs K. M. Barrow, *Three Years in Tristan da Cunha* (London, 1910); H. N. Moseley, *Notes by a Naturalist on the "Challenger"* (new ed., London, 1892); F. and C. Stoltenhoff, "Two Years on Inaccessible," in *Cape Monthly Mag.* (December 1873). Among papers relating to Tristan da Cunha published by the British government, see especially reports issued in 1897, 1902, 1906—which gives a detailed account of the island and islands—and 1907. For the discovery of Tristan see *The Commentaries of the Great Afonso Dalboquerque* (Hakluyt Society's Series, 1875, vol. 53). For Gough Island, see R. N. R. Brown of the "Scotia" expedition, "Diego Alvarez or Gough Island," in *Scottish Geog. Mag.* (August 1905); Brown and others, "The Botany of Gough Island," in *Journ. Linn. Soc. (Botany)* (1905), and *The Voyage of the "Scotia"* ch. xiii. (London, 1906). *The Africa Pilot*, pt. II. (5th ed., 1901), contains descriptions both of Tristan da Cunha and Gough Island.

TRISTAN L'HERMITE, FRANÇOIS (1601-1655), French dramatist, was born at the château de Soliers in the Haute Marche about 1601. His adventures began early, for he killed his enemy in a duel at the age of thirteen, and was obliged to flee to England. The story of his childhood and youth he embroiders in a burlesque novel, the *Page disgracié*. He was in succession poet to Gaston d'Orléans, to the duchesse de Chaulnes and the duke of Guise. He died on the 7th of September 1655. His first tragedy, *Mariamne* (1636), was also his best. It was followed by *Penhèze* (1637), *La Mort de Sénèque* (1644), *La Mort de Crispe* (1645) and the *Parasite* (1653). He was also the author of some admirable lyrics. Three of his best plays are printed in the *Théâtre français* of 1737.

TRITHEMIUS, JOHANNES (1462-1516), German historian and divine, was born at Tritenheim on the Moselle, on the 1st of February 1462. His name was originally "von Heidenberg," but according to the fashion of the times he adopted the name of his birthplace. After an unhappy childhood, he studied at Heidelberg, and at the age of twenty entered the Benedictine monastery of Sponheim near Kreuznach, of which, in 1485, he became abbot. He established an excellent library, and through his strict discipline and consummate scholarship soon raised the monastery to an educational institution of a high order. In 1506 he resigned, and was appointed soon after abbot of the monastery of St Jakob at Würzburg; and in this city he died on the 13th of December 1516. Trithemius was, though an accomplished scholar, untrustworthy as a chronicler, and his *Annales hirsaugiensis* (1514), *Annales de origine Francorum*, as well as his *Chronologia mystica* (1516) are, on this account, of doubtful value. More reliance can, however, be placed on his *De scriptoribus ecclesiasticis* (1494) and the *Catalogus illustrum virorum Germaniae* (1491). He also wrote a fanatical book against sorcery, *Antipolus maleficiorum* (1508).

See Silbernagel, *J. Trithemius* (1868; 2nd ed., 1885); Schneegans, *Abt Joh. Trithemius und Kloster Sponheim* (1882); and F. X. Wegele, in *Allgemeine deutsche Biographie*.

TRITON, in Greek mythology, son of Poseidon and Amphitrite, the personification of the roaring waters. According to Hesiod (*Theog.* 930), he dwelt with his parents in a golden palace in the depths of the sea. The story of the Argonauts places his home on the coast of Libya. When the Argo was driven ashore on the Lesser Syrtis the crew carried the vessel to Lake Tritonis, whence Triton, the local deity, guided them across to the Mediterranean (Apollonius Rhodius iv. 1552). He was represented as human down to the waist, with the tail of a fish. His special attribute was a twisted seashell, on which he blew to calm or raise the waves. Its sound was so terrible, when loudly blown, that it put the giants to flight, who imagined it to be the roar of a mighty wild beast (Hyginus, *Poet. astronom.* ii. 23). When Misenus, the trumpeter of Aeneas, challenged him to a contest of blowing, Triton in his jealousy flung him into the sea. In course of time Triton became the name for individuals of a class, like Pan and Silenus, and Tritons (male and female) are mentioned in the plural, usually as forming the escort of marine divinities. The beings called Centauro-Tritons or Ichthyocentaur were of a triple nature, with the forefeet of a horse in addition to the human body and fish tail. Pausanias (ix. 21) gives a detailed description of the ordinary Triton. It is probable that the idea of Triton owes its origin to the Phœnician fish-deities.

See Preller, *Griechische Mythologie* (4th ed., 1894); F. R. Dressler, *Triton und die Tritonen* (Wurzen, 1892).

TRIUMPH (*triumphus*), amongst the ancient Romans, the highest honour bestowed upon a victorious general. Originally it was only granted on certain conditions, which were subsequently relaxed in special cases. Only those who had held the office of dictator, consul or praetor were entitled to the distinction; the war must have been brought to a definite conclusion, resulting in an extension of the boundaries of the state; at least 500 of the enemy must have been slain; the victory must have been gained over a foreign enemy, victories in civil war or over rebels not being counted. The power of granting a triumph rested with the senate, which held a meeting outside the city walls (generally in the temple of Bellona) to consider the claims put forward by the general. If they were considered satisfactory special legislation was necessary to keep the general in possession of the *imperium* on his entry into the city. Without this, his command would have expired and he would have become a private individual the moment he was inside the city walls, and would have had no right to a triumph. Consequently he remained outside the pomerium until the special ordinance was passed; thus Lucullus on his return from Asia waited outside Rome three years for his triumph.

The triumph consisted of a solemn procession, which, starting from the Campus Martius outside the city walls, passed through the city to the Capitol. The streets were adorned with garlands, the temples open, and the procession was greeted with shouts of *Io triumphe!* At its head were the magistrates and senate, who were followed by trumpeters and then by the spoils, which included not only arms, standards, statues, &c., but also representations of battles, and of the towns, rivers and mountains of the conquered country, models of fortresses, &c. Next came the victims destined for sacrifice, especially white oxen with gilded horns. They were followed by the prisoners who had not been sold as slaves but kept to grace the triumph; when the procession reached the Capitol they were taken off to prison and put to death. The chariot which carried the victorious general (*triumphator*) was crowned with laurel and drawn by four horses. The general was attired like the Capitoline Jupiter in robes of purple and gold borrowed from the treasury of the god; in his right hand he held a laurel branch, in his left an ivory sceptre surmounted by an eagle. Above his head the golden crown of Jupiter was held by a slave who reminded him in the midst of his glory that he was a mortal man. Last came the soldiers shouting *Io triumphe* and singing

songs both of a laudatory and scurrilous kind. On reaching the temple of Jupiter on the Capitol, the general placed the laurel branch (in later times a palm branch) on the lap of the image of the god, and then offered the thank-offerings. A feast of the magistrates and senate, and sometimes of the soldiers and people, concluded the ceremony, which in earlier times lasted one day, but in later times occupied several. Generals who were not allowed a regular triumph by the senate had a right to triumph at the temple of Jupiter Latiaris on the Alban Mount. Under the empire only the emperors celebrated a triumph, because the generals commanded under the auspices of the emperors (not under their own) merely as lieutenants (*legati*); the only honour they received was the right of wearing the triumphal insignia (the robes of purple and gold and the wreath of bay leaves) on holidays. After the time of Trajan, when all consuls were allowed to wear the triumphal dress on entering office and in festal processions, the only military reward for a successful general was a statue in some public place. The last triumph recorded is that of Diocletian (A.D. 302). A naval or maritime triumph was sometimes allowed for victories at sea, the earliest being that celebrated by C. Duilius in honour of his victory over the Carthaginians in 260 B.C.

See Mommsen, *Römisches Staatsrecht* (1887), i. 126-136; Marquardt, *Römische Staatsverwaltung* (1884), ii. 582-593; H. A. Gell. *De triumphis romani origine, permisso, apparatu, via* (1854); S. Peine, "De ornamentis triumphalibus" (1885), in C. E. Ascherson's *Berliner Studien*, ii.

TRIUMPHAL ARCH, the term given to arches erected to commemorate some special victory, but here extended to include those built as memorial arches to some benefactor of the Roman Empire, such as those at Rimini, Ancona and Benevento; arches erected as monumental entrances to towns, as at Nîmes and Autun; arches on bridges, as at Chama in France and Alcantara in Spain; and lastly those which preceded the entrance to a forum or sacred enclosure, or formed part of a colonnaded street, as in Syria. There is every reason to suppose that in early times in Greece and Etruria temporary erections, such as those of the present day, were set up on the occasion of the public entry, after a great victory, of some emperor or general; but the Romans would seem to have been the first to erect such structures in stone or marble, to enrich them with sculpture, and to raise aloft on their summit the quadriga or four-horsed chariot with statues and trophies. The time involved in the construction of such a memorial, and more especially that which would be required for its enrichment with sculpture, rendered it impossible that they should be set up on the occasion of the triumphal entry itself, and it is known that the arch of Titus was not erected till some time after his death by his successor Domitian. There is always some difficulty in deciding between triumphal and memorial arches, as they were virtually similar in design, equally enriched with sculpture, generally surmounted with a quadriga and statues, and as a rule were isolated structures. The earlier arches were pierced with a single arch and were comparatively simple in design, being decorated by pilasters or semi-detached columns only; the existence of chariots and statues on their summit is known only from coins or gems, on which such features are always shown. The arch of Titus in Rome (fig. 4), A.D. 81, is the first one enriched with bas-relief sculpture, in this case representing the triumphs of Titus with the seven-branched candlestick and the golden table brought from Jerusalem. The next sculptural arch of triumph is that built at Benevento (fig. 2) in South Italy (A.D. 112) by Trajan, recording the Dacian victories. The triumphal arch (fig. 5) of Septimius Severus (A.D. 203) has a central and two side arches, the bas-reliefs on it representing the Parthian victories; and the last important arch in Rome is that of Constantine (fig. 6), which had also three arches, and was embellished with bas-reliefs, representing the Dacian victories, which were taken from the arch of Trajan on the Via Appia and others of Constantine's time, representing the conquest of Mæxentius.

Passing to other countries, we have the triumphal arches at St Remy and at Orange (fig. 8); those at Carpentras and Cavailon, also in France, which were probably of later date, as possibly

also the triple arch at Reims. The triumphal arch with three arches at Fano in Italy is said to have been commenced by Augustus, but completed by Constantine, who probably added the two side arches and decorated it with inferior sculpture. At Timgad (Thamugada) in North Africa is a triumphal arch with central and two side arches, probably of Hadrian's time, and one with triple arches at Sbeitla (Suffetula), also in North Africa, and another example at Saintes in France, built on a bridge.

Of memorial arches the earliest are the examples of Rimini (fig. 7) and Aosta, erected to Augustus, and later the arch at Ancona (fig. 3) erected to Trajan (A.D. 112) as a record of the construction of the port there. At Pola, in Istria, is an archway erected in memory of the Sergii. Of less important examples in Rome are the arches of Dolabella (A.D. 10), Drusus (A.D. 23), Gallienus (A.D. 262), the silversmith's arch (A.D. 204); in Verona, the Porta dei Borsari and the Porta de Leoni, erected by Gallienus (A.D. 265); at Aix-les-Bains in France, an arch of late 3rd century; and at Lambessa, in North Africa, the arches of Commodus (A.D. 187) and of Septimius Severus (A.D. 200). In Spain there are two monumental arches erected by Trajan at Alcantara, in the centre of the bridge built by him (A.D. 108), and the arch of Santiago at Merida; a third example exists in the Arco di Bara at Tarragona.

Quadriportal archways are those which were built in the centre of four cross roads, such as the arch of Janus in Rome, built by Constantine (A.D. 350), the arch of Caracalla at Tebessa (Thevesti) in North Africa, and many examples in Syria, of which the arch at Ladikiyah (Laodicea ad Mare) is in perfect preservation.

The colonnaded streets in Syria were entered through magnificent archways, of which the finest examples are those at Palmyra and Gerasa. As entrance gateways to towns there are many examples which were sometimes built as memorial arches, but formed part of the city walls, such as the entrance gate at Susa in Italy, erected in memory of Augustus (8 B.C.), decorated with reliefs of the Suovetaurelia (sacrifices); the Porte d'Avroux and Porte St André at Autun, and the Porte d'Auguste at Nîmes, in France; the Porte d'Auguste at Perugia in Italy and the Porta Nigra at Treves in Germany; to these should be added the three entrance gateways to the palace of Spalato (A.D. 303), one of these, the Porta Aurea, or Golden Gate, showing in its enriched design certain decadent forms which led to the Byzantine and Renaissance styles; lastly there are the arched entrances to sacred or civil enclosures, such as the example at Sbeitla (Suffetula) in North Africa, the arch of Hadrian at Athens (fig. 1), built to his memory by his successors, and the archway of the Propylæa at Damascus.

The triumphal arch found no place in mediæval architecture, but in Renaissance works there are many examples, of which the triumphal entrance arch of King Alfonso at Naples (A.D. 1470) comes first. Of isolated structures, there are in Paris the Porte St Martin (1647), St Denis (1684), arch of Carrousel in the Tuileries (1808), and the Arc de l'Étoile in the Champs Élysées, completed in 1830; in Berlin the Brandenburger Thor (1790); in Munich the Siegesthor (1843) and Metzger Thor (1880); in Milan the Arch of Peace, commenced by Napoleon in 1807 and completed in 1857 by the Austrians (an interesting example, as it still preserves the chariot and horses and statues which formerly crowned all triumphal arches); and in London the Marble Arch, originally built in front of Buckingham Palace, but removed to the north-east angle of Hyde Park in 1843, and the Wellington Arch at Hyde Park Corner, without the statue of the duke on horseback, afterwards set up at Aldershot. (R. P. S.)

TRIVANDRUM, or **TRIVANDRUM**, a city of southern India, capital of the state of Travancore, situated 2 m. from the sea-coast. Pop. (1901), 57,882. It is the residence of the maharaja, and contains an observatory and a museum, besides several other fine buildings. The chief fame of the place, however, centres upon the shrine of Sri Ananta Padmanabhaswami, a great resort of pilgrims, round which the city grew up. The

According to Aristotle (*Hist. An.* viii. 12) a dwarfish race of Troglodytes dwelt on the upper course of the Nile, who possessed horses and were in his opinion the Pygmies of fable. But the best known of these African cave-dwellers were the inhabitants of the "Troglodyte country" (Τρογλοδυτις) on the coast of the Red Sea, as far north as the Greek port of Berenice, of whom an account has been preserved by Diodorus (iii. 31) and Photius (p. 454 Bekker) from Agatharchides of Cnidus, and by Artemidorus in Strabo (xvi. 776). They were a pastoral people, living entirely on the flesh of their herds, or, in the season of fresh pasture, on mingled milk and blood. But they killed only old or sick cattle (as indeed they killed old men who could no longer follow the flock), and the butchers were called "unclean"; nay, they gave the name of parent to no man, but only to the cattle which provided their subsistence. This last point seems to be a confused indication of totemism. They went almost naked; the women wore necklaces of shells as amulets. Marriage was unknown, except among the chiefs—a fact which agrees with the prevalence of female kinship in these regions in much later times. They practised circumcision or a mutilation of a more serious kind. Their burial rites were peculiar. The dead body, its neck and legs bound together with withies of the shrub called *paliurus*, was set up on a mound, and pelted with stones amidst the jeers of the onlookers, until its face was completely covered with them. A goat's horn was then placed above it, and the crowd dispersed with manifestations of joy. It is supposed that the Horim or Horites, the aboriginal inhabitants of Mount Seir, if their name is correctly interpreted "cave-dwellers," were a kindred people to the Troglodytes on the other side of the Red Sea.

TROGON, a word apparently first used as English¹ by G. Shaw (*Mus. Lævianum*, p. 177) in 1792, and now for many years accepted as the general name of certain birds forming the family Trogonidae of modern ornithology. The trogons are birds of moderate size: the smallest is hardly bigger than a thrush and the largest less bulky than a crow. In most of them the bill is very wide at the gape, which is invariably beset by recurved bristles. They seize most of their food, whether caterpillars or fruits, on the wing, though their alar power is not exceptionally great, their flight being described as short, rapid and spasmodic. Their feet are weak and of a unique structure, the second toe, which in most birds is the inner anterior one, being reverted, and thus the trogons stand alone, since in all other birds that have two toes before and two behind it is the outer toe that is turned backward. The plumage is very remarkable and characteristic. There is not a species which has not beauty beyond most birds, and the glory of the group culminates in the quezal (*q.v.*). But in others golden green and steely blue, rich crimson² and tender pink, yellow varying from primrose to amber, vie with one another in vivid coloration, or contrasted, as happens in many species, with a warm tawny or a sombre slaty grey—to say nothing of the delicate freckling of black and white, as minute as the markings of a moth's wing—the whole set off by bands of white, producing an effect hardly equalled in any group. The plumage is further remarkable for the large size of its contour-feathers, which are extremely soft and so loosely seated as to come off in scores at a touch, and there is no down. The tail is generally a very characteristic feature, the rectrices, though in some cases pointed, being often curiously squared at the tip, and when this is the case they are usually

barred ladder-like with white and black.³ According to J. Gould, they are larger and more pointed in the young than in the old, and grow squarer and have the white bands narrower at each succeeding moult. He also asserts that in the species which have the wing coverts freckled, the freckling becomes finer with age. So far as has been observed, the nidification of these birds is in holes of trees, wherein are laid without any bedding two roundish eggs, generally white, but certainly in one species (quezal) tinted with bluish green.

The trogons form a very well-marked family, belonging to the coraciiform birds, and probably to be placed in that assemblage near the colies (see *MOUSE BIRD*) and swifts (*q.v.*). The remains of one, *T. gallicus*, have been recognized by A. Milne-Edwards (*Ois. foss. de la France*, ii. 395, pl. 177, figs. 18-22) from the Miocene of the Allier. This fortunate discovery seems to account for the remarkable distribution of the trogons at the present day. While they chiefly abound, and have developed their climax of magnificence, in the tropical parts of the New World, they yet occur in the tropical parts of the Old. The species now inhabiting Africa, forming the group *Hapaloderma*, can hardly be separated generically from those of the Neotropical Trogon, and the difference between the Asiatic forms, if somewhat greater, is still comparatively slight. It is plain then that the Trogons are an exceptionally persistent type; indeed in the whole class few similar instances occur, and perhaps none that can be called parallel. The extreme development of the type in the New World just noticed also furnishes another hint. While in some of the American trogons (*Pharomacrus*, for instance) the plumage of the females is not very much less beautiful than that of the males, there are others in which the hen birds retain what may be fairly deemed a more ancient livery, while the cocks flaunt in brilliant attire. Now the plumage of both sexes in all but one⁴ of the Asiatic trogons, *Harpactes*, resembles rather that of the young and of those females of the American species which are modestly clothed. The inference from this fact would seem to be that the general coloration of the Trogons prior to the establishment, by geographical estrangement, of the two types was a russet similar to that now worn by the adults of both sexes in the Indian region, and by a portion only of the females in the Neotropical. The Ethiopian type, as already said, very closely agrees with the American, and therefore would be likely to have been longer in connexion therewith. Again, while the adults of most of the American trogons (*Pharomacrus* and *Euphilotis* excepted) have the edges of the bill serrated, their young have them smooth or only with a single notch on either side near the tip, and this is observable in the Asiatic trogons at all ages. At the same time the most distinctive features of the whole group, which are easily taken in at a glance, but are difficult to express briefly in words, are equally possessed by both branches of the family, showing that they were in all likelihood—for the possibility that the peculiarities may have been evolved apart is not to be overlooked—races before the geographical sundering of these branches (whereby they are now placed on opposite sides of the globe) was effected.

About sixty species of trogons are recognized, which J. Gould in the second edition of his *Monograph* of the family (1875) divides into seven genera. *Pharomacrus*, *Euphilotis* and *Trogon* inhabit the mainland of tropical America, no species passing to the northward of the Rio Grande nor southward of the forest district of Brazil, while none occur on the west coast of Peru or Chile. *Priotelus* and *Tmetrotrogon*, each with one species, are peculiar respectively to Cuba and Haiti. The African form *Hapaloderma* has two species, one found only on the west coast, the other of more general range. The Asiatic trogons, *Harpactes* (with eleven species according to the same authority), occur from Nepal to Malacca, in Ceylon, and in Sumatra. Java and Borneo, while one species is peculiar to some of the Philippine Islands. (A. N.)

TROGUS, GNAEUS POMPEIUS, Roman historian from the country of the Vocontii in Gallia Narbonensis, nearly contemporary with Livy, flourished during the age of Augustus. His grandfather served in the war against Sertorius with Pompey, through whose influence he obtained the Roman citizenship; hence the name Pompeius, adopted as a token of gratitude to his benefactor. His father served under Julius Caesar in the capacity of secretary and interpreter. Trogus himself seems to have been a man of encyclopaedic knowledge. He wrote, after Aristotle and Theophrastus, books on the natural history of animals and plants, frequently quoted by the elder Pliny. But his principal work was *Historiae Philippicae* in forty-four

¹ *Trogonem* (the oblique case) occurs in Pliny (*H. N.* x. 16) as the name of a bird of which he knew nothing, save that it was mentioned by Hylas, an augur, whose work is lost; but some would read *Trygonem* (turtle-dove). In 1752 Möhring (*Av. Genera*, p. 85) applied the name to the "Curucui" (pronounced "Suruquá," vide Bates, *Nat. Amazons*, i. 254) of Marcgrav (*Hist. nat. Brasiliae*, p. 211), who described and figured it in 1648 recognizably. In 1760 Brisson (*Ornithologie*, iv. 164) adopted *Trogon* as a generic term, and Linnaeus having followed his example, it has since been universally accepted.

² Anatole Bogdanoff determined the red pigment of the feathers of *Pharomacrus auriceps* to be a substance which he called "zooxanthine" (*Comptes rendus*, Nov. 2, 1857, xlv. 690).

³ In the trogon of Cuba, *Priotelus*, they are most curiously "cupped out," as it were, at the extremity, and the lateral pointed ends diverge in a way almost unique among birds.

⁴ Or two species if *N. maculoti* be more than a local form of *H. reinwardti*.

books, so called because the Macedonian empire founded by Philip is the central theme of the narrative. This was a general history of the world, or rather of those portions of it which came under the sway of Alexander and his successors. It began with Ninus, the founder of Nineveh, and ended at about the same point as Livy (A.D. 9). The last event recorded by the epitomator Justin (*q.v.*) is the recovery of the Roman standards captured by the Parthians (20 B.C.). He left untouched Roman history up to the time when Greece and the East came into contact with Rome, possibly because Livy had sufficiently treated it. The work was based upon the writings of Greek historians, such as Theopompus (also the author of a *Philippica*), Ephorus, Timaeus, Polybius. Chiefly on the ground that such a work was beyond the powers of a Roman, it is generally agreed that Trogus did not gather together the information from the leading Greek historians for himself, but that it was already combined into a single book by some Greek (very probably Timagenes of Alexandria). His idea of history was more severe and less rhetorical than that of Sallust and Livy, whom he blamed for putting elaborate speeches into the mouths of the characters of whom they wrote. Of his great work, we possess only the epitome by Justin, the *prologi* or summaries of the 44 books, and fragments in Vopiscus, Jerome, Augustine and other writers. But even in its present mutilated state it is often an important authority for the ancient history of the East. Ethnographical and geographical excursions are a special feature of the work.

Fragments edited by A. Bielowski (1855); see also, A. H. L. Heeren, *De Trogi P. Jonitibus et auctoritate* (prepared to C. H. Frotcher's edition of Justin); A. Ernann on the authorities used by Trogus for Greek and Sicilian history (1880); A. von Gutschmid, *Über die Fragmente des Pompeius Trogus* (1857); M. Schanz, *Geschichte der römischen Literatur* (2nd ed., 1899), *ii.*, where all that is known of Timagenes is given; Justin-Schwabe, *Hist. of Roman Literature*, § 258; and article JUSTIN.

TROIA, a town and episcopal see of Apulia, Italy, in the province of Foggia, situated 140 ft. above sea-level, 7 m. N.W. of the station of Giardinetto-Troia, which is 16 m. S.W. of Foggia. Pop. (1901), 6674. Troia occupies the site of the ancient Accae, 12 m. S. of Luceria, on the Via Traiana, a town which fell to Hannibal after the victory of Cannae, but was won back by the Romans in 214. Under the empire it appears to have become a colony. Troia was itself founded in 1017 by the Greek prefect Basilius Bugianus. The cathedral dates from 1107, but the upper part of the façade with its curious sculptures, fine rose-window and polychromatic decoration, the choir apse and the interior were restored early in the 13th century. The latter has been somewhat spoilt by recent decorations. The bronze doors, partly in relief and partly in niello, of 1110 and 1127 respectively, were cast in Beneventum by Oderisius Berardus. The small domed church of S. Basilio has an ambo of 1158.

TROLLUS, in Greek legend, son of Priam (or Apollo) and Hecuba. His father, when upbraiding his surviving sons for their cowardice, speaks in the *Iliad* (xxiv. 257) of Troilus as already slain before the action of the poem commences. According to a tradition drawn from other sources and adopted by Virgil (*Aen. i.* 474), when a mere boy he fell by the hand of Achilles. In another account, he was dragged to death by his own horses. His death formed the subject of a lost tragedy by Sophocles. There is no trace in classical writers of the story of Shakespeare's *Troilus and Cressida*, the materials for which were derived from Chaucer's poem of the same name, Lydgate's *History, Siege, and Destruction of Troy*, Caxton's *Recuyell of the Historyes of Troy* (trans. from Norman French of Raoul le Fevre), Chapman's translation of Homer, and perhaps a play on the subject by Dekker and Chettle.

TROITSK, a town of eastern Russia, in the government of Orenburg, situated in a fertile steppe, 315 m. N.E. of Orenburg, and 77 m. S. of Chelyabinsk, on the Siberian highway. Pop. (1885), 18,497; (1900), 23,293. It has grown rapidly in modern times. The Troitskiy fort, erected in 1743, became a centre for trade with the Kirghiz steppe and Turkestan, and in that trade Troitsk is now second only to Orenburg. Cotton, silk, and especially horses and cattle are imported, while leather, cotton,

woollen and metal wares are exported. An active trade in corn for the Ural gold mines is carried on. The place has ironworks and tanneries.

TROLLE, HERLUF (1516-1565), Danish naval hero, was born on the 14th of January 1516 at Lillö. At the age of nineteen Trolle went to *Vor Frue Skole* at Copenhagen, subsequently completing his studies at Wittenberg, where he adopted the views of Melancthon, with whom he was in intimate correspondence for some years. His marriage with Brigitte, the daughter of Lord Treasurer Mogens Gjøbe, brought him a rich inheritance, and in 1557 he took his seat in the senate. Both Christian III. and Frederick II. had a very high opinion of Trolle's trustworthiness and ability and employed him in various diplomatic missions. Trolle was, indeed, richly endowed by nature, and his handsome face and lively manners made him popular everywhere. His one enemy was his wife's nephew Peder Oxe, the subsequently distinguished finance minister, whose narrow grasping ways, especially as the two men were near neighbours, did not contribute towards family harmony. It was Trolle whom Frederick II. appointed to investigate the charges of malversation brought against Oxe. Both Trolle and his wife were far renowned for their piety and good works, and their whole household had to conform to their example or seek service elsewhere. A man of culture, moreover, he translated David's 31st Psalm into Danish verse. He also promoted literature and learning by educating poor students both at home and abroad, endowing Latin schools and encouraging historical research. In 1559 Trolle was appointed admiral and inspector of the fleet, a task which occupied all his time and energy. In 1563 he superseded the aged Peder Skram as admiral in chief. On the 10th of May he put to sea with twenty-one ships of the line and five smaller vessels and, after uniting with a Lübeck squadron of six liners, encountered, off the isle of Öland, a superior Swedish fleet of thirty-eight ships under Jacob Bagge. Supported by two other Danish ships Trolle attacked the Swedish flagship "Makalös" (Matchless), then the largest battleship in northern waters, but was beaten off at nightfall. The fight was renewed at six o'clock the following morning, when the "Makalös" was again attacked and forced to surrender, but blew up immediately afterwards, no fewer than 300 Lübeck and Danish sailors perishing with her. But the Swedish admiral was captured and the remnant of the Swedish fleet took refuge at Stockholm. Despite the damage done to his own fleet and flagship "Fortuna" by this great victory, Trolle, on the 14th of August, fought another but indecisive action with a second Swedish fleet under the famous Swedish admiral Klas Horn, and kept the sea till the 13th of October. Trolle spent the winter partly at his castle of Herlufsholm completing his long cherished plan of establishing a school for all classes, and partly at Copenhagen equipping a new fleet for the ensuing campaign. On the 1st of June 1565 he set sail with twenty-eight liners, which were reinforced off Femern by five Lübeck vessels. Klas Horn had put to sea still earlier with a superior fleet and the two admirals encountered off Fehmarn on the 4th of June. The fight was severe but indecisive, and both commanders finally separated to repair their ships. Trolle had been severely wounded in the thigh and shoulder, but he would not let the ship's surgeon see to his injuries till every one else had been attended to. This characteristic act of unselfishness was his undoing, for he died at Copenhagen on the 25th of June, seventeen days after they had put him ashore.

TROLLHÄTTAN, a town of Sweden in the district (*län*) of Elfsborg, 45 m. by rail N. by E. of Gothenburg. Pop. 6000. It lies on the left (east) bank of the Göta at the point where that river descends 108 ft. in the course of nearly a mile by the famous falls of Trollhättan (six in number) and several rapids. The scenic setting of the falls is not striking, but the great volume of water, nearly 18,000 cub. ft. per second, renders them most imposing. The narrowed river here surrounds several islands, on either side of one of which (Toppö) are the first falls of the series, Toppö and Tjuf. These are 42 ft. in height. The water-power is used in rolling-mills, a cellulose factory and other works.

Several "giant's caldrons" are seen in the exposed bed of a former channel. Below the falls are valuable salmon fisheries. To the east of the river the Berg canal, part of the Göta canal system, ascends in a series of eleven new locks (Akersvass) completed in 1844. An old series of locks (1800) is in use for small vessels. There are also ruins of an abortive attempt made to lock the falls in 1755. (See GÖTA.)

TROLLOPE, ANTHONY (1815-1882), English novelist, was born in London, on the 24th of April 1815. His father, Thomas Anthony Trollope (1780-1835), a barrister who had been fellow of New College, Oxford, was reduced to poverty by unbusiness-like habits and injudicious speculation, and in 1829 Anthony's mother, FRANCES MILTON TROLLOPE (1780-1863), went with her husband to the United States to open a small fancy-goods shop in Cincinnati. The enterprise was a failure, but her three years' stay in that country resulted in a book on the *Domestic Manners of the Americans* (1832), of which she gave an unflattering account that aroused keen resentment. Returning to England her husband was compelled to flee the country in order to escape his creditors, and Mrs Trollope thereafter supported him in Bruges until his death by her incessant literary work. She published some books of travel, most of which are coloured by prejudice, and many novels, among the best known of which are *The Vicar of Wrexhill* (1837) and *The Widow Barnaby* (1839), studies in that vein of broad comedy in which lay her peculiar gift. She wrote steadily for more than twenty years, until her death, at Florence, on the 6th of October 1863. (See *Frances Trollope, her Life and Literary Work*, by her daughter-in-law 1895.) Her eldest son THOMAS ADOLPHUS TROLLOPE (1810-1892), was educated at Winchester and Oxford, and spent most of his life in Italy. He wrote a number of works on Italian subjects, among them *Homes and Haunts of Italian Poets* (1881), in collaboration with his second wife, Frances Eleanor Trollope, herself a novelist of no mean ability. He was a voluminous author, and perhaps the quantity of his work has obscured its real merit. Among his novels are *La Beata* (1861) *Gemma* (1866), and *The Garstangs of Garstang Grange* (1869). (See his autobiography, *What I Remember* 1887.)

Anthony Trollope was the third son. By his own account few English men of letters have had an unhappier childhood and youth. He puts down his own misfortunes, at Harrow, at Winchester, at Harrow again, and elsewhere, to his father's pecuniary circumstances, which made his own appearance dirty and shabby, and subjected him to various humiliations. But it is permissible to suspect that this was not quite the truth, and that some peculiarities of temper, of which in after life he had many, contributed to his unpopularity. At any rate he seems to have reached the verge of manhood as ignorant as if he had had no education at all. After an experience as usher in a private school at Brussels he obtained, at the age of nineteen, by favour (for he could not pass even the ridiculous examination then usual) a position in the London post office. Even then his troubles were not over. He got into debt; he got into ridiculous entanglements of love affairs, which he has very candidly avowed; he was in constant hot water with the authorities; and he seems to have kept some very queer company, which long afterwards stood him in good stead as models for some of his novels. At last in August 1841 he obtained the appointment of clerk to one of the post office surveyors in a remote part of Ireland with a very small salary. This, however, was practically quadrupled by allowances; living was cheap; and the life suited Trollope exactly, being not office work, which he always hated, but a kind of travelling inspectorship. In the discharge of his duties he evinced a business capacity quite unsuspected by his former superiors. Here he began that habit of hunting which, after a manner hardly possible in later conditions of official work, he kept up for many years even in England. Within three years of his appointment he became engaged to Rose Heselton, whom he had met in Ireland but who was of English birth. They were married in June 1844. His headquarters had previously been at Banagher; he was now transferred to Clonmel.

Trollope had always dreamt of novel-writing, and his Irish

experiences seemed to supply him with promising subjects. With some assistance from his mother he got published his first two books, *The Macdermots of Ballycloran* (1847) and *The Kellys and the O'Kellys* (1848). Neither was in the least a success, though the second perhaps deserved to be, and a third, *La Vendée* (1850), besides being a much worse book than either, was equally a failure. Trollope made various literary attempts, but for a time ill fortune attended all of them. Meanwhile he was set on a new kind of post office work, which suited him even better than his former employment—a sort of roving commission to inspect rural deliveries and devise their extension, first in Ireland, then throughout the west of England and South Wales. That he did good work is undeniable; but his curious conception of official duty, on his discharge of which he prided himself immensely, is exhibited by his confessions that he "got his hunting out of it," and that he felt "the necessity of travelling miles enough"—he was paid by the mileage—"to keep his horses." It was during this work that he struck the vein which gave him fortune and fame. A visit to Salisbury Close inspired him with the idea of *The Warden* (1855). It brought him little immediate profit, nor was even *Barchester Towers*, which followed in 1857, very profitable, though it contains his freshest, his most original, and, with the exception of *The Last Chronicle of Barset*, his best work. The two made him a reputation, however, and in 1858 he was able for the first time to sell a novel, *The Three Clerks*, for a substantial sum, £250. A journey on post office business to the West Indies gave him material for a book of travel, *The West Indies and the Spanish Main* (1859), which he frankly and quite truly acknowledges to be much better than some subsequent work of his in the same line. From this time his production, mainly of novels, was incessant, and the sums which he received were very large, amounting in one case to as much as £355 for a single book, and to nearly £70,000 in the twenty years between 1859 and 1879. All these particulars are given with great minuteness by himself, and are characteristic. The full high tide of his fortunes began when the *Cornhill Magazine* was established. He was asked at short notice to contribute a novel, and wrote in 1861 *Framley Parsonage*, which was extremely popular; two novels immediately preceding it, *The Bertrams* (1859) and *Castle Richmond* (1860) had been much less successful.

As it will be possible to notice few of his other works, the list of them, a sufficiently astonishing one, may be given here: *Doctor Thorne* (1858); *Tales of All Countries* (3rd series 1863); *Orley Farm*; *North America* (1862); *Rachel Ray* (1863); *The Small House at Allington*, *Can You Porgive Her?* (1864); *Miss Mackenzie* (1865); *The Belton Estate* (1866); *The Cloversings*, *Nina Balatka*, *The Last Chronicle of Barset* (1867); *Linda Tressell* (1868); *Phineas Finn*, *He Knew He Was Right* (1869); *The Struggles of Brown, Jones and Robinson*, *The Vicar of Bullhampton*, *An Editor's Tales*, *The Commentaries of Caesar* (1870); *Sir Harry Hotspur of Humblethwaite*, *Ralph the Heir* (1871); *The Golden Lion of Granpere* (1872); *The Eustace Diamonds*, *Australia and New Zealand* (1873); *Phineas Redux*, *Harry Heathcote of Gangoil*, *Lady Anna* (1874); *The Way We Live Now* (1875); *The Prime Minister* (1876); *The American Senator* (1877); *Is He Popenjoy?* *South Africa* (1878); *John Caldigate*, *An Eye for an Eye*, *Cousin Henry*, *Thackeray* (1879); *The Duke's Children*, *Cicero* (1880); *Ayala's Asph.*, *Dr Worley's Work* (1881); *Frank Frohmann*, *Lord Palmerston*, *The Fixed Period*, *Kept in the Dark*, *Marion Fay* (1882); *Mr Scarborough's Family*, *The Land Leaguers* (1883); and *An Old Man's Love* (1884), and several volumes of short stories.

How this enormous total was achieved in spite of official work (of which, lightly as he took it, he did a good deal, and which he did not give up for many years), of hunting three times a week in the season, of whist-playing, of not a little going into general society, he has explained with his usual curious minuteness. He reduced novel-writing to the conditions of regular mechanical work—so much so that latterly he turned out 250 words every quarter of an hour, and wrote at this rate three hours a day. He divided every book beforehand into so many days' work and checked off the amount as he wrote.

A life thus spent could not be very eventful, and its events may be summed up rapidly. In 1858 he went to Egypt on post office business, and at the end of 1859 he got himself

transferred from Ireland to the eastern district of England. Here he took a house, at Waltham. He took an active part in the establishment of the *Fortnightly Review* in 1865; he was editor of *St Paul's* for some time after 1867; and at the end of that year he resigned his position in the post office. He stood as a parliamentary candidate for Beverley and was defeated; he received from his old department special missions to America and elsewhere—he had already gone to America during the Civil War. He went to Australia in 1871, and before going broke up his household at Waltham. When he returned he established himself in London, and lived there until 1880, when he removed to Harting, on the confines of Sussex and Hampshire. He had visited South Africa in 1877 and travelled elsewhere. He died of paralysis on the 6th of December 1882.

Of Trollope's personal character it is not necessary to say much. Strange as his conception of official duty may seem, it was evidently quite honest and sincere, and, though he is said to have been as an official popular neither with superiors nor inferiors, he no doubt did much good work. Privately he was much liked and much disliked—a great deal of real kindness being accompanied by a blustering and overbearing manner, and an egotism, not perhaps more deep than other men's; but more vociferous. None of his literary work except the novels is remarkable for merit. His *Caesar* and *Cicero* are curious examples of a man's undertaking work for which he was not in the least fitted. *Thackeray* exhibits, though Trollope appears to have both admired Thackeray as an artist and liked him as a man, grave faults of taste and judgment, and a complete lack of real criticism. The books of travel are not good, and of a kind not good. *Nina Balatka* and *Linda Treissi*—stories dealing with Prague and Nuremberg respectively—were published anonymously and as experiments in the romantic style. They have been better thought of by the author and by some competent judges than by the public or the publishers. *The Struggles of Brown, Jones and Robinson* was still more disliked, and is certainly very bad as a whole, but has touches of curious originality in parts. Trollope seldom creates a character of the first merit; at the same time his characters are always alive. Dr Thorne, Mr Harding, who has the courage to resign his sinecure in *The Warden*, Mr Crawley, Archdeacon Grantley, and Mrs Proudie in the same ecclesiastical series, are distinct additions to the *personae* of English fiction. After his first failures he never produced anything that was not a faithful and sometimes a very amusing transcript of the sayings and doings of possible men and women. His characters are never marionettes, much less sticks. He has some irritating mannerisms, notably a trick of repetition of the same form of words. He is sometimes absolutely vulgar—that is to say, he does not deal with low life, but shows, though always robust and pure in morality, a certain coarseness of taste. He is constantly rather trivial, and perhaps nowhere out of the Barset series (which, however, is of itself no inconsiderable work) has he produced books that will live. The very faithfulness of his representation of a certain phase of thought, of cultivation, of society, uninformed as it is by any higher spirit, in the long run damaged, as it had first helped, the popularity of his work. But, allowing for all this it may and must still be said that he held up his mirror steadily to nature, and that the mirror itself was fashioned with no inconsiderable art.

Trollope wrote an *Autobiography*, edited by his son Henry M. Trollope in 1883, explaining his literary methods with amusing frankness. See also Sir L. Stephen's *Studies of a Biographer* (1898), James Bryce's *Studies in Contemporary Biography* (1903), and Henry James's *Partial Portraits* (1886).

TROMBA MARINA, OF MARINE TRUMPET (Fr. *trompette marine*; Ger. *Marine Trompete*, *Trompetengeige*, *Nonnengeige*, *Tympanischia* or *Trummscheit*), a triangular bowed instrument about 6 ft. in length, which owes its characteristic timbre to the peculiar construction of the bridge. The tromba marina consists of a body and neck in the shape of a truncated

cone resting on a triangular base. In the days of Michael Praetorius (1618), the length of the Trummscheit was 7 ft. 3 in. and the three sides at the base measured 7 in., tapering to 2 in. at the neck. These measurements varied considerably, as did also the shape of the body and the number of strings. In some cases the base of the body was left open, and in others there were sound-holes. The bridge, from its curiously irregular shape, was known as the "shoe"; it was thick and high at the one side on which rested the string, and low and narrow at the other which was left loose so that it vibrated against the belly with every movement of the bow, producing a trumpet-like timbre. It is to this feature, in conjunction with its general resemblance in contour to the marine speaking-trumpet of the middle ages, that the name of the instrument is doubtless due.

There was at first but one string, generally a D violoncello string, which was not stopped by the fingers in the usual way, but played only in harmonics by lightly touching it with the thumb at the nodal points. The heavy blow, similar to that of the violoncello, is used between the highest positions of the left hand at the nodal points and the nut of the head. In a Trummscheit in the collection of the Kgl. Hochschule, at Charlottenburg (No. 772 in catalogue) the frets are lettered A, D, F, A, D, F, G, A, B, C, D. Sometimes an octave string, half the length of the melody string, and even two more, respectively the twelfth and the double octave, not resting on the bridge but acting as sympathetic strings, were added to improve the timbre by strengthening the pure harmonic tones without increasing the blare due to the action of the bridge. In Germany, at the time when the trumpet was extensively used in the churches, nuns often substituted the tromba marina, whence the name *Nonnengeige*. In France, the *Grande Écurie du Roi* comprised five trumpets-marine and cromornes among the band in 1662, when the charge was mentioned for the first time in the accounts; and in 1666 the number was increased to six. The instrument fell into disuse during the first half of the 18th century, and was only to be seen in the hands of itinerant and street musicians. (K. S.)

TROMBONE (Fr. *trombone*, Ger. *Posaune*, Ital. *trombone*), an important member of the brass wind family of musical instruments formerly known as *sackbut*. The trombone is characterized by the *slide*, consisting of two parallel cylindrical tubes, over which two other cylindrical tubes, communicating at their lower extremities by means of a short semicircular

FIG. 1.—Tenor Trombone (Besson & Co.).

pipe, slip without loss of air. The outer tube, therefore, slides upon the inner, and as it is drawn downwards by the right hand opens a greater length of tube proportional to the depth of pitch required. When the slide is closed the instrument is at its highest pitch. To the upper end of one of the inner tubes is fastened the cup-shaped mouthpiece and to the end of the other tube is fixed the bell-joint. This joint, on the proper proportions of which depend in a greater measure the acoustic properties of the trombone, consists of a length of tubing with conical bore widening out into a large bell and doubled back once upon itself in a plane at right angles to that of the slide. The bell-joint is strengthened by two or three stays, and the slide also has two, one between the inner immovable tubes and the other on the outer sliding tubes, by means of which the slide is drawn out and pushed in.

Sound is produced on the trombone, as on the horn, by means of the lips stretched like a vibrating reed across the cup mouthpiece from rim to rim; the acoustic principles involved are the same for both instruments. By overblowing, i.e. by the varying tension of the lips and pressure of breath, the harmonic series is obtained, which is effective between the second and the tenth harmonics, the fundamental being but rarely of practical use.

There are seven positions of the slide on the trombone, each

giving a theoretical fundamental tone and its upper partials a semitone lower than the last, and corresponding to the seven shifts on the violin and to the seven positions on valve instruments. These seven positions are found by drawing out the slide a little more for each one, the first position being that in which the slide remains closed. The performer on the trombone is just as dependent on an accurate ear for finding the correct positions as a violinist.

The table of harmonics for the seven positions of the tenor trombone in B \flat is appended; they furnish a complete chromatic compass of two octaves and a sixth.

Position I. (with closed slide).

III.

IV.

V.

VI.

VII.

These notes represent all the notes in practical use, although it is possible to produce certain of the higher harmonics. The instrument being non-transposing, the notation represents the real sounds.

The four chief trombones used in the orchestra are the following:—

The Alto in E flat or F.

The Tenor-Bass in B flat.

The Bass in F or G (with double slide in E flat).

The Contra-Bass in B flat. An octave below the Tenor-Bass.

The compass given above is extreme and includes the notes obtained by means of the slide; the notes in brackets are very difficult; the fundamental notes, even when they can be played, are not of much practical use. The contra-bass trombone, although not much in request in the concert hall, is required for the *Nibelungen Ring*, in which Wagner has scored effectively for it.

The quality of tone varies greatly in the different instruments and registers. The alto trombone has neither power nor richness of tone, but sounds hard and has a timbre between that of a trumpet and a French horn. The tenor and bass have a full rich quality suitable for heroic, majestic music, but the tone depends greatly on the performer's method of playing; the modern tendency to produce a harsh, noisy blare is greatly to be deplored.

Besides the slide trombone, which is most largely used, there are the valve trombones, and the double-slide trombones. The former

are made in the same keys as the instruments given above and are constructed in the same manner, except that the slide is replaced by three pistons, which enable the performer to obtain a greater technical execution; as the tone suffers thereby and loses its characteristic timbre, the instruments have never become popular in England.

FIG. 2.

The double-slide trombone (fig. 2)—patented by Messrs Rudall Carte & Co. but said to have been originally invented by Halary in 1830—is made in B \flat , G bass and E \flat contrabass. In these instruments each of the branches of the slide is made half the usual length. There are four branches instead of two and the two pairs lie one over the other, each pair being connected at the bottom by a semi-circular tube and the second pair similarly at the top as well. The usual bar or stay suffices for drawing out both pairs of slides simultaneously, but as the lengthening of the air column is now doubled in proportion to the shift of the slide, the extension of arm for the lower positions is lessened by half, which increases the facility of execution but calls for greater nicety in the adjustment of the slide, more especially in the higher positions.

The history of the evolution of the trombone from the *buccina* is given in the article on the Sackbut (*q.v.*), the name by which the earliest *draw* or *slide* trumpets were known in England. The Germans call the trombone *Posaune*, formerly *buzann*, *busine*, *pusin* or *puinn* in the poems and romances of the 12th and 13th century, words all clearly derived from the Latin *buccina*. The modern designation "large trumpet" comes from the Italian, in which *tromba* means not only trumpet, but also pump and elephant's trunk. It is difficult to say where or at what epoch the instrument was invented. In a psalter (No. 20) of the 11th century, preserved at Boulogne, there is a drawing of an instrument which bears a great resemblance to a trombone deprived of its bell. Sebastian Virdung, Ottmar Luscinius, and Martin Agricola say little about the trombone, but they give illustrations of it under the name of *buzann* which show that early in the 16th century it was almost the same as that employed in our day. It would not be correct to assume from this that the trombone was not well known at that date in Germany, and for the following reasons. First, the art of trombone playing was in the 15th century in Germany mostly in the hands of the members of the town bands, whose duties included playing on the watch towers, in churches, at pageants, banquets and festivals, and they, being jealous of their privileges, kept the secrets of their art closely, so that writers, such as the above, although acquainted with the appearance, tone and action of the instrument would have but little opportunity of learning much about the method of producing the sound. Secondly, German and Dutch trombone players are known to have been in request during the 15th century at the courts of Italian princes. Thirdly, Hans Neuschel of Nuremberg, the most celebrated performer and maker of his day, had already won a name at the end of the 15th century for the excellence of his "Posaunen," and it is recorded that he made great improvements in the construction of the instrument in 1498,² a date which probably marks the transition from sackbut to trombone, by enlarging the bore and turning the bell-joint round at right angles to the slide. Finally in early German translations of Vegetius's *De re militari* (1470) the *buccina* is described (bk. III., 5) as the trumpet or posaan which is drawn in and out, showing that the instrument was not only well known, but that it had been identified as the descendant of the *buccina*.

By the 16th century the trombone had come into vogue in England, and from the name it bore at first, *not sackbut*, but *shakmusse*, it

¹ E. Van der Straeten, *Les Musiciens néerlandais*, p. 26.
² See G. von Reuber, "Zur Gesch. d. Musik-instrumente" in *Anzeiger für Kunde der deutschen Vorzeit* p. 241. (Nuremberg, 1860). See also letters from Jörg Neuschel 1540-1545 in *Monatsh. f. Musikwissenschaft*, ix. p. 149 seq.

is evident that the instrument had been introduced from Spain and not from France (where it bore the name of saquebute), as some have assumed from the more frequent use of the word sackbut. The band of musicians in the service of Henry VIII. included ten sackbut players, and under Elizabeth, in 1587, there were six English instrumentalists then enjoyed a certain reputation and were sought for by foreign courts; thus in 1604 Charles III. of Lorraine sought to recruit his sackbut players from English bands.¹ Praetorius² classes the trombones in a complete family, the relative tonalities of which were thus composed: 1 *Alt-Posaunen*, 4 *Gemeine rechte Posaunen*, 2 *Quart-Posaunen*, 1 *Octav-Posaun*—eight in all. The *Alt-Posaunen* was in D. With the slide closed, it gave the first of the accompanying harmonics:—

The *gemeine rechte Posaunen*, or ordinary trombones, were in A. Without using the slide they gave the subjoined sounds:—

The *Quart-Posaun* was made either in E, the fourth below the *gemeine rechte Posaun*, or in D, the lower fifth. In the latter case it was exactly an octave below the *Alt-Posaun*. The *Octav-Posaun* was in A. It was constructed in two different fashions: either it had a length double that of the ordinary trombone, or the slide was shortened, the length of the column of air being still maintained by the adaptation of a crook. The first system, which was invented by Hans Schreiber four years before the work of Praetorius appeared, gave the instrumentalist a slide by which he could procure in the lower octave all the sounds of the ordinary trombone. The second system, which Praetorius had known for years, was distinguished from the first, not only by modifications affecting the form, but also by a larger bore. Mersenne³ calls the trombone *trompette harmonique*, or *tuba tractilis*. He describes carefully the seven positions and gives the diatonic scale for the first octave, but he does not, like Praetorius, mention the pitch of the trombones in use in his day. He established this fact, however, that it was customary in France, as in Germany, to lower the instrument a fourth below the pitch of the ordinary trombone by means of a *fortin*, a kind of crook with a double turn that was fitted between the bell and the slide, "in order," he said, "to make the bass to hautbois concerta." This system, so simple and rational, might have been expected always to serve for the basis of the technique of the instrument; but from the middle of the 18th century the art of playing the trombone became the object of purely empiric teaching. Owing to the decline in the popularity of the trombone during the 18th century in England, France, Germany and Italy, writers of that period are sometimes at a loss to describe the working and effect of the slide, as were the early 16th-century authors. J. J. Eisel, and after him Jacob Lotter, whose work is a *réchauffé* of Eisel's, mention four principal positions, "the others not being of much importance." The lowering of the pitch effected by means of these four positions, however, is almost equal to that of the seven positions of the modern trombone. The tenor or ordinary trombone is given as an example. It stood in the first position in A. The second position, equal to the modern third produced the harmonic series of the fundamental G one tone lower than the first position. The third position gave F again a tone lower and corresponding to our sixth position. The fourth position, which extended so far outward "that the arm could hardly reach it," gave E as fundamental. The intermediate semitones, instead of being considered as positions, are treated as accidentals, lowering or raising any note obtained in one of the positions by drawing out, or pushing in, the slide approximately an extra two-fingers breadth. It would not be correct to state without qualification that four positions only were used on the trombone in the 18th century.

Samuel Wesley, who has left notes on the scales of various instruments, in his own hand (Add MS. 35011 fol. 166 Br. Mus.), has added under the scales of the trombones—bass, tenor and alto—the remark "sacbut or double trumpet, the scale of which is wanting."

Of all wind instruments the trombone has perhaps been least modified in form; changes have occasionally been attempted, but for the most part with only trifling success. The innovation which has had the most vogue dates from the end of the 18th century; it consisted in bending the tube of the bell in a half circle above the head of the executant, which produced a very bizarre effect. It also gave rise to very serious inconveniences: by destroying the regularity of the proportions of the bell it prejudicially affected the quality of tone and intonation of the instrument. For a long time the curved bell with its serpent's mask known as the

Bucin—a term borrowed from the French in this instance—was maintained in military music, and it is not so very long since it was completely given up. By giving a half turn more to the bell tube its opening was directed to the back of the executant; but this

FIG. 3.—Contrabass Trombone (Boosey & Co.).

form, in fashion for a little while about 1830, was not long adhered to, and the trombone reassumed its primitive form, which is still maintained. As appears from a patent deposited by Stölzel and Blümel at Berlin on the 12th of April 1818 the application of ventsils or pistons was then made for the first time.⁴ The ventsils, at first two in number, effected a definite lengthening of the instrument. The first augmented the length of the tube by a tone, lowering by as much the natural harmonics. The second produced a similar effect for a semitone, and the simultaneous employment of the two pistons resulted in the depression of a tone and a half. The principle, therefore, of the employment of ventsils or pistons is the same as that which governs the use of slides (see VALVES). Notwithstanding the increased facility obtained by the use of pistons, they are very far from having gained the suffrage of all players; many prefer the slide, believing that it gives a facility of emission that they cannot obtain with a piston trombone. The flat tonalities having been preferred for military music since the beginning of the 19th century the pitch of each variety of trombones has been raised a semitone. At present six trombones are more or less in use, viz. the alto trombone in F, the alto in Eb (formerly in D), the tenor in Bb (formerly in A), the bass in G, the bass in F (formerly in E), the bass in Eb (formerly in D), and the contrabass in Bb. This transposition has no reference to the number of vibrations that may be officially or tacitly adopted as the standard pitch of any country or locality. A trombone an octave lower than the tenor has recently been reintroduced into the orchestra, principally by Wagner. The different varieties just cited are constructed with pistons or slides, as the case may be.

Further information on the trombone will be found in the monographs by the Rev. F. W. Galpin, "The Sackbut: its Evolution and History," *Proc. Mus. Assoc.* (1906-1907); by Victor Mahillon, *Le Trombone, son histoire, sa théorie, sa construction* (Brussels, London, 1907). Before his recent death Professor George Case had in preparation an important work on the trombone. (V. M.; K. S.)

TROMP, the name of two famous Dutch admirals.

1. **MARTIN HARPERTZ ZOOM TROMP** (1597-1653) was born at Brielle, South Holland, in 1597. At the age of eight he made a voyage to the East Indies in a merchantman, but was made prisoner and spent several years on board an English cruiser. On making his escape to Holland he entered the navy in 1624, and in 1637 was made lieutenant-admiral. In February 1630 he surprised, off the Flemish coast near Gravelines, a large Spanish fleet, which he completely destroyed, and in the following September he defeated the combined fleets of Spain and Portugal off the English coast—achievements which placed him in the first rank of Dutch naval commanders. On the outbreak of war with England Tromp appeared in the Downs in command of a large fleet and anchored off Dover. On the approach of Blake he weighed anchor and stood over towards France, but suddenly altered his course and bore down on the English fleet, which was much inferior to his in numbers. In the engagement which followed (May 10, 1652) he had rather the worst of it and drew off with the loss of two ships. In November he again appeared in command of eighty ships of war, and a convoy of 300 merchantmen, which he had undertaken to guard past the English coast. Blake resolved to attack him, and the two fleets coming to close quarters near Dungeness on the 30th of November, the English, after severe losses, drew off in the darkness and anchored off Dover, retiring next day to the Downs, while Tromp anchored off Boulogne

⁴ This was mentioned in the Leipzig *Allg. musik. Ztg.* (1815), the merit of the invention being assigned to Heinrich Stölzel of Pless in Silesia.

till the Dutch merchantmen had all passed beyond danger. The statement that he sailed up the Channel with a broom at his masthead in token of his ability to sweep the seas is probably mythical. In the following February (1653), while in charge of a large convoy of merchantmen, he maintained a running fight with the combined English fleets under Blake, Penn and Monk off Portland to the sands of Calais, and, though baffling to some extent the purposes of the English, had the worst of the encounter, losing nine ships of war and thirty or forty merchantmen. On the 3rd of June he fought an indecisive battle with the English fleet under Richard Dean in the Channel, but the arrival of reinforcements under Blake on the following day enabled the English to turn the scale against him and he retired to the Texel with the loss of seventeen ships. Greatly discouraged by the results of the battle, the Dutch sent commissioners to Cromwell to treat for peace, but the proposal was so coldly received that war was immediately renewed, Tromp again appearing in the Channel towards the end of July 1653. In the hotly contested conflict which followed with the English under Monk on the 20th Tromp was shot by a musket bullet through the heart. He was buried with great pomp at Delft, where there is a monument to his memory in the old church.

2. CORNELIUS VAN TROMP (1629-1691), the second son of the preceding, was born at Rotterdam on the 9th of September 1629. At the age of nineteen he commanded a small squadron charged to pursue the Barbary pirates. In 1652 and 1653 he served in Van Galen's fleet in the Mediterranean, and after the action with the English fleet off Leghorn on the 13th of March 1653, in which Van Galen was killed, Tromp was promoted to be rear-admiral. On the 13th of July 1665 his squadron was, by a hard stroke of ill-fortune, defeated by the English under the duke of York. In the following year Tromp served under De Ruyter, and on account of De Ruyter's complaints of his negligence in the action of the 5th of August he was deprived of his command. He was, however, reinstated in 1673 by the stadtholder William, afterwards king of England, and in the actions of the 7th and of the 14th of June, against the allied fleets of England and France, manifested a skill and bravery which completely justified his reappointment. In 1675 he visited England, where he was received with honour by King Charles II. In the following year he was named lieutenant-admiral of the United Provinces. He died at Amsterdam, on the 20th of May 1691, shortly after he had been appointed to the command of a fleet against France. Like his father he was buried at Delft.

See H. de Jager, *Het Geslacht Tromp* (1883).

TROMSÖ, a seaport of Norway, capital of the *omi* (county) and *sift* (diocese) of the same name on the north-western coast. Pop. (1900), 6955. It stands on the eastern shore of a low fertile islet between Kvalö and the mainland, in 69° 38' N., 18° 55' E. (the latitude is that of Disco, Greenland). The vegetation of the island (mountain ash and birch) is remarkably luxuriant. The buildings, mostly of wood, include the town-hall and a museum, which contains a good zoological collection. Sealskins and other furs, and whale and seal oil, are exported, and the herring fishery is very productive. Imports are coal, textiles, salt, grain and flour. Mean temperature of year 36.4° F.; February 25°; July 51.8°. Tromsö was founded in 1794. A number of Lapps usually encamp in the neighbouring Tromsland during summer. The coast scenery, with its islands and snowy mountains, is wild and beautiful.

TRONCHET, FRANÇOIS DENIS (1726-1806), French jurist, was born in Paris on the 23rd of March 1726. He was an avocat at the parlement of Paris, and gained a great reputation in a consultative capacity. In 1789 he was elected deputy to the states-general. In the Constituent Assembly he made himself especially conspicuous by his efforts to obtain the rejection of the jurisdiction of the jury in civil cases. In the king's trial, he was chosen by Louis as counsel for the defence, and performed this difficult and dangerous task with high ability and courage. During the Directory he was deputy at the Council

of the Ancients, where he unsuccessfully opposed the resolution that judges be nominated by the executive directory. Under the Consulate he was president of the tribunal of cassation, and collaborated in preparing the final scheme for the civil code. He had a marked influence on the code, and succeeded in introducing common law principles in spite of the opposition of his colleagues, who were deeply imbued with Roman law. He died on the 20th of March 1806, being the first senator of the empire to be buried in the Pantheon.

See François de Neuchâteau, *Discours sur Tronchet* (Paris, undated); Coqueret, *Essai sur Tronchet* (Caen, 1867).

TROMDHJEM, or **TERONDHJEM** (sometimes written in the German form *Drontheim*), a city and seaport of Norway, chief town of the *sift* (diocese) of Trondhjem and the *omi* (county) of South Trondhjem, 384 m. by rail N. of Christiania. Pop. (1900), 38,156. It lies on the south side of the broad Trondhjem Fjord on a low peninsula between the fjord and the River Nid, its situation, though picturesque, lacking the peculiar beauty of that of Christiania or Bergen. The latitude is 63° 26' N., that of southern Iceland. In front of the town is the islet of Munkholm, formerly a monastery and now a fortress; on the high ground to the east is the small stronghold of Christiansten. The houses are principally of wood, and the streets are wide, as a precaution against the spreading of fire. The principal building is the cathedral, standing finely on a slightly elevated open site, and dating in part from the close of the 11th century, but chiefly belonging to the 12th and 13th centuries (c. 1161-1248). Its extreme length is 325 ft. and its extreme breadth 124 ft.; but in the 14th, 15th and 17th centuries it suffered greatly from repeated fires, and after the last of these the nave was completely abandoned and soon became a heap of ruins. The whole building, however, had been extensively and judiciously restored, and is the finest church in Norway and the scene of the coronation of the Norwegian sovereigns. It is cruciform, with a central tower, and has an eastern octagon which may have been copied from the corona of Canterbury Cathedral, as Eystein, archbishop of Trondhjem (1160-1188) and an active builder, was in England during his episcopate. The cathedral contains rich work in Norman style, and also much that is comparable with the best Early English. In the museums at Trondhjem there are interesting zoological and antiquarian collections, also exhibits illustrative of the fisheries and other industries. The port, which has regular communication with all the Norwegian coast towns—Hull, Newcastle, Hamburg, &c.—carries on an extensive trade in timber, oil, fish, copper, &c. The industries include shipbuilding, saw-milling, wood-pulp and fish-curing works and machine shops. Imports (coal, grain, salt, machinery, &c.) come chiefly from Great Britain. A considerable portion of the exports pass into Sweden by the Meraker railway.

Trondhjem, originally Nidaros, was founded by Olaf Trygvason, who built a royal residence and a church here in 996. It was made an archbishopric in 1152. The city attained its highest development about the latter half of the 13th century, by which time it had become an important pilgrimage centre and had as many as fifteen churches. It sustained frequent sieges, as well as devastating conflagrations. Its importance declined about the time of the Reformation when it ceased to be a resort of pilgrims.

TROON, a police burgh, seaport and watering-place of Ayrshire, Scotland. Pop. (1901), 4764. It is situated 6 m. N. by W. of Ayr, and 35 m. S.W. of Glasgow by the Glasgow & South-Western railway. It has the best natural harbour in the county, with over a mile of quays, a breakwater 3000 ft. long, and two graving docks. Shipbuilding is the leading industry, and there is a rope and sail factory. The town contains a public hall and library and reading-room. The municipality controls the waterworks and gasworks. Fullarton House, 1 m. south-east, is a seat of the duke of Portland; and at Auchans, about 3 m. west, Susannah, countess of Eglington, in 1773 entertained Dr Johnson. Adjoining this estate stands the ruined castle of the Duardnolds.

TROOP (an adaptation of Fr. *troupe*, O. Fr. *trope*; cf. Ital. *troppa*, *truppa*; Med. Lat. *truppis*; the origin is doubtful; suggestions have been made that it represents a German conception of Latin *turba*, crowd, or is an adaptation of Norw. *torp*, flock), a company or assemblage of persons, the term being usually applied in the plural to a body of soldiers of varying strength and of different arms. Specifically, a "troop" is one of the smaller units into which a regiment of horse-soldiers is divided, forming a subdivision of a squadron. Roughly speaking, it consists of sixteen files, and does not exceed from 30 to 40 sabres; in some armies, however, a maximum limit of 60 sabres are found (see CAVALRY). For the military ceremony known as "trooping of the colours," see COLOURS, MILITARY.

TROPHY (Gr. *τρόπαιον*, from *τρέπω*, put to flight; Lat. *tropaeum*), in classical antiquities, in the strict sense a memorial of victory set up on the field of battle at the spot where the enemy had been routed. It consisted of captured arms and standards hung upon a tree (preferably an olive or an oak) and booty heaped up at its foot, dedicated to the god to whom the victory was attributed, especially Zeus Tropaeus. If no suitable tree was at hand, a lopped trunk was fixed in the ground on an eminence. The tree or trunk bore an inscription containing the names of the god and the combatants, a list of the booty and of the chief incidents of the battle or the entire war. In the case of a naval victory the trophy, composed of the beaks of ships (sometimes an entire ship), was generally set up on the nearest beach and consecrated to Poseidon. It was regarded as a sacrilege to destroy a trophy, since it was dedicated to a god; but, on the other hand, one that had fallen to pieces through lapse of time was not restored, to prevent feelings of resentment being kept alive. For the same reason trophies of stone or metal were forbidden by law, although this rule was not always observed. To facilitate reconciliation with their conquered foes, neither the Macedonians nor the Romans in early times erected such trophies. The usual custom was to take home the spoils, and to use them for decorating public buildings and private houses. The first example of a trophy set up after the Greek fashion occurs in 121 B.C., when Domitius Ahenobarbus celebrated his victory over the Allobroges in this manner. Although instances are not uncommon in later times, the Romans still showed a preference for setting up the memorials of victory in Rome rather than on the field of battle. These were decorated with the spoils, and were themselves called trophies; such were the trophies of Marius recording his victories over Jugurtha and the Cimbri and Teutones. In later republican and imperial times enormous columns, on which the chief incidents of a battle or war were represented in bas-relief, were frequently erected, the most famous and most perfect example being the column of Trajan (see ROME: *Archaeology*, "The Imperial Forums").

TROPIC-BIRD, so called of sailors from early times,¹ because as W. Dampier (*Voyages*, i. 53) among many others testifies, it is "never seen far without either Tropic"; hence, indulging a pretty fancy, Linnaeus bestowed on it the generic term, continued by modern writers, of *Phaethon*, in allusion to its attempt to follow the path of the sun.² There are certainly three well-marked species of this genus, but their respective geographical ranges have not yet been definitely laid down. All of them can be easily known by their totalpalate condition, in which the

four toes of each foot are united by a web, and by the great length of the two middle tail-quills, which project beyond the rest, so as to have gained for the birds the name of "Rabijunco," "Paille-en-queue" and "Pijlstaart" among mariners of different nations. These birds fly to a great distance from land and seem to be attracted by ships, frequently hovering round or even settling on the mast-head. Their flight is performed by rapid strokes, unlike the action of other long-winged sea-fowl, and they are rarely seen on the water.

The yellow-billed tropic-bird, *P. flavirostris* or *candidus*, appears to have habitually the most northerly, as well, perhaps, as the widest range, visiting Bermuda yearly to breed there, but also occurring numerously in the southern Atlantic, the Indian, and a great part of the Pacific Ocean. In some islands of all these three it breeds, sometimes on trees, which the other species are not known to do. However, like the rest of its congeners, it lays but a single egg, and this is of a pinkish white, mottled, spotted, and smeared with brownish purple, often so closely as to conceal the ground colour. This is the smallest of the group, and hardly exceeds in size a large pigeon; but the spread of its wings and its long tail make it appear more bulky than it really is. Except some black markings on the face (common to all the species known), a large black patch partly covering the scapulars and wing-coverts, and the black shafts of its elongated rectrices its ground colour is white, glossy as satin, and often tinged with roseate. Its yellow bill readily distinguishes it from its larger congener *P. aethereus*, but that has nearly all the upper surface of the body and wings closely barred with black, while the shafts of its elongated rectrices are white. This species has a range almost equally wide as the last; but it does not seem to occur in the western part of the Indian Ocean. The third and largest species, the red-tailed tropic-bird, *P. rubricauda* or *phoeniceus*, not only has a red bill, but the elongated and very attenuated rectrices are of a bright crimson red, and when adult the whole body shows a deep roseate tinge. The young are beautifully barred above with black arrow-headed markings. This species has not been known to occur in the Atlantic, but is perhaps the most numerous in the Indian and Pacific oceans, in which last great value used to be attached to its tail-feathers to be worked into ornaments.³

That the tropic-birds form a distinct family, Phaethontidae, of the Steganopodes (the Dysmorphomorphae of Huxley), was originally maintained by Brandt, and is now generally admitted, yet it cannot be denied that they differ a good deal from the other members of the group; indeed St. G. Milvart in the *Zoological Transactions* (x. 364) hardly allowed *Fregata* and *Phaethon* to be steganopodous at all; and one curious difference is shown by the eggs of the latter, which are in appearance so wholly unlike those of the rest. The osteology of two species has been well described and illustrated by Alph. Milne-Edwards in A. Granddidier's *oiseaux de Madagascar* (pp. 701-704, pls. 279-281a). (A. N.)

TROPINE, $C_8H_{15}NO$, a base formed together with tropic acid, $C_7H_{13}O_2$, in the hydrolysis of the alkaloid atropine (K. Kraut, *Ann.*, 1863, 128, p. 280; 1865, 133, p. 87). It crystallizes in plates which melt at 63° C. and boil at 233° C.; it is very hygroscopic and easily soluble in water. It is an optically inactive, strongly alkaline tertiary base. On heating with sodium in amyl alcoholic solution it is transformed into a stereoisomer, identical with the ψ -tropine obtained by hydrolysing tropa-cocaine with hydrochloric acid. It possesses alcoholic properties, since it forms esters, the so-called "**tropines**." On distillation with caustic baryta or soda lime it decomposes into methylamine and tropilidene, C_7H_7 (A. Ladenburg, *Ann.* 1883, 217, p. 74), the same hydrocarbon being also obtained when it is destructively methylated, a certain amount of tropilene, C_7H_{10} , being produced simultaneously. When heated with fuming hydrochloric acid to 150-180° C. it yields tropilone, $C_7H_{11}N$, and with hydriodic acid similarly forms an

¹ More recently sailors have taken to call it "Boatswain-bird" — a name probably belonging to a very different kind. (See SKUA.)

² Occasionally, perhaps through violent storms, tropic-birds wander very far from their proper haunts. In 1700 Leigh, in his *Nat. Hist. Lancashire* (i. 164, 195, Birds, pl. 1, fig. 3), described and figured a "Tropic Bird" found dead in that county. Another is said by Mr. Lees (*Zoologist*, 2nd series, p. 2666) to have been found dead at Cradley near Malvern — apparently before 1856 (J. H. Gurney, *jun.*, *op. cit.*, p. 4766) — which, like the last, would seem (W. H. Heaton, *op. cit.*, p. 5086) to have been of the species known as *P. aethereus*. Naumann was told (*Rhea*, i. 25) of its supposed occurrence at Heligoland, and Colonel Legge (*B. Ceylon*, p. 1174) mentions one taken in India 170 m. from the sea. The case cited by Degland and Gerbe (*Ornith. européenne*, ii. 363) seems to be that of an albatross.

³ A fourth species, *P. fulvipes*, was said to be found from the Gull of Oman, but doubtless belongs to the same species as well.

iodo-compound, $C_8H_{11}NI$, which, on reduction with zinc and hydrochloric acid, is converted into hydrotropidine, $C_8H_{11}N$. It yields various oxidation products. With an alkaline solution of potassium permanganate it yields tropigenine, $C_8H_{11}NO$; with chromic acid in the presence of acetic acid it yields tropinone, $C_8H_{11}NO$; and with chromic acid in the presence of sulphuric acid it yields tropinic acid, $C_8H_{11}N(CO_2H)$.

Tropidine, $C_8H_{11}N$, is a liquid having an odour resembling that of conine. It is a strong tertiary base, and is an unsaturated compound, forming addition products with the halogen acids. **Hydrotropidine**, $C_8H_{11}N$, is also a liquid. Its hydrochloride on distillation loses methyl chloride and yields norhydrotropidine, $C_7H_{11}N$, a compound which is a secondary base, and whose hydrochloride when distilled over zinc dust yields α -ethylpyridine. **Tropinic acid**, $C_8H_{11}N(CO_2H)$, obtained as above, is inactive; it was resolved by J. Gadamer (*Arch. Pharm.*, 1901, 239, p. 663) by means of its cinchonine salt. It is a dibasic acid, and the methiodide of its dimethyl ester on fusion with caustic alkalis yields α -adipic acid. It is apparently a derivative of *N*-methyl pyrrolidine, since it may be oxidized ultimately to *N*-methyl succinimide. **Tropigenine**, $C_8H_{11}NO$, is a secondary base.

The most important of the oxidation products of tropine is **tropinone**, $C_8H_{11}NO$, which is a ketone containing the grouping $-CH_2-CO-CH_2-$ since it yields a di-isonitroso derivative, a dibenzal derivative, and also forms mono- and di-oxalic esters. It is a strong base and has a powerful reducing action. Its constitution is determined by the above facts and also because tropinic acid on destructive methylation yields a diethylene dicarboxylic acid which on reduction is converted into α -pinelic acid. These data point to tropine possessing an unbranched chain of seven carbon atoms and incidentally determine the constitution of the other various oxidation products, &c. (R. Willstätter, *Ber.*, 1895-1901). These compounds may consequently be represented as

On the synthesis of tropine, see R. Willstätter, *Ber.*, 1901, 34, pp. 130, 3163.

Tropic acid, $C_8H_{11}O_2$, the other decomposition product of atropine, is a saturated hydroxy-acid which is readily converted into atropic acid, $C_8H_9O_2$, by dehydrating agents. This latter acid is shown by all its reactions to be $C_6H_5C(CH_3)CO_2H$, a fact which is confirmed by its synthesis from acetophenone by the action of phosphorus pentachloride, followed by the decomposition of the resulting chloride with an alcoholic solution of potassium cyanide and subsequent hydrolysis of the nitrile so formed. These results show that tropic acid must be either $C_6H_5-CH(CH_2OH)-CO_2H$ or $C_6H_5-C(OH)(CH_2)-CO_2H$, and since the latter compound has been prepared from acetophenone by the addition of the elements of hydrocyanic acid, followed by subsequent hydrolysis and is an isomer of tropic acid, it follows that tropic acid must be represented by the former of the two formulae. Hence the alkaloid atropine, being a tropine-tropate, must have the annexed formula—

TROPFAU (Polish, *Oppava*; Czech, *Opava*), the capital of the Austrian duchy and crown land of Silesia, 180 m. N.E. of Vienna by rail. Pop. (1900), 26,725. It is situated on the Oppa river, close to the Prussian frontier, and is a well-built town with extensive suburbs. The industries comprise the manufacture of cloth, industrial machines, sugar-refining, jute fabrics and brewing. Troppau was founded in the 13th century; but its only claim to historical mention is the fact that here the monarchs of Austria, Russia and Prussia met here in 1814 on the tendencies of the Neapolitan revolution. The congress of Troppau, however, left nearly the whole of Europe to be considered and decided at Laibach. The former city of Troppau is now divided between Austria and Prussia, the latter holding the lion's share.

CONFERENCE OF, a conference of the allied sovereign states to discuss a concerted policy with reference to the changes raised by the revolution in Naples of 1820. The congress, which met on the 20th of October

1820; the emperor Alexander I. of Russia and Francis I. of Austria were present in person; King Frederick William III. of Prussia was represented by the crown prince (afterwards Frederick William IV.). The three eastern powers were further represented by the ministers responsible for their foreign policy: Austria by Prince Metternich, Russia by Count Capo d'Istria, Prussia by Prince Hardenberg. Great Britain, on the other hand, which objected on principle to the suggested concerted action against the Neapolitan Liberals, sent no plenipotentiary, but was represented by Lord Stewart, ambassador in Vienna. France, too, though her policy was less clearly defined, had given no plenary powers to her representatives. Thus from the very first was emphasized that division within the concert of the powers which the outcome of the congress was to make patent.

The characteristic note of this congress was its intimate and informal nature; the determining fact at the outset was Metternich's discovery that he had no longer anything to fear from the "Jacobinism" of the emperor Alexander. In a three hours' conversation over a cup of tea at the little inn he had heard the tsar's confession and promise of amendment: "Aujourd'hui je déplore tout ce que j'ai dit et fait entre les années 1814 et 1818 . . . Dites-moi ce que vous voulez de moi. Je le ferai" (Metternich to Esterházy, Oct. 24, 1820, *F. O. Austria Dom. Sep.-Dec. 1820*). His failure to convert Castlereagh to his views was now of secondary importance; the "free" powers being in accord, it was safe to ignore the opinions of Great Britain and France, whose governments, whatever their goodwill, were fettered by constitutional forms.

In a series of conferences—to which the representatives of Great Britain and France were not admitted, on the excuse that they were only empowered to "report," not to "decide"—was drawn up the famous preliminary protocol signed by Austria, Russia and Prussia on the 19th of November. The main pronouncement of the "Troppau Protocol" is as follows: "States which have undergone a change of government due to revolution, the result of which threaten other states, *ipso facto* cease to be members of the European Alliance, and remain excluded from it until their situation gives guarantees for legal order and stability. If, owing to such alterations, immediate danger threatens other states the powers bind themselves, by peaceful means, or if need be, by arms, to bring back the guilty state into the bosom of the Great Alliance."

No effort was made by the powers to give immediate effect to the principles enunciated in the protocol; and after its promulgation the conferences were adjourned, it being decided to resume them at Laibach in the following January (see LAIBACH).

For authorities see the bibliography to ch. i. "The Congresses," by W. Alison Phillips, in the *Cambridge Med. Hist.* x. 787.

TROSSACHS, THE (Gaelic, "the bristled country," a crude allusion to its physical features), a defile in the south-west of Perthshire, Scotland. It is a narrow, beautifully wooded glen, of no great depth, extending from Loch Achray to Loch Katrine, and continued thence by a strip on the north-eastern shore to a point above the now submerged Silver Strand opposite to Ellen's Isle—a total distance of 2½ m. It is situated 8 m. W. of Callander and 5 m. N. of Aberfoyle, with both of which places there is daily communication by coach during the tourist season. It lies between the steep green slopes of Ben Venue (2303 ft.) on the S.W. and the precipitous crags of Ben A'an (1750 ft.) on the N.E. Characterized by lovely scenery, owing to its harmonious blending of wood, water, rock and hill, the region has been famous ever since the appearance of Sir Walter Scott's *The Lady of the Lake* and *Rob Roy*. Before the construction of the road that now winds through the pass, Sir Walter says that the only access to the lake was by means of a ladder formed out of the branches and roots of trees. A rustic pier has been built at the Trossachs end of Loch Katrine for the convenience of tourists, and a large hotel stands on the northern shore of Loch Achray, near the beginning of the pass.

TROTZENDORFF (or **TROCKENDORFIUS**), **VALENTIN FRIEDLAND** (1490-1556), German educationist, called Trotzendorff from his birthplace, near Görlitz, in Prussian Silesia, was born on the 14th of February 1490, of parents so poor that they could not keep him at school. The boy taught himself to read and write while herding cattle; he made paper from birch bark and ink from soot. When difficulties were overcome and he was sent for education to Görlitz, his mother's last words were "Stick to the school, dear son." The words determined his career: he refused all ecclesiastical promotion, and lived and died a schoolmaster. He became a distinguished student, learned Ciceronian Latin from Peter Mossellanus and Greek from Richard Croke, and after graduation was appointed assistant master in the school at Görlitz. There he also taught the rector and other teachers. When Luther began his attack on indulgences, Trotzendorff resigned his position and went to study under Luther and Melancthon, supporting himself by private tuition. Thence he was called to be a master in the school at Goldberg in Silesia, and in 1524 became rector. There he remained three years, when he was sent to Liegnitz. He returned to Goldberg in 1531 and began that career which has made him the typical German schoolmaster of the Reformation period. His system of education and discipline speedily attracted attention. He made his best elder scholars the teachers of the younger classes, and insisted that the way to learn was to teach. He organized the school in such a way that the whole ordinary discipline was in the hands of the boys themselves. Every month a "consul," twelve "senators" and two "censors" were chosen from the pupils, and over all Trotzendorff ruled as "dictator perpetuus." One hour a day was spent in going over the lessons of the previous day. The lessons were repeatedly recalled by examinations, which were conducted on the plan of academical disputations. Every week each pupil had to write two "exercitia styli," one in prose and the other in verse, and Trotzendorff took pains to see that the subject of each exercise was something interesting. The fame of the Goldberg School extended over all Protestant Germany, and a large number of the more famous men of the following generation were taught by Trotzendorff. He died on the 20th of April 1556.

See Herrmann, *Merkwürdige Lebensgeschichte eines berühmten Schulmanns, V. F. Trotzendorffs* (1727); Frosch, *V. F. Trotzendorff, Rektor zu Goldberg* (1818); Pinzer, *V. F. Trotzendorff* (with the Goldberg portrait, and a complete list of his writings, 1825); Kochler, *V. F. Trotzendorff, ein biographischer Versuch* (1848). The biographical facts appear to be derived from a funeral or memorial oration delivered by Balthasar Rhau in the university of Wittenberg on the 15th of August 1564, and published in an edition of Trotzendorff's *Rosarium* (1565).

TROUBADOUR, the name given to the poets of southern France and of northern Spain and Italy who wrote in the *langue d'oc* from the 12th to the 14th centuries. In Provençal the word is spelt *trobarre* or *trovador*, and is derived from the verb *trobar*, to find, or to invent (Fr. *trouver*). The troubadour was one who invented, and originally improvised, poetry, who "found out" new and striking stanzaic forms for the elaborate lyrics he composed. In later times, the word has been used for romantic and sentimental persons, who dress in what is supposed to be medieval fashion, and who indite trivial verses to the sound of a lute; but this significance does less than justice to the serious artistic aims of the original and historic troubadours of Provence.

The earliest troubadour of whom anything definite is known is Guilhem IX. (b. 1071), count of Poitiers and duke of Aquitaine, whose career was typical of that of his whole class, for, according to his Provençal biographer, "he knew well how to sing and make verses, and for a long time he roamed all through the land to deceive the ladies." The high rank of this founder of the tradition was typical of its continuation; by far the largest number of the troubadours belonged to the noble class, while no fewer than twenty-three of their number were reigning princes. Among them is a king of England, Richard I., who is believed to have written in *langue d'oïl* as well as in *langue d'oc*, and who

has left at least one *canzo*, that written in prison, which is of remarkable beauty. These noble troubadours were distinguished by their wealth and independence from those who made their song their profession, and who wandered from castle to castle and from bower to bower. But whether dependent or independent, the poets exercised a social influence which was extremely remarkable, and had been paralleled by nothing before it in the history of mediæval poetry. They had great privileges of speech and censure, they entered into questions of politics, and above all they created around the ladies of the court an atmosphere of cultivation and amenity which nothing had hitherto approached. The troubadour was occasionally accompanied in his travels by an apprentice or servant, called a *joglar*, whose business was to provide a musical setting for the poet's words; sometimes it was not the troubadour himself, but his *joglar*, who sang the songs. It was a matter of jealous attention to the troubadour to keep his name and fame clear of the claims of the *joglar*, who belonged to a lower caste; although it is true that some poets of very high talent rose from being *joglars* and attained the rank of troubadours. The latter were looked upon with deep admiration, and their deeds and sayings, as well as their verses, were preserved and were even embroidered with fiction.

There were recognized about four hundred troubadours, during the whole period in which they flourished, from Guilhem de Poitiers down to Guiraut Riquier (c. 1230-1204). Several MS. collections of biographies have been preserved, and from these we gain some idea of the careers of no fewer than 111 of the poets. In this respect, the troubadours possess an immense advantage over the *trouvères* of northern France, of whose private life very little is any longer known. Early in the living history of the troubadours their personal adventures came to be thought worthy of record. One of themselves, Uc of St Cyr (c. 1200-1240), interested himself in "the deeds and words of goodly men and women," and in the collection of lives he seems to claim to be, in several instances, the biographer. At the beginning of the 14th century it became the practice to preface the MS. works of each poet by a life of him, and even where the text seems to be quite independent, it is noticeable that there is little variation in the biography. One late troubadour, Rambaud of Orange, left a commentary on his own poems, and Guiraut Riquier one on those of a fellow troubadour, Guiraut of Calanson (1280). All this proves the poetry of Provence to have passed early into the critical stage, and to have been treated very seriously by those who were proficient in it. This is further shown by the respect with which the Provençal poets are mentioned by Dante, Petrarch and the authors of the *Novelle Critiche*.

The principal source of the lives of the troubadours is a collection, evidently written by various hands, which was made towards the middle of the 13th century. Of these we have said that Uc of Saint Cyr was certainly one of the authors. Another source of information is the *Vies des plus célèbres et anciens poètes provençaux*, published by Jehan de Notre-dame or Nostradamus, in 1575. This work professed to be founded on the MSS. of a learned monk, who was librarian of the monastery of St Honorat, in the island of Lérins, and died there in 1408. He was known by no other name than that of the Monk of the Golden Isles. This book, unfortunately, lies under more than a suspicion of forgery. Nostradamus no doubt possessed valuable documents, but he did not hesitate to deal with them in a highly fantastic way. His *Vies des poètes* has yet to be examined by careful and searching criticism. Even the genuine biographies, and they are numerous and above suspicion, are often embroidered with fantastic and whimsical statements which make a severe demand upon the credulity of a modern reader.

The verse form most frequently employed by the troubadours was the *serventis*, a term which is earliest met with in the second half of the 12th century. The early critics believed this word to be derived from *servir*, and to mean that the poem was made by a servant; but Paul Meyer has contested this derivation, and holds that a *serventis* is a poem composed by a minstrel, that is to say a *soudoyer* or paid man-at-arms. The troubadours also employed the *ballada*, which was a song of a somewhat not much like the formal ballade of the French. It was a *pastorella*; and the *alba*. The circumstance that the

stanza. This was a morning-song, as the *serena*, a later invention, was an evensong. The *planh* was a funeral elegy, composed by the troubadour for the obsequies of his protector, or for those of the lady of his devotion. Most interesting of all, perhaps, was the *lenson*, which was a lyrical dialogue between two persons, who discussed in it, as a rule, some point of amorous casuistry, but sometimes matters of a religious, metaphysical or satirical nature. The notion that the troubadours cultivated epic or dramatic poetry is now generally discarded; they were in their essence lyrical (see PROVENÇAL LITERATURE).

The biographies of the troubadours, which, in spite of their imperfection and conventionality of form, throw an unparalleled light upon medieval literary life, may perhaps be most conveniently treated in connexion with the courts at which each group of them flourished. It is in Poitou that we trace them first, where Guilhem, count of Poitiers, who reigned from 1087 to 1127, was both the earliest patron and the earliest poet of the school. This prince was the type of medieval gallantry, sudden and violent in arms, brilliant and impudent in wit, with women so seductive as to be esteemed irresistible. He led an army of 300,000 men in the crusade of 1101, being then thirty years of age; he returned in dismal disarray, supported in his defeat by the arts of love and song. His levity was the wonder and delight of his contemporaries; William of Malmesbury, who speaks much of him, tells us of Guilhem's project to found a religious house at Niort for the worship of Venus. Guilhem of Poitiers was handsome, bold and of easy access; Gottfried of Vendôme says that he moved among other men as a god among mortals for the beauty of his body and the magnanimity of his soul. The surviving poems of the great count are simple in form; he does not attempt the technical subtleties of later poets; but he laboured at the art, and he was anxious to be thought a professional, not an amateur writer. His songs are highly personal and betray the author's variety, sensuality, wit and skill as a versifier.

The son of the earliest of the troubadours is known neither as a poet nor as a patron of poets, but the daughter of Guilhem IX. carried on her father's tradition. This was Eleanor of Guienne, at whose court Bernart of Ventadour rose to eminence. This poet was an exception to the rule that the troubadours belonged to the princely class. He seems to have been the son of a kitchen-scellion in the castle of Eble II., viscount of Ventadour. Eble was himself a poet, *valde graciosus in cantilenis*, but his compositions have wholly disappeared; he was early impressed, we know not how, by the talents of his serving-boy, and he trained him to be a poet. The wife of Eble, the viscountess Agnes of Montluçon, who was extremely beautiful, encouraged the suit of the youthful Bernart; indeed, they had secretly loved one another from their childhood. The poems which this passion inspired are among the most admirable lyrics which have come down to us from the middle ages. The husband at last discovered the intrigue between his wife and the poet, and exiled Bernart from Ventadour, although, as it would seem, without violence. The troubadour took shelter with Eleanor of Guienne, who became in 1152 the queen-consort of Henry II. of England, himself a protector of poets. It has been supposed that Bernart accompanied the royal pair to London. He afterwards proceeded to the court of Raymond V. at Toulouse, where he is said to have remained until the death of that prince in 1164, when he withdrew to a cloister at Dalou in Poitou. He must at that time have been a very old man.

The son of Henry II., Henry Curtmantle, was the patron of another eminent troubadour, Bernart de Rogas, viscount of Hautefort in Perigord, had become a vassal of Richard I. by the marriage of Eleanor.

Richard I. was a great admirer of the troubadours, and he saw Bernart de Rogas at the court of Richard I. in 1191. He was a knight of the order of the Holy Sepulchre, and he was the patron of the troubadour Bernart de Rogas.

works in Provençal literature. The poet was immediately afterwards besieged in his castle of Hautefort by Richard Cœur de Lion, to whom he became reconciled and whom he accompanied to Palestine. He grew devout in his old age, and died about 1205. As a soldier and a condottiere, as the friend and enemy of kings, and as an active factor in the European politics of his time, Bertran de Born occupies an exceptional position among the troubadours.

There were poetesses in the highly refined society of Provence, and of these by far the most eminent was Beatrix, countess of Die, whose career was inextricably interwoven with that of another eminent and noble troubadour, Rambaut III., count of Orange, who held his court at Courthézon, a few miles south of Orange. Rambaut said that since Adam ate the apple no poet had been born who could compete in skill with himself, but his existing lyrics have neither the tenderness nor the ingenuity of those of his illustrious lady-love. The poems of Beatrix are remarkable for a simplicity of form rare among the poets of her age. One of the earliest troubadours, Cercamon, was at the court of Guilhem IX. of Poitiers, and was the master of perhaps the most original of all the school, namely the illustrious Marcabrun (c. 1120-1195), from whose pen some forty poems survive. He was a founding, left on the door-step of a rich man in Gascony, and no one knew anything about his descent. Marcabrun was an innovator and a reformer; to him the severity of classical Provençal style is mainly due, and he was one of the first to make use of that complexity and obscurity of form which was known as the *trobar clus*. He was also original in his attitude to love; he posed as a violent misogynist—"I never loved and I was never loved"—and he expressed, in the accents of amorous poetry, an aversion to women. "Famine, pestilence and war do less evil upon earth than the love of woman" is one of his aphorisms. He was in the service of Richard Cœur de Lion, and after 1167 in that of Alfonso II. of Aragon. Marcabrun was the object of much dislike and attack, and it is said that he was murdered by Castellane of Guian, whom he had satirized. This, however, is improbable, and it is rather believed that Marcabrun survived to a great age. For one of his contemporaries he mitigated the severities of his satiric pen; he expresses great affection for "that sweet poet," Jaufre Rudel, prince of Blaye, whose heart turned, like the disk of a sunflower, towards the Lady of Tripoli. Little else than that famous adventure is known about the career of this ultra-romantic troubadour, except that he went as a crusader to the Holy Land, and that his surviving poems, which are few in number, have so mystical a tone that Jaufre Rudel has been suspected of being a religious writer who used the amorous language of his age for sanctified purposes, and whose "Princess Far-away" was really the Church of Christ. If so, the statement that he died in the arms of the Lady of Tripoli would merely mean that he passed away, perhaps at Antioch, in the odour of sanctity. Peire d'Alveona (Peter of Auvergne), like Marcabrun, was of mean birth, son of a tradesman in Clermont-Ferrand, but he was handsome and engaging, and being the first troubadour who had appeared in the mountain district, "he was greatly honoured and fêted by the valiant barons and noble ladies of Auvergne." . . . "He was very proud and despised the other troubadours." It is believed that Peire's poems were produced between 1158 and 1180. He flourished at the court of Sancho III., king of Castile, and afterwards at that of Ermengarde, viscountess of Narbonne.

It is doubtless owing to the vehement and repeated praise which was given by Dante, in the *Inferno* and elsewhere, to Arnaut Daniel that this name remains the most famous among those of the troubadours. Yet not very much is known of the personal history of this poet. He was a knight of Riberac, in Perigord, and he attached himself as a troubadour to the court of Richard Cœur de Lion. Dante had been made acquainted with the highly complicated and obscure verse of Arnaut Daniel by Guido Guinicelli, and thus to the historian of literature a most valuable link is provided between medieval and modern poetry. Dante calls Daniel the "smith," the

finished craftsman, of language, and it is evident that it was the brilliant art of the Provençal's elaborated verse which delighted the Italian. In the *De vulgari eloquentia* Dante returned to the praise of Arnaut Daniel, as the greatest of all those who have sung of love, and Petrarach was not less enthusiastic. His invention of forms of verse (see *SESTINA*), in particular, dazzled the great Italians. But the seventeen *sirventés* which have survived scarcely sustain the traditional idea of the supremacy of Arnaut Daniel as a poet, while their lack of historical and personal allusions deprives them of general interest. Dante was curiously anxious to defend Arnaut Daniel as being a better artist than his immediate rival, Giraut de Bornelh, whose "rectitude" Dante admits, in the sense that Giraut was a singer of gnomic verses of a high morality, but prefers the poetry of Daniel; critical posterity, however, has reversed this verdict. Giraut came from the neighbourhood of Limoges, passed over into Spain about 1180, and became famous in the courts of Pedro II. of Aragon and other Spanish monarchs. He disappears about 1230. There is a curious anecdote of his having incurred the hatred or the cupidity of the viscount of Limoges, who robbed him of his library and then burned his house to the ground. Giraut laments, in his poems, the brutality of the age and the lawlessness of princes. A troubadour of the same district of south-western France was Arnaut de Mareuil, to whom is attributed the introduction into Provençal poetry of the amatory epistle. He settled at the courts of Toulouse and Beziers, where he sang, in mystical terms, his passion for the countess Adalasia, in whose affections he had a dangerous rival in the person of Alfonso II., king of Aragon. Arnaut de Mareuil fled for his life to Montpellier, where he found a protector in Count William VIII., but he continued to address his *sirventés* to Adalasia. As that princess died in 1199, and as no *plank* to her memory is found among the works of Arnaut de Mareuil, it is conjectured that by that time he was already dead.

Peire Vidal of Toulouse was the type of the reckless and scatterbrained troubadour. His biographer says that he was "the maddest man in all the world." His early life was a series of bewildering excursions through France and Spain, but he settled down at last at Marseilles, where he made a mortal enemy of Azalais, the wife of Viscount Barral de Baux, from whom he stole a kiss (1180). Vidal fled to Genoa, but he continued to address the viscountess in his songs. At the entreaty of her husband, Azalais forgave the poet, and Peire Vidal returned to Marseilles. He committed a thousand follies; among others, being in love with a lady called Louve (she-wolf), the poet dressed himself as a wolf, and was hunted by a pack of hounds in front of the lady's castle. Starting on a crusade, he stopped at Cyprus, where a Greek girl was presented to him as being of the imperial family. He married her, assumed the title of emperor, and carried a throne about with him from camp to camp. According to a late poem, his eccentric adventures closed in Hungary about the year 1215. Folquet of Marseilles was a troubadour of Italian race, the son of a merchant of Genoa; Dante met Folquet in paradise, and gives an interesting notice of him. He was a rival with Peire Vidal for the favours of the beautiful Azalais; and he was one of the troubadours who gathered around the unfortunate Eudoxia, empress of Montpellier, until the close of her singular and romantic adventure (1187). He wrote a very touching *plank* on the death of the viscount Barral de Baux in 1192. Soon after this, disgusted with love, Folquet took holy orders, became the abbot of the rich Cistercian house of Torronet in Provence, and in 1205 became bishop of Toulouse. Here he threw in his lot with Simon de Montfort and disgraced himself by his fanatic rage against the Albigenses, of whom a contemporary says that he slew 500,000 persons, acting "more like Antichrist than like an envoy of Rome." Folquet died in 1231 in the abbey of Grandselve, in his diocese. It is in the *sirventés* of Folquet that critics have seen the earliest signs of that decadence which was so rapidly to destroy Provençal poetry.

Gaucelm Faidit came from Uzerche, in the Limousin. He

seems to have been a wandering minstrel of gay and reckless habits, and to have been accompanied by a light-o'-love, Guillemeta Monja, who was the object of much satire and ridicule. In Gaucelm we probably see, if we can credit his story, the troubadour at his lowest social level. He made, however, Maria of Ventadour, who was probably a scion of the princely and neighbouring house of that name, the object of his songs, and he addresses her in strains of unusual pathos and delicacy. Gaucelm Faidit ultimately proceeded to Italy, to the court of the marquis Boniface of Montferrat, a prince who greatly encouraged the troubadours and who in 1201 undertook the conduct of a crusade. Gaucelm, who was still celebrating the perfections of Maria of Ventadour, accompanied him to the East. He wrote several canzones in the Holy Land and Syria, returned safely to Uzerche, and disappears about 1240. We possess sixty of his poems. Another troubadour, Raimbaut of Vaquères, passed the greater part of his life at the same court of Montferrat; he devoted himself to the Lady Beatrix, sister of the marquis. It is believed that he died in the Holy Land in 1207. The most celebrated of the Italian troubadours was Sordello, born at Mantua, at the beginning of the 13th century, who owes his fame rather to the benevolence of later poets, from Dante to Robert Browning, than to the originality of his adventures or the excellence of his verse.

We have now mentioned the troubadours who were most famous in their own time, and on the whole modern criticism has been in unison with contemporary opinion. There are, however, still one or two names to be recorded. The English historian of the troubadours, Dr Hueffer, gave great prominence to the writings of a poet who had previously been chiefly heard of in connexion with a romantic adventure, Guillem de Cabestanh (or Capestang). This was a knight of Roussillon, who made love to Seremonda, countess of Castel-Roussillon. The lady's husband, meeting the poet out hunting, slew him in a paroxysm of jealousy and, having cut out his heart, had it delicately cooked and served to his wife's dinner. When Seremonda had eaten her lover's heart, her husband told her what she had done, and she fainted away. Coming to her senses she said: "My Lord, you have served to me so excellent a dish that I will never eat of another," and she threw herself out of window and was killed. The importance of this story lies in the fact that the cruelty of the count of Castel-Roussillon was the cause of universal scandal in all good society. Feeling grew so strong that the surrounding nobles rose against the murderer, with Alfonso, king of Spain, at their head, hunted him down and killed him. The bodies of the lady and the troubadour were buried side by side, with great pomp, in the cathedral of Perpignan, and became the objects of pilgrimage. Doubt has, of course, been thrown on the veracity of this romantic story, but at all events it testifies to the fact that the troubadour enjoyed, or was expected to enjoy, all the privileges of toleration and exemption. A burlesque or satiric troubadour, who disregarded the laws of gallantry and wrote satires of great virulence against the ladies and their lovers, remains anonymous, and is spoken of as the monk or prior of Montaudon.

The classic period of the troubadours lasted until about 1210, and was contemporaneous with the magnificence of the nobles of the south of France. The wealth and cultivated tastes of the seigneurs, and the peace which had long surrounded them, led them into voluptuous extravagances and sometimes into a madness of expenditure. From this the troubadours reaped an immediate advantage, but when the inevitable reaction came they were the first to suffer. The great cause, however, of the decadence and ruin of the troubadours was the struggle between Rome and the heretics. This broke out into actual war in June 1209, when the northern barons, called to a crusade by Pope Innocent III., fell upon the Albigenses and pillaged Beziers and Carcassonne. Most of the protectors of the troubadours were, if not heretics, indulgent to the heretical party, and shared in their downfall. The poets, themselves, were not immediately injured, and no doubt their habits and

and strong opposition was taken against them by the clergy and at the universities (see COSTUME).

TROUT (*Salmo trutta*), a fish closely related to the salmon. Most modern ichthyologists agree in regarding the various North European forms of trout, whether migratory or not, as varieties or races of a highly variable and plastic species, to be distinguished from the salmon by a few more or less constant characters, the most readily ascertainable of which resides in the smaller scales on the back of the caudal region of the body, these being 14 to 16 (rarely 13) in an oblique series between the posterior border of the adipose fin and the lateral line, and in the greater length of the folded anal fin as compared to the depth of the caudal peduncle. The gill-rakers are also usually fewer, 16 to 18 on the anterior branchial arch. The young may be distinguished from salmon-parr by the greater length of the upper jaw, the maxillary bone extending beyond the vertical of the centre of the eye, and in specimens 6 in. long often to below the posterior of the eye. The young are brown or olive above, silvery or golden below, with more or less numerous black and red spots in addition to the parr marks, and, contrary to what is observed in the salmon, black spots are usually present below the lateral line. Except for the gradual disappearance of the parr marks, this coloration is retained in the form known as the brook trout or brown trout (*S. fario*), which is non-migratory, and varies much in size according to the waters it inhabits, in some brooks not growing to more than 8 in., whilst in larger rivers and lakes it may attain a weight of 20 lb or more. The coloration of the young is more strongly departed from in the races known as sea trout (*S. trutta*) and sewin (*S. eriox* or *cambricus*), anadromous forms resembling the salmon in habits, and assuming in the sea a silvery coat, with, however, as a rule, more black spots on the sides below the lateral line.

The principal British races of trout are the following: the northern sea trout (*S. trutta, sensu stricto*), silvery, losing the teeth on the shaft of the vomer in the adult, and migratory like the salmon; the southern sea trout (*S. eriox* or *cambricus*), similar to the preceding, but with the hind margin of the gill-cover more or less produced, the lower bone (suboperculum) projecting beyond the end of the upper (operculum); the brown trout (*S. fario*), non-migratory, usually retaining the teeth on the shaft of the vomer, brown or olive with black and red spots, rarely more silvery, with numerous black spots; the Lochleven trout (*S. levenensis*), distinguished from the preceding by a more silvery coloration, frequent absence of red spots and a pink or red flesh; the estuary trout, (*S. gillensis* and *S. orcadensis*), large brown trout living in salt water without assuming the silvery coloration; the Gillaroo trout (*S. stomachicus*), in which the membranes of the stomach are conspicuously thicker than in the other trout, more so in adult examples than in young ones. But all these forms are ill-defined and subject to such variations when transported from one locality to another as to render their recognition a matter of insuperable difficulty. The instability of the characters on which *S. levenensis* is based has been conclusively shown by the experiments conducted by Sir James Maitland at Howietoun. Large specimens of migratory trout are often designated as bull-trout, but no definition has ever been given by which this form could be established, even as a race.

Other European varieties are the trout of the Lake of Geneva (*S. lemanus*), of the Lake of Garda (*S. carpio*), of Dalmatia (*S. denlex*), of Hungary (*S. microlepis*), of the Caspian Sea (*S. caspius*), &c. The size of trout varies much according to the waters in which they live, the anadromous forms nearly equalling the salmon in this respect, specimens of over 4 ft. and weighing up to 50 lb being on record.

The habitat of *S. trutta* extends over the whole of Europe, the Atlas of Morocco and Algeria, Transcaucasia, Asia Minor and northern Persia. By the agency of man the species has been thoroughly established in Tasmania and New Zealand, where it thrives in an extraordinary manner, and attains a very large size.

Closely allied species are found in North America, west of the Rocky Mountains, the best known being the rainbow trout (*S. irideus* or *shasta*), which has been introduced into many parts of Europe as well as the eastern states of North America, New Zealand and South Africa. It is more hardy than the English trout, and accommodates itself in almost stagnant waters, and has thus proved a success in many ponds which were regarded as fit for coarse fish only; but in many places it has caused disappointment by going down to the sea, whence it is not known ever to return. It is a handsome trout, bluish or purplish above, silvery or golden below, more or less profusely spotted with black on the body and fins, and with an orange or red lateral band. Its range extends from Alaska to North Mexico. The rainbow trout merges into a larger form, *S. gairdneri*, which resembles the British sea trout.

A remarkable European trout is the short-snouted trout, *S. obtusirostris*, a non-migratory species from Dalmatia, Herzegovina, Bosnia and Montenegro. It has a small mouth with a feeble dentition, resembling that of the grayling. A closely allied form, *S. ohridanus*, has recently been discovered in Macedonia. (G. A. B.)

TROUVÈRE, the name given to the medieval poets of northern and central France, who wrote in the *langue d'oïl* or *langue d'oui*. The word is derived from the French verb *trouver*, to find or invent. The trouvères flourished abundantly in the 12th and 13th centuries. They were court-poets who devoted themselves almost exclusively to the composition and recitation of a particular kind of song, for which the highest society of that day in France had an inordinate fondness. This poetry, the usual subject of which was some refinement of the passion of love, was dialectical rather than emotional. As Jeanroy has said, the best trouvères were those who "into the smallest number of lines could put the largest number of ideas, or at least of those commonplaces which envelop thought in its most impersonal and coldest form." The trouvères were not, as used to be supposed, lovers singing to their sweethearts, but they were the pedants and attorneys of a fantastic tribunal of sentiment. This was more monotonous in the hands of the trouvères than it had been in those of the troubadours, for the latter often employed their art for purposes of satire, religion, humour and politics, which were scarcely known to the poets of the northern language.

The established idea that the poetry of the trouvères was entirely founded upon imitation of that of the troubadours, has been ably combated by Paul Meyer, who comes to the conclusion that the poetry of the north of France was essentially no less original than that of the south. The passage of Raoul Glaber, in which he says that about the year 1000 southern men began to appear in France and in Burgundy, "as odd in their ways as in their dress, and having the appearance of jongleurs," is usually quoted, but although this is valuable contemporary evidence, it proves neither what these "jongleurs" brought from the south nor what the poets of the north could borrow from them. The first appearance of trouvères seems to be much later than this, and to date from 1137, when Eléonore of Aquitaine, who was herself the granddaughter of an illustrious troubadour, arrived in the court of France as the queen of Louis VII. It is recorded that she continued to speak her native language, which would be the Poitiers dialect of the *langue d'oc*. She was queen for fifteen years (1137-1152), and this, no doubt, was the period during which the southern influence was strongest in the literature of northern France. There is not any question that the successive crusades tended to produce relations between the two sections of poetical literature. The great mass of the existing writings of the trouvères deals elaborately and artificially with the passion of love, as it had already been analysed in the *langue d'oc*. But those who are most inclined to favour the northern poets are obliged to confess that the latter rarely approach the grace and delicacy of the troubadours, while their verse shows less ingenuity and less variety. The earliest trouvères, like Cuene de Béthune and Hugues de Berzé, in writing their amatory lyrics, were

certainly influenced by what troubadours had written, especially when, like Bertrand de Born, these troubadours were men who wandered far and wide, under the glory of a great social prestige. We should know more exactly what the nature of the Provençal influence was if the songs of all the trouvères who flourished before the middle of the 13th century had not practically disappeared. When we become conscious of the existence of the trouvères, we find Cuene de Béthune in possession of the field, a poet of too much originality to be swept away as a mere imitator. At the same time, even Paul Meyer, who has been the great assertor of the independence of the poetry of northern France, is obliged to admit that if, at the end of the 12th century and throughout the 13th, several literary centres were formed where an amatory poetry, full of conventional grace, was held in high honour, it was because several princely courts in the south had set the example. In this sense it cannot be denied that the whole art of the trouvères was secondary and subsidiary to the art of the troubadours.

The poetical forms adopted by the trouvères bore curious and obscure names, the signification of which is still in some cases dubious. As a rule each poem belonged to one of three classes, and was either a *rotuenge*, or a *serventois*, or an *estrabat*. The *rotuenge* was a song with a refrain; the *serventois* was, in spite of its name, quite unlike the *serventes* of the troubadours and had a more ribald character; the *estrabat* was allied to the *strambotto* of the Italians, and was a strophic form "composed of a front part which was symmetrical, and of a tail which could be varied at will" (Gaston Paris). But scholars are still uncertain as to the positive meaning of these expressions, and as to the theory of the verse-forms themselves.

The court poetry of the trouvères particularly flourished under the protection of three royal ladies. Marie, the regent of Champagne, was the practical ruler of that country from 1181 to 1197, and she encouraged the minstrels in the highest degree. She invited Ricaut de Barbezieux to her court, rewarded the earliest songs of Gace Brulé, and discussed the art of verse with Chrétien of Troyes. Her sister, Aëlis or Alice, welcomed the trouvères to Blois; she was the protector of Gautier d'Arras and of Le Châtelain de Couci. A sister of the husbands of these ladies, another Aëlis, who became the second queen of Louis VII. in 1160, received Cuene de Béthune in Paris, and reproved him for the Picard accent with which he recited his poetry. At the end of the 12th century we see that the refinement and elegance of the court-poets was recognized in the north of France by those who were responsible for the education of princes. A trouvère, Gui de Ponthieu, was appointed tutor to William III. of Macon, and another, Philippe of Flanders, to Philippe Auguste. The vogue of the trouvères began during the third crusade; it rose to its greatest height during the fourth crusade and the attack upon the Albigenses. The first forty years of the 13th century was the period during which the courtly lyrical poetry was cultivated with most assiduity. At first it was a purely aristocratic pastime, and among the principal trouvères were princes such as Thibaut IV. of Navarre, Louis of Blois and John, king of Jerusalem. About 1230 the taste for court poetry spread to the wealthy bourgeoisie, especially in Picardy, Artois and Flanders. Before its final decline, and after the courts of Paris and Blois had ceased to be its patrons, the poetry of the trouvères found its centre and enjoyed its latest successes at Arras. It was here that some of the most original and the most skilful of all the trouvères, such as Jacques Bretel and Adam de la Halle, exercised their art. Another and perhaps still later school flourished at Reims.

About 1280; having existed for a century and a half, the poetical system suddenly decayed and disappeared; the very names of the court-poets were forgotten. During this time the song, *chanson*, had been treated as the most dignified and honourable form of literature, as Dante explains in his *De vulgari eloquentia*. But the song, as the trouvères understood it, was not an unstudied or emotional burst of verbal melody; it was, on the contrary, an effort of the intelligence, a piece of wilful and elaborate casuistry. The poet was

invariably a lover, devoted to a married lady who was not his wife, and to whose caprices he was bound to submit blindly and patiently, in an endless and resigned humility. The progress of this conventional courtship was laid down according to certain strict rules of ceremonial; love became a science and a religion, and was practised by the laws of precise etiquette.

The curious interest of the trouvères, for us, lies in the fact that during an age when the northern world was ignorant and brutal, sunken in a rude sensuality, the trouvères advanced a theory of morals which had its absurd and immoral side, but which demanded a devotion to refinement and a close attention to what is reserved, delicate and subtle in personal conduct. They were, moreover, when the worst has been admitted about their frigidity and triviality, refiners of the race, and they did much to lay the foundation of French wit and French intelligence. The trouvères have not enjoyed the advantage of the troubadours, whose feats and adventures attracted the notice of contemporary biographers. Little is known about their lives, and they pass across the field of literary history like a troop of phantoms. Close students of this body of somewhat monotonous poetry have fancied that they detected a personal note in some of the leaders of the movement. It is certainly obvious that Cuene (or Conon) de Béthune had a violence of expression which gives life to his chansons. The delicate grace of Thibaut of Champagne, the apparent sincerity of Le Châtelain de Couci, the descriptive charm of Monlot of Arras, the irony of Richard of Fournival, have been celebrated by critics who have perhaps discovered differences where none exist. It is more certain that Adam de la Halle, the hunchback of Arras, had a superb gift of versification. The *rondelet* (published in E. de Coussemaker's edition, 1872) beginning

"A Dieu courant amourettes,
Car je m'en vois
Soupirant en terre estrange!"

marks perhaps the highest point to which the delicate, frosty art of the trouvères attained. Music took a prominent place in all the performances of the trouvères, but in spite of the erudition of de Coussemaker, who devoted himself to the subject, comparatively little is known of the melodies which they used. But enough has been discovered to justify the general statement of Tiersot that "we may conclude that the musical movement of the age of the trouvères was derived directly from the most ancient form of popular French melody." A precious MS. in the Faculty of Medicine of Montpellier contains the music of no fewer than 345 part-songs attributed to trouvères, and an examination of these enables a "pitiless arranger" to divine the air, the primitive, simple and popular melody.

The principal authorities on the poetry and music of the trouvères are: H. Binet, *Le Style de la lyrique courtoise en France aux XII^e et XIII^e siècles* (Paris, 1891); Gaston Paris, *Les Origines de la poésie lyrique en France au moyen âge* (Paris, 1892); A. Jeanroy, *Les Origines de la poésie lyrique en France au moyen âge* (Paris, 1889); Julian Tiersot, *Histoire de la chanson populaire en France: E. de Coussemaker. Art harmonique aux XII^e et XIII^e siècles* (Paris, 1865). The works of the principal trouvères have been edited: those of Le Châtelain de Coucy by F. Michel (1830); of Adam de la Halle by E. de Coussemaker (1872); of Conon de Béthune by Wallensköld (Helsingfors, 1891); of Thibaut IV., king of Navarre, by P. Tarbé (E. G.)

TROUVILLE, a seaside town of north-western France, in the department of Calvados, on the English Channel, 34 m. N.E. of Caen by rail. Pop. (1906), 5684. Trouville is situated on the slopes of well-wooded hills at the mouth of the Touques on its right bank opposite Deauville. Its fine stretches of sand and excellent bathing, a spacious casino and beautiful villas, are among the attractions which make it the most frequented French resort on the channel. Deauville is well known for its race-course and villas, exceeding those of Trouville in luxury, but except during the race fortnight in August (*la grande semaine*) it is quiet and comparatively deserted. The port shared with Deauville and formed by the Touques is entered by a channel between jetties with a depth at high tide of 18½ ft. This leads on the one side to a tidal harbour, on the other to an outer and an inner basin. Timber, coals and cement are imported. The

London & South Western Railway Company have a daily steamboat service from Havre to Trouville in connexion with their Southampton and Havre boats. Besides trawling and the provisioning of ships, in which Deauville is also engaged, Trouville carries on boat-building and has rope and briquette works.

TROVER (O. Fr. *trover*, to find, mod. *trouver*), or "trover and conversion," the name of a form of action in English law no longer in use, corresponding to the modern action of conversion. It was brought for damages for the detention of a chattel, and differed from detinue in that the latter was brought for the return of the chattel itself. The name *trover* is due to the action having been based on the fictitious averment in the plaintiff's declaration that he had lost the goods and that the defendant had found them. The necessity for this fictitious averment was taken away by the Common Law Procedure Act 1852. An action of *trover lay* (as an action of conversion still lies) in every case where the defendant was in possession of a chattel of the plaintiff and refused to deliver it up on request, such refusal being *prima facie* evidence of conversion. The damages recoverable are usually the value of the chattel converted. In an action for detention of a chattel (the representative of the old action of detinue), the plaintiff may have judgment and execution by writ of delivery for the chattel itself or for its value at his option. An action for conversion or detention must be brought within six years. The corresponding action in Scots law is the action of spuilzie. It must be brought within three years in order to entitle the pursuer to violent profits, otherwise it prescribes in forty years.

TROWBRIDGE, a market town in the Westbury parliamentary division of Wiltshire, England, 9 $\frac{1}{4}$ m. W. by S. of London by the Great Western railway. Pop. of urban district (1901), 11,526. It is unevenly built on a slope at the foot of which flows the Biss or Mere, a tributary of the Avon. The parish church of St James is a fine Perpendicular building, with a lofty spire, and a beautiful open-work roof over the nave. It was rebuilt on the original plan in 1848. George Crabbe, the poet, was rector from 1813 to 1851.

Trowbridge (*Trubrig*, *Trobrigg*, *Trowbrigg*) was probably mentioned in Domesday under the name of Straburg, a manor held by one Brictric together with Staverton and Trowle, now both included within its limits. The first reference to the "town" of Trowbridge occurs early in the 16th century; previous to that date mention is made of the manor and castle only. The latter, round which the town probably grew up, is said to have been built by the de Bohuns, who obtained possession of the manor by marriage with the daughter of Edward de Sarisbury. Later it passed to William de Longespée, son of Henry II., to the Lancasters, to the protector Somerset (by grant of Henry VIII.) and then to the Rutlands, and Trowbridge is now a non-corporate town. In 1200 John granted a weekly market on Tuesday, Thursday and Saturday; also a yearly fair on the 24th, 25th and 26th of July, on which days it continued to be held until at the end of the 18th century it was changed to the 5th, 6th and 7th of August. The manufacture of woollen cloths has long been the staple trade of Trowbridge. It was introduced before the 16th century, for Ireland, writing in the reign of Henry VIII., says: "The town flourisheth by drapery." In 1751 the trade was of some note, and by 1813 had attained such proportions that the whole area of the castle site was sold for the erection of dyeworks, cloth manufactories and other industrial buildings.

TROWEL (Med. Eng. *troed*, O. Fr. *troic*, Low Lat. *trudis*, a variant of *trudis*, diminutive of *trus*, stirring spoon, ladle, Gr. *τροπῆ*, from the root *tro*, to turn round and round; cf. *ropeis*, *bover*), a tool or implement, varying in shape according to the use to which it is put, but consisting of a blade of iron or steel fitted with a handle. The bricklayers' or plasterers' trowel, used for mixing, spreading and smoothing the mortar or plaster, has a flat, triangular, oval or rectangular blade; the gardeners' trowel, for digging plants, laying or mixing mould, &c., has a semi-cylindrical blade. Highly ornamental trowels

made of, or decorated with, the precious metals are presented to royal, official or other personages who formally lay the foundation stones of buildings.

TROY, JEAN FRANÇOIS DE (1679-1752), French painter, was born at Paris in 1679. He received his first lessons from his father, himself a skilful portrait painter, who afterwards sent his son to Italy. There his amusements occupied him fully as much as his studies, but his ability was such that on his return he was at once made an official of the Academy, and obtained a large number of orders for the decoration of public and private buildings, executing at the same time a quantity of easel pictures of very unequal merit. Amongst the most considerable of his works are thirty-six compositions painted for the hotel of De Live (1729), and a series of the story of Esther, designed for the Gobelins whilst De Troy was director of the school of France at Rome (1738-1751)—a post which he resigned in a fit of irritation at court neglect. He did not expect to be taken at his word, and was about to return to France when he died on the 24th of January 1752. The life-size painting (Louvre) of the "First Chapter of the Order of the Holy Ghost held by Henry IV.," in the church of the Grands Augustins, is one of his most complete performances, and his dramatic composition, the "Plague at Marseilles," is widely known through the excellent engraving of Thomassin. The Cochins, father and son, Fessard, Galimard, Bauvarlet, Herisset, and the painters Boucher and Parrocel, have engraved and etched the works of De Troy.

TROY and TROAD. 1. *The Troad.*—The Troad (η Τρωάς), or the land of Troy, the north-western promontory of Asia Minor. The name "Troad" is never used by Homer—who calls the land, like the city, *Τροή*—but is already known to Herodotus. The Troad is bounded on the N. by the Hellespont and the westernmost part of the Propontis, on the W. by the Aegean Sea and on the S. by the Gulf of Adramyttium. The eastern limit was variously defined by ancient writers. In the widest acceptance, the Troad was identified with the whole of western and south-western Mysia, from the Aesepus, which flows into the Propontis, a little west of Cyzicus, to the Caicus, which flows into the Aegean south of Atarneus. But the true eastern boundary is undoubtedly the range of Ida, which, starting from near the south-east angle of the Adramyttian Gulf, sends its north-western spurs nearly to the coast of the Propontis, in the region west of the Aesepus and east of the Granicus. Taking Ida for the eastern limit, we have the definition which, as Strabo says, best corresponds with the actual usage of the name Troad. Ida is the key to the physical geography of the whole region; and it is the peculiar character which this mountain-system imparts to the land west of it that constitutes the real distinctness of the Troad from the rest of Mysia. Nature has here provided Asia Minor with an outpost against invaders from the north-west; and as the Troad was the scene of the struggle between Agamemnon and Priam, so it was in the Troad that Alexander won the battle which opened a path for his further advance.

Natural Divisions.—The length of the Troad from north to south—taking a straight line from the north-west point, Cape Sigeum (Yeni Shehr), to the south-west point, Cape Loxum (Baba Kale)—is roughly 40 m. The breadth, from the middle point of the west coast to the main range of Ida, is not much greater. The whole central portion of this area is drained by the Mendere (anc. *Σαμόνδης*), which rises in Ida and is by far the most important river of the Troad. The basin of the Mendere is divided by hills into two distinct parts, a southern and a northern plain. The southern—anciently called the Samonian plain—is the great central plain of the Troad, and takes its modern name from Bairamich, the chief Turkish town, which is situated in the eastern part of it near Ida. From the north end of the plain the Mendere winds in large curves through deep gorges in metamorphic rocks, and issues into the northern plain, stretching to the Hellespont. This is the plain of Troy, which is 7 or 8 m. long, and 2 or 3 m. broad on the average. The hills on the south are quite low, and towards the east the acclivities are in places so gentle as to leave the limits of the plain indeterminate. Next to the basin of the Mendere, with its two plains, the best marked feature in the river-system of the Troad is the valley of the Tuzla (anc. *Σαζούρι*). The Tuzla rises in the western part of Mt Ida, south of the plain of Bairamich, from which its valley is divided by hills; and, after flowing for many miles almost parallel with the south coast of the Troad, from which, at

Assus, it is less than a mile distant, it enters the Aegean about 20 m. north of Cape Lectum. Three alluvial plains are comprised in its course. The easternmost of these, into which the river issues from rugged mountains of considerable height, is long and narrow. The next is the broad plain round Assus, which was a fertile source of supply to that city. The third is the plain at the embouchure of the river on the west coast. This was anciently called the Halesian (*Ἁλῆσιον*) plain, partly from the maritime salt-works at Tragasae, near the town of Hamaxitus, partly also from the hot salt-springs which exist at some distance from the sea, on the north side of the river, where large formations of rock-salt are also found. Maritime salt-works are still in operation at the mouth of the river, and its modern name (*Tuzla*=salt) preserves the ancient association. A striking feature of the southern Troad is the high and narrow plateau which runs parallel with the Adramyttian Gulf from east to west, forming a southern barrier to the valley of the Tuzia. This plateau seems to have been formed by a volcanic upheaval which came late in the Tertiary period, and covered the limestone of the south coast with two successive flows of trachyte. The lofty crag of Assus is like a tower standing detached from this line of mountain-wall. The western coast is of a different character. North of the Tuzia extends an undulating plain, narrow at first, but gradually widening. Much of it is covered with the valonia oak (*Quercus agrifolia*), one of the most valuable products of the Troad. Towards the middle of the west coast the adjacent ground becomes higher, with steep acclivities, which sometimes rise into peaks; and north of these, again, the seaboard subsides towards Cape Sigeum into rounded hills, mostly low.

Natural Products.—The timber of the Troad is supplied chiefly by the pine forests on Mt Ida. But nearly all the plains and hills are more or less well wooded. Besides the valonia oak, the elm, willow, cypress and tamarisk shrub abound. Lotus, galingale and reeds are still plentiful, as in Homeric days, about the streams in the Trojan plain. The vine, too, is cultivated, the Turks making from it a kind of syrup and a preserve. In summer and autumn water-melons are among the abundant fruits. Cotton, wheat and Indian corn are also grown. The Troad is, indeed, a country highly favoured by nature—with its fertile plains and valleys, abundantly and continually irrigated from Ida, its numerous streams, its fine west seaboard, and the beauty of its scenery. Under Turkish rule, the natural advantages of the land suffice to mitigate the poverty of the sparse population, but have scarcely any positive result.

Early History.—In the Homeric legend, with which the story of the Troad begins, the people called Troes are ruled by a king Priam, whose realm includes all that is bounded by "Lesbos, Phrygia, and the Hellespont" (*Il.* xxiv. 544), i.e. the whole "Troad," with some extension of it, beyond Ida, on the north-west. According to Homer, the Achæans under Agamemnon utterly and finally destroyed Troy, the capital of Priam, and overthrew his dynasty. But there is an Homeric prophecy that the rule over the Troes shall be continued by Aeneas and his descendants. From the "Homeric" hymn to Aphrodite, as well as from a passage in the 20th book of the *Iliad* (75-353)—a passage probably later than the bulk of the book—it is certain that in the 7th or 6th century B.C. a dynasty claiming descent from Aeneas reigned in the Troad, though the extent of their sway is unknown. The Homeric tale of Troy is a poetic creation, for which the poet is the sole witness. The geographical compactness of the Troad is itself an argument for the truth of the Homeric statement that it was once united under a strong king. How that kingdom was finally broken up is unknown. Thracian hordes, including the Treres, swept into Asia Minor from the north-west about the beginning of the 7th century B.C., and it is probable that, like the Gauls and Goths of later days, these fierce invaders made havoc in the Troad. The Ionian poet Callinus has recorded the terror which they caused farther south.

Greek Settlements.—A new period in the history of the Troad begins with the foundation of the Greek settlements. The earliest and most important of these were Aeolic. Lesbos and Cyme in Aeolis seem to have been the chief points from which the Aeolic colonists worked their way into the Troad. Commanding positions on the coast, such as Assus and Sigeum, would naturally be those first occupied; and some of them have been in the hands of Aeolians as early as the 10th century B.C. It appears from Herodotus (v. 95) that about 620 B.C. Athenians occupied Sigeum, and were resisted by the Aeolic colonists from Mytilene in Lesbos, who had already established themselves in that neighbourhood. Struggles of this kind may help to account

for the fact noticed by Strabo, that the earlier colonies had often migrated from one site in the Troad to another. Such changes of seat have been, he observes, frequent causes of confusion in the topography.

The chief Greek towns in the Troad were Ilium in the north, Assus in the south and Alexandria Troas in the west. The site of the Greek Ilium is marked by the low mound of Hissarlik ("place of fortresses") in the Trojan plain, about 3 m. from the Hellespont. Exactly at what date it was founded on the top of earlier remains is uncertain (perhaps the 7th century); but it was not a place of any importance till the Hellenistic age. When Xerxes visited the Trojan plain, he "went up to the Pergamon of Priam," and afterwards sacrificed to the Ilian Athena (Herod. vii. 42). Ilium is mentioned among the towns of the Troad which yielded to Dercyllidas (399 B.C.), and as captured by Charidemus (350 B.C.). It possessed walls, but was a petty place, of little strength. In 334 B.C. Alexander, on landing in the Troad, visited Ilium. In their temple of Athena the Ilians showed him arms which had served in the Trojan War, including the shield of Achilles. Either then, or after the battle of Granicus, Alexander directed that the town should be enlarged, and should have the rank of "city," with political independence, and exemption from tribute. The battle of Ipsus (301 B.C.) added north-western Asia Minor to the dominions of Lysimachus, who executed the intentions of Alexander. He gave Ilium a wall 3 m. in circumference, incorporating with it some decayed towns of the neighbourhood, and built a handsome temple of Athena. In the 3rd century B.C. Ilium was the head of a federal league (*κοινον*) of free Greek towns, which probably included the district from Lampascus on the Hellespont to Gargara on the Adramyttian Gulf. Twice in that century Ilium was visited by Gauls. On the first occasion (278 B.C.) the Gauls, under Lutarius, sought to establish a stronghold at Ilium, but speedily abandoned it as being too weak. Forty years later (238 B.C.) Gauls were brought over by Attalus I. to help him in his war against Achaëus. After deserting his standard they proceeded to pillage the towns on the Hellespont, and finally besieged Ilium, from which, however, they were driven off by the troops of Alexandria Troas. At the beginning of the 2nd century B.C. Ilium was in a state of decay. As Demetrius of Scepsis tells us, the houses "had not even roofs of tiles," but merely of thatch. Such a loss of prosperity is sufficiently explained by the incursions of the Gauls and the insecure state of the Troad during the latter part of the 3rd century. The temple of the Ilian Athena, however, retained its prestige. In 192 B.C. Antiochus the Great visited it before sailing to the aid of the Aetolians. In 190 B.C., shortly before the battle of Magnesia, the Romans came into the Troad. At the moment when a Roman army was entering Asia, it was politic to recall the legend of Roman descent from Aeneas. Lucius Scipio and the Ilians were alike eager to do so. He offered sacrifice to the Ilian Athena; and after the peace with Antiochus (189 B.C.) the Romans annexed Rhoeeteum and Gergis to Ilium, "not so much in reward of recent services, as in memory of the source from which their nation sprang." The later history of Ilium is little more than that of Roman benefits. A disaster befell the place in 85 B.C., when Fimbria took it, and left it in ruins; but Sulla presently caused it to be rebuilt. Augustus, while confirming its ancient privileges, gave it new territory. Caracalla (A.D. 211-217) visited Ilium, and, like Alexander, paid honours to the tomb of Achilles. In the 4th century, as some rhetorical "Letters" of that age show, the Ilians did a profitable trade in attracting tourists by their pseudo-Trojan memorials. After the 4th century the place is lost to view. But we find from Constantine Porphyrogenitus (911-959) that in his day it was one of the places in the Troad which gave names to hishoprics.

Other Ancient Sites.—Many classical sites in the Troad have been identified with more or less certainty. (For ALEXANDRIA TROAS and ASSUS, see separate articles. *Neandria* seems to be rightly fixed by F. Calvert at Mount Chigri, a hill not far from Alexandria Troas, remarkable for the fine view of the whole Troad which it commands. *Cebrene* has been conjecturally placed in the eastern part of the plain of Bairamich. *Palaeosepsis* was farther east

To "Mycenaean" Troy succeeded a small unfortified settlement, which maintained itself all through the Hellenic age till the Homeric enthusiasm of Alexander the Great called a city again into being on Hisarlik.

8. The Hellenistic Ilion, however, has left comparatively little trace, having been almost completely destroyed in 85 B.C. by Fimbria. Portions of fortifications erected by Lysimachus are visible both on the acropolis (west face chiefly) and round the lower city in the plain. A small Doric temple belongs to the foundation of this city, and a larger one, probably dedicated to Athena, seems to be of the Pergamene age. Of its metopes, representing Helios and a gigantomachia, important fragments have been recovered. Coins of this city are not rare, showing Athena on both faces, and some inscriptions have been recovered proving that Hellenistic Ilion was an important municipality.

9. Lastly about the Christian era, arose a Graeco-Roman city, to which belong the theatre on the south-east slope of the hill and the ornate gateway in the same quarter, as well as a large building on the south-west and extensive remains to north-east. This seems to have sunk into decay about the 5th century A.D.

III. *The Legend of Troy*.—According to Greek legend, the oldest town in the Troad was that founded by Teucer, who was a son of the river Scamander and the nymph Ideia. Tzetzes says that the Scamander in question was the Scamander in Crete, and that Teucer was told by an oracle to settle wherever the "earth-born ones" attacked him. So when he and his company were attacked in the Troad by mice, which gnawed their bow-strings and the handles of their shields, he settled on the spot, thinking that the oracle was fulfilled. He called the town Sminthium and built a temple to Apollo Smintheus, the Cretan word for a mouse being *sminthius*. In his reign Dardanus, son of Zeus and the nymph Electra, daughter of Atlas, in consequence of a deluge, drifted from the island of Samothrace on a raft or a skin bag to the coast of the Troad, where, having received a portion of land from Teucer and married his daughter Batea, he founded the city of Dardania or Dardanus on high ground at the foot of Mt Ida. On the death of Teucer, Dardanus succeeded to the kingdom and called the whole land Dardania after himself. He begat Erichthonius, who begat a son Troos by Aeyvoche, daughter of Simois. On succeeding to the throne, Troos called the country Troy and the people Trojans. By Callirhoe, daughter of Scamander, he had three sons—Ilius, Assaracus and Ganymede. From Ilius and Assaracus sprang two separate lines of the royal house—the one being Ilius, Laomedon, Priam, Hector; the other Assaracus, Capys, Anchises, Aeneas. Ilius went to Phrygia, where, being victorious in wrestling, he received as a prize from the king of Phrygia a spotted cow, with an injunction to follow her and found a city wherever she lay down. The cow lay down on the hill of the Phrygian Ate; and here accordingly Ilius founded the city of Ilion. It is stated that Dardania, Troy and Ilion became one city. Desiring a sign at the foundation of Ilios, Ilius prayed to Zeus and as an answer he found lying before his tent the Palladium, a wooden statue of Pallas, three cubits high, with her feet joined, a spear in her right hand, and a distaff and spindle in her left. Ilius built a temple for the image and worshipped it. By Eurycleia, daughter of Adrastus, he had a son Laomedon. Laomedon married Strymo, daughter of Scamander, or Placia, daughter of Atricus or of Leucippus. It was in his reign that Poseidon and Apollo, or Poseidon alone, built the walls of Troy. In his reign also Heracles besieged and took the city, slaying Laomedon and his children, except one daughter Hesione and one son Podarees. The life of Podarees was granted at the request of Hesione; but Heracles stipulated that Podarees must first be a slave and then be redeemed by Hesione; she gave him veil for him; hence, his name of Priam (Gr. *πριάμης*, to buy). Priam married first Arisbe and afterwards Hecuba, and had fifty sons and twelve daughters. Among the sons were Hector and Paris, and among the daughters Polyxena and Cassandra. To recover Helen, whom Paris carried off from Sparta, the Greeks under Agamemnon besieged Troy for ten years. At last they contrived a way in which hollow belly many of the Greek heroes being in their army and fleet then withdrew to Tenedos, the Greeks caused the siege. The Trojans conveyed the horses to the city, and in the night the Greeks stole out, opened the gates, and Troy was taken.

Antiq. Rom. i. 68 seq. The *Iliad* deals with a period of fifty-one days in the tenth year of the war. For the wooden horse, see Homer, *Od.* iv. 271 seq.; Virgil, *Aen.* ii. 13 seq.

The Medieval Legend.—The medieval romance of Troy, the *Roman de Troie*, exercised greater influence in its day and for centuries after its appearance than any other work of the same class. Just as the *chansons de geste* of the 10th century were the direct ancestors of the prose romances which afterwards spread throughout Europe, so, even before Heliodorus and Achilles Tatius, there were quasi-histories, which reproduced in prose, with more or less exactness, the narratives of epic poetry. Long previous to the *Historia* of Flavius Philostratus (*f.* 3rd century A.D.) the Trojan War had been the subject of many a prose fiction, dignified with the title of history; but to remodel the whole story almost in the shape of annals, and to give a minute personal description of the persons and characters of the principal actors, were ideas which belonged to an artificial stage of literature. The work of Philostratus is cast in the form of a dialogue between a Phoenician traveller and a vine-grower at Eleus, and is a discourse on twenty-six heroes of the war. A fictitious journal (*Éphéméris*), professing to give the chief incidents of the siege, and said to have been written by Dictys of Crete, a follower of Idomeneus, is mentioned by Suidas, and was largely used by John Malalas and other Byzantine chroniclers. This was abridged in Latin prose, probably in the 4th century, under the title of *Dictys Cretensis de bello Trojano libri VI*. It is preceded by an introductory letter from a certain L. Septimius to Q. Aradius Rufinus, in which it is stated that the diary of Dictys had been found in his tomb at Gnosus in Crete, written in the Greek language, but in Phoenician characters. The narrative begins with the rape of Helen, and includes the adventures of the Greek princes on the return voyage. With Dictys is always associated Dares, a pseudo-historian of more recent date. Old Greek writers mention an account of the destruction of the city earlier than the Homeric poems, and in the time of Aelian (2nd century A.D.) this *Iliad* of Dares, priest of Hephaestus at Troy, was believed to be still in existence. Nothing has since been heard of it; but an unknown Latin writer, living between 400 and 600, took advantage of the tradition to compile *Dareis Phrygii de excidio Trojae historia*, which begins with the voyage of the Argo. It is in prose and professes to be translated from an old Greek manuscript. Of the two works that of Dares is the later, and is inferior to Dictys. The matter-of-fact form of narration recalls the poem of Quintus Smyrnaeus. In both compilations the gods and everything supernatural are suppressed; even the heroes are degraded. The permanent success, however, of the two works distinguishes them among apocryphal writings, and through them the Troy legend was diffused throughout western Europe. The Byzantine writers from the 7th to the 12th century exalted Dictys as a first-class authority, with whom Homer was only to be contrasted as an inventor of fables. Western people preferred Dares, because his history was shorter, and because, favouring the Trojans, he flattered the vanity of those who believed that people to have been their ancestors. Many MSS. of both writers were contained in old libraries; and they were translated into nearly every language and turned into verse. In the case of both works, scholars are undecided whether a Greek original ever existed (but see DICTYS CRETENSIS). The Byzantine grammarian, Joannes Tzetzes (*f.* 12th century), wrote a Greek hexameter poem on the subject (*Iliaca*). In 1272, a monk of Corbie translated "sans rime *L'Estoire de Troiens et de Troie* (de Dares) du Latin en Roumanns mot à mot" because the *Roman de Troie* was too long. Geoffrey of Waterford put Dares into French prose; and the British Museum has three Welsh MS. translations of the same author—works, however, of a much later period.

The name of Homer never ceased to be held in honour; but he is invariably placed in company with the Latin poets. Few of those who praised him had read him, except in the Latin redaction, in 1100 verses, by the so-called Pindarus Thebanus. It supplied the chief incidents of the *Iliad* with tolerable exactness and was a textbook in schools.

For a thousand years the myth of descent from the dispersed heroes of the conquered Trojan race was a sacred literary tradition throughout western Europe. The first Franco-Latin chroniclers traced their history to the same origin as that of Rome, as told by the Latin poets of the Augustan era; and in the middle of the 7th century Fredegarus Scholasticus (*Res. gal. script.* i. 461) relates how one party of the Trojans settled between the Rhine, the Danube and the sea. In a charter of Dagobert occurs the statement, "ex nobilissimo et antiquo Trojanorum relictorum sanguine nati." This statement is repeated by chroniclers and panegyric writers, who also considered the *History of Troy* by Dares to be the first of national books. Succeeding kings imitated their predecessors in giving official sanction to their legendary origin: Charles the Bald, in a charter, uses almost the same words as Dagobert, "ex praclaro et antiquo trojanorum sanguine nati." In England a similar tradition had been early formulated, as appears from Nennius's *Historia britonum* and Geoffrey of Monmouth. The epic founder of Britain was Brutus, son, or in another tradition, great-grandson, of Aeneas, in any case of the royal house of Troy. The tradition, repeated in Wace's version of Geoffrey, by Matthew Paris and others, persisted to the time of Shakespeare. Brutus found Albion uninhabited except by a few giants. He founded his capital on the

Troy. Opposite Troy on the west bank of the Hudson, and connected with it by bridges, are Cohoes, Watervliet and Waterford. Industrially and commercially they virtually form a part of Troy. Troy is the seat of Rensselaer Polytechnic Institute, founded in 1824 by Stephen van Rensselaer as a "school of theoretical and practical science," incorporated in 1826, and reorganized in 1849 as a general polytechnic institute. It is the oldest school of engineering in the country, and has always maintained a high rank of efficiency. The large gifts (about \$1,000,000) to the school made by Mrs Russell Sage in 1907 enabled it to add courses in mechanical and electrical engineering to its course in civil engineering. The institute had 55 instructors and 650 students in 1910. The Emma Willard School, founded as the Troy Female Seminary in 1821 by Mrs Emma Willard (1787-1870),¹ is one of the oldest schools for women in the United States. Other educational institutions include Troy Academy (1834), a non-sectarian preparatory school; La Salle Institute (conducted by the Brothers of the Christian Schools); St Joseph's Academy (Roman Catholic) and St Peter's Academy (Roman Catholic). Noteworthy buildings of a public and semi-public character include the post office, the public library, containing in 1910 43,500 volumes, the Troy Savings Bank building, the city hall, the Rensselaer county court house, a Y.M.C.A. building and St Paul's Episcopal, the Second Presbyterian and St Mary's (Roman Catholic) churches. An area of 175 acres is comprised in the city's parks, the largest of which are Prospect Park and Beman Park. In Oakwood cemetery, 400 acres, are the grave of General George H. Thomas, and a monolithic shaft to the memory of General John Ellis Wool (1784-1869), who served with distinction in the War of 1812 and in the Mexican War, and in the Civil War commanded for a time the Department of Virginia. In Washington Square there is a Soldiers' and Sailors' Monument, 93 ft. high. Altro Park, on an island a short distance down the river, is a pleasure resort in summer.

Two rapid streams, Poesten Kill and Wynants Kill, flowing into the Hudson from the east, through deep ravines, furnish good water-power, which, with that furnished by the state dam across the Hudson here, is utilized for manufacturing purposes. In 1905 the value of Troy's factory product was \$31,860,820. Of this \$11,271,708 was the value of collars and cuffs (89.5% of the value of the total American product), an industry which gave employment to 49.3% of the wage-earners in Troy; and paid 47.1% of the wages. Closely allied with this industry was shirt-making, with an output valued at \$4,263,610. Troy is the market for a fertile agricultural region, and the principal jobbing centre for a large district in north-eastern New York and eastern Massachusetts.

The site of Troy was part of the Van Rensselaer manor grant of 1629. In 1659 it was bought from the Indians, with the consent of the patroon, by Jan Barentsen Wemp, and several families settled here. In 1707 it passed into the hands of Derick van der Heyden, who laid out a large farm. During this early period it was known variously as Ferryhook, Ashley's Ferry and Van der Heyden's Ferry. In 1777 General Philip Schuyler established his headquarters on Van Schaick's Island in the Mohawk and Hudson, then the principal rendezvous of the army which later met Burgoyne at Saratoga. After the close of the war there was an influx of settlers from Rhode Island, Connecticut, New Hampshire and Vermont; a town was laid out on the Van der Heyden farm, and in 1780 the name of Troy was selected in town meeting; and in 1791 the town of Troy was formed from part of Rensselaerwyck. The county-seat was established here in 1793, and Troy was incorporated as a village in 1794 and was chartered as a city in 1816. The first newspaper, *The*

Farmer's Oracle, began publication in 1797. In 1812 a steamboat line was established between Troy and Albany. Troy benefited financially by the War of 1812, during which contracts for army beef were filled here. The opening of the Erie Canal in 1825 contributed greatly to Troy's commercial importance. During the Civil War army supplies, ammunition and cannon, and the armour-plate and parts of the machinery for the "Monitor" were made here. The first puddling works were opened in 1839, and Troy was long the centre of the New York iron and steel industry; in 1865 the second Bessemer steel works in the United States were opened here. Troy has three times been visited by severe conflagrations, that of June 1820 entailing a loss of about \$1,000,000, that of August 1854 about the same, and that of May 1862, known as "the Great Fire," the destruction of over 500 buildings, and a property loss of some \$3,000,000.

See Arthur J. Weise, *History of the City of Troy* (Troy, 1876), and *Troy's One Hundred Years* (Troy, 1891).

TROY, a city and the county-seat of Miami county, Ohio, U.S.A., on the west bank of the Great Miami river, about 65 m. W. of Columbus. Pop. (1890), 4494; (1900), 5881 (234 foreign-born); (1910), 6122. Troy is served by the Cleveland, Cincinnati, Chicago & St Louis and the Cincinnati, Hamilton & Dayton railways, and by the Dayton & Troy and the Springfield, Troy & Piqua electric inter-urban lines. The Miami and Erie Canal, formerly important for traffic, is now used only for power. The principal public buildings include the court house and the city hall, and there are a public library (housed in the city hall) and a children's home. Troy is situated in a good general farming region, of which tobacco is an important crop; and there are various manufactures. The municipality owns and operates the waterworks and electric-lighting plant. The first settlement was made in 1807, and Troy was first chartered as a city in 1890.

TROYES, a town of France, capital of the department of Aube, 104 m. E.S.E. of Paris on the Eastern railway to Belfort. Pop. (1906), 51,228. The town is situated in the wide alluvial plain watered by the Seine, the main stream of which skirts it on the east. It is traversed by several small arms of the river, and the Canal de la Haute-Seine divides it into an upper town, on the left bank, and a lower town on the right bank. The streets are, for the most part, narrow and crooked. It is surrounded by a belt of *boulevards*, outside which lie suburbs. The churches of the town are numerous, and especially rich in stained glass of the Renaissance period, from the hands of Jean Soudain, Jean Macadré, Linard Gonthier and other artists.

St Pierre, the cathedral, was begun in 1208, and it was not until 1640 that the north tower of the façade was completed. With a height to the vaulting of only 98 ft. it is less lofty than other important Gothic cathedrals of France. It consists of an apse with seven apse chapels, a choir with double aisles, on the right of which are the treasury and sacristy, a transept without aisles, a nave with double aisles and side chapels and a vestibule. The west façade belongs to the 16th century with the exception of the upper portion of the north tower; the south tower has never been completed. Three portals, that in the centre surmounted by a fine flamboyant rose window, open into the vestibule. The stained glass of the interior dates mainly from the 15th and 16th centuries. The treasury contains some fine enamel work and lace. The church of St Urban, begun in 1262 at the expense of Pope Urban IV., a native of the town, is a charming specimen of Gothic architecture, the lightness and delicacy of its construction rivaling that of churches built a century later. The glass windows, the profusion of which is the most remarkable feature of the church, date, for the most part, from the years 1265 to 1280. The church of La Madeleine, built at the beginning of the 13th century, and enlarged in the 16th, contains a rich rood-screen by Giovanni Gualdo (1508) and fine stained-glass windows of the 16th century. The church of St Jean, though hidden among old houses, is one of the most picturesque in Troyes. The choir is a fine example of Renaissance architecture and the church contains a high altar of the 17th century, stained glass of the 16th century and many other works of art. St Nicholas is a building of the 16th century with a beautiful vaulted gallery in the interior. The church of St Parolain of the 16th century and that of St Nizier, mainly of the same period, contain remarkable sculptures and paintings. St René (14th, 15th and 16th centuries) and St Martin-des-Vignes (16th and 17th centuries), the latter notable for its 18th-century windows, are also of interest. The old abbey of St Loup is occupied by a

¹ Emma Hart was born in Berlin, Connecticut, became a teacher in 1803, and in 1809 married Dr John Willard of Middlebury, Vermont, where she opened a boarding school for girls in 1812. In 1819 she wrote *A Plan for Improving Female Education*, submitted to the governor of New York state; and in 1821 she removed to Troy. Her son took charge of the school in 1838. She prepared many textbooks and wrote *Journal and Letters from France and Great Britain* (1833). See the biography (1873) by John Lord.

museum containing numerous collections. The Hôtel Dieu of the 18th century is remarkable for the fine gilded iron railing of its courtyard. Most of the old houses of Troyes are of wood, but some of stone of the 16th century are remarkable for their beautiful and original architecture. Amongst the latter the hôtels de Vauluisant, de Mauroy and de Marisy are specially interesting. The prefecture occupies the buildings of the old abbey of Notre-Dame-aux-Nonnains; the Hôtel-de-ville dates from the 17th century; the savings bank, the theatre and the Lycée are modern buildings. A marble monument to the Sons of Aube commemorates the war of 1870-71.

Troyes is the seat of a bishop and a court of assize. Its public institutions include a tribunal of first instance, a tribunal of commerce, a council of trade arbitrators, a chamber of commerce and a branch of the Bank of France. A Lycée, an ecclesiastical college, training colleges for male and female teachers, and a school of hosiery are its chief educational institutions. There are also several learned societies and a large library. The dominant industry in Troyes is the manufacture of cotton, woollen and silk hosiery, which is exported to Spain, Italy, the United States and South America; printing and dyeing of fabrics, tanning, distilling, and the manufacture of looms and iron goods are among the other industries. The market gardens and nurseries of the neighbourhood are well known. There is trade in the wines of Burgundy and Champagne, in industrial products, in snails and in the dressed pork prepared in the town.

History.—At the beginning of the Roman period Troyes (*Augustobona*) was the principal settlement of the Tricassi, from whose name its own is derived. It owed its conversion to Christianity to Saints Savinian and Potentian, and in the first half of the 4th century its bishopric was created as a suffragan of Sens. St Loup, the most illustrious bishop of Troyes, occupied the episcopal seat from 426 to 479. He is said to have persuaded Attila, chief of the Huns, to leave the town unpillaged, and is known to have exercised great influence in the Church of Gaul. The importance of the monastery of St Loup, which he founded, was overshadowed by that of the abbey of nuns known as Notre-Dame-aux-Nonnains, which possessed large schools and enjoyed great privileges in the town, in some points exercising authority even over the bishops themselves. In 802 and 808 Troyes suffered from the depredations of the Normans, who on the second occasion reduced the town to ruins. In the early middle ages the bishops were supreme in Troyes, but in the 10th century this supremacy was transferred to the counts of Troyes (see below), who from the 11th century were known as the counts of Champagne. Under their rule the city attained great prosperity. Its fairs, which had already made it a prominent commercial centre, flourished under their patronage, while the canals constructed at their expense aided its industrial development. In the 12th century both the counts and the ecclesiastics joined in the movement for the enfranchisement of their serfs, but it was not till 1230 and 1242 that Thibaut IV. granted charters to the inhabitants. A disastrous fire occurred in 1188; more disastrous still was the union of Champagne with the domains of the king of France in 1304, since one of the first measures of Louis le Hutin was to forbid the Flemish merchants to attend the fairs, which from that time declined in importance. For a short time (1419-1425), during the Hundred Years' War, the town was the seat of the royal government, and in 1420 the signing of the Treaty of Troyes was followed by the marriage of Henry V. of England with Catherine, daughter of Charles VI., in the church of St Jean. In 1420 the town capitulated to Joan of Arc. The next hundred years was a period of prosperity, marred by the destruction of half the town by the fire of 1524. In the 16th century Protestantism made some progress in Troyes but never obtained a decided hold. In 1562, after a short occupation, the Calvinist troops were forced to retire, and on the news of the massacre of St Bartholomew fifty Protestants were put to death. The revocation of the Edict of Nantes in 1685 was a severe blow to the commerce of Troyes, which was not revived by the re-establishment of the lower fairs in 1697. The population fell from 40,000 in 1600 to 25,000 at the beginning of the 16th century and in the 17th century.

COUNTS OF TROYES
from the 10th to the 15th century.

following manner. Aleran, mentioned in 837, died before the 25th of April 854. Odo (or Eudes) I. appears as count on the 25th of April 854, and seems to have been stripped of his dignities in January 859. Raoul, or Rudolph, maternal uncle of King Charles the Bald, was count of Troyes in 863 and 864, and died on the 6th of January 866. Odo I. seems to have entered again into possession of the countship of Troyes after the death of Raoul, and died himself on the 10th of August 871. Boso, afterwards king of Provence, received the countship in ward after the death of Odo I. A royal diploma was granted at his request, on the 20th of March 877, to the abbey of Montier-la-Celle in Troyes. Odo II., son of Odo I., became count of Troyes on the 25th of October 877. Robert I., brother of Odo II., was count from 879. He married Gisla, sister of kings Louis III. and Carloman, and was killed by the Northmen in 886. Alcaume, nephew of Robert I., is mentioned in 893. Richard, son of the viscount of Sens Garnier, is styled count of Troyes in a royal diploma of the 10th of December 926. He was living in 931. Herbert I., already count of Vermandois, succeeded Richard, and died in 943. Robert II., one of the five sons of Herbert of Vermandois, is called count of Troyes in an act of the 6th of August 959, and died in August 968. Herbert II. the Old, younger brother of Robert II., succeeded him and died between 980 and 983. Herbert III. the Young, nephew and successor of Herbert II., died in 995. Stephen I., son and successor of Herbert III., was alive in 1019. His successor was his cousin, Odo II., count of Blois. From the 11th century the counts of Troyes, whose domains increased remarkably, are commonly designated by the name of counts of Champagne.

See H. d'Arbois de Jubainville, *Histoire des ducs et des comtes de Champagne* (1859), vol. i.; F. Lot, *Les Derniers Carolingiens*, (1891), pp. 370-377; A. Longnon, *Documents relatifs au comté de Champagne et de Brice* (1904), ii. 9, note. (A. Lo.)

TROYON, CONSTANT (1810-1865), French painter, was born on the 28th of August 1810 at Sèvres, near Paris, where his father was connected with the famous manufactory of china. Troyon was an animal painter of the first rank, and was closely associated with the artists who painted around Barbizon. The technical qualities of his methods of painting are most masterly; his drawing is excellent, and his composition always interesting. It was only comparatively late in life that Troyon found his *métier*, but when he realized his power of painting animals he produced a fairly large number of good pictures in a few years. Troyon entered the *atelier* very young as a decorator, and until he was twenty he laboured assiduously at the minute details of porcelain ornamentation; and this kind of work he mastered so thoroughly that it was many years before he overcame its limitations. By the time he reached twenty-one he was travelling the country as an artist, and painting landscapes so long as his finances lasted. Then when pressed for money he made friends with the first china manufacturer he met and worked steadily at his old business of decorator until he had accumulated enough funds to permit him to start again on his wanderings.

Troyon was a favourite with Roqueplan, an artist of distinction eight years his senior, and he became one of his pupils after receiving certain tuition from a painter, now quite unknown, named Rioereux. Roqueplan introduced Troyon to Rousseau, Jules Dupré, and the other Barbizon painters, and in his pictures between 1840 and 1847 he seemed to endeavour to follow in their footsteps. But as a landscapist Troyon would never have been recognized as a thorough master, although his work of the period is marked with much sincerity and met with a certain success. It may be pointed out, however, that in one or two pure landscapes of the end of his life he achieved qualities of the highest artistic kind; but this was after lengthy experience as a painter, by which his talents had become thoroughly

in 1846 Troyon went to the Netherlands, and at the Hague painted Potter's famous "Young Bull." From the studies made of this picture, of Cuypp's sunny landscapes, and

brandt's noble masterpieces he soon evolved a new method of painting, and it is only in works produced after this time that Troyon's true individuality is revealed. When he became conscious of his power as an animal painter he developed with rapidity and success, until his works became recognized as masterpieces in Great Britain and America, as well as in all countries of the Continent. Success, however, came too late, for Troyon never quite believed in it himself, and even when he could command the market of several countries he still grumbled loudly at the way the world treated him. Yet he was decorated with the Legion of Honour, and five times received medals at the Paris Salon, while Napoleon III. was one of his patrons; and it is certain he was at least as financially successful as his Barbizon colleagues.

Troyon died, unmarried, at Paris on the 21st of February 1865, after a term of clouded intellect. All his famous pictures are of date between 1850 and 1864, his earlier work being of comparatively little value. His mother, who survived him, instituted the Troyon prize for animal pictures at the *École des Beaux Arts*. Troyon's work is fairly well known to the public through a number of large engravings from his pictures. In the Wallace Gallery in London are "Watering Cattle" and "Cattle in Stormy Weather"; in the Glasgow Corporation Gallery is a "Landscape with Cattle"; the Louvre contains his famous "Oxen at Work" and "Returning to the Farm"; while the Metropolitan Museum of Art and other galleries in America contain fine examples of his pictures. His "Vallée de la Touque, Normandy," is one of his greatest pictures; and at Christie's sale-room in 1902 the single figure of a cow in a landscape of but moderate quality fetched £7350. Émile van Marcke (1827-1891) was his best-known pupil.

TRUCE OF GOD, an attempt of the Church in the middle ages to alleviate the evils of private warfare. Throughout the 9th and 10th centuries, as the life-benefices of the later Carolingian kings were gradually transformed into hereditary fiefs, the insecurity of life and property increased, for there was no central power to curb the warring local magnates. The two measures which were adopted by the Church to remedy these conditions—the *pax ecclesie* or *Dei* and the *truga* or *trena Dei*—are usually both referred to as the Truce of God, but they are distinct in character. The latter was a development of the former.

The *pax ecclesie* is first heard of in the year 990 at three synods held in different parts of southern and central France—at Charroux, Narbonne and Puy. It enlisted the immediate support of the regular clergy, particularly the vigorous congregation of Cluny, and of William V. of Aquitaine, the most powerful lord of southern France, who urged its adoption at the Councils of Limoges (994) and Poitiers (999). The peace decrees of these various synods differed considerably in detail, but in general they were intended fully to protect non-combatants, they forbade, under pain of excommunication, every act of private warfare or violence against ecclesiastical buildings and their envoys, and against certain persons, such as clerics, pilgrims, merchants, women and peasants, and against cattle and agricultural implements. With the opening of the 11th century, the *pax ecclesie* spread over northern France and Burgundy, and diocesan leagues began to be organized for its maintenance. The bishop, or count, on whose lands the peace was violated was vested with judicial power, and was directed, in case he was himself unable to execute sentence, to summon to his assistance the laymen and even the clerics of the diocese, all of whom were required to take a solemn oath to observe and enforce the peace. At the Council of Bourges (1038), the archbishop decreed that every Christian fifteen years and over should take such an oath and enter the diocesan militia. The idea that peace is a divine institution seems to

have given rise to a new name for the peace, the *pax Dei*, or peace of God.

The *truga* or *trena Dei*, the prohibition of every act of private warfare during certain days, goes back at least to the Synod of Elne, held in the Pyrenees in 1027, which suspended all warfare from noon on Saturday till prime on Monday. Like the *pax ecclesie* it found ardent champions in the regular clergy, especially in Odilo (962-1049), the fifth abbot of Cluny, and soon spread over all France. It penetrated Piedmont and Lombardy in 1041 and Normandy in 1042. By this time the truce extended from the Wednesday evening to the Monday morning in every week and also, in most places, lasted during the seasons of Lent and Advent, the three great vigils and feasts of the Blessed Virgin, and those of the twelve apostles and a few other saints. The *truga Dei* was decreed for Flanders at the Synod of Thérouanne (1063) and was instituted in southern Italy in 1089, probably through Norman influence. The bishop of Liège introduced it in Germany in 1082, and three years later a synod held at Mainz in the presence of the emperor Henry IV. extended it to the whole empire. It does not appear to have secured a firm footing in England, although its general provisions were incorporated in the laws of the land (1130-1154). The popes took the direction of the matter into their own hands towards the end of the 11th century as they realized the necessity of promoting peace among Christians in order to unite them successfully in the crusades against the Mahomedans, and the first decree of the Council of Clermont (1095), at which Urban II. preached the first crusade, proclaimed a weekly truce for all Christendom, adding a guarantee of safety to all who might take refuge at a wayside cross or at the plough. The Truce of God was reaffirmed by many councils, such as that held at Reims by Calixtus II. in 1119, and the Lateran councils of 1123, 1139 and 1179. When the *truga Dei* reached its most extended form, scarcely one-fourth of the year remained for fighting, and even then the older canons relating to the *pax ecclesie* remained in force. The means employed for its enforcement remained practically the same: spiritual penalties, such as excommunication, special ecclesiastical tribunals, sworn leagues of peace, and assistance from the temporal power. The Council of Clermont prescribed that the oath of adherence to the truce be taken every three years by all men above the age of twelve, whether noble, burgess, villein or serf. The results of these peace efforts were perhaps surprisingly mediocre, but it must be borne in mind that not only was the military organization of the dioceses always very imperfect, but feudal society, so long as it retained political power, was inherently hostile to the principle and practice of private peace. The Truce of God was most powerful in the 12th century, but with the 13th its influence waned as the kings gradually gained control over the nobles and substituted the king's peace for that of the Church.

A few bishops, notably Gerard of Cambrai (1013-1051), seem from the first to have opposed the peace laws of the Church as encroaching on royal authority, but the lay rulers usually co-operated with the ecclesiastical authorities in encouraging and maintaining the Truce of God. In fact, the emperor Henry II. and the French king Robert the Pious discussed the subject of universal peace under church auspices at Monzon in 1023. By the 12th century, however, the ecclesiastical measures had proved ineffectual in coping with private warfare, and secular rulers sought independently to diminish the number and atrocity of private wars within their own domains. The provisions of the Truce of God were often incorporated bodily in municipal and district statutes such as the laws of Barcelona (1067). The emperor Henry IV. approved (1085) the extension of the truce to the whole land, and in 1103 royal laws entirely prohibiting private warfare in the empire replaced the Truce of God. In France royalty acquired little by little a preponderant influence over feudalism and used its increased prestige to substitute for the Truce of God the peace of the state. Louis VI., Louis VII. and Philip Augustus

to *T. aestivum*, of which it is regarded as a variety and probably grows in Britain. Another edible species, *T. macrosporum*, also grows in Britain, in clayey places under young beeches and oaks, on the borders of streams and roads, and sometimes in fields; more rarely it grows in plantations of willow and poplar. It has a strong scent of onions or garlic somewhat similar to *T. aestivum*, but it is less esteemed on account of its toughness and its small size.

Terfezia leonis, a famous truffle of Italy, Algeria, Sardinia, &c., resembles externally a potato. It grows in March, April and May. Some persons eat it in a raw state, sliced and dipped in oil or egg. It is not scented, and its taste is generally considered insipid or soapy. *Melanogaster variiegatus*, an ally of the puff-balls, and therefore (like *Scleroderma*) not a true truffle, is sometimes eaten in England and France. It has been, and possibly still is, occasionally sold in England under the name of "red truffle." It is a small subglobose brown species with a strong aromatic and pleasant odour of bitter almonds. When the plant is eaten raw the taste is sweet and sugary, but when cooked it is hardly agreeable. The odour belonging to many truffles is so potent that their places of growth can be readily detected by the odour exhaled from the ground. Squirrels, hogs and other animals commonly dig up truffles and devour them, and pigs and dogs have long been trained to point out the places where they grow. Pigs will always eat truffles, and dogs will do so occasionally; it is therefore usual to give the trained pig or dog a small piece of cheese or some little reward each time it is successful. Truffles are reproduced by spores, which serve the same purpose as seeds in flowering plants; in true truffles the spores are borne in transparent sacs (asci), from four to eight spores in each ascus. The asci are embedded in vast numbers in the flesh of the truffle.

Spores of the Chief European Truffles.

In false truffles the spores are free and are borne on minute spicules or supports. The spores of the chief European truffles, true and false, enlarged five hundred diameters, are shown in the accompanying illustration. Many references to truffles occur in classical authors. The truffle *Elaphomyces variiegatus* was till quite recent times used, under the name of Hart's nut or Lycoperdon nut, on account of its supposed aphrodisiac qualities.

TRUJILLO, or **TRUXILLO**, a seaport on the Atlantic coast of Honduras, in 15° 54' N. and 86° 5' W. Pop. (1905), about 4000. The harbour, an inlet of the Bay of Honduras, is sheltered on the north by the promontory of Cape Honduras; it is deep and spacious, but insecure in westerly winds. Mahogany, dye-woods, sarsaparilla, cattle, hides and fruit are exported; grain, flour, hardware and rum are imported. Trujillo was founded in 1524, and became one of the most prosperous ports of the new world, and the headquarters of a Spanish naval squadron. During the 17th century it was frequently and successfully raided by buccaneers, and thus lost much of its commerce. Still more has in modern times been diverted to Puerto Cortes and the Bay Islands.

TRUJILLO, or **TRUXILLO**, a city of northern Peru, the capital of the department of Libertad, 110 m. from Lima and 14 m. from the Pacific coast, 9° 29' S. 79° 9' W. Pop. (1906, estimate), about 10,000. It is situated on the arid, sandy plain (Mansiché) on the coast from Paita south to the mouth of the Moche or Chimu river, and is 100 m. from the celebrated Chimu Valley. The ruins of an old Indian city commonly known as Trujillo together with extensive aqueducts are partly enclosed by an old adobe wall. The public institutions include a

university, two national colleges, one of which is for girls, an episcopal seminary, a hospital and a theatre.

Trujillo was once an important commercial centre and the metropolis of northern Peru, but the short railways running inland from various ports have taken away its commercial importance. The port of Salaverry (with which Trujillo is connected by rail) is about 10 m. south-east, where the national government has constructed a long iron pier. Railways also extend northward to Ascope and eastward to Laredo, Galindo and Menocucho, and a short line runs from Roma, on the Ascope extension, to the port of Huanchaco. The only important manufactures of Trujillo are cigars and cigarettes.

Trujillo was founded in 1535, by Francisco Pizarro, who gave it the name of his native city in Spain. Its position on the road from Tumbez to Lima gave it considerable political and commercial importance, and some reflection of that colonial distinction still remains. It suffered little in the War of Independence, but was occupied and plundered by the Chileans in 1882.

Of the ancient aboriginal city, or group of towns, whose ruins and burial-places cover the plain on every side of Trujillo, comparatively little is definitely known. The extent of these ruins, which cover an area 12 to 15 m. long by 5 to 6 m. wide, demonstrate that it was much the largest Indian city on the southern continent. The principal ruins are 4 m. north of Trujillo, but others lie more to the eastward and still others southward of the banks of the Moche. The great aqueduct, which brought water to the several large reservoirs of the city, was 14 m. long and in some places in crossing the Chimu Valley it had an elevation of 60 ft.

The name of Grand Chimu is usually given to the ruined city, this being the title applied to the chief of the people, who were called the Chimu, or Yuncas. They were a race wholly distinct from the Incas, by whom they were finally conquered. They spoke a different language and had developed an altogether different civilization, and it is not unreasonable to presume that they were related to some earlier race of southern Mexico. Specimens of skillfully wrought ornaments of gold and silver, artistically made pottery, and finely woven fabrics of cotton and wool (alpaca), have been found in their huacas, or burial-places. Bronze was known to them, and from it tools and weapons were made. Their extensive irrigation works show that they were painstaking agriculturists, and that they were successful ones may be assumed from the size of the population maintained in so arid a region. Since the Spanish conquest their huacas have been opened and rifled, and many of the larger masses of ruins have been extensively mined in search of treasure, but enough still remains to impress upon the observer the magnitude of the city and the genius of the people who built it. Nothing is known of their history or of their political institutions, but these remains of their handiwork bear eloquent testimony that they had reached a degree of development in some respects higher even than that of the Incas.

See E. G. Squier, *Peru* (New York, 1877); and Charles Wiener, *Pérou et Bolivie* (Paris, 1882).

TRUJILLO, a town of Spain, in the province of Caceres; on a hill 25 m. east of Caceres, and on the river Tozo, a tributary of the Tagus. Pop. (1900), 12,512. The surrounding country is rugged, but produces wheat, wine, oils and fruit, besides livestock of all sorts, and much phosphorite. There are valuable forests close to the town. In the oldest part of Trujillo are the remains of a castle said to be of Roman origin, but rebuilt by the Moors and restored in modern times. The Julia tower is also said to be Roman, like much of the fortifications. The Roman name for the town was Turgalum. The principal parish church, Santa Maria, is a fine Gothic structure of the 15th century. Trujillo was a town of importance in the middle ages. Pizarro, the conqueror of Peru, was born here about 1471, and built a palace, which still stands, in the main square of the town.

TRUMBALL, **SIR WILLIAM** (1639-1716), English politician, was a grandson of William Trumball (d. 1635), who was for sixteen years English resident at Brussels and afterwards a clerk of the privy council. Educated at St John's College, Oxford, young Trumball became a fellow of All Souls and settled down as a practising lawyer in Oxford and in London. He was made chancellor of the diocese of Rochester and was sent to Tangier on public business in 1683, one of his companions

on this errand being the diarist Pepsys. In 1684 Trumbull was knighted by Charles II. and in 1685 he was sent as envoy to France, where he worked hard on behalf of the English Protestants there who were threatened by the Revocation of the Edict of Nantes. In 1685 he became a member of Parliament, in 1687 he went as ambassador to Constantinople, and in 1694 he was made a lord of the treasury. From May 1695 until December 1697 he was a secretary of state under William III. He died on the 14th of December 1716. His son, William Trumbull (1708-1760), had an only daughter, who became the wife of the Hon. Martin Sandys. She was thus the ancestress of the later marquesses of Downshire.

Many of Trumbull's letters are in the British Museum and in the Record Office, London. Trumbull was on friendly terms with Pierre Bayle and with Dryden, whom he advised to translate Virgil. He was also very intimate with Pope, whom he influenced in several ways, especially in urging him to make a translation of Homer.

TRUMBULL, JAMES HAMMOND (1821-1897), American scholar, was born in Stonington, Connecticut, on the 20th of December 1821. He studied at Yale, but ill-health prevented his graduation. He was state librarian in 1854-1855, assistant-secretary of state of Connecticut in 1847-1852 and in 1858-1861, and secretary of state in 1861-1866; and was a prominent member of the Connecticut Historical Society, of which he was president in 1863-1889, the National Academy of Science, to which he was elected in 1872, and of other learned societies. He died in Hartford on the 5th of August 1897. He wrote *Historical Notes on some Provisions of the Connecticut Statutes* (1860-1861) and *The True Blue Laws of Connecticut* (1876), and edited *The Colonial Records of Connecticut* (3 vols., 1850-1859). He is better known, however, as a student of the Indian dialects of New England.

He edited Roger Williams's *Key to the Language of America* (1866), and wrote *The Composition of Indian Geographical Names* (1870), *The Best Methods of Studying the Indian Languages* (1871), *Indian Names of Places in . . . Connecticut with Interpretations* (1881) and other works on similar subjects.

TRUMBULL, JOHN (1750-1831), American poet, was born in what is now Watertown, Connecticut, where his father was a Congregational preacher, on the 24th of April 1750. At the age of seven he passed his entrance examinations at Yale, but did not enter until 1763; he graduated in 1767, studied law there, and in 1771-1773 was a tutor. In 1773 he was admitted to the bar, in 1773-1774 practised law in Boston, working in the law-office of John Adams, and after 1774 practised in New Haven. He was state attorney in 1789, a member of the Connecticut Assembly in 1792 and 1800, and a judge of the Superior Court in 1801-1819. The last six years of his life were spent in Detroit, Michigan, where he died on the 10th of May 1831. While studying at Yale he had contributed in 1769-1770 ten essays, called "The Meddler," imitating *The Spectator*, to the *Boston Chronicle*, and in 1770 similar essays, signed "The Correspondent" to the *Connecticut Journal and New Haven Post Boy*. While a tutor he wrote his first satire in verse, *The Progress of Dulness* (1772-1773), an attack in three poems on educational methods of his time. His great poem, which ranks him with Philip Freneau and Francis Hopkinson as an American political satirist of the period of the War of Independence, was *McFingal*, of which the first canto, "The Town-Meeting," appeared in 1776 (dated 1775). This canto, about 1500 lines, contains some verses from "Gage's Proclamation," published in the *Connecticut Courant* for the 7th and the 14th of August 1775, it portrays a Scotch Loyalist, McFingal, and his Whig opponent, Honorius, evidently a portrait of John Adams. This first canto was divided into two, and with a third and a fourth canto was published in 1782. After the war Trumbull was a right Federalist, and with the "Hartford Wits" David Humphreys, Joel Barlow and Lemuel Hopkins, wrote the *Anarchiad*, a poem directed against the enemies of a firm central government.

See the memoir in the Hartford edition of Trumbull's *Poetical Works* (2 vols., 1820); James Hammond Trumbull's *The Origin of "McFingal"* (Morrisania, New York, 1868); and the estimate in M. C. Tyler's *Literary History of the American Revolution* (New York, 1897).

TRUMBULL, JOHN (1736-1843), American artist, was born at Lebanon, Connecticut, on the 6th of June 1736, the son of Jonathan Trumbull (1710-1785), governor of Connecticut. He graduated at Harvard in 1753, served in the War of Independence, rendering a particular service at Boston by sketching plans of the British works, and was appointed second aide-de-camp to General Washington and in June 1776 deputy adjutant-general to General Gates, but resigned from the army in 1777. In 1780 he went to London to study under Benjamin West, but his work had hardly begun when the news of the arrest and execution of Major André, who was deputy adjutant-general in the English army, suggested the arrest of Trumbull as having been an officer of similar rank in the Continental army; he was imprisoned for seven months. In 1784 he was again in London working under West, in whose studio he painted his "Battle of Bunker Hill" and "Death of Montgomery," both of which are now in the Yale School of Fine Arts. In 1785 Trumbull went to Paris, where he made portrait sketches of French officers for "The Surrender of Cornwallis," and began, with the assistance of Jefferson, "The Signing of the Declaration of Independence," well-known from the engraving by Asher B. Durand. These paintings, with "The Surrender of Burgoyne," and "The Resignation of Washington," were bought by the United States government and placed in the Capitol at Washington. Trumbull's "Sortie from Gibraltar" (1787), owned by the Boston Athenaeum, is now in the Boston Museum of Fine Arts, and a series of historical paintings, the "Trumbull Gallery," by far the largest single collection of his works (more than 50 pictures), has been in the possession of Yale College since 1831, when Trumbull received from the college an annuity of \$1000. His portraits include full lengths of General Washington (1790) and George Clinton (1791), in the city-hall of New York—where there are also full lengths of Hamilton and of Jay; and portraits of John Adams (1797), Jonathan Trumbull, and Rufus King (1800); of Timothy Dwight and Stephen Van Rensselaer, both at Yale; of Alexander Hamilton (in the Metropolitan Museum of Art, New York City, and in the Boston Museum of Fine Arts, both taken from Ceracchi's bust); a portrait of himself painted in 1833; a full length of Washington, at Charleston, South Carolina; a full length of Washington in military costume (1792), now at Yale; and portraits of President and Mrs Washington (1794), in the National Museum at Washington. Trumbull's own portrait was painted by Stuart and by many others. In 1794 Trumbull acted as secretary to John Jay in London during the negotiation of the treaty with Great Britain, and in 1796 he was appointed by the commissioners sent by the two countries the fifth commissioner to carry out the seventh article of the treaty. He was president of the American Academy of Fine Arts in 1816-1825. He died in New York on the 10th of November 1843.

See his *Autobiography* (New York, 1841); J. F. Weir, *John Trumbull, A brief Sketch of His Life, to which is added a Catalogue of his Works* (New York, 1901); and John Durand, "John Trumbull," *American Art Review*, vol. ii. pt. 2, pp. 181-191 (Boston, 1881).

TRUMBULL, JONATHAN (1710-1785), American political leader, was born at Lebanon, Connecticut, on the 12th of October 1710. He graduated at Harvard in 1727, and began the study of theology, but in 1731 engaged in business with his father. He next studied law, was elected to the Assembly in 1773, and held public office almost continuously afterward. He served for seven years in the Assembly, being Speaker for three years, for seventeen years as county judge of Windham county, for twenty-two years (after 1740) as governor's assistant, for two years as deputy-governor (1767-1769), and for three years (1766-1769) as chief justice of the colony. In 1769 he was elected governor and continued in office until his voluntary retirement in 1784. During the War of Independence he was a valued counsellor of Washington. The story that the term "Brother Jonathan," a sobriquet for the United States, originated in Washington's familiar form of addressing him seems to be without any foundation. After the war Trumbull was a strong Federalist. He died in Lebanon on the 17th of August 1785.

His public papers have been printed in the Massachusetts Historical Society's *Collections*, 5th series, vols. ix.-x. (Boston, 1885-1888), and 7th series, vols. ii.-iii. (1902). See I. W. Stuart, *Life of Jonathan Trumbull, sen.* (Boston, 1899).

His son JONATHAN (1740-1809) graduated at Harvard in 1759, served in the War of Independence as paymaster-general of the northern department in 1775-1778 and as a military secretary of Washington in 1778-1783, and was a member of the national House of Representatives in 1780-1795, serving as Speaker in 1791-1793, and of the United States Senate in 1795-1796; he was lieutenant-governor of Connecticut in 1796-1798, and governor in 1798-1809. Another son, JOSEPH (1737-1778), was a member of the first Continental Congress (1774-1775), became commissary-general of stores of the Continental army in July 1775 and commissary-general of purchases in June 1777, resigned in August 1777, and from November 1777 to April 1778 was commissioner for the board of war. A grandson of the first Jonathan, JOSEPH (1782-1861), was a Whig representative in Congress in 1834-1835 and in 1839-1843, and was governor of Connecticut in 1849-1850.

TRUMBULL, LYMAN (1813-1896), American jurist and political leader, was born at Colchester, Connecticut, on the 12th of October 1813, and was a grandson of Benjamin Trumbull (1735-1830), a Congregational preacher and the author of a useful *Complete History of Connecticut* (2 vols., 1818). He taught in Georgia, studied law, and was admitted to the bar in 1837. Removing to Belleville, Illinois, in the same year, he was elected to the state House of Representatives as a Democrat in 1840, and in 1841-1843 was secretary of state of Illinois. In 1848-1853 he was a justice of the state Supreme Court, and in 1855-1873 was a member of the United States Senate. Elected as an Anti-Nebraska Democrat, he naturally joined the Republicans, and when this party secured control in the Senate he was made chairman of the important judiciary committee, from which he reported the Thirteenth Amendment to the Constitution of the United States abolishing slavery. Throughout the Civil War he was a trusted counsellor of the president. In the impeachment trial of President Andrew Johnson he was one of the seven Republicans who voted to acquit, and he afterwards returned to the Democratic party. After 1873 he practised law in Chicago, was the Democratic candidate for governor of Illinois in 1880, became a Populist in 1894, and defended the railway strikers in Chicago in the same year. He died in Chicago on the 25th of June 1896.

TRUMP (1) (O. Fr. *trompe*), originally the name of a musical instrument, of which "trumpet" is a diminutive; the term is now chiefly used in the sense of the sound of a trumpet, or a sound resembling it, such as is made by an elephant. It has been usually accepted that the Romanic forms (cf. Span. and Port. *trompa*) represent a corruption of Latin *tuba*, tube. On the other hand a distinct initiative or echoic origin is sometimes assigned. (2) In the sense of a playing card belonging to the suit which beats all other cards of other suits for the period during which its rank lasts, "trump" is a corruption of "triumph." The name was first used of a game of cards, also known as "ruff," which was the parent of the modern game of whist. There are traces in English of an early confusion with a term meaning to deceive or trick, cf. "trumpery," properly deceit, imposture, hence idle talk, gossip, now chiefly used as an adjective, worthless, trivial. This is an adaptation of French *tromper*, to deceive, which, according to the generally received explanation, meant "to play on the trumpet," *se tromper de quelqu'un* being equivalent to play with a person, hence to cheat.

TRUMPET (Fr. *trompette, clairon*; Ger. *Trompete, Klarino, Trummet*, Ital. *tromba, trombetta, clarino*), in music, a brass wind instrument with cup-shaped mouthpiece and a very characteristic tone. It consists of a brass or silver tube with a narrow cylindrical bore except for the bell joint, forming from $\frac{1}{2}$ to $\frac{3}{4}$ of the whole length, which is conical and terminates in a bell of moderate diameter. The tube of the trumpet is doubled round upon itself to form a long irregular rectangle with rounded

corners. A tuning slide consisting of two U-shaped cylindrical tubes fitting into each other is interpolated between the bell joint and the long cylindrical joint to which the mouthpiece is attached. The mouthpiece consists of a hemispherical cup with a rim across which the lips stretch. The shape of the cup, and more especially of the bottom, in which is pierced a hole communicating with the main bore, is of the greatest importance on account of its influence on the tone quality and on the production of the higher harmonics (see MOUTHPIECE). The shallower and smaller the cup the more easily are the higher harmonics produced; the sharper the angle at the bottom of the cup the more brilliant and incisive is the timbre, given, of course, the correct style of blowing. The diameter of the cup varies according to the pitch and to the lip-power of the player who chooses one to suit him. See HORN for the laws governing the acoustic properties of brass tubes and the production of sound by means of the lips stretched like a vibrating membrane across the mouthpiece.

There are three principal kinds of trumpets: (1) the natural trumpet, mainly used in cavalry regiments, in which the length of the tube and pitch are varied by means of crooks; (2) the slide and double-slide trumpets, in which a chromatic compass is obtained, as in the trombone, by double tubes sliding upon one another without loss of air; (3) the valve trumpet, similar in its working to all other valve instruments. The first and second of these alone give the true trumpet timbre; the tone of the valve trumpet approximates to that of the cornet, nevertheless, it is now almost universally used.

FIG. 1.—Military Trumpet in F (Besson).

In the trumpet the notes of the harmonic series from the 3rd to the 10th or 10th upper partials are produced by the varied tension of the lips and pressure of breath called overblowing. The fundamental and the second harmonic are rarely obtainable, and are therefore left out of consideration; the next octave from the 4th to the 8th harmonics contains only the 3rd, 5th and minor 7th, and is therefore mainly suitable for fanfare figures based on the common chord. The diatonic octave is the highest and its upper notes are only reached by very good players on trumpets of medium pitch. Examination of the scoring for the trumpet before any satisfactory means of bridging over the gaps in the compass had been found, shows how little the composers, and especially Bach, allowed themselves to be daunted by the limited resources at their disposal.

A curious phenomenon has been observed¹ in connexion with the harmonic series of the trumpet, when the instrument is played by means of a special clarino mouthpiece (a shallow one enabling the performer to reach the higher harmonics), in which the passage at the bottom of the cup inaugurated by the sharp angle (known as the *grain* in French) is prolonged in cylindrical instead of conical bore for a distance of about 10 cm. (4 in.) right into the main tube. This peculiar construction of the mouthpiece, which might be considered insignificant, so upsets the acoustic properties of the tube that extra notes can be interpolated between the legitimate notes of the harmonic series thus:—

The black notes represent the extra notes, which in the next octave transform the diatonic into a chromatic scale.

This phenomenon may perhaps furnish an explanation of some peculiarities in the scoring of Bach and other composers of his day, and also in accounts of certain performances on the trumpet which have read as fairy tales. It is probable that the clarino mouthpiece was one of the secrets of the guilds which has remained undiscovered till now. D. J. Blaikley writes: "I had an opportunity yesterday of trying the trumpet mouthpiece as described by Mahillon with the 'grain' or 'throat,' as we would call it, extended for about 10 cm. and terminating abruptly. With such a mouthpiece, used by itself without any trumpet, I could easily get

notes from that is to say, that a continuous

glide ranging over that compass can be made, the pitch at any moment being determined by the lip-pressure, rather than by the small air-column. When such a distorted mouthpiece is fitted to a

² See Fétis, *Biographie universelle des musiciens*, "Fantini."

³ Letter to the present writer, 6th of February 1909.

trumpet, we have a resonator whose proper tones are disturbed and all the notes sounded are capable of being much modified in pitch by the lips. For instance, we may regard the 'd' as either No. 4 sharpened or No. 5 flattened, merely by lip-action, and other notes in the same way."

The compass of the three kinds of trumpets in real sounds is as follows:—

For the natural trumpet with crooks—

For the slide or double-slide trumpet with all chromatic semitones—

This instrument is a non-transposing one, the music being sounded as written.

For the valve trumpet—

The material of which the tube is made has nothing to do with the production of that brilliant quality of tone by which the trumpet is so easily distinguished from every other mouthpiece instrument; the difference is partly due to the distinct form given to the basin of the mouthpiece, as stated above, but principally to the proportions of the column of air determined by the bore. The difference in timbre between trumpet and trombone is accounted for by the wider bore and differently shaped mouthpiece of the latter instrument.

Tonguing, both double and triple, is used with great effect on the trumpet: this device consists in the articulation with the tongue of the syllables *te-ke* or *ti-ke* repeated in rapid succession for groups of two or four notes, and of *te-ke-ti* for triplets.

We have no precise information as to the form which the lituus, one of the ancestors of the modern trumpet, assumed during the middle ages, and it is practically unrepresented in the miniatures and other antiquities, though there is a miniature in the Bible, presented in 850 to Charles the Bald, which places the lituus in the hands of one of the companions of King David. We are not, however, warranted in concluding from this that the Etruscan instrument was in use in the 9th century. The lituus or cavalry trumpet of the Romans seems to have vanished with the fall of the Roman Empire, for although the name occasionally finds a place in Latin vocabularies, the instrument and name are both unrepresented in the development of musical instruments of western Europe: its successor, the cavalry trumpet of the 15th and succeeding centuries, was evolved from the straight *busine*, an instrument traced, by means of its name no less than by the delicate proportions of its tube and the shape of the bell, to the Roman *buccina* (*q.v.*). The straight *busine*, if we may judge from the presentments made by various artists, were not all made with bores of the same calibre, some having the wider bore of the trombone, others that of the trumpet. They abound in the illuminated MSS. of the 11th to the 14th centuries. The uses to which they are put, as the instruments of angels, of heralds, of trumpeters on horseback and on foot, at court banquets and functions of state, form additional proof of their identity. Fra Angelico (*d. 1455*) painted angels with trumpets having either straight or zigzag tubes, the shortest being about 5 ft. long. The perfect representation of the details, the exactness of the proportions, the natural pose of the angel players, suggest that the artist painted the instrument from real models.

The credit of having bent the tube of the trumpet in three parallel branches, thus creating its modern form, has usually been claimed for a Frenchman named Maurin (1498-1515). But the transformation was really made much earlier, probably in the Low Countries or north Italy; in any case it had already been accomplished in the bas-reliefs of Luca della Robbia intended to ornament the organ chamber of the cathedral of Florence where a trumpet having the tube bent back as just described is very distinctly figured. From the beginning of the 16th century we have numerous sources of information. Virdung¹ cites three

¹ In the Bibliothèque Nationale at Paris, reproduced in facsimile by Count Auguste de Bastard (Paris, 1883).

² *Musica getulst und aussgezogen* (Basel, 1511).

kinds of mouthpiece instruments—the *Felltrummel*, the *Clarets*, and the *Thurner Horn*; unfortunately he does not mention their distinctive characters, and it is impossible to make them out by examination of his engravings. Probably the *Felltrummel* and the *Clarets* closely resembled each other; but the compass of the former, destined for military signals, hardly went beyond the eighth proper tone, while the latter, reserved for high parts, was like the clarino (*see below*). The *Thurner Horn* was probably a kind of clarino or clarion used by watchmen on the towers. The *Trummel* and the *Jäger Trummel* are the only two mouthpiece instruments of the trumpet kind cited by Praetorius.³ The first was tuned in D at the chamber pitch or "Cammerton," but with the help of a shank it could be put in C, the equivalent of the "chorton" D, the two differing about a tone. Sometimes the *Trummel* was lowered to B and even B \flat . The *Jäger Trummel*, or "trompette de chasse," was composed of a tube bent several times in circles, like the posthorn, to make use of a comparison employed by Praetorius himself. His drawing does not make it clear whether the column of air was like that of the trumpet; there is therefore some doubt as to the true character of the instrument. The same author further cites a wooden trumpet (*hölzerne Trummel*), which is no other than the Swiss Alpenhorn or the Norwegian *luur*. The shape of the trumpet, as seen in the bas-reliefs of Luca della Robbia, was retained for more than three hundred years: the first alterations destined to revolutionize the whole technique of the instrument were made about the middle of the 18th century. Notwithstanding the imperfections of the trumpet during this long period, the performers upon it acquired an astonishing dexterity.

The usual scale of the typical trumpet, that in D, is

Praetorius exceeds the limits of this compass in the higher range, for he says a good trumpeter could produce the subjoined notes.

This opinion is shared by Bach, who, in a trumpet solo which ends the cantata "Der Himmel lacht," wrote up to the twentieth harmonic. So considerable a compass could not be reached by one instrumentalist: the trumpet part had therefore to be divided, and each division was designated by a special name.⁴ The part that was called principal went from the fifth to the tenth of these tones. The higher region, which had received the name of "clarino," was again divided into two parts: the first began at the eighth proper tone and mounted up towards the extreme high limit of the compass, according to the skill of the executant; the second, beginning at the sixth proper tone, rarely went beyond the twelfth. Each of these parts was confided to a special trumpeter, who executed it by using a larger or a smaller mouthpiece. Some of the members of the harmonic series also received special names; the fundamental or first proper note was called *Flattertrub*, the second *Grobstimme*, the third *Businung*, the fourth *Mittelstimme*.

Playing the clarino differed essentially from playing the military trumpet, which corresponded in compass to that called principal. Compelled to employ very small mouthpieces to facilitate the emission of very high sounds, clarino players could not fail to alter the timbre of the instrument, and instead of getting the brilliant and energetic quality of tone of the mean register they were only able to produce more or less sonorous notes without power and splendour. Apart from this inconvenience, the clarino presented numerous deviations from just intonation. Hence the players of that time failed to obviate the bad effects inevitably resulting from the natural imperfection of the harmonic scale of the trumpet in that extreme part of its compass; in the execution, for instance, of the works of Bach, where the trumpet should give sometimes

and sometimes \sharp , only command the eleventh proper tone, which is neither the one nor the other of these. Further, the thirteenth proper tone, for which is written, is really too flat, and but little can be done to remedy this defect, since it entirely depends upon the laws of resonance affecting columns of air.

³ *Organographia* (Wolffenbüttel, 1619).

⁴ *Musicus abstrahentes oder der sich selbst informierende Musicus* (Eiscl, Erlurt, 1738).

the best form for a speaking trumpet. Lambert, in the *Berlin Memoirs* for 1763, seems to have been the first to give a theory of the action of this instrument, based on an altogether imaginary analogy with the behaviour of light. In this theory, which is still commonly put forward, it is assumed that sound, like light, can be propagated in rays. This, however, is possible only when the aperture through which the wave-disturbance passes into free air is large compared with the wave-length. If the fusiform mouth of the speaking trumpet were half a mile or so in radius, Lambert's theory might give an approximation to the truth. But with trumpets whose aperture is only a foot in diameter at the most the problem is one of diffraction.

In the hearing trumpet, the disturbance is propagated along the converging tube much in the same way as the tide-wave is propagated up the estuary of a tidal river. In speaking and hearing trumpets alike all reverberation of the instrument should be avoided by making it thick and of the least elastic materials, and by covering it externally with cloth. (See SOUND.)

TRUMPETER, or **TRUMPET-BIRD**, the literal rendering in 1747, by the anonymous English translator of De la Condamine's travels in South America (p. 87), of that writer's "Oiseau trompette" (*Mém. de l'Acad. des Sciences*, 1745, p. 473), a bird, which he says was called "Trompetero" by the Spaniards of Maynas on the upper Amazons, from the peculiar sound it utters. He added that it was the "Agami" of the inhabitants of Para and Cayenne,¹ wherein he was not wholly accurate, since those

(After Mitchell.)

White-winged Trumpeter (*Psophia leucoptera*).

birds are specifically distinct, though, as they are generically united, the statement may pass. But he was also wrong, as had been P. Barrère (*France équinoxiale*, p. 132) in 1741, in identifying the "Agami" with the "Macucagua" of Marcgrav, for that is a Tinamou (*q.v.*); and both still more wrongly accounted for the origin of the peculiar sound just mentioned, whereby Barrère was soon after led (*Ornith. Spec. Novum*, pp. 62, 63) to apply to the bird the generic and vulgar names of *Psophia* and "Petteuse," the former of which, being unfortunately adopted by Linnaeus, has ever since been used, though in 1766 and 1767 Pallas (*Miscellanea*, p. 67, and *Spicilegium*, iv. 6), and in 1768 Vosmaer (*Descr. du Trompette Américain*, p. 5), showed that the notion it conveys is erroneous. Among English writers the name "Trumpeter" was carried on by Latham and others so as to be generally accepted, though an author may occasionally be found willing to resort to the native "Agami," which is that almost always used by the French.

P. L. Sclater and O. Salvin in their *Nomenclator* (p. 141) admit 6 species of Trumpet-birds: (1) the original *Psophia petteuses* of Guiana; (2) *P. majuscula* of eastern Ecuador (which is very likely

¹ Not to be confounded with the "Hervo Agami" of Buffon (*Oiseaux*, ii. 316), which is the *Ardea agami* of other writers.

the original "Oiseau trompette" of De la Condamine); (3) *P. ochroptera* from the right bank of the Rio Negro; (4) *P. leucoptera* from the right bank of the upper Amazons; (5) *P. viridis* from the right bank of the Madeira; and (6) *P. obscura* from the right bank of the lower Amazons near Para. And they have remarked in the *Zoological Proceedings* (1867, p. 592) on the curious fact that the range of the several species appears to be separated by rivers, a statement confirmed by A. R. Wallace (*Geogr. Distr. Animals*, ii. 358), and in connexion therewith it may be observed that these birds have short wings and seldom fly, but run, though with a peculiar gait, very quickly. A seventh species, *P. cantalairi*, from Bolivia, has since been indicated by W. Blasius (*Journ. f. Ornith.*, 1884, pp. 203-210), who has given a monographic summary of the whole group very worthy of attention. The chief distinctions between the species lie in colour and size, and it will be here enough to describe briefly the best known of them, *P. crepians*. This is about the size of a large barndoor fowl; but its neck and legs are longer, so that it is a taller bird. The head and neck are clothed with short velvety feathers; the whole plumage is black, except that on the lower front of the neck the feathers are tipped with golden green, changing according to the light into violet, and that a patch of dull rusty brown extends across the middle of the back and wing-coverts, passing into ash-colour lower down, where they hang over and conceal the tail. The legs are bright pea-green. The habits of this bird are very wonderful, and it is much to be wished that fuller accounts of them had appeared. The curious sound it utters, noticed by the earliest observers, has been already mentioned, and by them also was its singularly social disposition towards man described; but the information supplied to Buffon (*Oiseaux*, iv. 496-501) by Manoncour and De la Borde, which has been repeated in many works, is still the best we have of the curious way in which it becomes semi-domesticated by the Indians and colonists and shows strong affection for its owners as well as for their living property—poultry or sheep—though in this reclaimed condition it seems never to breed.² Indeed nothing can be positively asserted as to its mode of nidification; but its eggs, according to C. E. Bartlett, are of a creamy white, rather round, and about the size of bantams'. C. Waterton in his *Wanderings* (Second Journey, chap. iii.) speaks of falling in with flocks of 200 or 300 "Waracabas," as he called them, in Demerara, but added nothing to our knowledge of the species; while the contributions of Trill (*Mem. Wern. Society*, v. 523-532) and as Dr Hancock (*Mag. Nat. History*, 2nd series, vol. ii. pp. 490-492) as regards its habits only touch upon them in captivity.

To the trumpeters must undoubtedly be accorded the rank of a distinct family, *Psophiidae*; but like so many other South-American birds they seem to be the less specialized descendants of an ancient generalized group—perhaps the common ancestors of the *Rallidae* and *Gruidae*. The structure of the trachea, though different from that described in any Crane (*q.v.*), suggests an early form of the structure which in some of the *Gruidae* is so marvelously developed, for in *Psophia* the windpipe runs down the breast and belly immediately under the skin to within about an inch of the anus, whence it returns in a similar way to the front of the sternum, and then enters the thorax. Analogous instances of this formation occur in several other groups of birds not at all allied to the *Psophiidae*. (A. N.)

TRUNK (Fr. *tronc*, Lat. *truncus*, cut off, maimed), properly the main stem of a tree from which the branches spring, especially the stem when stripped of the branches; hence, in a transferred sense, the main part of a human or animal body without the head, arms or legs. It is from this last sense that the term "trunk-hose" is derived. These were part of the typical male costume of the 16th century, consisting of a pair of large puffed and slashed over-hose, reaching from the waist to the middle of the thigh, the legs clad in the long hose being thrust through them; the upper part of the body was covered by the jerkin or jacket reaching to the thigh (see COSTUME). The word "trunk" as applied to the elongated proboscis of the elephant is due to a mistaken confusion of French *trompe*, trumpet, with "trunk" meaning the hollow stem of a tree. A somewhat obscure meaning of French *tronc*, i.e. an alms-box, has given rise to the general use of "trunk" for a form of travellers' luggage.

TRURO, THOMAS WILDE, 1ST BARON (1782-1855), lord chancellor of England, was born in London on the 7th of July

² In connexion herewith may be mentioned the singular story told by Montagu (*Orn. Dict.*, Suppl. Art. "Grosbeak, White-winged") on the authority of the then Lord Stanley, afterwards president of the Zoological Society, of one of these birds, which, having apparently escaped from confinement, formed the habit of attending a peach-orchard. On the occasion of a party of hounds running through the yard, the trumpeter joined and kept up with them for nearly three miles!

1782, being the second son of Thomas Wilde, an attorney. He was educated at St Paul's School and was admitted an attorney in 1805. He subsequently entered the Inner Temple and was called to the bar in 1817, having practised for two years before as a special pleader. Retained for the defence of Queen Caroline in 1820 he distinguished himself by his cross-examination and laid the foundation of an extensive common law practice. He first entered parliament in the Whig interest as member for Newark (1831-1832 and 1835-1841), afterwards representing Worcester (1841-1846). He was appointed solicitor-general in 1839, and became attorney-general in succession to Sir John (afterwards Baron) Campbell in 1841. In 1846 he was appointed chief justice of the common pleas, an office he held until 1850, when he became lord chancellor, and was created Baron Truro of Bowes, Middlesex. He held this latter office until the fall of the ministry in 1852. He died in London on the 11th of November 1855. His son Charles (1816-1891) succeeded as 2nd baron, but on the death of his nephew the 3rd baron in 1899 the title became extinct.

Lord Truro was the uncle of JAMES PLAISTED WILDE, BARON PENZANCE (1816-1890), who was appointed a baron of the court of exchequer in 1860, and was judge of the court of probate and divorce from 1863 to 1872. In 1875 he was appointed dean of the court of arches, retiring in 1890. He was created a peer in 1869, but died without issue, and the title became extinct.

TRURO, the chief town of Colchester county, Nova Scotia, on the Salmon river, near the head of Cobequid Bay, 61 m. from Halifax by rail. Pop. (1901), 5903. It is an important junction on the Intercolonial and Midland railways, and the thriving centre of a lumbering and agricultural district. There are numerous local industries, such as engine and boiler works, carriage factory and milk-condensing factory. It also contains the county buildings and the provincial normal school. The Victoria (or Joseph Howe) Park in the vicinity is of great natural beauty.

TRURO, an episcopal city and municipal borough in the Truro parliamentary division of Cornwall, England, 11 m. N. of Falmouth, on the Great Western railway. Pop. (1901), 11,562. It lies in a shallow valley at the junction of the small rivers Kenwyn and Allen in Truro river, a branch creek of the great estuary of the Fal. It is built chiefly of granite, with broad streets, through the chief of which there flows a stream of water. The episcopal see was founded in 1876, covering the former archdeaconry of Cornwall in the diocese of Exeter; the area including the whole of the county of Cornwall, with a small portion of Devonshire. The cathedral church of St Mary was begun in 1880 from the designs of John Loughborough Pearson, and is among the most important modern ecclesiastical buildings in England. The architect adopted the Early English style, making great use of the dog-tooth ornament. The form of the church is cruciform, but it is made irregular by the incorporation, on the south side of the choir, of the south aisle of the parish church, this portion retaining, by Act of Parliament of 1887, all its legal parochial rights. The design of the cathedral includes a lofty central and two western towers with spires, and a rich west front and south porch; with a cloister court and octagonal chapter-house on the north. Among other noteworthy modern institutions may be mentioned the theological library presented by Bishop Phillpotts in 1856, housed in a Gothic building (1871). The grammar school possesses exhibitions to Exeter College, Oxford. Truro has considerable trade in connexion with the tin mines of the neighbourhood. There are tin-smelting works, potteries, and manufactures of boots, biscuits, jam and clothing. Small vessels can lie at the quays, though the harbour is dry at low water; but large vessels can approach within three miles of the city. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 1127 acres.

At the time of the Domesday Survey Truro (Trueret, Treurok, Treurer) was a comparatively small manor held by Jovin of Count Robert of Mortain. Its municipal charter dates from

Richard Lucy the chief justiciar who held the demesne lands and under whom the free burgesses had apparently a grant of sake and soke, toll and team and infangenethef. Reginald earl of Cornwall, by an undated charter, added to these privileges exemption from the jurisdiction of the hundred and county courts and from toll throughout the county. Henry II. confirmed the grant of his uncle the said Reginald. In 1304 Truro was constituted a coinage town for tin. In 1378 the sheriff reported that the town was so impoverished by pestilence, hostile invasions and intolerable payments made to the king's progenitors that it was almost uninhabited and wholly wasted. A similar complaint was preferred in 1401 in consequence of which the fifteenth and tenth amounting to £12 was for the three years ensuing reduced to 50s. The charter of incorporation granted in 1589 provided for a mayor, recorder and steward and a council of twenty capital burgesses and four aldermen. Under it the mayor and burgesses were to enjoy the liberties of infangenethef, ufangenethef, sake, soke, toll, team, thesote, backberindthef and ordelf; also freedom from toll passage, pontage, murage, sletage, picage, anchorage, stallage, lastage and tollage of Horn geld throughout England except in London; they were, moreover, to be entitled in respect of their markets to pontage, keyage, &c. The assize of bread and ale and wine and view of frankpledge were also granted and a court of piepolder was to regulate certain specified fairs. In 1835 the number of aldermen was increased to six. From 1295 to 1885 Truro enjoyed separate parliamentary representation, returning two members. The charter of 1589 provided that the burgesses should have power by means of the common council to elect them. Such was the procedure from 1589 to 1832 when the burgesses recovered the privilege. Under the Redistribution of Seats Act of 1885 the representation of Truro was merged in the county. No fairs or markets are mentioned prior to 1589 when two markets, on Saturdays and Wednesdays, were provided, also three fairs. Both markets and two of the three fairs are held.

See *Victoria County History: Cornwall*; Canon Donaldson. *Bishopric of Truro* (1902).

TRUSS (from O. Fr. *trusser, trosser, torser, trousser*, to pack, bind, gird up, Low Lat. *loriare*, formed from *lorius*, twisted, *lorquere*, to twist; cf. "torch" and "trousers," also *trousseau*, a bride's outfit, literally a small pack or bundle), a pack or bundle, applied specifically to a quantity of hay or straw tied together in a bundle. A truss of straw contains 36 lb. of old hay 56 lb. of new hay 60 lb. A load contains 36 trusses. The term is also used generally of a supporting frame or structure, especially in the construction of a roof or a bridge. It is thus used as the name of a surgical appliance, a belt with an elastic spring keeping in place a pad used as a support in cases of hernia (*q.v.*).

TRUST COMPANY, the name given to a form of fiduciary corporation, originally adopted in the United States under state laws to accomplish financial objects not specially provided for under the national banking system. The function which gives a trust company its name is to execute trusts for individuals, estates and corporations. In the United States, however, these functions have been extended to include many of those of commercial banks receiving deposits payable on demand and subject to check. The relations between trust companies and their depositors are based, however, upon different principles from those between the bank and its client (see **BANKS AND BANKING**). The larger trust companies prefer deposit accounts which, even when subject to check, are not actively drawn upon. The fact that they pay interest on such deposits absolves them from the obligation to extend accommodation by way of loans, except upon collateral security. Hence out of the difference in their relations with depositors grows a difference in the character of their investments, which are usually in loans on stock exchange securities and not on commercial paper discounted. In New York they are prohibited from directly discounting commercial paper, but not from buying it. The rate of interest paid on demand deposits is usually

2% for small accounts, and 3% for large accounts; for time deposits it is sometimes more.

In the administration of estates for private individuals, the trust company has taken the place to a large extent of individual attorneys. The trust company has the advantage of corporate responsibility, which involves continuous life, and of proper offices, fire-proof safes, and special employees in each department devoting their time and attention exclusively to their special functions. Investments for estates are limited by law, like savings bank investments, to certain classes of securities, and a trust company has little temptation to violate such laws. It is customary, moreover, for investments of trust funds to be made by authority of the board of directors, thus protecting the estate against the uncertainties of individual judgment.

The trust company has found a special field in America as agent of railway and industrial corporations in the issue, transfer and exchange of securities. For these purposes it has an organized system, tested by experience, more perfect in its operation and less expensive than each corporation could organize for itself separately. As trustee for the bondholders under a railway mortgage, for instance, it becomes the duty of the trust company, in case of default in payment of interest on the bonds, to take steps to foreclose the mortgage and protect the bondholders. Trust companies have sometimes been named as receivers of failed banks.

The big industrial combinations in America have contributed to the business of the trust companies as registrars or transfer agents for capital stock, agents for the issue of bonds and payment of interest thereon, agents for underwriting and distributing new securities, and depositories of securities and cash under plans of reorganization or while held in escrow. In the case of the reorganization of the tobacco companies, in the autumn of 1904, securities aggregating about \$600,000,000 passed through the hands of the trust company charged with the work; and while this was the largest single operation of its kind, it is typical of many similar operations resulting from the activity in the creation of new companies in America which bring business to trust companies.

The attractions offered by the trust company to the non-commercial depositor by the payment of interest on his deposit built up the deposit balances of trust companies rapidly after 1896. Their competition in this respect with national banks soon led to an effort to compel trust companies to keep cash reserves against their deposits. This demand was resisted for a while, but in 1903 a rule was made by the New York Clearing House requiring trust companies to keep certain reserves. The alternative was to withdraw from the Clearing House, and this all but a few did. The New York legislature, however, at the session of 1906, passed an act requiring trust companies in New York city to establish within fixed dates reserves of 15% of their deposits, of which only 5% was required to be currency, 5% might be on deposit in another banking institution, and 5% might be kept in certain classes of bonds.

The experience of the panic of 1907 developed several weaknesses in the position of the trust companies, and in New York led a special commission appointed by Governor Hughes to recommend much stronger reserves. The fact that the trust companies relied upon the national banks to meet the heavy demands upon them for currency doubled the strain imposed on the national banks of New York city, and the isolation of the trust companies through their withdrawal from the Clearing House in 1903 made it difficult to bring about co-operation in support of those which were subjected to severe runs. Between the 22nd of August and the 19th of December 1907 the deposits of the trust companies of New York declined by the sum of more than \$275,000,000 while deposits in national banks increased about \$50,000,000.

The number, resources and activities of trust companies have shown a rapid development. In New York the general law under which companies can be formed without a special act dates only from 1887, but several companies ante-date this law. The following figures¹ from reports made to the comptroller of the currency speak for themselves:—

Trust Companies of the United States.

30th June	Number	Capital.	Individual Deposits.
		\$	\$
1891	171	79,292,889	355,330,080
1897	251	106,968,253	566,922,205
1900	290	126,930,845	1,028,232,407
1901	334	137,361,704	1,271,081,174
1902	417	179,732,581	1,525,887,493
1903	531	232,807,735	1,589,398,796
1904	585	237,745,488	1,600,322,325
1905	683	243,133,622	1,980,856,737
1906	742	268,384,337	2,008,937,790
1907	794	276,146,081	2,061,623,035

Approximately half of the deposits in United States trust companies are in the state of New York, the number of such companies in New York about the 30th of June 1907, being 88, with a capital of \$67,850,000, and deposits of \$1,020,678,220. The next highest states in amount of deposits were Pennsylvania, with 328 companies, with capital of \$103,953,067 and deposits of \$381,397,305; and Massachusetts, with 46 companies, with capital of \$16,677,000 and deposits of \$179,278,436.

See Kirkbride and Sterrett, *The Modern Trust Company* (New York, 1905). (C. A. C.)

TRUST AND TRUSTEES, in the law of equity. In Roman and English law alike that legal relation between two or more persons implied in the word *trust* was of comparatively late growth. The trust of English law is probably based upon a combination of the Roman conceptions of *usus* and *fideicommissum*. To *usus* is perhaps due the name as well as the idea of that right over property, co-ordinate with the right of the nominal owner, possessed by the person having the use. To *fideicommissum* appears to be due the name as well as the idea of that confidence reposed in another which is the essence of the modern trust. *Usus* was in Roman law a personal servitude, or right of one person over the land of another, confined to his personal wants and without the right to the produce and profits which *usufructus* carried. It has little in common with the use of English law but the name and the conception of a dual ownership. The *fideicommissum* is more important (see ROMAN LAW). By the legislation of Justinian the law of *legata* was practically assimilated to that of *fideicommissum*. The only thing that distinguished the one from the other was the mode in which the gift was made: if by words of direct bequest it was a *legatum*, if by precatory words, a *fideicommissum*. It may be noticed, as an illustration of the course afterwards taken by the law in England, that *fideicommissa* in favour of the Church were so far favoured over others that if paid over by mistake they could not be recovered. In addition to *usus* and *fideicommissum*, the Roman division of ownership into quiritary and bonitary (to use words invented at a later time) may perhaps to some extent have suggested the English division into legal and equitable estate. The two kinds of ownership were amalgamated by Justinian. The gradual manner in which the beneficiary became subject to the burdens attaching to the property of which he enjoyed the benefit was a feature common to both the Roman and the English system.

Use in Early English Law.—The use or trust² is said to have been the invention of ecclesiastics well acquainted with Roman law, the object being to escape the provisions of the laws against Mortmain by obtaining the conveyance of an estate to a friend on the understanding that they should retain the use, i.e. the actual profit and enjoyment of the estate. Uses were soon extended to other purposes. They were found valuable for the defeat of creditors, the avoiding of attainder and the charging of portions. A use had also the advantage of being free from the incidents of feudal tenure: it could be alienated *inter vivos* by secret conveyance, and could be devised by will. In many cases the feoffee³ to uses, as he was called, or the person seized to the use of another, seems to have been specially

¹ The table, it may be observed, represents only the number of companies reporting and not the number actually in existence. Kirkbride and Sterrett, for example, give the number of trust companies in the United States on the 1st of January 1905 as 1427, or more than twice the number given here for 1905. On this point the comptroller of the Treasury in 1905 said: "In order to obtain this information [from institutions other than national banks] the comptroller is necessarily dependent upon the courtesy of officers of different states, and upon individual banks in states the laws of which states do not provide for compilation of data of this character. . . Each year one or more states formerly without adequate provision for obtaining and compiling reports of banks incorporated under their laws, have through legislative enactment, placed such banks under the supervision of an official whose duty it is to receive and tabulate the reports so required, which information is placed at the disposal of the comptroller. Every year this office is thereby enabled to publish official, and hence more reliable statistics. . ."

² Use seems to be an older word than trust. Its first occurrence in statute law is in 7 Ric. II. c. 12, in the form *seps*. In Littleton "confidence" is the word employed. The Statute of Uses seems to regard use, trust and confidence as synonymous. According to Bacon, it was its permanency that distinguished the use from the trust.

³ Feoffment, though the usual, was not the only mode of conveyance to uses. The preamble of the Statute of Uses mentions fines and recoveries, and other assurances.

chosen on account of his rank and station, which would enable him to defy the common law and protect the estate of his *cestui que use*, or the person entitled to the beneficial enjoyment. The act of 1 Ric. II. c. 9 was directed against the choice of such persons. This alienation of land in use was looked upon with great disfavour by the common law courts, in whose eyes the *cestui que use* was only a tenant at will. Possibly the ground of their refusal to recognize uses was that the assizes of the king's court could only be granted to persons who stood in a feudal relation to the king. The denial of the right followed the denial of the remedy. The use was on the other hand supported by the court of chancery, and execution of the confidence reposed in the feoffee in uses was enforced by the court in virtue of the general jurisdiction which as a court of conscience it claimed to exercise over breach of faith. Jurisdiction was no doubt the more readily assumed by ecclesiastical judges in favour of a system by which the Church was generally the gainer. A double ownership of land thus gradually arose, the nominal and ostensible ownership—the only one acknowledged in the court of common law—and the beneficial ownership protected by the court of chancery. The reign of Henry V. to a great extent corresponds with that of Augustus at Rome, as the point of time at which legal recognition was given to what had previously been binding only in honour. The means of bringing the feoffee to uses before the court was the writ of *subpoena*, said to have been invented by John de Waltham, bishop of Salisbury and master of the rolls in the reign of Richard II. By means of this writ the feoffee to uses could be compelled to answer on oath the claim on his *cestui que use*. The doctrine of the court of chancery as to the execution of a use varied according as there was transmutation of possession or not. In the former case it was unnecessary to prove consideration; in the latter, generally a case of bargain and sale, the court would not enforce the use unless it was executed in law—that is, unless there was a valuable consideration, even of the smallest amount. Where no consideration could be proved or implied, the use resulted to the feoffor. This theory led to the insertion in deeds (especially in the lease of the lease and release period of conveyancing) of a nominal consideration, generally five shillings. Lands either in possession, reversion or remainder could be granted in use. Most persons could be feoffees to uses. The king and corporations aggregate were, however, exceptions, and were entitled to hold the lands discharged of the use. On the accession of Richard III., who from his position of authority had been a favourite feoffee, it was necessary to pass a special act (1 Ric. III. c. 5), vesting the lands of which he had been feoffee either in his co-feoffees or, in the absence of co-feoffees, in the *cestui que use*. The practical convenience of uses was so obvious that it is said that by the reign of Henry VII. most of the land in the kingdom was held in use. The freedom of uses from liability to forfeiture for treason must have led to their general adoption during the Wars of the Roses. The secrecy with which a use could be transferred, contrary as it was to the publicity required for livery of Seisin (*q.v.*) at common law, led to the interference of the legislature on several occasions between the reign of Richard II. and Henry VIII., the general tendency of the legislation being to make the *cestui que use* more and more subject to the burdens incident to the ownership of land. One of the most important statutes was the Statute of Mortmain (15 Ric. II. c. 5), forbidding evasion of the Statute *De Religiosis* of Edward I. by means of feoffments to uses. Other acts enabled the *cestui que use* to transfer the use without the concurrence of the feoffee to uses (1 Ric. III. c. 1), made a writ of *formedon* maintainable against him (1 Hen. VII. c. 1), rendered his heir liable to wardship and relief (4 Hen. VII. c. 17), and his lands liable to execution (19 Hen. VII. c. 15). At length in 1535 the famous Statute of Uses (27 Hen. VIII. c. 10) was passed.¹ The preamble of the statute enumerates the mischiefs which it was considered that the universal prevalence of uses had occasioned, among others that by fraudulent feoffments, fines, recoveries and other like assurances to uses, confidences and trusts lords lost their feudal aids, men their tenancies by the curtesy, women their dower, manifest perjuries in trials were committed, the king lost the profits of the lands of persons attainted or enfeoffed to the use of aliens, and the king and lords their rights of year, day and waste, and of escheats of felons' lands. To remedy this state of things it was enacted, *inter alia*, that, where any person was seized of any hereditaments to the use, confidence or trust of any other person by any means, the person having such use, confidence or trust should be seized, deemed and adjudged in lawful seisin, estate and possession of such hereditaments. Full legal remedies were given to the *cestui que use* by the statute. He was enabled to distrain for a rent-charge, to have action, entry, condition, &c. The effect of this enactment was to make the *cestui que use* the owner at law as well as in equity (as had been done once before under the exceptional circumstances which led to 1 Ric. III. c. 5), provided that

the use was one which before the statute would have been enforced by the court of chancery. For some time after the passing of the statute an equitable as distinct from a legal estate did not exist. But the somewhat narrow construction of the statute by the common law courts in *Tyrell's case*² (1537) enabled estates cognisable only in equity to be again created. In that case it was held that a use upon a use could not be executed; therefore in a feoffment to A and his heirs to the use of B and his heirs to the use of C and his heirs only the first use was executed by the statute. The use of B being executed in him, that of C was not acknowledged by the common law judges; but equity regarded C as beneficially entitled, and his interest as an equitable estate held for him in trust, corresponding to that which B would have had before the statute. The position taken by the Court of Chancery in trusts may be compared with that taken in Mortgage (*q.v.*). The Judicature Act 1873, while not going as far as the Statute of Uses and combining the legal and equitable estates, makes equitable rights cognisable in all courts. From the decision in *Tyrell's case* dates the whole modern law of uses and trusts. In modern legal language use is restricted to the creation of legal estate under the Statute of Uses, trust is confined to the equitable estate of the *cestui que trust* or beneficiary.

Uses since 1535.—The Statute of Uses is still the basis of conveyancing. A grant in a deed is still, after the alterations in the law made by the Conveyancing Act 1881, made "to and to the use of A." The statute does not, however, apply indiscriminately to all cases, as only certain uses are executed by it. It does not apply to leaseholds or copyholds, or to cases where the grantee to uses is anything more than a mere passive instrument, e.g. where there is any direction to him to sell the property. The seisin, too, to be executed by the statute, must be in another than him who has the use, for where A is seized to the use of A it is a common law grant. The difference is important as far as regards the doctrine of Possession (*q.v.*). Constructive possession is given by a deed operating under the statute even before entry, but not by a common law grant, until actual receipt of rent by the grantee. The operation of the Statute of Uses was supplemented by the Statute of Inrolments and that of Wills (see *WILL*). The Statute of Inrolments (27 Hen. VIII. c. 16) enacted that no bargain and sale should pass a freehold unless by deed indented and enrolled within six months after its date in one of the courts at Westminster or with the *custos rotulorum* of the county. As the statute referred only to freeholds, a bargain and sale of a leasehold interest passed without enrolment. Conveyancers took advantage of this omission (whether intentional or not) in the act, and the practical effect of it was to introduce a mode of secret alienation of real property, the lease and release, which was the general form of conveyance up to 1845. (See *CONVEYANCING*.) Thus the publicity of transfer, which it was the special object of the Statute of Uses to effect, was almost at once defeated. In addition to the grant to uses there were other modes of conveyance under the statute which are now obsolete in practice, viz.: the covenant to stand seised and the bargain and sale. Under the statute, as before it, the use has been found a valuable means of limiting a remainder to the person creating the use and of making an estate take effect in derogation of a former estate by means of a shifting or springing use. At common law a freehold could not be made to commence *in futuro*; but this end might be attained by a shifting use, such as a grant (common in marriage settlements) to A to the use of B in fee simple until a marriage, and after the celebration of the marriage to other uses. An example of a springing use would be a grant to A to such uses as B should appoint and in default of and until appointment to C in fee simple. The difficulty of deciding where the seisin was during the suspension of the use led to the invention of the old theory of *sciintilla juris*, or continued possibility of seisin in the grantee to uses. This theory was abolished by 23 & 24 Vict. c. 38, which enacted that all uses should take effect by force of the estate and seisin originally vested in the person seized to the uses. The most frequent instances of a springing use are powers of appointment, usual in wills and settlements. There has been much legislation on the subject of powers, the main effect of which has been to give greater facilities for their execution, release or abandonment, to aid their defective execution, and to abolish the old doctrine of illusory appointments.

Trusts.—A trust in English law is defined in *Lewin's Law of Trusts*, adopting Coke's definition of a use, as "a confidence reposed in some other, not issuing out of the land, but as a thing collateral, annexed in privity to the estate of the land, and to the person touching the land, for which *cestui que trust* has no remedy but by *subpoena* in Chancery." The term *trust* or *trust estate* is also used to denote the beneficial interest of the *cestui que trust*. The term *trustee* is not used, as it is in Scotland, to denote the creator of the trust. A trust has some features in common with contract (*q.v.*); but the great difference between them is that a contract can only be enforced by a party or one in the position of a party to it, while a trust can be, and generally

¹The use, as in later times the trust, was, however, forfeited to the Crown on attainder of the feoffee or trustee for treason.

²It was adopted in Ireland exactly a century later by 10 Car. I. c. 1 (I.). The law of uses and trusts in Ireland is practically the same as that in England, the main differences being in procedure rather than in substantive law.

is, enforced by one not a party to its creation. It has more resemblance to *fideicommissum*. But the latter could only be created by a testamentary instrument, whilst a trust can be created either by will or *inter vivos*; nor was there any trace in Roman law of that permanent legal relation which is suggested by the position of trustee and cestui que trust. The heir, too, in Roman law was entitled, from A.D. 70 to the reign of Justinian, to one-fourth of a *hereditas fideicommissaria* as against the beneficiary, while the very essence of the trust is its gratuitous character. Trusts may be divided in more than one way, according to the ground taken as the basis of division. One division, and perhaps the oldest, as it rests on the authority of Bacon, is into *simple* and *special*, the first being where the trust is simply vested in a trustee and the nature of the trust left to construction of law, the second where there is an act to be performed by the trustee. Another division is into *lawful* and *unlawful*, and corresponds to Bacon's division into intents or confidences and frauds, covins, or collusions. A third division is into *public* and *private*. A division often adopted in modern textbooks and recognized by parliament in the Trustee Act 1850, is into *express*, *implied* and *constructive*. An express trust is determined by the person creating it. It may be either *executed* or *executory*, the former where the limitations of the equitable interest are complete and final, the latter where such limitations are intended to serve merely as minutes for perfecting the settlement at some future period, as in the case of marriage articles drawn up as a basis of a marriage settlement to be in conformity with them. An implied trust is founded upon the intention of the person creating it; examples of it are a resulting trust, a precatory trust, and the trust held by the vendor on behalf of the purchaser of an estate after contract and before conveyance. In this case the vendor is sometimes called a trustee *sub modo* and the purchaser a cestui que trust *sub modo*. A constructive trust is judicially created from a consideration of a person's conduct in order to satisfy the demands of justice, without reference to intention. The distinction between an implied and a constructive trust is not always very consistently maintained. Thus the position of a vendor towards a purchaser after contract is sometimes called a constructive trust. The present law governing trusts rests upon the doctrines of equity as altered by legislation. The law was consolidated by the Trustee Act 1893 and some subsequent amending statutes. Its great importance has led to its becoming one of the most highly developed departments of equity.

Who may be a Trustee or Cestui que Trust.—The modern trust is considerably more extensive in its operation than the ancient use. Thus the Crown and corporations aggregate can be trustees, and personality can be held in trust. Provision is made by the Municipal Corporations Act 1882, for the administration of charitable and special trusts by municipal corporations. There are certain persons who for obvious reasons, even if not legally disqualified, ought not to be appointed trustees. Such are infants, lunatics, persons domiciled abroad, felons, bankrupts and *cestuis que trustent*. The appointment of any such person, or the falling of any existing trustee into such a position, is generally ground for application to the court for appointment of a new trustee in his place. Any one may be a cestui que trust except a corporation aggregate, which cannot be a cestui que trust of real estate without a licence from the Crown. For the Public Trustee, see below.

Creation and Extinction of the Trust.—A trust may be created either by act of a party or by operation of law. Where a trust is created by act of a party, the creation at common law need not be in writing. The Statute of Frauds altered the common law by enacting that all declarations or creations of trusts or confidences of any lands, tenements or hereditaments shall be manifested and proved by some writing, signed by the party who is by law enabled to declare such trust, or by his last will in writing, or else they shall be utterly void and of none effect. Trusts arising or resulting by implication or construction of law are excepted, and it has been held that the statute applies only to real estate and not to chattels, so that a trust of personal chattels may still be created orally. The declaration of a trust by the Crown must be in writing. Trusts created by will must conform to the provisions of the Wills Act (see WILL). Except in the case of a trust created by a cestui que trust must be a definite person. A trust created for the purpose of keeping up family tombs is void. A trust created by appointment of a new trustee is not subject to the Statute of Frauds where the instrument creating the trust is not a will.

or by order of the court of chancery. But now by s. 10 of the Trustee Act 1893 (superseding Lord St Leonards's Act of 1860 and the Conveyancing Act 1881), the surviving or continuing trustee or trustees, or the personal representative of the last surviving or continuing trustee, may nominate in writing a new trustee or new trustees. On such appointment the number of trustees may be increased. Existing trustees may by deed consent to the discharge of a trustee wishing to retire. Trust property may be vested in new or continuing trustees by a simple declaration to that effect. Also a separate set of trustees may be appointed for any part of the property held on distinct trusts. Trusts created by operation of law are those which are the effect of the application of rules of equity. They include resulting and constructive trusts. A resulting trust is a species of implied trust, and consists of so much of the equitable interest as is undisposed of by the instrument creating the trust, which is said to result to the creator and his representatives. An example is the purchase of an estate in the name of the purchaser and others, or of others only. Here the beneficial interest is the purchaser's. An example of a constructive trust is a renewal of a lease by a trustee in his own name, where the trustee is held to be constructively a trustee for those interested in the beneficial term. Besides being duly created, it is necessary for the validity of the trust that it should be a lawful one. An unlawful trust is one which contravenes the policy of the law in any respect. Examples of such trusts are trusts for a corporation without licence, for a perpetuity, and for purposes subversive of morality, such as trusts for illegitimate children to be hereafter born. Superstitious uses also fall under this head. There are also certain trusts which are avoided by statute under particular circumstances, such as settlements in fraud of creditors (see BANKRUPTCY). The law cannot be evaded by attempting to constitute a secret trust for an unlawful purpose. If an estate be devised by words *prima facie* carrying the beneficial interest, with an understanding that the devisee will hold the estate in trust for such a purpose, he may be compelled to answer as to the secret trust, and on acknowledgment or proof of it there will be a resulting trust to the heir-at-law. In the case of an advowson suspected to be held for the benefit of a Roman Catholic patron, there is a special enactment to the same effect (see QUARE IMPEDIRI). The rules of equity in charitable trusts are less strict than those adopted in private trusts. Charitable trusts must be lawful, e.g. they must not contravene the Statutes of Mortmain; but a wider latitude of construction is allowed in order to carry out the intentions of the founder, and they will not be allowed to fail for want or uncertainty of objects to be benefited. The court, applying the doctrine of *cy pres (q.v.)*, will, on failure of the original ground of the charity, apply the funds as nearly as possible in the same manner. On this principle gifts originally made for purely charitable purposes have been extended to educational purposes. Further, trustees of a charity may act by a majority, but ordinary trustees cannot by the act of a majority (unless specially empowered so to do) bind a dissenting minority or the trust property. A trust estate is subject as far as possible to the rules of law applicable to a legal estate of a corresponding nature, in pursuance of the maxim, "Equity follows the law." Thus trust property is assets for payment of debts, may be taken in execution, passes to creditors in bankruptcy, and is subject to dower and curtesy, to the rules against perpetuities, and to the Statutes of Limitation. This assimilation of the legal and equitable estates has been produced partly by judicial decisions, partly by legislation. A trust is extinguished, as it is created, either by act of a party or by operation of law. An example of the former mode of extinction is a release by deed, the general means of discharge of a trustee when the purposes of the trust have been accomplished. Extinction by operation of law takes place when there is a failure of the objects of the trust: e.g. if the cestui que trust dies intestate without heirs or next of kin, the property, by the Intestates Estates Act 1884, escheats in the same manner as if it were a legal estate in corporeal hereditaments. Equitable interests in real estate abroad are as a rule subject to the *lex loci rei sitae*, and an English court has no jurisdiction to enforce a trust or settle a scheme for the administration of a charity in a foreign country. An English court has, however, jurisdiction to administer the trusts of a will as to the whole real and personal estate of a testator, even though only a very small part of the estate, and that wholly personal, is in England. This was decided by the House of Lords in a well-known case in 1883 (*Evings v. Orr-Ewing*, L.R. 9, A.C. 34).

Rights and Duties of the Trustee.—The principal general properties of the office of trustee are these: (1) A trustee having once accepted the trust cannot afterwards renounce. (2) He cannot delegate it, but an inconvenience which formerly attached to dealings with trustees and trust property, in consequence partly of this rule, and partly of the liability of persons dealing with trustees to see that money paid to them was properly applied, was largely obviated by the Trustee Act 1893 (replacing s. 2 of the Trustee Act 1850). The Act provides that a trustee may appoint a solicitor to receive and give a discharge for any money or other property receivable by the trustee under the trust, and that the solicitor, by appointing the trustee, shall have in the body thereof or endorsed thereon a

receipt for the consideration money or other consideration, the deed being executed or the endorsed receipt being signed by the trustee; and a trustee is not chargeable with breach of trust by reason only of his having made or concurred in making any such appointment; and the producing of any such deed by the solicitor is a sufficient authority to the person liable to pay for his paying to the solicitor without the solicitor producing any separate or other direction or authority in that behalf from the trustee. (3) In the case of co-trustees the office must be exercised by all the trustees jointly. (4) On the death of one trustee there is survivorship; that is, the trust will pass to the survivors or survivor. (5) One trustee shall not be liable for the acts of his co-trustee. (6) A trustee shall derive no personal benefit from the trusteeship. The office cannot be renounced or delegated, because it is one of personal confidence. It can, however, be resigned, and legislation has given a retiring trustee large powers of appointing a successor. The liability of one trustee for the acts or defaults of another often raises very difficult questions. A defence is made between trustees and executors. An executor is liable for joining in a receipt *pro forma*, as it is not necessary for him to do so, one executor having authority to act without his co-executor; a trustee can show that he only joined for conformity, and that another received the money. The rule of equity by which a beneficiary who consented to a breach of trust was liable to indemnify the trustees to the extent of his interest has taken definite statutory shape in s. 45 of the Trustee Act 1893 (replacing s. 6 of the Trustee Act 1888), which enacts that when a trustee commits a breach of trust at the instigation or request, or with the consent in writing of a beneficiary, the High Court may, if it thinks fit, and notwithstanding that the beneficiary is a married woman entitled for her separate use and restrained from anticipation, make such order as to the court seems just for impounding all or any part of the interest of the beneficiary in the trust estate by way of indemnity to the trustee. The rule that a trustee is not to be benefited by his office is subject to some exceptions. He may do so if the instrument creating him trustee specially allows him remuneration, as is usually the case where a solicitor is appointed. The main duties of trustees are to place the trust property in a proper state of security, to keep it (if personally) in safe custody, and to properly invest and distribute it. A trustee must be careful not to place himself in a position where his interest might clash with his duty. As a rule he cannot safely purchase from his *cestui que trust* while the fiduciary relation exists between them. Investments by trustees demand special notice. The Trustee Act 1893 has consolidated the law on this point, and provides, as it were, a code or charter of investment authorizing trustees, unless expressly forbidden by the instrument (if any) creating the trust, to invest trust funds in various modes, of which the more important are as follows: In any of the parliamentary stocks or public funds or government securities of the United Kingdom; or real or heritable securities in Great Britain or Ireland; in stock of the Bank of England or the Bank of Ireland; in India 3½% stock and India 3% stock; in any securities, the interest of which is for the time being guaranteed by parliament; in consolidated stock created by the London County Council; in the debenture or rent-charge or guaranteed or preference stock of any railway company in Great Britain or Ireland incorporated by special act of parliament, and having during each of the ten years last past before the date of investment paid a dividend at the rate of not less than 3% on its ordinary stock; in the debenture stock of any railway company in India, the interest on which is paid or guaranteed by the secretary of state in council of India; in the "Bengal and Delhi railways; and also in deferred annuities—comprised in the register of holders of annuity Class D, and annuities comprised in the register of annuitants Class C of the East Indian Railway Company; in the stock of any railway company in India upon which a fixed or minimum dividend in sterling is paid or guaranteed by the secretary of state in council of India, or upon the capital of which the interest is so guaranteed; in the debenture or guaranteed or preference stock of any company in Great Britain or Ireland established for the supply of water for profit, and incorporated by special act of parliament or by royal charter, and having during each of the ten years last past before the date of investment paid a dividend of not less than 5% per annum on its ordinary stock; in nominal or inscribed stock issued, or to be issued, by the corporation of any municipal borough having, according to the returns of the last census prior to the date of investment, a population exceeding 50,000; or by any county council under the authority of any act of parliament or provisional order; in any of the stocks, funds or securities for the time being authorized for the investment of cash under the control or subject to the order of the High Court. Trustees may from time to time vary any such investments for others of an authorized nature. The statutory power to invest on real securities does not, of course, authorize the purchase of realty; but by s. 5 of the Trustee Act 1893 a power to invest in real securities (in the absence of express provision to the contrary) authorizes investment on mortgage of leasehold property held for an unexpired term of not less than 200 years and not subject to a greater rent than one shilling a year, or to any right of redemption or condition of re-entry except for non-payment of rent.

The position of trustees in respect of what was frequently an undue personal responsibility for the administration of their trust has been much improved by s. 8 of the Trustee Act 1888 (not repealed by the Trustee Act 1893) and s. 3 of the Judicial Trustees Act 1896. Sub-section (1) of the former enactment (with some omissions) runs as follows: "In any action or other proceeding against a trustee or any person claiming through him, except where the claim is founded upon any fraud or fraudulent breach of trust to which the trustee was party or privy, or to recover trust property, or the proceeds thereof still retained by the trustee, or previously received by the trustee and converted to his use, the following provisions shall apply: (a) All rights and privileges conferred by any statute of limitations shall be enjoyed in the like manner and to the like extent as if the trustee or person claiming through him had not been a trustee or person claiming through him. (b) If the action or other proceeding is brought to recover money or other property, and is one to which no existing statute of limitations applies, the trustee or person claiming through him shall be entitled to the benefit of, and be at liberty to plead the lapse of time as a bar to such action or other proceeding in the like manner and to the like extent as if the claim had been against him in an action of debt for money had and received." The statutory period of limitation which trustees are thus permitted to plead is the six years fixed as the period of limitation for actions of debt by the Limitation Act 1623. It has been decided on the above section that in the case of a breach of trust consisting of an improper investment of the trust funds, time begins to run in favour of the trustee from the date of the investment. Sub-section (3) of the Judicial Trustees Act 1896 provides that "if it appears to the court that a trustee, whether appointed under that act or not, is or may be personally liable for any breach of trust, whether the transaction alleged to be a breach of trust occurred before or after the passing of that act, but has acted honestly and reasonably, and ought fairly to be excused for the breach of trust and for omitting to obtain the directions of the court in the matter in which he committed such breach, then the court may relieve the trustee either wholly or partly from personal liability for the same." Owing to the generally reduced rate of interest obtainable for money invested on trust securities, the court has in several instances, and even as against defaulting trustees, charged them with interest at 3% per annum (instead of 4%, which was formerly the recognized rate) upon sums found due from them to the trust estate.

Under the old law trustees could not safely advance on mortgage more than two-thirds of the actual value of agricultural land or one-half of the value of houses. This "two-thirds rule" is now made statutory by s. 8 of the Trustee Act 1893, which enacts that "A trustee lending money on the security of any property on which he can lawfully lend shall not be chargeable with breach of trust by reason only of the proportion borne by the amount of the loan to the value of the property at the time when the loan was made, provided that it appears to the court that in making the loan the trustee was acting upon a report as to the value of the property made by a person whom he reasonably believed to be an able practical surveyor or valuer instructed and employed independently of any owner of the property, whether such surveyor or valuer carried on business in the locality where the property is situate or elsewhere, and that the amount of the loan does not exceed two equal third parts of the value of the property as stated in the report, and that the loan was made under the advice of the surveyor or valuer expressed in the report." The same section protects trustees for not investigating the lessor's title when lending on the leasehold security; and for taking a shorter title than they might be otherwise entitled to on the purchase or mortgage of any property, if they act with prudence and caution. By s. 9 (replacing s. 5 of the Trustee Act 1888) trustees who commit a breach of trust by lending more than the proper amount on any property are excused from making good any more than the excess of the actual loan over the sum which they might have properly lent in the first instance.

Rights and Duties of the Cestui que Trust.—These may be to a great extent deduced from what has been already said as to the correlative duties and rights of the trustee. The *cestui que trust* has a general right to the due management of the trust property, to proper accounts and to enjoyment of the profits. He can as a rule only act with the concurrence of the trustee, unless he seeks a remedy against the trustee himself.

Judicial Trustees.—The Judicial Trustees Act 1896, inaugurated a semi-official system of trusteeship which was new in England, but had been known in Scotland for upwards of 150 years. The general scope of the act is indicated by s. 1 (1), which runs as follows: "Where application is made to the court by or on behalf of the person creating or intending to create a trust, or by or on behalf of a trustee or beneficiary, the court may, in its discretion, appoint a person (in this act called a judicial trustee) to be a trustee of that trust, either jointly with any other person or as sole trustee, and if sufficient cause is shown, in place of all or any existing trustees." The act and the rules made under it (the Judicial Trustees Rules 1897) provide that judicial trustees shall be under the control and supervision of the court as officers thereof, and may be paid for their services out of the trust property. The trust accounts are to be

audited annually, and a report thereon made to the court, which has power to order inquiries into transactions connected with the administration of the trust. A judicial trustee may be required to give security, and in any case has to keep the trust account with a bank approved by the court, and deposit title-deeds and other documents of title in such custody as the court directs. Communications between judicial trustees and the court with reference to their duties are permitted to be made with little or no formality, and strict proof of facts may be waived in proper cases. The act may, in short, be described as an attempt to provide for an official check upon the administration of trusts, while avoiding the formality and expense incident to the procedure in an administration action.

Public Trustee.—A step further was taken by the Public Trustee Act 1906, which established the office of public trustee. By the act he is a corporation sole, with perpetual succession and an official seal and may sue and be sued under his official title. He may, if he thinks fit, act in the administration of estates of small value; as custodian trustee, or as an ordinary trustee; he may be appointed a judicial trustee, or administrator of a convict's property. The law of trusts generally is applicable to him and he can act either alone or jointly with other persons. He has an absolute discretion as to whether he will accept or not any trust, but cannot decline acceptance on the ground only of the small value of the trust property. He cannot accept any trust which involves the management or carrying on of a business, except in certain cases authorized under rules appended to the act. He cannot accept a trust under a deed of arrangement for the benefit of creditors, nor of an insolvent estate, nor one exclusively for religious or charitable purposes. His powers and duties are dealt with by the act under three headings: (1) *In the administration of small estates.*—On the application of any person entitled to apply to the court (i.e. the High Court, and as respects trusts within its jurisdiction, the county court) for an order for administration of any estate, the gross value of which is proved to the satisfaction of the public trustee to be less than £1000, he may administer the estate, and must do so if the persons beneficially entitled are persons of small means, unless he sees good reason for refusing. By declaration in writing signed and sealed by him the trust property other than stock vests in him, and the right to transfer or call for the transfer of any stock forming part of the estate, provided that he does not exercise the right of himself transferring stock without the leave of the court; this general provision also does not apply to copyhold, in respect of which he has the same powers to convey them as if he had been appointed under s. 33 of the Trustee Act 1893. Power is given to the court to order, for reasons of economy, that an estate being administered by the court be administered by the public trustee. (2) *As custodian trustee.*—The public trustee, if he consents to act, may be appointed custodian trustee on an application to the court, or by the testator, settlor or other creator of any trust or by a person having power to appoint new trustees. When he is so appointed the trust property is transferred to him as if he were the sole trustee, but the management of the trust property and any discretionary power remain vested in the other trustees. His relations with the managing trustees are further defined by the act. (3) *As an ordinary trustee.*—The public trustee may be appointed trustee, executor, &c., of any will or settlement or instrument of any date either under his official title or other sufficient designation. In a will a sentence to the following effect would be sufficient: "I appoint the Public Trustee executor and trustee of this my will." Where the public trustee has been appointed a trustee of any trust, a co-trustee may retire from the trust under s. 11 of the Public Trustee Act 1893 notwithstanding that there are not more than two trustees, and without such consents as are required by that section. The consolidated fund of the United Kingdom is liable to make good all sums required to discharge any liability which the public trustee, if he were a private trustee, would be personally liable to discharge, except where neither the public trustee nor his officers has contributed to it, and which neither he nor any of his officers could by reasonable diligence have averted. A person aggrieved by any act or omission or decision of the public trustee in relation to any trust may apply to the court, and the court may make such order in the matter as it sees fit. The act contains provisions for the investigation and audit of trust accounts, which may take place on the application of any trustee or beneficiary; if the parties do not agree upon a solicitor and public accountant for the purpose, they are appointed by the public trustee, who has entire discretion over the source from which the expenses are to be defrayed. The fees payable under the act are fixed by the Public Trustee (Fees) Order; they are of two kinds: fees on capital and fees on income. The object of the department is not to make a profit, but merely to pay expenses. Full information as to the machinery and procedure of the office and the requirements necessary to obtain the services of the public trustee are obtainable on application to the Public Trustee Office, Clement's Inn, London.

Scotland.—The history of the law differs considerably from that of England, though perhaps the position of the Scottish trustee is now not very different from that of the trustee in England. The Statute of Uses did not apply to Scotland, since neither that nor any similar legislation was necessary in a system in which land and equity were administered by the same tribunals. Trusts, however, have existed from time immemorial, and have been the basis of the

regulated by statute. The policy of the English Statute of Frauds was no doubt intentionally imitated in the Act 1696, c. 25, enacting that no action of declarator of trust should be sustained as to any deed of trust made for thereafter, except upon a declaration or back-bond of trust lawfully subscribed by the person alleged to be trustee and against whom or his heirs or assignees the declarator should be intended, or unless the same were referred to the oath of the party *simpliciter*. The act does not apply to all cases, but only to those in which by the act of parties documents of title are in the name of a trustee, but the beneficial interest in another. The person creating the trust is called the *truster*, a term unknown in England. On the other hand the term *cestui que trust* is unknown in Scotland. The office of trustee is *prima facie* gratuitous, as in England, it being considered to fall under the contract of mandate. Some of the main differences between English and Scottish law are these. There is no presumption in Scotland of a resulting trust in favour of a purchaser. A trust which lapses by the failure of a beneficiary goes to the Crown as *ultimus heres*. The office of trustee is not a joint office, therefore there is no right of survivorship, and on the death of a trustee the survivors are incompetent to act, unless a certain number be declared or presumed to be a *quorum*, or the office be conferred on trustees and the accedors and survivors of them. Sometimes the concurrence of one trustee is rendered absolutely necessary by his being named *sine qua non*. The Court of Session may appoint new trustees, but generally appoints a judicial factor. There has been a considerable amount of legislation, chiefly in the direction of extending the powers of trustees and of the court in trust matters. The powers of investment given to trustees are much the same as those allowed in England.

United States.—In New York and many other States uses and trusts have been abolished (with certain exceptions), and every estate, subject to those exceptions, is deemed a legal right cognisable in courts of law. Some of these exceptions are implied trusts and express trusts to sell land for the benefit of creditors, to sell, mortgage or lease lands for the benefit of legatees, or for the purpose of satisfying any charge thereon, to receive the rents and profits of lands and apply them to the use of any person during the life of such person or any shorter term, or to receive such rents and profits, and accumulate the same within the limits allowed by the law. Some states allow the creation of trusts (other than those arising by implication or operation of law) only by means of will or deed. Where the trust is of real estate, the deed must generally be registered. Forms of deeds of trust are given in the Statutes of Virginia and other states. The English doctrine of *cy pres* is being adopted in many states. A public trustee as a corporation sole exists in some states. A trustee under American law is generally entitled to compensation for his services. Spendthrift trusts, i.e. those under which the enjoyment of income bequeathed by will in such a way as to prevent creditors of the beneficiary from reaching it before it gets into his hands, are generally supported (*Nichols v. Eaton*, 91 United States Reports, 713). A "voting trust" is a concerted transfer of their shares in a corporation by a majority of the shareholders to trustees to hold and vote on them for a specified period for the purpose of securing the adoption or continuance of a certain line of corporate action. Any shareholder may recede from such an arrangement and reclaim his stock.

Authorities.—The principal authority is Lewin's *Law of Trusts*; other treatises are those of Godefroi and Underhill. For American Law see Perry *On Trusts*. The principal authority on charitable trusts is Tudor. For the history may be consulted Bacon, *Law Tracts*; Reading, *On the Statute of Uses*; Gilbert, *On Uses*; Sanders, *On Uses and Trusts*; Spence, *Equitable Jurisdiction*, l. 435; Digby, *Hist. of the Law of Real Property*, chs. vi., vii.

TRUSTS, in Economics. The word "trusts," as used here, includes all those aggregations of capital engaged in productive industry that, by virtue of their industrial strength, have or are supposed to have some monopolistic power. Legal monopolies, as such, and natural monopolies are excluded, although it is frequently true that the trusts are aided by and sometimes control natural monopolies. Trusts are here considered to be identical with the so-called "capitalistic monopolies." As "trusts" started in America, the subject will be considered here first from the point of view of American experience.

While it is probably true that trusts are a product of evolution, it is desirable to analyse and explain that conception in some detail if we are to understand their industrial significance. Competition, especially among industries managed on a great scale, often makes modern business unprofitable. Commercial men have been obliged to be organized in some way to modify former methods. So long as most industries were run individually and the facilities for doing so were abundant, it was not unusual that only those at the head of the business were able to control the industry. The

great mass of producers remained vigorously competing with one another, some making larger, others smaller profits, but all except a few at the lower margin making at least a living. Under modern business conditions competitors are often, relatively speaking, few in number, of substantially equal ability, and controlling substantially equal facilities for managing the business economically. Consequently, in such circumstances, modern competition differs greatly from that form which was familiar to the earlier economists. Among competitors of such great resources, the struggle may last long after the business has become unprofitable to all before any will fail. Among competitors so nearly equal in strength, the entire industry may be very seriously injured by competition before enough are forced out to affect materially the severity of the competition.

The dictum of Stephenson, that "where combination is possible, competition is impossible," has a much wider application now than in the early days of railways. The modern facilities for the transportation of goods, for the rapid transmission of intelligence by fast mail, and especially for the instantaneous exchange of information by the telegraph and telephone, have made it possible to manage easily a large business, however widely separated its different plants or establishments may be. In the middle of the 19th century or thereabouts, on account of the lack of these facilities, management of such institutions would often have been impossible. Many of the advantages of combinations are entirely dependent upon these modern facilities, and on that account these facilities may be said to be an occasion, if not a cause, of the trusts.

If the product of an industry is of such a nature that its quality is substantially uniform and can be readily tested by purchasers, especially if the goods are such that they are ordinarily sold in large quantities, the competition between rival establishments must almost of necessity be a competition in price. Sugar refining, oil refining, the distilling of spirits, the manufacture of salt, are such industries. The standard quality is readily tested, and the manufacturer who can offer the standard product at the lowest price effects a sale. Industries manufacturing comparatively inexpensive articles for the retail trade, put them up in packages which become well known to customers, and those industries whose goods are sold under brands or trade-marks, or in some other form so that they are familiar to buyers, afford an example of competition of an entirely different kind. When the reputation of a certain brand of goods of this nature becomes established, consumers make no further efforts to test its quality, and the retail price often becomes a customary price. If a manufacturer of such goods finds his trade injured by a rival, his most effective means of competition will often be, not a lowering of the price, but an increase of the outlay on advertising. Soap, baking-powder, photographic cameras for general use, and of late years certain brands of coffee, patent medicine, and other drugs of similar nature, are examples of this class. Those industries in which the competition becomes a matter of cutting of prices can by combination remove rivals from the field, and then put prices up to a remunerative rate. Competitors in industries of the second class by combination can save many of the costs of selling, and thus without any increase in the price of the product may save enough of the cost to make the business profitable.

Some of the advantages of combination over competition which have led to the organization of trusts may be enumerated:—

1. The cost of selling may be greatly lessened. As has been indicated, competition in the case of industries of the second class named above leads to very expensive advertising in order to effect sales. An examination of the pages of many of the American magazines, with a thought as to the amount charged for the use of these advertising pages, would be as high as even four hundred dollars, or from one hundred to two hundred dollars, for a single insertion in some of the magazines (circulation) will convince one of the cost of such advertising. The expense involved in making attractive displays in stores or shops, and in calling the attention to popular wares by posters scattered about the

country and by legends painted on rocks, on buildings along the lines of railways, &c., are other common examples.

2. The salaries of commercial travellers, together with their hotel and travelling expenses, are of a similar nature. This competitive advertising in many cases does not increase to any noteworthy extent the consumption of the products in question, but merely attracts customers from one manufacturer to another. Combination among establishments that do this costly advertising saves a large part of the expense without lessening materially the quantity of goods sold.

3. If different manufacturing establishments, scattered throughout the country, are brought under one management, it will be possible for orders for goods to be received at one central office, and then to be distributed to the federated establishments, so that goods can be despatched to customers in each case from the nearest establishment. In this way freight expenses may be very greatly lessened, cross freights over the same territory being substantially eliminated. A single establishment supplying all of its customers would often be compelled to deliver much longer distances at greatly increased expense.

4. The entire profit of an establishment frequently depends upon the skill of the manager. When many different establishments are organized into one, it is possible to select the most skillful manager of all and to put him in charge of the combination, thus securing in many cases, if the trust includes practically all of the establishments in the entire industry, the ablest manager in the country for them all. It is of course true that as an establishment increases in size, or as a combination increases the number of its branches, especially if they are widely scattered, it becomes impossible for the manager to give his personal supervision to the details of management of each institution. An executive officer of the highest skill, however, will so select his subordinates, so direct their work, and so infuse into them his own spirit, that, under careful inspection, comparatively little will be lost from his inability to be present personally in each separate establishment. In the larger combinations frequent reports, often daily, are made from each concern, giving in detail the quantity of the output, the quality of the goods, the exact cost of the different processes of manufacture; so that it is possible to compare continually each of them with all of the others; to detect the special weakness of each, and in this way to remedy any slight defects in any one establishment, and to bring all nearly up to the highest level of productive capacity.

5. Each business manager is likely to have some special excellence in his methods of management. One will be particularly skillful in the technique of manufacturing; another in the organization of the business; a third in selling goods, and so on. By combining many establishments into one, it is possible to distribute this managerial skill that each superintendent will be given the department for which he is peculiarly fitted, and the whole establishment will thus get the benefit, not merely of the best executive ability at the head, but also of the best managing skill at the head of each separate department. In many cases it is probable that as much is saved in this way as in any other.

6. Besides this distribution of skill of the managers, it is sometimes equally beneficial to distribute the various products of the combination among the different plants. For example, in the manufacture of hoop and bar iron the products are turned out in great varieties of size, probably from seventy-five to a hundred. Wholesale dealers in sending their orders to the mills are likely to call for from ten to fifty different kinds. If these orders go to an establishment which has but one large mill, it may be necessary, in order to execute the order, to change the rolls in the mill several times, causing thus a waste of power, of time and of energy. If several establishments are combined, each can be equipped for certain sizes. When, in these circumstances, a large order is received, to each establishment will be sent that part of the order which it is especially equipped to fulfil, and thus, without any changes of rolls or stoppage of machinery, the separate sizes can be made. The same principle holds of course in nearly all lines of work, in some to a greater degree than in others; but in the manufacture of hoop and bar iron a saving from this source amounting to from a dollar to a dollar and a half, or from 4% to 6%, per ton is sometimes made.

7. The advantage of unifying in one establishment the manufacture of products somewhat allied in nature appears also in selling goods. If customers can buy all of the various kinds of related goods in one establishment, much of their time and energy will be saved. Some of the larger combinations, therefore, in order to make this saving for their customers and thus to be sure of retaining their orders, add to their plant facilities for making products which a smaller establishment could hardly manufacture. For example, the Distilling Company of America, which controls probably 90% of the entire product of corn spirits, found it to its advantage to add to its plant several rye distilleries, and to purchase a number of the leading brands of whiskies for consumption as beverages, in order that they might supply the needs along different lines of practically all dealers in spirits and whiskies, in this way saving for themselves many customers who otherwise might have been lost.

8. The mere size of an establishment and its ability to supply at any time on short notice any order, however large, gives it also an advantage in retaining custom. A concern that controls only

from 5 to 10% of the entire output of a country in any special line of goods might at times find it impossible to supply goods promptly. Large customers who might thus be embarrassed are more ready to deal regularly with an establishment controlling 75 to 90% of the output, if they can in this way be sure of having their orders attended to promptly. It is stated that the American Sugar Refining Company on this account has been able to secure, with considerable regularity, one-sixteenth of a cent a pound more on its refined sugars than the independent refiners, the latter being frequently compelled to cut their prices to that extent in order to make sales.

9. Owing to the fact that the introduction of goods into new markets, especially into foreign markets, is a matter of time, expenditure of energy, and of money, the large establishment with great capital has in this particular also a decided advantage. The Standard Oil Company, and American Tobacco Company, and other similar establishments, have thus been able to open up new markets in Europe, in Japan, China and other portions of the Far East more readily by far than individual producers along those lines could have done. This stimulus to the foreign trade acts also beneficially to the domestic trade, inasmuch as the exportation of part of the product tends to keep prices somewhat higher at home, and as the added demand for the raw material influences its price, thus creates a demand for labour along many lines.

10. The combination also frequently saves for its stockholders considerable sums from its wiser dealing with credits, and this in a way also that is beneficial to the entire business community. When competition is very severe among different establishments, the managers, in order to increase their sales, will not infrequently grant credit somewhat unwisely. The combination controlling a large part of the market is not so tempted, and moreover has the power to bring needed pressure to bear upon delinquent debtors more readily, so that losses from bad debts are much less frequent.

Besides the special savings that serve as reasons for the formation of combinations, certain special favours at times lead to their formation.

1. The protective tariff is most frequently cited as such a favour. By the protection which a protective duty gives against foreign competition, it doubtless often furnishes the occasion

Special Favours to Combinations. for the formation of trusts. If a large amount of capital is tempted into the industry through the profits promised by the tariff, and therefore competition among the various establishments becomes fierce, it is much easier for them to form a combination with the certainty of good profits, provided the domestic competition can be overcome, if they are certain that foreign competition also is to be excluded. On the other hand, it would hardly be right to speak of the tariff as in this case the direct cause. In other industries not protected by the tariff the same fierce competition leads to the formation of combinations. The tariff is simply an encouraging condition. The removal of the tariff would not destroy the combination unless it destroyed the industry at the same time; but, on the other hand, the removal of a protective tariff might very easily prevent the abuses of exorbitant prices which might be exacted by a combination protected by the tariff.

2. It is doubtless true that combinations have a good many times been encouraged by special discriminating rates of freight granted by the railways or other transportation agencies. There is, of course, a certain economic advantage to the railways in having goods despatched in large quantities by consignors who are able to supply their own cars, loading and unloading facilities, &c. Railways on that account often prefer to deal with large firms, and, other things being equal, are willing to give them some special rates. These concerns also are likely to have rather better credit than the smaller ones, so that dealing with them ensures prompt pay and cheaper collection of accounts. The competition among the different railways also for the freights which an important customer can furnish leads to cutting of the rates in their favour. These special rates, however, whether justified from the business point of view or not, are beyond any question from the social point of view, often a very grave injury. A manufacturer who receives these special favours can build up a business substantially monopolistic in its extent, whereas his rival of equal or even of greater ability, and equally skillful as a manufacturer, would be ruined if he did not receive like rates. The injustice of such discriminations and their evil effects on the community have been recognized by legislatures and courts in America, and they are practically universally forbidden. It remains beyond question true that they are, notwithstanding, very frequently granted.

In recent years in the United States there can be little question that the formation of the great combinations has been much

Promotion. encouraged by the opportunities, which promoters were able to seize, of making for themselves large profits. The movement towards combination was so fully recognized and the advantages in many cases so palpable, that a well-informed and skilful promoter was often able to persuade a large proportion of the manufacturers in some special industry to combine. In preparing the plan for such combination, the

promoter has in many cases seen to it that he himself first bought the properties which he could very shortly turn over to the combination at high rates of profit; or else he has been able to persuade the new corporation to issue large amounts of stock, of which considerable proportions were given to him in return for his services. It has been true in many cases that these securities have been speculative in nature, but nevertheless the promoter has often reaped in this way large rewards. The possibility of this profit has doubtless stimulated his activity in urging the combinations.

Associated with the promoter in the organization of these combinations have usually been bankers or other financiers who stood ready, for an amount of stock or other promised profit sufficiently large to compensate them for their risk, *The Underwriter.* to furnish to the combinations cash sufficient to start the business and to provide other needed capital. Usually the form of underwriting employed has been this: A promoter engaged in the formation of a combination and needing a certain fixed sum in cash, would make an arrangement with a bank to sell to it at a price agreed upon such portions of a named amount of stock as were not disposed of to other customers before a certain fixed date. For example, the bank might agree to furnish one million dollars in cash (£200,000) in return for say four millions of stock (\$800,000), or to purchase itself at a fixed price all the remainder of the \$4,000,000 stock unsold at the date agreed upon, the bank itself to become the sales agent. In those circumstances the bank would naturally use its best endeavours to sell the four millions of stock to other customers at the price agreed upon, say twenty-five dollars, or \$5. per share. So far as it failed of disposing of the entire amount, it would take the remainder itself. For taking these risks, naturally the bank has almost invariably asked a very high commission, and not infrequently it has been asserted that the managers of the banks have been given a special bonus for themselves privately, in addition to the rates of profits granted the bank.

These large amounts of stock that are paid to the promoter and the financier for the purpose of bringing about the organization of a large trust, lead, of course, to what is called over-capitalization. What the proper basis of capitalization *The Basis of Capitalization.* for a manufacturing industry should be, is a matter that cannot perhaps easily be determined by a definite principle which shall be applicable in every case. The laws that have been most strict on the subject attempt to limit the capitalization to the "actual cash value" of the business, by that being understood at times simply the cost of the plant itself with the running cash capital needed. On the other hand, most business men think that it is a wiser plan, and on the whole equally just, to capitalize a business on the basis of its earning capacity, regardless of what the plant may have cost. When, as has been frequently the case of late years, in addition to this cash value of the plant and the cash itself which may have been paid in, large sums of stock are issued also for properties which may be in themselves highly over-valued, and for the services of the promoter, the financier and others, we can see that the capitalization must be far above what may ordinarily be considered a paying basis. On the other hand, if the element of monopoly enters into the business to any noteworthy extent, the prices of the product may be kept so high that fair dividends may be paid even on this high capitalization. That the tendency towards increasing the capital has been very strong there can be no question, and a penalty is apt to be paid for this somewhat reckless financing. As soon as a slight depression in business comes, so that it is perfectly evident not merely that dividends cannot be paid on the common stock, but that in all probability both the deferred stock and the bonds, if any have been issued, will also have to go without interest, it may be necessary to reorganize many of these combinations and to start them anew on a much lower capitalization.

When the person organizing the combination is himself an active business man, and has the intention of himself directing the affairs of the combination, another *The Industrial Manager.* element besides that of personal profit very frequently enters into the problem. Most strong men like to take responsibility and to be dominant in affairs. When, owing to the advantages of combination that have been enumerated above, the prospect of a virtual monopoly seems certain, provided due skill in management is exercised, it is natural that the manager should wish to bring about the combination in order that he may himself have the satisfaction of being in substantially absolute control of the entire industry in a country, or possibly even in the world. The ambition thus to dominate is not so alien to the nature of that of a statesman, and a promoter, as it may at first sight appear. It is a natural ambition that this pride of position, and the desire to be in a position to

of many of the most successful and most skilfully managed combinations.

1. The form of combination which has ordinarily been first adopted has been some kind of agreement with reference *The Form of Combination.* to maintaining prices, or to paying wages, or to dividing the territory for the distribution of the product, or similar questions. Experience has shown that, generally speaking, such agreements are not likely to be kept in good faith for a long period.

2. In order to make the combination more permanent in its nature, the form of the trust, technically so called, was adopted. Under this form of combination, the stockholders of the various constituent companies of the trust place their stock in the hands of a small board of trustees, giving to these trustees an irrevocable power of attorney to vote the stock as they see fit, or in accordance with specific instructions given at the beginning. The title to the stock itself remains in the original holder, with the right to sell or pledge or dispose of it as he sees fit, but without the power of recalling his right to vote. In return for this stock thus deposited with the trustees, the trustees have ordinarily issued trust certificates, which are in themselves negotiable and take the place of the stock. Inasmuch as the holding of the voting power of the majority of the stock of each of the different constituent companies gave to the trustees absolute power of election of directors, and consequently the power of guiding harmoniously the affairs of all of the plant entering into the combination regardless of the will of the stockholders, the United States courts held that the corporations entering into such an agreement had gone beyond their powers, and that such a trust was illegal. Owing chiefly to these hostile decisions of the courts, this form of trust was abandoned, and new forms, which still, however, leave the power of unified direction in the hands of a few men, were adopted.

3. After the trusts were declared illegal, it was usual, when a combination was formed, to organize a new corporation which bought all of the properties of the constituent members of the trust. These constituent companies then dissolved, and the one great corporation owning all of the properties remained.

4. The form that now seems to be much in favour approaches in its general nature more closely to that of the original trust. Under this form a corporation is organized for the special purpose of buying and owning all, or a controlling share, of the stocks of each one of the constituent companies. The separate companies are then managed technically independently, the dividends of the separate corporations are all paid to the parent corporation as the stockholder owning all of the stocks, and these dividends are the source of profits of the new corporation. The officers in this parent corporation, of course, vote the stocks of the separate companies, and thus absolutely control.

From the savings which it is possible for the combinations to make, it would seem possible for them to pay higher rates of wages to those remaining in their employment than it was possible for the constituent companies to do. In certain instances, especially when the combination has first been made, wages have been increased. On the whole, however, it is probable that as yet the wage-earners have succeeded in getting an increase of wages in circumstances substantially similar to those under which their wages would be increased by single corporations. An increase of wages comes only through pressure on their part. Under a prosperous condition of industry it is possible, without materially lowering profits, to increase the wages.

Certain classes of employes, especially superintendents and commercial travellers, are less needed by the combinations, and consequently the total sum of wages paid to these classes by the combination is less than that formerly paid by the constituent companies. On the other hand, the number of employes of these classes being less than before, the average wage has, in fact, been increased. Owing to the fact that the number of employes has been largely done away with, it has been possible for fewer employes to receive lower wages, to do the

work than before the combination, so that not merely has the total expense been lessened, but also the average salary paid to those retained in the business.

In case of disputes arising between the combination and the operatives, the position of the combination is stronger than that of an individual corporation. It is possible to close one or two works where troubles have arisen, and to transfer orders to the other works without any material injury to the business, provided the closing of the one or two establishments is not for too long a period. Such instances have occurred. On the other hand, labour organizations are also rapidly increasing in strength, and their leaders are of the opinion that within a comparatively short time they will be so thoroughly organized in all of the chief industries that a strike can be instituted and supported not merely in one or two establishments, but throughout the entire industry. Whenever this condition of affairs shall have been reached, the employes will be substantially on an equality with their employers in such cases of conflict, so that the advantage now resting with the combination will be largely removed. In certain industries this condition seems already to have been reached.

From the sources of savings that were enumerated before, it is evident that it would be possible for a combination either to increase the prices paid for raw materials, or to lower *Prices.* the prices of its finished products. Experience, however, seems to show beyond question that whenever the combinations are powerful enough to secure a monopolistic control it has usually been the policy to increase the prices above those which obtained during the period of competition preceding the formation of the combination. Inasmuch, however, as an attempt to increase prices to any great extent, so as to secure very high profits, would certainly result in tempting new capital into the field, it has been the general experience that prices have either been increased only comparatively little after the combination was formed, or else that competition entering the field has comparatively soon forced a lowering of prices to substantially the former competitive rates. It should be noted, however, that inasmuch as combinations have very frequently been formed only after a period of competition so fierce that practically all the competitors were running at a loss, it is hardly just to speak of a combination placing its prices above "competitive rates" unless one defines what is meant exactly by that expression. Whenever they have put their prices above the competitive rates existing just before the combination, it may mean that they have put their prices back to rates that will allow medium profits instead of losses, and not above rates that would be normal in the case of small competitors.

It will have been noted from what has been said that the excellences of the combination consist largely in the savings that have already been enumerated. The evils are: *Legislative Remedies.* (1) The losses to investors through the acts of the promoters and financiers at the time of the organization of the combinations, and through the speculation in the stocks which is at times carried on by the directors of the combinations themselves. (2) The losses to the wage-earners from the power that sometimes exists of forcing wages rather lower than it would be possible for a single corporation or manufacturer to do, and also from the discharge of certain classes of employes whose services are no longer needed, such as commercial travellers. It should be remarked of the latter case, however, that the injury is a personal one to those men that are discharged, but that it results in a saving to the community, and, therefore, presumably to the wage-earning class as a whole in the long run. (3) A further injury at times to the consumer arises, as has been suggested, from the increase in price. Other evils come through the power that is sometimes exercised by combinations in the corruption of legislatures; in the control over industries of such a nature that it tends to destroy the spirit of individual activity and independence on the part of many persons who would otherwise enter business independently; and evils also come through the increased force of any improper or dishonourable business practices, since this added force for evil

is given to any combination by virtue of its greater influence in the community. It is not intended to convey the impression that managers of combinations are less moral than other business men, but merely that whenever they are dishonourable in their practices the influence reaches more widely.

The chief remedies for these evils enumerated would seem to be more rigid laws with reference to the methods of incorporation and to the responsibility of directors to stockholders and to the public. This can perhaps best be brought about through greater publicity in both of these directions, probably under the inspection of government officials. The other line of remedies would seem to be the removal of special favours granted to these combinations either by the government or by railways or other bodies so situated that they can distribute favours to the larger combinations.

The movement towards consolidation of industries in the United States began to be noticeable soon after the Civil War (1861-65), but it had not reached noteworthy proportions, excepting in connection with the railways, until within the last twenty years of the 19th century. During the later years many consolidations were made, the largest number during the years 1898-1900. From what has been said earlier, it is evident that certain classes of industries, especially those that require the investment of fixed capital to large amounts, are especially adapted for combination. Very little tendency towards consolidation is found in the farming industry, and, relatively speaking, little in industries that require the investment of but small capital. It is perhaps, however, not too much to say that in nearly all lines of industry which from their nature are adapted for consolidation combinations more or less firm have been made during the last few years. It is probable that as time passes we shall have many of these combinations reorganized, and that in many lines of industry there will be further consolidation of present combinations.

Experience has shown that when combinations are made in industries that from their nature do not seem well suited for consolidation, failure follows. In many individual instances corporation lawyers, who have had much practice in forming combinations, advise their clients in lines of business especially fitted for competition not to enter a combination, but to remain independent, assuring them that an individual is able to compete in such lines of industry with any combination, however large. Such advice, of course, would not be given were the industry one which was well adapted for consolidation.

Great Britain.—The tendency towards consolidation has been for several years very noticeable in Great Britain, although the form has been rather that of a *pool* or *ring* than that of a trust or of a single large corporation. In the coal and milling industries there have been agreements; and, particularly in London and other distributing centres, these selling combinations have been able at times to control the market. This has also been true with reference to certain kinds of provisions, such as the bacon imported from Denmark.

Of late years there has been a marked tendency towards the formation of large corporations that buy up a very large proportion of competing manufacturing plant, and in this way secure at least a temporary monopoly of the market. The Salt Union was formed along these lines, but this has not proved successful, owing probably to the fact that new sources of supply were discovered. The dyeing industries in Bradford and in Yorkshire have been consolidated, so that in certain respects they have an absolute monopoly of the business, and in most directions of over 90% of it. The calico printers, the fine cotton spinners, the thread manufacturers, the bleachers, and others connected with the cotton manufacturing industries in Great Britain, have nearly all been brought together into large corporations which control from 90% upwards of the entire business. Similar combinations in cement, wall-paper, soap, tobacco and other trades have been formed. Most of these large corporations have been in existence for such a short time that one cannot yet

judge accurately regarding their permanent success. Many of them seem to have been over-capitalized and their dividends have not always met shareholders' anticipations. There has been no active popular movement against consolidation in England, and the government has passed no laws opposed to it. Parliament, however, has passed stringent amendments to the Companies Acts, changes enforcing publicity regarding the organization of all limited liability companies and their methods of management. The amended law is expected to prevent most of the abuses of the combinations.

Germany.—Germany seems to be peculiarly the home of combinations so far as Europe is concerned. In 1897 Liefmann, writing regarding combinations in Germany, was able to mention combinations which were international in their scope in forty-one different branches of industry. Of combinations that were confined to Germany alone he mentioned 345, although many of them were in the same line of industry; for example, he found 80 combinations in different branches of the iron industry, 82 in the chemical industries, 38 in the textiles, and so on. Of that number he thought that definite information could be secured, but he was of the opinion that very many more of less importance existed, and had excluded from his reckoning all of those that were purely local, as for example those among the breweries in the different cities, as well as those among firms engaged merely in trade. The form of combination in Germany is ordinarily that merely of contracts among independent establishments (*Cartels, Kartells*) regulating the amount of output for each, and in certain cases also the prices. As in Austria and in France, a central selling bureau for all the members of the combination is frequently found. The most successful combinations have been those among the coal-miners in western Germany and the four or five in the leading branches of iron manufacture, also in western Germany. Others of somewhat similar rank have been organized, one, for example, in the sugar industry, which includes both refiners and producers, and another among the manufacturers of spirits. The former, following that among the Austrian sugar manufacturers, is somewhat peculiar in that the refiners guarantee to the producers of raw sugar a fixed price for their output so far as the sugar is intended for the home market, the refiners expecting to recoup themselves from the consumers through the monopolistic power which they possess. The law does not seem to be hostile to these combinations. Contracts that are immoral in their nature are, of course, non-enforceable. But the courts have, on the whole, not taken an attitude inimical to the larger combinations, and the government seems at times to have been inclined to favour them. In one or two cases where the government is itself a producer, as of soda, it is a member of a combination. Indeed, a Prussian minister in a speech in the Landtag has expressed himself favourably regarding the coal and iron combinations. The facts seem to show that the coal combination, at any rate, has used its power of fixing prices in a conservative way, and it has at times held prices somewhat lower than they probably would have been had free competition existed in that industry. So long as the combinations are managed conservatively, and so long as the government is able to secure a careful supervision over them, it is not to be expected that there will be much hostility in Germany on the part of the government.

France.—The number of combinations in France is probably much less than in Great Britain or Germany. In the penal code there has been a provision for many years against monopoly brought about by unfair means, and in one or two rather prominent instances there seem to have been convictions under this article. Consequently, the agreements that have been made, so far as they are intended to control prices, are usually kept secret. There have been, however, notably in the case of the iron industries, agreements made among the leading manufacturers, under which the proportion of output to each was fixed. A single selling bureau was established, which received the orders of the different organizations.

secured monopolistic power has not been successfully attacked in the courts. For several years it has been supposed that a similar agreement existed among the sugar refiners. They themselves, however, acknowledge only an agreement regarding the amount of the output which shall be assigned to each, and deny any agreement as to prices. Of course an agreement regarding output would be likely to have a material effect upon prices. Somewhat similar combinations exist among the petroleum refiners, the porcelain makers, and some few others. The government has taken no active steps in the matter, but popular opinion seems to be awakening somewhat.

Austria.—In Austria the development of combinations has been very marked. The most successful combination, on the whole, as well as one of the earliest, has been that of the iron industry. The sugar industry, however, including both refiners and producers of the raw sugar, and the petroleum industry, are also combinations of great power. The form of these combinations is ordinarily that of an agreement regarding both output and prices. In some instances a central selling bureau fixes the prices, in others the market is divided, while in others still other forms of agreements of many kinds which serve to secure a monopoly are found. The movement has spread very rapidly indeed, until, in the opinion of many writers in Austria, practically all branches of industry, in which agreements for the lessening of competition will prove advantageous, are now largely controlled by combinations. The courts of Austria have, on the whole, shown themselves hostile to the movement. Contracts for the division of the market, for the assignment of fixed proportions of the entire output to different establishments, the fixing of prices, &c., are declared void and will not be enforced by the courts. This adverse action, however, does not seem to have affected very materially the tendency towards combination, although it has perhaps tended somewhat to encourage the formation of large corporations which should purchase all of the separate plant in any one industry. This tendency, again, is checked by the fact that the corporation law requires publicity in business, and that the taxes are heavier on corporations than on private firms, both as regards the legal rate and the certainty of collection. A government commission has recommended recognition of the combinations by law and their careful supervision and regulation by government authority. (J. W. J.)

TRUXTUN, THOMAS (1755-1822), American naval officer, was born at Jamaica, Long Island, on the 13th of February 1755. He went young to sea, and in 1775 was in the *Enterprise* when she first participated in the struggle for independence. But having been wounded in the *Enterprise* by his

with British vessels. When the independence of the United States was recognized he returned to trade with a high reputation as a seaman. He was the author of a treatise on longitude and latitude, of a "System of masting a 44-gun frigate," and was an advocate for the foundation of a national navy. When the United States navy was reconstituted in 1798 he was one of the original corps of six captains. During the last years of the 18th and first of the 19th century American commerce was subject to much intolerable interference on the part of the French as well as of the British naval officers. It was against the first that Truxtun rendered the services which have made him a prominent personage in the history of the United States navy. In February 1799 he was captain of the United States "Constellation" (36) and on the 19th of that month he captured the French "L'Insurgente" (36). In the following year, and while still in command of the "Constellation," he fought the French "Vengeance" (40), and drove her into Curaçao. The crippled state of his own ship, which had lost her mainmast, prevented him from taking possession of the enemy. In 1802 he was to have sailed in command of the squadron sent against the Barbary pirates, but a difference having occurred between him and the navy department in regard to the appointment of a captain to his flagship, his remonstrance against the official decision of the authorities was treated as a resignation, which it was apparently not meant to be, and he was not employed any further. He died at Philadelphia on the 5th of May 1822.

TRYON, DWIGHT WILLIAM (1849-), American artist, was born at Hartford, Connecticut, on the 13th of August 1849. At the age of twenty-five he left his position as a clerk in a Hartford publishing house to devote himself entirely to art, and two years afterwards went to Paris, where he became a pupil of the École des Beaux Arts, under J. de la Chevreuse, Charles Daubigny and A. Guillemet. A skilful landscape painter, New England provided his best subjects. He first exhibited at the Salon in 1881, and in the same year returned to the United States, settling first in New York City; in 1882-1886 he was director of the Hartford School of Art, and in 1886 became professor of art at Smith College. He became a member of the Society of American Artists (1882), a National Academician (1891), and a member of the American Water Color Society. He won numerous medals and prizes at important exhibitions, among his pictures being "Daybreak," "Moonlight" and "Early Spring, New England."

TRYON, SIR GEORGE (1832-1893), British admiral, a younger son of Thomas Tryon, of Bulwick Park, Northamptonshire, was born on the 4th of January 1832. He entered the navy in 1848, on board Lord Dundonald's flagship on the North American station; was subsequently in the "Vengeance" with Lord Edward Russell in the Black Sea; was landed for service with the naval brigade; and was made a lieutenant in November, but dated back to the 21st of October 1854. From 1855 to 1858 he was in the "Royal Albert" flagship of Sir Edmund Lyons; and from 1858 to 1860 in the royal yacht, which gave him his promotion to commander on the 25th of October 1860. From 1861 to 1864 he was commander of the "Warrior," the first British sea-going ironclad; from 1864 to 1866 he commanded the "Surprise" gunvessel in the Mediterranean; and was promoted to be captain on the 11th of April 1866. In 1867 he was sent out as director of transports and store ships for the Abyssinian expedition, a post which involved a great deal of hard work in a sweltering and unhealthy climate. He discharged his duties exceedingly well, but his health broke down, and he returned to England a helpless invalid. From 1871 to 1873 he was private secretary to Mr Goschen, then first lord of the admiralty, and from 1874 to 1877 commanded the "Raleigh" in India with the Prince of Wales, and later in the Mediterranean. In the years 1878-1881 he had command of the "Monarch," one of the Mediterranean fleet under Sir Geoffrey Hornby and Sir Beauchamp Seymour, afterwards Lord Alcester. He was subsequently for two years secretary of the admiralty; and for three years more, on his

he was made K.C.B.; afterwards he was for three years superintendent of reserves, in which capacity it fell to him to command one of the opposing fleets during the summer manoeuvres, when he showed marked ability and originality of ideas. In 1880 he was promoted to be vice-admiral; and in August 1891 was appointed to command the Mediterranean fleet, which under him—following the example of his old chief, Sir Geoffrey Hornby—became very distinctly an evolutionary and, in that sense, experimental squadron. Some of his methods were afterwards said to be dangerous; but those which were most severely criticized do not appear to have had anything to do with the lamentable accident which ended Tryon's career. On the 22nd of June 1893, the fleet being then off Tripoli on the coast of Syria, in two columns, Tryon made the signal to invert the course, the ships turning inwards in succession. By a fatal error, the psychological cause of which has never been explained, he ignored the patent fact that the two columns were so near each other that the manoeuvre, as ordered, must entail the most serious risk, if not certainty, of collision. And, in fact, the two leading ships did come into collision, with the result that the "Victoria," Tryon's flagship, was cut open and sank in a few minutes. Tryon and 358 officers and men were drowned.

See the *Life*, by Rear-Admiral C. C. Penrose-FitzGerald.

TRYON, THOMAS (1634-1703), English humanitarian, was born at Bilbury near Cirencester on the 6th of September 1634. He had but little schooling, spending his youth first in spinning and carding and then as a shepherd. In 1652 he went to London, apprenticed himself to a hatter, and accepted his master's Anabaptist principles until he read the works of Jacob Behmen. He now lived a very ascetic life, though he married and became a prosperous merchant. In 1682 he began to publish his views in support of vegetarianism and abstinence from alcohol and tobacco. He detested war, and in this and his mysticism resembled the early Quakers. He died on the 21st of August 1703.

His best known book, *The Way to Health* (1691), which much impressed Benjamin Franklin, was a second edition of *Health's Grand Preservative; or, The Women's Best Doctor* (London, 1682). He wrote on many other subjects, e.g. the education of children, the treatment of negro slaves, the way to save wealth, and dreams and visions. Some scanty autobiographical memoirs were published in 1705.

TRYON, WILLIAM (1720-1788), American colonial governor, was born at Norbury Park, Surrey, England, in 1729. In 1757, when he was a captain of the First Foot Guards, he married a London heiress with a dower of £30,000. In 1764 he was appointed lieutenant-governor of North Carolina, upon Arthur Dobbs's death in 1765 became governor *pro tem.*, and in December of the same year received his commission as governor. Like many other pre-Revolutionary officials in America, he has generally been pictured by American writers as a tyrant. In reality, however, he seems to have been tactful and considerate, an efficient administrator, who in particular greatly improved the colonial postal service, and to have become unpopular chiefly because, through his rigid adherence to duty, he obeyed the instructions of his superiors and rigorously enforced the measures of the British government. By refusing to allow meetings of the Assembly from the 18th of May 1765 to the 3rd of November 1766, he prevented North Carolina from sending representatives to the Stamp Act Congress in 1765. To lighten the stamp tax he offered to pay the duty on all stamped paper on which he was entitled to fees. With the support of the law-abiding element he suppressed the Regulator uprising in 1768-71, caused partly by the taxation imposed to defray the cost of the governor's fine mansion at New Bern (which Tryon had made the provincial capital), and executed seven or eight of the ringleaders, pardoning six others. From 1771 nominally until the 22nd of March 1780 he was governor of New York. While he was on a visit to England the War of Independence broke out, and on the 19th of October 1775, several months after his return, he was compelled to seek refuge on the sloop of

war "Halifax" in New York Harbour, but was restored to power when the British took possession of New York City in September 1776, though his actual authority did not extend beyond the British lines. In 1777, with the rank of major-general, he became commander of a corps of Loyalists, and in 1779 invaded Connecticut and burned Danbury, Fairfield and Norwalk. In 1780 he returned to England, and in 1782 was promoted to be lieutenant-general. He died in London on the 27th of January 1788.

See Marshal D. Haywood, *Governor William Tryon and his Administration in the Province of North Carolina* (Raleigh, North Carolina, 1903).

TRYPANOSOMES, or HAEMOFLAGELLATES, minute Protozoan parasites, characterized by the possession of one or two flagella and an undulating membrane, and specially adapted for life in the blood of a vertebrate.¹ Of late years considerable progress has taken place in our knowledge of these organisms, research upon them having been stimulated by the realization of their extreme importance in medical parasitology. Not only has the number of known forms been greatly multiplied, but the study of the biology and life-history of the parasites has been attended in some cases with remarkable and unexpected results.

Historical.—The first observation of a trypanosome is usually ascribed to Valentin (55), who in 1841 announced his discovery of certain amoeboid parasites in the blood of a trout. In the two or three years following several other observers recorded the occurrence of similar haematozoa in various fishes. The generic name of *Trypanosoma* was conferred by Gruby in 1843 upon the well-known parasite of frogs. E. Ray Lankester (18) subsequently described this same form (under the name of *Undulina ranarum*)

(From Lankester.)
FIG. 1.—*Undulina ranarum*. Lankester, 1871. In B the nucleus is shown.

and was the first to indicate the presence of a nucleus in the cell-body. To Mitrophanow (1883-1884) and Danilewsky (1885-1889) we owe the first serious attempts to study the comparative anatomy of these haematozoa. Trypanosomes were first met with in cases of disease by Griffith Evans, who in 1880 found them in the blood of horses suffering from surra in India. In 1894 (Sir) David Bruce discovered the celebrated South African parasite (*T. brucei*) in cattle and horses laid low with nagana or the tsetse-fly disease; and this worker subsequently demonstrated, in a brilliant manner, the essential part played by the tsetse-fly in transmitting the parasites. The credit for first recognizing a trypanosome in human blood, and describing it as such, must undoubtedly be assigned to G. Neveu (1868). Trypanosomes were next seen in human blood

¹ *Trypanosphis*, although lacking (so far as is known) a haemal habitat, is included here, since it is undoubtedly closely related to *Trypanosplasma*.

² The illustrations in this article are from H. M. Woodcock's "Trypanosomes," in the *Quarterly Journal of Microscopical Science*.

in Senegambia in 1901, in a European suffering from intermittent fever. Forde discovered the parasites, but was uncertain of their nature; he showed them to E. Dutton, who (11) gave this form the name of *Trypanosoma gambiense*. A year later A. Castellani (6) found the organisms (most probably the same species) in the cerebro-spinal fluid of patients suffering from sleeping-sickness in Uganda; and it has since been conclusively proved by Sir David Bruce and D. Nabarro (4) that they are the true cause of that dreadful malady.

More important, from the standpoint of protozoology, than these interesting medical discoveries have been the investigations by A. Laveran and F. Mesnil (20-24), L. Léger (30-35), S. Prowazek (47), F. Schaudinn (50) and others, upon numerous tolerated (*i.e.* non-pathogenic) forms; these researches supply, indeed, practically all the material facts on which to base an account of the Haemoflagellates at the present day.

Trypanosomes are harboured by members of all the chief classes of vertebrates with the exception of cyclostomes. By far the greater number of hosts are furnished by **Occurrence.** fishes, birds and mammals. Among batrachians the parasites have been found, up till now, only in frogs; and among reptiles their occurrence has only been observed in one or two solitary instances (*T. damosiae*, fig. 3 J). Data with regard to the frequency with which individual species occur, in any kind of host, are as yet somewhat scanty; in one or two cases the parasites are fairly common, *T. lewisi*, for example, being met with in a considerable percentage of sewer-rats throughout the world.

In considering the occurrence of Trypanosomes in mammals, careful distinction must be drawn between natural or true hosts, which are tolerant of the parasites, and casual ones, which are unaccustomed and unadapted to them. A Trypanosome usually produces markedly harmful effects upon gaining an entry into animals which have never been, by their distribution, liable to its invasion previously. Such a state of affairs is produced by the march of civilization into the "hinterlands" of the various colonies, when man, together with the numerous domesticated animals which accompany him, is brought into proximity to big game, &c., and, what is equally important, into the zone of the particular blood-sucking insects which prey upon the same.

Very many of the common domestic mammals can be successfully infected (either thus accidentally or else on purpose) with different "pathogenic" Trypanosomes, to which they succumb more or less readily, but they cannot be regarded as the natural hosts of those Trypanosomes. In dealing with disease-causing forms, the more narrowly the original source of the parasite concerned is defined, the closer do we get to the true vertebrate host or hosts. In the case of the nagana-parasite, various Antilopidae (*e.g.* the gnu, bushbuck and koodoo) can certainly lay a strong claim to the honour. The capybara, again, is most probably the native host of *T. equinum* of mal de caderas of horses in South America. Similarly with regard to the many other pathogenic Trypanosomes now known, there is undoubtedly, in each case, some indigenous wild animal tolerant of that particular form, which serves as a "latent source of supply" to strange mammals.

The transmission of the parasites from one vertebrate individual to another is effected, in the great majority of cases,¹ by a blood-sucking invertebrate, and by this means **Trans- alone.** mission alone. The "carrier" of a Trypanosome of warm-blooded vertebrates is, in all instances so far described, an insect, generally a member of the Diptera; in the case of parasites of cold-blooded vertebrates the same rôle is usually played by an Ichthyobdellid leech (piscine forms), but possibly, now and again, by an *Ixodes* (amphibian or reptilian forms).

Until lately it remained quite uncertain, however, whether the invertebrate merely conveys the Trypanosomes or whether

it is a true alternate host, one *i.e.* in which definite stages of the parasite's life-cycle are undergone. Schaudinn (50), who investigated certain avian Trypanosomes, considered the latter view to be correct, and believed that the carrier—in this instance a gnat—is indeed the definitive host, *i.e.* the one in which sexual conjugation occurs. Many other workers have since studied the subject and, so far as the parasites of fishes are concerned, there can be little doubt, thanks to the researches of E. Brumpt (50), L. Léger (32, 33) and others, that leeches are true alternate hosts for these forms, in which certain phases of the life-cycle are normally undergone.

We cannot write quite so confidently with regard to the relation of the various pathogenic Trypanosomes to Tsetse-flies (*Glossinæ*). In the first place experiment has shown that biting-flies, other in all probability than the true, natural hosts, may at times transmit the parasites—as it were—accidentally, if, after feeding on an infected animal, they are allowed to bite a fresh one within a limited time. One very helpful factor in determining which is the principal carrier of any form is the coincidence of the zone of a particular insect with that of any disease. By this means it has been ascertained with practical certainty that, among the family of Tsetse-flies (*Glossinæ*) for instance, at least four species are the natural carriers of different Trypanosomes. Of these perhaps the best-known is *G. palpalis*, of Equatorial Africa, whose bite transmits the human parasite (*T. gambiense*). Nevertheless, the fact, commented upon by several observers, that even here an infected fly is only infectious for a comparatively short period suggests that this species of fly, at any rate, is not the true alternate host in which the life-cycle of that particular Trypanosome is completed. However, indications furnished by Koch (16a) point in this connexion to *G. fusca*. Lastly, before leaving this interesting and important subject, F. Stahlmann's work (54a) on developmental phases of *T. brucei*, the nagana parasite in *G. fusca* and *G. tachinoides*, does render it probable that the pathogenic forms also have true invertebrate hosts.

Schaudinn had fully described the relations of certain avian Trypanosomes to their invertebrate host, *Culex pipiens* (females). The distribution of the parasites in the gnat is closely **Habitat:** connected with the process of digestion. The Try- **Effects on** panosomes ultimately overrun practically all parts **Host.** of the body, sometimes not even the ova escaping. Thus true hereditary infection of a succeeding generation of gnats may be brought about. The life of the parasites while in the insect is characterized by an alternation of active periods, during which multiplication goes on, with resting-periods, when the Trypanosomes become attached to the epithelial cells of the host. According to S. Prowazek (47), the behaviour of *T. lewisi* in a louse (*Haemolopinus*) is, in its main features, similar.

On gaining an entry into the blood of a vertebrate the organisms pass rapidly into the general circulation, and are thus carried all over. Considering them first in a tolerant host, the trend of observation is to show that they are never abundant, but on the contrary usually somewhat scarce. One reason for this scarcity is to be sought in connexion with the fact that multiplicative stages are very rarely met with, at any rate in the general circulation. The parasites are frequently more numerous in the spleen, bone-marrow, kidneys, &c., than elsewhere, and it has been found that multiplication goes on rather more actively in the capillaries of these organs.

The Trypanosomes, in the active phase, are of course always free in the blood plasma (interglobular). In the majority of cases it is very uncertain whether they actually come into relation with the blood corpuscles or not. Schaudinn has stated, however, that *Trypanomorpha* becomes, in certain phases, attached to a red blood-corpuscle (ectoglobular), and, in others, penetrates inside one and eventually destroys it (endoglobular); while his other avian parasite, *Trypanosoma siemanni*, apparently draws up into itself the white corpuscle (leucocyte) to which it becomes attached. In addition, there are two or three

¹ *Trypanosoma equiperdum*, the cause of dourine in horses and asses, is apparently only conveyed by the act of coitus. This direct mode of transmission is most likely a secondary acquirement.

observations to hand which shew that piscine, amphibian and mammalian Trypanosomes may also become attached. Probably most forms possess a resting, attached phase at some period or other, in the invertebrate, if not in the vertebrate host.

Considering now the Trypanosomes in an unaccustomed, mammalian host, they may either remain infrequent or rare (sometimes, indeed, being unnoticed until shortly before death), or, on the other hand, they may soon become numerous and go on increasing (fig. 2). In the latter case the disease is acute and rapidly fatal; in the former it is more chronic and lasts much longer, often several months. The main features of trypanosomiasis, or illness caused by a Trypanosome, show a general agreement, whichever variety is considered; one symptom may be, of course, more marked than another in any particular case. Death is due either to weakness and emaciation (in chronic cases), or to blocking of the cerebral capillaries by the parasites (where these are abundant), or to disorganization of the nervous system (paraplegic and sleeping-sickness cases).

FIG. 2.—*Trypanosoma equiperdum* (of dourine), in the blood of a rat eight days after inoculation.

a, Parasites.
b, Blood-corpuses.

In post-mortem examination, the most obvious pathological lesion is hypertrophy of the spleen, which may be very pronounced; the lymphatic glands in the neck, inguinal region, &c., are also often greatly swollen. These are undoubtedly the organs which react most strongly to the parasites, and their enlarged condition is to a great extent due to their enhanced activity in elaborating blood-corpuses and leucocytes to cope with the enemy. Ingestion and dissolution of the Trypanosomes by phagocytes has frequently been observed; and it is probable also that the haematopoietic organs secrete some substance which exerts a harmful action on the parasites, and causes them to undergo involution and assume weird-looking "amoeboid" and "plasmodial" forms.

A peculiar feature in the behaviour of the parasites, which is most probably caused by unfavourable biological conditions in the host, is that known as agglomeration. The

process is readily brought about artificially by the addition of sera or chemical solutions to blood containing the parasites. Agglomeration consists in the grouping or union together of several Trypanosomes around a common centre; this leads to the formation of rosette-like clusters, or even of large masses composed of several rosettes. The end by which the parasites join is typically, in the case of *Trypanosoma*, the non-flagellate (anterior) end. If a favourable change in the surrounding medium sets in, the Trypanosomes are able to undergo the reverse process, namely disagglomeration; the parasites liberate themselves and the rosette is dissolved.

Trypanosomes vary greatly with regard to size; even in one and the same species this variation is often noticeable, especially under different conditions of life. The common *Trypanosoma rotatorium* of frogs (fig. 4, A and B) is, taking it all in all, one of the largest forms so far described. Its length (inclusive of the flagellum) varies from 40–60 μ , while its greatest width (including the undulating-membrane) is from 8–30 μ ; in the very wide individuals breadth is gained more or less at the expense of length. Conversely, *T. gambiense*, the human parasite (fig. 3 C) is one of the smallest forms known, its average size being about 21–23 μ by 1½–2 μ .

There is equally great diversity in respect of form. Typically, the body is elongated and spindle-shaped; it is usually more or less curved or falciform (fig. 4, A–D), and tends to be slightly compressed laterally. It may be, however, anything from extremely slender or vermiform (fig. 3, *Heteromastix* and *Stumpy* (fig. 3, G, 4, A); moreover, apart from the fact that a full-grown adult, ready to divide, is in many cases much plumper than a young adult (cf. *T. vivax*, fig. 6, A and B), there can be no doubt that considerable polymorphism also sometimes occurs (e.g. *T. equiperdum*). In many cases, at any rate, this indicates a difference in flagellar type and it is particularly necessary to bear this factor in mind when considering

the avian Trypanosomes, where, perhaps, the extremes of form are to be met with. That one and the same species may appear entirely different in different phases of the life-history is manifest on comparing, for instance, the chief "forms" of *Trypanosoma*

sicimanni described by Schaudinn. The asexual or indifferent type (fig. 3, H) is extremely thread-like, greatly resembling, in fact, a *Spirichia*; on the other hand, both male and female individuals have the form of a very wide spindle.

In *Trypanoplasma* and *Trypanophis* there are two flagella, inserted into the body very close to the anterior end (fig. 4, F and G). One flagellum is entirely free and directed forwards; the other at once turns backwards and is attached to the convex or dorsal side of the body for the greater part of its length. In all other Trypanosomes there is only one flagellum, which is invariably attached to the body in the same manner as the posterior end of biflagellate forms. This flagellum, however, is most probably not to be considered homologous in all cases. (See Woodcock, *loc. cit.*)

In *Trypanomorpha* (fig. 3, E), which is to be derived from a Heteromonadine type, the single, anterior flagellum of the ancestral parasite has been drawn backwards along one side of the body and now originates in the posterior half. Hence in this genus the end bearing the free part of the flagellum is the anterior end. The genus *Trypanosoma*, in which are included at present the great majority of Trypanosomes, is rather to be regarded as derived from a Heteromastigine ancestor, such as *Trypanoplasma*, by the loss of the anterior flagellum. Hence in this type the single flagellum represents the posteriorly-directed one of *Trypanoplasma*, and the end at which it becomes free is the hinder end. The point of origin of the flagellum in *Trypanosoma* is usually near the anterior end, but may vary considerably (cf. figs.); and its free portion may be very short or lacking.

Along the dorsal side runs the characteristic fin-like expansion of the body, the undulating-membrane, which is the organella principally concerned in locomotion. This always begins at the place where the attached flagellum emerges from the body; and its free edge is really constituted by the latter, which forms a flagellar border. The membrane is usually more or less sinuous in outline, and is sometimes thrown into broad folds (fig. 3, F and J). Distally it thins away concurrently with the body.

The body appears to be in all cases naked. A differentiation of the peripheral cytoplasm in the form of an ectoplasmic layer has been described in one or two instances, and it seems probable that in most Trypanosomes there is such a layer, although only poorly developed, as a rule, around the body generally. On the other hand, the undulating-membrane is largely if not entirely an ectoplasmic development. This is usually much clearer and more hyaline than the general cytoplasm. In many forms deep-staining grains or granules, of a chromatoid nature and of varying size, are to be seen in the cytoplasm. In

only is there an intimate correspondence in this respect between the two principal organelles, but the flagellar apparatus itself is really of nuclear origin and remains closely connected with the kinetonucleus (cf. fig. 7). In most cases, however, little beyond the position and general appearance of the nuclei has been so far made known. The trophonucleus is usually situated somewhere about the middle of the body. The kinetonucleus is typically near the anterior end; but in a few instances it lies more centrally (e.g. *T. inopinatum*, *T. rotatorium*, fig. 4, A-C); in *Trypanomorpha* it is in the posterior half of the body (fig. 3, E).

most cases these granules are, if not confined to, chiefly distributed in the posterior (flagellate) half of the body (figs. 3, B, D and E, 4, E and G). In certain Trypanosomes a well-defined, usually oval vacuole is often, though not constantly, to be observed, situated at a varying distance from the anterior end (figs. 3 and C, G, 4, F). There is no reason to doubt that this vacuole is a normal cell-constituent, for it has been described in parasites in quite normal surroundings and conditions.

A Trypanosome always possesses two distinct nuclear bodies, one the *trophonucleus*, regulating the trophic life of the cell, the other, the *kinetonucleus*, directing its locomotor activities. The recent investigations of Schaudinn and Prowazek (tt. c) have shown that, in some forms at any rate, the finer structure and detailed development of the nuclear apparatus is extremely complex. Not

In certain forms the occurrence of prominent myonemes or muscle-fibrillae has been described, and, moreover, a nuclear origin assigned to them also. In *Trypanomorpha* they are confined to the undulating-membrane (fig. 3, E), but in other cases—*Trypanosoma ziemanni*, *T. lewisi*, *T. brucei*, and *T. soleae*—they are arranged laterally, half running down each side of the body (fig. 4, J). In *Trypanoplasma borreli* there is only a single myoneme on either side.

All Trypanosomes are capable of binary longitudinal fission, and this appears to be the chief method of multiplication. The division of the nuclear apparatus is the first to take place (fig. 5, A). The *Multiplication* kinetonucleus more often leads the way, but sometimes either kinetonucleus or trophonucleus may do so indifferently. The duplication of the flagellum begins at its proximal end, that which is in relation with the kinetonucleus. Until recently the process has been considered as an actual longitudinal splitting of the flagellum, following upon the separation of the two daughter-kinetonuclei. Both Schaudinn (in the case of *Trypanomorpha*) and Prowazek (in the case of *Trypanosoma lewisi* and *T. brucei*), have found, however, that the new flagellum is developed quite independently and laid down alongside the old one. It is at present somewhat uncertain, therefore, in what cases actual splitting occurs. The same applies equally to the formation of the undulating-membrane. If the flagellar border splits, the membrane doubtless divides also; but where the flagellum is a new formation the membrane will be too. The division of the cytoplasm in most forms is equal or sub-equal, and two approximately equal daughter-Trypanosomes result (fig. 5, C). In some instances (e.g. *T. equiperdum*) the longitudinal fission is apparently multiple, three or even four descendants being produced simultaneously.

(After Lav. and Mesnil.)

FIG. 5.—Stages in Binary Longitudinal Fission of *Trypanosoma brucei*.

T. lewisi differs from most Trypanosomes in that the cytoplasm divides in a very unequal manner (fig. 6). The process is more comparable to budding, since the larger or parent-individual may produce, successively, more than one "daughter", moreover, the daughter-individuals may subdivide before separating, the whole family remaining attached by the non-flagellate (anterior) end (fig. 6, F).

In this type of division it may be noted that the kinetonucleus comes to lie alongside the trophonucleus, or even passes to the other side of it (i.e. nearer the flagellar end). Easily derivable from this method is the other one characteristic of *T. lewisi*, viz. segmentation. The chief difference is that in the latter no parent-individual is distinguishable, a rosette of many equal daughter-parasites being formed.

The small Trypanosomes resulting from either of these modes of division differ from typical adults by their stumpy, pyriform shape, the position of the kinetonucleus near the flagellar end of the body, and the absence, during the first part of their youth, of an undulating-membrane. At this period they have, in fact, what may be termed a "pseudo-herpetomonadine" aspect. These young individuals can themselves multiply by equal binary fission, giving

rise to little fusiform parasites; with growth, these gradually assume the adult appearance.

Comprehensive researches (1905, seq.) have made it evident that Trypanosomes have a much more varied and complex development and life-history than was previously supposed.

This has now been found to be the case in widely-differing parasites, occurring in widely-different hosts.

Development and Life-cycle. The following examples have been investigated: *Trypanosoma lewisi* (also, but much less completely, *T. brucei*), among mammalian forms, described by Prowazek (47); *T. ziemanni* and *Trypanomorpha noctuae*, among avian parasites, described by Schaudinn (50); *Trypanosoma inopinatum*, among batrachian forms, described by A. Billet (1a and 2), *T. barbatulae* and *Trypanoplasma varium*, described by Léger (32 and 33), and *T. borreli*, by

rise to one of three types of Trypanosome individual: indifferent, male or female. The development of an indifferent ookinete into an indifferent Trypanosome is shown in fig. 7, from which it will be seen that the cytological details are very complex. The indifferent parasites exhibit an alternation of resting, attached phases with active periods, during which they multiply actively and become very abundant in the insect. The male forms, which are very small and the homologues of the microgametes developed in the blood, appear to die off soon. The female Trypanosomes, on the other hand, grow to a large size, laying up a store of reserve nutriment. They are very sluggish and do not divide. They are the most resistant to unfavourable conditions of environment, and are able, by a process of parthenogenesis, to give rise to ordinary, indifferent forms again, which can repopulate the gnat.

So far as regards the remarkable connexion between Trypanosomes and Haemosporidia indicated by Schaudinn, this has met with a great deal of criticism on the part of Novy and McNeal among others, and it must be admitted that up to 1909 no definite corroboration can be said to have been brought forward. Again, the spirochaetiform *Trypanosoma (T. ziemanni)* described may have been really a true *Spirochaeta*, i.e. a Bacterium. In short, it is quite possible Schaudinn did not sufficiently distinguish between the life-cycles of four distinct parasites of the Little Owl: a Trypanosome, a *Spirochaeta*, a *Halteridium* and a *Leucocytozoon*; though, on the other hand, this is by no means proved. However this may be, the research of subsequent workers—e.g. Brumpt (5a), Léger (32, 33), Keysselitz (16), Prowazek (47), Minchin (41b) and others—has undoubtedly shown that much of Schaudinn's scheme of the life-history of a Trypanosome is well-founded. It is certain, for instance, that the three types of form which he discovered, viz. indifferent, male or female, can be recognized in many cases, often in the vertebrate, but always more sharply differentiated in the invertebrate. Moreover, it is very probable that conjugation occurs soon after the arrival of the parasites in their specific invertebrate host; and this act may perhaps give rise to an aflagellar copula, which is gregariniform, and comparable to an ookinete. Different investigators, it may be noted, have described various

(A-E, after Lav. and Mesnil; F, after Wasieł and Senn.)

FIG. 6.—Unequal Division and "Budding" process in *T. lewisi*. m, Parent-individual; d, Daughter-individual; d', Daughter-individual dividing.

G. Keysselitz (16), from fishes; also several other piscine Trypanosomes have their development phases in leeches worked on by Brumpt (5a). In addition, a Trypanosome whose vertebrate host is yet unknown (*T. grayi*) has been studied in detail by Minchin (41a).

It is impracticable here to consider fully all the various developmental phases and modifications of the life-cycle described as occurring in the above parasites. In view, however, of the great interest excited by Schaudinn's work on avian parasites, as well as on account of the far-reaching importance of his conclusions to the study of the Haematozoa, a brief summary of his celebrated research is necessary.

According to Schaudinn's account, he was dealing with two separate Trypanosome parasites of the Little Owl (*Athene noctua*), viz. *Trypanomorpha (Trypanosoma) noctuae* and *Trypanosoma (Spirochaete) ziemanni*. The latter organism, in certain phases, very closely resembles a *Spirochaete*. In the blood of the owl resting, intracellular phases of both parasites alternate with active trypaniform ones; and, when in the former condition, Schaudinn considers that the parasites are identical with what have been formerly regarded as distinct Haemosporidia, *Halteridium* and a *Leucocytozoon* respectively. In other words, he considers that these two Haemosporidian forms are really only phases in the life-history of particular Trypanosomes. To this life-cycle belongs the formation of sexual individuals and their conjugation on arrival in the gnat (*Culex*); the process is described as agreeing in the main, in both cases, with what has already been made known by MacCallum for another species of *Halteridium*. The male gametes, it may be noted, are said to possess the essential characters of a Trypanosome. The motile copula or ookinete formed in the gnat gives

(After Schaudinn.)

FIG. 7.—Development of an Ookinete (of *Halteridium*) into an indifferent Trypanosome (*Trypanomorpha*). A-D shows the formation of the two nuclear elements (trophonucleus and kinetonucleus) from the definitive nucleus (syngaryon) of the ookinete.

complicated nuclear changes and divisions undergone by Trypanosomes; these are considered, in many cases, to represent some kind of parthenogenesis.

A very interesting modification of the life-cycle of a Trypanosome which must be mentioned has been made known by Miachin, in his account of *T. grayi*, in a tsetse-fly (*G. palpalis*). Unfortunately the vertebrate host of this form is not yet known. Certain individuals of a particular character form definite rounded cysts in the rectum of the fly; in this condition, the only sign of Trypanosome structure is afforded by the two nuclei, which remain separate. These cysts are doubtless for dispersal by way of the anus, and the vertebrate host is in all likelihood infected by the mouth and alimentary canal. This reveals a quite novel mode by which infection with a Trypanosome may be brought about; so far, however, *T. grayi* remains the only known example.

As remarked in the section on morphology, the Trypanosomes ~~classified~~ as a whole are preferably regarded as including two entirely distinct groups, Monadina and Heteromastigia.

SUB-ORDER MONADINA

Family: Trypanomorphidae, Woodcock.—Haemoflagellates derived from a uniflagellate, Herpetomonadine form, in which the point of insertion of the single (anterior) flagellum into the body has travelled backwards from the anterior end for a greater or less distance, the flagellum itself having become, concurrently, attached to the body for a portion of its length by means of an undulating membrane.

Genus *Trypanomorpha*, Woodcock, 1906.—With the characters of the family. The only species yet known is the type species, *T. noctua* (Celli and San Felice). [Syn. *Trypanosoma* n. (C. & S.F.), Schaud., = *Halteridium* n. (C. & S.F.)]. See figs. 3, E, 7. Vertebrate host, *Athene noctua*, Little Owl; invertebrate host, *Culex pipiens*.

There are, in addition, other forms, which are probably to be placed in this family, but which are not yet sufficiently well known for their systematic position to be settled. It is, for instance, quite likely that certain Herpetomonadine parasites described by Léger (29, 34) from various blood-sucking insects are really only stages in the life of a Haemoflagellate. Some of these are placed by Léger in a newly discovered genus, *Cribbidia*.

SUB-ORDER HETEROMASTIGINA

Family: Trypanomatidae, Doflein.—Flagellates, in the great majority of instances haemal parasites, derived from a biflagellate, Bodo-like type, in which the posteriorly-directed (trailing) flagellum is always present and attached to the body by an undulating membrane, of which it constitutes the thickened edge. The other, the anterior flagellum, may or may not persist.

Genus *Trypanoplasma*, Lav. and Mesnil, 1909.—The anterior flagellum is present. Both flagella are inserted close together, near the anterior end of the body. Two sub-groups may be distinguished. In one, exemplified by *T. borrali* (fig. 4, F and G) from the rodd and minnow, the anterior flagellum is well-developed, and the free parts of both are of about equal length. In the other, exemplified by *T. cyprini* (fig. 4, H) from carp, the anterior flagellum is much shorter than the free part of the posterior one, and evidently tending to disappear. Known invertebrate hosts for different species are *Hemiclepsis* and *Piscicola*, leeches.

Genus *Trypanophis*, Keymelitz, 1904.—The body resembles that of *Trypanoplasma* in general appearance, but the locomotor apparatus does not appear to be so well-developed, especially in *T. grobbeni*. The anterior flagellum is longer than the free part of the posterior one. The species included are not, so far as is known, haemal parasites. *T. grobbeni* occurs in the coelenteric cavity of various Siphonophora.

An interesting form, "*Trypanoplasma*" *intestinalis*, which resembles both the above genera, occurs in the alimentary canal of *Box boops*. Probably this is not a haemal parasite, and lacks an alternate host.

Genus *Trypanosoma*, Gruby, 1843.—(Principal synonyms: *Undulinea*, Lank., 1871; *Herpetomonas*, Kent, 1880, only in part; *Paramastocoides*, Grassi, 1881; *Haematomonas*, Mitrophan, 1883.) There is no anterior flagellum. The point of insertion of the attached (posterior) flagellum into the body, and, consequently, the commencement of the undulating membrane may be almost anywhere in the anterior half of the body, but is usually near the extremity.

Among the more important and better-known forms are the following:—

Parasitic in mammals: *T. lewisi* (Kent), the well-known natural Trypanosome of rats (figs. 3, A, 6, A); *T. brucei*, Plin. and Bradl., the cause of nagana among cattle, horses, &c., in South Africa (fig. 3, B); *T. evansi*, Stead, the cause of surra to horses in Indo-Burma; *T. equiperdum*, Dofl., the cause of dourine in horses in Algeria and other regions of the Mediterranean littoral; *T. equinum*, Voges, causing mal de cadenas or "hip-paraplegia" in South America (fig. 3, D); *T. theileri*, Lav., a very large form, the cause of

galactia or bile-sickness to cattle in the Transvaal; and *T. gambiense*, Dutton (syn. *T. ugandense*, Castellani, *T. castellanii*, Kruse), the cause of human trypanosomiasis in central Africa, which becomes sleeping-sickness when the organisms penetrate into the cerebro-spinal fluid (fig. 3, C).

Parasitic in birds: *T. avium* (Danil., Lav. emend.), probably the form to which Danilewsky's original investigations related, parasitic in owls and (according to Novy and McNeal) also in other birds (fig. 3, F); *T. johnstoni*, Dutt. and Todd, a very spirochaetiform type, from little birds (*Estrilda*) in Senegambia; and Hanna's peculiar wild species from Indian birds, with a remarkably tapering anterior end (fig. 3, G). Lastly, there is *T. ziamanni*, Lav., [syn. *Spirochaete* z. (Lav.), Schaud., "*Haemamoeba*" z., Lav., the "Leucocytosoon" of Danil.], from various owls, and *Culex pipiens*, whose life-history has been described by Schaudinn (fig. 3, H). (As above mentioned, this form may not be a true Trypanosome.)

Only one reptilian form is well known, *T. damouae*, Lav. and Meun., from a tortoise, *Damonis reevesii* (fig. 3, J). Parasitic in batrachia: *T. rostellorum*, Mayer (syn. *Amoeba* r., Mayer, July 1843; *T. sauguisis*, Gruby, November 1843; *Undulinea ranarum*, Lank., 1871), the best-known parasite of frogs, which exhibits remarkable polymorphism (fig. 4, A and B); *T. megs* and *T. maryseuklon*, Dutt. and Todd, even larger than *T. r.* (fig. 4, D), with peculiar cytological differentiation, may be only sub-species; *T. scipinatum*, Sergeant, and *T. ussuriense*, Lav., also from frogs (fig. 4, C). Parasitic in fishes: *T. remaki*, Lav. and Mesnil, from pike, a relatively small form (fig. 4, L); *T. barbatauis*, Léger, from leach; *T. granulolum*, Lav. and Mesnil, a very long vermiform parasite, from eels (fig. 4, K); *T. solesae*, Lav. and Mesnil, from soles, with a relatively small flagellum (fig. 4, J); and *T. scyllii* and *T. rajae*, from those Elasmobranchs, both very large forms, described by Lav. and Mesnil.

Undoubtedly closely allied to the Haemoflagellates, although no actual trypaniform phase has yet been observed, are the important parasites usually known as the "Leishman-Donovan" bodies, without some consideration of which an account of the Haemoflagellates would ^{The Leishman-Donovan-Wright Bodies.} hardly be complete. These bodies are constantly found in certain tropical fevers (e.g. dum-dum fever, kala-azar) particularly prevalent throughout Indo-Burma, of which they are generally held to be the cause. They were discovered by W. Leishman in 1900, but before his first account of them (36) was published they were also seen quite independently by C. Donovan. Moreover, organisms very similar to these (morphologically, indeed, the two sorts appear scarcely distinguishable) are found in various sores or ulcers (e.g. Delhi boil, Oriental sore, "bouton d'Alep") to which people in different parts of the East are liable. These were first described by J. H. Wright (58).

The chief distinction between the parasites in the two cases is in their habitat. In the one case they are entirely restricted to the neighbourhood of the boil or ulcer, whereas in the other there is a general infection of the body, the organisms spreading to all parts and being met with in the spleen, liver, bone-marrow, &c., and (rarely) in the peripheral circulation. The parasites are either free or intracellular. In the latter case they invade cells of a leucocytic or phagocytic character as a rule; Leishman's form is particularly abundant in large macrophagel cells originating from the vascular endothelium of the spleen (fig. 8, I, M).

The parasites themselves are very minute and usually ovoid or pyriform in shape (fig. 8, I, a), the latter being, perhaps, the most typical. The splenic type is somewhat smaller than Wright's parasite; the former, when pear-shaped, is from 3½ to 4 μ in length by 1½ to 2 μ in width, the latter being about 4 μ by 3 μ (fig. 8, III.). The body is probably not limited by any distinct membrane. The cytoplasm is finely granular and fairly uniform in character. The most interesting point about the morphology is the fact that two chromatic bodies, of very unequal size, are almost invariably to be recognized. The larger nuclear body, which corresponds to the trophonucleus of a Trypanosome, is usually round or oval; the smaller one, representing a kinetoculeus, has the form either of a little rod or of a round grain, and is generally separate from the larger nucleus.

The parasites multiply in two ways—(a) by binary fission, and (b) by multiple division or segmentation. The principal stages in the first method are well known (fig. 8, I, B); they offer strong resemblance to the process in *Parablastus*. Multiple division has not yet been so satisfactorily made out. It appears to conform more or less to the radial or rotary type of multiplication, enlarged rounded parasites, with a varying number of nuclei (up to about eight) uniformly arranged near the periphery, having been often noticed (fig. 8, I, c and IV, b). The details of the process are somewhat differently described, however, by different observers. Laveran and Mesnil (27) gave the name *Piroplasma donovani* to

and this name in the slightly altered form of Dembea was in use until towards the close of the 19th century. By many Abyssinians the lake is called Tana, but the correct Amharic form is Tsana.

See NILK and ABYSSINIA, and the authorities there cited. The British Blue Book, *Egypt*, No. 2, 1904, contains a special report (with maps) upon Lake Tana by Mr C. Dupuis, of the Egyptian Irrigation Service. In the *Bull. soc. geog. italiana* for December 1908 Captain A. M. Tancredi gives the results (also with maps) of an Italian expedition to the lake. (W. E. G.; F. R. C.)

: **TSAR**, or **CZAR**, the title commonly given both abroad and in Russia itself to the sovereign of Russia, whose official style is, however, "Emperor and Autocrat" (*Imperator i Samonlastitelyel*). In its origin the word *tsar* seems to have connoted the same as *imperator*, being identical with the German *Kaiser* in its derivation from the Latin *Caesar*. In the old Slavonic Scriptures the Greek βασιλεύς is always translated *tsar*, and this title was also given to the Roman Emperor. The old Russian title for a sovereign was *knyaz*, prince, or *velikiy knyaz*, grand prince. The title *tsar* was first adopted by the Slavonic peoples settled in the Balkan peninsula, who were in close touch with the Eastern emperor; thus it was used by the medieval Bulgarian kings. It penetrated into Russia as a result of the growing intercourse between old Muscovy and Constantinople, notably of the marriage alliances contracted by Russian princes with the dynasty of Basil the Macedonian; and it was assumed by the Muscovite princes who revolted from the yoke of the Mongols. The other *tsars* were gradually ousted by those of Moscow, and the modern Russian emperors inherit their title of *tsar* from Ivan III. (1462-1505), or perhaps rather from his grandson Ivan IV. (1533-1584) who was solemnly crowned *tsar* in 1547.

Throughout, however, the title *tsar* was used, as it still is in popular parlance, indifferently of both emperors and kings, being regarded as the equivalent of the Slavonic *król* or *król* (Russ. *koról*, Magyar, *király*), a king, which had been adopted from the name of Charlemagne (Germ. *Karl*, Lat. *Carolus Magnus*). This use being equivocal, Peter the Great, at the peace of Nystad (November 2, 1721), assumed the style of *imperator*, an exotic word intended to symbolize his imperial dignity as the equal of the western emperor. This new style was not, however, recognized by the powers until the time of Catherine II., and then only on the express understanding that this recognition did not imply any precedence or superiority of the Russian emperor over other sovereigns. Henceforth, whatever popular usage might be, the title *tsar* was treated officially as the equivalent of that of king. Thus the Russian emperor is *tsar* (king) of Poland and of several other parts of his dominions. Thus, too, the prince of Bulgaria, on assuming the royal style, took the title of *tsar* of Bulgaria.

The title "White Tsar," applied to the Russian emperor and commonly quoted as though it had a poetic or mystic meaning, is a translation of a Mongol word meaning "independent" (cf. the feudal "bleach tenure," i.e. a tenure free from all obligation of personal service).

The wife of the *tsar* is *tsaritsa*. In former times the title *tsarevich* (king's son) was borne by every son of a *tsar*; but the word has now fallen out of use. The heir to the throne is known as the *tsarevitch* or *cesarevich* (q.v.), i.e. son of *Caesar*, the other Imperial princes bearing the old Russian title of *velikiy knyaz* (grand duke; q.v.).

: **TSARITSYN**, a town of Russia, in the government of Saratov, situated on the right bank of the Volga, where it suddenly turns towards the south-east, 40 m. distant from the Don. Pop. (1900), 67,050. Tsaritsyn is the terminus of a railway which begins at Riga and, running south-eastwards, intersects all the main lines which radiate from Moscow to the south. It is also connected by rail with Kalach on the Don, where merchandise from the Sea of Azov is disembarked. Corn from middle Russia for Astrakhan is transferred from the railway to boats at Tsaritsyn; timber and wooden wares from the upper Volga are unloaded here and sent by rail to Kalach; and fish, salt and fruits sent from Astrakhan by boat up the Volga are here unloaded and despatched by rail to the interior of Russia. The town has grown rapidly since the completion of the railway system, and has a large trade in petroleum from Baku. Tsaritsyn is also the centre of the trade in the mustard of Sarepta, Dubovka and the neighbourhood. The fisheries are important. The buildings of the town include

a public library, and the church of St John (end of 16th century), a fine specimen of the architecture of its period. Here are iron, machinery and brick works, tanneries, distilleries, and factories for jam, mustard and mead. Market gardening is an important industry.

A fort was erected here in the 16th century to prevent the incursions of the free Cossacks and runaway serfs who gathered on the lower Volga, as also the raids of the Kalmucks and Circassians. In 1606 Tsaritsyn took part in the rising in favour of the false Demetrius, and Stenka Razin took the town in 1670. The Kalmucks and Circassians of the Kubañ attacked it repeatedly in the 17th century, so that it had to be fortified by a strong earthen and palisaded wall, traces of which are still visible.

: **TSARSKOYE SELO**, a town of north Russia, in the government of St Petersburg, and an imperial residence, 15 m. by rail south of the capital. Pop. (1885), 15,000; (1897), 22,353. The town stands on the Duderhof Hills and consists (1) of the town proper, surrounded by villages and a German colony, which are summer resorts for the inhabitants of St Petersburg; and (2) of the imperial parks and palaces. The former is built on a regular plan, and its houses nearly all stand in gardens. The cathedral of St Catherine is a miniature copy of that at Constantinople. The imperial parks and gardens cover 1680 acres; the chief of them is the "old" garden, containing the "old palace," built (1724) by Rastrelli and gorgeously decorated with mother-of-pearl, marbles, amber, lapis lazuli, silver and gold; the gallery of Cameron adorned with fine statues and entrance gates; numerous pavilions and kiosks; and a bronze statue (1900) of the poet Pushkin. A second palace, the Alexander, was built by Catherine II. in 1792, and has in its park an historical museum and an arsenal.

When Peter the Great took possession of the mouth of the Neva, a Finnish village, Saari-mois, stood on the site now occupied by the town, and its Russified name Sarskaya was changed into Tsarskoye when Peter presented it to his wife Catherine. It was especially embellished by the tsaritsa Elizabeth. Under Catherine II., a town, Sophia, was built close by, but its inhabitants were transferred to Tsarskoye Selo under Alexander I. The railway connecting the town with St Petersburg was the first (1838) to be constructed in Russia.

: **TSCHAIKOVSKY, PETER ILICH** (1840-1893), Russian composer, born at Volkinsk, in the province of Vyatka, on the 7th of May 1840, was the son of a mining engineer, who shortly after the boy's birth removed to St Petersburg to assume the duties of director of the Technological Institute there. While studying in the school of jurisprudence, and later, while holding office in the ministry of justice, Tschaikovsky picked up a smattering of musical knowledge sufficient to qualify him as an adept amateur performer. But the seriousness of his musical aspiration led him to enter the newly founded Conservatorium of St Petersburg under Zarembo, and he was induced by Anton Rubinstein, its principal, to take up music as a profession. He there resigned his post in the ministry of justice. On quitting the Conservatorium he was awarded a silver medal for his thesis, a cantata on Schiller's "Ode to Joy." In 1866 Tschaikovsky became practically the first chief of the recently founded Moscow Conservatorium, since Serov, whom he succeeded, never took up his appointment. In Moscow Tschaikovsky met Ostrovskiy, who wrote for him his first operatic libretto, *The Vojvodas*. After the Russian Musical Society had rejected a concert overture written at Rubinstein's suggestion, Tschaikovsky in 1866 was much occupied on his *Winter Day Dreams*, a symphonic poem, which proved a failure in St Petersburg but a success at Moscow. In 1867 he made an unsuccessful début as conductor. Failure still dogged his steps, for in January 1869 his *Vojvodas* disappeared off the boards after ten performances, and subsequently Tschaikovsky destroyed the score. The *Romeo and Juliet* overture has been much altered since its production by the Russian Musical Society in 1870, in which year the composer once more attempted unsuccessfully an operatic production,

St Petersburg rejecting his *Undine*. In 1871 Tschalkovsky was busy on his cantata for the opening of the exhibition in celebration of the bicentenary of Peter the Great, his opera *The Oprischnik*, and a textbook of harmony, which latter was adopted by the Moscow Conservatorium authorities. At Moscow in 1873 his incidental music to the *Snow Queen* failed, but some success came next year with the beautiful quartet in F. During these years Tschalkovsky was musical critic for two journals, the *Sovremennays Lietopis* and the *Russky Vestnik*. On the death of Serov he competed for the best setting of Polovsky's *Wakula the Smith*, and won the first two prizes. Yet on its production at St Petersburg in November 1876 this work gained only a *succès d'estime*. Since then it has been much revised, and is now known as *The Little Shoes*. Meanwhile the Second Symphony and the *Tempesi* fantasia had been heard, and the pianoforte concerto in B flat minor completed. This was first played by von Bülow in Boston, Massachusetts, some time later, and was entirely revised and republished in 1889. At last something like success came to Tschalkovsky with the production of *The Oprischnik*, in which he had incorporated much of the best of *The Wojewoda*. The Third—or Polish—Symphony, four sets of songs, the E-flat quartet (dedicated to the memory of Lamb), the ballet "The Swan Lake," and the "Francesca da Rimini" fantasia, all belong to the period of the late 'seventies—the last being made up of operatic fragments. Tschalkovsky in 1877 first began to work on the opera of *Eugen Onegin*. With the production of this work at the Moscow Conservatorium in March 1879 real success first came to him. The story, by Pushkin, was a familiar one, and the music of Tschalkovsky was not so extravagant in its demands as had been the music of his earlier operas.

Meanwhile the more personal side of the composer's career had been given a romantic touch by his acquaintance with his lifelong benefactress, Mme von Meck, and his deplorable fiasco of a marriage. In 1876 he had aroused the interest of Nadezhda Filaretowna von Meck (1831–1894), the wife (left a widow in 1876) of a wealthy railway engineer and contractor. She had a large fortune and she began by helping the composer financially in the shape of commissions for work, but in 1877 this took the more substantial shape of an annual allowance of £600. The romance of their association consisted in the fact that they never met, though they corresponded with one another continually. In 1890 Mme von Meck (who died two months after the composer, of progressive nervous decline), imagining herself—apparently a pure delusion—to be ruined, discontinued the allowance; and though Tschalkovsky was then no longer really in need of it, he failed to appreciate the pathological reason underlying Mme von Meck's condition of mind, and was deeply hurt. The wound remained unhealed, and the correspondence broken, though on his death-bed her name was on his lips. Her connexion with his life was one of its dominating features. His marriage was only a brief and misguided incident. Tschalkovsky married Antonina Ivanovna Milyukova on the 6th of July 1877, but the marriage rapidly developed into a catastrophe, through no fault of hers but simply through his own abnormality of temperament; and it resulted in separation in October. He had become taciturn and morose, and finally quitted Moscow and his friends for St Petersburg. There he fell ill, and an attempt to commit suicide by standing chin-high in the river in a frost (whereby he hoped to catch his death from exposure) was only frustrated by his brother's tender care.

With his brother, Tschalkovsky went to Clarens to recuperate. He remained abroad for many months, moving restlessly from one place to another. In 1878 he accepted (but later resigned) the post of director of the Russian musical department at the Paris Exhibition, completed his Fourth Symphony and the Italian *Capriccio*, and worked hard at his "1812" overture, more songs, the second pianoforte concerto, and his "Liturgy of St Chrysostom," an interesting contribution to the music of the Eastern Church. The work was confiscated for some time by the intendant of the imperial chapel, on the ground that it

had not received the imprimatur of his predecessor Bortniansky in due accordance with a ukaz of Alexander I. Bortniansky was dead, but his successor was obstinate. Finally the work was saved from destruction by an official order. Tschalkovsky returned only for a short time to Moscow. Thence he went to Paris. In 1879 he wrote his *Maid of Orleans* (produced in 1880) and his first suite for orchestra. In 1881 died Nicholas Rubinstein—to whose memory Tschalkovsky dedicated the trio in A minor. During the next five years Tschalkovsky travelled, and worked at *Manfred* and *Hamlet*, the operas *Mazepa* and *Chardakha*, the Mozartian suite and the fine Fifth Symphony. During a great part of the time he lived in retirement at Klin, where his generosity to the poor made him beloved. His operas *The Queen of Spades* and the one-act *Iolanke* were feeble by comparison with his earlier works; more effective, however, were the ballets *Sleeping Beauty* and *Casse-noisette*. In 1893 Tschalkovsky sketched his Sixth Symphony, now known as the *Pathetic*, a work that has done more for his fame in foreign lands than all the rest of his works. This was the year in which the composer conducted a work of his own at Cambridge on the occasion of his receiving the honorary degree of Doctor of Music. In the same year, on the 6th of November, he died from an attack of cholera at St Petersburg.

Tschalkovsky's work is unequal. In dramatic compositions he lacked point precisely as Anton Rubinstein lacked point. But in the invention of broad, sweeping melody Tschalkovsky was far ahead of his compatriot. Among his songs and smaller pianoforte works, as in his symphonies and quartets, are passages of exquisite beauty. The best of Tschalkovsky's work is more distinctly Russian than that of most of his compatriots; it is not German music in disguise, as is so much of the music by Rubinstein and Glazounow, and it is not incoherently ferocious, like so much of the music by Balakirev.

See Mrs Rosa Newmarch's *Tschalkovsky* (1900) supplemented in 1906 by her condensed English edition of the *Life and Letters*, which appeared in Russian in 1901 in three volumes, edited by Modeste Tschalkovsky, the composer's brother.

TSCHUDI, or **SCHUDY**, the name of one of the most distinguished families of the land of Glarus, Switzerland. It can be traced back as a peasant, not a noble, race to 1280, while after Glarus joined the Swiss Confederation in 1352 various members of the family held high political offices at home, and were distinguished abroad as soldiers and in other ways.

In literature, its most eminent member was GILES or AEGIDIUS TSCHUDI (1505–1572), who, after having served his native land in various offices, in 1558 became the chief magistrate or *landammann*, and in 1559 was ennobled by the emperor Ferdinand, to whom he had been sent as ambassador. Originally inclined to moderation, he became later in life more and more devoted to the cause of the counter-Reformation. It is, however, as the historian of the Swiss Confederation that he is best known; by incessant wanderings and unwearied researches amongst original documents he collected material for three great works, which therefore can never wholly lose their value, though his researches have been largely corrected by those of more recent students. In 1538 his book on Rhaetia, written in 1528, was published in Latin and in German—*De prisca ac vera Alpina Rhaetia, or Die uralt wahrhaftig Alpisch Rhätia*. The historical reputation of Giles Tschudi has suffered very much owing to recent researches. His inventions as to the early history of the Swiss Confederation are described under TELL. His statements and documents relating to Roman times and the early history of Glarus and his own family had long roused suspicion. Detailed examination of late years has proved beyond the shadow of a doubt that he not merely claimed to have copied Roman inscriptions that never existed, and amended others in a most arbitrary fashion, but that he deliberately forged a number of documents with a view to pushing back the origin of his family to the 10th century, thus also entirely misrepresenting the early history of Glarus, which is that of a democratic community, and not (as he pretended) that of a preserve of several aristocratic families. Tschudi's historical credit is thus hopelessly ruined, and no

document printed or historical statement made by him can henceforward be accepted without careful verification and examination. These discoveries have a painful interest and importance, since down to the latter part of the 19th century Swiss historical writers had largely based their works on his investigations and manuscripts.

For a summary of these discoveries see C. v. Wyss in the *Jahrbuch der Historischen Society of Glarus* (1895), vol. xxx., in No. 1 (1894), of the *Anzeiger f. schweizerische Geschichte*, and in his *Geschichte d. Historiographie in d. Schweiz* (1895), pp. 196, 201, 202. The original articles by Vogelín (Roman inscriptions) appeared in vols. xi., xiv. and xv. (1886-1890) of the *Jahrbuch f. schweizer Geschichte*, and that by Schulte (Glarus) in vol. xviii. (1893) of the same periodical. For the defence, see a weak pamphlet, *Schulte u. Tschudi* (Coire, 1898), by P. C. v. Planta.

Tschudi's chief works were not published until long after his death. The *Beschreibung Galliae Comatae* appeared under Gallati's editorship in 1758, and is mainly devoted to a topographical, historical and antiquarian description of ancient Helvetia and Rhaetia, the latter part being his early work on Rhaetia revised and greatly enlarged. This book was designed practically as an introduction to his magnum opus, the *Chronicon helveticum*, part of which (from 1001 to 1470) was published by J. R. Iselin in two stately folios (1734-1736); the rest consists only of rough materials. There exist two rather antiquated biographies of Tschudi by I. Fuchs (2 vols., St Gall, 1805) and C. Vogel (Zürich, 1856), but his extensive complete correspondence has not yet been printed.

Subjoined is a list of other prominent members of the family. DOMINIC (1596-1654) was abbot of Muri and wrote a painstaking work, *Origo et genealogia gloriosissimorum comitum de Habsburg* (1651). JOSEPH, a Benedictine monk at Einsiedeln, wrote a useful history of his abbey (1823). The family, which became divided in religious matters at the Reformation, also includes several Protestant ministers: JOHN HENRY (1670-1729), who wrote *Beschreibung des Lands Glarus* (1714); JOHN THOMAS (1714-1788), who left behind him several elaborate MSS. on the local history of Glarus; and JOHN JAMES (1722-1784), who compiled an elaborate family history from 900 to 1500, and an account of other Glarus families. JOHN LOUIS BAPTIST (d. 1784), who settled in Metz and contributed to the *Encyclopedie*, and FREDERICK (1820-1886), the author of *Das Thierleben der Alpenwelt* (1853), were distinguished naturalists. Among the soldiers may be mentioned CHRISTOPHER (1571-1629), a knight of Malta and an excellent linguist, who served in the French and Spanish armies; while the brothers LOUIS LEONARD (1700-1770) and JOSEPH ANTHONY (1703-1770) were in the Neapolitan service. VALENTINE (1499-1555), the cousin of Giles, was, like the latter, a pupil of Zwingli, whom he afterwards succeeded as pastor of Glarus, and by his moderation gained so much influence that during the thirty years of his ministry his services were attended alike by Romanists and Protestants. The best-known member of the family in the 19th century was IWAN (1816-1887), author of an excellent guide-book to Switzerland, which appeared first (1855) under the name of *Schweizerführer*, but is best known under the title (given in 1872 to an entirely recast edition) of *Der Tourist in der Schweiz*. (W. A. B. C.)

TSENG KUO-FAN (1811-1872), Chinese statesman and general, was born in 1811 in the province of Hunan, where he took in succession the three degrees of Chinese scholarship. In 1843 he was appointed chief literary examiner in the province of Szechuen, and six years later was made junior vice-president of the board of rites. When holding the office of military examiner (1851) he was compelled by the death of his mother to retire to his native district for the regulation mourning. At this time the Taiping rebels were overrunning Hunan in their conquering career, and had possessed themselves of the cities and strongholds on both shores of the Yangtse-kiang. By a special decree Tseng was ordered to assist the governor of the province in raising a volunteer force, and on his own initiative he built a fleet of war junks, with which he attacked the rebels. In his first engagement he was defeated, but, happily for him, his lieutenants were more successful. They recovered the capital, Chang-sha, and destroyed the rebel fleet. Following up these victories of his subordinates, Tseng recaptured Wuchang and Hanyang, near Hankow, and was rewarded for his success

by being appointed vice-president of the board of war. In 1853 other triumphs led to his being made a baturu (a Manchu order for rewarding military prowess), and to his being decorated with a yellow riding-jacket. Meanwhile, in his absence, the rebels retook Wuchang and burnt the protecting fleet. The tide quickly turned, however, and Tseng succeeded in clearing the country round the Poyang lake, and subsequently in ridding the province of Kiangsu of the enemy. His father died in 1857, and after a brief mourning he was ordered to take supreme command in Cheh-kiang, and to co-operate with the governor of Fukien in the defence of that province. Subsequently the rebels were driven westwards, and Tseng would have started in pursuit had he not been called on to clear the province of Ngan-hui of rebel bands. In 1860 he was appointed viceroy of the two Kiang provinces and Imperial war commissioner. At this time, and for some time previously, he had been fortunate in having the active support of Tso Tsung-t'ang, who at a later period recovered Kashgar for the emperor, and of Li Hung-Chang. Like all true leaders of men, he knew how to reward good service, and when occasion offered he appointed the former to the governorship of Cheh-kiang and the latter to that of Kiangsu. In 1862 he was appointed assistant grand secretary of state. At this time the Imperial forces, assisted by the "Ever-victorious Army," had checked the progress of the rebellion, and Tseng was able to carry out a scheme which he had long formulated of besieging Nanking, the rebel headquarters. While Gordon, with the help of Li Hung-Chang, was clearing the cities on the lower waters of the Yangtse-kiang, Tseng drew closer his besieging lines around the doomed city. In July 1864 the city fell into his hands, and he was rewarded with the rank and title of marquis and the right to wear the double-eyed peacock's feather. After the suppression of the Taipings the Nienfei rebellion, closely related to the former movement, broke out in Shantung, and Tseng was sent to quell it. Success did not, however, always attend him on this campaign, and by Imperial order he was relieved of his command by Li Hung-Chang, who in the same way succeeded him in the viceroyalty of Chihli, where, after the massacre of Tientsin (1870), Tseng failed to carry out the wishes of his Imperial master. After this rebuff he retired to his viceroyalty at Nanking, where he died in 1872.

Tseng was a voluminous writer. His papers addressed to the throne and his literary disquisitions are held in high esteem by the scholars of China, who treasure as a memorial of a great and uncorrupt statesman the edition of his collected works in 156 books, which was edited by Li Hung-Chang in 1876. (R. K. D.)

TSETSE-FLY (*Tsetse*, an English rendering of the Bantu *nsi-nsi*, a fly), a name applied indiscriminately to any one of the eight species of *Glossina*, a genus of African blood-sucking Diptera (two-winged flies, see DIPTERA), of the family Muscidae. Tsetse-flies are of great economic and pathological importance as the disseminators of tsetse-fly disease (nagana) and sleeping sickness. These maladies are caused by minute unicellular animal parasites (*haematozoa*) of the genus *Trypanosoma* (see TRYPANOSOMES); and recent investigations have shown that, under normal conditions, the particular species of *Trypanosoma* concerned (*T. brucei*, in the case of nagana, and *T. gambiense* in that of sleeping sickness) are introduced into the blood of susceptible animals or man only by the bite of one or other of the species of tsetse. (See PARASITIC DISEASES). The names of the recognized species of tsetse-flies are as follows: *Glossina palpalis* (see fig.); *G. palliara*; *G. morsitans*; *G. tachinoides*; *G. pallidipes*; *G. longipalpis*; *G. fusca*; and *G. longipennis*. A ninth so-called species, described in 1905 from specimens from Angola, is not really distinct from *G. palpalis* but appears to be identical with the sub-species *G. palpalis wellmani*.

In appearance tsetse are somewhat narrow-bodied flies, with a prominent proboscis, which projects horizontally in front of the head, and with the wings in the resting position closed flat one over the other like the blades of a pair of scissors (see fig., B). The latter characteristic affords an infallible means for the recognition of these insects, since it at once serves to distinguish them from any blood-sucking flies with which they might otherwise be confused. The coloration of tsetse-flies is sombre and inconspicuous; the brownish

or greyish-brown thorax usually exhibits darker longitudinal markings, and when the insect is at rest the abdomen or hinder half of the body is entirely concealed by the brownish wings. In some species the abdomen is of a paler colour and marked with sharply defined, dark brown bands, which are interrupted on the middle line. The length of the body, exclusive of the proboscis, which measures about a line to a line and a half, varies according to the species from 6 or 8 millimetres in the case of *G. tachinoides*, to about 11½ millimetres in that of *G. fusca* or *longipennis*; the closed

As a rule tsetse-flies are most active during the warmer hours of the day, but they frequently bite at night, especially by moonlight. The blood-sucking habit is common to both sexes, and the abdomen, being capable of great expansion, is adapted for the periodical ingestion of an abundant food-supply. The act of feeding, in which the proboscis is buried in the skin of the victim nearly up to the bulb, is remarkably quick, and in thirty seconds or less the abdomen of the fly, previously flat, becomes swollen out with blood like a berry. Stuhlmann's experiments with *G. fusca* show that the insect is able to ingest considerably more than (sometimes more than twice) its own weight of blood, which would appear to be the only food, and must be drawn from the tissues of a victim. Specimens of *G. fusca*, even though fasting and kept for days in absolutely dry air, could never be induced to imbibe water, sugar-cane juice or extravasated blood. The reproduction of tsetse-flies is highly remarkable; instead of laying eggs or being ovoviviparous the females deposit at intervals of about a fortnight or three weeks a single full-grown larva, which forthwith buries itself in the ground to a depth of several centimetres, and assumes the pupal state. The practical importance of this peculiar life-history is very great, since larvae thus protected cannot easily be destroyed. It is important to note that although sleeping sickness (of which the chief foci are at present the Congo Free State and Uganda) has hitherto been associated with one particular species of *Glossina*, it has been shown experimentally both that other tsetse-flies are able to transmit the parasite of the disease, and that *G. palpalis* can convey kindred parasites which are fatal to domestic animals. Since, moreover, it is believed that at least five species of *Glossina* are carriers of nagana, it may well be that all tsetse-flies can disseminate both nagana and sleeping sickness. (E. E. A.)

wings, however, project beyond the body and thus increase its apparent length. *G. palpalis*, the disseminator of sleeping sickness (see fig.), is about 9½ millimetres in length and is the darkest of all the tsetse-flies, though the dark brown abdomen has pale lateral triangular markings and usually, at least an indication of a pale longitudinal median stripe. In all tsetse-flies the proboscis in the living insect is entirely concealed by the palpi, which are grooved in their inner sides and form a closely fitting sheath for the piercing organ; the base of the proboscis is expanded beneath into a large onion-shaped bulb, which is filled with muscles. The head of the insect contains a muscular pharynx by means of which the blood from the wound inflicted by the proboscis (labium) is pumped into the alimentary canal and the so-called sucking-stomach. The tip of the proboscis is armed with a complicated series of chitinous teeth and rasps, by means of which the fly is enabled to pierce the skin of its victim; as usual in Diptera the organ is closed on the upper side by the labrum, or upper lip, and contains the hypopharynx or common outlet of the paired salivary glands, which are situated in the abdomen. The proboscis of tsetse-flies is without the paired piercing srilets (mandibles and maxillae) possessed by other blood-sucking Diptera, such as the female horse-flies and mosquitoes.

For the anatomy of the tsetse see E. A. Minchin, *Proc. Roy. Soc. Lond.* 531-547.

Tsetse-flies are restricted to Africa, where they occur in suitable localities throughout the greater portion of the tropical region, although not found either in the Sahara or in the veld country of the extreme south. For practical purposes the northern limit of *Glossina*, as at present known, may be shown on the map by drawing a line from Cape Verde to the Nile at the south-east of El Obeid, and thence to the coast of Somaliland at 4° N.; while the southern boundary of the genus may similarly be represented by the Cunene river, in the south of Angola, and a line thence to the north-eastern end of St Lucia lake, in Zululand. Within the area thus defined tsetse-flies are not found continuously, however, but occur only in small tracts called "belts" or "patches," which, since cover and shade are necessities of life to these insects, are always situated in forest, bush or banana plantations, or among other shady vegetation. In South and Central Africa, at any rate, "fly-belts" are usually met with in damp, hot, low-lying spots on the margins of water-courses, rivers and lakes, and seldom far from water of some kind. It appears, however, that in this respect the habits of the different species show a certain amount of variation; thus, while *G. palpalis* exhibits an especial fondness for water and haunts more or less dense cover at the water's edge, recent observations in German East Africa show that *G. fusca* is in no way connected with water, but is much more frequently encountered at a distance from it. Similarly the oft-repeated assertion that there is a definite connexion between tsetse-flies and big game, especially the buffalo (*Bubalus caffer*), in that the former are dependent upon the latter for their continued existence, is certainly not true as regards *G. palpalis*, although in South Africa there can be no question that the extermination of big game has been followed or accompanied by the disappearance of tsetse from many localities in which they formerly abounded.

TSHI, TCHW, CHU, or OJI, a group of Negro peoples of the Gold Coast (q.v.). The chief of these are the Ashanti, Fanti, Akim and Aquapem. Their common language is the Tshi, from which they gain their family name.

Tsu-shima ("the island of the port"), an island belonging to Japan, situated about midway between Korea and the island of Iki, so that the two islands were used as places of call in former times by vessels plying between Japan and Korea. Tsu-shima lies about 34° 20' N., 129° 20' E. The nearest point of the Korean coast is 48 m. distant. It has an area of 262 sq. m. and a population of 39,000. It is divided at the waist by a deep sound (Asaji-ura), and the southern section has two hills, Yatachi-yama and Shira-dake, 2130 ft. and 1660 ft. high respectively, while the northern section has Ibeshi-yama and Mi-take, whose heights are 1128 ft. and 1598 ft. The chief town is Izu-hara. The Mongol armada visited the island in the 13th century and committed great depredations. In 1861 an attempt was made by Russia to obtain a footing on the island. The name of the battle of Tsu-shima is given to the great naval engagement of the 27th and 28th of May 1905, in which the Russian fleet under Admiral Rozhdestvenky was defeated by the Japanese under Admiral Togo.

TUAM, a market town and episcopal city of Co. Galway, Ireland, 20 m. directly N.N.E. of Galway on the Limerick & Sligo branch of the Great Southern & Western railway. Pop. (1901), 3012. An abbey was founded here towards the end of the 5th century, and in the beginning of the 6th an episcopal see by St Jarlath. The Protestant archbishopric of Tuam was lowered to a bishopric on the death of Archbishop Power Le Poer Trench in 1839, and united with that of Killala and Achonry. It is, however, a Roman Catholic archbishopric. The Protestant cathedral is also the parish church, and was to a great extent rebuilt c. 1861 from plans by Sir Thomas Deane. Only the chancel of the old church remains, but its red sandstone arch is a remarkably fine example of Norman work; it dates from the middle of the 12th century. The modern Roman Catholic cathedral is Perpendicular in style and cruciform in plan. The interior is elaborately decorated. The cross of Tuam, re-erected in modern times, bears inscriptions in memory of Turlogh O'Connor, king of Ireland, and O'Hoisin, successively (1128) abbot of St Jarlath's Abbey and archbishop (1152) of Tuam, when the see was raised. St Jarlath's Roman Catholic college, usually called the New College, is a seminary founded in 1814 for the education of priests. To the west are the archbishop's palace and a convent of

Presentation nuns. The town has a considerable retail trade, and is a centre for the disposal of agricultural produce. Tuam received its first charter from James I. Before the union in 1800 it returned two members to the Irish Parliament.

TUAREG, or **TAWAREK** (more properly **Tawarik**, the collective form of *tarki*, from Arabic *terek*, to give up), the name given to the western and central Saharan Berber peoples, in reference possibly to their abandonment of Christianity or their early home in Mauretania. They call themselves *Imashagh* ("the noble people"), another form of Amazigh. They inhabit the desert from Tuat to Timbuktu and from Fezzan to Zinder. The Tuareg country covers about 1,500,000 sq. m., less than 3000 acres of which are cultivated. There are only some half-dozen commercial places in the whole Sahara to which the Tuareg resort. These are the centres from which the trade routes radiate, Wargla, Timbuktu, Ghat, Ghadames, Murzuk and Insalah.

The Tuareg, at any rate the noble class, are regarded as among the purest of the Berber stocks, but with the adoption of Islam they have become largely Arabized in manners and customs, though the nomad Tuareg preserve in singular purity the Tamashek dialect of the Berber language. Their general colour is the reddish yellow of southern Europeans, the uncovered parts of the body being, however, darker through exposure. Their hair is long, black, and silky, beards black and thin; eyes black, sometimes blue; noses small; hands delicate, but bodies muscular. They are a tall people, the chiefs being especially noted for their powerful build. They dress generally in a black tunic (some tribes wear white), trousers girt with a woollen belt, and wear as turban a cloth called *liham*, the end of which is drawn over the face, allowing nothing to be seen but the eyes and the tip of the nose. The purpose of this is to protect the throat and lungs from the sand. These cloths are dark blue or white: the former being worn most by the nobles, the latter by the common people. To this difference of colour is due the terms "black" and "white" Tuareg. The Tuareg seldom remove their masks or face-cloths. Even abroad they wear them, and have been seen so dressed in the streets of Paris. The Arabs call them "People of the Veil."

The Tuareg are divided into five main tribes or confederations of tribes: the *Aszar* (*Asjer*) about Ghat and Ghadames; the *Kelui* around Air; the *Hoggar* (*Ahaggar*) in the mountains of that name and in the centre of the Sahara; the *Awellimiden* in the desert north and east of Timbuktu; and the *Arreff Ahnet*, a recent offshoot of the *Hoggars* living in the *Adrar'n Ahnet* region north-west of the *Hoggar* massif. Owing to their nomadic life their political organization is not so democratic as that of other Berber peoples; chiefs and the members of the popular assembly are nominally elective; practically, however, the office of chief is hereditary in a ruling family. On a chief's death the office goes, with the approval of the tribesmen, to the eldest son of his eldest sister, in no case to any of his sons. The Tuareg are nominally *Mahomedans*, and belong to the *Malikite* section of the *Sunnites*. The *Senussite* sect, however, has many adherents, but more because of the Tuareg hatred of foreigners than from devoutness. A very few perform, by way of Tripoli, the pilgrimage to Mecca. They have not many mosques, and these are merely small stone enclosures a few feet high, with a niche at one end towards Mecca. There are a number of desert monasteries, huge camps pitched in a circle. Here the *marabout* lives surrounded by his followers, shifting the "monastery" as the requirements of his flocks compel. In these monasteries many Tuareg children receive their education.

Socially the Tuareg are divided into five classes, viz.: *Thaggaren* or nobles; *Marabouts* or priests; *Imghad* or serfs; *Irephenalen* or cross-bred; and the slaves. The nobles are all pure-blooded, and provide the tribal chiefs. They do no manual work, but almost live in the saddle, either conveying those caravans which have paid blackmail for safe passage, or making raids on trade-routes or even outlying Arab settlements. Before the French occupation they sometimes penetrated into the very heart of Algeria and Tunisia. Among the *Imghad* serfdom is hereditary, and whole tribes are vassals to the nobles. They cannot be sold or freed like slaves, though they may be inherited. Most of them have practical independence and act as "squires" to the nobles on their pillaging expeditions. The cross-bred are the descendants of mixed marriages between the nobles and serfs. These follow their mother's status. The slaves are chiefly *Sudanese* negroes. They are well treated and are practically members of the Tuareg family, but the Tuareg never intermarry with them. Tuareg weapons are a straight two-edged sword and a dagger bound

to the left forearm by a leather ring, and a slender iron lance some 9 ft. long barbed for about a foot. On his right arm the Tuareg warrior wears a heavy stone to give increased weight to his lance and sword-play or to parry blows. Muskets are common, no noble or freedman being without one. Besides this the Tuareg carry leather shields. In hunting, wooden missiles like boomerangs are used. Among the low-caste hill tribes of *Hoggar* bows and arrows are the only weapons.

Little is known of the history of the Tuareg. The name is that given them by the Arabs. They are the descendants of those Berbers who were driven into the desert by the great Arab invasion of North Africa in the 11th century. Ibn Khaldūn in the 14th century locates them to the south and west of Tunisia. They were constantly at war with the Arabs on the north, and the Negro peoples of the Sudan on the south. For their relations with the French, with whom they came into contact after the conquest of Algeria, see SAHARA.

TUAT, a Berber word¹ sometimes applied generally to all the oases in the western part of the Algerian Sahara, i.e. between 2° W. and 2½° E. 26° and 30° N., sometimes restricted to a particular group which borders the east side of Wad Mzaud between 26½° and 27½° N. According to the first usage Tuat includes the oases of Gurara in the north and Tidikelt in the south with the important centre of Insalah. The three groups are spoken of collectively by the French as the Tuat archipelago. The district is comparatively fertile, being formed of recent alluvium extending along the base of the Tademaït plateau (Cretaceous), and produces dates and some cereals and vegetables. The wadi Saura (known in its lower course as the Messaud), formed by the junction of the wadis Zufana and Ghir, marks the north-western boundary of the oases. After the winter rains in the Atlas it carries a considerable body of water in its upper course, but lower down its channel is choked by sand. Works were undertaken (1909) by the French to keep open the channel as it passes Tuat proper. At Gurara water is obtained from springs brought to the surface by the outcrop of impervious Devonian rocks. There is an extensive *sebkha* or salt lake at Gurara. The oases support a comparatively large population. The separate *ksurs* or hamlets, of which the district is said to contain over 300, are in Tuat proper placed close together. The political centre of Tuat is the oasis of Timmi, which has some forty *ksurs*. All the *ksurs* are strongly fortified, the walls of the citadels being of immense thickness. The whole region has been formed into an administrative unit known as *Serrilaire des oasis sahariennes*, and comprising a native commune subdivided into the annexes of Tuat, Gurara and Tidikelt. In 1906 the commune had a population of 134 Europeans and 49,873 natives, of whom 112 enjoyed municipal rights. There were four places with over 2000 inhabitants: Adrar (Timmi), 2686, and Zaniet-Kunta, 3090, in Tuat; Insalah, 2837, in Tidikelt; and Timimun, 2330, in Gurara. Nine other places had between 1000 and 2000 inhabitants. By race (excluding the troops) there were 19,654 Arabs, 5470 Berbers, 4370 negroes, 191 Jews (professing Islam) and 19,422 persons of mixed blood. The district is of importance as commanding the routes southwards to Timbuktu from both Morocco and Algeria, and it is thus a great centre of trade. The oases appear to have been inhabited from a very early period. According to tradition numbers of Jews migrated thither in the 2nd century A.D. They were the predominant element in the oases when the conquests of Sidi Okba drove the *Zenata* south (7th century). These Berbers occupied Tuat and, to a large extent, absorbed the Jewish population. The Arabs took possession of the oases in the 10th century and imposed Islam upon the people. Thereafter the region was governed by *Zenata* Berbers or by Arab chieftains. In the 14th

¹ The etymology of the word is doubtful; it is used in the sense of an inhabited district—hence an oasis.

² By a clerical error the native population in the census returns is given as 60,497.

century the sultan of Morocco occupied the oases, which remained in political dependence upon Morocco. In the 17th century, however, the sovereignty of the sultan had become almost nominal and this state of quasi-independence continued. The treaty of 1845 between Morocco and France left the question of the possession of Tuat, Gurara and Tidikelt unsettled. After the murder in 1881 of the members of the Flatters mission—a French expedition sent into the Sahara—a measure concerted at Insalah, several of the Tuat headmen sought Moroccan protection, fearing the vengeance of France. A chief calling himself the Moroccan pasha established himself at Timmi, but Morocco took no active step to assert her sovereignty. In 1899 a French scientific mission, under Colonel Flamand, was despatched to the oasis of Tidikelt. The French were attacked by the natives (Dec. 28, 1899), whom they defeated, and the next day Insalah was occupied. This was the beginning of a serious campaign in which the French suffered severe losses, but by March 1901 the whole of the fortified places in the three oases had been captured. To cut off the oases from Morocco the town of Igli, 140 m north-west of Gurara, was also annexed by the French (April 5, 1900) Igli (pop. 1057 in 1906) occupies an important position, being placed at the junction of the wadi Zulfana and the wadi Ghir. The French were not, however, left in peaceable possession of their newly acquired territory. Attacks by the nomad tribes, Moroccan and others, were made on the line of communications, and during 1903 the French troops suffered serious losses. To punish the tribes the town of Figig was bombarded by the French (June 8, 1903). On the 2nd of September following a band of nomads attacked, at a place called El Mungar, the escort of a convoy going to Taghit. After maintaining the fight 7½ hours the French were reinforced and their enemies drew off. Out of 115 combatants the French lost 38 killed and 47 wounded.

To consolidate their position the French authorities determined to connect the oases with the Algerian Sahara proper by carriage roads and railways. One road goes north-east to El Golea, 150 m. distant from Insalah; another north from Igli to a post called Beni Ounif, 2½ m. south of Figig, to which point the railway from Ain Sefra, in the Oranese Sahara, was carried in 1903. The continuation of this railway to Igli was begun in the following year.

Major A. G. Laing visited the Tuat territory in 1825 on his way to Timbuktu, but his papers were lost. The next European to visit Tuat was Gerhard Rohlf, who described his explorations and investigations in *Tagebuch seiner Reise durch Marokko nach Tuat, 1864* (Gotha, 1865) and *Reise durch Marokko. Exploration der Oasen von Tafilet, Tuat und Tidikelt.* (Bremen, 1868). A. G. P. Martin's *Les Oasis sahariennes* (Algiers, 1908) gives an account of the history and economic condition of the oases. Consult also Commandant E. Laquière, *Les Reconnaissances du Général Servière dans les oasis sahariennes* (Paris, 1902), a valuable monograph by an officer who took part in the operations in 1900-1901; E. F. Gautier, *Sahara algérien* (Paris, 1908), and various contributions by G. B. M. Flamand in *La Géographie* and *Annales géographiques* for 1900, *Comptes rendus* (1902), *Bull. géog. hist. et de description* (1903), &c. (F. R. C.)

TUBA, in music. The tubas—bombardon, helicon, euphonium (Fr. *tuba*, sax-tuba, bombardon; Ger. *Tuben*, Tenor-bass, Bombardon, Kontrabass-tuba, Helikon, Ital *bassituba*, bombardon)—are a family of valved instruments of powerful tone forming the tenor and bass of the brass wind. In the orchestra these instruments are called tubas; in military bands euphonium (tenor), bombardon and helicon (bass).

The modern tubas owe their existence to the invention of valves or pistons (Ger. *Ventile*) by two Prussians, Stölzel and Blümel, in 1815. The tubas are often confounded with the baritone and bass of the saxhorns, being like them the outcome of the application of valves to the bugle family. There is, however, a radical difference in construction between the two types: given the same length of tubing, the fundamental octave of the tubas is an octave lower than that of the saxhorns, the quality of tone being besides immeasurably superior. This difference is entirely due to the proportions of the truncated cone of the bore and consequently of the column of air within. By increasing the calibre of the bore in proportion to the length of the tube it was found that the fundamental note or first sound of the harmonic series was easily

obtained in a full rich quality, and by means of the valves, with this one note as a basis, a valuable pedal octave is obtained, absent in the saxhorns. Prussia has not adopted these modifications; the bass tubas with large calibre, which have long been introduced into the military bands of other countries and retained in that country, are founded on the original model invented in

B♭ Bombardon or Contrabass Tuba (Besson).

1835 by Wieprecht and Moritz, a specimen of which is preserved in the museum of the Brussels Conservatoire. The name "bass tuba" was bestowed by Wieprecht upon his newly invented bass with valves, which had the narrow bore afterwards adopted by Sax for the saxhorns. The evolution of the modern tubas took place between 1835 and 1854 (see VALVES).

The instruments termed Wagner tubas are not included among the foregoing. The Wagner tubas are really horns designed for Wagner in order to provide for the *Nibelungen Ring* a complete quartet having the horn timbre. The tenor tuba corresponds to the tenor horn, which it outwardly resembles, having its tube bent in rectangular outline and being played by means of a funnel-shaped mouthpiece. The bore of the Wagner tenor and tenor-bass tubas, in B♭ and F, is slightly larger than in the horn, but much smaller than in the real tubas. The bell, funnel-shaped as in the German tubas, is held to the right of the performer, the valves being fingered by the left hand. There are four valves, lowering the pitch respectively 1 tone, ½ tone, 1½ tone, 2 tones (or 2½ tones). The harmonic series is the same for both instruments. The notation being as for the horn in C.

C. Real Sounds.

B flat Tenor.

F Bass.

N.B.—The black notes are difficult to obtain strictly in tune as open notes.

By means of the valves the compass is extended downwards an octave for each instrument. The timbre of the tenor tuba is only slightly more metallic and less noble than that of the French horn with valves. Many motives in the *Ring* are given out by the quartet of horns and Wagner tubas.

The modern tuba finds its prototype as well as the origin of the name in the Roman tuba (the Greek *salpinx*), definite information concerning which is given by Vegetius.¹ Compared with the other military service instruments of the Romans, the *buccina* and *cornu*, the tuba was straight and was used to sound the charge and retreat, and to encourage and lead the soldiers during action; it was sounded at the changing of the guard, as the signal to begin and leave off work, &c. The tuba is represented, together with the *buccina* and *cornu*, on Trajan's column in the scenes described by Vegetius.

During the middle ages the tuba was as great a favourite as the busine (see BUCCINA and TRUMPET), from which it may readily be distinguished by its marked conical bore and absence of bell. It is recorded that King Frederick Barbarossa gave an order on the 14th of January 1240 in Arezzo for four tubas of silver and for slaves to be taught to play upon them.² During the middle ages the Latin word *tuba* is variously translated, and seems to have puzzled the compilers of vocabularies, who often render it by *trumpbo* (Fr. *trompe*). (K. S.)

TUBE (Lat. *tuba*), a pipe or hollow cylinder. Tubes play an important part in engineering and other works for the conveyance of liquids or gases, and are made of diverse materials and dimensions according to the purpose for which they are intended, metal pipes being of the greatest consequence. According to the process of manufacture metal tubes may be divided into seamed and seamless. One of the earliest uses of seamed wrought-iron tubes was for gun-barrels, and formerly these were made by taking a strip of wrought iron, bending it so that the edges overlapped and then welding by hammering, with or without the aid of grooved swages. The development of gas lighting increased the demand for tubes, and in 1824 James Russell introduced the butt-welded tube, in which the edges of the skelp are not made to overlap, but are brought into closest possible contact and the welding is effected in a double swage, having corresponding grooves of the diameter of the tube required; this method required no mandrel as did those previously in use. The following year saw another improvement in making these pipes, when Cornelius Whitehouse effected a butt weld by drawing the bent skelp through a die. Stronger tubes are obtained by using grooved rollers instead of a die, the skelp being mounted on a mandrel. This is the method commonly adopted at the present day for making this class of tube. Seamed tubes, especially of copper and brass, are made by brazing or soldering the edges of the skelp. Another method is to bend the edges so that they interlock, the contact being perfected by rolling. Seamless tubes, which are stronger than those just described, are made by drawing a bloom of the metal perforated by an axial hole or provided with a core of some refractory material, or, in certain cases, by forcing the plastic metal by hydraulic pressure through an appropriate die. The seamless steel tube industry is now of great dimensions owing to the development of steam engineering. Another type of seamless tube is the cast-iron tube, usually of large diameter and employed for gas and water mains; these pipes are made by casting.

TUBERCULOSIS. The word "tuberculosis," as now used, signifies invasion of the body by the tubercle bacillus, and is applied generally to all morbid conditions set up by the presence of the active parasite. The name is derived from the "tubercles" or "little lumps" which are formed in tissues invaded by the bacillus; these were observed and described long before their real nature or causation was known. (For an account of the organism, which was discovered by Koch in 1882, see PARASITIC DISEASES.) The bacillus attacks every organ and tissue of the body, but some much more frequently than others. The commonest seats of tuberculous disease are the lungs, lymphatic glands, bones, serous membranes, mucous membranes, intestines and liver. Before the discovery of the bacillus its effects in different parts of the body received separate names and were classified as distinct diseases. For instance, tuberculosis of the lung was called "consumption" or "phthisis" of the bones and lymphatic glands "struma" or "scrofula," of the skin "lupus," or the intestinal glands "tabes mesenterica." Some of these names are still retained for convenience, but the diseases indicated by them are known to be really forms of tuberculosis. On the other hand, there are "tubercles" which are not caused by the tubercle bacillus, but by some other source of irritation, including various parasitic organisms, some of which closely resemble the tubercle bacillus. To these forms of disease, which are not as yet well understood, the term pseudo-tuberculosis has been given. Lastly, the word "tubercular" is still sometimes applied to mere lumpy eruptions of the skin, which have no connexion with tuberculosis or pseudo-tuberculosis.

Pathology.—The effects of tuberculosis on the structures attacked vary greatly, but the characteristic feature of the disease is a breaking-down and destruction of tissue. Hence the word "phthisis," which means "wasting away" or "decay," and was used by Hippocrates, accurately describes the morbid process in tuberculosis generally, as well as the constitutional effect on the patient in consumption. According to the most

recent views, the presence and multiplication of the bacilli excite by irritation the growth of epithelioid cells from the normal fixed cells of the tissue affected, and so form the tubercle, which at first consists of a collection of these morbidly grown cells. In a typical tubercle there is usually a very large or "giant" cell in the centre, surrounded by smaller epithelioid cells, and outside these again a zone of leucocytes. The bacilli are scattered among the cells. In the earliest stages the tubercle is microscopic, but as several of them are formed close together they become visible to the naked eye and constitute the condition known as miliary tubercle, from their supposed resemblance to millet seeds. In the next stage the cells forming the tubercle undergo the degenerative change known as "caseation," which merely means that they assume in the mass an appearance something like cheese. In point of fact, they die. This degeneration is believed to be directly caused by a toxin produced by the bacilli. The further progress of the disease varies greatly, probably in accordance with the resisting power of the individual. In proportion as resistance is small and progress rapid the cheesy tubercles tend to soften and break down, forming abscesses that burst when superficial and leave ulcers, which in turn coalesce, causing extensive destruction of tissue. In proportion as progress is slow the breaking-down and destructive process is replaced by one in which the formation of fibrous tissue is the chief feature. It may be regarded as Nature's method of defence and repair. In tuberculosis of the lungs, for instance, we have at one end of the scale acute phthisis or "galloping consumption," in which a large part or even the whole of a lung is a mass of caseous tubercle, or is honeycombed with large ragged cavities formed by the rapid destruction of lung tissue. At the other end we have patches or knots of fibrous tissue wholly replacing the original tubercles or enclosing what remains of them. Such old encapsuled tubercles may undergo calcareous degeneration. Between these extremes come conditions which partake of the nature of both in all degrees, and exhibit a mixture of the destructive and the healing processes in the shape of cavities surrounded by fibrous tissue. Such intermediate conditions are far more common than either extreme; they occur in ordinary chronic phthisis. The term "fibroid phthisis" is applied to cases in which the process is very chronic but extensive, so that considerable cavities are formed with much fibrous tissue, the contraction of which draws in and flattens the chest-wall. Tuberculosis commonly attacks one organ or part more than another, but it may take the form of an acute general fever, resembling typhoid in its clinical features. "Acute miliary tuberculosis" is a term generally used to indicate disseminated infection of some particular organ—usually the lungs or one of the serous membranes—in which the disease is so severe and rapid that the tubercles have not time to get beyond the miliary state before death occurs. Tuberculosis is exceedingly apt to spread from its original seat and to invade other organs. The confusing multiplicity of terms used in connexion with this disease is due to its innumerable variations, and to attempts to classify diseases according to their symptoms or anatomical appearances. Now that the cause is known, and it has become clear that different forms of disease are caused by variations in extent, acuteness and seat of attack, the whole subject has become greatly simplified, and many old terms might be dropped with advantage.

Tuberculosis in the Lower Animals.—Most creatures, including worms and fishes, are experimentally susceptible to tuberculosis, and some contract it spontaneously. It may be called a disease of civilization. Domesticated animals are more susceptible than wild ones, and the latter are more liable in captivity than in the natural state. Captive monkeys, for instance, commonly die of it, and of birds the most susceptible are farmyard fowls, but it is practically unknown in animals in the wild state. In cattle coming chiefly from the plains (*United States Bureau of Animal Industry Reports, 1900-1905*) the number found diseased was only 0.132% in 28,000,000. Of the domesticated animals, horses and sheep are least, and cattle most affected; pigs, dogs and cats occupy an intermediate position.

The percentage of tuberculous animals recorded at the slaughter-houses of Berlin in 1892-1893 was as follows: Cows and oxen, 15.1; swine, 1.55; calves, 0.11; sheep, 0.004. Similar records at Copenhagen in 1890-1893 give the following result: Cows and oxen, 17.7; swine, 15.3; calves, 0.2; sheep, 0.0003. The order of the animals is the same, and it is confirmed by other slaughter-house statistics; but the discrepancies between the figures indicate considerable variation in frequency, and only allow general conclusions to be drawn. A striking fact is the comparatively small amount of tubercle in calves. It shows, as Nocard has pointed out, that heredity cannot play an important part in the transmission of bovine tuberculosis. The infrequency of the disease in sheep is attributed to the open-air life they lead, and no doubt that is an important factor. The more animals and persons are herded together and breathe the same air in a confined and covered space, the more prevalent is tuberculosis among them. Stefansky found the disease in 5% of the rats caught in Odessa, and Lydia Rabinowitch obtained similar results in rats caught in Berlin. But there are evidently degrees of natural resistance also. Horses are more confined than cattle in the United Kingdom, yet they are far less affected; and on the other hand, cattle running free in the purest air may take the infection from others. Professor McEachern of Montreal states that he has seen tuberculosis prevalent in ranch cattle, few of which were ever under a roof, ranging on the foothills of the Rocky Mountains in Montana. In cows and monkeys the lungs are chiefly affected; in horses and pigs the intestine and abdominal organs.

The relation between human and animal tuberculosis has been much debated. The bacillus in man very closely resembles that found in other mammalia, and they were considered identical until Koch threw doubt on this view at the British Congress on Tuberculosis in 1901. The British government thereupon appointed a royal commission to inquire into the relations of human and animal tuberculosis. The second interim report of the commission was issued in 1907, and the conclusions arrived at in it are: "That there seems to be no valid reason for doubting the opinion, never seriously doubted before 1901, that human and bovine bacilli belong to the same family. On this view the answer to the question, Can the bovine bacillus affect man? is obviously in the affirmative. The same answer must also be given to those who hold the theory that human and bovine tubercle bacilli are different in kind, since the 'bovine kind' are readily to be found as the causal agents of many fatal cases of human tuberculosis." The commission also found that there is an essential unity not only in the nature of the morbid processes induced by human and bovine tubercle bacilli, but also in the morphological characteristics exhibited by the tubercle bacilli which cause these processes. The conclusions of the members of the Paris Congress on Tuberculosis, held in 1905, are: "That human tuberculosis can be transferred to the bovine animal, and that what is termed the bacillus of bovine origin can be discovered in the human subject, and that there is a possibility that they may be varieties of one species."

The distribution of tuberculosis is universal, and it is coincident with the existence of the human race in the habitable regions of the globe. Its comparative absence in the Arctic regions seems more due to the sparsity of population than to climatic effect. Indeed, it has been shown that climate has much less effect in its prevalence than has been formerly thought to be the case, the conclusion of Hirsch being that "the mean level of the temperature has no significance for the frequency or rarity of phthisis in any locality." The nature of the occupations and the density of population in any given area tend to its increase or otherwise, and the comparative immunity enjoyed by

untivilized races is due to their open-air life and to the sanitary advantages derived from the comparatively frequent changes of the sites of their camps and villages. Segregation of these races in fixed areas has shown an increased incidence of tuberculosis, and when living under civilized conditions they fail to exhibit any natural immunity. Altitude has an apparent influence on the frequency of phthisis, the rarity of the disease at high altitudes in Switzerland having been demonstrated, and a like protective influence is enjoyed by certain elevated districts in Mexico, notwithstanding the insanitary conditions of the towns thereon. The protection afforded by the altitude is alleged to be due to the dryness of the atmosphere, its freedom from impurities and the increased solar radiation. While no race is exempt from tuberculosis, certain races afford a greater case incidence. E. Baldwin states that the mortality from consumption in recently immigrated races in the United States is much greater than in those of longer residence. It was found that among those whose mothers were of foreign birth the rate was—in Russians 71.8, Germans 167, Scottish 172.5, French 187.7 and Irish 339.6, while in native-born Americans it was 112.8. The well-known susceptibility of the Irish has been attributed to the moisture of the climate, under-feeding, and the residual inferiority of a population drained by the emigration of a large number of able-bodied adults. That there is some added factor is shown by the fact that the above mortality of 339 in those having Irish mothers, in 1901, was greater by 31% than that of the Irish in Ireland at the same period. The Jews are said to show a relative immunity, but the matter requires further investigation. The factor which seemingly has the most constant influence on the mortality from tuberculosis is density of population. A high rate of mortality occurs in connexion with overcrowding and bad ventilation in cities, and it is proved that the death-rate from this disease is considerably lower in the country than in the towns. In addition, when we consider that it does not occur in epidemics or at certain seasons, but is constantly active, it will easily be seen that no other disease is so destructive to the human race. At the Tuberculosis Congress, held in Paris in 1905, it was stated by Kayserling that one-third of all deaths and one-half the sickness amongst adults in Germany was due to tuberculosis.

In 1908 the mortality from all forms of tuberculosis in England and Wales was, according to the registrar-general's returns, 56,080, less by 3455 than the average of the previous five years, being equal to 10.8% of the mortality from all causes, while in Ireland in 1909 14% of the total mortality was assigned to it.

The following table gives the comparative mortality from pulmonary tuberculosis for certain fixed years together with the estimated population of certain selected countries:—

	Estimated Population in Years.			Mortality from Pulmonary Tuberculosis.		
	1892.	1900.	1907.	1892.	1900.	1907.
England and Wales	29,760,842	32,249,187	34,945,600	43,323	42,987	39,839
Ireland	4,633,808	4,468,501	4,377,064	10,048	10,076	8,828
German Empire	47,125,446	52,624,706	61,994,743	113,720	108,827	97,555
France	38,360,000	38,900,000	39,222,000	31,080	34,357	40,304
Norway	2,010,000	2,211,300	2,305,700	3,358	4,249	4,656
Italy	30,665,662	32,346,366	33,778,087	39,715	41,733	41,968
Holland	4,645,660	5,159,347	5,709,755	8,906	8,451	7,403
Belgium	6,195,355	6,693,348	7,317,581	10,491	9,177	7,377
Switzerland	3,002,263	3,299,939	3,525,290	5,785	6,692	6,063

* In Italy the mortality given is for all forms of tuberculosis.

We thus see there is a general tendency to decrease in the death-rate, with the possible exception of France and Norway. In England the decrease has been most marked, having fallen from 3457 per million living in 1851-1860, or 15.6% of all deaths, to 1583 per million living, or a mortality of 10.8% of the death-rate from all causes for all ages and sexes.

Death-rate of Tuberculosis per million living in England and Wales.

	1860.	1870.	1880.	1890.	1900.	1908.
Males	3300	3300	2900	2700	2200	1800
Females	3300	3000	2500	2100	1600	1350
Both Sexes	3300	3150	2700	2400	1900	1583

the existence of the human race in the habitable regions of the globe. Its comparative absence in the Arctic regions seems more due to the sparsity of population than to climatic effect. Indeed, it has been shown that climate has much less effect in its prevalence than has been formerly thought to be the case, the conclusion of Hirsch being that "the mean level of the temperature has no significance for the frequency or rarity of phthisis in any locality." The nature of the occupations and the density of population in any given area tend to its increase or otherwise, and the comparative immunity enjoyed by

In English counties containing populations of 100,000 or over the highest rates were—in 1908—London, 1806; Lancashire, 1848; Northumberland, 1947; Carnarvonshire, 2025; and Carmarthen-shire, 2328 per million living. Of the fifteen counties in England and Wales with the highest tuberculosis mortalities, no fewer than seven are Welsh. Cardiganshire, with 2270 for both sexes, has a rate nearly double that of England.

According to the United States census of 1900, the death-rate from tuberculosis in the area chosen for registration which embraced ten registration states, namely, Connecticut, Maine, District of Columbia, Massachusetts, Michigan, New Hampshire, New Jersey, New York, Rhode Island and Vermont, and 153 registration cities outside these states, was:—

	Number of Deaths from Tuberculosis.	Death-rate per 100,000.
1890	48,236	245.4
1900	54,898	190.5

The returns of the mortality statistics of the United States for the year 1908 cover an area of 17 states, the district of Columbia and 74 registration cities, representing an aggregate population of 45,028,767, or 51.8% of the total estimated population of the United States.

Mortality from Tuberculosis in the United States in given areas.

Annual Average, 1901-1905.	Tuberculosis (all forms), 62,835.	Pulmonary Phthisis, 55,251.	Number Tuberculosis (all forms) per 100,000 of the population, 103.2.
1904	66,797	58,763	201.6
1905	65,352	56,770	193.6
1906	75,512	65,341	184.2
1907	176,650	66,374	183.6
1908	78,289	67,376	173.9

In the United States tuberculosis of the lungs forms from 86 to 87% of all cases. The death-rate, as we see, is steadily decreasing. It is, however, difficult to estimate the ravages of the disease in that country owing to the fact that rather less than half the United States is still unprovided with an adequate system of registration.

The following was the death-rate from tuberculosis (all forms) per 100,000 of the population of the chief cities of the United States during 1908:—

New Orleans	298.3
Sacramento, California	294.3
Washington	264.0
Baltimore	249.9
Jersey City	241.1
New York	234.4
Philadelphia	234.1
Saratoga Springs, New York	232.2
Indianapolis	222.6
Boston, Massachusetts	219.1
St. Louis	188.3
Chicago	180.7
Kansas City	172.9
Cleveland, Ohio	142.4
Pittsburg, Pennsylvania	139.2
Detroit	122.5
St Paul, Minnesota	111.8

The returns in the United States show a high rate of mortality from tuberculosis amongst the coloured population, the negro being particularly susceptible to pulmonary phthisis; the death-rate from this cause is nearly double that amongst whites.

Age and Sex.—The most complete information under this heading is derived from the English records. "In both sexes," says Dr Tatham, "the real liability to phthisis begins somewhere between the fifteenth and the twentieth year. Among males it attains its maximum at age 45-55, when it reaches 3173 per million living. Among females it attains its maximum (2096) at age 25-45. In both sexes the rate rapidly declines after the attainment of its maximum. Practically the incidence of pulmonary phthisis is upon the ages from 25 to 75 years, very old people and young children being comparatively free according to recent experience. It is to be rather less liable to occur in

by phthisis at ages under 5 years, more liable at the age of 5-20, and again less liable at subsequent ages." These observations, it must be noted, refer only to consumption. The comparative immunity of the very young does not extend to all forms of tuberculous disease. On the contrary, tuberculosis of the bowels and mesenteric glands (tabes mesenterica), tuberculous peritonitis and tuberculous meningitis are pre-eminently diseases of childhood. The tables at foot of page show in detail the relative incidence of pulmonary phthisis at different ages, and the steady diminution of the disease in England and Wales since 1850.

Occupation has a marked influence on the prevalence of pulmonary tuberculosis. The comparative mortality figures for various occupations are taken from the supplement to the registrar-general's 65th annual Report, and show the incidence of pulmonary phthisis, agriculturists being taken at 100 for purposes of comparison.

Occupied Males: England and Wales.	
Highest.	Lowest.
Tin miner	816
Copper miner	574
Scissors maker	533
File maker	387
General shopkeeper	387
Brush maker	325
Furrier	316
Printer	300
Chimney sweep	284
Hatter	280
Coal miner	89
Chemical manufacturer	98
Carpenter, joiner	150
Artist	156
Blacksmith	158
Worsted manufacturer	159
Baker	165
Bricklayer	194
Cotton manufacturer	197
Tailor	248

The high incidence in the first group will be seen chiefly to affect those occupations where there is dust (scissors and file makers and furriers). The high mortality amongst general shopkeepers can only be ascribed to continuous indoor occupation. Coal miners enjoy an unexplained immunity.

Dr Von Kórsós has tabulated the result of seventeen years' observation in Budapest, which is an excessively tuberculous town. His figures include both males and females above fifteen years of age, and extend to 100,944 deaths. The field of observation is evidently very different from those which furnished the statistics already given. His results are: (1) *Males*—printers 606, butlers 520, shoemakers 494, dyers 493, millers 492, joiners 485, tinkers and locksmiths 484, masons 467, labourers 433, tailors 418, bakers 398, drivers 370, servants 360, carpenters 339, officials 336, butchers 333, innkeepers 272, merchants 253, lawyers 205, physicians 118, capitalists 106; (2) *Females*—servants 353, day labourers (? char-women) 333, washerwomen 314, gardeners 269, capitalists 42. The inmates of lunatic asylums, who are classed among the

"unoccupied," suffer excessively from tubercle. According to Dr Mott, pathologist to the London County Council, tuberculous lesions are found in more than one-third of the bodies of inmates examined post mortem. The majority contract the disease in the asylums.

Medical opinion has undergone a great change with regard to the influence of heredity. The frequent occurrence of consumption among members of the same family used to be explained by assuming the existence of a tuberculous "diathesis" or inherent liability to consumption which "ran in families" and was handed down from one generation to another. As the real nature of the disease was not understood, the inherited diathesis was regarded as a sort of latent or potential consumption which might develop at any time and could hardly be avoided. The children of consumptive parents had the "seeds" of the disease in them, and were thought to be doomed with more or less certainty. Great importance was therefore attached to heredity as a factor in the incidence of tuberculosis. The discovery that it is caused by a specific parasitic infection placed the question in a different light, and led to a more careful examination of the facts, which has resulted in a general and increasing tendency to minimize or deny the influence of heredity. At the Berlin Congress on Tuberculosis in 1899 Virchow pronounced his disbelief in the theory on pathological grounds. "I dispute this heredity absolutely," he said. "For a course of years I have been pointing out that if we examine the bodies of infants newly born, who have had no life apart from the mother, we find no tuberculosis in them. I am convinced that what looked like tuberculosis in the newly born was none of it tuberculosis. In my opinion there is no authenticated case of tubercle having been found in a dissected newly-born infant." Observations on animals similarly tend to disprove the existence of congenital tuberculosis (Nocard). The theory that the germs may remain latent in the offspring of tuberculous parents (Baumgarten) is unsupported by evidence. The occurrence of disease in such offspring is ascribed to infection by the parents, and this view is confirmed by the fact that the incidence in consumptive families is greater on female children, who are more constantly exposed to home infection, than on the male (Squire). The statistical evidence, so far as it goes, points in the same direction. It is even denied that the children of consumptives are specially predisposed.

Heredity.

Recognition of the communicability of tuberculosis has directed attention to the influence of conditions in which people live massed together in close proximity. The prevalence of the disease in large centres of population has already been noted, and the influence of aggregation is no doubt considerable; but it does not always hold good. The distribution in England and Wales does not correspond with density of population, and some purely rural districts have a very high mortality. Broadly, however, the rural counties have a low mortality, and those containing large urban populations a high one. In France in the department of the Oise, in purely industrial villages, the mortality from pulmonary phthisis is from 56 to 61 per 10,000; in a village in which part of the population worked in the fields and part in factories the mortality was 46 per 10,000; and in purely agricultural villages it ranged from 0 to 10 per 10,000.

The following table is taken from the Supplement to the Registrar-General's 65th Report for England and Wales:—

Density of Population and Overcrowding.

and Wales does not correspond with density of population, and some purely rural districts have a very high mortality. Broadly, however, the rural counties have a low mortality, and those containing large urban populations a high one. In France in the department of the Oise, in purely industrial villages, the mortality from pulmonary phthisis is from 56 to 61 per 10,000; in a village in which part of the population worked in the fields and part in factories the mortality was 46 per 10,000; and in purely agricultural villages it ranged from 0 to 10 per 10,000.

The following table is taken from the Supplement to the Registrar-General's 65th Report for England and Wales:—

	All occupied Males.		Occupied Males (London).		Occupied Males (industrial districts).		Occupied Males (agricultural districts).	
	1900-1902.	1890-1892.	1900-1902.	1890-1892.	1900-1902.	1890-1892.	1900-1902.	1890-1892.
All Causes ..	100	119	119	143	121	156	72	86
Tuberculous Phthisis.	100	122	156	183	115	147	71	90

It will be noted that the rate in the agricultural districts is low compared to the industrial districts or purely urban district chosen. There is obviously a close relation between density of population and the prevalence of phthisis. Comparing phthisis with other

diseases in relation to overcrowding, the same authority found that "while associated with overcrowding is a tendency of the population to die from disease generally, this tendency is especially manifested in the case of phthisis, and is not manifested in the case of every disease."

Other Conditions.—Poverty, insufficient food and insanitary dwellings are always more or less associated with overcrowding, and it is difficult to distinguish the relative influence of these factors. An analysis of 553 deaths in Edinburgh according to rentals in 1899 gave these results: under £10, 230; from £10 to £20, 190; above £20, 106 (Littlejohn); but the corresponding population is not stated. An investigation of selected houses in Manchester gave some interesting results (Coates). The houses were divided into three classes: (1) infected and dirty; (2) infected but clean; (3) dirty but not infected; infected meaning occupied by a tuberculous person. Dust was taken from all parts of the rooms and submitted to bacteriological tests. The conclusions may be summarized thus: The effects of overcrowding were not apparent; a large cubic space was found to be of little avail if the ventilation was bad; the beneficial effects of light and fresh air were markedly shown even in the dirtiest houses; ordinary cleanliness was found not sufficient to prevent accumulation of infectious material in rooms occupied by a consumptive; no tuberculous dust was found in dirty houses in which there was no consumption. The upshot is to emphasize the importance of light and air, and to minimize that of mere dirt. This is quite in keeping with earlier investigations, and particularly those of Dr Tatham on back-to-back houses. Darkness and stuffiness are the friends of the tubercle bacillus.

So much has the question of cleanliness, and of housing in a sanitary district, to do with the prevalence of the disease, that the following table taken from the Report of the Registrar-General for Ireland for the year 1909 shows the marked class incidence in all forms of tuberculosis.

Distribution of Tuberculosis Mortality by Classes in Ireland, 1909.

	All forms of Tuberculosis.	Pulmonary Phthisis.	Other forms of Tuberculosis.
Professional and independent class	1.41	0.64	0.77
Middle class, civil service and smaller officials	1.82	1.30	0.52
Large traders, business managers	1.59	1.04	0.55
Clerks	2.92	2.33	0.59
Householders in 2nd-class localities	2.52	1.85	0.67
Artisans	2.94	2.23	0.71
Petty shopkeepers and other traders	3.85	3.00	0.85
Domestic servants	1.31	1.04	0.27
Coach and car drivers, and vanmen	4.24	3.06	1.18
Hawkers, porters and labourers	4.83	2.88	1.95

In relation to the last two classes the effect of exposure and also of alcoholic excess must be added to overcrowding and privation. The low rate noticeable for domestic servants must be ascribed to the better food and housing they enjoy while in situations. In Hamburg the mortality was 10.7 per 10,000 in those whose income rose above 3500 marks, 39.3 where the income was 900 to 1200 marks, and 60 per 10,000 where the income fell below that figure.

It is now generally accepted that tubercle bacilli may enter the body by various paths. At the International Congress on Tuberculosis held in Vienna in 1907 Weichselbaum summarized the channels of infection in pulmonary tuberculosis as follows:

- (1) By inhalation directly into the bronchioles and pulmonary alveoli, or by way of the bronchial glands through the blood and lymph channels into the lung.
- (2) Through the mucous

membrane of the nose, mouth or tonsils into the neighbouring lymphatic glands, and thence through the blood or lymph into the lungs. (3) By ingestion of tubercle bacilli into the lower part of the gastro-intestinal tract in the food; thence the bacilli may pass through the lining membrane, infect the neighbouring glands and pass by the blood or lymph stream to the lungs. (4) By penetration of other mucous membranes (such as the conjunctival or urogenital) or through the skin. (5) Possible, though very rare, placental infection.

Tubercle bacilli may not produce any anatomical lesion at the point of entrance, or they may remain latent for a very long time; and it has been experimentally proved that they may pass through mucous membranes and leave no trace of their progress. As reported to the Royal Commission, the introduction of bacilli into the alimentary canal is not necessarily followed by the development of tuberculosis. The writings of Von Behring have led to renewed attention being paid to intestinal infection, particularly through the milk supply. Von Behring suggests that the bacillus itself may become modified in the human body.

Measures for the prevention of tuberculosis may be divided into two classes: (1) general; (2) special. Great attention has been paid to the latter since the infectious nature of the disease was established. The former include all means by which the conditions of life are improved among the mass of the people. The most important of these are probably housing and food supply. The reduction of the disease recorded in England is attributed to the great changes which have gradually taken place in such conditions since, say, 1850. Wages have been raised, food cheapened, housing improved, protection afforded in dangerous trades, air spaces provided, locomotion increased, the ground and the atmosphere have been cleaned and dried by sanitary means. In addition to these general measures is the provision of consumption hospitals, which act by segregating a certain amount of disease. Yet all these things, beneficial as they may be, do not wholly account for the reduction, for, if the records can be trusted, it was in progress before they had made any way or had even been begun. This observation, coupled with the apparently general tendency to diminution among civilized races, suggests the operation of some larger agency. The theory of acquired resistance, which has been already mentioned, would explain the diminution; and it is also in keeping with other facts, such as the great susceptibility of savage races, which have not been long exposed to tuberculosis, and the results of laboratory experiments in artificial immunity. The point is of great importance, and deserves careful attention; for if the theory be correct, the special measures for preventing tuberculosis, which are occupying so much attention, may eventually have unexpected results. Their general aim is the avoidance of infection, and they include (1) the provision of special institutions—hospitals, sanatoria and dispensaries; (2) the prevention of spitting; (3) the notification of consumption; (4) the administrative control of tuberculosis in animals; (5) the dissemination of popular knowledge concerning the nature of the disease.

The greatest stress is laid upon the prevention of spitting, because the germs are contained in the sputum of consumptive persons, and are scattered broadcast by expectoration. The sputum quickly dries, and the bacilli are blown about with the dust. There is no question that infection is so conveyed. The Manchester scientific experiments, mentioned above, are only one series out of many which prove the infectivity of dust in the proximity of consumptive persons, and they are confirmed by actual experience. Several cases are recorded of healthy persons having contracted the disease after occupying rooms in which consumptive persons had previously lived. It is a legitimate inference that spitting in public is an important means of disseminating tuberculosis, though it may be noticed that international sanitary conferences have corresponded with this direction.

Britain, and far more common both there and in the United States than on the continent of Europe. Prohibition of spitting under a statutory penalty is attended with certain difficulties, as it is obviously impossible to make any distinction between tuberculous and other persons; but it has been applied in New York and elsewhere in America, and some local authorities in Great Britain have adopted by-laws to check the practice. Another means of controlling dangerous sputa is more practicable, and probably more effective, namely, the use of pocket spittoons by consumptive persons. Convenient patterns are available, and their use should always be insisted on, both in public and in private. The most effective way of destroying the sputa is by burning. For this purpose spittoons of papier mâché and of turf have been successfully used in the Vienna hospitals (Schrötter). When glass spittoons are used the contents can be sterilized by disinfectants and passed down the drain.

Notification is of great service as an aid to practical measures of prevention. It has been applied to that purpose with good results in several cities and states in America, and in some towns in Great Britain. New York has made the most systematic use of it. Voluntary notification was adopted there in 1894, and in 1897 it was made compulsory. The measures linked with it are the sanitary supervision of infected houses, the education of the people and the provision of hospitals. In England, Manchester has led the way. Voluntary notification was adopted there in 1899: it was at first limited to public institutions, but in 1900 private practitioners were invited to notify their cases, and they heartily responded. In Sheffield notification was made compulsory by a local act in 1904 for a limited period, and was found so valuable that the period was extended in 1910. The objects aimed at are to visit homes and instruct the household, to arrange and provide disinfection, to obtain information bearing on the modes of infection, to secure bacteriological examination of sputum, and to collect information to serve as a basis of hospital provision. Disinfection is carried out by stripping off paper, previously soaked with a solution of chlorinated lime (1½ oz. to the gallon), and washing the bare walls, ceiling, floor and everything washable with the same solution. This is found effective even in very dirty houses. In clean ones, where the patients have not been in the habit of spitting about the rooms, it is sufficient to rub the walls with bread-crumbs and wash the rest with soap and water. Clothing, bedding, &c., are disinfected by steam. The advantages of these sanitary measures are obvious. Notification is no less important as a step towards the most advantageous use of hospitals and sanatoria by enabling a proper selection of patients to be made. It is compulsory throughout Norway, and is being adopted elsewhere, chiefly in the voluntary form. In 1908 the Prevention of Tuberculosis (Ireland) Act was passed, which conferred on local authorities the right to make notification compulsory in their districts, and provided that certain sections of the Public Health (Ireland) Act 1878 and the Infectious Diseases Prevention Act 1890 should apply to tuberculosis. By this act also the county councils were enabled to establish hospitals and dispensaries for the treatment of tuberculosis and were empowered to borrow money or levy a poor rate for the erection of sanatoria for the treatment of persons from their respective counties suffering from the disease.

The prevalence of tuberculosis in cattle is of importance from the point of view of prevention of the probability that abdominal tuberculosis, which is a very fatal form of the disease in young children, and has not diminished in prevalence like other forms, is caused by the ingestion of tuberculous milk. Whether it be so or not, it is obviously desirable that both meat and milk should not be tuberculous, if it can be prevented without undue interference with commercial interests. Preventive measures may be divided into two classes. They may deal merely with the sale of meat and milk, or they may aim at the suppression of bovine tuberculosis altogether. The former is a comparatively easy matter, and may be summed up in the words "efficient inspection." The latter is probably impracticable. If practicable,

It would be excessively costly, for in many herds one half the animals or even more are believed to be tuberculous, though not necessarily the sources of tuberculous food. Unless the danger is proved to be very much greater than there is any reason to suppose, "stamping out" may be put aside. Efficient inspection involves the administrative control of slaughterhouses, cowsheds and dairies. The powers and regulations under this head vary much in different countries; but it would be useless to discuss them at length until the scientific question is settled, for if the reality of the danger remains doubtful, oppressive restrictions, such as the compulsory slaughter of tuberculous cows, will not have the support of public opinion. Whatever measures may be taken for the public protection, individuals can readily protect themselves from the most serious danger by boiling milk; and unless the source is beyond suspicion, parents are recommended, in the present state of knowledge, so to treat the milk given to young children.

A great deal has been done in most countries for the dissemination of popular knowledge by forming societies, holding conferences and meetings, issuing cheap literature, and so forth. It is an important item in the general campaign against tuberculosis, because popular intelligence and support are the most powerful levers for setting all other forces in motion. In Ireland, where an attempt had been made to deal with the question by arousing the interest of all classes, tuberculosis exhibitions have been held in nearly every county, together with lectures and demonstrations organized by the Women's National Health Association, and an organized attempt was made in the autumn of 1910 in England, by a great educational campaign, to compel the public to realize the nature of the disease and the proper precautions against it.

The improved outlook in regard to the arrest or so-called "cure" of tuberculosis is mainly derived from the improved methods of diagnosis, thus enabling treatment to be undertaken at an earlier and therefore more favourable stage of the disease. The physical signs in early stages of the lung affection are often vague and inconclusive. A means of diagnosis has therefore been sought in the use of tuberculin. The methods are three: (1) The subcutaneous injection method of Koch; (2) the cutaneous method of Von Pirquet, (3) the conjunctival method of Wolff-Eisner and Calmette. The first method depended on the reaction occurring after an injection of "old tuberculin." It is unsuitable in febrile conditions, and has now been relegated to the treatment of cattle, where it has proved invaluable. In Von Pirquet's method a drop of old tuberculin diluted with sodium chloride is placed on a spot which has been locally scarified. The presence of tuberculosis is demonstrated by a local reaction in which a hyperaemic papule forms, surrounded by a bright red zone. Reaction occurs in tuberculosis of the bones of joints and skin. Von Pirquet in 1000 cases obtained a reaction in 88% of the tuberculous, and 10% of those clinically non-tuberculous. In the latter there may have been latent cases of tuberculosis. In the conjunctival or ophthalmic-reaction of Calmette and Wolff-Eisner the instillation of a drop of a dilute solution of tuberculin into the conjunctiva is followed in the tuberculous subject by conjunctivitis. The reaction generally appears in from 3 to 12 hours, but may be delayed to 48. In a series of cases observed by Audeoud a positive reaction was obtained in 95% of 261 obviously tuberculous cases and in 8.3% of 303 cases which presented no clinical symptoms. Very advanced cases fail to react to any of these tests, as do general miliary tuberculosis and tuberculous meningitis. As well as the three methods mentioned above the occurrence of a "negative phase" in the phagocytic power of the leucocytes following an injection of Koch's tuberculin T.R. may be said to be diagnostic of tuberculosis. Another valuable aid in diagnosis is that of the X-rays. By their help a pulmonary lesion may be demonstrated long before the physical signs can be obtained by ordinary examination.

To discuss at all fully the treatment of the various forms of tuberculosis or even of consumption alone would be quite

beyond the scope of this article. It must suffice to mention the more recent points. The open-air treatment of consumption has naturally attracted much attention. Neither the curability of this disease nor the advantages of fresh air are new things. Nature's method of spontaneous healing, explained above, has long been recognized and understood. There are, indeed, few diseases involving definite lesions which exhibit a more marked tendency to spontaneous arrest. Every case, except the most acute, bears signs of Nature's effort in this direction; and complete success is not at all uncommon, even under the ordinary conditions of life. Perhaps it was not always so: the ominous character popularly attributed to consumption may once have been justified, and the power of resistance, as we see it now, may be the result of acquired immunity or of the gradual elimination of the susceptible. However this may be, the natural tendency to cure is undoubtedly much assisted by the modern system of treatment, which makes pure air its first consideration. The principle was known to Sydenham, who observed the benefit derived by consumptives from horse exercise in the open air; and about 1830 George Boddington proposed the regular treatment of patients on the lines now generally recognized. The method has been most systematically developed in Germany by the provision of special sanatoria, where patients can virtually live in the open air. The example has been followed in other countries to a certain extent, and a good many of these establishments have been provided in Great Britain and elsewhere; but they are, for the most part, of a private character for the reception of paying patients. Germany has extended these advantages to the working classes on a large scale. This has been accomplished by the united efforts of friendly and philanthropic societies, local authorities, and the state; but the most striking feature is the part played by the state insurance institutes, which are the outcome of the acts of 1889 and 1899, providing for the compulsory insurance of workpeople against sickness and old age. The sanatoria have been erected as a matter of business, in order to keep insured members off the pension list, and they are supported by the sick clubs affiliated to the institutes. They number forty-five, and can give three months' treatment to 20,000 patients in the year. The clinical and economic results are said to be very encouraging. In about 70% of the cases the disease has been so far arrested as to enable the patients to return to work.

In England, where more than 14 millions of the population belong to friendly societies, it is estimated that the sick pay of consumptive members costs three times as much as the average sick pay to members dying of other causes. An effort has been made by the National Association for the Establishment and Maintenance of Sanatoria for Workers Suffering from Tuberculosis to establish such sanatoria, together with training for suitable work during convalescence, the gradual resumption of wage-earning being resumed while in touch with the medical authorities.

The important features of the sanatorium treatment are life in the open air, independently of weather, in a healthy situation, rest and abundance of food. The last has been carried to rather extravagant lengths in some institutions, where the patients are stuffed with food whether they want it or not. The sanatorium movement on the German model is rapidly extending in all countries. For those who are able to do so advantage may be taken of the combined sanatorium and sun treatment. In certain high altitudes in Switzerland, which are favoured by a large amount of sunshine and a small percentage of moisture, much benefit has been derived from the exposure of the unclothed body to the sun's rays. The power of the sun in high altitudes is so great that the treatment can be continued even when the snow is on the ground. Not only is the sun-treatment applicable to pulmonary tuberculosis, but also to the tuberculosis of joints, even in advanced cases. The treatment has to a great extent replaced surgical procedure in tuberculosis of joints, but it requires to be persevered in over a considerable period of time. It should be remembered that the benefits of fresh air are not confined to sanatoria. If the superstitious

dread of the outer air, particularly at night, could be abolished in ordinary life, more would be done for public health than by the most costly devices for eluding microbes. Not only consumption, but the other respiratory diseases, which are equally destructive, are chiefly fomented by the universal practice of breathing vitiated air in stuffy and overheated rooms. The cases most suitable for the treatment are those in an early stage. Other special institutions for dealing with consumption are hospitals, in which England is far in advance of other countries, and dispensaries; the latter find much favour in France and Belgium.

In Great Britain the pioneer work as regards the establishment of tuberculosis dispensaries was the establishment of the Victoria Dispensary for Consumption in Edinburgh in 1887, where the procedure is similar to that in Dr Calmette's dispensaries in France. In connexion with the dispensary home visits are made, patients suitable to sanatoria selected, advanced cases drafted to hospitals, bacteriological examinations made, cases notified under the voluntary system, and the families of patients instructed. There is an urgent need for the multiplication of such dispensaries throughout the United Kingdom. The recent act providing for the medical inspection of schools has done much to sort out cases of tuberculosis occurring in children, and to provide them with suitable treatment and prevent them from becoming foci for the dissemination of the disease. In Germany special open-air schools, termed forest-schools, are provided for children suffering from the disease, and an effort is being made in England to provide similar schools.

Of specific remedies it must suffice to say that a great many substances have been tried, chiefly by injection and inhalation, and good results have been claimed for some of them. The most noteworthy is the treatment by tuberculin, first introduced by Koch in 1890, which, having sunk into use as a diagnostic reagent for cattle, received a new lease of life owing to the valuable work done by Sir Almroth Wright on opsonins. The tuberculin most in use are Koch's "old" tuberculin T.O., consisting of a glycerin broth culture of the tubercle bacilli, and Koch's T.R. tuberculin, consisting of a saline solution of the triturated dead tubercle bacilli which has been centrifuged. This latter is much in use, the dosage being carefully checked by the estimation of the tuberculo-opsonic index. The injections are usually unsuitable to very advanced cases. Marmorek's serum, the serum of horses into which the filtered young cultures of tubercle bacilli have been injected, and in which a tuberculo-toxin has been set free, has proved very successful. Behring's Tulase is a tuberculin preparation formed by a process of treating tubercle bacilli with chloral, and Béreneck's tuberculin consists of a filtered bouillon culture treated with orthophosphoric acid. The variety of cases to which these treatments are suitable can only be estimated from a careful consideration of each on its own merits.

In the treatment of tuberculous lesions, the surgeon also plays his part. Tuberculosis is specially prone to attack the spongy bone-tissue, joints, skin (*lupus*) and lymphatic glands—especially those of the neck. Recognizing the infective nature of the disease, and knowing that from one focus the germs may be taken by the blood-stream to other parts of the body, and so cause a general tuberculosis, the surgeon is anxious, by removing the primary lesion, to cut short the disease and promote immediate and permanent convalescence. Thus, in the early stage of tuberculous disease of the glands of the neck, for instance, these measures may render excellent service, but when the disease has got a firm hold, nothing short of a radical operation will give results. In such cases, however, the results of this modern treatment of tuberculous disease of the skin and of the lymphatic glands has been found to be very good, for not only has the infected tissue been removed, but the resulting scars have been so small that they would have been hardly noticed. One rarely sees a patient showing how

work out their own cure. A few years ago, however, such conditions were by no means unusual.

TUBEROSE. The cultivated tuberose (*Polygonatum tuberosum*) is a plant allied to the Mexican agaves, and is a native of the same country. The tuberous root-stock sends up a stem 3 ft. in height, with numerous lanceolate leaves and terminal racemes of waxy white funnel-shaped very fragrant flowers. Each flower is about 1½ in. long, with a long tube and a six-parted limb. The stamens are six in number, emerging from the upper part of the tube, and bear linear anthers. The ovary is three-celled, and the ovoid fruit is crowned by the persistent flower. The plant is largely grown in the United States and at the Cape of Good Hope for export to England, as it is found that imported bulbs succeed better than those grown in the United Kingdom. The double-flowered form is that principally grown. Cultivated plants require a rich soil, considerable heat, and, at first, abundance of water.

TÜBINGEN, a town of Germany, in the kingdom of Württemberg, picturesquely situated on the hilly and well-wooded banks of the Neckar, at its junction with the Ammer and Steinlach, 22 m. south of Stuttgart by road and 43 m. by rail. Pop. (1905), 16,809. The older town is irregularly built and unattractive, but the newer suburbs are handsome. The most conspicuous building is the old ducal castle of Hohentübingen, built in 1507-1535 on a hill overlooking the town, and now containing the university library of 460,000 volumes, the observatory, the chemical laboratory, &c. Among the other chief buildings are the quaint old *Stiftskirche* (1469-1483), a Gothic building containing the tombs of the rulers of Württemberg, the new *aula* and numerous institutes of the university, all of which are modern, and the town-hall dating from 1435 and restored in 1872. The university possesses a very important library. A monument was erected in 1873 to the poet Johann Ludwig Uhland (1787-1862), who was born and is buried here, and another, in 1881, to the poet Johann Christian Friedrich Hölderlin (1770-1843). Tübingen's chief claim to attention lies in its famous university, founded in 1477 by Duke Eberhard of Württemberg. Melancthon was a lecturer here (1512-1518). The university adopted the reformed faith in 1534, and in 1537 a Protestant theological seminary, a residential college—the so-called *Stift*—was incorporated with it. In 1817 a Roman Catholic theological faculty was added, with a seminary called the *Konvikt*, and there are now also faculties of law, medicine, philosophy, political economy and natural science. The leading faculty has long been that of theology, and an advanced school of theological criticism, the founder and chief light of which was F. C. Baur, is known as the Tübingen school. The university was attended in 1908 by 1891 students and had a teaching staff of over 100. The commercial and manufacturing industries of the town are slight. Printing, book-selling, the manufacture of surgical and scientific instruments, chemicals, gloves and vinegar, and the cultivation of hops, fruit and vines are among the leading occupations of the inhabitants. The country in the neighbourhood of Tübingen is very attractive; one of the most interesting points is the former Cistercian abbacy of Bebenhausen, founded in 1185, and containing a beautiful chateau.

It is mentioned as a strong fortress in 1078, and was held by counts palatine. In 1342 it was purchased by Duke Ulrich of Württemberg, whose descendants afterwards held it. The treaty of Tübingen is the name

given in German history to an arrangement made in 1514 between Duke Ulrich and his subjects, by which the latter acquired various rights and privileges on condition of relieving the former of his debts. The town was captured by the Swabian League in 1510, by Turenne in 1647, and again in 1688 by the French, who destroyed the walls.

See Eifer, *Geschichte und Beschreibung der Stadt und Universität Tübingen* (Tübingen, 1849); Maier, *Die Museumstadt Tübingen* (Tübingen, 1904); *Tübingen und seine Umgebung* (Tübingen, 1887-1889).

TUBUAI, or AUSTRAL ISLANDS, an archipelago in the south Pacific Ocean, between 21° 40' and 27° 41' S., 144° 22' and 154° 51' W., to the south of the Society Islands, with a total land area of 110 sq. m., belonging to France. They form a curved broken chain from north-west to south-east which includes four principal islands: Tubuai (area 40 sq. m.), Vavatao or Ravaivai, Rurutu or Oheteroa, Rapa or Oparo, and Rimitara, with Maretiri or the Bass Islands, and other islets. Tubuai, Vavatao and Rapa are volcanic and reach considerable elevations (2100 ft. in Rapa). The islands are well watered and fertile, producing coco-nut palms, arrowroot and bananas; but they lie too far south for the bread fruit to flourish. The natives belong to the Polynesian race; they were once much more numerous than now, the present population not exceeding 2000. A Tahitian dialect is spoken in the western islands; in Rapa, however, which with the Bass Islands lies detached from the rest, to the south, the language is akin to that of the Rarotongan in the Cook Islands. There are remarkable ancient stone platforms and walls, massively built, on the summits of some of the peaks in Rapa, they resemble the terraces in Easter Island (Rapanui), which is believed to have been peopled from Rapa. The scattered islands of the Tubuai archipelago were discovered at different times. Captain Cook visited Rurutu in 1769 and Tubuai in 1777; Rapa was discovered by George Vancouver in 1791. Vavatao perhaps in 1772 by the Spaniards who attempted to colonize Tahiti, and certainly by Captain Broughton in 1791. The islands never attracted much attention from Europeans, and the French protection and subsequent annexation were carried out spasmodically between the middle of the 19th century and 1880.

TUCKER, ABRAHAM (1705-1774), English moralist, was born in London, of a Somerset family, on the 2nd of September 1705, son of a wealthy city merchant. His parents dying during his infancy, he was brought up by his uncle, Sir Isaac Tillard. In 1721 he entered Merton College, Oxford, as a gentleman commoner, and studied philosophy, mathematics, French, Italian and music. He afterwards studied law at the Inner Temple, but was never called to the bar. In 1727 he bought Betchworth Castle, near Dorking, where he passed the remainder of his life. He took no part in politics, and wrote a pamphlet, "The Country Gentleman's Advice to his Son on the Subject of Party Clubs" (1755), cautioning young men against its snares. In 1736 Tucker married Dorothy, the daughter of Edward Barker of East Betchworth, cursor baron of the exchequer. On her death in 1754, he occupied himself in collecting together all the letters that had passed between them, which, we are told, he transcribed twice over under the title of "The Picture of Artless Love." From this time onward he occupied himself with the composition of his chief work, *The Light of Nature Pursued*, of which in 1763 he published a specimen under the title of "Free Will." The strictures of a critic in the *Monthly Review* of July 1763 drew from him a pamphlet called *Man in Quest of Himself*, by *Cuthbert Comens* (reprinted in Parr's *Metaphysical Tracts*, 1837), "a defence of the individuality of the human mind or self." In 1765 the first four volumes of his work were published under the pseudonym "Edward Search." The remaining three volumes appeared posthumously. His eyesight failed him completely in 1771, but he contrived an ingenious apparatus which enabled him to write so legibly that the result could easily be transcribed by his daughter. In this way he completed the later volumes, which were ready for publication when he died on the 20th of November 1774.

His work embraces in its scope many psychological and more strictly metaphysical discussions, but it is chiefly in connexion with ethics that Tucker's speculations are remembered. In some impor-

tant points he anticipates the utilitarianism afterwards systematized by Paley, who expresses in the amplest terms his obligations to his predecessor. "Every man's own satisfaction" Tucker holds to be the ultimate end of action; and satisfaction or pleasure is one and the same in kind, however much it may vary in degree. This universal motive is further connected, as by Paley, through the will of God, with the "general good, the root where out all our rules of conduct and sentiments of honour are to branch."

The Light of Nature was republished as a biographical sketch by Tucker's grandson, Sir H. P. St John Mildmay (1905), 7 vols. (other editions 1834, 1836, &c.), and an abridged edition by W. Haslitt appeared in 1807. See James Mackintosh, *Dissertation on the Progress of Ethical Philosophy* (Edinburgh, 1822); and specially Sir Leslie Stephen, *English Thought in the 18th Century*, iii. 119-130.

TUCKER, CHARLOTTE MARIA (1821-1893), English author, who wrote under the pseudonym "A.L.O.E." (a Lady of England), was born near Barnet, Middlesex, on the 8th of May 1821, the daughter of Henry St George Tucker (1771-1851), a distinguished official of the East India Company. From 1852 till her death she wrote many stories for children, most of them allegories with an obvious moral, and devoted the proceeds to charity. In 1875 she left England for India to engage in missionary work, and died at Amritsar on the 2nd of December 1893.

TUCKER, JOSIAH (1712-1799), English economist and divine, the son of a small Welsh farmer, was born at Laugharne, Carmarthenshire, in 1712. He was educated at St John's College, Oxford, and became successively a curate and rector in Bristol. This led him to take considerable interest in politics and trade, and during the greater portion of a long life he poured out a succession of pamphlets on these matters. He was appointed dean of Gloucester in 1758. He died on the 4th of November 1799, and was buried in Gloucester Cathedral. His *Important Questions on Commerce* (1755) was translated into French by Turgot.

TUCSON (possibly from Piman *stuyk-son*, "dark or brown spring," pronounced *Tooson*), a city and the county-seat of Pima county, Arizona, U.S.A., on the Santa Cruz river, in the S.E. part of the state, about 130 m. S.E. of Phoenix. Pop. (1880), 7007; (1890), 5150; (1900), 7531 (2352 foreign-born, chiefly from Mexico); (1910), 13,703. It is served by the Southern Pacific and the Twin Buttes railways, the latter connecting with the mines of the Twin Buttes district, about 27 m. south by east, and with the Randolph lines in Mexico. The city lies about 2360 ft. above the sea in a broad valley sheltered by mountains 5000-9000 ft. high. Its climate, characteristic of southern Arizona, attracts many invalids and winter visitors. Tucson is the seat of the university of Arizona (1891; non-sectarian, coeducational), which is organized under the Morrill Acts; in 1909 it had 40 instructors and 201 students. At Tucson also are a desert botanical laboratory (owning a tract of some 1000 acres about 1 m. west of the city) established by the Carnegie Institution of Washington, St Joseph's Academy (Roman Catholic); a Roman Catholic cathedral, the Tucson Mission (Presbyterian), a boarding school for Indians, the San Xavier Mission for Indians (Roman Catholic) and a Carnegie library. In 1900 Tucson became the see of a Roman Catholic bishop. The surrounding country is arid and unproductive except where irrigated; but the soil is very rich, and Tucson is the centre of one of the oldest farming and ranching districts of the state. The Southern Pacific railway has division headquarters and repair shops here.

Tucson is first heard of in history in 1699, conjecturally, as an Indian rancheria or settlement; and in 1763 certainly as a *visita*, in that year temporarily abandoned, of the Jesuit mission of San Xavier del Bac, founded between 1720 and 1732, 9 m. south of what is now Tucson; in 1776 it was made a presidio (San Augustin del Tugison), or military outpost, and although a few Spaniards may possibly have lived there before, the foundation of Tucson as a Spanish town dates from this time. It was never after abandoned through the Indian wars. In 1848 it had 760 inhabitants. The abandonment by the Mexicans in 1848 of the mission towns of Tamacacori (a *visita* of Guevavi, a mission founded in the first third of the 18th century) and the presidio at Tubac (established before 1752) increased its importance. Tucson lay within the territory acquired by the United States by the Gadsden Purchase in 1853; it was occupied by the United States in 1856. Fort Lowell, 7 m. north-east of the city, was built as a protection

Some 12 m. south-west at the desert end of the Wadi Ghir is the oasis and town of Temacin (pop. 21,200), one of the chief centres of the Mussulman fraternity of Tidjanes.

TUG-OF-WAR, a contest between two teams composed of one or more persons, each team striving to pull the other in its own direction by means of a rope held by the hands alone. Some rules allow the "anchor-men," who hold the ends of the rope, to fasten it to their persons. A ribbon or handkerchief is tied round the middle of the rope, and others at a distance, usually, of one yard on each side of it. That team loses which allows itself to be pulled more than one yard from its original position. The British army teams are usually composed of ten men each, but the number varies in different parts of the world. The rules of the modern Olympic Games recognize teams of five. When a tug-of-war takes place out of doors the men, or at least the "anchors," are allowed to dig holes in the ground for their feet; when indoors cleats are bolted to the floor as braces.

TUGUEGARAO, a town and the capital of the province of Cagayan, Luzon, Philippine Islands, on the Grande de Cagayan River, about 60 m. from its mouth. Pop. (1903), 16,105. Many of Tuguegarao's buildings—government, religious, business and residential—are of stone or brick. There are a Dominican college for boys, a convent school for girls, and good public schools, including a high school. The river is navigable to Tuguegarao for vessels of light draught; the Cagayan Valley is the great tobacco-producing region of the Philippines; and Tuguegarao is an important shipping point for tobacco. Local business is largely in the hands of Chinese merchants; Spanish and German companies control the exportation of tobacco. The town was settled in 1774, and the old church and bell tower are still standing. The local dialects are Cagayan, and, of less importance, Ilocano and Tagalog.

TUKE, the name of an English family, several generations of which were celebrated for their efforts in the cause of philanthropy.

WILLIAM TUKE (1732-1822) was born at York on the 24th of March 1732. His name is connected with the humane treatment of the insane, for whose care he projected in 1792 the Retreat at York, which became famous as an institution in which a bold attempt was made to manage lunatics without the excessive restraints then regarded as essential. The asylum was entirely under the management of the Society of Friends. Its success led to more stringent legislation in the interests of the insane.

His son **HENRY TUKE** (1753-1814) co-operated with his father in the reforms at the York Retreat. He was the author of several moral and theological treatises which have been translated into German and French.

Henry's son **SAMUEL TUKE** (1784-1857), born at York on the 31st of July 1784, greatly advanced the cause of the amelioration of the condition of the insane, and devoted himself largely to the York Retreat, the methods of treatment pursued in which he made more widely known by his *Description of the Retreat near York*, &c. (York, 1813). He also published *Practical Hints on the Construction and Economy of Pauper Lunatic Asylums* (1815). He died at York on the 14th of October 1857.

Samuel's son **JAMES HACK TUKE** (1819-1896) was born at York on the 13th of September 1819. He was educated at the Friends' school there, and after working for a time in his father's wholesale tea business, became in 1852 a partner in the banking firm of Sharples and Co., and went to live at Hitchin in Hertfordshire. For eighteen years he was treasurer of the Friends' Foreign Mission Association, and for eight years chairman of the Central Education Board. But he is chiefly remembered for his philanthropic work in Ireland, which was in a large measure the result of a visit to Connaught in 1847, and of the distress which he there witnessed. In 1880, when invited by W. E. Forster, he spent two months in the north of Ireland, contributing relief which had been privately distributed in England. Letters descriptive of the results of his visit were published in *The Times*, and in his *Travels and its Remedies* (1880), he pointed out that the distress was due to economic rather than political

difficulties, and advocated state-aided land purchase, peasant proprietorship, light railways, government help for the fishing and local industries, and family emigration for the poorest peasants. From 1882 to 1884 he worked continuously in Ireland superintending the emigration of poor families to the United States and the Colonies. The failure of the potato crop in Ireland in 1885 again called forth Tuke's energy, and on the invitation of the government, aided by public subscription, he purchased and distributed seed potatoes in order to avert a famine. To his reports of this distribution and his letters to *The Times*, which were reprinted under the title *The Condition of Donegal* (1889), were due in a great measure the bill passed for the construction of light railways in 1889 and the Irish Land Act which established the Congested Districts Board in 1891. He died on the 13th of January 1896.

See *Report of the Select Committee of the House of Commons* (1815-1816); Dr Conolly, *Treatment of the Insane without Mechanical Restraints* (1855); Dr Hack Tuke, *Chapters in the History of the Insane in the British Isles* (1882).

DANIEL HACK TUKE (1827-1895), younger brother of James Hack Tuke, was born at York on the 19th of April 1827. In 1845 he entered the office of a solicitor at Bradford, but in 1847 began work at the York Retreat. Entering St Bartholomew's Hospital in London in 1850, he became a member of the Royal College of Surgeons in 1852, and graduated M.D. at Heidelberg in 1853. In 1858, in collaboration with J. C. Bucknill, he published a *Manual of Psychological Medicine*, which was for many years regarded as a standard work on lunacy. In 1853 he visited a number of foreign asylums, and later returning to York he became visiting physician to the York Retreat and the York Dispensary, lecturing also to the York School of Medicine on mental diseases. In 1859 ill health obliged him to give up his work, and for the next fourteen years he lived at Falmouth. In 1875 he settled in London as a specialist in mental diseases. In 1880 he became joint editor of the *Journal of Mental Science*. He died on the 5th of March 1895.

Among his works were *Illustrations of the Influence of the Mind on the Body* (1872); *Insanity in Ancient and Modern Life* (1878); *History of the Insane in the British Isles* (1882); *Sleepwalking and Hypnotism* (1884); *Past and Present Provision for the Insane Poor in Yorkshire* (1889); *Dictionary of Psychological Medicine* (1892).

TUKULOR (TUCULERS), the name, by some said to be the French *lost-couleur*, for the negro half-castes of Senegal, who are principally of Fula-Wolof descent. By others the word is identified with Taculor, an old name of the country, which took the form of Tacurores in the Portuguese writers of the 16th century. The Tukulor are settled chiefly in the Damga, Futa, Toro and Dimar districts of Senegal, and are remarkable for their fanaticism as Mabommedans. An intelligent, energetic and fierce people, they offered strenuous opposition to the conquest of their country by the French in the latter half of the 19th century.

TULA, a government of central Russia, bounded by the governments of Moscow on the N., Ryazan' on the E., Tambov and Orel on the S., and Kaluga on the W. Area, 11,950 sq. m.; pop. (1906 estimate), 1,662,600. It is intersected from S.W. to N.E. by a gently undulating plateau, 950 to 1020 ft. in altitude, which separates the drainage area of the Oka from that of the Don.

The government is divided into twelve districts, the chief towns of which are Tula, Bogoroditsk, Alexin, Byelev, Epifan, Efiremov, Kashira, Krapivna, Novosil, Odoyev, Chern and Venev. Only 2.4% of the aggregate area is considered as unavailable for cultivation, the remainder being distributed as follows: peasants, 48½%; nobility, 32½%; other private landowners, 11%; crown, towns, &c., 2%. Agriculture is the chief occupation. Petty trades and domestic industries (e.g. the making of tea-urns, brass wares, harmoniums, &c.) have always flourished. The principal factory establishments are machinery works, hardware factories, flour-mills, sugar works and distilleries. Coal is extracted, as also pyrites and iron ore. Metallurgy is a growing industry.

Before the Slav immigration the territory of Tula was inhabited by Mordvinians in the north and by Meshcheryaks in the south. The Slavs who occupied the Oka were soon compelled to pay tribute to the Khazars. Subsequently the territory on the Oka belonged to the principality of Chernigov. In the 14th century part fell under the rule of Ryazan' and

Moscow, while the rest was under Lithuanian dominion till the 15th century.

TULA, a town of Russia, capital of the government of the same name, 120 m. by rail S. of Moscow, in the broad but low, marshy and unhealthy valley of the Upa. Pop. (1882), 63,500, (1901), 100,352. It is an old town of Old Russia, but its growth began only towards the end of the 18th century after the manufacture of arms had commenced. The chief branch of industry is the making of rifles, next in importance comes the manufacture of *samovars* (tea-urns). Tula is an episcopal see of the Orthodox Greek Church. The public buildings include two cathedrals and an industrial museum.

The town is first mentioned in 1147, but its former site seems to have been higher up the Tulsitsa. Its wooden fort was replaced in 1514-1521 by a stone *krem*, or citadel, which still exists. Tsar Boris Godunov founded a gun factory here in 1595, and in 1632 a Dutchman, Winius, established an iron foundry. Tsar Michael Alexis and Peter the Great, especially the last-named, took great interest in the gun factories, and large establishments were built in 1705 and 1714.

TULCEA, or **TULTCHA**, the capital of the department of Tulcea, Rumania, on the right bank of the Danube, 42 m. from its mouth at Sulina. Pop (1900), 18,800; including many Russians, Turks, Greeks and Jews. There is no railway within 20 m., and the surrounding country is barren and desolate. The principal commerce is in fish and grain. Wool is also exported to France, and hides to Turkey. Sheep-farming is carried on among the mountains.

TULIP (*Tulipa*), a genus of bulbous herbs belonging to the Liliaceae. The species are found wild along the northern shores of the Mediterranean, in the Levant, Armenia, Caucasus, Northern Africa, Persia, and sporadically across North and Central Asia to Japan. The cup-shaped flowers have six regular segments in two rows, as many free stamens, and a three-celled ovary with a sessile stigma, which ripens into a leathery many-seeded capsule. The species are numerous, and are distinguished one from another by the scales of the bulb being woolly or smooth on the inner surface, by the character of the flower-stalks, by the filaments being hairy or otherwise, and by other characters. Owing to the great beauty of the flowers they have been favourites in European gardens for two or three centuries, and have been crossed and recrossed till it has become almost impossible to refer the plants to their original types. The early flowering "Van Thol" tulips, the segments of which are mostly scarlet with yellow edges, are derived from *T. suaveolens*, a native of the Caspian region. *T. Gesneriana*, a native of Armenia and central Russia, is the origin of some of the later flowering varieties. *T. pubescens*, which is probably a hybrid between the two species just named, is the source of some of the early flowering kinds known as Pottebakker, &c. *T. oculus-solis* and *T. Clusiana* are lovely species, natives of southern Europe, and *T. silvestris*, with elegant yellow flowers, is a doubtful native of England. More recently, owing to the exertions of Russian naturalists, a large number of new species have been discovered in Turkestan, and introduced into Europe. Some of these are very beautiful, and render it probable that by intercrossing with the older species still further difficulties will be presented in the way of identification. These difficulties are further enhanced by the fact that, quite apart from any cross-breeding, the plants, when subjected to cultivation, vary so greatly in the course of two or three years from the original species from which they are directly descended that their parentage is scarcely recognizable. This innate power of variation has enabled the florist to obtain, and ultimately to "fix," so many remarkable varieties. At the present day tulips of all kinds are much more extensively grown than at any previous period. Not only are millions of bulbs cultivated in Holland for export every year, but thousands are now also grown for the same purpose in the Channel Islands, more particularly in Guernsey. Of late years tulips have become very popular in America, and an extensive trade is now done between the U.S.A. and Europe. The enormous prices once given for rare varieties of tulip bulbs no longer obtain, though, even now, two and three guineas are asked for special bulbs. It must, how-

ever, be remembered that the "tulipomania" of the 17th century was really a form of gambling, in which admiration of the flower and interest in its culture were very secondary matters. Tulips were introduced into the Low Countries in the 16th century from Constantinople and the Levant.

The florists' varieties of tulips, which have sprung from *Tulipa Gesneriana*, are arranged in separate classes named bizarres, bybloemens and roses, according to their colour and marking. Tulips are readily raised from seeds, and the seedlings when they first flower (after about 7 years cultivation) are of one colour—that is, they are self-coloured. Judged by the florists' rules, they are either good or bad in form, and pure or stained (white or yellow) at the base, the badly formed and stained flowers are thrown away, while the good and pure are grown on, these being known as "breeder" tulips. The breeder bulbs and their offsets may grow on for years producing only self-coloured flowers, but after a time, which is varied and indefinite, some of the progeny "break," that is, produce flowers with the variegation which is so much prized. The flower is then said to be "rectified"; it is a *bizarre* when it has a yellow ground marked with purple or red, a *bybloemen* when it has a white ground marked with violet or purple, or a *rose* when it has a white ground marked with rose colour. One of the most important of the properties of a fine florists' tulip is that the cup should form, when expanded, from half to a third of a hollow ball, the six divisions of the perianth being broad at the ends, and smooth at the edges, so that the divisions may scarcely show an indentation. Another is that the ground colour should be clear and distinct, whether white or yellow. The least stain at the base of the flower, technically called the "bottom," would render a tulip comparatively valueless. What are called "feathered" flowers are those which have an even close feathering, forming an unbroken edging of colour all round, "flamed" flowers being those which have a beam or bold mark down the centre, not reaching to the bottom of the cup.

Tulips flourish in any good garden soil that has been deeply dug or trenched and manured the previous season. To secure perfect drainage and greater warmth a fair quantity of sand or grit should be present. Fresh manure should be avoided, but the remains from an old hot-bed or mushroom bed may be incorporated. The best time to plant is in September and October, the bulbs being buried about 6 in. deep and the same distance apart. The best effects are produced in formal beds by planting the same variety in each, to secure the plants being of the same height and in flower simultaneously. In mixed flower borders, mixed varieties may be planted. After planting the space between the rows of tulips may be planted with such plants as forget-me-nots, wallflowers, silenes, violas, double white arabis, polyantheses, &c., to obtain beautiful colour combinations in spring.

Propagation.—Tulips are usually increased by offsets, which most varieties produce in fairly large numbers. These are taken off and sown in drills, like seed. They are usually strong enough to flower the third year from this sowing. Some varieties produce offsets sparingly and must be increased by seed—a slow and uncertain method. New varieties are raised from seed. (The colour variation in the flowers of seedlings is discussed above.) Seeds are sown in boxes or cold frames, in light sandy soil, and the young plants are allowed to remain undisturbed until the second year. They are then lifted and treated like offsets, being sown thinly in beds out of doors. They usually flower in about the seventh year. The soil in which tulips are propagated should be sandy, free working and thoroughly drained. A warm sheltered position is a necessity.

Cultivation Out of Doors.—Planting is best effected during September, October and early November. It is usual thoroughly to dig and manure the ground in preparation. Holes 6 to 8 in. apart and 5 in. deep are then made with a dibber. Sometimes a little loose earth or sand is put in to the depth of about 1 in., and the bulbs laid singly thereon, the holes being closed by the dibber and the whole raked over. Valuable varieties are planted at about the same depth, with a trowel, a little sand being placed around them.

Unless seed is required, the young capsules should be removed as soon as the perianth has withered, to conserve the strength of the bulb. The plants should be left until the leaves have withered, unless it becomes necessary to lift them to make way for other plants. When lifted they should be laid about a week shaded in a cool dry place. The tops can then be cut off, the bulbs sorted and stored singly in trays in a cool dry place. The bulbs may be wrapped

are the most convenient. The tops should be covered with $\frac{1}{2}$ in. of soil, and about half an inch left for water. The soil should be a light and fairly rich compost, comprising about 2 parts loam, 1 part decayed manure or horse droppings that have been thoroughly sweetened, 1 part leaf mould and half a part of sand. Pot firmly, and plunge the pots in several inches of ashes out of doors, to protect the bulbs from frost. As soon as growth commences at the top and a fair amount of roots are formed they may be introduced into gentle heat, in batches according to the need and the amount of stock available. For market a slightly different method is adopted. The bulbs are placed in long shallow boxes, plunged in soil or ashes in the open air, and are later introduced as required into heat in semi-darkness, and are afterwards transferred to benches in the forcing houses where they flower. Bulbs which have been forced are of no further value for that particular purpose. If planted in borders and shrubberies, however, they will continue to bear fairly good blossoms in the open air for several seasons.

Varieties.—The following varieties are among the most useful for bedding and pot culture.

Early Single Flowering Kinds:—

Name.	Colour.	Height.
Duc van Thol	Various	6 in.
Adelaine	Rose Carmine	7 "
Artus	Dark Scarlet	8 "
Bacchus	Dark Crimson	7 "
Belle Alliance	Crimson Scarlet	8 "
Canary Bird	Yellow	10-12 "
Chrysolora	Yellow	9 "
Cottage Maid	Pink and White	12 "
Duchess de Parma	Orange Crimson	10 "
Gold Finch	Golden Yellow	12 "
Joost van Vondel	Crimson, flaked White.	9 "
Keisers Kroon	Scarlet and Yellow, superb flower	10 "
La Reine	White (when forced) and Pink.	9 "
Lac van Rhijn	Rosy Violet	9 "
Ophir d'Or	Golden Yellow	8 "
Pottbakker	Scarlet, White, Yellow vars.	12 "
Primrose Queen	Primrose.	9 "
Proserpine	Rosy Carmine, superb flower	9 "
Rose Gris de lin	White and Pink	9 "
Thomas Moore	Terra-cotta	9 "
White Hawk	Pure White	10 "
Yellow Prince	Yellow	8 "

Early Double Flowering Kinds:—

Name.	Colour.	Height.
Duc van Thol	Red, edged Yellow	6 in.
Alba Maxima	Pure White	9 "
Couronne d'Or	Yellow and Orange	9 "
Gloria Solis	Orange Crimson	9 "
Imperator rubrorum	Crimson Scarlet	9 "
La Candeur	Pure White	9 "
Leonardo da Vinci	Crimson and Gold	8 "
Toornood	Scarlet and Yellow	8 "

Late Single Flowering Kinds:—

These are tall-growing hardy kinds, suitable for herbaceous borders where they can be left undisturbed. With them may be associated what are more popularly known as "Darius" tulips, beautiful long-stemmed kinds with self colours, and the "Cottage" or "May-flowering" tulips, all easily grown in ordinary garden soil.

Colour	Name	Colour
Golden Yellow	Gesneriana	Bright Scarlet.
Orange Scarlet.	Gesneriana	
Yellow and Vermilion.	Lutea	Yellow.
Vermilion.	Picotée	White edged Pink.
Violet Crimson.	The Fawn.	Dove Colour.

Tulips.—This late flowering group is supposed to be derived from a cross between the various green and yellow striped *T. viridiflora*. The flowers are heavy and drooping, petals brightly coloured, the edges fringed and waved.

Name.	Colour
Lutea Major	Yellow, Crimson and Green
Monstre Rouge	Crimson

TULIP-TREE, *Liriodendron tulipifera* (Nat. Ord. Magnoliaceae), a North American tree of great beauty, with peculiarly four-lobed, truncate leaves and solitary tulip-like sweet-scented flowers, variegated with green, yellow and orange. It is hardy in England, but while young it requires protection from cold, cutting winds. In habit it resembles a somewhat stiff-growing plane tree, and becomes fully as large. It does not flourish in the atmosphere of towns. It thrives best in deep sandy loam, and is propagated by seeds.

TULL, JETHRO (1674-1742), English agricultural writer and farmer, was born at Basildon, Berkshire, in 1674, probably in March. He entered St John's College, Oxford, in 1691, and was called to the bar at Gray's Inn in 1699 but never practised. In that year he married and began farming on his father's land at Howberry, near Wallingford, and here about 1701 he invented and perfected his machine drill and began experiments in his new system of sowing in drills or rows sufficiently wide apart to allow for tillage by plough and hoe during almost the whole period of growth. In 1709 he moved to a farm near Hungerford and from 1711 to 1714 travelled in France and Italy, making careful observations of the methods of agriculture in those countries which aided and confirmed his theories as to the true use of manure, and the importance of "pulverizing" the soil. He did not publish any account of his agricultural experiments or theories until 1731, when his *Horse-hoeing Husbandry* appeared. This was followed by *The Horse-hoeing Husbandry, or an Essay on the Principles of Tillage and Vegetation*, by J. T., in 1733. He was attacked in the agricultural periodical *The Practical Husbandman and Farmer* and accused of plagiarizing from such earlier writers as Sir A. Fitzherbert, Sir Hugh Plat (1552-1611?), Gabriel Plattes (*J.* 1638) and John Worlidge (*J.* 1669-1698). Tull answered in various smaller works forming additions to his main work. He died on the 21st of February 1741.

Many editions of his *Horse-hoeing Husbandry* were published subsequently, and in 1822 William Cobbett edited it. It was translated into French, notably by H. L. Dubamel Dumonceau (1700-1782), the naturalist and agriculturalist, in 1753-1757 (see AGRICULTURE).

TULLAMORE, a market town and the county town of King's County, Ireland, on the Grand Canal and a branch of the Great Southern & Western railway, by which it is 58 m. W. by S. of Dublin. Pop. (1901), 4639. The town is the seat of the county assizes, has a court house and other county buildings, and is governed by an urban district council. There is considerable trade in agricultural produce, and brewing and distilling are carried on. Charleville park is a fine demesne, and there are several small ruined castles in the neighbourhood, notably Shragh Castle, dating from 1588.

TULLE, a town of central France, capital of the department of Corrèze, 58 m. S.S.E. of Limoges by rail. Pop. (1906), of the town, 11,741; of the commune, 17,245. The town extends along the narrow valley of the Corrèze, its streets here and there ascending the hill-slopes on either side by means of stairways. Tulle is the seat of a bishop. Of its 12th-century cathedral, once attached to an abbey, only the porch and nave remain, the choir and transept having been destroyed in 1793, but there is a tower of the 13th century with a fine stone steeple of the 14th century. The neighbouring cloister (12th and 13th century) has been restored. The abbot's house (15th century) has a carved doorway and well-preserved windows. Other curious old houses are to be seen in the vicinity of the cathedral. The prefecture of Tulle is a sumptuous building of 1860 surrounded by gardens. The town has tribunals of first instance and of commerce, a lycée for boys, training colleges for both sexes, a chamber of commerce and a branch of the Bank of France. Its principal industry is the manufacture of small-arms, established in 1690, and now carried on by the state under the direction of the artillery authorities. At its busiest times the factory has employed 3000 hands. The well-known cascades of Gimel formed by the Montane are near Tulle.

Tulle (*Tulda*) owed its importance in the middle ages to the abbey of St Martin, founded in the 7th or 8th century. The

abbey was raised to the rank of bishopric in 1317. The town was taken by the English in 1346 and was subsequently ravaged by the Black Death. It was again conquered by the English in 1369; but, when the inhabitants succeeded in freeing themselves, they were exempted from all imposts by Charles V. The Protestants tried in vain to seize Tulle in 1577, but were successful in 1585.

TULLE, a term restricted in England to a fine bobbin-net of silk, used for veils, scarves, millinery purposes, and trimmings of ladies' dresses, &c. The French used the word to mean all machine-made lace the basis of which is the interwisted network made on the bobbin-net machine. The word is derived from the town of Tulle in France.

TULLOCH, JOHN (1823-1886), Scottish theologian, was born at Bridge of Earn, Perthshire, in 1823, and received his university education at St Andrews and Edinburgh. In 1845 he became minister of St Paul's, Dundee, and in 1849 of Kettins, in Strathmore, where he remained for six years. In 1854 he was appointed principal of St Mary's College, St Andrews. The appointment was immediately followed by the appearance of his Burnet prize essay on *Theism*. At St Andrews, where he held also the post of professor of systematic theology and apologetics, his work as a teacher was distinguished by several features which at that time were new. He lectured on comparative religion and treated doctrine historically, as being not a fixed product but a growth. From the first he secured the attachment and admiration of his students. In 1862 he was appointed one of the clerks of the General Assembly, and from that time forward he took a leading part in the councils of the Church of Scotland. In 1878 he was chosen moderator of the Assembly. He did much to widen the national church. Two positions on which he repeatedly insisted have taken a firm hold—first, that it is of the essence of a church to be comprehensive of various views and tendencies, and that a national church especially should seek to represent all the elements of the life of the nation; secondly, that subscription to a creed can bind no one to all its details, but only to the sum and substance, or the spirit, of the symbol. For three years before his death he was convener of the church interests committee of the Church of Scotland, which had to deal with a great agitation for disestablishment. He was also deeply interested in the reorganisation of education in Scotland, both in school and university, and acted as one of the temporary board which settled the primary school system under the Education Act of 1872. He died at Torquay on the 13th of February 1886.

Tulloch's best-known works are collections of biographical sketches of the leaders of great movements in church history, such as the Reformation and Puritanism. His most important book, *Rational Theology and Christian Philosophy* (1872), is one in which the Cambridge Platonists and other leaders of dispassionate thought in the 17th century are similarly treated. He delivered the second series of the Croall lectures, on the *Doctrine of Sin*, which were afterwards published. He also published a small work, *The Christ of the Gospels and the Christ of History*, in which the views of Renan on the gospel history were dealt with; a monograph on *Pascal for Blackwood's Foreign Classics series*; and a little work, *Beginning Life*, addressed to young men, written at an earlier period. See the *Life* by Mrs Oliphant.

TULLUS HOSTILIUS, third legendary king of Rome (672-640 B.C.). His successful wars with Alba, Fidenae and Veii shadow forth the earlier conquests of Latian territory and the first extension of the Roman domain beyond the walls of Rome. It was during his reign that the combat between the Horatii and Curiatii, the representatives of Rome and Alba, took place. He is said to have been struck dead by lightning as the punishment of his pride.

Tullus Hostilius is simply the duplicate of Romulus. Both are brought up among shepherds, carry on war against Fidenae and Veii, double the number of citizens, organize the army, and disappear from earth in a storm. As Romulus and Numa represent the Ramnes and Titians, so, in order to complete the list of the four traditional elements of the nation, Tullus was made the representative of the Luceres, and Ancus the founder of the Plebs. The distinctive event of this reign is the destruc-

tion of Alba, which may be regarded as an historical fact. But when and by whom it was destroyed is uncertain—probably at a later date, by the Latins, and not by the Romans, who would have regarded as impious the destruction of their traditional mother-country.

See Livy i. 22-31; Dion. Halic. iii. 1-35; Cicero, *de Republica*, ii. 17. For a critical examination of the story see Schwieger, *Römische Geschichte*, bk. xii.; Sir G. Cornewall Lewis, *Credibility of early Roman History*, ch. 11; W. Ihne, *Hist. of Rome*, vol. i.; E. Pais, *Storia di Roma*, vol. i. (1898); O. TULSA, a city (and co-extensive township) and the county-seat of Tulsa county, Oklahoma, U.S.A., on the Arkansas river, about 110 m. N.E. of Guthrie. Pop. (1900), 1390; (1907), 7298 (638 negroes); (1910) 18,182. Tulsa is served by the Atchison, Topeka & Santa Fé, the St. Louis & San Francisco, the Midland Valley, the Missouri, Kansas & Texas, and the Arkansas Valley & Western railways. The city is situated on the old boundary line between Indian Territory and Oklahoma Territory, where the boundaries of the Cherokee, Creek and Osage nations intersected. It is on an elevation from the rolling prairie, which commands a fine view over the valley of the Arkansas. Tulsa is the seat of Henry Kendall College (Presbyterian, 1894), removed hither from Muskogee in 1907; it was named in honour of Henry Kendall (1815-1892), who from 1861 until his death was secretary of the board of Home Missions of the Presbyterian Church. The city is a trading centre for a rich oil, gas and coal region and a grain, cotton and live-stock-country. Natural gas is used for manufacturing purposes; among the manufactures are glass and cotton-seed oil products. Tulsa was founded in 1887, was first chartered as a city in 1902, and in 1908 adopted a commission form of government.

TULSĪ DĀS (1532-1623), the greatest and most famous of Hindi poets, was a Sarwariyā Brahman, born, according to tradition, in A.D. 1532, during the reign of Humāyūn, most probably at Rājāpur in the Bāndā District south of the Jumna. His father's name was Ātmā Rām Sukal Dubē; that of his mother is said to have been Hulāsī. A legend relates that, having been born under an unlucky conjunction of the stars, he was abandoned in infancy by his parents, and was adopted by a wandering *sādhū* or ascetic, with whom he visited many holy places in the length and breadth of India; and the story is in part supported by passages in his poems. He studied, apparently after having rejoined his family, at Sūkarkhēt, a place generally identified with Sorōn in the Etāh district of the United Provinces, but more probably the same as Varāhakhshētra¹ on the Gogra River, 30 m. W. of Ajōdhya (Ayōdhya). He married in his father's lifetime, and begat a son. His wife's name was Ratnāwālī, daughter of Dinabandhu Pāthak, and his son's Tārak. The latter died at an early age, and Tulsī's wife, who was devoted to the worship of Rāma, left her husband and returned to her father's house to occupy herself with religion. Tulsī Dās followed her, and endeavoured to induce her to return to him, but in vain; she reproached him (in verses which have been preserved) with want of faith in Rāma, and so moved him that he renounced the world, and entered upon an ascetic life, much of which was spent in wandering as a preacher of the necessity of a loving faith in Rāma. He first made Ajōdhya (the capital of Rāma and near the modern Fyzābād) his headquarters, frequently visiting distant places of pilgrimage in different parts of India. During his residence at Ajōdhya the Lord Rāma is said to have appeared to him in a dream, and to have commanded him to write a *Rāmāyana* in the language used by the common people. He began this work in the year 1574, and had finished the third book (*Aranya-kāṇḍ*), when differences with the Vairagi Vaidyanavās at Ajōdhya, to whom he had attached himself, led him to migrate to Meerut, where he settled at Ashrāfi. There he died

¹ This is the view of Ballalath Dās. At Sorōn the name is Varāhakhshētra. See Ballalath Dās.

In 1623, during the reign of the emperor Jahāngir, at the great age of 91.

The period of his greatest activity as an author synchronized with the latter half of the reign of Akbar (1556-1605), and the first portion of that of Jahāngir, his dated works being as follows: commencement of the *Rāmāyan*, 1574; *Rām-satsai*, 1584; *Pārbat-māngal*, 1586; *Rāmāgyā*, 1598; *Kābilā Rāmāyan*, between 1612 and 1614. A deed of arbitration in his hand, dated 1612, relating to the settlement of a dispute between the sons of a land-owner named Tōḍar, who possessed some villages adjacent to Benares, has been preserved, and is reproduced in facsimile in Dr Grierson's *Modern Vernacular Literature of Hindustan*, p. 51. Tōḍar (who was not, as formerly supposed, Akbar's finance minister, the celebrated Rāja Tōḍar Mall) was his attached friend, and a beautiful and pathetic poem² by Tulsi on his death is extant. He is said to have been resorted to, as a venerated teacher, by Mahārāja Mān Singh of Jaipur (d. 1618), his brother Jagat Singh, and other powerful princes; and it appears to be certain that his great fame and influence as a religious leader, which remain pre-eminent to this day, were fully established during his lifetime.

Tulsi's great poem, popularly called *Tulsi-kṛit Rāmāyan*, but named by its author *Rām-charit-mānas*, "the Lake of Rāma's deeds," is perhaps better known among Hindūs in upper India than the Bible among the rustic population in England. Its verses are everywhere, in this region, popular proverbs; an apt quotation from them by a stranger has an immediate effect in producing interest and confidence in the hearers. As with the Bible and Shakespeare, his phrases have passed into the common speech, and are used by every one (even in Urdu) without being conscious of their origin. Not only are his sayings proverbial; his doctrine actually forms the most powerful religious influence in present-day Hinduism; and, though he founded no school and was never known as a guru or master, but professed himself the humble follower of his teacher, Nārhari-Dās,³ from whom as a boy in Sūkar-khet he heard the tale of Rāma's doings, he is everywhere accepted as an inspired and authoritative guide in religion and conduct of life.

The poem is a rehandling of the great theme of Vālmīki, but is in no sense a translation of the Sanskrit epic. The succession of events is of course generally the same, but the treatment is entirely different. The episodes introduced in the course of the story are for the most part dissimilar. Wherever Vālmīki has condensed, Tulsi Dās has expanded, and wherever the elder poet has lingered longest, there his successor has hastened on most rapidly. It consists of seven books, of which the first two, entitled "Childhood" (*Bāl-kāṇḍ*) and "Ayōdhyā" (*Ayōdhya-kāṇḍ*), make up more than half the work. The second book is that most admired. The tale tells of King Dasarath's court, the birth and boyhood of Rāma and his brethren, his marriage with Sitā, daughter of Janak king of Videha, his voluntary exile, the result of Kaikeyī's guile and Dasarath's rash vow, the dwelling together of Rāma and Sitā in the great central Indian forest, her abduction by Rāvan, the expedition to Lankā and the overthrow of the ravisher, and the life at Ajōdhyā after the return of the reunited pair. It is written in pure Baiswārī or Eastern Hindi, in stanzas called *chāupāis*, broken by *dōhās* or couplets, with an occasional *śorāṭhā* and *chhand*—the latter a hurrying metre of many rhymes and alliterations. Dr Grierson well describes its movement:

"As a work of art, it has for European readers prolixities and episodes which grate against occidental tastes, but no one can read it in the original without being impressed by it as the work of a great genius. Its style varies with each subject. There is the deep pathos of the scene in which is described Rāma's farewell to his mother; the rugged language depicting the horrors of the battlefield—a torrent of harsh sounds clashing against each other and reverberating from phrase to phrase; and, as occasion requires, a contentious, apologetic method of narrative, teeming with similes drawn from nature here and not from the traditions of the schools. His characters, too, live and move with all the dignity of an heroic age. Each is a real being, with a well-defined personality. Rāma, perhaps too perfect to elicit all our sympathies; his impetuous and headstrong brother Lakṣmaṇ; the tender, constant Bharat; Sitā, the ideal Indian wife and mother; Rāvan, destined to failure, and fighting with all his demon force against his destiny—the Satan of the East—these are characters as lifelike and distinct as any in the history of literature."

The *Āyōdhya-kāṇḍ* is said to be in the poet's own hand. He was born in Bānda, his reputed birthplace. One of his poems, dated January 1623, is dated ten years before the poet's

death, and carefully corrected, it is alleged by Tulsi Dās himself, as at Ajōdhyā. Another autograph is reported to be preserved at Mainihārd in the Lucknow district, but has not so far as known, been seen by a European. Other ancient MSS. are to be found at Benares, and the materials for a correct text of the *Rāmāyan* are thus available. Good editions have been published by the *Khaḍga Bāis* press at Bānkipur (with a valuable life of the poet by Baijnāth Dās), and by the *Nāgarī Prachārīni Sabhā* at Allahabad (1909). The ordinary bāzār copies of the poem, repeatedly reproduced by lithography, teem with interpolations and variations from the poet's language. An excellent translation of the whole into English was made by the late Mr F. S. Growse, of the Indian Civil Service (5th edition, Cawnpore, 1891).

Besides the "*Lake of Rāma's deeds*," Tulsi Dās was the author of five longer and six shorter works, most of them dealing with the theme of Rāma, his doings, and devotion to him. The former are (1) the *Dōhābālī*, consisting of 573 miscellaneous *dōhā* and *śorāṭhā* verses; of this there is a duplicate in the *Rām-satsai*, an arrangement of seven centuries of verses, the great majority of which occur also in the *Dōhābālī* and in other works of Tulsi; (2) the *Kābilā Rāmāyan* or *Kābilābālī*, which is a history of Rāma in the *hablīlā*, *ghāṇākhari*, *chāpāṭī* and *sawāiyā* metres; like the *Rām-charit-mānas*, it is divided into seven *kāṇḍ*s or cantos, and is devoted to setting forth the majestic side of Rāma's character; (3) the *Gū-Rāmāyan*, or *Gūṭābālī*, also in seven *kāṇḍ*s, aiming at the illustration of the tender aspect of the Lord's life; the metres are adapted for singing; (4) the *Kṛishṇāvat* or *Kṛishṇa gītābālī*, a collection of 61 songs in honour of Kṛishṇa in the Kanauj dialect; the authenticity of this is doubtful; and (5) the *Binay Patricā*, "Book of petitions," a series of hymns and prayers of which the first 43 are addressed to the lower gods, forming Rāma's court and attendants, and the remainder, Nos. 44 to 279, to Rāma himself. Of the smaller compositions the most interesting is the *Vairāgya Saṅgṛah*, or "Kindling of continence," a poem describing the nature and greatness of a holy man, and the true peace to which he attains. This work has been translated by Dr Grierson in the *Indian Antiquary*, xxii, 198-201.

Tulsi's doctrine is derived from Rāmānuja through Rāmānand. Like the former, he believes in a supreme personal God, possessing all gracious qualities (*śaguna*), not in the quality-less (*nirguna*) neuter impersonal *Brahman* of Sankarāchārya; this Lord Himself once took the human form, and became incarnate, for the blessing of mankind, as Rāma. The body is therefore to be honoured, not despised. The Lord is to be approached by *śūkh* (*bhakti*)—disinterested devotion and surrender of self in perfect love, and all actions are to be purified of self-interest in contemplation of Him. "Show love to all creatures, and thou wilt be happy; for when thou lovest all things, thou lovest the Lord, for He is all in all." The soul is from the Lord, and is submitted in this life to the bondage of works (*karma*); "Mankind, in their obstinacy, keep binding themselves in the net of actions, and though they know and hear of the bliss of those who have faith in the Lord, they attempt not the only means of release. Works are a spider's thread, up and down which the soul travels, and which is never broken; so works lead a soul downwards to the Earth, and upwards to the Lord." The bliss to which the soul attains, by the extinction of desire, in the supreme home, is not absorption in the Lord, but union with Him in abiding individuality. This is emancipation (*mukhā*) from the burthen of birth and rebirth, and the highest happiness.⁴

Tulsi, as a *Smārta Vaiṣṇava* and a Brahman, venerates the whole Hindu pantheon, and is especially careful to give Siva or Mahādevī, the special deity of the Brahmins, his due, and to point out that there is no inconsistency between devotion to Rāma and attachment to Siva (*Rāmāyan*, *Lankākāṇḍ*, *Dōhā* 3). But the practical end of all his writings is to inculcate *bhakti* addressed to Rāma as the great means of salvation—emancipation from the chain of births and deaths—a salvation which is as free and open to men of the lowest caste as to Brahmins.

The best account of Tulsi Dās and his works is contained in the papers contributed by Dr Grierson to vol. xxii, of the *Indian Antiquary* (1893). In Mr Growse's translation of the *Rām-charit-mānas* will be found the text and translation of the passages in the *Bhakti-mālā* of Nābhāji and its commentary, which are the main original authority for the traditions relating to the poet. Nābhāji had himself met Tulsi Dās; but the stanza in praise of the poet gives no facts relating to his life; these are stated in the *śikā* or gloss of Priyā Dās, who wrote in A.D. 1712, and much of the material is legendary and untrustworthy. Unfortunately, the biography of the poet, called *Gōṣāi-charitra*, by Bēnīmādhav Dās, who was a personal follower and constant companion of the Master, and died in 1642, has disappeared, and no copy of it is known to exist. In the introduction to the edition of the *Rāmāyan* by the *Nāgarī Prachārīni Sabhā* all the known facts of Tulsi's life are brought together and critically discussed. For an exposition of his religious position,

² The summary given above is condensed from the translation by Dr Grierson, at pp. 227-236 of the *Indian Antiquary*, vol. xxii, of the fifth *arga* of the *Satsai*, in which work Tulsi unfolds his system of doctrine.

and this place in the popular religion of northern India, see Dr Grierson's paper in the *Journal of the Royal Asiatic Society*, July 1903, pp. 447-466.

TULU, or **TULUVA**, a language of the Dravidian family, found chiefly in the South Kanara district of Madras. It has no literature, nor has it been adopted for official use even where it is spoken by the majority of the population. In 1901 the total number of speakers of Tulu exceeded half a million.

TUMBLER, that which "tumbles," i.e. falls or rolls over or down. The O. Eng. *lumbiare*, of which Mid. Eng. *tumbler* is a frequentative form, appears also in Du. *lumelen*, Ger. *taumeln*, to stagger, tumble about; Fr. *tomber*, to fall, is Teutonic in origin. As applied to a person, "tumbler" is another word for an acrobat; one who shows his agility by turning somersaults, standing on his head, walking or dancing on his hands, &c. It is interesting to note that Herodias' daughter Salome is described as a *tumbler* in Harl. MS., 1701, f. 8, quoted by Halliwell (*Dict. of Archæic Words*), and in the margin of Wycliffe's Bible (Matt. xiv. 6) *tumbide* is given as a variant of daunside (danced). Similarly, in early pictures of her dancing before Herod, she is represented sometimes as standing on her head. The common drinking-glass known as a "tumbler," which now is the name given to a plain cylindrical glass without a stem or foot, was originally a glass with a rounded or pointed base, which could only stand on being emptied and inverted (see **DRINKING VESSELS**, Plate I, fig. 3).

TUMBLE-WEED, a botanical term for a plant which breaks loose when dry, and is blown about, scattering its seeds by the way.

TUMKUR, or **TOOMKOOR**, a town and district of southern India, in the west of Mysore state. The town has a station on the Madras & Southern Mahratta railway, 43 m. N.W. from Bangalore. The area of the district is 4158 sq. m. It consists chiefly of elevated land intersected by river valleys. A range of hills rising to nearly 4000 feet crosses it from north to south, forming the waterparting between the systems of the Krishna and the Cauvery. The principal streams are the Jayamangala and the Shimsha. The mineral wealth of Tumkur is considerable; iron is obtained in large quantities from the hill-sides; and excellent building-stone is quarried. The slopes of the Devaray-durga hills, a tract of 18 sq. m., are clothed with forests, in which large game abounds, including tigers, leopards, bears and wild hog. The climate of Tumkur is equable and healthy; the annual rainfall averages 39 in.

The population in 1901 was 679,162, showing an increase of 17% in the decade. The cultivated products consist chiefly of millets, rice, pulses and oil seeds. The chief industries are the making of coarse cotton cloths, woollen blankets and ropes.

TUMMEL, a river of Perthshire, Scotland. Discharging from Loch Rannoch, it flows eastward to a point near the Falls of Tummel, where it bends to the S.E., a direction which it maintains until it falls into the Tay, just below Logierait, after a course of 58 m. from its source in Stob Ghabhar (3565 ft.). Its only considerable affluent is the Garry, 24 m. long, an impetuous river which issues from Loch Garry (2½ m. long, ¼ m. wide, and 1334 ft. above the sea). About midway in its course the Tummel expands into Loch Tummel (2½ m. long, ¼ m. wide, 128 ft. deep, and 500 ft. above the sea), between which and the confluence with the Garry occur the Pass and Falls of the Tummel, which are rather in the nature of rapids, the descent altogether amounting to 15 ft. The scenery throughout this reach is most picturesque, culminating at the point above the eastern extremity of the loch, known as Queen Victoria's View. The chief places of interest on the river are Kinloch Rannoch; Dunastair, a rocky hill in well-wooded grounds, the embellishment of which was largely due to Alexander Robertson of Struan (1690-1740), the Jacobite and poet, from whom the spot takes its name ("the stronghold of Alexander"); Foss; Faskally House (beautifully situated on the left bank); Pitlochry; and Ballinluig.

TUMOUR (Lat. *tumor*, a swelling), a term applied, from the earliest period of medical literature, to any swelling of which

the nature and origin were unknown. Thus used in its most literal sense, the word is of purely clinical derivation and has no pathological significance of any kind. Consequently a very heterogeneous collection of swellings have been described as tumours, including such diverse conditions as an abscess, a tubercular gland, the enlarged spleen of malaria or a cancer. With the progress of bacteriology and the improved technique of histology it has been found possible, however, to separate these various "swellings" into certain groups: (1) *Inflammatory or Infective Tumours*; (2) *Tumours due to Hypertrophy*; (3) *Cysts*; (4) *Spontaneous Tumours, or Tumours proper*. The tendency of modern convention is to restrict the use of the term "tumour" to the last group, but for the sake of completeness it is necessary to touch briefly on the distinguishing features of the first three groups.

1. *Inflammatory or Infective Tumours*.—These have certain characteristics which separate them sharply from other classes of tumour. In the first place all of them are due to the irritative action of some micro-organism (see **PATHOLOGY**). Inflammation due to microbial action always follows a typical course. First, a number of wandering cells derived from the blood, the lymph or the connective tissues make their way to the site of irritation, and thus produce the red, painful swelling with which every one is familiar. A struggle now ensues between these cells and the invading bacteria; if the victory rests with the former, the inflammation gradually subsides, and the swelling disappears in course of time. But if the bacteria gain the upper hand a number of the cells are killed, undergo liquefaction and are converted into pus, so that an abscess results. Thus an inflammatory swelling may be solid or fluid according to the severity of the irritant. The common inflammatory bacteria—staphylococcus and streptococcus—cause suppuration in the majority of cases, but there are a few organisms such as streptothrix, spirochaeta pallida, and in many instances the tubercle bacillus, which set up an inflammation of an extremely chronic type, rarely progressing to the formation of pus, but leading rather to the development of a hard, solid mass of very slow growth, that may persist for months or even years.

To the naked eye these solid inflammatory swellings may closely simulate the spontaneous tumours with which they have been often confused, but a microscopical examination will correct the mistake in nearly every case. For the minute structure of the infective tumours, whatever their situation, is almost identical; they consist merely of an irregular collection of inflammatory cells; and this of itself is sufficient to mark them off quite distinctly from the group of tumours proper, which, as will presently be seen, vary widely in structure according to the tissue from which they spring, and show a resemblance to the parent type at once characteristic and peculiar. To this statement there is one exception, for a form of malignant tumour, known as a sarcoma, may bear a very deceptive likeness to an inflammatory swelling.

2. *Hypertrophic Tumours*.—A tissue or organ is said to be hypertrophied when it is increased in size but remains normal in structure. The most familiar example is the hypertrophy of the skeletal muscles that follows increased use, or the hypertrophy of the heart muscle which helps to compensate the faulty action of the valves. But neither of these constitutes a hypertrophic tumour. For an instance of this we must turn to the enlargement of the spleen that occurs in malaria and certain forms of anaemia, of the thyroid gland in goitre, and of the lymphatic glands in Hodgkin's disease. In each of these conditions there is merely an increase of apparently normal tissue, and from a microscopical examination of the hypertrophied organ it would be impossible to say that it was other than healthy.

The enlargement of the spleen and of the thyroid in these cases are overshadowed by certain changes in the blood and in the nervous system which constitute a distinct disease; but in Hodgkin's disease there are no specific symptoms apart from the swelling of the glands, and it has been suggested that this may be due either to the action of some micro-organism which has hitherto escaped detection, or to a widely diffused growth of a sarcomatous type. If the former supposition be correct these glandular swellings must be classed with the infective tumours; if the latter they should be regarded as spontaneous tumours. There is, at present, no agreement on this point, and they have, therefore, been described here as hypertrophic tumours.

3. *Cysts*.—A cyst may be defined as a collection of fluid surrounded by a wall or capsule. The nature of the fluid varies according to the site and origin of the cyst; the cyst-wall is usually composed of a tough layer of fibrous tissue. Cases arise by the dilatation of a pre-existing space with fluid; and when, as often happens, the cyst-wall is tenely stretched by the pressure of the fluid within, they may easily be mistaken for solid tumours.

The number and variety of cysts are very great, and they, as mentioned here on account of the errors in diagnosis, are often responsible. For further data on this subject see the special treatise.

4. *Spontaneous Tumours, or Tumours Proper* (synonymis: *Neoplasms, New Growth*).—The following definition of a spontaneous tumour suggested by Ziegler is perhaps the most satisfactory: "A neoplasm or tumour is a new formation of tissue, which is atypical in structure, serves no useful purpose to the whole economy, and the growth of which has no typical termination." In this definition the words "new formation of tissue" exclude the cystic swellings; the attribute "atypical in structure" excludes hypertrophies; and the final clause "the growth of which has no typical termination" excludes all swellings of an inflammatory nature which progress, however slowly, towards either suppuration or resolution and recovery.

These tumours arise by the exaggerated and abnormal proliferation of a single cell, or a group of cells. They increase in size solely by the multiplication of their own cells, and the only contribution which the surrounding tissues make to the progress is the formation of a "stroma," or supporting framework of fibrous tissue; and even that is wanting in many cases. Inasmuch as the newly-formed cells of the tumour take on the likeness of the parent from which they are sprung, it follows that the minute structure of such a tumour, whatever its situation, will be a more or less exact copy of that of the tissue whence it originated. A tumour growing from the skin will therefore imitate the cell-structure of the normal skin; the resemblance of a breast tumour to the healthy breast is often so close as to make it a hard task to distinguish the one from the other; whilst the similarity of bony and cartilaginous tumours to true bone and cartilage is evident to all.

This imitation of the parent type by the spontaneous tumours is one of their most remarkable characteristics, and provides a reliable criterion by which they may be separated from the inflammatory new growths, which are all built up on the same general plan. Consequently it is almost always possible to determine the origin of a tumour from an examination of its histological appearances; and conversely we know that an epithelial tumour will never spring from a connective tissue nor a connective tissue tumour from an epithelium.

Another outstanding feature of the neoplastic tumours is that they lead an entirely independent existence subject to none of the restraints to which the normal cell must needs submit. These normal cells are, indeed, possessed of certain limited powers of multiplication, by which they are enabled to replace the slight loss of tissue which the wear and tear of life perpetually entails; or, again, they can on occasion make good a greater loss of substance, as in the healing of an ulcer, or the regeneration of a skin wound. But these powers are confined within certain well-marked bounds, which may not be transgressed. Contrast with this the tumour cell, emancipated from all control and owing to no restraint. It is true that the simple tumours often remain stationary after attaining a certain size, but the general tendency of all tumours is towards persistent and unlimited growth, and the cancer cell continues its career unchecked by everything save death.

The spontaneous tumours are seen in every tissue and organ of the body, though in some they are relatively infrequent. Nor are they confined to man, for they have been found throughout the vertebrate kingdom. It is often stated that a higher state of civilization has inflicted on European races a greater susceptibility to tumour formation. As to this, reliable evidence is hard to obtain, but such a statement would seem to be only partially true, and the apparent immunity of certain native races is to some extent due to lack of sufficient observations.

It is usual to separate these tumours into two groups: the *Non-malignant, Innocent or Benign*, and the *Malignant or Cancerous*. Of these two groups the latter are the more familiar and have attracted much more attention and study than the former, on account of the danger to life which they involve, but in point of numbers they are greatly outweighed by the first group. Two or more non-malignant tumours, of the same or different varieties, are often found in the same individual; but with the cancers this is a rare occurrence, and such growths are usually single.

The *non-malignant tumours* are usually rounded in shape. In size they vary enormously; a fibroid tumour may be as small as a pea; a fatty tumour may weigh forty pounds. Often they cease growing after attaining a certain size, but there are very many exceptions to this, and it is seldom possible to predict the subsequent course of one of these growths. They possess, however, four constant characteristics by which they may be distinguished from the malignant variety.

1. A *non-malignant tumour*, whatever its size, remains localized to the part from which it originates. It is not an "infiltrating" growth, that is to say it does not eat its way into the surrounding tissues, but rather pushes them aside, and may be called "expansive."

Moreover, it is separated from them by a thin but usually well-defined layer of fibrous tissue known as the "capsule" of the tumour, and formed as the result of a slight inflammation that has taken place among the cells of the stroma as a protest on the part of the surrounding tissues against the presence of the dangerous to

death, when situated in some sensitive or delicate organ. For instance, a small tumour may cause intense pain by pressing on a nerve, or dropsical swelling of a limb by obstructing a vein, or death from suffocation by blocking the larynx. Nevertheless it remains true that any evil effects are due not to the nature of the tumour, but to its situation, whereas a cancer causes death whatever its position.

3. These tumours never reproduce themselves in distant parts of the body. More than one may be present in the same individual, but each arises independently, and the widespread dissemination so typical of a cancerous growth is never seen.

4. An innocent growth never recurs after operation. The boundaries of the growth are so well defined that complete removal is usually easy, and the operation is a simple and satisfactory proceeding.

Malignant Tumours, or Cancers.—There are two varieties of malignant tumour: the *Sarcomata*, arising from the connective tissues; the *Carcinomata*, arising from epithelial tissues. It is customary to describe them both as cancers. The main features of these tumours are as follows:—

1. *The Infiltrating Nature of a Malignant Tumour.*—A cancer follows a course very different from that of an innocent tumour. Its growth has no appointed termination, but continues with unabated vigour until death; moreover, it is more rapid than that of the innocent tumours, and so does not permit of the formation of a capsule by the neighbouring tissues. In consequence such a tumour shows no well-defined boundary, but from its margin fine tendrils of cancer cells make their way in all directions into the surrounding parts, which gradually become more and more involved in the process. Thus a cancer of the breast will attack both the skin covering it and the underlying muscle and bone; a cancer of the intestine will eat its way into the liver, spleen and kidney, until these organs become to a great extent replaced by cancer cells, and can no longer perform their proper functions.

2. *Formation of Secondary Growths, or Metastases.*—In addition to this spread of growth by direct extension, another characteristic of malignant tumours is a tendency to dissemination, that is, to reproduce themselves in various parts of the body far removed from the original site; so that it is not unusual to find after death that a cancer of the breast has given rise to secondary, or metastatic, deposits in the lymphatic glands, the lungs, the ribs and other bones, the brain and the abdominal organs. These secondary deposits are due to the tumour cells making their way through the walls of the small lymph and blood vessels and becoming detached by the force of the circulation, by which they are carried to some distant part of the body, there to continue their career of uncontrolled growth.

The sarcomata and carcinomata differ somewhat as regards the path of dissemination. The former are vascular tumours, well supplied with blood-vessels; consequently dissemination usually occurs by way of the blood-stream rather than by the lymphatic circulation, and the commonest site for the secondary deposits of sarcoma is the lung. The carcinomata are less vascular, and the tendency of the growth is to invade the small lymph channels; so that the first signs of metastases are to be looked for in the lymphatic glands; at a later date these deposits may be spread throughout the body, particularly in the liver and other abdominal organs, the lungs and the bones.

The formation of metastases is of the utmost importance from a clinical point of view, as the success of an operation depends on the removal of all the secondary deposits as well as of the original growth. For instance, a few months after the first appearance of a cancer of the breast the axillary lymph glands will be found to be hard and enlarged. This means that some of the cells of the primary growth have been carried in the lymph stream to these glands, and have begun to grow there; consequently any operation for the removal of the cancer of the breast must include the removal of these glands. If the breast tumour only be taken away the growth will continue unchecked in the glands. It is a matter of great difficulty to determine by the naked eye or the touch whether a gland is infected or not. In many cases where there is no evident enlargement the microscope will show the presence of cancer cells; and a certain opinion can only be given after a microscopic examination.

In operations for cancer of the breast or tongue the modern practice is to regard the lymphatic glands of the axilla or neck respectively as infected in every case, however early it be, and to remove them accordingly. In other parts of the body where the glands are inaccessible, the only solution of the difficulty is to urge the removal of the tumour at the earliest possible moment, before lymphatic infection has had time to occur.

The frequency and rapidity of metastasis formation varies greatly. As a general rule cancer of the breast is more liable than other forms of growth to be followed by widespread secondary deposits. On the other hand, in cases of cancer of the skin secondary infection is usually confined to the neighbouring lymphatic glands, and seldom occurs in any of the internal organs.

3. *Termination of Malignant Tumours.*—In one or two well authenticated cases a malignant tumour has disappeared of its

own accord without any treatment, and a natural cure may be said to have occurred. But these form such an infinitesimal proportion of the whole that they do not affect the general truth of the statement that the universal tendency of a malignant tumour is to cause death.

Although the separation of the new growths into two groups is supported by certain fairly definite characteristics, both clinical and histological, yet it seems likely that the difference between them is one of degree rather than of kind. There is every reason to believe that the same perverted impulse may give rise either to an innocent or a cancerous growth, the issue depending in part on the intensity of the impulse, and in part on the resisting powers of the tissues in which the incipient tumour cells lie. Such a hypothesis is supported by the analogy of the microbial infections, where the final outcome of life or death depends no less on the defensive mechanism of the individual than on the virulence of the infecting organism. Again, it is beyond doubt that occasionally a tumour, which for years has been void of the least taint of malignancy, may become converted into an active cancer. Moreover, certain tumours seem to lie on the border line, for example, rodent ulcers and cancers of the parotid gland. These are malignant in that they are undoubtedly infiltrating tumours, they are innocent in that they never form metastatic deposits. Therefore it seems that malignancy or the reverse is not to be regarded as an absolute and constant attribute of any particular tumour or class of tumours, but rather as an expression of the balance struck in the conflict between the opposing forces of the tumour and its host.

Histology of Tumours.—On examining a microscopical preparation of an epithelial tumour it is found to be built up of two distinct elements. There are the epithelial cells, which form the essential part of the tumour; there is a network of fibrous connective-tissue cells, which acts as a supporting framework to the epithelial elements, and is known as the stroma of the tumour. This twofold structure is seen in all the epithelial tumours, both non-malignant and malignant, and in the case of the latter it is a general rule that the greater the proportion of epithelial to connective-tissue elements the faster will the tumour grow. On the other hand in the connective-tissue tumours (with the exception of the sarcoma) this compound structure is absent and there is only one type of cell present; thus a fatty tumour consists merely of fat cells; a bony tumour of bone cells, and so on.

To understand clearly the differences and likenesses that obtain between the malignant and the non-malignant new growths it is necessary to compare the histology of the two groups.

Figs. 1a, 1b represent an innocent tumour (adenoma) of the breast. Figs. 2a, 2b a cancer (spheroidal-celled carcinoma) of the breast. Fig. 3 an innocent tumour (papilloma) of the skin. Fig. 4 a cancer of the skin.

FIG. 1a.—Diagram to show the relations of an innocent tumour (adenoma) of the breast.

a, Tumour; b, normal breast tissue; c, underlying muscular tissue.

FIG. 1b.—Microscopical appearances of an adenoma of the breast. (Drawn from an actual specimen.)

a, Tumour cells; b, fibrous connective tissue.

In the adenoma the individual cells bear the closest resemblance to the glandular cells of the normal breast from which they are derived. In addition they tend to follow the normal very closely in their arrangement, so that at times it is possible to

decide which is tumour and which is healthy breast substance. Finally the growth is surrounded by a well defined capsule of fibrous tissue.

FIG. 2a.—Diagram to show the relations of a malignant tumour (spheroidal cell carcinoma) of the breast. Note the indrawing of the nipple by the growth and the infiltration of the underlying muscle.

a, Tumour; b, normal breast tissue; c, muscle.

FIG. 2b.—Microscopical appearances of a carcinoma of the breast. (Drawn from an actual specimen.)

a, Tumour cells; b, stroma.

In the carcinoma, the individual resemblance is present, though less conspicuous, as many of the cells are irregular in size and shape. But the similarity of the arrangement is very hard to make out or even absent. The cells are arranged in disorderly masses; they are not enclosed by any semblance of a capsule, but tend to transgress their proper boundaries and invade the underlying muscles. Figs. 3 and 4 show analogous changes in an innocent and in a malignant tumour of the skin.

FIG. 3.—Non-malignant tumour (papilloma) of the skin. The tumour is formed by an outward proliferation of the cells of the epidermis, but these cells show no tendency to invade the underlying connective tissue or muscle. (Semidiagrammatic.)

a, Normal skin. d, Muscular tissue.
b, Epithelium or epidermis. c, Papilloma.
c, Connective tissue.

Speaking generally it may be said that the cells of an adenoma are fully differentiated and typical of the normal, whereas the cells of a carcinoma show less perfect differentiation, are in some degree atypical and resemble rather the actively growing cells found at an early stage of embryonic life. But it is in the cells of a sarcoma that the widest departure from type is seen. A sarcoma is a malignant growth arising from connective tissue, but the resemblance to adult

connective tissue is almost non-existent and the cells are essentially of an embryonic type. These differences between the innocent and the malignant cell bear out the well-established physiological rule that the less the functional development of a cell or tissue the greater its power of growth. The primitive impulse is growth, which gives place at a later stage to the development of function.

FIG. 4.—Malignant tumour (epithelioma, squamous-celled carcinoma) of the skin. The cells of the epidermis have proliferated both outwardly and inwardly and have invaded and replaced the underlying tissues. An ulcer has been formed on the surface by the necrosis of the superficial cells. (Semi-diagrammatic.)

In theory it is always possible to distinguish with certainty between an innocent tumour and a cancer by means of the microscope. In practice this is, unfortunately, not the case. There are some tumours whose histological appearances seem to be on the borderline between the two conditions, and often these are the very cases in which the clinical features give no direct clue to their nature. In such circumstances it is only by taking into consideration every detail, both clinical and pathological, that an opinion can be formulated, and even then it remains to some extent a matter of guess-work.

The Causation of Tumours.—An enormous number of suggestions as to the causation of tumours have been put forward from time to time. Many of these were at the outset quite untenable, and reference can only be made here to the more important.

First in point of time came *Virchow's hypothesis* that tumours arise as the direct result of irritation or injury. Many examples of such a sequence of events are familiar to everybody. A cancer of the lip or tongue will often follow the irritation of a clay pipe or a jagged tooth; a tumour of the breast is often attributed to a blow. But, on the other hand, there must be innumerable instances in which such a cause of irritation has not been followed by a tumour; and it is necessary to discount the natural anxiety of mankind to seek a cause for every unexplained occurrence, so that a slight injury which under ordinary circumstances would be forgotten is branded as the undoubted cause of any tumour that may subsequently make its appearance. As a complete explanation *Virchow's hypothesis* is insufficient, but it is quite probable that irritation may have an accessory or predisposing influence in tumour formation, and that it may be enough finally to upset the balance of a group of cells, which for some other reason were already hovering on the brink of abnormal growth.

There is one peculiar form or irritation that demands special attention, that is exposure to the X rays. It is beyond doubt that exposure to these rays will cause cancerous ulceration of the skin; though what is the constituent of the rays that produces this effect is not known. Fortunately the danger can be obviated by the use of rubber gloves.

Cohnheim's Hypothesis of Embryonic Remnants.—According to *Cohnheim* more cells are produced in embryonic life than are required for the development of the body, and a remnant is left unappropriated. Owing to their embryonic nature, these cells possess an exaggerated power of proliferation, and if at a later period of life this should be roused into activity by some mechanical or other form of stimulus, their rate of growth will outstrip that of the adult cells, and a tumour will develop. As with *Virchow's* so with *Cohnheim's hypothesis*. It is at best only a partial explanation which may be applicable to a small proportion of tumours; and it could never account for X-ray cancer, or the inoculability of mouse cancer.

The *Parasitic hypothesis* is still a matter of keen debate. In some degree cancer with its localized primary growth and widespread secondary deposits resembles certain infective diseases of microbial origin, such as pyaemia, where from a small primary site of infection the bacteria become disseminated throughout the body. From this analogy it was argued that tumour formation was due to the activity

of some parasite. But if the mode of dissemination of a cancer and of a micro-organism be carefully examined this analogy is found to be false. When a micro-organism lodges in a gland or other part of the body, by its irritative action it stimulates the cells of that gland to increased activity, and any swelling that occurs is produced by the proliferation of those cells. But when a group of cancer-cells is deposited in a gland the subsequent growth arises entirely from the multiplication of those cancer-cells, and the gland cells take no part whatever in its formation.

A very large number of organisms both animal and vegetable have been described as occurring in tumours; and some of these have been cultivated on artificial media outside the body; but to none of them can any direct causal relationship with cancer be attributed. One of the best authenticated, a small coccus, known as *Micrococcus neoformans* can certainly be cultivated from many tumours malignant and innocent, and it has been suggested that it may be responsible for the slight inflammatory changes that occur in the neighbourhood of most new growths. The final and critical test of the connexion of an organism with some diseased condition is the production of a similar condition in animals by inoculation of that organism, and this experiment has signally failed with all the suggested cancer parasites. Another very cogent argument against the infective hypothesis is the fact that although tumours of identical structure are found throughout the vertebrate kingdom, it has never yet been found possible artificially to transmit these tumours from one species to another. If they were of an infective nature it is almost inconceivable that the gap between two allied species should be such an insuperable bar to transmission.

Quite recently *Borrel* of the Pasteur Institute has stated that certain animal parasites from the skin are often to be found buried in the cell masses of cancers of the skin and breast, and he thinks that these parasites may be the carriers of some as yet unknown cancer virus, just as the mosquito is the carrier of malaria.

Ribbert has suggested that tumour formation may be due to "alteration of tissue tension." In his opinion the various cells of the body are normally held in a state of equilibrium by some condition of mutual interdependence amongst themselves. Should this equilibrium be disturbed some of these cells may escape from the controlling influence usually exercised upon them by their neighbours, and become endowed with greatly enhanced powers of growth.

Adami considers that every cell possesses two distinct properties, a property of function and a property of growth, and he regards these as incompatible, that is to say, a cell cannot at the same time be carrying out a specific function and also undergoing active growth. He believes that on occasion some of these cells may abandon their "habit of work" and assume a "habit of growth," and this will lead to the development of a tumour.

Neither of the two latter explanations brings us very much nearer the solution of the question—they merely place the unknown factor one step farther back; but they serve to emphasize the biological aspect of the problem. At the present time the general weight of evidence seems to favour the idea that tumour formation is due to some intrinsic cause, whereby the normal processes of growth are disturbed, rather than to any extrinsic cause such as microbial infection. Therefore it is from a careful study of the laws of growth, and from research directed along broad biological lines that the best results are to be looked for in the future.

Classification of Spontaneous Tumours.—So little is known as to the nature of these tumours that a satisfactory classification on a scientific basis is not yet within reach. The following is merely suggested as convenient:—

I.—Connective-tissue Tumours.

Innocent.	Malignant.
Lipoma (fatty tumour).	
Fibroma (fibrous tumour).	Sarcoma.
Myoma (muscular tumour).	Endothelioma.
Osteoma (bony tumour).	
Chondroma (cartilaginous tumour).	
Odontoma (tumour in connexion with teeth).	
Myxoma (mucoid tumour).	
Neuroma (tumour in connexion with nerves).	
Glioma (neuroglial tumour).	
Endothelioma (endothelial tumour).	
Angioma (tumour composed of blood vessels).	

II.—Epithelial Tumours.

Innocent.	Malignant.
Papilloma.	Carcinoma.
Adenoma.	Rodent Ulcer.

I. **Connective-tissue Tumours.**—*Lipoma* (fig. 5).—Of the connective-tissue group the fatty tumours are the most common. They often arise from the layer of fat beneath the skin, and a usual site for these subcutaneous lipomata is the back of the trunk, though at times they are found on the limbs and elsewhere. They

¹ Figs. 5, 6, 7, 8, 9, 14, 15 and 17 have been redrawn from *Bland Sutton's Tumours*, by permission; figs. 10, 11, 12 and 13 are from *Rose & Carless, Surgery*, by permission.

are soft, painless swellings, sometimes of great size; though usually single, as many as a dozen may be present in the same individual. Lipomata are also found in the abdominal cavity, growing from the subperitoneal layer of fat.

FIG. 5.—Lipoma of the palm.

What is known as a *diffuse lipoma* (fig. 6) consists of a generalized overgrowth of the subcutaneous fat of the neck, and this may be so extensive as to obliterate the outline of the jaw.

FIG. 6.—Diffuse lipoma of the neck.

Fibroma (fig. 7).—Of tumours containing fibrous tissue, by far the most important are the fibroids of the uterus. A better name for these tumours would be Fibromyomata, as they always contain a varying proportion of muscle fibres. They originate in the wall of the uterus, but generally come to project either internally into the cavity of the uterus, or externally into the peritoneal cavity; and often their sole connexion with the uterine wall is a stalk or pedicle formed from the capsule of the tumour. Fibromyomata of the uterus are most common from 35 to 45 years of age; in girls under 20 they are almost unknown. They may attain a great size and are often multiple. They seem to be equally common in married and unmarried women. Not every fibroid is a source of danger or discomfort, for in the majority of cases they are discovered by chance or not until after death. On the other hand they may give

FIG. 7.—Uterus in sagittal section showing interstitial and submucous fibroids.

rise to severe symptoms, and that in many different ways. First, they may cause haemorrhage prolonged over years so that the health is entirely ruined. Secondly, they may become inflamed and septic, and lead to severe blood-poisoning. Next, for some unknown reason, a fibroid tends to prevent conception, whilst, should pregnancy occur, labour is greatly impeded. Finally, it seems to be established that a fibroid may occasionally become converted into a sarcoma.

Examples of *pure* fibrous tissue tumours are the small multiple growths of the subcutaneous tissue, known as *Painful subcutaneous nodule*, and the irregular outgrowth from the gum known as *Epulis*.

A *Myoma* is composed of unstripped muscle fibres. It is a rare tumour sometimes found in the oesophagus, stomach and bladder.

Osteoma (fig. 8).—Bony tumours not infrequently arise from the bones of the head or face. They grow very slowly, and are so hard

FIG. 8.—Osteoma of the left frontal sinus (seen from below).

that surgical removal may be very difficult. They also occur as irregular outgrowths from the bones of the limbs, and are then known as *Exostoses* (fig. 9). A common site for these is the inner and lower end of the femur, at the point of attachment of the adductor muscle, and such a tumour seems to originate from an ossification of the tendon of this muscle.

FIG. 9.—Exostosis of the femur produced by the ossification of the tendon of the adductor magnus. FIG. 10.—Multiple chondromata of the fingers.

Chondroma (fig. 10).—Cartilaginous tumours are often found in children and young people growing from the bones of the limbs in the neighbourhood of the joints. They are frequently multiple, especially in the hands and feet. These tumours grow slowly and are quite painless. Should removal be necessary, it is usually an easy matter.

Osteoma.—Several varieties of this tumour have been described arising in connexion with the teeth and due to delayed or faulty development. They may cause great deformity of the jaw.

A *Myoma* is composed of loose, cartilaginous connective tissue similar to that found in the umbilical cord. Some nasal polypi seem to be of this nature, but true myomatous tumours are rare. It is, however, not uncommon for a fibroma or a sarcoma to be converted by degeneration into myomatous-like tissue.

Neuroma.—A *pure* neuroma is very uncommon, but a tumour known as a *Pseudo-neuroma* (fig. 11) is often found in the course of a nerve. This is formed by a localized overgrowth of the fibrous tissue of the nerve sheath.

Glioma.—This variety of tumour arises from the neuroglia, the

supporting tissue of the brain and spinal cord. Consequently gliomata are only found in these two structures.

Endothelioma.—Of late years a small class of tumour has been described as originating apparently from the endothelium lining the lesser blood and lymph channels. Many of the recorded examples have been connected with the mouth, the tongue, the palate or the parotid gland. Some of these tumours are quite innocent, others are typically malignant.

An **Angioma** consists of a mesh-work of blood-vessels bound together by a small amount of fat and fibrous tissue. Two varieties are described: (a) The *simple naevus*, or *port-wine stain*, scarcely deserves to be called a tumour. It appears as a reddish-blue discolouration of the skin due to over growth and dilatation of the underlying blood-vessels. This condition is most commonly found on the face or scalp, and may be of congenital origin. (b) In the

throughout the body. The *myeloid sarcoma*, or *myeloma* (fig. 14), is composed of very large cells like those of bone-marrow from which it is probably derived. It is only found in the interior of bones, chiefly in those of the arm and leg. The degree of malignancy is low, dissemination never occurs, and recurrence after operation is rare.

FIG. 11.—Pseudo-neuroma: fibrous tumour growing from nerve sheath, and causing the fibres to be stretched over it.

Caerous naevus the vascular hypertrophy is on a larger scale, and may produce a definite pulsating tumour. Here, again, the head is the usual situation.

Sarcoma.—This is the malignant type of the connective-tissue tumour. The general arrangement of

atypical cells loosely bound together by a small amount of connective tissue. The cells vary greatly in size and shape in different tumours, and in accordance with the prevailing type the following varieties of sarcoma have been described: (i.) *round-cell sarcoma*, (ii.) *spindle-cell sarcoma*, (iii.) *melanotic sarcoma*, (iv.) *myeloid sarcoma*. The first two groups contain the great majority of all sarcomata, and may occur in almost any part of the body, but they are especially liable to attack the bones (fig. 12). A sarcoma of bone may be either *periosteal* when it grows from the periosteum covering the outer surface of the bone, or *endosteal* when it lies in the medullary cavity. A peculiar form of sarcoma is found in the parotid and other salivary glands. The cells are usually spindle-shaped, and among them lie scattered masses of cartilage and fibrous tissue. These tumours are seldom very malignant, and dissemination is rare (fig. 13). The *melanotic sarcoma* is of a brown or black colour owing to the presence of granules of pigment (melanin) in and among the tumour cells. A melanotic sarcoma may arise from a pigmented wart or mole, or

FIG. 12.—Ossifying periosteal sarcoma of fibula.

from the pigmented layers of the retina. The primary growth is usually small, but dissemination occurs with great rapidity

FIG. 13.—Malignant tumour of the parotid gland.

FIG. 14.—Lower end of a femur in longitudinal section, showing a myeloma.

II.—Epithelial Tumours.

Papilloma.—The familiar example of a papilloma is the simple wart, which is formed by a proliferation of the squamous epithelium of the skin (fig. 3). It seems probable that some warts are of an infective nature, for instances of direct contagion are not uncommon. Occasionally warts are pigmented, and are then liable to be the seat of a melanotic sarcoma. Papillomata are also found in the bladder (fig. 15), as long delicate filaments growing from the bladder wall. These consist of a connective-tissue core covered by a thin layer of epithelium.

FIG. 15.—Villous papilloma of the bladder.

Adenoma.—(Figs. 11a and 16). The glandular tumours are of very common occurrence in the breast, the ovary and the intestinal canal. The structure of an adenoma of the breast has already been described (*vide supra*), and the structure of other adenomata is on the same general plan. The main features of an innocent glandular tumour are: (a) the presence of a rounded, painless swelling with a well-defined margin; (b) the swelling is freely movable in the surrounding tissues, and if it lies close beneath the skin it is not attached thereto; (c) there is no enlargement of the neighbouring lymphatic glands.

Carcinoma.—The following varieties of carcinoma are described:—
i. *Squamous-cell carcinoma* (fig. 4), arising from those parts of the body covered by squamous epithelium, namely the skin, the mouth, the pharynx, the upper part of the oesophagus and the bladder.
ii. *Spheroidal-cell carcinoma* (figs. 2a and 2b), arising from spheroidal epithelium, as in the breast, the pylorus, the pancreas, the kidney and the prostate.
iii. *Columnar-cell carcinoma* (figs. 16 and 17), arising from columnar epithelium, as in the intestine.

The general histology of these tumours corresponds to that of a spheroidal-cell carcinoma already described (*vide supra*), the only variation between the three groups being in the shape of the cells. The clinical characteristics of a carcinoma, whatever its situation, are: (a) the presence of a swelling which has no well defined margin, but fades away into the surrounding tissues to which it is fixed; (b) when the tumour lies near the skin (e.g. a carcinoma

of the breast) it becomes fixed to this at an early date; (c) the tumour is painful and tender, the degree of pain varies widely,

(Redrawn from Ziegler's *Pathological Anatomy*, by permission of Macmillan & Co.)
FIG. 16.—Section through advancing margin of colossar cancer of stomach.

FIG. 17.—Cancer of the sigmoid flexure of the colon.

and in the early stages there may be none; (d) the neighbouring lymphatic glands soon become enlarged and tender, showing that they are the seat of metastatic deposits; (e) in squamous carcinoma of the skin, ulceration speedily occurs.

Rodent Ulcer.—This shows itself as a slowly progressing ulceration of the skin, and is especially common on the face near the eye or ear. The condition is one of purely local malignancy, and dissemination does not occur. It is believed to be a carcinoma of the sebaceous glands of the skin. (L. C.)*

TUMULUS, a Latin word meaning a heap or mound, also used in classical writings in the secondary sense of a grave. In Roman epitaphs we meet with the formula *tumulum faciendum curavit*, meaning the grave and its monument; and on the inscribed monumental stones placed over the early Christian graves of Gaul and

Perhaps the largest tumulus on record is the tomb of Alyattes, king of Lydia, situated near Sardis, constructed in his own lifetime, before 560 B.C. It is a huge mound, 1180 ft. in diameter and 200 ft. high. In south-eastern Europe, and especially in southern Russia, the sepulchral tumuli are very numerous and often of great size, reaching occasionally to 400 ft. in circumference and over 100 ft. in height. These are mostly of the period of the Greek colonies of the Tauric Chersonese, dating from about the 5th century B.C. to about the 2nd century A.D., and their contents bear striking testimony to the wealth and culture of the people who reared them.

(J. AN.)

TUN, a town in the province of Khorasan, Persia, situated about 150 m. S. of Nishapur in 34° N., 58° 7' E., at an elevation of 1200 ft. The town, which has a population of 7000, is surrounded by a wall, 20 ft. in height, raised on a high rampart of mud. It has three gates, handsome bazaars, good caravanserais and numerous large gardens and fields producing opium, tobacco and cotton. Some silk is also grown.

TUNBRIDGE WELLS, a municipal borough and inland watering-place of England, chiefly in the Tonbridge parliamentary division of Kent, but extending into the eastern division of Sussex, 34½ m. S.E. by S. of London by the South Eastern & Chatham railway, served also by a branch of the London Brighton & South Coast line. Pop. (1891), 29,296; (1901), 33,373. It owes its popularity to its chalybeate spring and its beautiful situation in a hilly wooded district. The wells are situated by the Parade (or Pantiles), a walk associated with fashion since the time of their discovery. It was paved with pantiles in the reign of Queen Anne. Reading and assembly rooms adjoin the pump-room. The town is built in a picturesquely irregular manner, and a large part of it consists of districts called "parks" occupied by villas and mansions. On Rushtall Common about a mile from the town is the curiously shaped mass of sandstone known as the Toad Rock, and a mile and a half south-west is the striking group called the High Rocks. The Tunbridge Wells sanatorium is situated in grounds sixty acres in extent. Five miles south-east of Tunbridge Wells is Bayham Abbey, founded in 1200, where ruins of a church, a gateway, and dependent buildings adjoin the modern Tudor mansion. Three miles south, in Sussex, the village of Frant stands on a hill which is perhaps the finest of the many view-points in this district, commanding a wide prospect over some of the richest woodland scenery in England. The vicinity of Tunbridge Wells is largely residential. To the north lies the urban district of Соуѣборочн (pop. 6977). There is a large trade in Tunbridge ware, which includes work-tables, boxes, toys, &c., made of hard woods, such as beech, sycamore, holly, and cherry, and inlaid with mosaic. Tunbridge Wells was incorporated in 1889, and is governed by a mayor, 8 aldermen and 24 councillors. Area, 3991 acres.

The town owes its rise to the discovery of the medicinal springs by Dudley, Lord North, in 1606. Henrietta Maria, wife of Charles I., retired to drink the waters at Tunbridge Wells after the birth of her eldest son Charles. Soon after the Restoration it was visited by Charles II. and Catherine of Braganza. It was a favourite residence of the princess Anne previous to her accession to the throne, and from that time became one of the chief resorts of London fashionable society. In this respect it reached its height in the second half of the 18th century, and is specially associated with Colley Cibber, Samuel Johnson, Cumberland the dramatist, David Garrick, Samuel Richardson, Sir Joshua Reynolds, Beau Nash, Miss Chudleigh and Mrs Thrale. The Tunbridge Wells of that period is sketched with much graphic humour in Thackeray's *Virginians*.

TUNDRA (a Russian word, signifying a marshy plain), in physical geography, the name applied to the treeless and often marshy plains which border the arctic coasts of Europe, Asia

Britain the phrase *in hoc tumulo jacet* expresses the same idea. But among archaeologists the word is usually restricted in its technical modern application to a sepulchral mound of greater or less magnitude. The mound may be of earth, or of stones with a covering of earth, or may be entirely composed of stones. In the latter case, if the tumulus of stones covers a megalithic cist or a sepulchral chamber with a passage leading into it from the outside, it is often called a dolmen. (See **STONE MONUMENTS, BARROW AND CAIRN**.) The custom of constructing sepulchral tumuli was widely prevalent throughout the prehistoric ages and is referred to in the early literature of various races as a fitting commemoration of the illustrious dead. Prehistoric tumuli are found abundantly in almost all parts of Europe and Asia from Britain to Japan. They occur with frequency also in northern Africa, and in many parts of North and South America the aboriginal populations have practised similar customs. Sepulchral tumuli, however, vary so much in shape and size that the external appearance is no criterion of age or origin. In North America, especially in the Wisconsin region, there are numerous mounds made in shapes resembling the figures of animals, birds or even human forms. These have not been often found to be sepulchral, but they are associated with sepulchral mounds of the ordinary form, some of which are as much as 300 ft. in diameter and 100 ft. in height.

and North America. The Russian tundra, apart from the arctic conditions of climate and flora, may be compared with the steppes farther south.

TUNGABHADRA, a river of southern India, the chief tributary of the Kistna. It is formed by the junction of two streams, the Tunga and the Bhadra, which both rise in Mysore in the Western Ghats. The united river for nearly all its course forms the boundary between Madras and the dominions of the nizam of Hyderabad. On its right bank stood the capital of the ancient Hindu dynasty of Vijayanagar, now a wilderness of ruins. From of old its waters have been utilized for irrigation. Near its confluence with the Kistna it supplies the Kurnool-Cuddapah Canal. A project has been recently under consideration to dam the river higher up, and there construct an artificial lake that would have an area of 160 sq. m., the cost of this scheme being roughly estimated at nearly £6,000,000.

T'UNG-CHOW, a sub-prefectural city in Chih-li, the metropolitan province of China, on the banks of the Peiho in 39° 54' N. 116° 41' E., 12 m. E. of Peking. Its population is estimated at about 50,000.

T'ung-Chow marks the highest point at which the Peiho is navigable, and here merchandise for Peking is transferred to a canal. The city, which is faced on its eastern side by the river, and on its other three sides is surrounded by populous suburbs, is upwards of 3 m. in circumference. The walls are about 45 ft. in height and about 24 ft. wide at the top. They are being allowed to fall into decay. Two main thoroughfares connect the north and south gates and the east and west gates. The place derives its importance from the fact that it is the port of Peking. Like most Chinese cities, T'ung-Chow has appeared in history under various names. By the founder of the Han dynasty (206 B.C.) it was called Lu-Hien; with the rise of the T'ang dynasty (618 A.D.) its name was changed to Hsuan-Chow; and at the beginning of the 12th century, with the advent of the Kin dynasty to power, Hsuan-Chow became T'ung-Chow. It was at T'ung-Chow that Sir Harry Parkes, Sir Henry Loch and their escort were treacherously taken prisoner by the Chinese when they were sent forward by Lord Elgin to negotiate terms of peace after the troubles of 1860. During the Boxer outbreak in 1900 T'ung-Chow was occupied by the allied armies, and a light railway connecting the city with Peking was constructed by German military engineers.

TUNGSTEN [symbol W, atomic weight 184.0 (O=16)], a metallic chemical element found in the minerals wolfram, an iron and manganese tungstate, scheelite, a calcium tungstate, stolzite, a lead tungstate, and in some rarer minerals. Its presence in scheelite was detected by Scheele and Bergman in 1781, and in 1783 Juan, José and d'Elhuyar showed the same substance occurred in wolfram; they also obtained the metal. Tungsten may be prepared from wolfram by heating the powdered ore with sodium carbonate, extracting the sodium carbonate with water, filtering and adding an acid to precipitate tungstic acid, H_2WO_6 . This is washed and dried and the oxide so obtained reduced to the metal by heating with carbon to a high temperature (Hadfield, *Journ. Iron and Steel Inst.*, 1903, ii. 38). On a small scale it is obtained by reducing the trioxide in a current of hydrogen, or the chloride by sodium vapour, or the oxide with carbon in the electric furnace; in the last case the product is porous and can be welded like iron. In the form of a powder, it is obtained by reducing the oxide with zinc and extracting with soda, or by dissolving out the manganese from its alloys with tungsten. The metal may be used uncombined, but large quantities of ferrotungsten are made in the electric furnace; other alloys are prepared by acting on a mixture of the oxides with aluminium. Tungsten has been applied in the manufacture of filament electric lamps. The metal has a crystalline structure, and melts at about 2800°. The powdered metal burns at a red heat to form the trioxide; it is very slowly attacked by moist air. It combines with fluorine with incandescence at ordinary temperatures, and with chlorine at 250–300°; carbon, silicon, and boron, when heated with it in the electric furnace, give crystals harder than the ruby. It is soluble in a mixture of nitric

and hydrofluoric acids, and the powdered metal, in aqua regia, but slowly attacked by sulphuric, hydrochloric and hydrofluoric acids separately; it is also soluble in boiling potash solution, giving a tungstate and hydrogen.

Tungsten dioxide, WO_2 , formed on reducing the trioxide by hydrogen at a red heat or a mixture of the trioxide and hydrochloric acid with zinc, or by decomposing the tetrachloride with water. It is a brown strongly pyrophoric powder, which must be cooled in hydrogen before being brought into contact with air. It is slightly soluble in hydrochloric and sulphuric acids, giving purple solutions. It dissolves in potash, giving potassium tungstate and hydrogen, and is readily oxidized to the trioxide.

Tungsten trioxide, WO_3 , occurs in nature as wolframite, a yellow mineral found in Cumberland, Limoges, Connecticut and in North Carolina. It is prepared as shown above, or by other methods. It is a canary-yellow powder, which becomes a dark orange on heating; the original colour is regained on cooling. On exposure to light it assumes a greenish tinge. A crystalline form was obtained by Debray as olive-green prisms by igniting a mixture of sodium tungstate and carbonate in a current of hydrochloric acid gas, and by Nordeuskjold by heating hydrated tungstic acid with borax. Partial reduction of tungsten trioxide gives blue or purple-red products which are intermediate in composition between the dioxide and trioxide. Tungsten trioxide forms two acids, tungstic acid, H_2WO_6 , and metatungstic acid, $H_4W_2O_{11}$; it also gives origin to several series of salts, to which the acids corresponding are unknown. Thus we have salts of the following types $M_2O(WO_3)_n$, where $n=1, 2, 3, 4, 5, 6, 7, 8$, and also $(M_2O)_m(WO_3)_n$, where $m, n=2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12$; M standing for a monovalent metal. The $(M_2O)_m(WO_3)_n$ or $M_2mW_nO_{3n}$ salts are called paratungstates. *Tungstic acid*, H_2WO_6 , is obtained as $H_2WO_6 \cdot H_2O$ by precipitating a tungstate solution with cold acid; this substance has a bitter taste and its aqueous solution reddens litmus. By using a hot acid the yellow anhydrous tungstic acid is precipitated, which is insoluble in water and in all acids except hydrofluoric. It may be obtained in a flocculent form by exposing the hexachloride to moist air. *Metatungstic acid*, $H_4W_2O_{11} \cdot 2H_2O$, is obtained by decomposing the barium salt with sulphuric acid or the lead salt with hydrochloric acid. It forms yellow octahedra, which become anhydrous at 100°, and are converted into the trioxide on ignition. It is readily soluble in water, and on boiling the aqueous solution a white hydrate is first deposited which after a time is converted into the trioxide. Graham obtained a colloidal tungstic acid by dialysing a dilute solution of sodium tungstate and its equivalent of hydrochloric acid; on concentrating in a vacuum a gummy product is obtained, which still remains soluble after heating to 200°, but it is converted into the trioxide on heating to redness. When moistened it becomes adhesive. The solution has a bitter taste and does not gelatinize, even under the influence of boiling acids.

Of the salts, the normal tungstates are insoluble in water with the exception of the alkaline tungstates; they are usually amorphous, but some can be obtained in the crystalline form. The metatungstates of the alkalis are obtained by boiling normal tungstates with tungstic acid until the addition of hydrochloric acid to the filtrate gives no precipitate. The most important tungstate is the so-called tungstate of soda, which is sodium paratungstate, $Na_{10}W_6O_{30} \cdot 28H_2O$. This salt is obtained by roasting wolfram with sodium carbonate, lixiviating, neutralizing the boiling filtrate with hydrochloric acid and crystallizing at ordinary temperatures. The salt forms large monoclinic prisms; molecules containing 25 and 21 H_2O separate from solutions crystallized at higher temperatures. The salt is used as a mordant in dyeing and calico printing, and also for making textiles non-inflammable. Several other sodium tungstates are known, as well as potassium and ammonium tungstates. Many salts also occur in the mineral kingdom; for example, scheelite is $CaWO_4$, stolzite is $PbWO_4$, ferberite is $FeWO_4$, wolfram is $(Fe, Mn)WO_4$, whilst hübnerite is $MnWO_4$. By partial reduction of the tungstates under certain conditions products are obtained which are insoluble in acids and alkalis and present a bronze-like appearance which earned for them the name of tungsten bronzes. The sodium compound was first obtained by Wöhler on reducing sodium tungstate with hydrogen; coal-gas, zinc, iron or tin also effect the reduction. It forms golden cubes which are unattacked by alkalis or by any acid except hydrofluoric. It appears to be a mixture of which the components vary with the materials and methods used in its production (Philipp, *Ber.*, 1882, 15, p. 499). A blue bronze, $Na_2W_6O_{19}$, forming dark blue cubes with a red reflex, is obtained by electrolytically fused sodium paratungstate; a purple-red variety, $Na_6W_6O_{19}$, and a reddish yellow form result when sodium carbonate and sodium tungstate are heated respectively with tungsten trioxide and tin foil. Similar potassium tungsten bronzes are known.

Tungstic acid closely resembles molybdic acid in combining with phosphoric, arsenious, arsenic, boric, vanadic and silicic acids to form highly complex acids of which a great many salts exist. Of the phosphotungstic acids the most important is phosphododecatungstic acid, $H_4P_2W_{12}O_{41} \cdot nH_2O$, obtained in quadrate pyramids by crystallizing mixed solutions of orthophosphoric and

metatungstic acids. Two sodium salts, viz. $\text{Na}_2\text{HPW}_6\text{O}_{21}\cdot n\text{H}_2\text{O}$ and $\text{Na}_2\text{PW}_6\text{O}_{21}\cdot n\text{H}_2\text{O}$, are obtained by heating sodium hydrogen phosphate with a tungstate. The most important silicotungstic acids are silicooctatungstic acid $\text{H}_8\text{W}_8\text{SiO}_{40}\cdot 3\text{H}_2\text{O}$, tungstosilicic acid, $\text{H}_2\text{W}_6\text{SiO}_{26}\cdot 20\text{H}_2\text{O}$, and silicoheptatungstic or silicotungstic acid, $\text{H}_2\text{W}_7\text{SiO}_{32}\cdot 29\text{H}_2\text{O}$. On boiling gelatinous silica with ammonium polytungstate and evaporating with the occasional addition of ammonia, ammonium silicoheptatungstate is obtained as short rhombic prisms. On adding silver nitrate and decomposing the precipitated silver salt with hydrochloric acid, a solution is obtained which on evaporation in a vacuum gives the free acid as a glassy mass. If this be dissolved in water and the solution concentrated, some silicic acid separates and the filtrate deposits triclinic prisms of tungstosilicic acid. Silicotungstic acid is obtained as quadratic pyramids from its mercurous salt which is prepared from mercurous nitrate and the salt formed on boiling gelatinous silicic acid with a polytungstate of an alkali metal.

Pertungstic Acid, HWO_6 .—The sodium salt, $\text{NaWO}_6\cdot\text{H}_2\text{O}$, is obtained by evaporating in a vacuum the product of boiling a solution of sodium paratungstate with hydrogen peroxide. Its solution liberates chlorine from hydrochloric acid and iodine from potassium iodide.

Halogen Compounds.—Although the trioxide is soluble in hydrofluoric acid, evaporation of the solution leads to the recovery of the oxide unchanged. A double salt of the oxyfluoride, viz. $2\text{KF}\cdot\text{WO}_3\cdot\text{H}_2\text{O}$, is obtained as crystalline scales by dissolving normal potassium tungstate in hydrofluoric acid and adding potassium hydroxide till a permanent precipitate is just formed. Other oxyfluorides are known. The hexafluoride, WF_6 , is a very active gaseous compound, which attacks glass and metals, obtained from tungsten hexachloride and hydrofluoric acid (Ruff and Eisner, *Ber.*, 1905, 38, p. 742). Oxyfluorides of the formulae WOF_4 and WO_2F_2 are also known. Tungsten forms four chlorides, viz. WCl_4 , WCl_5 , WCl_6 , WCl_7 . The dichloride, WCl_2 , is an amorphous grey powder obtained by reducing the hexachloride at a high temperature in hydrogen, or, better, by heating the tetrachloride in a current of carbon dioxide. It changes on exposure to air and dissolves slightly in water to give a brown solution, the insoluble portion gradually being converted into an oxide with evolution of hydrogen. The tetrachloride, WCl_4 , is obtained by partial reduction of the higher chlorides with hydrogen; a mixture of the penta- and hexa-chloride is distilled in a stream of hydrogen or carbon dioxide, and the pentachloride which volatilizes returned to the flask several times. This gives the tetrachloride as a greyish-brown crystalline powder. It is very hygroscopic and with cold water gives the oxide and hydrochloric acid. On heating it gives the di- and penta-chlorides. At a high temperature hydrogen reduces it to the metal partly in the form of a black pyrophoric powder. The pentachloride, WCl_5 , is obtained as a product in the preparation of the tetrachloride. It forms black lustrous crystals, or when quickly condensed, a dark green crystalline powder. It melts at 248° and boils at 275.6° ; the vapour density corresponds to the above formula. It is more hygroscopic than the tetrachloride; and when treated with much water the bulk is at once decomposed into the blue oxide and hydrochloric acid, but an olive-green solution is also produced. The hexachloride, WCl_6 , is obtained by heating the metal in a current of dry chlorine in the absence of oxygen or moisture, otherwise some oxychloride is formed; a sublimate of dark violet crystals appear at first, but as the hexachloride increases in quantity it collects as a very dark red liquid. When perfectly pure, the hexachloride is stable even in moist air, but the presence of an oxychloride brings about energetic decomposition; similarly water has no action on the pure compound, but a trace of the oxychloride occasions sudden decomposition into a greenish oxide and hydrochloric acid. It melts at 275° and boils at 346.7° (759.5 mm.). Vapour density determinations indicate that dissociation occurs when the vapour is heated above the boiling point.

Several oxychlorides are known. The monooxychloride, WOCl_2 , is obtained as red acicular crystals by heating the oxide or dioxychloride in a current of the vapour of the hexachloride, or from the trioxide and phosphorus pentachloride. It melts at 210.4° and boils at 227° , forming a red vapour. Moist air brings about the immediate formation of a yellowish crust of tungstic acid. The dioxychloride, WO_2Cl_2 , is obtained as a light lemon-yellow sublimate on passing chlorine over the brown oxide. It is unaffected by moist air or cold water, and even when boiled with water the decomposition is incomplete. Tungsten combines directly with bromine to give, when the bromine is in excess, the penta- and not a hexabromide. This substance forms crystals resembling iodine, which melt at 276° and boil at 333° . It slowly evolves bromine on standing, and is at once decomposed by water into the blue oxide and hydrobromic acid. The dibromide, WBr_2 , is a non-volatile bluish-black powder obtained by reducing the pentabromide with hydrogen. By passing bromine vapour over red-hot tungsten dioxide a mixture of WO_2Br_2 and WOBBr_2 is obtained, from which the latter can be removed by gently heating when it volatilizes. The dibromide forms light red crystals or a sublimate which is decomposed on heat, and in presence of water gives a blue oxide.

forms brownish-black needles, which melt at 277° and boil at 327.5° ; it is decomposed by water. The di-iodide is obtained as green metallic scales on passing iodine over red-hot tungsten.

Tungsten disulphide, WS_2 , is obtained as soft black acicular crystals by the action of sulphur, sulphuretted hydrogen or carbon bisulphide on tungsten. The trisulphide, WS_3 , is obtained by dissolving the trioxide in ammonium sulphide or by passing sulphuretted hydrogen into a solution of a tungstate and precipitating by an acid in both cases. When dry it is a black mass which yields a liver-coloured powder. It is sparingly soluble in cold water, but is easily dissolved by potassium carbonate or ammonia. By dissolving it in a hydrosulphide a sulphotungstate is produced; these salts can also be obtained by passing sulphuretted hydrogen into a solution of a tungstate.

A nitride, W_2N_3 , is obtained as a black powder by acting with ammonia on the oxytetrachloride or hexachloride; it is insoluble in sodium hydroxide, nitric and dilute sulphuric acids; strong sulphuric acid, however, gives ammonia and tungstic acids. Ammonia does not react with tungsten or the dioxide, but with trioxide at a red heat a substance of the formula $\text{W}_2\text{H}_2\text{N}_2\text{O}_3$ is obtained, which is insoluble in acids and alkalis and on ignition decomposes, evolving nitrogen, hydrogen and ammonia. Phosphorus combines directly with the metal to form WP_3 ; another phosphide, WP_2 , results on igniting a mixture of phosphorus pentoxide and tungsten trioxide.

The atomic weight has been determined by many investigators; the chief methods employed being the analysis and synthesis of the trioxide and the analysis of the hexachloride. The former was employed by Pennington and Smith and Desai (*Zest. anorg. Chem.*, 1895, 8, pp. 198, 205) who obtained the value 183.42.

TUNGUSES, a widespread Asiatic people, forming a main branch of the Mongol division of the Mongol-Tatar family. They are the *Tung-hu* of the Chinese, probably a corrupt form of *tonki* or *donki*, that is, "men" or "people." The Russian form *Tungus*, wrongly supposed to mean "lake people," appears to occur first in the Dutch writer Massa (1612); but the race has been known to the Russians ever since they reached the Yenisei. The Tungus domain, covering many hundred thousand square miles in central and east Siberia and in the Amur basin, stretches from the Yenisei eastwards to the Pacific, where it occupies most of the seaboard between Korea and Kamchatka. It also reaches the Arctic Ocean at two points, in the Nisovaya tundra, west of the Khatanga River, and in a comparatively small enclosure in the Yana basin over against the Lyakhov (New Siberia) Archipelago. But the Tunguses proper are chiefly centred in the region watered by the three large eastern tributaries of the Yenisei, which from them take their names of the Upper, Middle or Stony, and Lower Tunguska. Here the Tunguses are known to the Samoyedes by the name of *Aiyo* or "younger brothers," implying a comparatively recent immigration (confirmed by other indications) from the Amur basin, which appears to be the original home both of the Tunguses and of the closely allied Manchus. The Amur is still mainly a Tungus river almost from its source to its mouth: the Orochis (Orochus), Daurians, Bitars, Golds, Manegrs, Sanagirs, Ngatkons, Nigidals, and some other aboriginal tribes scattered along the main stream and its affluents—the Shilka, Sungari and Usuri—are all of Tungus stock and speech. On the Pacific the chief subdivisions of the race are the Lamuts, or "sea people," grouped in small isolated hunting communities round the west coast of the Sea of Okhotsk, and farther south the Tazi between the Amur delta and Korea. The whole race, exclusive of Manchus, numbers probably little more than 50,000, of whom some 10,000 are in the Amur basin, the rest in Siberia.

The Tungus type is essentially Mongolic, being characterized by broad flat features, small nose, wide mouth, thin lips, small black and somewhat oblique eyes, black lank hair, dark olive or bronze complexion, low stature, averaging not more than 5 ft. 4 in.; they are distinguished from other Mongolic peoples by the square shape of the skull and the slim, wiry, well-proportioned figure. This description applies more especially to the Tunguska tribes, who may be regarded as typical Tunguses, and who, unlike most other Mongols, betray no tendency to obesity. They are classed by the Russians, according to their various pursuits, as Reindeer, Horse, Cattle, Dog, Steppe and Forest Tunguses. A few have become settled agriculturists; but the great bulk of the race are still essentially forest hunters, using the reindeer both as mounts and as pack animals. Nearly all lead nomad lives in pursuit of fur-bearing animals, whose skins they supply to Russian and Yakut traders in exchange for provisions, clothing and other necessities.

of life. The picturesque and even elegant national costume shows in its ornamentation and general style decided Japanese influence, due no doubt to long-continued intercourse with that nation at some period previous to the spread of the race from the Amur valley to Siberia. Many of the Tungus tribes have been baptized, and are, therefore, reckoned as "Greek Christians"; but Russian orthodoxy has not penetrated far below the surface, and most of them are still at heart Shamanists and nature-worshippers, secretly keeping the teeth and claws of wild animals as idols or amulets, and observing Christian rites only under compulsion. But, whether Christians or pagans, all alike are distinguished above other Asiatics, perhaps above all other peoples, for their truly noble moral qualities. All observers describe them as "cheerful under the most depressing circumstances, persevering, open-hearted, trustworthy, modest yet self-reliant, a fearless race of hunters, born amidst the gloom of their dense pine forests, exposed from the cradle to every danger from wild beasts, cold and hunger. Want and hardships of every kind they endure with surprising fortitude, and nothing can induce them to take service under the Russians or quit their solitary woodlands" (Keane's *Asia*, p. 479). Their numbers are steadily decreasing owing to the ravages of small-pox, scarlet fever, and especially famine, their most dreaded enemy. Their domain is also being continually encroached upon by the aggressive Yakuts from the north and east, and from the south by the Slavs, now settled in compact bodies in the province of Irkutsk about the upper course of the Yenisei. It is remarkable that, while the Russians often show a tendency to become assimilated to the Yakuts, the most vigorous and expansive of all the Siberian peoples, the Tunguses everywhere and before the advance of their more civilized neighbours or become absorbed in the surrounding Slav communities. In the Amur valley the same fate is overtaking the kindred tribes, who are disappearing before the great waves of Chinese migration from the south and Russian encroachments both from the east and west.

See L. Adam, *Grammaire de la langue tongouse* (Paris, 1874); C. Hkikiaci, *Die Tungusen* (St Petersburg, 1879); L. Schrenck, *Reisen und Forschungen im Amurlande* (St Petersburg, 1881-1891); Mainov, *Niekotorye dannyya* (Irkutsk, 1898).

TUNIC (Θ. Eng. *tunic*, *tunical*, taken, before the Norman conquest, directly from Lat. *tunica*, of which the origin is unknown), properly the name given in Latin to the principal undergarment of men and women, answering to the chiton (χιτών) of the Greeks, and covered by the outer garment, the *palla* (Gr. *πάλλιον*), in the case of women, and by the peculiar Roman garment, the *toga*, in the case of men. The male *tunica* differed from the χιτών in usually having short sleeves (see further **COSTUME**: § *Ancient Greek and Roman*). The term, more often in the form "tunicle" (Lat. dim. *tunicula*), is applied, in ecclesiastical usage, to a vestment worn over the alb by the sub-deacon in the celebration of the Mass. In general current usage it is used of any loose short garment, girt at the waist and reaching from the neck to some distance above the knee. It is thus the name of the fatigue coat of a soldier of the British army. There are numerous uses of "tunic" or "tunica" in anatomy, zoology and botany in the sense of a covering or integument.

TUNICATA. This group of marine animals was formerly regarded as constituting, along with the Polyzoa and the Brachiopoda, the invertebrate class Molluscoidea. It is now known to be a degenerate branch of the Chordata, and to be more nearly related to the Vertebrata than to any group of the Invertebrata. The Tunicata are found in all seas, from the littoral zone down to abyssal depths. They occur either fixed or free, solitary, aggregated or in colonies. The fixed forms are the "simple" and "compound" Ascidians. The colonies are produced by budding and the members are conveniently known as *Ascidiopods*. Some Tunicata undergo alternation of generations, and most of them show a retrograde metamorphosis in their life-history.

HISTORY!

More than two thousand years ago Aristotle gave a short account of a simple Ascidian under the name of *Tethyum*. Schlosser and Ellis, in a paper on *Batrillus*, published in the *Philosophical Transactions of the Royal Society for 1756*, first brought the compound Ascidians into notice; but it was not until the commencement of the 19th century, as a result of the careful anatomical investigations of C. Cuvier (1) upon the simple Ascidians and of J. C. Savigny (2) upon the compound, that the close relationship between these two

groups of the Tunicata was conclusively demonstrated. Lamarck (3) in 1816 instituted the class Tunicata, which he placed between the Radiata and the Vermes in his system of classification. The Tunicata included at that time, besides the simple and the compound Ascidians, the pelagic forms *Pyrosoma*, which had been first made known by F. Péron in 1804, and *Salpa*, described by P. Forskål in 1775.

A. v. Chamisso, in 1819, made the important discovery that *Salpa* in its life-history passes through the series of changes which were afterwards more fully described by J. J. S. Steenstrup in 1842 as "alternation of generations"; and a few years later Kuhl and Van Hasselt's investigations upon the same animal resulted in the discovery of the alternation in the directions in which the wave of contraction passes along the heart and in which the blood circulates through the body. It has since been found that this observation holds good for all groups of the Tunicata. In 1826 H. Milne-Edwards and Audouin made a series of observations on living compound Ascidians, and amongst other discoveries they found the free-swimming tailed larva, and traced its development into the young Ascidian.

In 1845 Carl Schmidt (6) first announced the presence in the test of some Ascidians of "tunicine," a substance very similar to cellulose, and in the following year Ludwig and A. v. Kölliker (7) confirmed the discovery and made some additional observations upon this substance and upon the structure of the test in general. T. H. Huxley (8), in an important series of papers published in the *Transactions of the Royal and Linnean Societies of London from 1851 onwards*, discussed the structure, embryology and affinities of the pelagic Tunicates *Pyrosoma*, *Salpa*, *Doliolum* and *Appendicularia*. These important forms were also investigated about the same time by C. Gegenbaur, C. Vogt, H. Müller, A. Krohn and F. S. Leuckart. The most important account in the history of the Tunicata is the date of the publication of A. Kowalevsky's celebrated memoir upon the development of a simple Ascidian (9). The tailed larva had been previously investigated; but its minute structure had not been sufficiently examined, and the meaning of what was known of it had not been understood. It was reserved for Kowalevsky in 1866 to demonstrate the striking similarity in structure and in development between the larval Ascidian and the vertebrate embryo. He showed that the relations between the nervous system, the notochord and the alimentary canal are the same in the two forms, and have been brought about by a very similar course of embryonic development. This discovery clearly indicated that the Tunicata are closely allied to *Amphioxus* and the Vertebrata, and that the tailed larva represents the primitive or ancestral form from which the adult Ascidian has been evolved by degeneration, and this led naturally to the view usually accepted at the present day, that the group is a degenerate side-branch from the lower end of the phylum Chordata, which includes the Tunicata (Urochorda), *Balanoglossus*, &c. (Hemichorda), *Amphioxus* (Cephalochorda) and the Vertebrata. Kowalevsky's great discovery has since been confirmed and extended to all other groups of the Tunicata by C. v. Kupfer (12), A. Giard (13 and 15), and others.

In 1872 H. Fol (14) added largely to the knowledge of the Appendiculariidae, and Giard (15) to that of the compound Ascidians. The most important additions which have been made to the latter since have been those described by Von Drasche (16) from the Adriatic and those discovered by the "Challenger" and other expeditions (17). The structure and the systematic arrangement of the simple Ascidians have been mainly discussed of recent years by J. Alder and A. Hancock (18), C. Heller (19), H. de Lacaze-Duthiers (20), M. Trautstedt (21), L. Roule, R. Hartmeyer, C. P. Sluiter, W. Michaelsen and W. A. Herdman (17, 22). In 1874 Usoff (23) investigated the minute structure of the nervous system and of the underlying gland (first discovered by Hancock), and showed that the duct communicates with the front of the branchial sac or pharynx by an aperture in the dorsal (or "olfactory") tubercle. In 1880 C. Julin (24) drew attention to the similarity in structure and relations between this gland and the *hypophysis cerebri* of the vertebrate brain, and insisted upon their homology. M. M. Metcalf has since added to our knowledge of these structures. The Thaliacea have of late years been the subject of several very important memoirs. The researches of F. Todaro, W. K. Brooks (25), W. Salensky (26), O. Seeliger, Korotneff and others have elucidated the embryology, the gemination and the life-history of the Salpidae; and K. Grobben, Barrois (27), and more especially Uljanin (28), have elaborately worked out the structure and the details of the complicated life-history of the Doliolidae. Finally, we owe to the successive memoirs of J. Hjort, O. Seeliger, W. E. Ritter, E. van Beneden, C. Julin, C. P. Sluiter, R. Hartmeyer and others the description of many new forms and much information as to the development and life-history of the group.

The new forms described from Puget Sound and Alaska have drawn renewed attention to the similarity of the fauna in that region of the North Pacific and the fauna of north-west Europe. There is probably a common circumpolar Tunicate fauna which sends extensions downwards in both Atlantic and Pacific. As the result of the careful quantitative work of the German Plankton expedition, A. Borgert thinks that the temperature of the water has more to do with both the horizontal and the vertical distribution of pelagic

¹ Only the more important works can be mentioned here. For a more detailed account of the history of the group and a full bibliography see (17) and (35) in the list of works at the end of this article.

Tunicata in the sea than any other factor. It is probable that the occasional phenomenal swarms of *Defolium* which have been met with in summer in the North Atlantic are a result of the curious life-history which, in favourable circumstances, allows a small number of budding forms to produce from the numerous minute buds an enormous number of the next generation. The great increase in the number of species known from nearly all seas during the last twelve or fifteen years of the 19th century enables us now to form a truer estimate of the geographical distribution of the group than was possible when the "Challenger" collections were described, and shows that the Tunicata at least give no support to the "bi-polar theory" of the distribution of animals.

ANATOMY

As a type of the Tunicata, *Ascidia mentula*, one of the larger species of the simple Ascidiata, may be taken. This species is

FIG. 1.—*Ascidia mentula*, from the right side.

at, Atrial aperture; br, branchial aperture; l, test.

ectoderm, which is a layer of flat cells. Although at first produced as a cuticle, the test soon becomes organized by the migration into it of cells derived from the mesoderm. A. Kowalevsky has shown that cells of the mesenchyme of the larva make their way through

(From Sars, "Challenger" Report.)

the ectoderm to the exterior during the metamorphosis, and become the first cells of the young test. Some of the cells in the adult test may, however, be ectodermal in origin (see fig. 2). These test cells may remain as rounded or fusiform or stellate cells embedded in the gelatinous matrix, to which they are constantly adding by secretions on their surfaces; or they may develop vacuoles which become larger and fuse so that each cell has an ovate clear cavity (a bladder cell), surrounded by a delicate film of protoplasm with the nucleus still visible at one point; or they may form pigment granules in the protoplasm; or, lastly, they may deposit carbonate of lime, so that one or several of them together produce a calcareous spicule in the test. Only the unmodified test cells and the bladder cells are found in *Ascidia mentula* (fig. 3).

FIG. 3.—Section through the surface layer of Test of *Ascidia mentula*.

bl, Bladder cells; ec, test cell; tk, terminal knobs of vessels; v, vessels of test.

Calcareous spicules are found chiefly in the Didemnidae amongst compound Ascidiata; but pigmented cells may occur in the test of almost all groups of Tunicata. The matrix in which these structures are embedded is usually clear and apparently homogeneous; but in some cases it becomes finely fibrillated, especially in the family Cynthiidae. It is this matrix which contains tunicine. At one point on the left side near the posterior end a tube enters the test, and then splits up into a number of branches, which extend in all directions and finally terminate in rounded enlargements or bulbs, situated chiefly in the outer layer of the test. These tubes are known as the "vessels" of the test, and they contain blood. Each vessel is bounded by a layer of ectoderm cells lined by connective tissue (fig. 4, B), and is divided into two tubes by a septum of connective tissue. The septum does not extend into the terminal bulb, and consequently the two tubes communicate at their ends (fig. 4, A). The vessels are formed by an outgrowth of a blood sinus (derived originally from the blastocoel of the embryo) from the body wall (mantle) into the test, the wall of the sinus being formed by connective tissue and pushing out a covering of ectoderm in front of it (fig. 2, s'). The test is

turned inwards at the branchial and atrial apertures to line two funnel-like tubes—the branchial siphon leading to the branchial sac, and the atrial siphon leading to the atrial or peribranchial cavity.

The body wall, inside the test and the ectoderm, is formed of a layer (the somatic layer of mesoderm) of connective tissue, enclosing muscle fibres, blood sinuses, and nerves. This layer (the mantle) has very much the shape of the test outside it, but at the two apertures it is drawn out to form the branchial and atrial siphons (fig. 5). In the walls of these siphons the muscle fibres form powerful circular bands, the sphincter muscles. Throughout the rest of the mantle the bands of muscle fibres form a rude irregular network. They are numerous on the right side of the body, and almost totally absent on the left. The muscles are all formed of very long fusiform non-striped fibres. The connective tissue of the mantle is chiefly a clear gelatinous matrix, containing cells of various shapes; it is frequently pigmented, giving brilliant red or yellow colours to the body, and is penetrated by numerous lacunae, in which the blood flows. Inside the mantle, in all parts of the body, except along the ventral edge, there is a cavity—the atrial or peribranchial cavity—which opens to the exterior by the atrial aperture. This cavity is lined by a layer of cells derived originally from the ectoderm!

According to E. van Beneden and Julin (30) only the outer wall of the atrium is lined with epiblast, the inner wall being derived from the hypoblast of the primitive branchial sac.

and directly continuous with that layer through the atrial aperture (fig. 6); consequently the mantle is covered both externally and internally by ectodermal cells.

There is no true body cavity or coelom in the mesoderm; and yet the Tunicata are Coelomata in their structure and affinities, although it is very doubtful whether the enterocoel which has been described in the development is really found. In any case the coelom if formed is afterwards suppressed, and in the adult is only represented by the pericardium and its derivatives and the small cavities of the renal and reproductive organs.

The branchial aperture (mouth) leads into the branchial siphon (buccal cavity or stomodaeum), and this opens into the anterior end of a very large cavity (the branchial sac) which extends nearly to the posterior end of the body (see figs. 5 and 6). This branchial sac is an enlarged and modified pharynx, and is therefore properly a part of the alimentary canal. The oesophagus opens from it far back on the dorsal edge (see below). The wall of the branchial sac is pierced by a large number of vertical slits—the stigmata—placed in numerous transverse rows (secondary or subdivided gill-slits). These slits place the branchial sac in communication with the peribranchial or atrial cavity, which lies outside it (fig. 6). Between the stigmata the wall of the branchial sac is traversed by blood-vessels, which are arranged in three regular series (fig. 7)—(1) the transverse vessels, which run horizontally round the wall

and open at their dorsal and ventral ends into large longitudinal vessels, the dorsal and ventral sinuses; (2) the fine longitudinal vessels, which run vertically between adjacent transverse vessels and open into them, and which bound the stigmata; and (3) the internal longitudinal bars, which run vertically in

a plane internal to that of the transverse and fine longitudinal vessels. These bars communicate with the transverse vessels by short side branches where they cross, and at these points are prolonged into the lumen of the sac in the form of hollow papillae. The edges of the stigmata are richly set with cilia, which drive the water from the branchial sac into the peribranchial cavity, and so cause the currents that flow in through the branchial aperture and out through the atrial.

Along its ventral edge the wall of the branchial sac is continuous externally with the mantle (fig. 6), while internally it is thickened to form two parallel longitudinal folds bounding a stigmatic groove, the "endostyle" or ventral furrow (figs. 5, *Endostyle*, 6, 8, *end.*) corresponding to the hypopharyngeal groove of *Amphioxus* and the median part of the thyroid gland of Vertebrata. The endoderm cells which line the endostyle are greatly enlarged at the bottom, where they bear very long cilia, and on parts of the sides of the furrow so as to form projecting glandular pads (fig. 8, *gl.*).

It is generally supposed that this organ is a gland for the production of the mucous secretion which is spread round the edges of the branchial sac and catches the food particles in the passing current of water. It has, however, been pointed out that there are comparatively few gland cells in the epithelium of the endostyle, and that it is possible that this furrow is merely a ciliated path along which the mucous secretion (produced in part by the bands; *pbr.*, peribranchial cavity; *sg.*, subneural gland) is conveyed posteriorly along the ventral edge of the branchial sac. There are sensory bipolar cells in the lateral walls of the endostyle. At its anterior end the edges of the endostyle become continuous with the right and left halves of the posterior of two circular ciliated ridges—the peripharyngeal bands—which run parallel to one another round the front of the branchial sac. The dorsal ends of the posterior peripharyngeal band then join to form the anterior end of a fold which runs along the dorsal edge of the branchial sac as far as the oesophageal aperture. This fold is the dorsal lamina (figs. 5, 6, *dl.*)

canal by its side walls growing up, arching over, and coalescing in the median dorsal line (fig. 13, D). This union of the *laminae dorsales* to form the neural canal commences at the posterior end behind the blastopore and gradually extends forwards. Consequently the blastopore comes to open into the posterior end of the neural canal (fig. 13, D), while the anterior end of that cavity remains

open to the exterior. In this way the archenteron communicates indirectly with the exterior. The short canal leading from the neural canal to the archenteron is known as the neurenteric canal (fig. 13, D, nec). Previous to this stage some of the hypoblast cells at the front edge of the blastopore and forming part of the dorsal wall of the archenteron (fig. 13, C, ch) have become separated off, and then arranged to form an elongated band, two cells wide, underlying the posterior half of the neural canal (fig. 13, D, E, ch). This is the origin of the notochord. Outgrowths from the sides of the archenteron give rise to laterally placed masses of cells, which are the origin of the mesolast. These masses show no trace of metameric segmentation. The cavities (reproductive and renal vesicles) which are formed later in the mesolast represent the coelom. Consequently the body cavity of the Tunicata is a modified form of enterocoele. The anterior part of the embryo, in front of the notochord, now becomes enlarged to form the trunk, while the posterior part elongates to form the tail (fig. 13, E). In the trunk the anterior part of the archenteron dilates to form the mesenteron, the greater part of which becomes the branchial sac; at the same time the anterior part of the neural canal enlarges to form the cerebral vesicle, and the opening to the exterior at the front end of the canal now closes. In the tail part of the embryo the neural canal remains as a narrow tube, while the remains of the wall of the archenteron—the dorsal part of which has become the notochord—are

converted into lateral muscle bands (fig. 13, G) and a ventral cord of cells, which eventually breaks up to form blood corpuscles. As the tail grows longer, it becomes bent round the trunk of the embryo inside the egg-membrane. About this period the epiblast cells begin to form the test as a cuticular deposit upon their outer surface. The test is at first devoid of cells and forms a delicate gelatinous investment, but it shortly afterwards becomes cellular by the migration into it of test cells formed by proliferation from the epiblast.¹

The embryo is hatched about two or three days after fertilization, in the form of a tadpole-like larva, which swims actively through the sea by vibrating its long tail. The anterior end of the body is provided with three adhering papillae (fig. 13, F, adp.) in the form of epiblastic thickenings. In the free-swimming tailed larva the nervous system, formed from the walls of the neural canal, becomes considerably differentiated. The anterior part of the cerebral vesicle remains thin-walled (fig. 13, F), and two unpaired sense-organs develop from its wall and project into the cavity. These are a dorsally and posteriorly placed optic organ, provided with retina, pigment layer, lens and cornea, and a ventrally placed auditory organ, consisting of a large spherical partially pigmented otolith, attached by delicate hair-like processes to the summit of a hollow *crista acoustica* (fig. 13, F, au). The posterior part of the cerebral vesicle thickens to form a solid ganglionic mass traversed by a narrow central canal: this becomes the ganglion of the adult Ascidian. The wall of the neural canal behind the cerebral vesicle becomes differentiated into an anterior thicker region, placed in the posterior part of the trunk and having a superficial layer of nerve fibres, and a posterior narrower part which traverses the tail, lying on the dorsal surface of the notochord, and gives off several pairs of nerves to the muscles of the tail. Just in front of the anterior end of the nervous system a dorsal involution of the epiblast breaks through into the upturned anterior end of the mesenteron and thus forms the mouth opening. Along the ventral edge of the mesenteron, which becomes the branchial sac, the endostyle is formed as a narrow groove with thickened side walls. It probably corresponds to the median portion of the thyroid body of Vertebrata. A curved outgrowth from the posterior end of the mesenteron forms the alimentary canal (oesophagus, stomach and intestine), which at first ends blindly. An anus is formed later by the intestine opening into the left of two lateral epiblastic involutions (the atria), which rapidly become larger and fuse dorsally to form the peribranchial cavity. Outgrowths from the wall of the branchial sac meet these epiblastic involutions and fuse with them to give rise to the first formed pair of stigmata, which thus come to open into the peribranchial cavity; and these alone correspond to the gill clefts of *Amphioxus* and the Vertebrata.

FIG. 14.—Sketches of Ascidian Larvae.

A, *Ascidia*; S, *Styela*; M, *Anurella*; C, Compound Ascidian.

Fig. 14 shows a few characteristic forms of Ascidian "tadpoles," or free-swimming larvae. A and S are typical simple Ascidians; M is the aberrant tailless form found in some *Molgulidae*; and C is the larva of a typical compound Ascidian.

After a short free-swimming existence the fully developed tailed larva fixes itself by its anterior adhering papillae to some foreign object, and then undergoes a remarkable series of retrogressive changes, which convert it into the adult Ascidian. The tail atrophies, until nothing is left but some fatty cells in the posterior part of the trunk. The adhering papillae disappear and are replaced functionally by a growth of the test over neighbouring objects. The nervous system with its sense organs atrophies until it is reduced to the single small ganglion, placed on the dorsal edge of the pharynx, and a slight nerve cord running for some distance posteriorly (van Beneden and Julien). Changes in the shape of the body and a further growth and differentiation of the branchial sac, peribranchial cavity and other organs now produce gradually the structure found in the adult Ascidian.

The most important points in connexion with this process of development and metamorphosis are the following: (1) In the

¹ Some of the first test cells are also probably derived from the epithelium of the egg follicle.

Ascidian embryo all the more important organs (e.g. notochord, neural canal, archenteron) are formed in essentially the same manner as they are in *Amphioxus* and other Chordata. (2) The free-swimming tailed larva possesses the essential characters of the

Chordata, inasmuch as it has a longitudinal skeletal axis (the notochord) separating a dorsally placed nervous system (the neural canal) from a ventral alimentary canal (the archenteron); and therefore during this period of its life-history the animal belongs to the Chordata. (3) The Chordate larva is more highly organized than the adult Ascidian, and therefore the changes by which the latter is produced from the former may be regarded as a process of degeneration (37). The important conclusion drawn from all this is that the Tunicata are the degenerate descendants of a group of primitive Chordata (see below).

CLASSIFICATION AND CHARACTERS OF GROUPS
ORDER I.—LARVACEA

Free-swimming pelagic forms provided with a large locomotory appendage (the tail), in which there is a skeletal axis (the urochord). A relatively large test (the "house") is formed with great rapidity as a secretion from the ectoderm; it is merely a temporary structure, which is cast off and replaced by another. The branchial sac is simply an enlarged pharynx with two ventral ciliated openings (stigmata) leading to the exterior. There is no separate peribranchial cavity. The nervous system consists of a large dorsally placed ganglion and a long nerve cord, which stretches backwards over the alimentary canal to reach the tail, along which it runs on the left side of the urochord. The anus opens ventrally on the surface of the body in front of the stigmata. No reproduction by gemmation or metamorphosis is known in the life-history.

This is one of the most interesting groups (fig. 16) of the Tunicata, as it shows more completely than any of the rest the characters of the original ancestral forms. It has undergone little or no degeneration, and consequently corresponds more nearly to the tailed-larval condition than to the adult forms of the other groups. The order includes a single family, the Appendiculariidae, all the members of which are minute and free-swimming. They occur on the surface of the sea.

They possess the power to form with great rapidity an enormously large investing gelatinous layer (fig. 11), which corresponds to the test of other groups. This was first described by von Mertens and by him named "Haus." It is only loosely attached to the body and is frequently thrown off soon after its formation and again reformed. H. Lohmann has made a careful study of the mode of formation of this "house" from certain large ectoderm cells, the "oikoplasts," and he considers that it probably fulfils the following functions: Its complicated apparatus of passages with partial septa form a finely perforated network, through which a relatively large volume of water is strained so as to entrap microscopic food particles; it helps in locomotion by its hydrostatic effect, and it is also a protection to the animal, which may escape from enemies by throwing off the house, which is many times its own size. The tail in the Appendiculariidae is attached to the ventral surface of the body (fig. 18), and usually points more or less anteriorly. The supposed traces of vertebrae in the muscle bands and the nerve cord are probably artifacts, and do not indicate true metameric segmentation. Near the base of the tail there is a distinct elongated ganglion (fig. 18, ng'). The anterior (cerebral) ganglion has connected with it an otocyst, a pigment spot, and a tubular process opening into the branchial sac and representing the dorsal tubercle and associated parts of an ordinary Ascidian. The branchial aperture or mouth leads into the branchial sac or pharynx. There are no tentacles. The endostyle is short. There is no dorsal lamina, and the peripharyngeal bands run dorsally and posteriorly. The wall of the branchial sac has only two ciliated apertures (fig. 19). They are homologous with the primary stigmata of the typical Ascidians and the gill clefts of vertebrates. They are

which, in an ordinary Ascidian, fuse to form the peribranchial cavity. The heart, according to Lankester, is formed of two cells, which are placed at the opposite ends and connected by delicate contractile protoplasmic fibrils. The large ovary and testis are placed at the posterior end of the body. The remainder of the structural details can be made out from figs. 18 and 19.

The family *Appendiculariidae* comprises amongst others the following genera: *Oikopleura* (Mertens), and *Appendicularia* (Cham.), in both of which the body is short and compact and the tail relatively long, while the endostyle is straight; *Megalocercus* (Chun) containing *M. abyssorum*, a huge deep-sea form from the Mediterranean (30 mm. long); *Fritillaria* (Quoy and Gaimard), in which the body is long and composed of anterior and posterior regions, the tail relatively short, the endostyle recurved, and an ectodermal hood is formed over the front of the body; and *Kowalevskia* (Fol), a remarkable form described by Fol (14), in which the heart and endostyle are said to be absent, while the branchial sac is provided with four rows of ciliated tooth-like processes.

ORDER II.—THALIACEA

Free-swimming pelagic forms which may be either simple or compound, and the adult of which is never provided with a tail or a notochord. The test is permanent and may be either well developed or very slight. The musculature of the mantle is in the form of more or less complete circular bands, by the contraction of which locomotion is effected. The branchial sac has either two large or many small apertures, leading to a single peribranchial cavity, into which the anus opens. Blastogenesis takes place from a ventral endostylar stolon. Alternation of generations occurs in the life-history, and may be complicated by polymorphism. The Thaliacea comprises two groups *Cyclomyaria* and *Hemimyaria*.

Sub-order 1.—*Cyclomyaria*.

Free-swimming pelagic forms which exhibit alternation of generations in their life-history but never form permanent colonies. The body is cask-shaped, with the branchial and atrial apertures at the opposite ends. The test is more or less well developed. The mantle has its musculature in the form of circular bands surrounding the body. The branchial sac is fairly large, occupying the anterior half or more of the body. Stigmata are usually present in its posterior part only. The peribranchial cavity is mainly posterior to the branchial sac. The alimentary canal is placed ventrally close to the posterior end of the branchial sac. Hermaphrodite reproductive organs are placed ventrally near the intestine.

This group forms one family, the *Doliolidae*, including three genera, *Doliolum* (Quoy and Gaimard), *Dolichinia* (Korotneff) and *Anchinia* (C. Vogt).

Doliolum, of which about a dozen species are known from various seas, has a cask-shaped body, usually from 1 to 2 cm. in length. The terminal branchial and atrial apertures (fig. 20) are lobed and the lobes are provided with sense organs. The test is very slightly developed and contains no cells. The mantle has eight or nine circular muscle bands surrounding the body. The most anterior and posterior of these form the branchial and atrial sphincters. The wide branchial and atrial apertures lead into large branchial and peribranchial cavities, separated by the posterior wall of the branchial sac, which is pierced by stigmata; consequently there is a free passage for the water through the body along its long axis, and the animal swims by contracting its ring-like muscle bands, so as to force out the contained water posteriorly. Stigmata may also be found on the lateral walls of the branchial sac, and in that case there are corresponding anteriorly directed diverticula of the peribranchial cavity. There is a distinct endostyle on the ventral edge of the branchial sac and a peripharyngeal band surrounding its anterior end, but there is no representative of the dorsal lamina on its dorsal edge. The oesophagus commences rather on the ventral edge of the posterior end of the branchial sac, and runs backward to open into the stomach, which is followed

Fig. 20.—*Doliolum denticulatum*, sexual generation, from the left side. Lettering as for fig. 18.

by a curved intestine opening into the peribranchial cavity. The alimentary canal as a whole is to the right of the middle line. The hermaphroditic reproductive organs are to the left of the middle line alongside the alimentary canal. They open into the peribranchial cavity. The ovary is nearly spherical, while the testis is elongated, and may be continued anteriorly for a long distance. The heart is placed in the middle line ventrally, between the posterior end of the endostyle and the oesophageal aperture. The nerve ganglion lies about the middle of the dorsal edge of the body, and gives off many nerves. Under it is placed the subneural gland, the duct of which runs forward and opens into the anterior end of the branchial sac by a simple aperture, surrounded by the spirally twisted dorsal end of the peripharyngeal band (fig. 20, *dl*).

The ova of the sexual generation produce tailed larvae; these develop into forms known as "nurses," which are asexual, and are

Development of *Doliolum*.—An auditory sac on the left side of the body, a ventrally-placed stolon near the heart, upon which buds are produced and a dorsal outgrowth near the posterior end of the body. The nurse after producing the buds becomes a degenerate form with very wide muscle bands. The buds give rise eventually to the sexual generation, which is polymorphic, having three distinct forms, in two of which the reproductive organs remain undeveloped. The buds while still very young migrate from their place of origin on the stolon, divide by fission, and become attached to the dorsal outgrowth of the body of the nurse, where they develop. The three forms produced are as follows. (1) Nutritive forms (trophozooids), which remain permanently attached to the nurse and serve to provide it with food; they have the body elongated dorso-ventrally, and the musculature is very slightly developed. (2) Foster forms (phoro-zooids), which, like the preceding, do not become sexually mature, but, unlike them, are set free as cask-shaped bodies with eight muscle bands and a ventral outgrowth, which is formed of the stalk by which the body was formerly united to the nurse. On this outgrowth the (3) forms (gonozooids) which become sexually mature are attached while still young buds, and after the foster forms are set free these reproductive forms gradually attain their complete development and are eventually set free and lose all trace of their connexion with the foster forms. They resemble the foster forms in having a cask-shaped body with eight muscle bands, but differ in having no outgrowth or process, and in having the reproductive organs fully developed.¹

Anchinis, of which only one species is known, *A. rubra*, from the Mediterranean, has the sexual forms permanently attached to portions of the dorsal outgrowth from the body of the *Anchinis* unknown nurse. The body is elongated dorso-ventrally. The test is well developed and contains branched cells. The musculature is not so well developed as in *Doliolum*. There are two circular bands at the anterior end and two at the posterior, and two on the middle of the body. The stigmata are confined to the obliquely placed posterior end of the branchial sac. The alimentary canal forms a U-shaped curve. The reproductive organs are placed on the right side of the body. The life-history is still imperfectly known. As in the case of *Doliolum* the sexual generation is polymorphic, and has three forms, two of which remain in a rudimentary condition so far as the reproductive organs are concerned. In *Anchinis*, however, the three forms do not occur together on one stolon or outgrowth, but are produced successively, the reproductive forms of the sexual generation being independent of the "foster forms" (see Barrois, 27).

Sub-order 2.—*Hemimyaria*.

Free-swimming pelagic forms which exhibit alternation of generations in their life-history and in the sexual condition form colonies.

Characters of *Hemimyaria*.—The body is more or less fusiform, with the long axis antero-posterior, and the branchial and atrial apertures nearly terminal. The test is well developed. The musculature of the mantle is in the form of a series of transversely-running bands, which do not form complete independent rings as in the *Cyclomyaria*. These transverse muscles are probably to be regarded as branchial and atrial sphincters which have spread over the body. The branchial and peribranchial cavities form a continuous space in the interior of the body, opening externally by the branchial and atrial apertures, and traversed obliquely from the dorsal and anterior end to the ventral and posterior by a long narrow vascular band, which represents the dorsal lamina, the dorsal blood-vessel, and the neighbouring part of the dorsal edge of the branchial sac of an ordinary Ascidian. The alimentary canal is placed ventrally. It may either be stretched out (ortho-enteric) so as to extend for some distance anteriorly, or—as is more usual—be concentrated (caryo-enteric) to form along with the reproductive organs a rounded opaque mass near the posterior end of the body known as the visceral mass or "nucleus." The embryonic development is direct, no tailed larva being formed.

This sub-order contains one family, the Salpidae, including the single genus *Salpa* (Forskäll), which, however, may be divided into two well-marked groups of species—(1) those, such as *S. pinnata*, in which the alimentary canal is stretched out along the

ventral surface of the body, and (2) those, such as *S. fusiformis* (fig. 21, A), in which the alimentary canal forms a compact globular mass, the "nucleus," near the posterior end of the body. About fifteen species

FIG. 21.—*Salpa runcinata-fusiformis*.

A, Aggregated form: *em*, Embryo; *gem*, Gemmiparous stolon; *m*, Mantle; *visc*, Visceral mass (nucleus). B, Solitary form: 1-9, Muscle bands. Lettering as before.

altogether are known; they are all pelagic forms and are found in nearly all seas. Each species occurs in two forms—the solitary (sexual) (*proles solitaria*) and the aggregated sexual (*proles gregaria*)—which are usually quite unlike one another. The solitary form (fig. 21, B) give rise by internal gemmation to a complex tubular stolon, which contains processes from all the more important organs of the parent body and which becomes segmented into a series of buds or embryos. As the stolon elongates, the embryos near the free end which have become advanced in their development are set free in groups, which remain attached together by processes of the test, each enclosing a diverticulum from the mantle so as to form "chains" (fig. 22). Each member of the chain is a *Salpa* of the sexual or aggregated form, and when mature may—either still attached to its neighbours or separated from them (fig. 21, A)—produce one or several embryos, which develop into the solitary *Salpa*. Thus the two forms alternate regularly.

FIG. 22.—Posterior part of solitary form of *Salpa demeritica-mucronata*, showing a chain of embryos nearly ready to be set free. *gem*, Young aggregated *Salpa* forming the chain. *st*, Stolon. *m*, Muscle band of the mantle.

The more important points in the structure of a typical *Salpa* are shown in fig. 23. The branchial and atrial apertures are at opposite ends of the body, and each leads into a large cavity, the branchial and peribranchial sacs, which are in free communication at the sides of the obliquely-running dorsal lamina or "gill." The test is well developed and adheres closely to the surface of the mantle. The muscle bands of the mantle do not completely encircle the body. They are present

FIG. 23.—Semi-diagrammatic representation of *Salpa* from left side. Lettering as before.

emb, Embryo. *m*, Mantle. *l*, Languet. *1'*, Thickening of test over nucleus. *dl*, Gill or branchia. 1-11, Muscle bands of mantle.

dorsally and laterally, but the majority do not reach the ventral surface. In many cases neighbouring bands join in the median dorsal line (fig. 21). The anterior end of the dorsal lamina is prolonged to form a prominent tentacular organ, the languet, projecting into the branchial sac. The nerve ganglion (which represents the ganglion of the Ascidian along with the subneural gland), dorsal lamina, peripharyngeal bands and endostyle, are placed in their

¹ For further details see Uljanin (28) and Neumann, *Doliolum*, in *Deutsch. Tief-See Exped.* (Jena, 1905).

usual positions; but in place of any distinct subneural gland there are two lateral neural glandular masses first described by Metcalf. These have no connexion with the ciliated funnel, but open by lateral ducts into the branchial cavity. Median and lateral eyes are also found in connexion with the ganglion. The large spaces at the sides of the dorsal lamina (often called the gill or branchia of *Salpa*), by means of which the cavity of the branchial sac is placed in free communication with the peribranchial cavity, are to be regarded as gigantic *stigmata* formed by the suppression of the lateral walls of the branchial sac. Fig. 23 represents an aggregated or sexual *Salpa* which was once a member of a chain, since it shows a testis and a developing embryo. The ova (always few in number, usually only one) appear at a very early period in the developing chain *Salpa*, while it is still a part of the gemiparous stolon in the body of the solitary *Salpa*. This gave rise to the view put forward by Brooks (25), that the ovary really belongs to the solitary *Salpa*, which is therefore a female producing a series of males by asexual gemination, and depositing in each of these an ovum, which will afterwards, when fertilized, develop in the body of the male into a solitary or female *Salpa*. This idea would of course entirely destroy the view that *Salpa* is an example of alternation of generations. The sexual or chain *Salpa*, although really hermaphrodite, is always protogynous; i.e. the female elements or ova are produced at an earlier period than the male organ or testis. This prevents self-fertilization. The ovum is fertilized by the spermatozoa of an older *Salpa* belonging to another chain, and the embryo is far advanced in its development before the testis is formed.

Development of *Salpa*. Follicular cells, known as kalymmocytes, migrate into the ovum and for a time play an important part in moulding the development and nourishing the blastomeres. At an early period in its development a part of the embryo becomes separated off, along with a part of the wall of the cavity in which it lies, to form the "placenta," in which the embryonic and the maternal blood streams circulate in close proximity (or actually coalesce during one period) and so allow of the passage of nutriment to the developing embryo. At a somewhat later stage a number of cells placed at the posterior end of the body alongside the future nucleus become filled up with oil-globules to form a mass of nutrient material—the elacoblact—which is used up later on in the development. Many suggestions have been made as to the homology of the elacoblact. The most probable is that it is the disappearing rudiment of the tail found in the larval condition of most Ascidians.

Addendum.

The family Octacnemidae includes the single remarkable genus *Octacnemus*, found during the "Challenger" expedition, and first described by Moseley (29). It is now known in both a solitary and an aggregated form, and was regarded by Herdman as a deep-sea representative of the pelagic Salpidae, possibly fixed; or, better, as related to the primitive fixed forms from which Salpidae have been derived. Metcalf, however, has shown that the aggregated form of *O. palagoniensis*, which he has described, is more nearly related to the Clavelinidae amongst Ascidiacea. The body is somewhat discoid, with its margin prolonged to form eight tapering processes (fig. 24), on to which the muscle bands of the mantle are continued. The alimentary canal

FIG. 24.—*Octacnemus*.

forms a distinct nucleus (fig. 24, A); the endostyle is very short, and the dorsal lamina is also reduced. The reproduction and life-history are entirely unknown. *Octacnemus* follows was found by the "Challenger" expedition in the South Pacific at depths of 1076 and 2176 fathoms, and Moseley has since described a new species, *O. palagoniensis*, one of the bathypneustes of the Pacific coast, in which

there is an aggregated form (fig. 24, B) consisting of individuals united by a stolon composed of test and body-walls.

ORDER III.—ASCIDIACEA

Fixed or free-swimming simple or compound Ascidiaceans which in the adult are never provided with a tail and have no trace of a notochord. The free-swimming forms are colonies, the simple Ascidiaceans being always fixed. The test is permanent and well developed; as a rule it increases with the age of the individual. The branchial sac is large and well developed. Its walls are perforated by numerous slits (*stigmata*) opening into the peribranchial cavity, which communicates with the exterior by the atrial aperture. Many of the forms reproduce by gemination, and in most of them the sexually-produced embryo develops into a tailed larva.

The Ascidiaceae includes three groups—the simple Ascidiaceans, the compound Ascidiaceans and the free-swimming colonial *Pyrosoma*.

Sub-Order 1.—*Ascidiae simplicis*.

Fixed Ascidiaceans which are solitary and very rarely reproduce by gemination; if colonies are formed, the members are not buried in a common investing mass, but each has a distinct test of its own. No strict line of demarcation can be drawn between the simple and the compound Ascidiaceans, and one of the families of the former group, the Clavelinidae (the social Ascidiaceans), forms a transition from the typical simple forms, which never reproduce by gemination, to the compound forms, which always do. The *Ascidiae simplicis* may be divided into the following families:—

Family 1., Clavelinidae.—Simple Ascidiaceans which reproduce by gemination to form small colonies in which each ascidozooid has a distinct test, but all are connected by a common blood system, and by prolongations of "epicardiac tubes" from the branchial sacs. Buds formed on stolons which are vascular outgrowths from the posterior end of the body, containing prolongations from the ectoderm, mesoderm and endoderm of the ascidozooid. Branchial sac not folded; internal longitudinal bars usually absent; stigmata straight; tentacles simple. This family contains, amongst others, the following three genera: *Ecteinascidia* (Herdman), with internal longitudinal bars in branchial sac; *Clavelina* (Savigny), with intestine extending behind branchial sac; and *Perophora* (Wiegmann), with intestine alongside branchial sac.

Family 2., Ascidiidae.—Solitary fixed Ascidiaceans with gelatinous test; branchial aperture usually eight-lobed, atrial aperture usually six-lobed. Branchial sac not folded; internal longitudinal bars usually present; stigmata straight or curved; tentacles simple. This family is divided into three sections:—

Sub-family 1., Hypobrythinae.—Branchial sac with no internal longitudinal bars. One genus, *Hypobrythia* (Moseley).

Sub-family 2., Ascidiinae.—Stigmata straight. Many genera, of which the following are the more important: *Ciona* (Fleming), dorsal languets present; *Ascidia* (Linnaeus, = *Phallusia*, Savigny), dorsal lamina present (see figs. 1 to 10); *Rhodossoma* (Ehrenberg), anterior part of test modified to form operculum; *Abyssascidia* (Herdman), intestine on right side of branchial sac.

Sub-family 3., Cordellinae.—Stigmata curved. Three chief genera: *Cordella* (Alder and Hancock), test gelatinous, body sessile; *Corynascidia* (Herdman), test gelatinous, body pedunculated; *Chelysoma* (Brod. and Sow.), test modified into horny plates.

Family 3., Cyathidae.—Solitary fixed Ascidiaceans, usually with leathery test; branchial and atrial apertures both four-lobed. Branchial sac longitudinally folded (fig. 26); stigmata straight; tentacles simple or compound. This family is divided into three sections:—

Sub-family 1., Styelinae.—Not more than four folds on each side of branchial sac (fig. 26, S) tentacles simple. The more important genera are: *Styela* (Macleay), stigmata normal, and *Bethyosarea* (Herdman), stigmata absent or modified.

(After Richardson. "Challenger" Report.)

| ped. Peduncle. | st. Stigmata. |
| | me. Mesoderm. |
| | ca. Calcareous spicules in vessels. |
| | tr. Transverse vessels. |

Sub-family 2, Cynthinae.—More than eight folds in branchial sac (fig. 26, C); tentacles compound; body sessile. The chief genus is *Cynthia* (Savigny), with a large number of species.

Sub-family 3, Bolleinae.—More than eight folds in branchial sac; tentacles compound; body pedunculated (fig. 25, A). The chief genera are: *Bolleina* (Savigny), branchial aperture four-lobed, stigmata normal; and *Culeolus* (Herdman), branchial aperture with less than four lobes, stigmata absent or modified (fig. 25, B). This last is a deep-sea genus discovered by the "Challenger" expedition (see 17).

Family IV, Molgulidae.—Solitary Ascidians, sometimes not fixed; branchial aperture six-lobed, atrial four-lobed. Test usually incrustured with sand. Branchial sac longitudinally folded; stigmata more or less curved, usually arranged in spirals; tentacles compound. The chief genera are: *Molgula* (Forbes), with distinct folds in the branchial sac, and *Eugyra* (Ald. and Hanc.), with no distinct folds, but merely broad internal longitudinal bars in the branchial sac. In some of the Molgulidae (genus *Anurella*, Lacaze-Duthiers, 20) the embryo (fig. 14, M) does not become converted into a tailed larva, the development being direct, without metamorphosis. The embryo when hatched assumes gradually the adult structure, and never shows the features characteristic of larval Ascidians, such as the urochord and the median sense-organs. Bourne has described an aberrant Molgulid, *Oligotrema*, from the Loyalty Islands, with a reduced branchial sac and enlarged pinnate muscular branchial lobes, apparently used for catching food!

Figs. 26 and 27 illustrate some details of structure of branchial sac, and of stomach in various simple and compound Ascidians, which are made use of in classification, and in the definitions of genera and larger groups.

Sub-Order 2.—Ascidiae Compositae.

Fixed Ascidians which reproduce by gemmation, so as to form colonies in which the ascidiozooids are buried in a common investing mass and have no separate tests. This is probably

Compound Ascidians. a somewhat artificial assemblage formed of two or three groups of Ascidians which produce colonies in which the ascidiozooids are so intimately united that they possess a common test or investing mass. This is the only character which distinguishes them from the Clavelinidae, but the property of reproducing by gemmation separates them from the rest of the Ascidiae Simples. The Ascidiae Compositae may be divided into seven families, which fall into two well-marked groups: (1) the Chalarosomata, including the first five families, with extended body, divided into two or three regions, and more nearly related to the Clavelinidae; and (2) the Pectosomata, including the Botryllidae and Polystyliidae, with a compact body, not divided into regions, and evidently related to the Cynthinae amongst simple Ascidians.

Family I., Distomidae.—Ascidiozooids divided into two regions,

thorax and abdomen; testes numerous; vas deferens not spirally coiled. The chief genera are: *Distoma* (Gaertner); *Distaplia* (Della Valle); *Coella* (Herdman), forming a pedunculated colony (see fig. 28, A) in which the ascidiozooids develop incubatory pouches, connected with the peribranchial cavity, in which the embryos undergo their development (17); and *Chondrostachys* (Macdonald).

Family II., Coelocormidae.—Colony not fixed, having a large axial cavity with a terminal aperture. Branchial apertures five-lobed. This includes one species, *Coelocormus huxleyi* (Herdman), which is, in some respects, a transition form between the ordinary compound Ascidians (e.g. *Distomidae*) and the Ascidae Luciae (*Pyrosoma*).

Family III., Didemnidae.—Colony usually thin and incrusting test containing stellate calcareous spicules. Testis single, large;

FIG. 28.—Colonies of Ascidiae Compositae. (Natural size.)

A, *Coella quoyi*. B, *Leptoclinnum neglectum*. C, *Pharyngodictyon mirabile*. D, *Botryllus*, showing arrangement of ascidiozooids in circular systems, each of which has a central common cloaca.

vas deferens spirally coiled. The chief genera are—*Didemnum* (Savigny), in which the colony is thick and fleshy and there are only three rows of stigmata on each side of the branchial sac; and *Leptoclinnum* (Milne-Edwards), in which the colony is thin and incrusting (fig. 28, B) and there are four rows of stigmata on each side of the branchial sac.

Family IV., Diplosomidae.—Test reduced in amount, rarely containing spicules. Vas deferens not spirally coiled. In *Diplosoma* (Macdonald), the most important genus, the larva is gemmiparous.

Family V., Polycyrtidae.—Ascidiozooids divided into three regions—thorax, abdomen and post-abdomen. Testes numerous; vas deferens not spirally coiled. The chief genera are: *Pharyngodictyon* (Herdman), with stigmata absent or modified, containing one species, *Ph. mirabile* (fig. 28, C), the only compound Ascidian known from a depth of 1000 fathoms; *Polycyrtum* (Savigny), with a smooth-walled stomach; *Aplidium* (Savigny), with the stomach wall longitudinally folded (fig. 27); and *Amaronium* (Milne-Edwards), in which the ascidiozooid has a long post-abdomen and a large atrial languet.

Family VI., Botryllidae.—Ascidiozooids having the intestine and reproductive organs alongside the branchial sac. Dorsal lamina present; internal longitudinal bars present in branchial sac. The chief genera are: *Botryllus* (Gaertn. and Pall.), with simple stellate systems (fig. 28, D), and *Botryllodes* (Milne-Edwards), with elongated or ramified systems. It is well known that in the family Botryllidae, amongst compound Ascidians, the ectodermal vessels containing

FIG. 29.—Young Colony of *Botryllus*, showing Buds and Ampullae. a, Ampullae; B₁ B₂ B₃ B₄, Successive generations of buds; i, Intestine; vp, Vessels of the test.

blood, which ramify through the common test and serve to connect the vascular systems of the various members of the colony, have numerous large ovate dilatations, the ampullae, upon their terminal twigs (fig. 29). Various functions have been assigned to these ampullae in the past, and Bancroft has shown that in addition to acting as storage reservoirs for blood, organs for the secretion of test matrix, and accessory organs of respiration, they are also organs for blood propulsion. The ampullae execute co-ordinated pulsations, the co-ordination being due to variations in the blood-pressure. It was actually found that the ampullae could keep up the circulation for some time in a portion of a colony independently of the hearts of the ascidozooids. All the hearts in a colony of *Botryllus* contract simultaneously and in the same direction. The reversal of the circulation may be regarded as due to the engorgement of the ampullae in the superficial parts of the colony. These when distended overcome the resistance of the heart's action, and cause it to stop and then reverse.

Family VII. Polystyelidae.—Ascidozooids not grouped in systems. Branchial and atrial apertures four-lobed. Branchial sac may be folded; internal longitudinal bars present. The chief genera are: *Thalassia* (Cuvier), with ascidozooids projecting above general surface of colony; *Goodmania* (Cunningham), with ascidozooids completely imbedded in investing mass; and *Chlorostomus* (Herdman), with ascidozooids united in little groups which are connected by stolons. Several of the species show transitions between the other Polystyelidae and the Styelinae amongst simple Ascidiaceae.

Gemmation and Growth of Colonies.—A number of new observations have been made in recent years upon the budding of compound Ascidiaceae, some of which are very puzzling and contradictory in their results. Metschnikoff, Kowalevsky, Giard, Hjort, Pizon, Seeliger, Ritter, van Beneden and Julin have all in turn added to our knowledge of the details of development and life-history, of the various processes of gemmation and of the formation of colonies. It is impossible as yet to reconcile all the conflicting accounts, but the following points at least seem pretty clear.

Gemmation may be very different in its details in closely related compound Ascidiaceae. There are, however, two main types of budding, to one or other of which most of the described methods may be referred. There is first the "stolonial" or "epicardiac" type, seen in the Chalarosomata, typically in Distomidae and Polydridae, and comparable with the gemmation in Clavelinidae, Pyrosomidae and Thaliaceae outside this group. Secondly, there is the "parietal" or "peribranchial" type, seen in the Pectosomata, typically in the Botryllidae. The remarkable process of gemmation seen in the families Dilemmidae and Diplosomidae may probably be regarded as a modification of the stolonial type. The double embryo in the Diplosomidae is probably to be interpreted as precocious budding (rather than as embryonic fission), due to acceleration in development (tachygenesis). The type of budding, and even details such as the length of the stolon, have much to do with differences in the nature and appearance of the colonies produced. The stolon, which has a wall continuous with the body-wall of the parent, contains an endodermal element in the form of the so-called "epicardium," and also a prolongation of the ovary, or at least a string of migrating germ-cells, so that the reproductive elements are also handed on. Still, it is clear from recent researches

and attempts to explain budding in Ascidiaceae as a process of regeneration, by which the organs of the parent or their germ-layers give rise to the corresponding organs in the bud, have signally failed.

Figs. 29 and 30 show the buds in the Botryllidae, after Pizon, who has followed day by day the changes of growth in young colonies of Botryllidae, tracing the rise of successive generations of buds and the degeneration of their parents. The buds are parietal, arising from the walls of the peribranchial cavities (fig. 29), and at an early period they acquire the structure shown in fig. 30, where there are two vesicles undergoing further subdivision and differentiation, but investigators still differ as to whether the inner, which gives rise to the branchial sac and alimentary canal, is not produced along with the outer from the ectoderm of the parent.

A remarkable case of polymorphism has been found by M. Caullery in the buds of the compound Ascidian *Coelata*. Some of the buds have an abundant store of reserve materials in their outer layer of cells, while others are without this supply.

The former are placed deeply in the stalk, develop slowly, and probably serve to regenerate the colony when the head portion has been removed or has died down. In these cases where the ectoderm has taken on the function of storing the reserve material, it is found that all the organs of the bud are formed from the cells of the endodermic vesicle. The first ascidozooid of the colony produced by the tailed larva does not form sexual reproductive organs, but reproduces by gemmation so as to make a colony. Thus there is alternation of generations in the life-history. In the most completely formed colonies (e.g. *Botryllus*) the ascidozooids are arranged in groups (systems or coenobii), and in each system are placed with their atrial apertures towards one another, and all communicating with a common cloacal cavity which opens to the exterior in the centre of the system (fig. 28, D).

Sub-Order 3.—Ascidide Luciae.

Free-swimming pelagic colonies having the form of a hollow cylinder closed at one end. The ascidozooids forming the colony are em-

bedded in the common test in such a manner that the branchial apertures open on the outer surface and the atrial apertures on the inner surface next to the central cavity of the colony. The ascidozooids are produced by gemmation from a rudimentary larva (the cyathozooid) developed sexually.

This sub-order includes a single family, the Pyrosomidae, containing one well-marked genus, *Pyrosoma* (Péron), with half a dozen species. They are found swimming near the surface of the sea, chiefly in tropical latitudes, and are brilliantly phosphorescent. A fully developed *Pyrosoma* colony may be from an inch or two to upwards of twelve feet in length. The shape of the colony is seen in fig. 31. It tapers slightly towards the closed end, which is rounded. The opening at the opposite end is released in size by the presence of a membranous prolongation of the common test (fig. 31, B). The branchial apertures of the ascidozooids are placed upon short papillae projecting from the general surface, and most of the ascidozooids have long conical processes of the test projecting outwards beyond their branchial apertures (figs. 31, 32 and 33).

There is only a single layer of ascidozooids in the *Pyrosoma* colony, as all the fully developed ascidozooids are placed with their antero-posterior axes at right angles to the surface and communicate by their atrial apertures with the central cavity of the colony (fig. 32). Their dorsal surfaces are turned towards the open end of the colony. The more important points in the structure of the ascidozooid of *Pyrosoma* are shown in fig. 33. A circle of tunicules, of which one, placed ventrally (fig. 33, A), is larger than the rest, is found just inside the branchial aperture. From this point a wide cavity, with a few circularly placed muscle bands running round its walls, leads back to the large branchial sac, which occupies the greater part of the body. The stigmata are elongated transversely and crossed by internal longitudinal bars. The dorsal lamina is represented by a series of eight laminae (L). The nerve ganglion (on which is placed a small pigmented sense organ), the salivary gland, the dorsal tubercle, the peripharyngeal

posteriorly to the branchial sac, and the anus opens into a large peribranchial (or atrial) cavity, of which only the median posterior part is shown (p.br.) in fig. 33. The reproductive organs are developed in a diverticulum of the peribranchial cavity, and consist of a lobed testis and a single ovum at a time. The development takes place in a part of the peribranchial cavity (fig. 32, em). The segmentation is meroblastic, and an elongated embryo is formed on the surface of a mass of yolk. The embryo, after the formation of an alimentary cavity, a tubular nervous system, and a pair of laterally placed atrial tubes, divides into an anterior and a posterior part. The anterior part then segments into four pieces, which afterwards develop into the first ascidiozooids of the colony, while the posterior part remains in a rudimentary condition, as the "cyathozoid"; it eventually atrophies. As the four ascidiozooids increase in size, they grow round the cyathozoid and soon encircle it (fig. 32, asc and cy). The cyathozoid absorbs the nourishing yolk upon which it lies, and distributes it

to the ascidiozooids by means of a heart and system of vessels which have been meanwhile formed. When the cyathozoid atrophies and is absorbed, its original atrial aperture remains and deepens to become the central cavity of the young colony, which now consists of four ascidiozooids placed in a ring, around where the cyathozoid was, and enveloped in a common test. The colony gradually increases by the formation of buds from these four original ascidiozooids.

PHYLOGENY

The accompanying diagram (fig. 34) shows graphically the probable origin and course of evolution of the various groups of Tunicata, and therefore exhibits their relations to one another *Phylogeny* much more correctly than any system of linear classification can do. The ancestral Proto-Tunicata are here regarded as an offshoot from the Proto-Chordata—the common

FIG. 34.

ancestors of the Tunicata (Urochordata), *Amphioxus* (Cephalochordata) and the Vertebrata. The ancestral Tunicata were probably free-swimming forms, not very unlike the existing Appendiculariidae, and are represented in the life-history of nearly all sections of the Tunicata by the tailed larval stage. The Larvacea are the first offshoot from the ancestral forms which gave rise to the two lines of descendants, the Proto-Thaliacea and the Proto-Ascidiacea. The Proto-Thaliacea then split into the ancestors of the existing Cyclommaria and Hemimmaria. The Proto-Ascidiacea gave up their pelagic mode of life and became fixed. This ancestral process is repeated at the present day when the free-swimming larva of the simple and compound Ascidians becomes attached. The Proto-Ascidiacea, after the change, are probably most nearly represented by the existing genus *Clavelina*. They have given rise directly or indirectly to the various groups of simple and compound Ascidians and the Pyrosomidae. These groups form two lines, which appear to have diverged close to the position of the family Claveliniidae. The one line leads to the more typical compound Ascidians, and includes the Polyclinidae, Distomidae, Didemniidae, Diplosomidae, Coelocormidae, and finally the Ascidiæ Luciae or Salpiformes. The second line gave rise to the simple Ascidians, and to the Botryllidae and Polystylidae, which are, therefore, not closely allied to the other compound Ascidians. The later Proto-Ascidiacea were probably colonial forms, and germination was retained by the Claveliniidae and by the typical compound Ascidians (Distomidae, &c.) derived from them. The power of forming colonies by budding was lost, however, by the primitive simple Ascidians, and must, therefore, have been regained independently by the ancestral forms of the Botryllidae and the Polystylidae. If this is a correct interpretation of the course of evolution of the Tunicata, we arrive at the following important conclusions. (1) The Tunicata, as a whole, form a degenerate branch of the Proto-Chordata; (2) the Ascidiæ Luciae (*Pyrosoma*) are much more closely related to the typical compound Ascidians than to the other pelagic Tunicata, viz. the Larvacea and the Thaliacea; and (3) the Ascidiæ Compositæ form a polyphyletic group, the sections of which have arisen at several distinct points from the ancestral simple Ascidiæ.

TUNICLE (Lat. *tunicella*), a liturgical vestment of the Christian church, proper to subdeacons. It is practically the same vestment as the dalmatic (q.v.).

TUNING FORK, a small bar of cast steel with tolerably defined edges, bent into a fork with two prongs, with a handle of the same metal extending from the bend of the fork and serving as a sound-post to transmit the vibrations to any resonance board or body convenient for reinforcing the sound. The fork is set in vibration by striking one of the prongs against a hard substance, or pressing the prongs together if they are light ones, or if heavy drawing a bow across. The tuning fork was invented by John Shore, royal trumpeter in 1711, sergeant trumpeter at the entry of George I. in 1714, and lutanist of the Chapel Royal in 1715. It is used for determining musical pitch (see PITCH), and also in certain physical experiments (see SOUND).

TUNIS, capital of Tunisia, the largest city in North Africa outside Egypt, in 36° 48' N., 10° 12' E. Tunis is situated on an isthmus between two salt lakes, the marshy Sebkhah-el-Sejumi to the south-west, and the shallow el-Bahira (little sea), or Lake of Tunis, to the north-east. An artificially deepened channel through the Bahira into the Gulf of Tunis has converted the city into a seaport (see below). North-west and south-west the city is commanded by hills, on which are forts, that on Sidi bel Hassan to the south dating from the middle ages. The city, which was formerly strongly fortified, is built in the shape of an amphitheatre, with the kasbah, or citadel, at its highest point. The old town (Medina), the walls of which have in great part disappeared, lies between two suburbs, the Ribat-el-Sowika on the north and the Ribat Bab-el-Jezira on the south. These suburbs were also surrounded by a wall, now pulled down, leaving the gates of the city isolated. An outer wall, however, encloses the Medina and its suburbs. Beyond the Bab-el-Bahar (sea-gate), now called Porte de France, on the level ground by the Bahira, is the marine town, or Quartier Franc, built since by the French occupation in 1831. No attempt has been made by the French to modernize the ancient city.

The European Quarter.—From the landing stage a short street leads into the broad Avenue Jules Ferry or de la Marine running east to west and ending in the Place de la Résidence, on the north side of which is the Roman Catholic cathedral and on the south side the palace of the French resident-general, with a large garden. The main thoroughfare is continued westwards by the Avenue de France, which leads to the Porte de France. Beyond the gate is the small Place de la Bourse, in which is the British consulate. From the Porte electric trams run to the harbour and also in a circle round the native city. —From the Place de la Résidence cross

and south. The northern road, the Rue de Rome, led to the Gare du Nord, the station for Carthage, Goletta and La Marsa. This line was replaced in 1908 by an electric tramway built along the northern bank of the canal connecting Tunis and Goletta. The southern road, the Rue-es-Sadikia, leads to the Gare du Sud, the station for Susa, Kairawan, &c., and also for Algiers. The Avenue Jules Ferry is intersected by a north-to-south street running in a straight line over two miles. The northern section is called the Avenue de Paris; the southern Avenue de Carthage. By these avenues, served by electric trams, access is gained to the suburbs of the city. In the Avenue de France or Avenue Jules Ferry are the chief hotels and cafés, the casino-theatre, the principal banks and the finest shops. In the Rue d'Italie, running south from the Avenue de France, are the post office, market buildings, and French Protestant church. There is an English church in the Rue d'Espagne. Behind the cathedral is a disused cemetery with a chapel, where the Christian slaves are supposed to have worshipped. The coffins in the vaults have been removed to the Chapel of St Louis at Carthage. Among them was that of M. de Lesseps, French consul-general (d. 1832), father of the maker of the Suez Canal. Next to the cemetery is the old Greek church. North of the Avenue de France is a district, inhabited chiefly by Maltese, which has obtained the name of Malta-es-Segheira (Little Malta).

The Native Town.—To the visitor from Europe the attraction of Tunis lies in the native city, where, in the Rue al Jezira, along which runs electric trams, he can see hundreds of camels in the morning bearing charcoal to market; where he may witness the motley life of the bazaars, or, by the Bab-Jedid, watch the snake-charmers and listen to the Moorish storytellers. Christians are forbidden to enter the mosques. From various points the traveller can look over the city, with its great citadel, its many minarets and its flat-topped houses. Many of the dwellings of the richer residents are adorned with arcades, the marble columns of which were taken from the ruins of Carthage. The Porte de France is the threshold of the ancient city. Two narrow streets climb the hill towards the citadel. That to the right, the Rue de la Kasbah, opens into a small square (Suk-el-Islam or Place de la Kasbah), on the left of which is the Dar-el-Bey (palace of the bey), while beyond it rise the walls of the citadel. That to the left leads to the chief mosque of the city, the Jamaa-el-Zeituna (mosque of the Olive Tree), founded in A.D. 698. It has many domes and a spacious cloister, and its central court can be seen from the neighbouring streets. Attached to the mosque is a college attended by several hundreds of Moslem youths. The Dar-el-Bey contains numerous rooms beautifully decorated in the Moorish style of the 18th century; and the judgment hall has a domed roof adorned with the delicate arabesque plaster-work known as *Nukab kadida*. The kasbah, which forms the western side of the Suk-el-Islam, includes within the circuit of its walls a mosque built about A.D. 1232 by Abu Zakariya the Hafside. Of the ancient kasbah nothing but the walls remain, the old buildings having been demolished to make way for barracks for the French troops. Besides being a fortress the kasbah formerly contained a palace of the beys, barracks for janissaries and bagnios for the Christian slaves. When in July 1535 the Spaniards under Charles V. attacked Tunis, the Christians in the kasbah, said to number 10,000, rose against their keepers and helped to secure the victory of the emperor. The Spaniards during their occupancy of Tunis strengthened the kasbah and built an aqueduct to supply it with water. Immediately north of the kasbah are the buildings of the Sadiki College, and north of the college is the Palais de Justice, a building completed in 1901. It stands between the line of the ancient wall and the enceinte. Its walls are decorated with faience taken from an ancient Tunisian palace. North-east of the Palais de Justice, which like the Sadiki College is built in the Moorish style, rises the great dome, surrounded by smaller cupolas, of the largest mosque in the city, that named after Sidi Mahrez, a renowned saint of the 5th century of the Mahommedan era, whose tomb makes it a

sanctuary for debtors. East of the mosque, which dates from the 17th century, and just without the inner city walls, here demolished, is the Protestant cemetery of St George, used during the 17th, 18th and the greater part of the 19th centuries. Here are buried several British consuls. Here also was the grave of John Howard Payne, author of "Home, Sweet Home" and consul for the United States, who died at Tunis in 1852. In 1883 the body was disinterred and removed to America, but a monument has been placed on the spot similar to that erected over the new tomb at Washington.

The Bazaars.—The native city to the north of the Rue de la Kasbah includes the Jewish quarter and the synagogue. The Jews of Tunis adopt a special costume, the women wearing gaily coloured vests and close-fitting white trousers. Beyond the Jewish quarter, in the Ribat-el-Soweika, is the Place el Halfa-Ouine, a favourite rendezvous of the poorer Moslem population, wherein are many native cafés. South of the Rue de la Kasbah is the bazaar quarter. Here the streets are very narrow and tortuous, some being vaulted and many covered in with planking. They are known as suks (markets), and each suk is devoted to one particular trade. Beyond paving the streets the French have made no alteration in the suks, which retain their original character unimpaired. The shops consist of small cubes, open in the front, in which the trader squats cross-legged amidst his wares. The principal suks are el-Attarin (market of the perfumers), el-Farashin (carpets and cloths), el-Serajin (saddlery) and el-Birka (jewelry). The suk el-Birka was formerly the slave market. Near by are the green-tiled domes and walls enriched with rose-coloured marbles of the mausoleum of the beys.

Public Institutions, &c.—Tunis is furnished with well-equipped hospitals and a large asylum for aged people kept by the Little Sisters of the Poor. The principal educational establishments, besides that of the mosque of the Olive Tree, are the Sadiki College, founded in 1875, for free instruction in Arabic and European subjects, the Lycée Carnot in the Avenue de Paris, formerly the College of St Charles (founded by Cardinal Lavignerie), open to Christians and Moslems alike, and the normal school, founded in 1884 by the reigning bey, for the training of teachers in the French language and European ideas. The Dames de Sion have a large establishment for the teaching of small children of both sexes, and there is a secondary school for girls. All the schools are well attended. About a mile and a half north of the centre of the European quarter, on the slopes of a hill rising 270 ft., is the Parc du Belvédère covering some 240 acres and commanding extensive views. Water is supplied to the city, with its numerous fountains, from Jebel Zaghwan (*vide infra*) by the Roman aqueduct repaired, at a cost of half a million sterling, by the bey Mahommed al-Sadik (d. 1882).

The Port.—The canal which traverses the shallow Bahira, and connects Tunis with the Mediterranean, is nearly seven miles long. By means of breakwaters it is continued beyond the coast-line and is at its mouth 328 ft. wide. It has a uniform depth of 214 ft., but its width within the lake is reduced to 98 ft. In the centre, however, the canal is widened to 147 ft. to allow vessels to pass. There is a harbour at the entrance (see GOLETTA). That at the Tunis end of the canal is 1312 ft. long by 984 ft. broad, and is of the same depth as the canal. The canal was begun in 1885 and was opened to navigation in June 1893. An additional basin, south-east of the main harbour, was opened in 1905 and is used for the exportation of phosphates. Of the ships using the harbour more than half are French, and one-third Italian, British vessels coming next. British goods, however, are largely carried in French bottoms, and next to France the United Kingdom and Malta take most of the trade of the port. The exports are chiefly phosphates and other minerals, cereals, olive oil, cattle, hides, sponges and wax. The imports are cotton goods, flour, hardware, coal, sugar, tea, coffee, &c. The figures of trade and shipping are included in those of the trade of the regency (see TUNISIA), of which Tunis and Goletta take about a third.

Population.—The population of the city at the census of 1906 was returned at 227,519. The "natives"—Arabs, Berbers, "Moors," Turks and negroes—were estimated at 100,000, Tunisian Jews at 50,000, French 18,000, Italians 52,000, Maltese 6000, Greeks 500 and Levantines 1000. The French language is predominant in the European quarter.

Environns: The Bardo Palace, Zaghwan, &c.—The environs of Tunis are picturesque and afford many beautiful views, the finest being from the hill on the south-east, crowned by a French fort, and from the Belvédère already mentioned. About a mile and a quarter from the Bab Bu Saadun, the north-west gate of the city, is the ancient palace called the Bardo, remarkable for the "lion court," a terrace to which access is gained by a flight of steps guarded by marble lions, and for some apartments in the Moorish style. The finest of these apartments, containing beautiful arabesque

plaster work, formed the old Harem, and are now part of the Musée Alaoui, which occupies a considerable portion of the Bardo. In this museum M. Paul Gauckler, the director of the department of art and antiquities in the Tunisian government, has formed a magnificent collection of Carthaginian and Roman antiquities, especially Roman mosaics. In the Musée Arabe, which occupies an adjacent small palace built about 1830, are treasures illustrative of the Arab-Berber or Saracenic art of Tunisia.

South-east of the city, along the valley of the Wadi Melain, are hundreds of large stone arches, magnificent remains of the Roman aqueduct from Zaghwan to Carthage. At Zaghwan (38 m. by rail from Tunis), over the spot whence the spring which supplies the aqueduct issues from the hill, are the ruins of a beautiful Temple of the Waters. The spring is now diverted direct into the aqueduct and is not visible at the surface. Between Zaghwan and Tunis, and accessible by the same railway, is Wadna, the Roman Uthina, where, besides numerous other ruins, are the fairly preserved arches of a large amphitheatre. The ruins of Carthage (q.v.) lie a few miles north of Goletta.

History.—Tunis is probably of greater antiquity than Carthage, of which city however it became a dependency, being repeatedly mentioned in the history of the Punic Wars. Strabo speaks of its hot baths and quarries. The importance of Tunis dates from the Arab conquest, when, as Carthage sank, Tunis took its place commercially and politically. It became the usual port for those going from the sacred city of Kairawan to Spain, and was one of the residences of the Aghlabite dynasty (800-900). In the 10th century it suffered severely, being repeatedly pillaged in the wars of the Fatimite caliphs Al-Qaim and Abu Tahir Isma'il of Mansur with the Sunnite leader Abu Yazid and the Zenata Berbers.

For its later fortunes, see TUNISIA, of which regency, since the accession of the Hafisites, Tunis has been the capital.

TUNISIA (Regency of Tunis), a country of North Africa, under the protection of France, bounded N. by the Mediterranean, W. by Algeria, E. by Tripoli and S. by the Sahara. Tunisia reaches farther north than any other part of Africa, Ras-al-Abiadh (Cape Blanc) being in 37° 20' N. On the south the boundary of the Tunisian Sahara is undetermined, but it may be roughly placed at 31° N. This would give, therefore, a greatest length of something like 440 m. The country lies between 11° 40' E. and 9° 35' E. The average length is about 300 m., and the average breadth 150 m.; consequently the area may be estimated at 50,000 sq. m. (For map, see ALGERIA.)

Physical Features.—Geographically speaking, Tunisia is merely the eastern prolongation of the Mauretanian projection of northern Africa, of that strip of mountainous, fertile and fairly well-watered country north of the Sahara desert, which in its flora and its fauna, and to some extent in its human race, belongs rather to Europe than to Africa. Tunisia is divided into the following four fairly distinct regions:—

1. On the north and north-west the Aures mountains of Algeria are prolonged into Tunisia, and constitute the mountainous region of the north, which lies between the Majerda river and the sea, and also includes the vicinity of the city of Tunis and the peninsula of the Dakhelat el Mawin, which terminates in Ras Addar (Cape Bon). This first division is called by the French "the Majerda Mountains." It includes within its limits the famous district of the "Kroumir," a tribe whose occasional thefts of cattle across the frontier gave the French an excuse to invade Tunisia in 1881. The highest point which the mountains attain in this division of Tunisia is about 4125 ft., near Ain Draham in Kroumiria. The country, however, about Bizerta is very mountainous, though the summits do not attain a greater altitude than about 3000 ft. The district between Bizerta and the Gulf of Tunis is a most attractive country, resembling greatly the mountainous regions of South Wales. It is well watered by streams more or less perennial. The principal river, the Majerda, is formed by the junction of the Wad Malleg and the Wad Kkallad. It and its

¹ It is possible that Ras-ben-Sekka, a little to the west of Cape Blanc, may be actually the most northerly point.

² The French seem systematically unable to master certain sounds foreign to their own language, or sounds which they suppose to be foreign. Thus the "w," though constantly represented in French by "ou," is continually changed by them into "v" when they transcribe foreign languages, just as the Greek x and the German and Scottish "ch" is almost invariably rendered by the French in Algeria and Tunis as "kr." Add to this the insertion of vowel sounds where they are lacking in the Arabic and you derive from the real word *Khamir* the modern French term of *Kroumir*. In like manner *sebkha*, a salt lake, is constantly written by the French as *sebkra*.

tributaries rise in the Majerda and Aures mountains. Flowing north-east the Majerda forms an extensive plain in its lower course, reaching the sea near the ruins of Utica. Vegetation is abundant, and recalls that of the more fertile districts of southern Spain and of Italy. On the higher mountains the flora has a very English character, though the actual species of plants may not be the same.

2. The central plateau region, stretching between the Majerda valley and the mountains of Gafsa. The average elevation of this country is about 2000 ft. The climate, therefore, in parts is exceedingly cold and bleak in winter, and as it is very wind-swept and parched in summer by the terrible *gibli* or "sirocco" it is much less attractive in appearance than the favoured region on the northern littoral. Although it is almost always covered with some kind of vegetation, trees are relatively rare. A few of the higher mountains have the Aleppo pine and the juniper; elsewhere only an infrequent wild terebinth is to be seen. In these two regions the date palm is never met with growing naturally wild. Its presence is always due to its having been planted by man at some time or another, and therefore it is never seen far from human habitations. These central uplands of Tunisia in an uncultivated state are covered with alfalfa or esparto grass; but they also grow considerable amounts of cereals—wheat in the north, barley in the south. The range of the Saharan Atlas of Algeria divides (roughly speaking) into two at the Tunisian frontier. One branch extends northwards up this frontier and north-eastwards across the central Tunisian table-land, and the other continues south-eastwards between Gafsa and the salt lakes of the Jerid. The greatest altitudes of the whole of Tunisia are attained on this central table-land, where Mt. Sid el Ali bu Musin ascends to about 5700 ft. About 30 m. south of the city of Tunis is the picturesque mountain of Zaghan, approximately 4000 ft. in altitude, and from whose perennial springs come the water-supply of Tunis to-day as it did in the time of the Carthaginians and Romans. North-east of Zaghan, and nearer Tunis, is the Jebel Resas, or Mountain of Lead, the height of which is just under 4000 ft.

3. The Sahel. This well-known Arab term for coast-belt (which in the plural form reappears as the familiar "Swahili" of Zanzibar) is applied to a third division of Tunisia, viz. the littoral region stretching from the Gulf of Hammamet to the south of Sfax. It is a region varying from 30 to 60 m. in breadth, fairly well watered and fertile. In a less marked way this fertile coast region is continued southwards in an ever-narrowing belt to the Tripolitan frontier. This region is relatively flat, in some districts slightly marshy, but the water oozing from the soil is often brackish, and in places large shallow salt lakes are formed. Quite close to the sea, all along the coast from Hammamet to Sfax, there are great fertility and much cultivation; but a little distance inland the country has a rather wild and desolate aspect, though it is nowhere a desert until the latitude of Sfax has been passed.

4. The Tunisian Sahara. This occupies the whole of the southern division of Tunisia, but although desert predominates, it is by no means all desert. At the south-eastern extremity of Tunisia there is a clump of mountainous country, the wind-and-water-worn fragments of an ancient plateau, which for convenience may be styled the Matmata table-land. Here altitudes of over 3000 ft. are reached in places, and in all the upper parts of this table-land there is fairly abundant vegetation, grass and herbage with low junipers, but with no pine trees. Fairly high mountains (in places verging on 4000 ft.) are found between Gafsa and the salt lakes of the Jerid.

These salt lakes are a very curious feature. They stretch with only two short breaks in a line from the Mediterranean at the Gulf of Gabes to the Algerian frontier, which they penetrate for a considerable distance. They are called by the French (with their usual inaccuracy of pronunciation and spelling) "chotts"; the word should really be the Arabic *shat*, an Arab term for a broad canal, an estuary or lake. These shats however are, strictly speaking, not lakes at all at the present day. They are smooth depressed areas (in the case of the largest, the Shat el Jerid, lying a few feet below the level of the Mediterranean), which for more than half the year are expanses of dried mud covered with a thick incrustation of white or grey salt. This salt covering gives them

The Shats. At a distance the appearance of big sheets of water-river water. During the winter, however, when the effect of the rare winter rains is left, there may actually be 3 or 4 ft. of water in these shats, which by liquefying the mud makes them perfectly impassable. Otherwise, for about seven months of the year they can be crossed on foot or on horseback. It would seem probable that at one time these shata (at any rate the Shat el Jerid) were an inlet of the Mediterranean, which by the elevation of a narrow strip of land on the Gulf of Gabes has been cut off from them. It is, however, a region of past volcanic activity, and these salt depressions may be due to that cause. Man is probably the principal agent at the present day in causing these shats to be without water. All round these salt lakes there are numerous springs, gushing from the sandy hillocks. Almost all these springs are at a very hot temperature, often at boiling point. Some of them are charged with salt, others are perfectly fresh and sweet, though boiling hot. So abundant is

their volume that in several places they form actual ever-flowing rivers. Only for the intervention of man these rivers would at all times find their way into the adjoining depressions, which they would maintain as lakes of water. But for a long period past the freshwater streams (which predominate) have been used for irrigation to such a degree that very little of the precious water is allowed to run to waste into the lake basins; so that these latter receive only a few salt streams, which deposit on their surface the salt they contain and then evaporate. This abundant supply of fresh warm water maintains oases of extraordinary luxuriance in a country where rain falls very rarely. Perennial streams of the description referred to are found between the Algerian frontier and Gabes on the coast. The town at Gabes itself is on the fringe of a splendid oasis, which is maintained by the water of an ever-running stream emptying itself into the sea at Gabes after a course of not more than 20 m.

All this region round the shats has been called the "Jerid" from the time of the Arab occupation. "Jerid" means in Arabic a "palm frond" and inferentially "a palm grove." *The Jerid.* The fame of this Belad-el-Jerid, or "Country of the Jerid," Date Palms," was so exaggerated during the 17th and 18th centuries that the European geographers extended the designation from this small area in the south of Tunisia to cover much of inner Africa. With this country of Jerid may be included the island of Jerba, which lies close to the coast of Tunisia in the Gulf of Gabes. The present writer believes that the date palm was really indigenous to this district of the Jerid, as it is to countries of similar description in southern Morocco, southern Algeria, parts of the Tripolitania, Egypt, Mesopotamia, southern Persia and north-western India; but that north of the latitude of the Jerid the date did not grow naturally in Mauretania, just as it was foreign to all parts of Europe, in which, as in true North Africa, its presence is due to the hand of man. To some extent it may be said that true North Africa lies to the north of the Jerid country, which, besides its Saharan, Arabian and Persian affinities, has a touch about it of real Africa, some such touch as may be observed in the valley of the Jordan. In the oases of the Jerid are found several species of tropical African mammals and two or three of Senegalese birds, and the vegetation seems to have as much affinity with tropical Africa as with Europe. In fact, the country between the Matmata highlands and the strait separating Jerba from the mainland is singularly African in the character and aspect of its flora. To the south of the Jerid the country is mainly desert—vast unexplored tracts of shifting sand, with rare oases. Nevertheless, all this southern district of Tunisia bears evidence of once having been subject to a heavy rainfall, which scooped out deep valleys in the original table-land, and has justified the present existence of immense watercourses—watercourses which are still, near their origin, favoured with a little water.

Hot and mineral springs may be almost said to constitute one of the specialties of Tunisia. They offered a singular attraction to the Romans, and their presence in remote parts of the country no doubt was often the principal cause of Roman settlement. Even at the present day their value is much appreciated by the natives, who continue to bathe in the ruined Roman baths. The principal mineral springs of medicinal value are those of Korbus and Hammam Lif (of remarkable efficacy in rheumatic and syphilitic affections and certain skin diseases), of the Jerid and Gafsa, of El Hamma, near Gabes, and of various sites in the Kroumir country.

Climate.—The rainfall in the first geographical division is pretty constant, and may reach a yearly average of about 22 in. Over the second and third divisions the rainfall is less constant, and its yearly average may not exceed 17 in. The mean annual temperature at Sôsa is 75° F., the mean of the winter or rainy season 60° and of the hot season 97°. At Tunis the temperature rarely exceeds 90°, except with a wind from the Sahara. The prevailing winds from May to September are east and north-east and during the rest of the year north-west and east. A rainy season of about two months usually begins in January; the spring season of verdure is over in May; summer ends in October with the first rains. Violent winds are common at both equinoxes. In the Tunisian Sahara rain is most uncertain. Occasionally two or three years may pass without any rainfall; then may come floods after a heavy downfall of a few weeks. Perhaps if an average could be struck it would amount to 9 or 10 in. per annum.

Geology.—The greater part of Tunisia is composed of sandstones, marls and loosely stratified deposits belonging to the Pliocene and Quaternary periods. The oldest strata, consisting of gypsiferous marls, are referred to the Muschelkalk and show an alternation of lagoon with marine conditions. The Liassic and Oolitic formations are well represented, but the Sequanian and Kimmeridgian subdivisions are absent. Lower Cretaceous rocks, consisting of thick limestones, shales and marls, occur in Central Tunisia. The fossils show many notable affinities with those in the Lower Cretaceous of the Pyrenees. Limestones and marls represent the stages Cenomanian to Upper Senonian. The fossils of the Cenomanian have affinities with those in the Cenomanian of Spain, Egypt, Madagascar, Mozambique and India. The Senonian consists of a

central facies with *Microsax pectini*; a meridional facies with *Ostrea*; and a northern facies developed round Tunisia with large forms of *Inoceramus* and echinoids. Phosphatic deposits are well developed among the Lower Eocene rocks. The Middle Eocene is characterized by the presence of *Ostrea bogharensis* and the Upper Eocene by highly fossiliferous sandstones and marls. The Oligocene and Miocene formations are present, but the Upper Miocene is confined to the coast. Quaternary deposits cover much of the desert regions.]

Minerals.—Coal has been discovered in the Khmir ("Kroumir") country, but the principal mines at present worked in Tunisia are those of copper, lead and zinc. Zinc is chiefly found in the form of calamine. Iron is worked in the Kel district. Valuable deposits of phosphates are present, chiefly in the south-west of Tunisia, in the district of Gafsa. Marble is found in the valley of the Majerda (at Schemtu), at Jebel Ust (about 35 m. south of Tunis), and at Jebel Dissa, near Gabes. The marbles of Schemtu are the finest pink Numidian marbles, which were much esteemed by the Carthaginians and Romans. It has been sought to work again the ancient quarries of Schemtu, but it was found that the marble had been spoilt by ferruginous and calcareous veins.

Flora.—The flora of Tunisia is very nearly identical with that of Algeria, though it offers a few species either peculiar to itself or not found in the last-named country. On the whole its character is less Saharan than that of parts of Algeria, for the influences of the desert do not penetrate so far north in Tunisia as they do in Algeria. There are very few patches of real forest outside the Khmir country, though it is probable that in the time of the Romans the land was a good deal more covered with trees than at the present day. Some authorities, however, dispute this, in a measure, by saying that it was not naturally forested, and that the trees growing represented orchards of olives or other fruit trees planted by the Romans or romanized Berbers. But in the Majerda Mountains there are dense primeval forests lingering to the present day, and consisting chiefly of the cork oak (*Quercus ruber*), and two other species of oak (*Quercus mirbeckii* and *Q. kermes*), the pistachio or terebinth tree, the sumach (*Rhus pentaphylla*), and other species of *Rhus* which are widely spread. In the mountains of Khmiria and the central plateau there are also the alder, the poplar, the Aleppo pine, the carob, the tamarisk, the maple, the nettle-tree, several willows and junipers. The jujube-tree (*Zizyphus*) is found at various places along the eastern littoral. The retama shrub is met with in sandy districts, especially in the Sahara, but also right up to the north of Tunisia. The wild olive, the wild cherry, two species of wild plums, the myrtle, the ivy, arbutus, and two species of holly are found in the mountains of Khmiria, at various sites at high elevation near Tunis and Bizerta, and along the mountainous belt of the south-west which forms the frontier region between Tunisia and Algeria. The present writer, riding up to these frontier mountains from the thoroughly Saharan country round Gafsa, found himself surrounded by a flora very reminiscent of Switzerland or England. On the other hand, the flora of the shat region, of the south-eastern littoral, and of the Kerkena islands opposite Sfax, is thoroughly Saharan, with a dash, as it were, in places of an African element. The date palm grows wild, as has been already related, in Jerba. The only other species of palm found wild in Tunisia is the *Chamaerops humilis*, or dwarf palm, which is found on the mountains of the north at no very great altitude. The wild flowers of the north of Tunisia are so extremely beautiful during the months of February, March and April as to constitute a distinct attraction in themselves.²

<i>Comolobus tricolor</i> , L.	
<i>Sileneanthus lanatus</i> , DC.	

Fauna.—The fauna of Tunisia at the present day is much impoverished as regards mammals, birds and reptiles. In 1880 the present writer saw lions killed in the north-west of Tunisia, but by 1902 the lion was regarded as practically extinct in the regency, though occasional rumours of his appearance come from the Khmir Mountains and near Feriana. Leopards of large size are still found in the north-west of central Tunisia. The cheetah lingers in the extreme south of the Jerid; so also does the caracal lynx. The pardiae lynx is found fairly abundantly in the west of Tunisia in the mountains and forest. The striped hyena is scattered over the country sparsely. The genet and the common jackal are fairly abundant. The common ichneumon is rare. The zorilla, another purely African species, is found in the south of Tunisia. The Barbary otter is present in the Majerda and in some of the salt lakes. The Tunisian hedgehog is peculiar to that country and to Algeria. There is a second species (*Eriacus deserti*) which is common to all North Africa. In the south of Tunisia, especially about the shats, the elephant-shrew (*Macroscelides*) is found, an animal of purely African affinities. Tunisia does not appear to possess the Barbary ape, which is found in Algeria and Morocco. Natives of Morocco and of the Sahara oases occasionally bring with them young baboons which they assert are obtained in various Sahara countries to the south and south-west of Tunisia. These baboons appear to belong to the Nubian species, but they cannot be considered indigenous to any part of Tunisia. The porcupine and a large Octodont rodent (*Clenodactylus*), the jerboa (two species), the hare, and various other rodents are met with in Tunisia. The wild boar inhabits the country, in spite of much persecution at the hands of "chasseurs." The forested regions shelter the handsome Barbary red deer, which is peculiar to this region and the adjoining districts of Algeria. In the extreme south, in the Sahara desert, the addax antelope is still found. The hartebeest appears now to be quite extinct; so also is the leucoryx, though formerly these two antelopes were found right up to the centre of Tunisia, as was also the ostrich, now entirely absent from the country. In the marshy lake near Mater (north Tunisia), round the mountain island of Jebel Ashkel, is a herd of over 50 buffaloes; these are said to resemble the domestic (Indian) buffalo of the Levant and Italy, and to have their origin in a gift of domestic buffaloes from a former king of Naples to a bey or dey of Tunis. Others again assert the buffaloes to have been there from time immemorial; in which case it is very desirable that a specimen should be submitted for examination. [An allied form with gigantic horns is found fossil in Algeria.] They are the private property of the bey, who very properly preserves them. Far down in the Sahara, to the south of Tunisia, the Arabs report the existence of a wild ass, apparently identical with that of Nubia. Roman mosaics show representations not only of this ass, but of the oryx, hartebeest, and perhaps of the addax. The dorcas gazelle is still common in the south of Tunisia; but perhaps the most interesting ruminant is the magnificent udd, or Barbary sheep, which is found in the sterile mountainous regions of south Tunisia. The birds have been already illustrated by Mr Whitaker in the *Ibis* magazine of the British Ornithological Union. They are, as a rule, common to the south Mediterranean region. A beautiful little bird almost peculiar to the south of Tunisia and the adjoining regions of Algeria, is a species of bunting (*Fringilla*), called by the Arabs *bu-kabibi*. This little bird, which is about the size of the linnet, has the head and back silvery blue, and the rest of the plumage chocolate red-brown. It is of the most engaging tameness, being fortunately protected by popular sentiment from injury. It inhabits the Jerid, and extends thence across the Algerian frontier. Among reptiles the Egyptian cobra seems to be indigenous in the south, where also is found the dreaded horned viper. Some nine or ten other species of snakes are present, together with an abundance of lizards, including the *Varanus*, and most species of Mediterranean tortoises are represented. The coasts are very rich in fish, and the tunny fisheries of the north are one of the principal sources from which the world's supply of tunny is derived.

Inhabitants.—The natives of Tunisia at the present day belong mainly to two stocks, which may be roughly classified as the Berber (*q.v.*) and the Arab (*q.v.*), about two-thirds being of Berber and the remaining third of Arab descent. But the Berbers of to-day are little more than an incomplete fusion of some four earlier and once independent stocks. These four divisions taken in the order of their assumed priority of invasion or habitation are: (1) the "Neanderthal" type, which is found in the districts of the shats and the adjoining Matmata table-land in the south, and in the "Kroumir" country of the

<i>Echium sericeum</i> , Vahl.	<i>Arum italicum</i> , Mill.
<i>Echium maritimum</i> , Willd.	<i>Lagurus onatus</i> , L.
<i>Anchusa italicum</i> , Retz.	

To this list should also be added the common wild tulip, the Italian cyclamen, the common scarlet poppy, the fennel, wild carrot and many varieties of thistle, some of gorgeous colouring.

³ "Father of my friend."

north-west;¹ (2) ordinary Berbers, dolichocephalous, and of brown complexion, found over the greater part of Tunisia, especially in the east and south centre; (3) the short-headed Berbers, found in part of the Matmata country, part of the Sahara, the island of Jerba, the Cape Bon Peninsula, and the vicinity of Susa, Kairwan, and Sfax; (4) Berbers of a blond type, that is to say, with a tendency to brown or yellow moustaches, brown beard and head hair, and grey eyes. These are met with in the west and north-west of Tunisia, and in one patch on the coast of the Cape Bon Peninsula, near Nabeul.

The Arabs of more or less unmixed descent are purely nomads. They are met with in a long strip of country south of the Majerda, between the Algerian frontier and the sea-coast north of Susa; also inland, to the south-west of Susa, and near Kef; also in another long strip between the vicinity of Sfax on the north and the Jerid on the south. They are descended from the second Arab invasion which began in the 11th century (see *History*). The extreme south of Tunis is ranged over by Berber Tawareq² or Tamasheq. Berber dialects are still spoken in Tunisia in the island of Jerba, in the Matmata country, and in the Tunisian Sahara. Elsewhere to a remarkable degree the Arabic language has extinguished the Berber tongue, though no doubt in vulgar Tunisia a good many Berber words remain. Short vocabularies of the Berber spoken in the Tunisian Sahara have been published by Sir H. H. Johnston in the *Geog. Journ.* (1898), vol. xi., and by Mr G. B. Michell in the *Journ. African Soc.* (1903). The Berbers are organized in tribes with purely democratic government and laws of their own, which are not those of the Koran.

On the north-eastern littoral of Tunisia the population is very mixed. The inhabitants of the Cape Bon Peninsula show evident signs of Greek blood arising from Greek invasions, which began in prehistoric times and finished with the downfall of the Byzantine Empire in North Africa. The presence of the Romans, and the constant introduction of the Italians, first as slaves, and quite recently as colonists, has also added an Italian element to the north Tunisian population. But from the fact that the bulk of the Tunisian population belongs to the Iberian section of the Berbers, and to this being no doubt the fundamental stock of most Italian peoples, the intermixture of the Italianized Berber with his African brother has not much affected the physique of the people, though it may have slightly tinged their mental characteristics.

The Phoenicians have left no marked trace of their presence; but inasmuch as they were probably of nearly the same race as the Arabs, it would not be easy to distinguish the two types. Arab and Berber have mingled to some extent, though no considerable fusion of the two elements has taken place. In fact, it is thought by some French students of the country that the Arab element will probably be eliminated from Tunisia, as it is the most unsettled. It is considered that these nomads will be gently pushed back towards the Sahara, leaving cultivable Tunisia to the settled Berber stock, a stock fundamentally one with the peoples of Mediterranean Europe.

The inhabitants of the coast towns belong, in large part, to the class generally known as "Moors." The pure Turks and the Kuluglis (sons of Turkish fathers by Moorish women or slave girls) are no longer numerous. Among the "Moors" the descendants of the Andalusian refugees form an exclusive and aristocratic class.

The present population of Tunisia numbers approximately 2,000,000, and consists of:—

Berbers, more or less of pure race, say	620,000
Arabs	500,000
Mixed Arab and Berber peoples, say	520,000

¹ In this Matmata country are the celebrated Troglodytes, people living in caves and underground dwellings now, much as they did in the days when the early Greek geographers alluded to them. See "A Journey in the Tunisian Sahara," by Sir H. H. Johnston, in the *Geog. Journ.* (June 1898).

² Tawareq (Twareg) is the Arab designation of the Libyan or Desert Berbers. It is the plural form of *Targi*, "a raider." The Tawareq call themselves by some variant of the root *Masheq*—*Tamasheq*, *Imosheq*, &c.

"Moors" (chiefly the population of the principal cities, of mixed Roman, Berber, Spanish, Moor and Christian races), say	110,000
Sudanese negroes and natives of Morocco, Tripoli and Turkey, say	40,000
Jews (mostly natives of Tunis, indeed, some descended from families settled at Carthage before the destruction of Jerusalem)	68,000
Europeans (Christians) ³	163,000

Towns.—Besides the capital, Tunis, the chief towns of Tunisia are Sfax, Susa and Kairwan. These places are noticed separately, as are also Goletta (formerly the port of Tunisia), Bizerta (a naval port and arsenal), Kef, Porto Farina, and the ruins at Carthage and Sbeitla (Sufetula). Other towns of Tunisia are, on the east coast, Nabeul, pop. about 5000, the ancient Neapolis, noted for the mildness of its climate and its pottery manufactures: Hammamet with 3700 inhabitants; Monastir (the Ruspina of the Romans), a walled town with 5600 inhabitants and a trade in cereals and oils; Mahdiya or Mahdia (*q.v.*; in ancient chronicles called the city of Africa and sometimes the capital of the country) with 8500 inhabitants, the fallen city of the Fatimites, which since the French occupation has risen from its ruins, and has a new harbour (the ancient *Colthou* or harbour, of Phoenician origin, cut out of the rock is nearly dry but in excellent preservation); and Gabes (Tacepa of the Romans, Qabis of the Arabs) on the Syrtes, a group of small villages, with an aggregate population of 16,000, the port of the Sbat country and a depot of the esparto trade. The chief town of the Majerda basin is Beja (pop. 5000), the ancient Vaga, an important corn market. The principal mosque at Beja was originally a Christian basilica, and is still dedicated to Sidna Aissa (our Lord Jesus). Gafsa, in the south of Tunisia, is a most interesting old Roman town, with hot springs. It is in railway communication with Sfax. West of Gafsa are immense beds of phosphates. Almost all the towns of Tunisia were originally Roman or romanized Berber settlements; consequently the remains of Roman buildings form a large part of the material of which their existing structures are composed.

Antiquities and Art.—The principal Roman and other ruins in the regency are the aqueducts near the capital (Tunis) and the temple at Zaghwan, described under Tunis city; the great reservoir near Carthage (*q.v.*); the amphitheatre at El Jem (see *SUSA*); the temples and other ruins of Sbeitla (*q.v.*); the ruins of Dugga, near Tebursuk, in the north-west of the regency (the amphitheatre of Dugga, the ancient Thugga, is a magnificent spectacle); the baths, amphitheatre and temples of Feriana (the ancient Thelepte); the whole route between Feriana (which is in the south of Tunisia, 33 m. north-west of Gafsa) and Tebessa in Algeria is strewn on both sides with Roman ruins; the old houses and other ruins at and near Thala; the baths and other ruins of Gafsa; the baths at Tuzer, El Hamma and Gabes. There is an interesting Phoenician burial-ground near Mahdia. There are Roman ruins, scarcely known, in the vicinity of Beja and the country of the Mogods (the district behind Cape Serrat). In short, Tunisia is as much strewn with Roman remains as is Italy itself.

Saracenic art has perhaps not attained here the high degree it reached in western Algeria, Spain and Egypt; still it presents much that is beautiful to see and worthy to be studied. One of the most ancient, as it is one of the loveliest fragments, strange to say, is found at Tuzer, in the Jerid, the *mahrab* of a ruined mosque.⁴ There are some very beautiful doorways to mosques and other specimens of Moorish art at Gabes. Examples of this art found at Tunis and Kairwan have been noticed under those headings. But the visible remains of Saracenic art in Tunis and its vicinity are of relatively recent date, the few mosques which might offer earlier examples not being open to inspection by Christians. It may be noted, however, as a general condition that the native towns and villages of Tunisia, where they have not been spoiled by the shocking tastelessness of Mediterranean Europe, are exceedingly picturesque, and offer exceptional attractions to the painter.

Industries.—Agriculture is the principal industry. Oats, wheat and barley are the chief crops in the north. In the central region

³ Of recent introduction for the most part, consisting (census of 1906) of 81,156 Italians, 34,610 French, 10,330 Maltese, about 1000 Greeks and the remainder British, German, Austrian, &c. The French army of occupation (20,360 men) is not included in these figures.

⁴ Since this was written the *mahrab* in question has been removed to Paris.

the olive is largely cultivated, in the south the date-palm. Viti-culture is also of importance; almonds, oranges, lemons, &c., are also grown for export. The alfa and cork industries employ large numbers of persons, as do also the sardine, anchovy and tunny fisheries. The fisheries are in the hands of Italians, Maltese and Greeks. There are large herds of cattle and flocks of sheep and goats. About 60,000 acres are cultivated by French immigrants and about 15,000 acres by Italians.

Among native industries may be mentioned the spinning and weaving of wool for clothing, carpet-weaving, the manufacture of pottery, silvers and metal, saddle-making and leather embroidery. Silk-weaving, formerly important, is declining.

In 1907 the number of mines working was 37. The export of phosphates rose from 445,000 tons in 1904 to 1,267,000 tons in 1908. The export of coal in that year was 74,000 tons, and copper ore 937 tons (*vide supra*, § Minerals).

Commerce.—The commerce of Tunisia has thriven under the French protectorate, having risen from an annual total of about £1,700,000 in 1881 to £8,687,000 in 1908. British trade with Tunisia has nearly tripled since the establishment of the French protectorate. It stood at over £600,000 in annual value during the year 1898. In 1908 the total trade with Great Britain and Malta amounted to £714,000. In the same year the imports from France exceeded £2,590,000 and the exports to France £1,685,000. From Algeria the imports were £656,000; to Algeria the exports were £185,000. The principal exports are olive oil, wheat, esparto grass, barley, sponges, dates, fish (especially tunny), hides, horses, wool, phosphates, copper, zinc and lead. The imports consist mainly of European manufactured goods (especially British cotton), machinery, flour, alcohol, sugar, timber, coal and petroleum. About half the shipping trade is in the hands of the French; in 1908, of the total tonnage of ships entered, 4,155,000, French vessels represented 1,905,000 tons, Italian vessels 1,422,000 tons and British vessels 299,000 tons.

Communications.—The French have made since 1882 about 2000 m. of good roads. The first railway built (1871–1872) was that between Collo and Tunis. This line, with the extensions to La Marsa and Bardo, is 214 m. in length. It was constructed by an English company, which in 1880 sold it to an Italian company, despite the keen competition of French rivals (see *History*, below). The conversion of Tunis into a seaport (1893) destroyed the importance of this line, which was then sold to the French Bone-Guelma Company (Bone-Guelma et Prolongements), which owns the majority of the railways in Tunisia.

The second railway connects the capital with the frontier of Algeria, where, at Suk Ahras, it joins the main line to Constantine, Algiers, &c. This line was built by the Bone-Guelma Company. The concession was obtained in 1877, and the line, 191 m. long, was finished in 1880. A branch line (8 m.) connected Beja with this railway, and another (11 m.) ran from Tunis to Hamman-el-Enf, a favourite seaside resort of the Tunisians.

For the next twelve years there was a pause in railway construction followed by the opening, in 1892, of the line between Susa and Moknine (30 m.). Then came the continuation of the line from Hamman-el-Enf to Hammamet and along the Sahel to Susa (93 m.), and the building of a line from Susa to Kairwan, 31 m. (the last-named line superseded a horse-tramway built by the French army during the campaign of 1881). A branch line to Bizerta (43½ m.) from Jeddida on the main Algeria-Tunis line was also built as well as one from Tunis to Zaghwan (44 m.). A short line, branching from the Tunis-Zaghwan line, was carried south-west to Pont du Fahs. These with a few short branch lines were built between 1892 and 1906 by the Bone-Guelma Company. In 1906 was opened a continuation of the line from Pont du Fahs to Kef and thence south-west to Kalat-es-Senam, a place midway between Kef and Tebessa, the centre of the Algerian phosphate region. A branch from the Kef line runs to the phosphate mines of Kalata-Jerda.

Another railway (completed by 1900) runs from Sfax, along the coast to Mahres, thence inland to Gafsa and the phosphate mines of Metawali. This line, 151 m. long, was for some years isolated from the general Tunisian system. The total mileage of the Tunisian railways was computed to be 1060 m. by the finishing of the Susa-Sfax, Gabes-Tebessa lines in 1909. Extensions of the railway system are contemplated at Gabes and, beyond, to the Tripolitan frontier. In the south communication is maintained chiefly by camel caravans.

Posts and Telegraphs.—The whole of Tunisia is covered with a network of telegraph lines (2500 m.), and there are telephones working in most of the large towns. The telegraph system penetrates to the farthest French post in the Sahara, is connected with the Turkish system on the Tripolitan frontier and with Algeria, and by cable with Sicily, Malta, Sardinia and Marseilles. There is an efficient post office service, with about 400 post offices.

Finance.—The principal bank is the Banque de Tunisie. The coinage formerly was the caroub and piastre (the latter worth about 6d.), but in 1891 the French reformed the coinage, substituting the franc as a unit, and having the money minted at Paris. The value of the coinage are pieces of 5, and 10 centimes in bronze, of 50 centimes, 1 franc and 2 francs in silver, of 10 francs and 20 francs in gold. The inscriptions are in French and Arabic.

The public debt was consolidated in 1884 into a total of £5,702,000, guaranteed by France, and bearing 4% interest. In 1888 it was converted into a loan paying 3½% interest, and in 1892 another conversion reduced the rate of interest to 3%. In 1902 a new loan of £1,800,000 was issued at 3%. At the beginning of 1907 the total Tunisian debt was £9,287,200; in that year the government was authorized to contract another loan of £5,000,000 at 3½% (£3,000,000 being guaranteed by France) for railways, roads and colonization. The weights and measures are those of France. The revenue for the year 1906 was £1,456,640, and the expenditure was £1,452,597. In 1910 receipts and expenditure balanced at about £388,000 each. The principal sources of revenue are direct taxation, stamp and death duties, customs, port and lighthouse dues, octroi and tithes, tobacco, salt and gunpowder monopolies, postal and telegraph receipts, and revenue from the state domains (lands, fisheries, forests, mines). The civil list paid to the Bey of Tunis amounts to £36,000 per annum, and the endowment of the princes and princesses of the beylical family to £31,200 a year more.

Administration.—From a native's point of view Tunisia still appears to be governed by the Bey of Tunis, his Arab ministers and his Arab officials, the French only exercising an indirect—though a very real—control over the indigenous population (Mahommedans and Jews). But all Christians and foreigners are directly governed by the French, and the native administration is supervised by a staff of thirteen French *contrôleurs* and their French and Tunisian subordinates. Seven of the departments of state have Frenchmen at their head, the other two, Tunisians: thus the larger proportions of the Bey's ministers are French. France is directly represented in Tunisia by a minister resident-general, and by an assistant resident. The French resident-general is the virtual viceroy of Tunisia, and is minister for foreign affairs. Besides Mussulman (native) schools there were in the regency, in 1906, 158 public schools, 5 lycées and colleges and 21 private schools. At these schools were 22,000 pupils (13,000 boys), all save 3500 Mussulmans being Europeans or Jews.

History.—The history of Tunisia begins for us with the establishment of the Phœnician colonies (see *PHœNICIA* and *CARTHAGE*). The Punic settlers semitized the coast, but left the Berbers of the interior almost untouched. The Romans entered into the heritage of the Carthaginians and the vassal kings of Numidia, and Punic speech and civilization gave way to Latin, a change which from the time *Province of* Caesar was helped on by Italian colonization; to "Africa," this region the Romans gave the name of "Africa," apparently a latinizing of the Berber term "Ifriqia," "Ifriqia" (in modern Arabic, *Ifriqiyyah*).

Rich in corn, in herds, and in later times also in oil, and possessing valuable fisheries, mines and quarries, the province of Africa, of which Tunisia was the most important part, attained under the empire a prosperity to which Roman remains in all parts of the country still bear witness. Carthage was the second city of the Latin part of the empire, "after Rome the busiest and perhaps the most corrupt city of the West, and the chief centre of Latin culture and letters." In the early history of Latin Christianity Africa holds a more important place than Italy. It was here that Christian Latin literature took its rise, and to this province belong the names of Tertullian and Cyprian, of Arnobius and Lactantius, above all of Augustine. Lost to Rome by the invasion of the Vandals, who took Carthage in 439, the province was recovered by Belisarius a century later (533–34), and remained Roman till the Arab invasions of 648–69. The conqueror, 'Oqba-bin-Nafa, founded the city of Kairwan (673) which was the residence of the governors of "Ifriqiyyah" under the Omayyads and thereafter the capital of the Aghlabite princes, the conquerors of Sicily, who ruled in merely nominal dependence on the Abbasids.

The Latin element in Africa and the Christian faith almost disappeared in a single generation; the Berbers of the

The North African Church was not utterly swept away by the Moslem conquest, though its numbers at that time were very greatly diminished, and thereafter fell gradually to vanishing point, partly by emigration to Europe. Its episcopate in the 10th century still numbered thirty members, but in 1076 the Church could not provide three bishops to consecrate a new member of the episcopate and for that purpose Gregory VII. named two bishops to act with the archbishop of Carthage. In the 13th century the native episcopate had disappeared. Abd ul-Mumin, the Almohade conqueror of Tunisia, compelled many of the native Christians to embrace Islam, but when Tunis was captured by Charles V. in 1535, there were still found in the city native Christians, the last remnants of the

mountains, who had never been latinized and never really christianized, accepted Islam without difficulty, but showed their stubborn nationality, not only in the character of their Mahommedanism, which has always been mixed up with the worship of living as well as dead saints (marabouts) and other peculiarities, but also in political movements. The empire of the Fâtimites (7.v.) rested on Berber support, and from that time forth till the advent of the Turks the dynasties of North Africa were really native, even when they claimed descent from some illustrious Arab stock. When the seat of the Fâtimate Empire was removed to Egypt, the Zirites, a house of the Sanhaja Berbers, ruled as their lieutenants at Mahdia, and about 1050 Mo'izz the Zirite, in connexion with a religious movement against the Shi'ites, transferred his very nominal allegiance to the Abbasid caliphs. The Fâtimites in revenge let loose upon Africa about A.D. 1045 a vast horde of Beduins from Upper Egypt (Beni Hilal and Solaim), the ancestors of the modern nomads of Barbary. All North Africa was ravaged by the invaders, who, though unable to found an empire or overthrow the settled government in the towns, forced the agricultural Berbers into the mountains, and, retaining from generation to generation their lawless and predatory habits, made order and prosperity almost impossible in the open parts of the country until its effective occupations by the French. The Zirite dynasty was finally extinguished by Roger I. of Sicily, who took Mahdia in 1148 and established his authority over all the Tunisian coast. Even Moslem historians speak favourably of the Norman rule in Africa; but it was brought to an early end by the Almohade caliph Abd ul-Mumin, who took Mahdia in 1160.

The Almohade Empire soon began to decay, and in 1336 Abû Zakariyâ, prince of Tunis, was able to proclaim himself independent and found a dynasty, which subsisted till the advent of the Turks. The Hafsites (so called from Abû Hâfs, the ancestor of Abû Zakariyâ, a Berber chieftain who had been one of the intimate disciples of the Almohade mahdi) assumed the title of Prince of the Faithful, a dignity which was acknowledged even at Mecca, when in the days of Mostanîr, the second Hafsite, the fall of Bagdad left Islam without a titular head. In its best days the empire of the Hafsites extended from Tlemcen to Tripoli, and they received homage from the Merinids of Fez; they held their own against repeated Frankish invasions, of which the most notable were that which cost St Louis of France his life (1270), and that of the duke of Bourbon (1300), when English troops took part in the unsuccessful siege of Mahdia. They adorned Tunis with mosques, schools and other institutions, favoured letters, and in general appear to have risen above the usual level of Moslem sovereigns. But their rule was troubled by continual wars and insurrections; the support of the Beduin Arabs was imperfectly secured by pensions, which formed a heavy burden on the finances of the state; and in later times the dynasty was weakened by family dissensions. Leo Africanus, writing early in the 16th century, gives a favourable picture of the "great city" of Tunis, which had a flourishing manufacture of fine cloth, a prosperous colony of Christian traders, and, including the suburbs, nine or ten thousand hearths; but he speaks also of the decay of once flourishing provincial towns, and especially of agriculture, the

once powerful Church. Traces of Christianity remained among the Kabyles till after the conquest of Granada (1492), when the influx of Andalusian Moors from Spain completed the conversion of those tribes. It may be added that down to the early years of the 19th century it was alleged that some of the Tuareg tribes in the Sahara professed Christianity (see e.g. Hornemann's *Touaregs*). For the North African Church after the Moslem conquest, see *History of the Christian Church in Africa*, *Africa septentrionale*. Their religion had been mentioned in the introduction to vol. ii. of Azurara's *History and Conquest of Senegal*, Hakluyt Society's edition 1850. The Berber faith continues the Hafsites also paid tribute to Sicily. The sea and the right to import Sicilian wine were the chief sources of Tunisian agriculture.

greater part of the open country lying waste for fear of the Arab marauders. Taxation was heavy, and the revenue very considerable. Don Juan of Austria, in a report to Philip II., states that the land revenue alone under the last Hafsite was 375,935 ducats, but of this a great part went in tribute to the Arabs.

The conquest of Algiers by the Turks gave a dangerous neighbour to Tunisia, and after the death of Mohammed the Hafsite in 1525 a disputed succession supplied Khair-ad-Din Barbarossa with a pretext for occupying the city in the name of the sultan of Constantinople. Al-Hasan, the son of Mahommed, sought help from the emperor, and was restored in 1535 as a Spanish vassal, by a force which Charles V. commanded in person, while Andrea Doria was admiral of the fleet. But the conquest was far from complete, and was never consolidated. The Spaniards remained at Goletta and made it a strong fortress, they also occupied the island of Jerba and some points on the south-east coast; but the interior was a prey to anarchy and civil war, until in 1570 'Ali-Pasha of Algiers utterly defeated Hâmid, the son and successor of Hasan, and occupied Tunis. In 1573 the Turks again retreated on the approach of Don Juan, who had dreams of making himself king of Tunis; but this success was not followed up, and in the next year Sultan Selim II. sent a strong expedition which drove the Spaniards from Tunis and Goletta, and reduced the country to a Turkish province. Nevertheless the Spanish occupation left a deep impression on the coast of Tunis, and not a few Spanish words passed into Tunisian Arabic. After the Turkish conquest, the civil administration was placed under a pasha; but in a few years a military revolution transferred the supreme power to a Dey elected by the janissaries, who formed the army of occupation. The government of the Deys lasted till 1705, but was soon narrowed or overshadowed by the authority of the Beys, whose proper function was to manage the tribes and collect tribute. From 1631 to 1702 the office of Bey was hereditary in the descendants of Murâd, a Corsican renegade, and their rivalry with the Deys and internal dissensions kept the country in constant disorder. Ibrahîm, the last of the Deys (1702-1705), destroyed the house of Murâd, and absorbed the beyship in his own office; but, when he fell in battle with the Algerians, Hussein b. 'Ali, the son of a Cretan renegade, was proclaimed sovereign by the troops under the title of "Bey," and, being a prince of energy and ability, was able to establish the hereditary sovereignty, which has lasted without change of dynasty to the present time.²

Frequent wars with Algiers form the chief incidents in the internal history of Tunisia under the Beys. Under Deys and Beys alike Tunisia was essentially a pirate state. Occasionally acts of chastisement, of which the bombardment of Porto Farina by Blake in 1655 was the most notable, and repeated treaties, extorted by European powers, checked from time to time, but did not put an end to, the habitual piracies, on which indeed the public revenue of Tunis was mainly dependent. The powers were generally less concerned for the captives than for the acquisition of trading privileges, and the Beys took advantage of the commercial rivalry of England and France to play off the one power against the other. The release of all Christian slaves was not effected till after the bombardment of Algiers; and the definite abandonment of piracy may be dated from the presentation to the Bey in 1819 of a collective note of the powers assembled at Aix-la-Chapelle. The government had not elasticity enough to adapt itself to so profound a change in its ancient traditions; the finances became more and more hopelessly embarrassed, in spite of ruinous taxation; and attempts at European innovations in the court and army made matters only worse, so long as no attempt was made to improve

² Muhammad VI. es Sadok, the reigning Bey at the time of the French occupation, died in October 1882, and was succeeded by his brother 'Ali IV. This prince reigned until 1902, the throne then passing to his son Muhammad VII. el Hadi, who died in 1906, when his cousin Muhammad VIII. en Nasr (b. 1855) became Bey.

the internal condition of the country. In the third quarter of the 19th century not more than a tenth part of the fertile land was under cultivation, and the yearly charge on the public debt exceeded the whole annual revenue. In these circumstances only the rivalry of the European powers that had interests in Tunisia protracted from year to year the inevitable revolution. The French began to regard the dominions of the Bey as a natural adjunct to Algeria, but after the Crimean War Turkish rights over the regency of Tunis were revived. After the Franco-German War the embarrassed Bey turned towards Great Britain for advice, and a British protectorate—suggested by the proximity of Malta—was not an impossibility under the remarkable influence of the celebrated Sir Richard Wood, British diplomatic agent at the court of Tunis from 1855 to 1870. The railways, lighthouses, gas and waterworks and other concessions and industries were placed in British hands. But in 1878, at the Congress of Berlin, Lord Salisbury agreed to allow France a "free hand" in Tunisia in return for French acquiescence in the British lease of Cyprus.

After 1862, however, the kingdom of Italy began to take a deep interest in the future of Tunisia. When the country went bankrupt in 1869, a triple control was established over Tunisian finances, with British, French and Italian "controllers." In 1880 the Italians bought the British railway from Tunis to Goletta. This and other actions excited the French to act on the secret understanding effected with the British foreign minister at the Berlin Congress. In 1881 a French force crossed the Algerian frontier under pretext of chastising the independent Khmir or Kroumir tribes on the north-east of the regency, and, quickly dropping the mask, advanced on the capital and compelled the Bey to accept the French protectorate. The actual conquest of the country was not effected without a serious struggle with Moslem fanaticism, especially at Sfax; but all Tunisia was brought completely under French jurisdiction and administration, supported by military posts at every important point. In 1883 the new situation under the French protectorate was recognized by the British government withdrawing its consular jurisdiction in favour of the French courts, and in 1885 it ceased to be represented by a diplomatic official. The other powers followed suit, except Italy, which did not recognize the full consequences of the French protectorate until 1896. In 1884 a thorough reform of the government and administration of the country was begun under the direction of a succession of eminent French residents-general. In 1897 Great Britain surrendered her commercial treaty with Tunisia and agreed (subject to a special temporary privilege regarding cotton goods) to allow her commerce and all other relations with Tunisia to be subjected to the same conditions as those affecting all such relations between Britain and France.

The French protectorate over Tunisia, based on the treaty signed by the Bey at Bardo on the 12th of May 1881 and confirmed by the treaty of La Marsa (June 8, 1883), was not recognized by Turkey, which claimed the regency as part of the Ottoman dominions. The protests of the Porte were ignored by the French, and in 1892 Turkey so far recognized the actual situation as to determine the Tunisia-Tripoli frontier as far south as Ghadames. South of that point the Saharan frontiers of Algeria, Tunisia and Tripoli remained undefined. Working eastward from Tunisia and Algeria the French occupied several points to which Turkey laid claim. Thus the oasis of Janet, S.S.W. of Rhat, was occupied in 1906. The action of France led to counter-action by Turkey and to various frontier incidents. Janet was re-occupied by Ottoman troops in the summer of 1910, but in deference to French protests the troops were withdrawn pending the delimitation of the frontier. At the same time Turkey maintained the claim that Tunisians were Ottoman subjects.

Frontier troubles had however little effect on the remainder of the protectorate. In 1904-1905 there were famines and some native discontent in the south of Tunisia; but in general the country has prospered amazingly under the French protec-

torate. The native dynasty has been strengthened rather than weakened, and Tunisia may be pointed out as the best and wisest example of French administration over an alien land and race. Though on a smaller scale it is worthy to be set as a pendant to the British work in Egypt.

BIBLIOGRAPHY.—Of Arabic sources accessible in translations the geographical works of Ya'qub (*Descriptio al Magribi*, by De Goeje, Leiden, 1860), Al-Bakri (*Descr. de l'Afrique septentrionale*, by De Slane, Paris, 1859; *Arabic text*, ibid. 1857) and Idrisi (*Descr. de l'Afrique*, &c., by Dozy and De Goeje, Leiden, 1866) belong to the 10th, 11th and 12th centuries respectively; the history of Ibn Khaldun (*Hist. des Berbères*, by De Slane, 4 vols., Algiers, 1852-1856) includes the earlier Hafsites, that of Al-Kairawani (*Hist. de l'Afrique*, by Pellissier and Rémusat, Paris, 1845, in *Expl. scient. de l'Algérie*, vol. vii.; Arabic text, Tunis, 1286 A.H.) deals especially with Tunisia and goes down to 1681. Especially valuable and lucid are the following works: Ernest Mercier, *Histoire de l'Afrique septentrionale (Berberie)* (3 vols., Paris, 1891), and *Histoire de l'Établissement des Arabes dans l'Afrique septentrionale selon les auteurs arabes* (Paris, 1875); Stanley Lane Poole, *The Barbary Corsairs* ("Story of the Nations Series," London, 1890), deals in part with the history of Tunisia. Other works which should be studied are: Dr. Thos. Shaw's *Travels* (1757); Leo Africanus's description of Africa in *Ramusio* and in *Purchas's Pilgrims*; Rousseau, *Annales tunisiennes* (Algiers, 1864); the late Sir R. Lambert Playfair, *In the Footsteps of Bruce* (London, 1887); A. M. Broadley, *Tunis, Past and Present* (Edinburgh, 1882); Guérin, *Voyage archéologique* (Paris, 1862); D'Hérison, *Mission archéologique en Tunisie* (Paris, 1884); E. D. Schoenfeld, *Aus den Staaten der Barbaren* (Berlin, 1902); Sir Harry Johnston, *The Colonization of Africa* (Cambridge, 1905); Gaston Loh, *La Tunisie et l'œuvre du protectorat français* (Paris, 1907); Professor Arthur Girault, *Principes de colonisation et de législation coloniale*, vol. iii. (3rd ed., Paris, 1908). Lists of all the rulers of Tunisia will be found in A. M. H. J. Stokvis, *Manuel d'histoire*, vol. i. (Leiden, 1898). The geography of Tunisia was first treated scientifically by E. Pellissier in the 16th volume of his *Explor. scient. de l'Algérie* (Paris, 1853); and by C. Tisot, *Explor. scient. de la Tunisie: Géog. comparée de la province romaine d'Afrique* (2 vols., Paris, 1884-1888); also in Murray's *Handbook*, by Sir R. Playfair (1887). The works of Canon Tristram on the Sahara describe southern Tunisia in the 'sixties of the 19th century. Two important articles on Tunisia appeared in Nos. 22 and 23 of the *Revue générale des sciences* (Paris, Nov. 30 and Dec. 15, 1896). Still more valuable is *La Tunisie française*, in two volumes, a government publication (Paris, 1896). An article on the Tunisian Sahara, the Tunisian Cave-Dwellers and Berber Languages, &c., by Sir H. H. Johnston, was published in the *Geog. Journ.* for June 1898. Other articles by the same author appeared in the *Graphic* during the years 1899, 1900 and 1902. An interesting dissertation on the question of the Berber race is given in Professor A. H. Keane's *Man, Past and Present*. Numerous other works in English and French have been published on Tunisia from the tourist's point of view; the best of these is by Douglas Sladen, *Carthage and Tunis* (2 vols., 1908). Gaston Boissier, *L'Afrique romaine* (1895), is a picturesque but somewhat superficial aperçu of the principal Roman ruins. Flaubert's *Salammbô* ought always to be read by those who visit Carthage and Tunisia. It was mainly written at La Marsa, near Carthage. See also H. S. Ashbee, *Bibliography of Tunisia* (London, 1889). (H. H. J.)

TUNNEL (Fr. *tonnel*, later *tonneau*, a diminutive from Low Lat. *tonna*, *tunna*, a tun, cask), a more or less horizontal underground passage made without removing the top soil. In former times any long tube-like passage, however constructed, was called a tunnel. At the present day the word is sometimes popularly applied to an underground passage constructed by trenching down from the surface to build the arching and then refilling with the top soil; but a passage so constructed, although indistinguishable from a tunnel when completed, is more correctly termed a "covered way," and the operations "cutting" and "covering," instead of tunnelling. Making a small tunnel, afterwards to be converted into a larger one, is called "driving a heading," and in mining operations small tunnels are termed "galleries," "driftways" and "adits." If the underground passage is vertical it is a shaft; if the shaft is begun at the surface the operations are known as "sinking"; and it is called a "rising" if worked upwards from a previously constructed heading or gallery.

Tunnelling has been effected by natural forces to a far greater extent than by man. In limestone districts innumerable swallow-holes, or shafts, have been sunk by the rain water following joints and dissolving the rock, and from the bottom of these shafts tunnels have been excavated to the sides of

hills in a manner strictly analogous to the ordinary method of executing a tunnel by sinking shafts at intervals and driving headings therefrom. Many rivers find thus a course underground. In Asia Minor one of the rivers on the route of the Mersina railway extension pierces a hill by means of a natural tunnel, whilst a little south at Seleucia another river flows through a tunnel, 20 ft. wide and 23 ft. high, cut 1600 years ago through rock so hard that the chisel marks are still discernible. The Mammoth Cave of Kentucky and the Peak caves of Derbyshire are examples of natural tunnelling. Mineral springs bring up vast quantities of matter in solution. It has been estimated that the Old Well Spring at Bath has discharged since the beginning of the 19th century solids equivalent to the excavation of a 6 ft. by 3 ft. heading 9 m. long; and yet the water is perfectly clear and the daily flow is only the 150th part of that pumped out of the great railway tunnel under the Severn. Tunnelling is also carried on to an enormous extent by the action of the sea. Where the Atlantic rollers break on the west coast of Ireland, or on the seaboard of the western Highlands of Scotland, numberless caves and tunnels have been formed in the cliffs, beside which artificial tunnelling operations appear insignificant. The most gigantic subaqueous demolition hitherto carried out by man was the blowing up in 1885 of Flood Rock, a mass about 9 acres in extent, near Long Island Sound, New York. To effect this gigantic work by a single instantaneous blast a shaft was sunk 64 ft. below sea-level, from the bottom of which 4 m. of tunnels or galleries were driven so as to completely honeycomb the rock. The roof rock ranged from 10 ft. to 24 ft. in thickness, and was supported by 467 pillars 15 ft. square; 13,286 holes, averaging 9 ft. in length and 3 ins. in diameter, were drilled in the pillars and roof. About 80,000 cub. yds. of rock were excavated in the galleries and 275,000 remained to be blasted away. The holes were charged with 110 tons of "rackarock," a more powerful explosive than gunpowder, which was fired by electricity, when the sea was lifted 100 ft. over the whole area of the rock. Where natural forces effect analogous results, the holes are bored and the headings driven by the chemical and mechanical action of the rain and sea, and the explosive force is obtained by the expansive action of air locked up in the fissures of the rock and compressed to many tons per square foot by impact from the waves. Artificial breakwaters have often been thus tunnelled into by the sea, the compressed air blowing out the blocks and the waves carrying away the débris.

With so many examples of natural caves and tunnels in existence it is not to be wondered at that tunnelling was one of the earliest works undertaken by man, first for dwellings and tombs, then for quarrying and mining, and finally for water-supply, drainage, and other requirements of civilization. A Theban king on ascending the throne began at once to drive the tunnel which was to form his final resting-place, and persevered with the work until death. The tomb of Mineptah at Thebes was driven at a slope for a distance of 350 ft. into the hill, when a shaft was sunk and the tunnel projected a farther length of about 300 ft., and enlarged into a chamber for the sarcophagus. Tunnelling on a large scale was also carried on at the rock temples of Nubia and of India, and the architectural features of the entrances to some of these temples might be studied with advantage by the designers of modern tunnel fronts. Flinders Petrie has traced the method of underground quarrying followed by the Egyptians opposite the Pyramids. Parallel galleries about 20 ft. square were driven into the rock and cross galleries cut, so that a hall 300 to 400 ft. wide was formed, with a roof supported by rows of pillars 20 ft. square and 20 ft. apart. Blocks of stone were removed by the workmen cutting grooves all round them, and, where the stone was required for use, but merely had to be removed to clear the gallery, the grooves were wide enough for a man to pass in. Where granite, diorite and other hard rocks were used the work was done by the use of iron tools, such as the hammer and corundum, or other hard substances. The method of driving, leaving a core of rock in the middle of the heading, and

drill. As instances of ancient tunnels through soft ground and requiring masonry arching, reference may be made to the vaulted drain under the south-east palace of Nimrod and to the brick arched tunnel, 12 ft. high and 15 ft. wide, under the Euphrates. In Algeria, Switzerland, and wherever the Romans went, remains of tunnels for roads, drains and water-supply are found. Pliny refers to the tunnel constructed for the drainage of Lake Fucino as the greatest public work of the time. It was by far the longest tunnel in the world, being more than 3½ m. in length, and was driven under Monte Salviano, which necessitated shafts no less than 400 ft. in depth. Forty shafts and a number of "cuniculi," or inclined galleries, were sunk, and the excavated material was drawn up in copper pails, of about ten gallons capacity, by windlasses. The tunnel was designed to be 10 ft. high by 6 ft. wide, but its actual cross-section varied. It is stated that 30,000 labourers were occupied eleven years in its construction. With modern appliances such a tunnel could be driven from the two ends without intermediate shafts in eleven months.

No practical advance was made on the tunnelling methods of the Romans until gunpowder came into use. Old engravings of mining operations early in the 17th century show that excavation was still accomplished by pickaxes or hammer and chisel, and that wood fires were lighted at the ends of the headings to split and soften the rock in advance (see fig. 1).

(From Agricola's *De re metallica*, Basel, 1611.)

FIG. 1.—Method of mining, 1621.

Crude methods of ventilation by shaking cloths in the headings and by placing inclined boards at the top of the shafts are also on record. In 1766 a tunnel 9 ft. wide, 12 ft. high and 2880 yds. long was begun on the Grand Trunk Canal, England, and completed eleven years later; and this was followed by many others. On the introduction of railways tunnelling became one of the ordinary incidents of a contractor's work; probably upwards of 4000 railway tunnels have been executed.

Tunnelling under Rivers and Harbours.—In 1825 Marc Isambard Brunel began, and in 1843 completed, the Thames tunnel between Rotherhithe and Wapping now used by the East London railway. He employed a peculiar "shield," made of timber, in several independent sections. Part of the ground penetrated was almost liquid mud, and the cost of the tunnel was about £100 per lineal yard. In 1818 he took out a patent for a tunnelling process, which included a shield, and which was a great advance on the ordinary method. His shield fore-and-aft, which is substituted for the ordinary heading, holds up the earth of the tunnel, and thus affords its shelter for building the walls in telescope fashion, and against their front ends. The shield is made of iron plates, and are that they have great strength

in small space as soon as the segments are bolted together, and they can be caulked water-tight.

In 1830 Lord Cochrane (afterwards 10th earl of Dundonald) patented the use of compressed air for shaft-sinking and tunnelling in water-bearing strata. Water under any pressure can be kept out of a subaqueous chamber or tunnel by sufficient air of a greater pressure, and men can breathe and work therein—for a time—up to a pressure exceeding four atmospheres. The shield and cast-iron lining invented by Brunel, and the compressed air of Cochrane, have with the aid of later inventors largely removed the difficulties of subaqueous tunnelling. Cochrane's process was used for the foundation of bridge piers, &c., comparatively early, but neither of these devices was employed for tunnelling until half a century after their invention. Two important subaqueous tunnels in the construction of which neither of these valuable aids was adopted are the Severn and the Mersey tunnels.

The Severn tunnel (fig. 16), 4½ m. in length for a double line of railway, begun in 1873 and finished in 1886, Hawkshaw, Son, Hayter & Richardson being the engineers and T. A. Walker the contractor, is made almost wholly in the Trias and Coal Measure formations, but for a short distance at its eastern end passes through gravel. At the lowest part the depth is 60 ft. at low water and 100 ft. at high water, and the thickness of sandstone over the brickwork is 45 ft. Under a depression in the bed of the river on the English side there is a cover of only 30 ft. of marl. Much water was met with throughout. In 1879 the works were flooded for months by a land spring on the Welsh side of the river, and on another occasion from a hole in the river bed at the Salmon Pool. This hole was subsequently filled with clay and the works completed beneath. Two preliminary headings were driven across the river to test the ground.

"Break-ups" were made at intervals of two to five chains and the arching was carried on at each of these points. All parts of the excavation were timbered, and the greatest amount excavated in any one week was 6000 cub. yds. The total amount of water raised at all the pumping stations is about 27,000,000 gallons in twenty-four hours.

The length of the Mersey tunnel (fig. 15) between Liverpool and Birkenhead between the pumping shafts on each side of the river is one mile. From each a drainage heading was driven through the sandstone with a rising gradient towards the centre of the river. This heading was partly bored out by a Beaumont machine to a diameter of 7 ft. 4 in. and at a rate attaining occasionally 65 lineal yds. per week. All of the tunnel excavation, amounting to 320,000 cub. yds., was got out by hand labour, since heavy blasting would have shaken the rock. The minimum cover between the top of the arch and the bed of the river is 30 ft. Pumping machinery is provided for 27,000,000 gallons per day, which is more than double the usual quantity of water. Messrs Brunlees & Fox were the engineers, and Messrs Waddell the contractors for the works, which were opened in 1886, about six years after the beginning of operations.

In 1869 P. W. Barlow and J. H. Greathead built the Tower foot-way under the Thames, using for the first time a cast-iron lining and a shield which embodied the main features of Brunel's design. Barlow had patented a shield in 1864, and A. E. Beach one in 1868. The latter was used in a short masonry tunnel under Broadway, New York City, at that time. In 1874 Greathead designed and built a shield, to be used in connexion with compressed air, for a proposed Woolwich tunnel under the Thames, but it was never used. Compressed air was first used in tunnel work by Hersent, at Antwerp, in 1879, in a small drift with a cast-iron lining.

In the same year compressed air was used for the first time in any important tunnel by D. C. Haskin in the famous first Hudson River tunnel, New York City. This was to be of two tubes, each having internal dimensions of about 16 ft. wide by 18 ft. high. The excavation as fast as made was lined with thin steel plates, and inside of these with brick. In June 1880 the northerly tube had reached 360 ft. from the Hoboken shaft, but a portion near the latter, not of full size, was being enlarged. Just after a change of shifts the compressed air blew a hole through the soft silt in the roof at this spot, and the water entering drowned the twenty men who were working therein. From time to time money was raised and the work advanced. Between 1888 and 1891 the northerly tunnel was extended 2000 ft. to about three-fourths of the way across, with British capital and largely under the direction of British engineers—Sir Benjamin Baker and E. W. Moir. Compressed

air and a shield were used, and the tunnel walls were made of bolted segments of cast iron. The money being exhausted, the tunnel was allowed to fill with water, and it so remained for ten years. Both tubes were completed in 1908.

The use of compressed air in the Hudson tunnel, and of annular shields and cast-iron lined tunnel in constructing the City & South London railway (1886 to 1890) by Greathead, became widely known and greatly influenced subaqueous and soft-ground tunnelling thereafter. The pair of tunnels for this railway from near the Monument to Stockwell, from 10 ft. 2 in. to 10 ft. 6 in. interior diameter, were constructed mostly in clay and without the use of compressed air, except for a comparatively short distance through water-bearing gravel. In this gravel a timber heading was made, through which the shield was pushed. The reported total cost was \$340,000. Among the tunnels constructed after the City & South London work was well advanced, lined with cast-iron segments, and constructed by means of annular shields and the use of compressed air, were the St Clair (Joseph Hobson, engineer) from Sarnia to Port Huron, 1889–1890, through clay, and for a short distance through water-bearing gravel, 6000 ft., 18 ft. interior diameter; and the notable Blackwall tunnel under the Thames (Sir Alexander Binnie, engineer, and S. Pearson & Sons, contractors), through clay and 400 ft. of water-saturated gravel, 1892–1897, about 3116 ft. long, 24 ft. 3 in. interior diameter. The shield, 19 ft. 6 in. long, contained a bulkhead with movable shutters, as foreshadowed in Baker's proposed shield (fig. 2). Numerous tunnels of small diameter have been similarly constructed under the Thames and Clyde for electric and cable ways, several for sewers in Melbourne, and two under the Seine at Paris for sewer siphons.

The Rotherhithe tunnel, under the Thames, for a roadway, with a length of 4863 ft. between portals, of which about 2400 ft. are directly under the river, has the largest cross-section of any subaqueous tube of this type in the world (see fig. 3). It was begun in 1904 and finished in 1908, Maurice Fitzmaurice being the engineer of design and construction, and Price & Reeves the contractors. It penetrates sandy and shelly clay overlying a seam of limestone, beneath which are pebbles and loamy sand. A preliminary tunnel for exploration, 12 ft. in diameter, was driven across the river, the top being within 2 ft. of the following main tunnel. The top of the main tunnel excavation in the middle of the river was only 7 ft. from the bed of the Thames, and a temporary blanket of filled earth, usually allowed in similar cases, was prohibited owing to the close proximity of the docks. The maximum progress in one day was 12.5 ft., and the average in six days 10.4 ft. The air compressors were together capable of supplying 1,000,000 cub. ft. of air per hour.

Some tunnels of marked importance of this type—to be operated solely with electric cars—have been built under the East and Hudson rivers at New York. Two tubes of 15 ft. interior diameter and 4150 ft. long penetrate gneiss and gravel directly under the East River between the Battery and Brooklyn. They were begun in 1902, with Wm. B. Parsons and George S. Rice as engineers, and were finished in December 1907, under the direction of D. L. Hough of the

under Rivers and Harbours

New York Tunnel Company. They carry subway trains. In one of the blow-outs of compressed air a workman was blown through the gravel roof into the river above. He lived until the next day. Two other tubes of the same size built also through *gneiss* and gravel between 1905 and 1907 by the Degnon Contracting Company, with R. A. Shailer as the contractors' engineer, go from 42nd Street to Long Island City.

Four much larger tubes (see fig. 3) built in 1904 to 1909, for the Pennsylvania railroad, with Alfred Noble as chief engineer, S. Pearson & Son as contractors, and E. W. Moir as general manager, cross from 32nd and 33rd Streets to Long Island. The maximum average progress per day (one heading) for the best month's work was: rock, 4.1 ft.; rock and earth, 3.8 ft.; earth, with full sand face, 12.8 ft. The best methods of preventing blow-outs were found to consist of employing clay blankets (sometimes 25 ft. thick) on the river bed, which could be carried up to 20 ft. depth of water, and of filling the pores of the sand and gravel with blue lias lime or cement grout. The maximum air pressure was 38 lb per sq. in. In the case of sand face with poor leaky cover the usual practice was to make the air pressure equal to that of water from the surface down to about a quarter the distance below the top of the shield. The average amount of free air supplied per man per hour was approximately 2300 cub. ft. On the Hudson river side two tubes of the same size as those in the East River are for the Pennsylvania trains to New Jersey. Two tubes from Morton Street to New Jersey, begun by Haskin, already referred to, are for subway trains, and so are the most southerly of all on the Hudson side, viz. the two from Cortlandt Street to under the Pennsylvania station in Jersey City.

The two tubes from Morton Street were completed under the direction of Charles M. Jacobs, who was also chief engineer of the four other Hudson River tubes. The contractors for the Hudson tubes for the Pennsylvania road were the O'Rourke Contracting Company. Skillful treatment was required to overcome the difficulties on the New York side of the Hudson in all the tubes where the face excavation was partly in rock and partly in soft earth. Most of their length, however, was through silt, and in this the tunnelling was the easiest and most rapid that has ever been carried out in subaqueous work, 50 lineal ft. per day being sometimes accomplished. A large proportion of the silt which under ordinary processes would be taken into the tunnel through the shield, carried to the shore and got rid of by expensive methods, was by the latter process merely displaced as the shield with nearly or quite closed diaphragm was pushed ahead.

The East Boston tunnel, the first important example of a shield-built monolithic concrete arch, from the Boston Subway to East Boston, is 1.4 m. long, 3400 ft. being under the harbour. One mile was excavated by tunnelling with roof shields about 20 ft. wide, through clay containing pockets of sand and gravel. The engineer was H. A. Carson, and the contractors the Boston Tunnel Construction Company and Patrick McGovern.

Some 25 m. of waterworks brick-lined tunnels have been built since 1864, mostly in clay, under the Great Lakes, without the use of shields, though in the later ones compressed air was utilized. A large portion of the latest Cleveland tunnel, 9 ft. interior diameter, was built at the rate of 17 ft. per day at a cost of about \$18 per ft. During this work three explosions of inflammable gases occurred, in which nineteen men were killed and others were injured. Later a fire at the shaft in the lake caused the death of ten men. Work was thereafter completed under the engineering direction of G. H. Benzenberg. *Less serious accidents*, principally explosions of marsh gas, occurred in many of the other tunnels. In one case (at Milwaukee under Benzenberg) drift material was penetrated, with large boulders and coarse and fine gravel, and without any sand or clay filling, apparently in direct communication with the lake bottoms. At times the necessary air pressure was 42 lb per sq. in.

Subaqueous Tunnels made by sinking Tubes, Caissons, &c.—In 1845 De la Haye, in England, doubtless having in mind the

tedious and difficult work of the Thames tunnel, proposed to make tunnels under water by sinking large tubes on a previously prepared bed and connecting them together. Since then many inventors have proposed similar schemes. In 1866 Belgrand sank twin plate-iron pipes, 1 metre diameter and 156 metres long, under the Seine at Paris for a sewer siphon, and there have since been numerous examples of sunk cast-iron subaqueous water-pipes. It is believed that the first tunnel of this class, large enough for men to move upright in, was by H. A. Carson, assisted by W. Blanchard and F. D. Smith, in 1893-1894, in the outer portion of Boston harbour, for the metropolitan sewer outlet. The later tubes were about 9 ft. exterior diameter, in sections each 52 ft. long, weighing about 210,000 lb, made of brick and concrete, with a skin of wood and water-tight bulkheads at each end. A trench was dredged in the harbour bed and saddles were accurately placed to support the tubes. The latter, made in cradles above water alongside a wharf, were lowered by long vertical screws moved by steam power, and were towed $\frac{1}{2}$ to $\frac{3}{4}$ m. to their final positions. After sufficient water had been admitted they were lowered to their saddles by travelling shears on temporary piles. The temporary joints between consecutive sections were made by rubber gaskets between flanges which were bolted together by divers. The later operations were backfilling the trench over the pipes, and in each section pumping out the water, removing its bulkheads, and making good the masonry between consecutive bulkheads, this masonry being inside the flanges. This work, about 1500 ft. in length, was done without contractors, by labourers and foremen under the immediate control of the engineers, and was found perfectly tight, straight and sound.

The double-track railroad tunnel at Detroit, made in 1906-1909, under the direction of an advisory board consisting of W. J. Wilgus (chairman), H. A. Carson and W. S. Kinnear (the last-named being chief engineer), is $1\frac{1}{2}$ m. long, with a portion directly under the river of $\frac{3}{4}$ m. The method used under the river (proposed by Wilgus) is an important variation on the Boston scheme. A trench was dredged with a depth equal to the thickness of the tunnel below the river bed and about 70 ft. below the river surface, and grillages were accurately placed in it to support the ends of thin steel tube-forms, inside of which concrete was to be moulded and outside of which deposited. These tubes, each about 23 ft. in diameter and 262.5 ft. long, were in pairs (one tube for each track), and were connected sidewise and surrounded by thin steel diaphragms 12 ft. apart. Planking, to limit the concrete, was secured outside the diaphragms (see fig. 3). The forms were made tight, bulkheaded at their ends, floated into place, sunk by admitting water, set on the grillages, and the ends of successive pairs connected together by bolts through rubber gaskets and flanges. The succeeding pair of tubes was not lowered until concrete had been deposited through the river around the tubes of the preceding pair. The following steps were to remove the water from one pair of tubes, mould inside a lining of concrete 20 in. thick, remove the contiguous bulkheads, and repeat again and again the processes described until the subaqueous tunnel was complete.

The New York Rapid Transit tunnel under Harlem river, built 1904-1905, has two tubes, each about 15 ft. diameter and 400 ft. long, with a surrounding shell of cast iron itself surrounded by concrete. The outside width of concrete is about 33 ft. Its top is 28 ft. below high water and about 3 ft. below the bed of the river. D. D. McBean, the sub-contractor, dredged a trench in the river to within 7 or 8 ft. of the required depth. He then enclosed a space of the width of the tunnel from shore to mid-stream with 12-in. sheet piling, which was evenly cut off some 2 ft. above the determined outside top of the tunnel. On top of this piling he sank and tightly fitted a flat temporary roof of timber 3 ft. thick in sections, and covered this with about 5 ft. of dredged mud. Water was expelled from this subaqueous chamber by compressed air, after which the remaining earth was easily taken out, and the iron and concrete

tunnel walls were then built in the chamber. For the remaining part of the river the foregoing process was varied by cutting off the sheet piling at mid-height of the tunnel and making the upper half of the tunnel, which was built above and lowered in sections through the water, serve as the roof of the chamber in which the lower half of the tunnel was built.

The tunnels of the Métropolitain railway of Paris (F. Bienvenüe, engineer-in-chief) under the two arms of the Seine, between Place Chatelât and Place Saint Michel, were made by means of compressed-air caissons sunk beneath the river bed,

were next made by the aid of temporary small caissons sunk through about 26 ft. of earth under the river. The tops of the side walls were made even with the end walls. A steel rectangular coffer-dam (figs. 5 and 6) was sunk to rest with rubber or clay joint on these surrounding walls. The coffer-dam had shafts reaching above the surface of the water, so that the earth core was easily taken out (after removing the water) in free air. The adjacent chambers under the caissons were then connected together. Three caissons, of a total length of 396 ft., were used under the larger arm, and two, of an aggregate length

Mountain Tunnels for Railways.

Tunnel.	Location.	Length. (miles)	Internal Width and Height.	Material penetrated.	Average progress per day = 24 hrs. (lin. yds.).	Approximate cost per lin. yd.

L. Chagnaud being the contractor. They were built of plates of sheet steel and masonry, with temporary steel diaphragms in the ends, filled with concrete, making a cross wall with a level top about even with the outside top of the tunnel and about 2 ft. below the bottom of the Seine. The caissons were sunk on the line of the tunnel so that adjacent ends (and the walls just described) were nearly 5 ft. apart with—at that stage—a core of earth between them. Side walls joining the end walls and thus enclosing the earth core on four sides (fig. 4)

of 132 ft., under the smaller arm of the Seine. The cost of the tunnel was 7000 francs per lineal metre.

William Sooy Smith published in Chicago, in 1877, a description of a scheme for building a tunnel under the Detroit river by sinking caissons end to end, each caisson to be secured to the adjoining one by tongued and grooved guides, and a nearly water-tight connexion between the two to be made by means of an annular inflated hose.

Tunnelling through Mountains.—Where a great thickness of rock overlies a tunnel through a mountain, it may be necessary to do the work wholly from the two ends without intermediate shafts. The problem largely resolves itself into devising the most expeditious way of excavating and removing the rock. Experience has led to great advances in speed and economy, as may be seen from examples in the above table.

In 1857 the first blast was fired in connexion with the Mont Cenis works; in 1861 machine drilling was introduced; and in 1871 the tunnel was opened for traffic. With the exception of about 300 yds. the tunnel is lined throughout with brick or stone. During the first four years of hand labour the average progress was not more than 9 in. per day on each side of the Alps; but with compressed air rock-drills the rate towards the end was five times greater.

FIG. 6.—Longitudinal Section.

Caissons in tunnels for the Métropolitain under the Seine at Paris.

In 1872 the St Gotthard tunnel was begun, and in 1881 the first locomotive ran through it. Mechanical drills were used from the beginning. Tunnelling was carried on by driving in advance a top heading about 8 ft. square, then enlarging this sideways, and finally sinking the excavation to invert level (see figs. 7 and 8). Air for working the rock-drills was compressed to seven atmospheres by turbines of about 2000 horse-power.

The driving of the Arlberg tunnel was begun in 1880 and the work was completed in little more than three years. The main heading was driven along the bottom of the

tunnel and shafts were opened up 25 to 70 yds. apart, from which smaller headings were driven right and left. The tunnel was enlarged to its full section at different points simultaneously in lengths of 8 yds., the excavation of each occupying about twenty days, and the masonry fourteen days. Ferroux percussion air-drills and Brandt rotary hydraulic drills were used, the performance of the latter being especially satisfactory. After each blast a fine spray of water was injected, which assisted the ventilation

FIGS. 7 and 8.—Method of excavation in St Gotthard Tunnel.

materially. In the St Gotthard tunnel the discharge of the air-drills was relied on for ventilation. In the Arlberg tunnel over 8000 cub. ft. of air per minute were thrown in by ventilators. To keep pace with the miners, 900 tons of excavated material had to be removed, and 350 tons of masonry introduced, daily at each end of the tunnel, which necessitated the transit of 450 wagons. The cost per lineal yard varied according to the thickness of masonry lining and the distance from the mouth of the tunnel. For the first thousand yards from the entrance the prices per lineal yard were £11 8s. for the lower heading; £7 12s. for the upper one; £30 10s. for the unlined tunnel; £45 for the tunnel with a thin lining of masonry; and £124 5s. with a lining 3 ft. thick at the arch, 4 ft. at the sides, and 2 ft. 8 in. at the invert.

The Simplon tunnel was begun in 1898 and completed in 1905. It is over 30 % longer than the St Gotthard, and the greatest depth below the surface is 7005 ft. A novel method was introduced in the shape of two parallel bores (56 ft. apart, connected at intervals of 660 ft. by oblique galleries), which greatly facilitated ventilation, and resulted in increased economy and rapidity of construction, while ensuring the health of the men. One of these galleries was made large enough for a single-track railroad, and the second is to be enlarged and similarly used. The death-rate in the Simplon tunnel was decreased as compared with the St Gotthard from 800 in eight years to 60 in seven years. Had one wide tunnel been made instead of two narrow ones, it would have been difficult to maintain its integrity; even with the narrow cross-section employed the floor was forced up at points in the solid rock from the great weight above, and had to be secured by building heavy inverts of masonry. Temperatures were reduced to 89° F. by spraying devices, although the rock temperatures ranged from 129° to 130° F. At one point 4374 yds. from the portal of Iselle the "Great Spring" of cold water was struck; it yielded 10,564 gallons per minute at 600 lb pressure per sq. in., and reduced the temperature to 55.4° F., the lowest point recorded. A spring of hot water was met on the Italian side which discharged into the tunnel 1600 gallons per minute with a temperature of 113° F. The maximum flow of cold water was 17,081 gallons per minute, and of hot water 4330 gallons per minute. These springs often necessitated a temporary abandonment of the work. Water power from the Rhone at the Swiss and from the Diveria at the Italian end provided the power for operating all plant during the construction of most of the work. Among the able engineers connected with this work must be mentioned Alfred Brandt, a man of remarkable energy and ability, whose drills were used with much success. He died early in the work, of injuries received from falling rock.

A group of tunnels—the Tauern, Bärengraben, Wocheiner and Boarck—was undertaken by the Austrian government in

connexion with new Alpine railroads to increase the commercial territory tributary to the seaport of Trieste, which at one time was greater than Hamburg. The principal tunnel of this group is under the main body of the Tauern mountain. The bottom drifts met on the 21st of July 1907. The difficulties resulted mostly from mountain débris and springs. There are four minor tunnels between Schwarzach, St Veit, and the north portal of the Tauern, and nineteen between the south portal and the south slope at Möllbrücken.

The electric railway from the Eiger glacier to near the summit of the Jungfrau includes a tunnel 1½ m. long, 3.6 metres wide and 3.8 metres high, with a midway station, from which a large part of northern Switzerland can be seen. From the Jungfrau terminus, at an elevation of 13,428 ft., the summit, 242 ft. higher, will be reached by an elevator.

The Hoosac tunnel was the first prominent tunnel in America. It was begun in 1855 and finished in 1876, after many interruptions. It was memorable for the original use in America of air-drills and nitroglycerin. The Pennsylvania railroad tunnels crossing New York City under 32nd and 33rd Streets are of unusual size. Owing to the close proximity of large buildings and other structures special methods were adopted for mining the rock to lessen the vibrations by explosions. At 33rd Street and 4th Avenue the tunnels pass directly under two of the Rapid Transit system, above which there is another belonging to the Metropolitan Traction Company, so that there are three tunnels at different levels under the street.

Among other rock tunnels may be mentioned the Albuja, through a granite ridge of the Rhaetian Alps, for a single-track narrow-gauge railroad, 3.6 m. long; tunnels on the Midland railway, near Totley in Derbyshire, over 3.5 m. long, largely in shale, and at Cowburn, over 2 m. long, in shale and harder rock, each 27 ft. wide and 20.5 ft. high inside; the Suram, on the Trans-Caucasus railway, for double track, 2.47 m. long, through soft rock; the tail-race tunnel for the Niagara Falls Water Power Company, 1.3 m. long, 19 ft. wide and 21 ft. high, through argillaceous shale and limestone, costing about \$1,250,000; the Tequiquiac outlet to the drainage system for the city of Mexico, costing \$6,760,000; the Cascade, Washington, part of the Great Northern railroad system, saving 9 m. in distance; and the Gunnison, irrigating 147,000 acres in Colorado.

Tunnelling in Towns.—Where tunnels have to be carried through soft soil in proximity to valuable buildings special precautions have to be taken to avoid settlement. A successful example of such work is the tunnel driven in 1886 for the Great Northern Railway Company under the Metropolitan Cattle

FIG. 9.—Paris Métropolitain Tunnel, longitudinal horizontal section.

Market, London. This was done by the crown-bar method, the bars being built in with solid brickwork. The subsidence in the ground was from 1 to about $3\frac{1}{2}$ in. Several buildings were tunneled under without any structural damage.

London has now some 90 m. of tunnels for railways, mostly operated by electric traction. Most of those which have been constructed since 1890 have been tunneled by the use of cylindrical shields and walls of cast iron. Shields about 23 ft. in diameter were used in constructing the stations on the Central London railway, and one 32 ft. 4 in. in diameter and only 9 ft. 3 in. long was used for a short distance on the Clapham extension of the City and South London railway.

general, the upper half of the tunnel was executed first (figs. 9 and 10) and the lower part completed by underpinning.

Figs. 11, 12 and 13 illustrate a case of tunnelling near important buildings in Boston in 1896, with a roof-shield 29 ft. 4 in. in external diameter. The vertical sidewalls were first made in small drifts, the roof-shield running on top of these, and the core was taken out later and the invert or floor of the tunnel put in last. Each hydraulic press of the shield reacted against a small continuous cast-iron rod imbedded in the brick arch. In some large sewerage tunnels in Chicago the shields were pushed from a wall of oak planks, 8 in. thick, surrounding the brick walls of the sewer.

FIG. 10.—Paris Métropolitain Tunnel, longitudinal vertical section.

Paris has an elaborate plan for underground railways some 50 m. in length, a considerable number of which have been constructed since 1898 under the engineering direction of F. Bienvenüe. Instead of using completely cylindrical shields and cast-iron walls, as in London, roof-shields (*boucliers de voûte*) were employed for the construction of the upper half of the tunnel, and masonry walls were adopted throughout. In

Ventilation of Tunnels.—The simplest method for ventilating a railway tunnel is to have numerous wide openings to daylight at frequent intervals. If these are the full width of the tunnel, at least 20 ft. in length, and not farther apart than 200 yds., it can be naturally ventilated. Such arrangements are, however, frequently impracticable, and then recourse must be had to mechanical means.

FIG. 11.—Boston Subway, first and second phases

FIG. 12.—Boston Subway, third phase.

FIG. 13.—Boston Subway, longitudinal vertical section through shield.

The first application of mechanical or fan ventilation to railway tunnels was made in the Lime Street tunnel of the London and North-Western railway at Liverpool, which has since been replaced by an open cutting. At a later date fans were applied to the Severn and Mersey tunnels.

The principle ordinarily acted upon, where mechanical ventilation has been adopted, is to exhaust the vitiated air at a point midway between the portals of a tunnel, by means of a shaft with which is connected a ventilating fan of suitable power and dimensions. In the case of the tunnel under the river Mersey (fig. 14) such a shaft could not be provided, owing to the river being overhead, but a ventilating heading was driven from the middle of the river (at which

point entry into the tunnel was effected) to each shore, where a fan 40 ft. in diameter was placed. In this way the vitiated air is drawn from the lowest point of the railway, while fresh air flows in at the stations on each side to replenish the partial vacuum, as indicated by arrows in the accompanying longitudinal section of the tunnel. The principle was that fresh air should enter at each station and "split" each way into the tunnel, and that thus the atmosphere on the station platforms should be maintained in a condition of purity.

The fans in the Mersey tunnel are somewhat similar to the well-known Guibal fans, with the exception of an important alteration in the shutter. With the Guibal shutter, the top of the opening

(From a diagram in Proc. Inst. Civ. Eng.)

FIG. 14.—Longitudinal Section of the Mersey Tunnel, showing Method of Ventilation.

into the chimney from the fan has a line parallel to that of the fan-shaft and of the fan-blades, and, as a consequence, as each blade passes this shutter, the stoppage of the discharge of the air is instantaneous, and the sudden change of the pressure of the air on the face of the blade whilst discharging and the reversal of the pressure, due to the vacuum inside the fan-casing, cause the vibration hitherto inseparable from this type of ventilator. As an illustration of the effect of the pulsatory action of the Guibal shutters the following figures may be given: a fan having ten arms and running, say, sixty revolutions per minute, and working twenty-four hours per day, gives (to $60 \times 60 \times 24 =$) 864,000 blows per day transmitted from the tip of the fan-vanes to the fan-shaft; the shaft is thus in a constant state of tremor, and sooner or later reaches its elastic limit, and the consequent injury to the general structure of the fan is obvious. This difficulty is avoided by cutting a *A*-shaped opening in the shutter, thus gradually decreasing the aperture and allowing the air to pass into the chimney in a continuous stream instead of intermittently. The action of this regulating shutter increases the durability and efficiency of the fans in an important degree. In towns like Liverpool and Birkenhead any pulsatory action would be readily felt by the inhabitants, but with the above arrangement it is difficult to detect any sound whatever, even when standing close to the buildings containing the fans. The admission of the air on both sides is found in practice to conduce to smooth running and to the reduction of the side-thrust which occurs when the air is admitted on one side only. The fans are five in number: two are 40 ft. in diameter by 12 ft. wide, and two 30 ft. in diameter by 10 ft. wide, one of each size being erected at Liverpool and at Birkenhead respectively. In addition, there is a high-speed fan 16 ft. in diameter in Liverpool which throws 300,000 cub. ft.

The following table gives the result of experiments made with the ventilating fans of the Mersey railway:—

Fan at	Diameter of Fan in feet.	Width of Blade in feet.	Number of Revolutions per minute.	Area of Drift-way in square feet.	Water-gauge in inches.	Velocity of Air in feet per minute.	Volume of Air in cubic feet per minute.

The central point of the Severn tunnel (fig. 15) lies toward the Monmouthshire bank of the river, and ventilation is effected from that point by means of one fan placed on the surface at Sudbrooke, Monmouth, at the top of a shaft which is connected with a horizontal

FIG. 15.—Section of Severn Tunnel (Fox).

heading leading to the centre. This fan, which is 40 ft. in diameter by 12 ft. in width, removes from the tunnel some 400,000 cub. ft. per minute, and draws in an equivalent volume of fresh air from the two ends.

About 1896 an excellent system was introduced by Signor Saccardo, the well-known Italian engineer, which to a great extent has minimized the difficulty of ventilating long tunnels under mountain-ranges where shafts are not available. This system, which is not applicable to tunnels in which underground stations exist, is illustrated in fig. 16, which represents its application to the single-line tunnel through the Apennines at Pracchia. This tunnel is one of fifty-two single-line tunnels, with a gradient of 1 in 40, on the main line between Florence and Bologna, built by Thomas Brassey. There is a great deal of traffic which has to be worked by heavy locomotives. Before the installation of a ventilating system under any condition of wind the state of this tunnel, about 3000 yds. in length, was bad;

¹In the case of this circular drift-way a velocity of 4000 ft. per minute was subsequently attained.

²Quick-running fan.

but when the wind was blowing in at the lower end at the same time that a heavy goods or passenger train was ascending the gradient the condition of affairs became almost insupportable. The engines, working with the regulators full open, often emitted large quantities of both smoke and steam, which travelled concurrently with the train. The goods trains had two engines, one in front and another at the rear, and when, from the humidity in the tunnel, due to the

(From the Proc. Inst. Civ. Eng.)

FIG. 16.—Diagram illustrating the Saccardo System for Ventilating Tunnels.

steam, the wheels slipped and possibly the train stopped, the state of the air was indescribable. A heavy train with two engines, conveying a royal party and their suite, arrived on one occasion at the upper exit of the tunnel with both engine-men and both fire-men insensible; and on another occasion, when a heavy passenger train came to a stop in the tunnel, all the occupants were seriously affected.

In applying the Saccardo system, the tunnel was extended for 15 or 20 ft. by a structure either of timber or brickwork, the inside line of which represented the line of maximum construction, and this was allowed to project for about 3 ft. into the tunnel. The space between this line and the exterior constituted the chamber into which air was blown by means of a fan. Considering the length of tunnel it might at first be thought there would be some tendency for the air to return through the open mouth, but nothing of the kind happened. The whole of the air blown by the fan, 164,000 cub. ft. per minute, was augmented by the induced current yielding 46,000 cub. ft. per minute, making a total of 210,000 cub. ft.; and this volume was blown down the gradient against the ascending train, so as to free the driver and men in charge of the train from the products of combustion at the earliest possible moment. Prior to the installation of this system the drivers and firemen had to be clothed in thick woollen garments, pulled on over their ordinary clothes, and wrapped round and round the neck and over the head; but in spite of all these precautions they sometimes arrived at the upper end of the tunnel in a state of insensibility. The fan, however, immensely improved the condition of the air, which is now pure and fresh.

In the case of the St Gotthard tunnel, which is 9½ m. in length and 26 ft. wide with a sectional area of 603 sq. ft., the Saccardo system was installed in 1899 with most beneficial results. The railway is double-tracked and worked by steam locomotives, the cars being lighted by gas. The ventilating plant is situated at Göschenen at the north end of the tunnel and consists of two large fans operated by water power. The quantity of air passed into the narrow mouth of the tunnel is 413,000 cub. ft. per minute at a velocity of 686 ft., this velocity being much reduced as the full section of the tunnel is reached. A sample of the air taken from a carriage contained 10.19 parts of carbonic acid gas per 10,000 volumes.

In the Simplon tunnel, where electricity is the motive power, mechanical ventilation is installed. A steel sliding door is arranged at each entrance to be raised and lowered by electric power. After the entrance of a train the door is lowered and fresh air forced into the tunnel at considerable pressure from the same end by fans.

The introduction of electric traction has simplified the problem of ventilating intra-urban railways laid in tunnels at a greater or less distance below the surface, since the absence of smoke and products of combustion from coal and coke renders necessary only such a quantity of air as is required by the passengers and staff. For supplying air to the shallow tunnels which form the underground portions of the Metropolitan and District railways in London, open staircases, blow-holes and sections of uncovered track are relied on. When the lines were worked by steam locomotives they afforded notorious examples of bad ventilation, the proportion of

carbonic acid amounting to from 15 or 20 to 60, 70 and even 89 parts in 10,000. But since the adoption of electricity as the motive power the atmosphere of the tunnels has much improved, and two samples taken from the cars in 1905 gave 11.27 and 14.07 parts of carbonic acid in 10,000.

When deep level "tube" railways were first constructed in London, it was supposed that adequate ventilation would be obtained through the lift-shafts and staircases at the stations, with the aid of the scouring action of the trains which, being of nearly the same cross-section as the tunnel, would, it was supposed, drive the air in front of them out by the openings at the stations they were approaching, while drawing fresh air in behind them at the stations they had left. This expectation, however, was disappointed, and it was found necessary to employ mechanical means. On the Central London railway, which runs from the Bank of England to Shepherd's Bush, a distance of 6 m., the ventilating plant installed in 1902 consists of a 300 h.p. electrically driven fan, which is placed at Shepherd's Bush and draws in fresh air from the Bank end of the line and at other intermediate points. The fan is 5 ft. wide and 20 ft. in diameter, and makes 145 revolutions a minute, its capacity being 100,000 cub. ft. a minute. It is operated from 1 to 4 a. m., and the openings at all the intermediate stations being closed it draws fresh air in at the Bank station. The tunnel is thus cleared out about 2½ times each night and the air is left in the same condition as it is outside. The fan is also worked during the day from 11 a. m. to 5 p. m., the intermediate doors being open; in this way the atmosphere is improved for about half the length of the line and the cars are cleared out as they arrive at Shepherd's Bush. Samples of the air in the tunnel taken when the fan was not running contained 7.07 parts of carbonic acid in 10,000, while the air of a full car contained 10.7 parts. The outside air at the same time contained 4.4 parts. A series of tests made for the London County Council in 1902 showed that the air of the cars contained a minimum of 9.60 parts and a maximum of 14.7 parts. In some of the later tube railways in London—such as the Baker Street and Waterloo, and the Charing Cross and Hampstead lines—electrically driven exhaust fans are provided at about half-mile intervals; these each extract 18,500 cub. ft. of air per minute from the tunnels, and discharge it from the tops of the station roofs, fresh air being conveyed to the points of suction in the tunnels.

The Boston system of electrically operated subways and tunnels is ventilated by electric fans capable of completely changing the air in each section about every fifteen minutes. Air admitted at portals and stations is withdrawn midway between stations. In the case of the East Boston tunnel, the air leaving the tunnel under the middle of the harbour is carried to the shore through longitudinal ducts (fig. 3) and is there expelled through fan-chambers.

In the southerly 5 m. of the New York Rapid Transit railway, which runs in a four-track tunnel of rectangular section, having an area of 650 sq. ft., and built as close as possible to the surface of the streets, ventilation by natural means through the open staircases at the stations is mainly relied upon, with satisfactory results as regards the proportions of carbonic acid found in the air. But when intensely hot weather prevails in New York the tunnel air is sometimes 4° hotter still, due to the conversion of electrical energy into heat. This condition is aggravated by the fine diffusion through the air of oil from the motors, dust from the ballast and particles of metal ground off by the brake shoes, &c.

Volume of Air Required for Ventilation.—The consumption of coal by a locomotive during the passage through a tunnel having been ascertained, and 29 cub. ft. of poisonous gas being allowed for each pound of coal consumed, the volume of fresh air required to maintain the atmosphere of the tunnel at a standard of purity of 20 parts of carbon dioxide in 10,000 parts of air is ascertained as follows: The number of pounds of fuel consumed per mile, multiplied by 29, multiplied by 500, and divided by the interval in minutes between the trains, will give the volume of air in cubic feet which must be introduced into the tunnel per minute. As an illustration, assume that the tunnel is a mile in length, that the consumption of fuel is 32 lb per mile, and that one train passes through the tunnel every five minutes in each direction; then the volume of air required per minute will be

$$\frac{32 \text{ lb} \times 29 \text{ cub. ft.} \times 500}{2\frac{1}{2} \text{ minutes}} = 185,600 \text{ cub. ft.}$$

Corrosion of Rails in Tunnels.—Careful tests made in the Box and Severn tunnels of the Great Western railway, to ascertain if possible the loss that takes place in the weight of rails owing to the presence of corrosive gases, gave the following results:—

BOX TUNNEL (1 m. 66 chains in length).

Percentage of Wear per annum.

	lb per yard
Down line, gradient falling 1 in 100—	% per annum.
At east mouth	0.439 = 0.377
28 chains from east mouth	1.800 = 1.540
48 chains from east mouth	2.110 = 1.810
1 m. 8 chains from east mouth	2.880 = 2.480
At west mouth	0.640 = 0.553

Up line, gradient rising 1 in 100—

At east mouth	0.620 = 0.575
1 m. 8 chains from east mouth	1.500 = 1.360
1 m. 28 chains from east mouth	1.520 = 1.310
At west mouth	0.680 = 0.587

SEVERN TUNNEL (4 m. 28½ chains in length).

Percentage of Wear per annum.

	lb per yard
Down line, outside and quite clear of tunnel, Bristol end, gradient falling 1 in 100	0.280 = 0.240
Up line, outside and quite clear of tunnel, Newport end, gradient falling 1 in 90	0.440 = 0.390
At Bristol mouth, gradient falling 1 in 100	1.200 = 1.020
33 chains from Bristol mouth, gradient falling 1 in 100	2.160 = 1.860
3 m. 75½ chains from Bristol mouth, gradient rising 1 in 90	1.900 = 1.630
At Newport mouth	0.310 = 0.270
Down and up line under main-shaft level	3.200 = 2.750

It will be seen that the maximum wear and corrosion together reached the extraordinary weight of 2½ lb per yard of rail per year—a very serious amount that involved great expenditure. The wear occurred over the whole of the rail, but the top, over which the engine and train passed, wore at a greater rate, presumably on account of the surface being kept bright and the gases being able to act on it. The Great Western Company tried the experiment in the Severn tunnel of boxing up the rails, so that the ballast approached their surface within 1 in. or 1½ in. It was found, however, that—in the case, at any rate, of the limestone ballast—the cure was almost worse than the disease, the result being a maximum wear of 2½ lb and an average wear of just under 2 lb per yard of rail per year. The average on the open line would be about 0.25 lb in the same time.

See *Proc. Inst. Civ. Eng.*; also works on tunnelling by Drinker, Simms, Stauffer and Prelini, and on tunnel shields, &c., by Copperthwaite. (H. A. C.)

TUNNEL VAULT, the term in architecture given to the semicircular or elliptical vault over underground passages, in contradistinction to the wagon or barrel vault of edifices above ground.

TUNNY (*Thunnus thynnus*), one of the largest fishes of the family of mackerels, belongs to the genus of which the bonito (*Th. pelamys*) and the albacores (*Th. albacora*, *Th. alalunga*, &c.) are equally well-known members. From the latter the tunny is distinguished by its much shorter pectoral fins, which reach backwards only to, or nearly to, the end of the first dorsal fin. It possesses nine short finlets behind the dorsal, and eight behind the anal fin. Its colour is dark bluish above, and greyish, tinged and spotted with silvery, below. The tunny is a pelagic fish, but periodically approaches the shore, wandering in large shoals, within well-ascertained areas along the coast. It is not infrequently appears in small companies or singly in the English Channel and in the German Ocean, probably in pursuit

Tunny.

of the shoals of pilchards and herrings on which it feeds. The regularity of its appearance on certain parts of the coasts of the Mediterranean has led to the establishment of a systematic fishery, which has been carried on from the time of the Phoenicians to the present day. Immense numbers of tunnies were caught on the Spanish coast and in the Sea of Marmora, where, however, this industry has much declined. The Sardinian tunnies were considered to be of superior excellence. The greatest number is now caught on the north coast of Sicily, the fisheries of this island supplying most of the preserved tunny which is exported to other parts of the world. In ancient times the fish were preserved in salt, and that coming from Sardinia, which was specially esteemed by the Romans, was known as

Salsamentum sardicum. At present preference is given to tunny preserved in oil. Many of the fishes, especially the smaller ones, are consumed fresh. The tunny occurs also in the Pacific and is much sought for by anglers on the coast of southern California, where tuna-fishing has become a fashionable sport; but several other species seem to take its place in the Indo-Pacific ocean. It is one of the largest fishes, attaining to a length of ten ft. and to a weight of more than a thousand pounds.

In connexion with the extremely active life of these fishes allusion should be made to the fact, first ascertained in 1839 by John (brother of Sir Humphry) Davy, that the temperature of the blood of a tunny may be considerably higher than that of the surrounding water, a discovery which disposed of the time-honoured division of vertebrate animals into warm-blooded and cold-blooded.

The variations and movements of the tunny and albacores were studied with special care by King Carlos of Portugal, who published in 1899 a large illustrated memoir entitled *A Pesca do atum no Algarve em 1808* (Lisbon). This memoir is accompanied by excellent figures of the different species of *Tunnus* and charts of their distribution in the Atlantic.

TUNSTALL (or **TONSTALL**), **CUTHBERT** (1474–1559), English prelate, was an illegitimate son of Thomas Tunstall of Thurland Castle, Lancashire, his legitimate half-brother, Brian Tunstall, being killed at Flodden in 1513. Cuthbert seems to have studied at Oxford, at Cambridge and at Padua, and he became a distinguished scholar, winning favourable comment from Erasmus. Having held several livings in quick succession, he became chancellor to William Warham, archbishop of Canterbury, in 1511, and he was soon employed on diplomatic business by Henry VIII. and Wolsey, being sent to Brussels in 1515 and to Cologne in 1519, while he was at Worms during the famous Diet of 1521. In 1516 he had been made master of the rolls; in 1521 he became dean of Salisbury, in 1522 bishop of London, and in 1523 keeper of the privy seal. For Henry VIII. he negotiated with Charles V. after his victory at Pavia in 1525 and he helped to arrange the Peace of Cambrai in 1529. In 1530 he succeeded Wolsey as bishop of Durham. Tunstall's religious views now gave some anxiety. He adhered firmly to the traditional teaching of the Church, but after some slight hesitation he accepted Henry as its head and publicly defended this position. In 1537 the bishop was appointed president of the new council of the north, but although he was often engaged in treating with the Scots he found time to take part in other public business and to attend parliament, where in 1539 he participated in the discussion on the bill of six articles. Although he disliked the religious policy pursued by the advisers of Edward VI. and voted against the first act of uniformity in 1549, he continued to discharge his public duties without molestation until after the fall of the protector Somerset; then in May 1551, he was placed in custody. A bill charging him with treason was introduced, but the House of Commons refused to pass it; he was, however, deprived of his bishopric in October 1552. On the accession of Mary in 1553 he was released and was again bishop of Durham, but during this reign he showed no animus against the Protestants. When Elizabeth came to the throne he refused to take the oath of supremacy, and he would not help to consecrate Matthew Parker as archbishop of Canterbury. He was arrested, and was still a prisoner at Lambeth when he died on the 18th of November

1559. Among Tunstall's writings are *De veritate corporis et sanguinis domini nostri Jesu Christi in eucharistia* (1554); and *De arte supputandi libri quattuor* (1522). The bishop's correspondence as president of the council of the north is in the British Museum.

TUNSTALL, a market town of Staffordshire, England, on the northern outskirts of the Potteries district, included in the parliamentary borough of Newcastle-under-Lyme, 4 m. N.W. from Stoke-upon-Trent by the North Staffordshire railway. Pop. of urban district (1901), 19,492. The town is of modern growth. The Victoria Institute (1889) includes a library and schools of art and science. The neighbourhood is full of collieries, ironworks and potteries. Kildgrove, Chatterley and Talk-o'-the-hill are large neighbouring villages; the mines at the last-named

were the scene of a terrible explosion in 1866, by which nearly a hundred lives were lost. There are brick and tile works in Tunstall. The town is included in the large parish of Wolstanton, and in the borough of Stoke-on-Trent (q.v.) under the "Potteries Federation" scheme (1908).

TUPIS (Comrades), a tribe and stock of South American Indians of Brazil. They call all other peoples *Tapuyas* (foreigners). Their original home is believed to have been on the Amazon, and from its mouth they spread far southwards along the Brazilian coast. When hard pressed by the Portuguese they retreated to the Andes. Martius gives the Tupi nation a wide range, from the Atlantic to the Andes, and from Paraguay to the Amazon. Of this stock are the Omaguas, Cocomas and other Guaranian tribes. Latham makes the Tupis members of the Peruvian stock. The "Lingoa Geral" or trade language between Portuguese and Amazon Indians is a corruption of the Tupi tongue.

TUPPER, SIR CHARLES, BART. (1821—), British colonial statesman, son of the Rev. Charles Tupper, D.D., was born at Amherst, Nova Scotia, on the 2nd of July 1821, and was educated at Horton Academy. He afterwards studied for the medical profession at Edinburgh University, where he received the diplomas of M.D. and L.R.C.S. In 1855 he was returned to the Nova Scotia Assembly for Cumberland county. In 1862 he was appointed, by act of parliament, governor of Dalhousie College, Halifax; and from 1867 till 1870 he was president of the Canadian Medical Association. Mr Tupper was a member of the executive council and provincial secretary of Nova Scotia from 1857 to 1860, and from 1863 to 1867. He became prime minister of Nova Scotia in 1864, and held that office until the Union Act came into force on the 1st of July 1867, when his government retired. He was a delegate to Great Britain on public business from the Nova Scotia government in 1858 and 1865, and from the Dominion government in March 1868. Mr Tupper was leader of the delegation from Nova Scotia to the Union conference at Charlottetown in 1864, and to that of Quebec during the same year; and to the final colonial conference in London, which assembled to complete the terms of union, in 1866–1867. On that occasion he received a patent of rank and precedence from Queen Victoria as an executive councillor of Nova Scotia. He was sworn a member of the privy council of Canada, June 1870, and was president of that body from that date until the 1st of July 1872, when he was appointed minister of inland revenue. This office he held until February 1873, when he became minister of customs under Sir John Macdonald, resigning with the ministry at the close of 1873. On Sir John's return to power in 1878, Mr Tupper became minister of public works, and in the following year minister of railways and canals. At this time he was made K.C.M.G. Mr Tupper was the author of the Public Schools Act of Nova Scotia, and had been largely instrumental in moulding the Dominion Confederation Bill and other important measures. Sir Charles represented the county of Cumberland, Nova Scotia, for thirty-two years in succession—first in the Nova Scotia Assembly, and subsequently in the Dominion parliament until 1884, when he resigned his seat on being appointed high commissioner for Canada in London. Shortly before the Canadian Federal elections of February 1887, Sir Charles re-entered the Conservative cabinet as finance minister. By his efforts the Canadian Pacific railway was enabled to float a loan of \$30,000,000, on the strength of which the line was finished several years before the expiration of the contract time. He resigned the office of finance minister in May 1888, when he was appointed high commissioner for the Dominion of Canada in London. Sir Charles was designated one of the British plenipotentiaries to the Fisheries Convention at Washington in 1887, the result of which conference was the signing of a treaty in February 1888 (rejected by the U.S. Senate) for the settlement of the matters in dispute between Canada and the United States in connexion with the Atlantic fisheries. He was created a baronet in September 1888. When the Dominion cabinet, under Sir Mackenzie Bowell, was reconstituted in January 1896 Sir Charles Tupper accepted office, and in the following April he

succeeded Bowell in the premiership. On both patriotic and commercial grounds he urged the adoption of a preferential tariff with Great Britain and the sister colonies. At the general election in the ensuing June the Conservatives were severely defeated, and Sir Charles Tupper and his colleagues resigned, Sir Wilfrid Laurier becoming premier. The Conservative party now gradually became more and more disorganized, and at the next general election, in November 1900, they were again defeated. Sir Charles Tupper, who had long been the Conservative leader, sustained in his own constituency of Cape Breton his first defeat in forty years.

TUPPER, MARTIN FARQUHAR (1810-1889), English writer, the author of *Proverbial Philosophy*, was born in London on the 17th of July 1810. He was the son of Martin Tupper, a doctor, who came of an old Huguenot family. He was educated at Charterhouse and at Christ Church, Oxford, where he gained a prize for a theological essay, Gladstone being second to him. He was called to the bar at Lincoln's Inn, but never practised. He began a long career of authorship in 1832 with *Sacra Poësis*, and in 1838 he published *Geraldine, and other Poems*, and for fifty years was fertile in producing both verse and prose; but his name is indissolubly connected with his long series of didactic moralisings in blank verse, the *Proverbial Philosophy* (1838-1867), which for about twenty-five years enjoyed an extraordinary popularity that has ever since been the cause of persistent satire. The first part was, however, a comparative failure, and N. P. Willis, the American author, took it to be a forgotten work of the 17th century. The commonplace character of Tupper's reflections is indubitable, and his blank verse is only prose cut up into suitable lengths; but the *Proverbial Philosophy* was full of a perfectly genuine moral and religious feeling, and contained many apt and striking expressions. By these qualities it appealed to a large and uncritical section of the public. A genial, warm-hearted man, Tupper's humane instincts prompted him to espouse many reforming movements; he was an early supporter of the Volunteer movement, and did much to promote good relations with America. He was also a mechanical inventor in a small way. In 1886 he published *My Life as an Author*; and on the 20th of November 1889 he died at Albury, Surrey.

TURBAN, the name of a particular form of head-dress worn by men of Mahomedan races. The earlier forms of the word in English are *turbant*, *turband*, and *tolbant* or *tulbant*, the latter showing that variant of the original which survives in the name of the flower, the tulip. All these forms represent the French adaptation of the Turkish *tulband*, a vulgarism for *dulband*, from Persian *dulband*, a sash or scarf wound round the head. The Moslem turban is essentially a scarf of silk, fine linen, cotton or other material folded round the head, sometimes, as in Egypt, round the tarbush or close-fitting felt cap; sometimes, as in Afghanistan, round a conical cap; or, as among certain races in India, round the skull-cap or *kullah*. Races, professions, degrees of rank, and the like vary in the style of turban worn; distinctions being made in size, methods of folding, and colour and the like (see INDIA: *Costume*). At the end of the 18th and beginning of the 19th century, a species of head-dress somewhat resembling the true turban in outward form was worn by ladies of western nations, chiefly for use indoors.

TURBERVILLE (or **TURBERVILLE**), **GEORGE** (1540?-1610?), English poet, second son of Nicholas Turberville of Whitchurch, Dorset, belonged to an old Dorsetshire family, the D'Urbervilles of Mr Thomas Hardy's novel, *Tess*. He became a scholar of Winchester College in 1554, and in 1561 was made a fellow of New College, Oxford. In 1562 he began to study law in London, and gained a reputation, according to Anthony à Wood, as a poet and man of affairs. He accompanied Thomas Randolph in a special mission to Moscow to the court of Ivan the Terrible in 1568. Of his *Poems describing the Places and Manners of the Country and People of Russia* (1568) mentioned by Wood, only three metrical letters describing his adventures survive, and these were reprinted in Hakluyt's *Voyages* (1589). His *Epitaphs, Epigrams, Songs and Sonnets* appeared "newly corrected with additions" in 1567. In the same year he published translations

of the *Heroycall Epistles* of Ovid, and of the *Eglogs* of Mantuan (Gianbattista Spagnuoli, called Mantuanus), and in 1568 *A Plaine Path to Perfect Vertue* from Dominicus Mancinus. The *Book of Falconry or Hawking* and the *Noble Art of Venerie* (printed together in 1575) may both be assigned to Turberville. The title page of his *Tragical Tales* (1587), which are translations from Boccaccio and Bandello, says that the book was written at the time of the author's troubles. What these were is unknown, but Wood says he was living and in high esteem in 1594. He probably died before 1611. He is a disciple of Wyatt and Surrey, whose matter he sometimes appropriated. Much of his verse is sing-song enough, but he disarms criticism by his humble estimate of his own powers.

His *Epitaphs* &c. were reprinted in Alexander Chalmers's *English Poets* (1810), and by J. P. Collier in 1867.

TURBET I HAJDARI, a district of the province of Khorasan in Persia, bounded N. by Meshed, E. by Bakharz, S. by Khaf and W. by Turshiz. It has a population of about 30,000, composed chiefly of members of the Turki Karai tribe and Beluchis. The Karais were settled here by Timur in the 14th century and now provide a battalion of infantry and 150 cavalymen to the army. The district contains about 150 villages and hamlets, most of them situated in its more fertile eastern part, and pays a yearly revenue of £14,000. Much silk was formerly produced, now very little, but there are large crops of grain.

TURBET I HAJDARI, the capital of the district, is 76 m. nearly S. of Meshed, in 35° 17' N., 59° 11' E., at an elevation of 4100 ft. The town is picturesquely situated on the bank of a deep and wide ravine in the midst of lofty hills, and surrounded by clusters of villages. Its population amounts to 8000 souls. There is a well-stocked bazaar and a number of Russian traders have established themselves here since 1903, when the place was connected with Meshed on one side and with Seistan on the other side by a telegraph line which, nominally Persian, is worked and maintained by a Russian staff. A British consul has resided here since 1905, and there is also a post office.

The place was formerly known as Zavah and derives its present name from the turbet or tomb of a holy man named Kutb ed din Haidar, the founder of the ascetic sect of dervishes known as the Haidaris. He died c. 1230 and is buried in a large domed building a short distance outside the town.

TURBINE (Lat. *turbo*, a whirlwind, a whirling motion or object, a top), in engineering, a machine which applies the energy of a jet of water or steam to produce the rotation of a shaft. It consists essentially of a wheel or chamber provided with a number of blades or vanes upon which the fluid jet impinges; the impelled fluid causes the blades to rotate and also the shaft to which they are attached. Water turbines are treated under **HYDRAULICS**, and steam turbines under **STEAM ENGINE**.

TURBOT (*Rhombus maximus* or *Psetta maxima*), one of the largest and most valuable of the flat-fishes or *Pleuronectidae*. The turbot, which rarely exceeds a length of two feet, has great width of body, and is scaleless, but is covered with conical bony tubercles. The eyes are on the left side of the body, the lower being slightly in advance of the upper; the mouth is large and armed with teeth of uniformly minute size. The turbot is found all round the coasts of Europe (except in the extreme north), preferring a flat sandy bottom with from 10 to 50 fathoms of water. The broad banks of the Dutch coast are a favourite resort. It is a voracious fish, and feeds on other fish, crustaceans and molluscs. It seems to constantly change its abode, wandering northward during the summer, and going into deeper water in the cold season. The eggs of the turbot, like those of the majority of flat-fishes, are pelagic and buoyant. They are small and very numerous, varying from five to ten millions in fish of 18 to 21 lb weight. The young fish are symmetrical and swim

The word "turbot" is of great antiquity, perhaps of Celtic origin: it is preserved in French in the same form as in English, and is composed of two words, of which the second is identical with the "but" in halibut and with the German "Butte," which signifies flat-fish. The German name for the turbot is "Steinbutte."

vertically like the young of other Pleuronectids, but they reach a much larger size before metamorphosis than species of other genera, specimens from $\frac{1}{2}$ in. to 1 in. in length being frequently taken swimming at the surface of the water and not completely converted into the adult condition. Specimens one year old are from 3 to $\frac{1}{2}$ in. long, some perhaps larger. About 1860 it was estimated that the Dutch supplied turbot to the London market to the value of £80,000 a year. In 1900 the total weight of turbot landed on English and Welsh coasts for the year was according to the Board of Trade returns 60,715 cwt. valued at £252,680. The turbot is also common, though not abundant, in the Mediterranean, and is replaced in the Black Sea by an allied species with much larger bony tubercles (*Rh. maculiculus*). Both species grow to a large size, being usually sold at from 5 to 10 lb; but the common turbot is stated to attain to a weight of 30 lb.

TUREEN, a deep dish or bowl, round or oval in shape, and with a cover, made to serve soup at table. The word is a corruption of the more correct "terrine," an earthenware vessel (Med. Lat. *terrines*, made of earth, *terra*). The corruption is due to misspelling in early cookery-books, and an absurd story that the name arose from Marshal Turenne once drinking his soup from his helmet was invented to account for it.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE (1611-1675), marshal of France, second son of Henri, duke of Bouillon and sovereign prince of Sedan, by his second wife Elizabeth, daughter of William the Silent, prince of Orange, was born at Sedan on the 11th of September 1611. He was educated in the doctrines of the Reformed religion and received the usual training of a young noble of the time, but physical infirmity, and particularly an impediment of speech (which he never lost), hampered his progress, though he showed a marked partiality for history and geography, and especial admiration of the exploits of Alexander the Great and Cæsar. After his father's death in 1623, he devoted himself to bodily exercises and in a great measure overcame his natural weakness. At the age of fourteen he went to learn war in the camp of his uncle, Maurice of Nassau, and began his military career (as a private soldier in that prince's bodyguard) in the Dutch War of Independence. Frederick Henry of Nassau, who succeeded his brother Maurice in 1625, gave Turenne a captaincy in 1626. The young officer took his part in the siege warfare of the period, and won special commendation from his uncle, who was one of the foremost commanders of the time, for his skill and courage at the celebrated siege of Hertogenbosch (Bois-le-Duc) in 1629. In 1630 Turenne left Holland and entered the service of France. This step was dictated not only by the prospect of military advancement but also by his mother's desire to show the loyalty of the Bouillon dominions to the French crown. Cardinal Richelieu at once made him colonel of an infantry regiment. He still continued to serve at frequent intervals with the prince of Orange, who was the ally of France, and his first serious service under the French flag was at the siege of La Motte in Lorraine by Marshal de la Force (1634), where his brilliant courage at the assault won him immediate promotion to the rank of *maréchal de camp* (equivalent to the modern grade of major-general). In 1635 Turenne served under Cardinal de la Valette in Lorraine and on the Rhine. The siege of Mainz was raised but the French army had to fall back on Metz from want of provisions. In the retreat Turenne measured swords with the famous imperialist General Gallas, and distinguished himself greatly by his courage and skill. The reorganized army took the field again in 1636 and captured Saverne (Zabern), at the storming of which place Turenne was seriously wounded. In 1637 he took part in the campaign of Flanders and was present at the capture of Landrecies (July 16) and in the latter part of 1638, under Duke Bernhard of Saxe-Weimar (1608-1639), he directed the assault of Breichach (repated the strongest fortress on the upper Rhine), which surrendered on the 17th of December. He had now gained a reputation as one of the foremost of the younger generals of France, and Richelieu

next employed him in the Italian campaign of 1639-40 under "Cadet la Perle," Henri de Lorraine, count of Harcourt (1601-1666). On the 10th of November 1639 he fought in the famous rearguard action called the battle of the "Route de Quiers," and during the winter revictualled the citadel of Turin, held by the French against the forces of Prince Thomas of Savoy. In 1640 Harcourt saved Casale and besieged Prince Thomas's forces in Turin, which were besieging in their turn another French force in the citadel. The latter held out, while Prince Thomas was forced to surrender on the 17th of September 1640, a fourth army which was investing Harcourt's lines being at the same time forced to retire. The favourable result of these complicated operations was largely due to Turenne, who had by now become a lieutenant-general. He himself commanded during the campaign of 1641 and took Coni (Cuneo), Ceva and Mondovì. In 1642 he was second in command of the French troops which conquered Roussillon. At this time the conspiracy of Cinq Mars (see FRANCE: History) in which Turenne's elder brother, the duke of Bouillon, was implicated, was discovered.

The earlier career of Turenne was markedly influenced by the relations of the principality of Sedan to the French crown, sometimes it was necessary to advance the soldier to conciliate the ducal family, at others the machinations of the latter against Richelieu or Mazarin prevented the king's advisers from giving their full confidence to their general in the field. Moreover his steady adherence to the Protestant religion was a further element of difficulty in Turenne's relations with the ministers. Cardinal Richelieu nevertheless entrusted him with the command in Italy in 1643 under Prince Thomas (who had changed sides in the quarrel). Turenne took Trino in a few weeks, but was recalled to France towards the end of the year. He was made a marshal of France (December 19) and was soon sent to Alsace to reorganize the "Army of Weimar"—the remnant of Duke Bernhard of Saxe-Weimar's troops—which had just been severely defeated at Tuttlingen (November 24-25, 1643). He was at this time thirty-two years of age and had served under four famous commanders. The methodical prince of Orange, the fiery Bernhard, the soldierly Cardinal de la Valette and the stubborn and astute Harcourt had each contributed much to the completeness of Turenne's training, and he took the field in 1644 prepared by genius and education for the responsibilities of high command.

The work of reorganization over, Marshal Turenne began the campaign in June by crossing the Rhine at Breisach, but was almost instantly joined by an army under the duc d'Enghien (afterwards the great Condé), who, as a prince of the royal house, took the chief command of the united armies of "France" and "Weimar." The four famous campaigns which followed brought to an end the Thirty Years' War (q.v.). The chief event of the first of these was the desperately-fought battle of Freiburg against Count Mercy's Bavarians (August 3, 5 and 9, 1644), after which Philippsburg was successfully besieged. Before the capitulation Enghien withdrew and left Turenne in command. The marshal opened the campaign of 1645 with a strong forward movement, but was surprised and defeated by Mercy at Mergentheim (Marienthal) on the 2nd of May. Enghien was again sent to the front with the army of France and Turenne's army was greatly increased by the arrival of a Swedish force and a contingent from Hesse-Cassel. The Swedes soon departed, but Enghien was at the head of 30,000 men when he met the Bavarians in a battle even more stubbornly contested than Freiburg. Mercy was killed and his army decisively beaten at Allerheim near Nördlingen (August 3, 1645).

Ill-health forced Enghien to retire soon afterwards, and Turenne was for the third time left in command of the French army. He was again unfortunate against the larger forces of the imperialists, but the campaign ended with a gleam of success in his capture of Trier (Trèves). In the following year (1646) he obtained more decided successes, and, by separating the Austrians from the Bavarians, compelled the

ector of Bavaria to make peace (signed March 14, 1647). In 1647 he proposed to attack the thus weakened army of the emperor, but was ordered into Flanders instead. Not only was the opportunity thus lost but a serious mutiny broke out amongst the Weimar troops, whose pay was many months in arrear. The marshal's tact and firmness were never more severely tried nor more conspicuously displayed than in his treatment of the disaffected regiments, among whom in the end he succeeded in restoring order with little bloodshed. He then marched into Luxembourg, but was soon recalled to the Rhine, for in 1648 Bavaria had returned to her Austrian alliance and was again in arms. Turenne and his Swedish allies made a brilliant campaign, which was decided by the action of Zusmarshausen (May 17), Bavaria being subsequently wasted with fire and sword until a second and more secure pacification was obtained. This devastation, for which many modern writers have blamed Turenne, was not a more harsh measure than was permitted by the spirit of the times and the circumstances of the case.

The peace of Westphalia (1648) was no peace for France, which was soon involved in the civil war of the Fronde (see FRANCE: History). Few of Turenne's actions have been more sharply criticized than his adhesion to the party of revolt. The army of Weimar refused to follow its leader and he had to flee into the Spanish Netherlands, where he remained until the treaty of Rueil put an end to the first war of the Fronde. The second war began with the arrest of Condé and others (January 1650), amongst whom Turenne was to have been included; but he escaped in time and with the duchesse de Longueville held Stenay for the cause of the "Princes"—Condé, his brother Conti, and his brother-in-law the duc de Longueville. Love for the duchess seems to have ruled Turenne's action, both in the first war, and now, in seeking Spanish aid for the princes. In this war Turenne sustained one of his few reverses at Rethel (December 15, 1650); but the second conflict ended in the early months of the following year with the collapse of the court party and the release of the princes.

Turenne became reconciled and returned to Paris in May, but the trouble soon revived and before long Condé again raised the standard of revolt in the south of France. In this, the third war of the Fronde, Turenne and Condé were opposed to each other, the marshal commanding the royal armies, the prince that of the Frondeurs and their Spanish allies. Turenne displayed the personal bravery of a young soldier at Jargeau (March 28, 1652), the skill and wariness of a veteran general at Gien (April 7), and he practically crushed the civil war in the battle of the Faubourg St Denis (July 2) and the reoccupation of Paris (October 21). Condé and the Spaniards, however, still remained to be dealt with, and the long drawn out campaigns of the "Spanish Fronde" gave ample scope for the display of scientific generalship on the part of both the famous captains. In 1653 the advantage was with Turenne, who captured Rethel, St Menesould and Muzon, while Condé's sole prize was Rocroy. The short campaign of 1654 was again to the advantage of the French; on the 25th of July the Spanish were defeated at Arras. In 1655 more ground was gained, but in 1656 Turenne was defeated at Valenciennes in the same way as he had beaten Condé at Arras. The war was eventually concluded in 1657 by Turenne's victory at the Dunes near Dunkirk, in which a corps of English veterans sent by Cromwell played a notable part (June 3-14); a victory which, followed by another successful campaign in 1658, led to the peace of the Pyrenees in 1659.

On the death of Cardinal Mazarin in 1661 Louis XIV. took the reins of government into his own hands and one of his first acts was to appoint Turenne "marshal-general of the camps and armies of the king." He had offered to revive the office of constable of France (suppressed in 1627) in Turenne's favour if the marshal would become a Roman Catholic. Turenne declined. Born of Calvinist parents and educated a Protestant, he had refused to marry one of Richelieu's nieces in 1639 and subsequently rejected a similar proposal of Mazarin.

He had later married a daughter of the Protestant Marshal de la Force, to whom he was deeply attached. But he sincerely deplored the division of the Christian church into two hostile camps. He had always distrusted the influence of many dissident and uncontrolled sects; the history of Independency in the English army and people made a deep impression on his mind, and the same fear of indiscipline which drove the English Presbyterians into royalism drew Turenne more and more towards the Roman Catholic Church. How closely both he and his wife studied such evidence as was available is shown by their correspondence, and, in the end, two years after her death, he was prevailed upon by the eloquence of Bossuet and the persuasions of his nephew, the abbé de Bouillon, to give in his adhesion to the Orthodox faith (October 1668). In 1667 he had returned to the more congenial air of the "Camps and Armies of the King," directing, nominally under Louis XIV., the famous "Promenade militaire" in which the French overran the Spanish Netherlands. Soon afterwards Condé, now reconciled with the king, rivalled Turenne's success by the rapid conquest of Franche Comté, which brought to an end the War of Devolution in February 1668.

In Louis XIV.'s Dutch War of 1672 (see DUTCH WARS) Turenne was with the army commanded by the king which overran Holland up to the gates of Amsterdam. The terms offered by Louis to the prince of Orange were such as to arouse a more bitter resistance. The dikes were opened and the country round Amsterdam flooded. This heroic measure completely checked Turenne, whom the king had left in command. Europe was aroused to action by the news of this event, and the war spread to Germany. Turenne fought a successful war of manœuvre on the middle Rhine while Condé covered Alsace. In January 1673 Turenne assumed the offensive, penetrated far into Germany, and forced the Great Elector of Brandenburg to make peace; later in the year, however, he was completely outmanœuvred by the famous imperial general Montecucculi, who evaded his opponent, joined the Dutch and took the important place of Bonn. In June 1674, however, Turenne won the battle of Sinsheim, which made him master of the Palatinate. Under orders from Paris the French wasted the country far and wide, and this devastation has usually been considered the gravest blot on Turenne's fame, though it is difficult to say that it was more unjustifiable than other similar incidents in mediæval and even in modern war. In the autumn the allies again advanced, and though Turenne was again outmanœuvred, his failure on this occasion was due to the action of the neutral city of Strassburg in permitting the enemy to cross the Rhine by the bridge at that place. The battle of Enzheim followed; this was a tactical victory, but hardly affected the situation, and, at the beginning of December, the allies were still in Alsace. The old marshal now made the most daring campaign of his career. A swift and secret march in mid-winter from one end of the Vosges to the other took the allies by surprise. Sharply following up his first successes, Turenne drove the enemy to Turkheim, and there inflicted upon them a heavy defeat (January 5, 1675). In a few weeks he had completely recovered Alsace. In the summer campaign he was once more opposed to Montecucculi, and after the highest display of "strategic chess-moves" by both commanders, Turenne finally compelled his opponent to offer battle at a disadvantage at Salsbach. Here, on the 27th of July 1675, he was killed by almost the first shot fired. The news of his death was received with universal sorrow. Turenne's most eloquent countrymen wrote his *Éloges*, and Montecucculi himself exclaimed: "Il est mort aujourd'hui un homme qui faisait honneur à l'homme." His body was taken to St Denis and buried with the kings of France. Even the extreme revolutionists of 1793 respected it, and, when the bones of the sovereigns were thrown to the winds, the remains of Turenne were preserved at the Jardin des Plantes until the 22nd of September 1800, when they were removed by order of Napoleon to the church of the Invalides at Paris, where they still rest.

Turenne was one of the great captains whose campaigns Napoleon recommended all soldiers to "read and re-read." His fame as a general was the highest in Europe at a period when war was studied more critically than ever before, for his military character epitomized the art of war of his time (Prince de Ligne). Strategic caution and logistic accuracy, combined with brilliant dash in small combats and constancy under all circumstances of success or failure may perhaps be considered the salient points of Turenne's genius for war. Great battles he avoided. "Few sieges and many combats" was his own maxim. And, unlike his great rival Condé, who was as brilliant in his first battle as in his last, Turenne improved day by day. Napoleon said of him that his genius grew bolder as it grew older, and a modern author, the duc d'Aumâle (*Histoire des princes de la maison de Condé*), takes the same view when he says: "Pour le connaître il faut le suivre jusqu'à Sulzbach. Chez lui chaque jour marque un progrès." In his personal character Turenne was little more than a simple and honourable soldier, endowed with much tact, but in the world of politics and intellect almost helpless in the hands of a skillful intriguer or casuist. His morals, if not beyond reproach, were at least more austere than those prevalent in the age in which he lived. He was essentially a commander of regular armies. His life was spent with the troops; he knew how to win their affection; he tempered a severe discipline with rare generosity, and his men loved him as a comrade no less than they admired him as a commander. Thus, though Condé's genius was far more versatile, it is Turenne whose career best represents the art of war in the 17th century. For the small, costly, and highly trained regular armies, and the dynastic warfare of the age of Louis XIV., Turenne was the ideal army leader.

The most notable of the numerous portraits of Turenne are those of P. de Champeigne at Versailles, and of Senin (dated 1670) in the Jones collection at South Kensington, London. Of the older memoirs of Turenne the most important are those of "Du Buisson," *La Vie du vicomte de Turenne*—the author is apparently Gatien de Sandraz de Courtlitz (Paris, the Hague, and Cologne, 1688-1695); Abbé Ragueneau, *Histoire du vicomte de Turenne* (Paris, 1741) and especially Ramsay, *Histoire d'Henry de la Tour d'Auvergne, vicomte de Turenne* (Paris, 1735), the second volume of which contains the marshal's memoirs of 1643-1658. These memoirs, of which the Prince de Ligne wrote that "ce ne sont pas de conseils, ce sont des ordres . . . faites . . . allez, &c."—were written in 1665, but were first published (*Mémoires sur la guerre, tirés des originaux, &c.*) in 1738, reprinted in Michaud, *Mémoires sur l'histoire de France*, 3rd series, vol. iii., and Liskenne and Sauvan's *Bibliothèque historique et militaire*, vol. iv. (Paris, 1846). A manuscript *Maximes de M. de Turenne* (1644) exists in the Staff Archives at Vienna, and of other documentary collections may be mentioned Grimoard, *Collections de lettres et mémoires trouvés dans la portefeuille de M. de Turenne* (Paris, 1782); *Recueil de lettres écrites au vicomte de Turenne par Louis XIV. et ses ministres, &c.* (Paris, 1779); *Correspondance inédite de Turenne avec Le Tellier et Louvois*, ed. Barthélemy (Paris, 1874). See also the *Observations on the Wars of Marshal Turenne*, dictated by Napoleon at St Helena (1893); Puysségur, *La Guerre par principes et règles* (Paris, 1748); Précis in *Bibliothèque internationale d'hist. milit.* (Brussels, 1883); Duruy, *Histoire de Turenne* (Paris, 1880); Roy, *Turenne, sa vie et les institutions militaires de son temps* (Paris, 1864); Hardy de Périni, *Turenne et Condé* (Paris, 1907); Neuberg, *Turenne als Kriegsoberster und Feldherr* (Vienna, 1869); Sir E. Cust, *Lives of the Warriors of the 17th Century* (London, 1867); T. O. Cockayne, *Life of M. de Turenne* (founded on Ramsay's work; London, 1853); G. B. Malleson, *Turenne, Marshal Turenne*, by "the author of the Life of Sir Kenelm Digby" (London, 1907), is a valuable work by a civilian, and is based in the main on Ramsay's work, the memoirs of Cardinal de Retz, James, duke of York, &c., and on Napoleon's commentaries. A remarkable parallel between Turenne and Condé, in Saint-Evremond's *Éloge* of the latter, will be found in Carrion-Nisas, *Essai sur l'histoire générale de l'art militaire*, li. 83 (Paris, 1824). (C. F. A.)

TURF, the top or surface of earth when covered with grass, forming a coherent mass of mould or soil in which the roots of grasses and other plants are embedded. This is capable of being cut out in solid mat-like blocks, known by the same name. Similarly "peat" (*q.v.*) when cut in pieces for fuel or other purposes is also styled "turf." The term is applied widely to any stretch or sward of trimmed grass-land, and to anyony, to horse-racing and all connected with it,

from the owning and running of race-horses to betting. The word "turf" is common to Teutonic languages, cf. Du. *turf*, Ger. *Turf*, Dan. *tørn*, &c. It has been connected with Skt. *darbha*, grass, so called from being matted or twisted together, *darbh*, to wind. The Teutonic word was adapted in Med. Lat., as *turba* (cf. Fr. *tourbe*, Ital. *torba*), whence was formed *turbaria*, turbarry, the right of digging and cutting turf in common with the owner of the land. (See COMMONS.)

TURGAI, a province of Russian Central Asia, formerly a part of the Kirghiz steppe, and now included in the governor-generalship of the Steppes, bounded by the province of Uralsk and the governments of Orenburg and Tobolsk on the W. and N., by Akmolinsk on the E., and by Syr-darya and the Sea of Aral on the S. This territory, which has an area of 176,219 sq. m.—nearly as large as that of Caucasia and Transcaucasia taken together—belongs to the Aral-Caspian depression. It has, however, the Mugojar Hills on its western border and includes a part of the southern Urals; and from Akmolinsk it is separated by a range of hills which run between the two largest rivers of the Kirghiz steppe—the Turgai and the Sary-su. In the north it includes the low belt of undulating land which stretches north-east from the Mugojar Hills and separates the rivers belonging to the Aral basin from those which flow towards the Arctic Ocean, and beyond this range it embraces the upper Tobol. The remainder is steppe land, sloping gently towards the Sea of Aral.

The Mugojar Hills consist of an undulating plateau nearly 1000 ft. in altitude, built up of Permian and Cretaceous deposits and deeply trenched by rivers. They are not the independent chain which our maps represent them to be; they merely continue the Urals towards the south, and are connected with the Ust-Urt plateau by a range of hills which was formerly an island of the Aral-Caspian Sea. Their northern extremity joins the undulating plateau (400 to 600 ft.), built up of sandstones and marls, which separates the tributaries of the Tobol from those of the river Ural, and falls by a range of steep crags—probably an old shore-line of the Aral basin—towards the steppes. The steppe land of Turgai is only some 300 ft. above the sea-level, and is dotted with lakes, of which the Chalkar-teniz, which receives the Turgai and its tributary the Irghiz, is the largest. The Turgai was, at a recent epoch, a large river flowing into the Sea of Aral and receiving an extensive system of tributaries, which are now lost in the sands before joining it. Remains of aquatic plants buried in the soil of the steppe, and shells of *Mytilus* and *Cardium*, both still found in the Sea of Aral, show that during the Glacial period this region was overflowed by the waters of the Aral-Caspian Sea.

The climate of Turgai is exceedingly dry and continental. Orsk, a town of Orenburg, on its north-western border, has a January as cold as that of the west coast of Novaya Zemlya (-4° F.), while in July it is as hot as July in Morocco (73°); the corresponding figures for Irghiz, in the centre of the province, are 7° and 77°. At Irghiz and Orsk the annual rainfall is somewhat under 10 in. and 12 in. respectively (3 in. in summer). The west winds are parched before they reach the Turgai steppes, and the north-east winds, which in winter bring cold, dry snows from Siberia, raise in summer formidable clouds of sand. A climate so dry is of course incompatible with a vigorous forest growth. There is some timber on the southern Urals, the Mugojar Hills and the water-parting of the Tobol; elsewhere trees are rare. Shrubs only, such as the wild cherry (*Cerasus chamaecerasus*) and the dwarf almond (*Amygdalus nana*) grow on the hilly slopes, while the rich black earth soil of the steppe is chiefly clothed with feather grass (*Stipa pennata*), the well-known ornament of the south Russian steppes. In the spring the grass vegetation is luxuriant, and geese and cranes are attracted in vast numbers from the heart of the steppe by the flocks of the Kirghiz. The jerboa (*Dipus jaculus*) and the marmot (*Spermophilus rufescens*) are characteristic of the fauna; another species of marmot (*Arctomys bobac*) and the steppe fox (*Canis corsac*) are common; and the saiga antelope of Central Asia is occasionally met with. Farther south the black earth disappears and with it the feather grass, its place being taken by its coeager, *Stipa capillata*. Trees disappear, and among the bushes along the banks of the rivers willows and the pseudo-acacia or Siberian pea tree (*Caragana microphylla*) are most prevalent. In the middle parts of the province the clayey soil is completely clothed with wormwood (*Artemisia fragrans* and *A. monogyna*), with a few grassy plants on the banks of the rivers and lakes (*Lasioglossis splendens*, *Alhagi camelorum* and *A. kirghisorum*, *Obione portulacoides*, *Halimodendrum argenteum*); while large areas consist of shifting sands, saline clays clothed with various *Salsolaceae*, and the desiccated beds of old lakes. Such lakes as still exist,

¹ See P. S. Nazarov, in "Recherches zoologiques dans les steppes des Kirghizes," in *Bull. soc. des natur. de Moscou* (1886), No. 4.

notwithstanding the rapid desiccation now going on, are surrounded by thickets of reeds—the retreat of wild boars. Turgai is thus the borderland between the flora of Europe and that of Central Asia.

The population was estimated in 1906 at 511,800, composed mainly of Kirghiz, though Russians have immigrated in large numbers. The province is divided into four districts, the chief towns of which are Turgai, the capital; Ak-tyubinsk in the district of Ilets; Irigis and Kustanaisk in the Nikolayevsk district, a prairie town which has grown with great rapidity. Agriculture is mainly carried on by the Russian settlers in the Nikolayevsk district, where the crops do not suffer so much from droughts as they do elsewhere. But the Kirghiz have also begun to cultivate the soil, and in 1900 there were in all 612,200 acres under cereals.

The principal crops are rye, wheat, oats, barley and potatoes. Livestock breeding is the leading occupation of the Kirghiz. Camels are bred and kept by the nomads both for their own personal use and for the transport of goods between Bokhara, Khiva and Russian Turkestan. Considerable quantities of cattle and various animal products are exported to Orenburg, Orsk and Troitsk, and to Ust-Issik and Zverinogolovsk, where large fairs are held. The Kirghiz of the southern part migrate in winter to the better sheltered parts of the province of Syr-Darya, while in the summer some 30,000 *hibibars* (felt tents) of nomads come from the neighbouring provinces to graze their cattle on the grassy steppes of Turgai. Salt is obtained from the lakes. There are a few oil-works, tanneries and flour-mills, and the Kirghiz are active in the making of carpets and felt goods. Education is a little more advanced than in the other steppe provinces; the system of "migratory schools" has been introduced for the Kirghiz.

See Y. Talleroz, *The Turgai Province* (1896), in Russian.

(P. A. K.; J. T. B.)

TURGOT, ANNE ROBERT JACQUES, BARON DE LAUNIE (1727-1781), French statesman and economist, was born in Paris on the 10th of May 1727. He was the youngest son of Michel Etienne Turgot, "provost of the merchants" of Paris, and Madeleine Françoise Martineau, and came of an old Norman family. He was educated for the Church, and at the Sorbonne, to which he was admitted in 1749 (being then styled abbé de Brucourt), he delivered two remarkable Latin dissertations, *On the Benefits which the Christian Religion has conferred on Mankind*, and *On the Historical Progress of the Human Mind*. The first sign we have of his interest in economics is a letter (1749) on paper money, written to his fellow student the abbé de Cicé, refuting the abbé Terrasson's defence of Law's system. He was fond of verse-making, and tried to introduce into French verse the rules of Latin prosody, his translation of the fourth book of the *Aeneid* into classical hexameters being greeted by Voltaire as "the only prose translation in which he had found any enthusiasm." In 1750 he decided not to take holy orders, giving as his reason, according to Dupont de Nemours, "that he could not bear to wear a mask all his life." In 1752 he became *substitut*, and later *conseiller* in the parlement of Paris, and in 1753 *maître des requêtes*. In 1754 he was a member of the *chambre royale* which sat during an exile of the parlement; in 1755 and 1756 he accompanied Gournay, then intendant of commerce, in his tours of inspection in the provinces, and in 1760, while travelling in the east of France and Switzerland, visited Voltaire, who became one of his chief friends and supporters. In Paris he frequented the salons, especially those of Mme Graffigny—whose niece, Mlle de Ligniville ("Minette"), afterwards Mme Helvétius and his lifelong friend, he is supposed at one time to have wished to marry—Mme Geoffrin, Mme du Deffand, Mlle de Lespinasse and the duchesse d'Enville. It was during this period that he met the leaders of the "physiocratic" school, Quesnay and Gournay, and with them Dupont de Nemours, the abbé Morellet and other economists. All this time he was studying various branches of science, and languages both ancient and modern. In 1753 he translated the *Questions sur la commerce* from the English of Josias Tucker, and wrote his *Lettre sur la tolérance*, and a pamphlet, *Le Conciliateur*, in support of religious tolerance. Between 1755 and 1756 he composed various articles for the *Encyclopédie*, and between 1757 and 1760 an article on *Valeurs et monnaies*, probably for the *Dictionnaire du commerce* of the abbé Morellet. In 1759 appeared his *Éloge de Gournay*.

In August 1761 Turgot was appointed intendant of the *généralité* of Limoges, which included some of the poorest and most over-taxed parts of France; here he remained for 13 years. He was already deeply imbued with the theories of Quesnay and Gournay (see *PHYSIOCRATIC SCHOOL*), and set to work to apply them as far as possible in his province. His first plan was to continue the work, already initiated by his predecessor Tourny, of making a fresh survey of the land (*cadastre*), in order to arrive at a juster assessment of the *taille*; he also obtained a large reduction in the contribution of the province. He published his *Avis sur l'assiette et la répartition de la taille* (1762-1770), and as president of the *Société d'Agriculture de Limoges* offered prizes for essays on the principles of taxation. Quesnay and Mirabeau had advocated a proportional tax (*impôt de quotité*), but Turgot a distributive tax (*impôt de répartition*). Another reform was the substitution for the *corvée* of a tax in money levied on the whole province, the construction of roads being handed over to contractors, by which means Turgot was able to leave his province with a good system of roads, while distributing more justly the expense of their construction. In 1769 he wrote his *Mémoire sur les prêts à intérêt*, on the occasion of a scandalous financial crisis at Angoulême, the peculiar interest of which is that in it the question of lending money at interest was for the first time treated scientifically, and not merely from the ecclesiastical point of view. Among other works written during Turgot's intendency were the *Mémoire sur les mines et carrières*, and the *Mémoire sur la marque des fers*, in which he protested against state regulation and interference and advocated free competition. At the same time he did much to encourage agriculture and local industries, among others establishing the manufacture of porcelain. During the famine of 1770-1771 he enforced on landowners "the obligation of relieving the poor" and especially the *métayers* dependent upon them, and organized in every province *ateliers* and *bureaux de charité* for providing work for the able-bodied and relief for the infirm, while at the same time he condemned indiscriminate charity. It may be noted that Turgot always made the *curets* the agents of his charities and reforms when possible. It was in 1770 that he wrote his famous *Lettres sur la liberté du commerce des grains*, addressed to the comptroller-general, the abbé Terray. Three of these letters have disappeared, having been sent to Louis XVI. by Turgot at a later date and never recovered, but those remaining demonstrate that free trade in corn is to the interest of landowner, farmer and consumer alike, and in too forcible terms demand the removal of all restrictions.

Turgot's best known work, *Réflexions sur la formation et la distribution des richesses*, was written early in the period of his intendency for the benefit of two young Chinese students. Written in 1766, it appeared in 1766-1770 in Dupont's journal, the *Éphémérides du citoyen*, and was published separately in 1776. Dupont, however, made various alterations in the text, in order to bring it more into accordance with Quesnay's doctrines, which led to a coolness between him and Turgot (see G. Schelle, in *Journal des économistes*, July 1888). A more correct text is that published by L. Robineau ("Turgot," in *Petite bibliothèque économique*, 1889), and is followed by Professor W. J. Ashley in his translation (*Economic Classics*, New York, 1898), but the original MS. has never been found.

After tracing the origin of commerce, Turgot develops Quesnay's theory that the land is the only source of wealth, and divides society into three classes, the productive or agricultural, the salaries (*stipendiée*) or artisan class, and the land-owning class (*classe disponible*). After discussing the evolution of the different systems of cultivation, the nature of exchange and barter, money, and the functions of capital, he sets forth the theory of the *impôt unique*, i.e. that only the *produit net* of the land should be taxed. In addition he demanded the complete freedom of commerce and industry.¹

¹ For the controversy as to how far Adam Smith (q.v.) was influenced by Turgot, see S. Feilbogen, *Smith und Turgot* (1892); also E. Cannan's introduction to Smith's *Lectures on Justice, &c.* (Clarendon Press, 1896); and H. Higgs's review of the latter in the *Economic Journal*, Dec. 1896. The question may still be considered an open one. See also Neymarck, i. 332, footnote, for the French authorities. Condorcet's statement that Turgot corresponded with Smith is disproved by a letter of Smith to the duc de la Rochefoucauld, published in the *Economic Journal* (March 1896), p. 165, in which he says, "But tho' I had the happiness of his acquaintance

Turgot owed his appointment to the ministry to Maurepas, the "Mentor" of Louis XVI., to whom he was warmly recommended by the abbé Véry, a mutual friend. His appointment as minister of the marine on the 20th of July 1774 met with general approval, and was hailed with enthusiasm by the *philosophes*. A month later he was appointed comptroller-general (August 24). His first act was to submit to the king a statement of his guiding principles: "No bankruptcy, no increase of taxation, no borrowing." Turgot's policy, in face of the desperate financial position, was to enforce the most rigid economy in all departments. All departmental expenses were to be submitted for the approval of the comptroller-general, a number of sinecures were suppressed, the holders of them being compensated, and the abuse of the "acquits au comptant" was attacked, while Turgot appealed personally to the king against the lavish giving of places and pensions. He also contemplated a thorough-going reform of the *ferme générale*, but contented himself, as a beginning, with imposing certain conditions on the leases as they were renewed—such as a more efficient personnel, and the abolition for the future of the abuse of the *croupes* (the name given to a class of pensions), a reform which Terray had shirked on finding how many persons in high places were interested in them, and annulling certain leases, such as those of the manufacture of gunpowder and the administration of the *messageries*, the former of which was handed over to a company with the scientist Lavoisier as one of its advisers, and the latter superseded by a quicker and more comfortable service of diligences which were nicknamed "turgotines." He also prepared a regular budget. Turgot's measures succeeded in considerably reducing the deficit, and raised the national credit to such an extent that in 1776, just before his fall, he was able to negotiate a loan with some Dutch bankers at 4%; but the deficit was still so large as to prevent him from attempting at once to realize his favourite scheme of substituting for indirect taxation a single tax on land. He suppressed, however, a number of *octrois* and minor duties,¹ and opposed, on grounds of economy, the participation of France in the War of American Independence, though without success.

Turgot at once set to work to establish free trade in corn, but his edict, which was signed on the 13th of September 1774, met with strong opposition even in the *conseil du roi*. A striking feature was the preamble, setting forth the doctrines on which the edict was based, which won the praise of the *philosophes* and the ridicule of the wits; this Turgot rewrote three times, it is said, in order to make it "so clear that any village judge could explain it to the peasants." The opposition to the edict was strong. Turgot was hated by those who had been interested in the speculations in corn under the régime of the abbé Terray—among whom were included some of the princes of the blood. Moreover, the *commerce des blés* had been a favourite topic of the salons for some years past, and the witty Galiani, the opponent of the physiocrats, had a large following. The opposition was now continued by Linguet and Necker, who in 1775 published his treatise *Sur la législation et le commerce des grains*. But Turgot's worst enemy was the poor harvest of 1774, which led to a slight rise in the price of bread in the winter and early spring of 1774-1775. In April disturbances arose at Dijon, and early in May took place those extraordinary bread-riots known as the "guerre des farines," which may be looked upon as a first sample of the Revolution, so carefully were they organized. Turgot showed great firmness and decision in repressing the riots, and was loyally supported by the king throughout. His position was strengthened by the entry of Malesherbes into the ministry (July 1775).

All this time Turgot had been preparing his famous "Six Edicts," which were finally presented to the *conseil du roi* (Jan. 1776). Of the six edicts four were of minor importance, and I flattered myself, even of his friendship and esteem. I never had that of his correspondence." but there is no doubt that Adam Smith met Turgot in Paris, and it is generally admitted that The Wealth of Nations owes a good deal to Turgot.

¹Account of Turgot's financial administration. see Ch. *Quinquies*, vol. I.

but the two which met with violent opposition were, firstly, the edict suppressing the *corvées*, and secondly, that suppressing the *jurandes* and *maîtrises*, the privileged trade corporations. In the preamble to the former Turgot boldly announced as his object the abolition of privilege, and the subjection of all three orders to taxation; the clergy were afterwards excepted, at the request of Maurepas. In the preamble to the edict on the *jurandes* he laid down as a principle the right of every man to work without restriction.² He obtained the registration of the edicts by the *lit de justice* of the 12th of March, but by that time he had nearly everybody against him. His attacks on privilege had won him the hatred of the nobles and the parlements, his attempted reforms in the royal household that of the court, his free trade legislation that of the "financiers," his views on tolerance and his agitation for the suppression of the phrase offensive to Protestants in the king's coronation oath that of the clergy, and his edict on the *jurandes* that of the rich bourgeoisie of Paris and others, such as the prince de Conti, whose interests were involved. The queen disliked him for opposing the grant of favours to her protégés, and he had offended Mme de Polignac in a similar manner (see Marquis de Ségur, *Au Couchant de la monarchie*, p. 305-306).

All might yet have gone well if Turgot could have retained the confidence of the king, but the king could not fail to see that Turgot had not the support of the other ministers. Even his friend Malesherbes thought he was too rash, and was, moreover, himself discouraged and wished to resign. The alienation of Maurepas was also increasing. Whether through jealousy of the ascendancy which Turgot had acquired over the king, or through the natural incompatibility of their characters, he was already inclined to take sides against Turgot, and the reconciliation between him and the queen, which took place about this time, meant that he was henceforth the tool of the Polignac clique and the Choiseul party. About this time, too, appeared a pamphlet, *Le Songe de M. Maurepas*, generally ascribed to the comte de Provence (Louis XVIII.), containing a bitter caricature of Turgot.

Before relating the circumstances of Turgot's fall we may briefly resume his views on the administrative system. With the physiocrats, he believed in an enlightened absolutism, and looked to the king to carry through all reforms. As to the parlements, he opposed all interference on their part in legislation, considering that they had no competency outside the sphere of justice. He recognized the danger of the recall of the old parlement, but was unable effectively to oppose it, since he had been associated with the dismissal of Maupeou and Terray, and seems to have underestimated its power. He was opposed to the summoning of the states-general advocated by Malesherbes (May 6, 1775), possibly on the ground that the two privileged orders would have too much power in them. His own plan is to be found in his *Mémoire sur les municipalités*, which was submitted informally to the king. In Turgot's proposed system landed proprietors alone were to form the electorate, no distinction being made between the three orders; the members of the town and country *municipalités* were to elect representatives for the district *municipalités*, which in turn would elect to the provincial *municipalités*, and the latter to a *grande municipalité*, which should have no legislative powers, but should concern itself entirely with the administration of taxation. With this was to be combined a whole system of education, relief of the poor, &c. Louis XVI. recoiled from this as being too great a leap in the dark, and such a fundamental difference of opinion between king and minister was bound to lead to a breach sooner or later. Turgot's only choice, however, was between "tinkering" at the existing system in detail and a complete revolution, and his attack on privilege, which might have been carried through by a popular minister and a strong king, was bound to form part of any effective scheme of reform.

²Turgot was opposed to all labour associations of employers or employed, in accordance with his belief in free competition.

The immediate cause of Turgot's fall is uncertain. Some speak of a plot, of forged letters containing attacks on the queen shown to the king as Turgot's, of a series of notes on Turgot's budget prepared, it is said, by Necker, and shown to the king to prove his incapacity. Others attribute it to the queen, and there is no doubt that she hated Turgot for supporting Vergennes in demanding the recall of the comte de Guines, the ambassador in London, whose cause she had ardently espoused at the prompting of the Choiseul clique. Others attribute it to an intrigue of Maurepas. On the resignation of Malesherbes (April 1776), whom Turgot wished to replace by the abbé Vély, Maurepas proposed to the king as his successor a nonentity named Amelot. Turgot, on hearing of this, wrote an indignant letter to the king, in which he reproached him for refusing to see him, pointed out in strong terms the dangers of a weak ministry and a weak king, and complained bitterly of Maurepas's irresolution and subjection to court intrigues; this letter the king, though asked to treat it as confidential, is said to have shown to Maurepas, whose dislike for Turgot it still further embittered. With all these enemies, Turgot's fall was certain, but he wished to stay in office long enough to finish his project for the reform of the royal household before resigning. This, however, he was not allowed to do, but on the 12th of May was ordered to send in his resignation. He at once retired to la Roche-Guyon, the château of the duchesse d'Enville, returning shortly to Paris, where he spent the rest of his life in scientific and literary studies, being made vice-president of the Académie des Inscriptions et Belles-lettres in 1777. He died on the 18th of March 1781.

In character Turgot was simple, honourable and upright, with a passion for justice and truth. He was an idealist, his enemies would say a doctrinaire, and certainly the terms "natural rights," "natural law," &c., frequently occur in his writings. His friends speak of his charm and gaiety in intimate intercourse, but among strangers he was silent and awkward, and produced the impression of being reserved and disdainful. On one point both friends and enemies agree, and that is his brusquerie and his want of tact in the management of men; Oncken points out with some reason the "schoolmasterish" tone of his letters, even to the king. As a statesman he has been very variously estimated, but it is generally agreed that a large number of the reforms and ideas of the Revolution were due to him; the ideas did not as a rule originate with him, but it was he who first gave them prominence. As to his position as an economist, opinion is also divided. Oncken, to take the extreme of condemnation, looks upon him as a bad physiocrat and a confused thinker, while Léon Say considers that he was the founder of modern political economy, and that "though he failed in the 18th century he triumphed in the 19th."

BIBLIOGRAPHY.—C. Schelle, *Turgot* (Paris, 1909); and Marquis de Ségur, *Un Couchant de la monarchie* (Paris, 1910), contain much that is based on recent research. The principal older biographies are those of Dupont de Nemours (1782, enlarged in his edition of *Turgot's Works*, 1807-1811), and Condorcet (1786); the best modern ones are those of A. Neymarck (Paris, 1885), Léon Say (Paris, 1897); and W. W. Stephens (London, 1895). See generally, Oncken, *Geschichte der Nationalökonomie*, vol. ii. ch. 1; Schelle, *Dupont de Nemours et l'école physiocratique* (1888); Henry Higge, *The Physiocrats* (1897); R. P. Shephard, *Turgot and the Six Edicts* (1903), in *Columbia Univ. Studies*, vol. xviii. No. 2.

TURGUENIEV, IVAN (1818-1883), Russian novelist, the descendant of an old Russian family, was born at Orel, in the government of the same name, in 1818. His father, the colonel of a cavalry regiment, died when our author was sixteen years of age, leaving two sons, Nicholas and Ivan, who were brought up under the care of their mother, the heiress of the Litvinovs, a lady who owned large estates and many serfs. Ivan studied for a year at the university of Moscow, then at St Petersburg, and was finally sent in 1843 to Berlin. His education at home had been conducted by German and French tutors, and was altogether foreign, his mother only speaking Russian to her servants, as became a great lady of the old school. For his first acquaintance with the literature of his country the future novelist was in-

debted to a serf of the family, who used to read to him verses from the *Rassiad* of Kheraskov, a once celebrated poet of the eighteenth century. Turgueniev's early attempts in literature, consisting of poems and trifling sketches, may be passed over here; they were not without indications of genius, and were favourably spoken of by Bielinski, then the leading Russian critic, for whom Turgueniev ever cherished a warm regard. Our author first made a name by his striking sketches "The Papers of a Sportsman" (*Zapiski Okhotnika*), in which the miserable condition of the peasants was described with startling realism. The work appeared in a collected form in 1852. It was read by all classes, including the emperor himself, and it undoubtedly hurried on the great work of emancipation. Turgueniev had always sympathized with the *musiks*; he had often been witness of the cruelties of his mother, a narrow-minded and vindictive woman. In some interesting papers recently contributed to the "European Messenger" (*Viestnik evropy*) by a lady brought up in the household of Mme Turgueniev, sad details are given illustrative of her character. Thus the dumb porter of gigantic stature, drawn with such power in *Mumu*, one of our author's later sketches, was a real person. We are, moreover, told of his mother that she could never understand how it was that her son became an author, and thought that he had degraded himself. How could a Turgueniev submit himself to be criticized?

The next production of the novelist was "A Nest of Nobles" (*Dvorianskoe gnezdo*), a singularly pathetic story, which greatly increased his reputation. This appeared in 1859, and was followed the next year by "On the Eve" (*Nakanunye*)—a tale which contains one of his most beautiful female characters, Helen. In 1862 was published "Fathers and Children" (*Ottsy i Ditya*), in which the author admirably described the nihilistic doctrines then beginning to spread in Russia. According to some writers he invented the word nihilism. In 1867 appeared "Smoke" (*Dym*), and in 1877 his last work of any length, "Virgin Soil" (*Nova*). Besides his longer stories, many shorter ones were produced, some of great beauty and full of subtle psychological analysis, such as *Rudin*, "The Diary of a Useless Man" (*Dnevnik iskhnogo chelovika*), and others. These were afterwards collected into three volumes. The last works of the great novelist were "Poetry in Prose" and "Clara Milich," which appeared in the "European Messenger."

Turgueniev, during the latter part of his life, did not reside much in Russia; he lived either at Baden Baden or Paris, and chiefly with the family of the celebrated singer Viardot Garcia, to the members of which he was much attached. He occasionally visited England, and in 1879 the degree of D.C.L. was conferred upon him by the university of Oxford. He died at Bougival, near Paris, on the 4th of September 1883.

Unquestionably Turgueniev may be considered one of the great novelists, worthy to be ranked with Thackeray, Dickens and George Eliot; with the genius of the last of these he has many affinities. His studies of human nature are profound, and he has the wide sympathies which are essential to genius of the highest order. A melancholy, almost pessimist, feeling pervades his writings, a morbid self-analysis which seems natural to the Slavonic mind. The closing chapter of "A Nest of Nobles" is one of the saddest and at the same time truest pages in the whole range of existing novels.

The writings of Turgueniev have been made familiar to persons unacquainted with Russian by French translations. There are many versions in English, among which we may mention the translation of the "Nest of Nobles" under the name of "Lisa," by Ralston, and "Virgin Soil," by Ashton Dilke. There is also a complete and excellent translation by Mrs Garnett.

(W. R. M.)

TURI, a Pathan tribe on the Kohat border of the North-West Frontier Province of India. The Turis inhabit the Kurram valley, which adjoins the western end of the Miranzai valley and number nearly 12,000. Though now speaking Pushtu and ranking as Pathans, they are by origin a Turki tribe, of the Shiah sect, who subjected the Bangash Afghans some time early in the

eighteenth century. They are strong, hardy, and courageous, and make first-rate horsemen. Their early dealings with the British government were inclined to turbulence, and they were concerned in the Miranzai expeditions of 1851 and 1855 (see MIRANZAI). But the only expedition specially sent against them was the Kurram expedition of 1856 (see KURRAM). Since then they have settled down and engaged in trade. During the Second Afghan War they supplied Sir Frederick Roberts with guides and provisions. In 1802 they voluntarily accepted British administration, and they now furnish a large part of the tribal militia in the Kurram Valley.

TURIN, a city of Piedmont, Italy, capital of the province of Turin, formerly of the kingdom of Sardinia until 1860, and of Italy till the removal of the seat of government to Florence in 1865. Pop. (1906), 277,121 (town), 361,720 (commune), with a garrison of 8500, the town being the headquarters of the I. army corps. The area of the city is 4155 acres, and its octroi circle measures nearly 9 m. Its geographical position is excellent; built upon alluvial soil 784 ft. above sea-level at a short distance from the Alps, it stands upon the river Po, which here runs from south to north just above the confluence of the Dora Riparia. The streets and avenues, almost all of which are straight, cut each other at right angles, forming blocks of houses, here as elsewhere called "islands." As viewed from the east the city stands out boldly against the Alps. Taken as a whole it is modern in aspect, but its regularity of form is in reality derived from the ancient Roman town of Augusta Taurinorum, which formed its nucleus. The mean temperature at Turin (1871-1900) is 53° F. (winter 35°, summer 71°), with an average maximum of 90°, and an average minimum of 17°. Mists are frequent in the winter mornings, and to a less degree in autumn. Snow falls on an average only on seven days per annum. The rainfall averages 34 in.

The cathedral of St John the Baptist is a cruciform Renaissance building dating from 1492-1498, by the Florentine Meo da Caprina. The site was first occupied by a church erected, it is said, by the Lombard duke Agilulf (7th century). Behind the high altar of the cathedral (from which it is separated by a glass screen) is the chapel of the Sudario or Sindone, built (1657-1694) by Guarini as a royal burial-place. The "sudario" from which it takes its name is asserted to be the shroud in which Joseph of Arimathea wrapped the body of Jesus. La Beata Vergine della Consolata, another of Guarini's works, has a tower which originally belonged to the church of St Andrew, founded by the monk Bruning in 1024, and attracts attention by Vincenzo Vela's beautiful kneeling statues of Queen Maria Teresa and Queen Maria Adelaide, as well as by the image of the Madonna, which has the credit of having ward off the cholera in 1835. Other churches of some note are San Filippo Neri (1672-1772), the dome of which fell in just as it was approaching completion under the hands of Guarini and was restored by Juvara, and La Gran Madre de Dio, erected to commemorate the return of the royal family in 1814. Of the secular buildings the more interesting are the Palazzo Madama, first erected by William of Montferrat at the close of the 13th century on the Roman east gate of the town, remains of the towers of which were incorporated in it, and owing its name to the widow of Charles Emmanuel II., who added the west façade and the handsome double flight of steps from Juvara's designs; and the extensive royal palace begun in the 17th century. Many of the palaces have fine pillared courtyards of the baroque period, some of which are the work of Guarini. For the Porta Palatina and other remains of the ancient city walls see below. The citadel, erected in 1565, has been almost entirely demolished. There is practically nothing of the Renaissance period except the cathedral. The Castello del Valentino is a building partly in the French style of the middle of the 16th century. The university, founded in 1400 by Lodovico di Acaja, has faculties of jurisprudence, medicine and surgery, literature, philosophy, and the mathematical, physical and astronomical sciences. The number of students is about 2500. The Palazzo Reale, erected in 1713 by the Genoese architect Filippo Juvara, and new buildings, fitted more especially

for the medical and scientific departments, have been erected. The original building contains the valuable library (now national), many of the treasures of which were destroyed by fire in 1906, and a collection of Roman antiquities. The academy of sciences was founded in 1757. It occupies a building erected in 1687 by Guarini as a Jesuit college. The museum of antiquities and the picture gallery, of which it has the custody, are both of high interest—the former for the local antiquities of Piedmont and Sardinia (notably from Industria) and for the Egyptian treasures collected by Donati and Drovetti, and the latter for its Van Dycks and pictures by north Italian masters. There is a museum of zoology and mineralogy in Palazzo Carignano (another of Guarini's buildings), and the royal palace contains the royal armoury (a fine collection made by Charles Albert in 1833) and the royal library with its rich manuscript collection and its 20,000 drawings, among which are sketches by Raphael, Michelangelo, and Leonardo da Vinci. The civic museum has a great variety of artistic and literary curiosities, among them a remarkable collection of autographs and the Lombard missal (1490).

There are many modern public monuments—considerably more than in other Italian towns—and some of them are fine. The Mole Antonelliana, built by Alessandro Antonelli, is the most important example of modern architecture in Turin. It belongs to the municipality, and is used for the Risorgimento Museum. It is the highest brick edifice in Europe, its summit being 510 ft. above ground. It is a square edifice with a large dome and lofty spire, the dome being raised upon a hall with three galleries, one above the other, so that from the floor to the top of the dome is over 300 ft.

Among the hospitals is that called by the name of its founder, Cottolengo, a vast institution providing for more than 5000 persons; there are also the Ospedale Maggiore di San Giovanni, the Ospedale Mauriziano, and many other hospitals for special diseases, as well as asylums and charitable institutions of all kinds.

The industries comprise metallurgy, machine-making, chemicals, silk and cotton weaving, tanning and leather-working. The manufacture of motor-cars has become of great importance, and Turin is the chief seat of the industry in Italy, nearly 5000 workmen being employed. Chocolate, liqueurs and vermouth are also made here. The application of electricity is widely developed on account of the proximity of Alpine valleys rich in torrents. The supply of drinking water is furnished by three aqueducts.

The opening of the St Gothard tunnel exercised a prejudicial influence upon the traffic of the network of railways of which Turin is the centre, and Milan, owing to its nearness both to this and to the Simplon, has become the most important railway centre of Italy. Turin has, however, the advantage of being the nearest to the Mont Cenis, while the completion of the line through Cuneo over the Col di Tenda affords direct communication with the French Riviera. Main lines run also from Turin to Vercelli and thence to Novara and Milan (the direct route), to Casale Monferrato, to Alessandria (and thence to Piacenza or Genoa), to Genoa via Asti and Acqui, to Brà and Savona, and branch lines to Lanzo, Torre Pellice, Aosta, Rivoli, Rivarolo, &c., and steam tramways in various directions.

For administrative purposes the city is divided into two municipal police sections and into seven government districts or *mandamenti*. The military organization is proportionate in importance to the strategic position of Turin near the French frontier. There is a military arsenal with laboratories, a military academy for artillery and engineer officers, a war school, and a military hospital.

Among the surroundings of Turin the Hill of Superga (2300 ft. above the sea) merits special mention. Victor Amadeus II. erected there a votive basilica in memory of the liberation of Turin from the French in 1706. King Charles Albert and other kings and princes of the Savoy dynasty are buried in the crypt. Not far from Turin are also the castles of Moncalieri, Stupinigi, Rivoli, Racconigi, Agliè, Venaria, and the ancient monastery of the Sagra di San Michele (753 metres above sea-level), famous for its view of the Alps as far as the beginning of the Lombard plain.

Turin was always a place of importance and military strength, in spite of numerous vicissitudes, till at length it was made the chief town of Piedmont by Amadeus, first duke of Savoy. Under Emmanuel Philibert it became the usual residence of the ducal family, and in 1515 the bishopric was raised to metropolitan rank by Leo X. Between 1536 and 1562 Turin was occupied by the French, and in 1630 it lost 8000 of its citizens by the plague. The French were masters once more from 1640 to 1706, and again from 1798 till 1814, when Piedmont was restored to the house of Savoy. From 1860 to 1865 Turin was the capital of Italy.

The ancient *Augusta Taurinorum* was a city of Gallia Cisalpina, the chief town of the Taurini. The natural advantages of its site and its position with relation to the pass over the Alps

Cottia (Mont Genève; see *COTTIA REGIONUM*) made it important in early times, though it cannot have been very strongly fortified, inasmuch as Hannibal, after crossing the Alps in 218 B.C., was able to take it after a three days' siege. It became a colony either under the triumvirs or under Augustus, and it was then no doubt that it was fortified. It was partly burned down in A.D. 69, but continued to be prosperous, as may be gathered from the remains of its fortifications and from the many inscriptions which have been discovered there. The Roman town formed a rectangle 2576 ft. by 2330; the line of the walls, which were 21 ft. high, 7 ft. thick at ground level and 3 ft. at the top, is well known, inasmuch as they were standing till about 1600; and the north gate, the *Porta Palatina*, still exists; it has a double opening, and two orders of arches above, and is flanked by two sixteen-sided brick towers. The east gate, similar in character, still exists in part within the *Palazzo Madama*. The north-west corner tower is also in part preserved, and traces of other parts of the enceinte have been found. The interior of the town was divided by seven streets from east to west and eight from north to south into 72 *insulae*; and the ancient pavement and the drains below it are frequently found under the streets of the central portion of the modern town, indicating that they follow the ancient lines (see especially *Notizie degli Scavi*, 1902, p. 277). In the great extensions which the city has undergone since 1600, the old rectangular arrangement has been followed. Remains of a theatre have been discovered beneath the *Palazzo Vecchio*, demolished in 1899 (A. Taramelli, in *Notizie degli Scavi*, 1900, p. 3).

See C. Promis, *Storia dell' antica Torino* (Turin, 1869); A. d'Andrade, *Relazione dell' ufficio regionale per la conservazione dei monumenti del Piemonte e della Liguria*, 7 seq. (Turin, 1899).

(T. As.)

TURKESTAN, a name conventionally employed to designate the regions of Central Asia which lie between Siberia on the N. and Tibet, India and Afghanistan on the S., the western limit being the Caspian Sea and the eastern Mongolia and the Desert of Gobi. Etymologically the term is intended to indicate the regions inhabited by Turkish races. How far this name was appropriate in the past need not be considered here; at present the regions called Turkestan not only contain races which do not belong to the Turk family, but it excludes races which do, e.g. the Turks of the Ottoman Empire. Nevertheless the term, in its dual application of West Turkestan and East or Chinese Turkestan, has long been established, and in default of any better designations cannot very well be dispensed with.

I.—WEST TURKESTAN

West Turkestan is very nearly, though not quite, coincident with the territories which Russia possesses and controls in Asia, Siberia excepted. Thus it includes (1) the governor-generalship of Turkestan, embracing the provinces of Ferghana, Samarkand, Semiriyehemsk, and Syr-darya; the provinces of Akmolinsk and Semipalatinsk, and sometimes that of Turgai belonging to the governor-generalship of the Steppes; the Transcasian region; and the semi-independent states of Bokhara and Khiva. Its total area amounts approximately to 1,200,000 sq. m.

Physical Geography.—Physically this region is divided into two sharply contrasted parts, the mountainous and highland country in the east and the flat steppes and deserts in the west and north. The former are sufficiently described under the heading *TIAN-SHAN*. It will be enough to say here that the mountainous region belongs to the great orographical flange which runs from south-west to north-east along the north-western margin of the great plateau of Central Asia. Hence it consists (1) partly of ranges, mostly snow-capped, which stretch from south-west to north-east, and which in several cases terminate *en échelon* on the verge of the desert, and (2) partly of ranges which strike away from the above at various angles, but in a predominantly north-western direction. The latter, including such ranges as the Chingia-tau, Chu-li Mountains, Kandyk-tau and Khan-tau, the Ferghana range, the Kara-tau and the Nura-tau, are geologically of later origin than the great border ranges of the Tian-shan proper, e.g. Trans-Alai, Alai, Kokshal-tau, Alexander range, Terzeli Ala-tau, Kumgei Ala-tau, Trans-Ili Ala-tau and Dzungarian Ala-tau. The Tarbagatai Mountains, still farther north, are often classified as belonging to the Altai system. Generally speaking, the ranges of both categories run at 10,000 to 20,000 ft., though

altitudes as high as 23,000 ft. are attained by individual peaks, such as Mt Kaufmann and Khan-tengri. Most of the loftier summits are capped with perpetual snow, and on some of them, e.g. Khan-tengri (Mushketov, Semenov, Inylchik) and the Kok-su Mountains (Fedchenko, Shurovsky), south of Peak Kaufmann, there are well-developed glaciers. Nearly all these border ranges rise abruptly to great heights from the plains on the north or north-west, but have a much shorter and easier descent on the south or south-east. Hence the passes lie at great altitudes, ranging from about 9000 to 14,000 ft. On the other hand the fact of the ranges radiating outwards towards the west, and the further fact that they are in more than one place penetrated by deep depressions (e.g. Dzungaria, Kulja, Issyk-kul, Ferghana) for a considerable distance towards the east, greatly facilitate access to the loftier plateau lands of Central Asia, and have from time immemorial been the highways of human intercourse between East and West.

Like the highlands of Siberia, those of Turkestan are fringed by a girdle of plains, having an altitude of 1000 to 1500 ft., and these again are skirted by an immense lowland area reaching only 400, 300 and 150 ft. above sea-level, or even Lowland Plains. sinking below the level of the ocean. Some geographers divide them into two sections—the higher plains of the Balkash (the Ala-kul and Balkash drainage areas) and the Aral-Caspian depression, which occupies nearly two-thirds of the whole and has been ably described by I. V. Mushketov under the appropriate name of Turanian basin—the Kara-tau Mountains, between the Chu and the Syr-darya rivers, being considered as the dividing line between the two. The Balkash plains, more than 1000 ft. above the sea, and covered with clay, with a girdle of loess at their foot, are well drained by the Ili and other feeders of Lake Balkash and support the numerous flocks and herds of the Kirghiz. To the south-west the clayey soil becomes saline. There is the Famine steppe (*Bek-pak-dala*), while in the Ak-kum steppe, which surrounds Lake Kara-kul, large areas consist of nothing but sands, partly shifting. The plains and lowlands of the Turanian basin are subdivided by a line drawn from north-east to south-west along a slight range of hills running from the sources of the Ishim towards the south-east corner of the Caspian (Bujnurd and Elburz edge of Khorasan). This low range, which most probably separated the lowlands of the Aral-Caspian region (submerged during the Post-Pliocene period) from the higher plains which had emerged by the end of the Tertiary period, now divides the Transcasian steppes from the somewhat different higher plains. In the Turanian basin the contrast between desert and oasis is much stronger than in the Balkash region. Fertile soil, or rather soil which can be rendered fertile by irrigation, is limited to a narrow terrace of loess along the foot of the mountains, and is surrounded by barren deserts. Even where the loess stretches out over terraces at some distance from the mountains, as in the south-east of the Transcasian region, it can be cultivated only when irrigated. Two rivers only—the Syr and the Amu—succeed in getting across the desert and reaching the Sea of Aral. But their former tributaries no longer run their full course: the glacier-fed Zarafshan dries up amid the gardens of Bokhara soon after emerging from the highlands; and the Tejeñ and the Murghab lose themselves in the recesses of the Kara-kum desert. The only tributaries which the Amu retains are those whose whole course is within the highlands. In the north such formerly important tributaries of the Syr-darya as the Chu, with its sub-tributary the Sary-su, now dry up some hundreds of miles before reaching the main stream.

The whole area is now undergoing geological changes on a vast scale. Rivers have changed their courses, and lakes their outlines. Far away from their present shores the geologist finds Desiccation. indubitable signs of the recent presence of lakes in the shells they have left amid the sands. Traces of former rivers and channels, which were the main arteries of prosperous regions within the period of written history, have now disappeared. Of the highly developed civilizations which grew up and flourished in Bactria, Bokhara and Samarkand the last survivals are now undergoing rapid obliteration with the simultaneous desiccation of the rivers and lakes. The great "Blue Sea" of Central Asia, the Sea of Aral, which at a recent epoch (Post-Glacial) extended south-west as far as Sary-kamysh, and the shells of which are found north and east of its present shores 50 to 200 ft. above its present level (157 ft. above the ocean, and 248 above the Caspian), now occupies but a small portion of its former extent. It fills a shallow depression which is drying up with astonishing rapidity, so that the process of desiccation can be shown on surveys separated by intervals of only ten years; large parts of it, like Aiburgay Gulf, have dried up since the Russians took possession of its shores. The whole country is dotted over with lakes, which are rapidly disappearing under the hot winds of the deserts.

Geology.—Like the highlands of eastern Asia, those of Turkestan are mostly built up on Pre-Cambrian gneisses and metamorphic slates, resting upon granites, syenites, old orthoclase porphyries, and the like. These upheavals date from the remotest geological ages; and since the Primary epoch a triangular continent having its

¹ R. Pumpelly and others, *Explorations in Turkestan* (Washington, 1905), contains references to the geological literature to the date of publication.

apex turned towards the north-east, as Africa and America have theirs pointing southward, rose in the middle of what now constitutes Asia. It is only in the outer foldings of the highlands that Palaeozoic fossiliferous deposits are found—Silurian, Devonian, Carboniferous and Permo-Carboniferous. Within that period the principal valleys were excavated, and their lower parts have been filled up subsequently with Jurassic, Cretaceous and Tertiary deposits. One of the most striking instances of this is the very thick Cretaceous and Tertiary deposits which cover the bottom of the valley of the Vakhsh (right tributary of the Amu) and are continued for about 300 m. to the north-east, as far as the Alai valley—probably along the edge of the Pamir plateau. The deposits of the Secondary period have not maintained their horizontal position. While upheavals having a north-eastern strike continued to take place after the Carboniferous epoch,¹ another series of upheavals, having a north-western strike, and occasioned by the expansion of diluases, dolerites, melaphyres and andesites, occurred later, subsequently at least to the close of the Tertiary period, if not also before it, dislocating former chains and raising rocks to the highest levels by the addition of new upheavals to the older ones. Throughout the Triassic and Jurassic periods nearly all Turkestan remained a continent indented by gulfs and lagoons of the south European Triassic and Jurassic sea.² Immense fresh-water lakes, in which were deposited layers of plants (now yielding coal), filled up the depressions of the country. Cretaceous and Tertiary deposits occur extensively along the edge of the highlands. Upper and Middle Cretaceous, containing phosphates, gypsum, naphtha, sulphur and alum, attain thicknesses of 2000 and 5000 ft. in Hisar. Representatives of all the Tertiary formations are met with in Turkestan; but while in the highlands the strata are coast-deposits, they assume an open sea character in the lowlands, and their rich fossil fauna furnishes evidence of the gradual shallowing of that sea, until at last, after the Sarmathian period, it became a closed Mediterranean. During the Post-Pliocene period this sea broke up into several parts, united by narrow straits. The connexion of Lake Balkash with the Sea of Aral can hardly be doubted; but this portion of the great sea was the first to be divided. While the Sea of Aral remained in connexion with the Caspian, the desiccation of the Lake Balkash basin, and its break-up into smaller separate basins, were already going on. The Quaternary epoch is represented by vast moraine deposits in the valleys of the Tian-shan. About Khan-Tengri glaciers descended to a level of 6800 ft. above the sea,³ and discharged into the wide open valleys or *syris*. It is most probable that, when allowance has been made for the obliteration of glacial markings, and the region has been better explored, it will appear that the glaciation of Turkestan was on a scale at least as vast as that of the Himalayas. In the lowlands the Aral-Caspian deposits, which it is difficult to separate sharply from the later Tertiary, cover the whole of the area. They contain shells of molluscs now inhabiting the Sea of Aral, and in their petrographical features are exactly like those of the lower Volga. The limits of the Post-Pliocene Aral-Caspian sea have not yet been fully traced. It extended some 200 m. north and more than 90 m. east of the present Aral shores. A narrow strait connected it with Lake Balkash. The Ust-Urt plateau and the Mugojar Mountains prevented it from spreading north-westward, and a narrow channel connected it along the Uzbos to the Caspian, which sent a broad gulf to the east, spread up to the Volga, and was connected by the Manych with the Black Sea basin. Great interest, geological and historical, thus attaches to the recent changes undergone by this basin. Since the theory of geological cataclysms was abandoned, and that of slow modifications of the crust of the earth accepted, new data have been obtained in the Aral-Caspian region to show that the rate of modification after the close of the Glacial period, although still very slow, was faster than had been supposed from the evidence of similar changes now going on in Europe and America. The effects produced by desiccating agencies are beyond all comparison more powerful than those which result from the earthquakes that are so frequent in Turkestan. All along the base of the highlands, from Khojent to Vyermya, earthquakes are frequent;⁴ but their effects lie beyond the scope of our observational methods.

Climate.—The climate of West Turkestan is exceedingly dry and continental. Although the country is approximately comprised within the latitudes of Sicily and Lyons, it has a south Norwegian January and a Persian summer. Temperatures of more than 100° F. in the shade are common, and the heat is rendered still more unbearable by the reflection from a soil destitute of vegetation. The winter is for the most part so cold that the average temperature of January is below the freezing point, and even reaches 0° F. Snow falls for several months on the lower Syr-darya, and were it not blown away by the winds, sledge-communication would be possible. This river is frozen for an average of 123 days every year in its lower parts and nearly 200 days at Ferovsk. At Tashkent there is snow during two months and temperatures of —10° F. have been observed; on the other hand the maximum observation

is 108°. To the south of Khojent the winter becomes more element. Absence of rain is the distinctive feature of the climate. Although it rains and snows heavily on the mountains, only 11 in. of rain and snow fall throughout the year at Tashkent, at the base of the highlands; and the steppes of the lower Amu have less. A few showers are all that fall from the almost invariably cloudless sky above the Transcasian steppes.

Fauna.—The fauna of Turkestan belongs to the zoo-geographical domain of northern Asia, and is only differentiated by the presence of species which have disappeared from the peripheral parts of the Old World and now find a refuge in the remotest regions of the uninhabited plateau. From the Palaeoartic region it is distinguished by the presence of Himalayan species. The distinctive animal of the Pamir plateau is the magnificent *Ovis poli* (conjectured to be the ancestor of the common sheep). In the alpine tracts of the Tian-shan, on the borders of the Pamir, their horns and skulls are frequently met with, but there the place of the species is now taken by *Ovis karelini*. The wild horse, which occurred in Poland a few centuries ago, was discovered by Przevalsky in the highlands of Dzungaria. The wild camel inhabits the lonely plateaus south of the Ala-shan. The other mammals of Turkestan are mostly those which are met with elsewhere in north Asia. The Himalayan bear (*Ursus isabellinus*) has its home on the Pamir, and the smaller *Leuconyx* up to the highest levels on the Tian-shan. Antelope, *Lepus khamsani*, *Lagomys varius*, various species of *Arvicola*, and the Himalayan long-tailed marmot (*Arctomys caudatus*), are the most characteristic inhabitants of the alpine meadows, are the only mammals of the Pamir proper. In the alpine region are found the badger (*Meles leurus*), the ermine (*Mustela erminea*) and six other Mustelidae, the wild dog (*Canis alpinus*), the common and the black-eared fox (*C. melanotis*), while the corsac fox (*C. corsac*) is met with only on the plains. Two species of lynx, the cheetah (*Felis jubata*), *F. manul*, and *F. irbis*, must be added to the above. The tiger is met with only on the lower Amu-darya, except when it wanders to the alpine region in pursuit of the maral deer (*Cervus marul*). The jackal is characteristic of the steppes; it banishes the wolves and foxes. Hares are represented by several species, *Lepus khamsani* being the most characteristic. Both the common and the long-tailed marmot (*A. baibacicus* and *A. caudatus*) live at the foot of the mountains, as well as four species of *Spermophilus*, three of voles, two of the mouse and three of the hamster. The *Meriones* (four species) and the jerboa (five species) are only met with in the steppe region. Of ruminants, beside the sheep (*O. poli*, *O. karelini*, *O. sibiricus*, *O. heimi*), we find one mouflon (*Moschus moschifer*), formerly known only in the Himalayas, the Chinese antelope (*Antelope subgutturosa*) and the saiga antelope in the steppes, the Siberian ibex and another goat, the yak, the zebu or Indian ox, the common ox, the camel and the dromedary. The wild boar is common in the reed thickets along the rivers and lakes, where it stays during the winter, migrating to the highlands in summer. The hedgehog and porcupine are common in the plains.

No fewer than 385 species of avifauna are recorded, most of them being middle-European and Mediterranean. A large number were formerly known only in the Himalayas, or in Persia, while others have their origin in East Asia. The commonest are mostly European acquaintances. The insect fauna is truly multitudinous. Among the Lepidoptera of the Pamir there is an interesting mixture of Tian-shan with Himalayan species. G. E. Grun-Grismanailo found on the Pamir the butterfly *Gonistis asteris*, a species characteristic of Labrador and Lapland; like the alpine plants which bear witness to a Glacial period flora in the Himalayas, this butterfly is a survival of the Glacial period fauna of the Pamir.⁵ Of 50 species of molluscs found in Turkestan quite one half are peculiar to the region.

Flora.—As a whole the flora of Turkestan is identical with that of Central Asia, which was formerly continued by geo-botanists as far west as the steppes of Russia, but which must now be considered as a separate region subdivided into two—the Central Asian proper and that of the Gobi. It has its own habitats, notwithstanding the number of species it has in common with Siberia and south-east Russia on the one hand and with the Himalayas on the other, and this habitat is due to the dryness of the climate and the consequent changes undergone by the soil. Towards the end of the Glacial period the Tian-shan Mountains had a flora very like that of northern Caucasia, combining the characteristics of the flora of the European Alps and the flora of the Altai, while the prairies had a flora very much like that of the lower Russian steppes. During the Stone Age the human inhabitants lived in forests of maple, white beech and apple trees. But the gradual desiccation of the country resulted

¹For fuller information, see N. A. Sveretsov's "Vertical and Horizontal Distribution of Turkestan Animals," in *Annals of the Moscow Soc. of Anatomists of Nat. Science* (1873); A. P. Fedchenko's "Travels in Turkestan" (vols. vi., xii., xiii., xiv., xv., and xvi. of the same Journal); likewise a series of monographs by specialists which deal with separate divisions of the animal and vegetable kingdom of the flora by E. A. Reeb, Obshchiye Zoo-Geographical Problems in Turkestan (Tashkent, 1888); G. E. Grun-Grismanailo's "Flora and Fauna of Pamir," in *Annals of Russ. Geog. Soc.* (1886); *Works of the Aral-Caspian Expedition*.

in the immigration from the Central Asian plateau of such species as could adapt themselves to the dry climate and soil, in the disappearance of European and Altaic species from all the more arid parts of the region, in the survival of steppe species, and in the adaptation of many of the existing species to the needs of an arid and extreme climate and a saline soil.¹ The Pamir vegetation and that of the Aral-Caspian steppes constitute two types with numberless intermediate gradations.

There is no arboreal vegetation on the Pamir, except a few willows and tamarisks along the rivers. Mountain and valley alike are carpeted with soft grass, various species of *Festuca* predominating. In the immediate vicinity of water the sedge (*Carex physoides*) grows, and sporadic patches of *Allium*. To these may be added a few Ranunculaceae, some *Myosotis*, the common *Taraxacum*, one species of *Chamomilla*, and a few Leguminosae. In the north and west the *Stipa* of the Russian steppes supercedes *Festuca* and affords splendid pastures for the herds of the Kara-Kirghiz. In the gorges and on the better-watered slopes of the mountains the herbaceous vegetation becomes luxuriant. Besides the above-named there are many other Gramineae, such as *Lasioglossis splendens*, the whole seas of *Scabiosa*. *Eremurus*, 6 to 7 ft. in height, forms thickets along with *Scorodiosma foetida*. The northern slopes of the Alai chain are richer in trees. Up to 12,000 ft. full-grown specimens occur of the archa or juniper (*Juniperus pseudo-Sabina*), characteristic of the whole northern slopes of the Turkestan highlands, the poplar, spruces, cedars, a very few birches (*B. Sogdiana*), and a copious undergrowth of shrubs familiar in European gardens, such as *Rhododendron chrysanthum*, *Sorbus aucuparia* (rowan), *Berberis heteropoda* (berberry), *Lonicera Tatarica* (honeysuckle), and *Crataegus* (hawthorn). Farther east and north comes the Turkestan pine (*Picea Schrenkiana*), while at lower levels there grow willows, black and white poplars, tamarisk, *Celtis*, as well as *Elaeagnus* (wild olive), *Hippophae rhamnoides* (sallow thorn), *Rubus fruticosus* (blackberry), *Prunus spinosa* (blackthorn) and *P. Armeniaca* (apricot). The characteristic poplar, *Populus diversifolia*, and the dwarf *Acer Lobelii*—very different from the European maple—also occur.

The above applies to most of the highlands of the Tian-shan. The drier southern slopes are quite devoid of arboreal vegetation. On the northern slopes, at the higher levels, *Juniperus pseudo-Sabina* is the only tree that grows on the mountains, and luxuriant meadow grasses cover the *syris*. Lower down, at 7500 to 8000 ft. the coniferous zone begins, characterized by the *Picea Schrenkiana*. Of course the juniper and a few other deciduous trees also occur. The richest zone is that which comes next, extending downwards to 5000 and 4500 ft. There woods of birch, several species of poplar, the maple (*Acer Scamoni*), and thick underwoods spread over the mountain slopes. Orchards of apple and apricot surround the villages. The meadows are clothed with a rich vegetation—numberless *Paeoniae*, *Scabiosae*, *Convolvulaceae*, Campanula, *Eremurus*, Umbelliferae, *Galium*, *Rosaceae*, *Althaeae*, *Glycyrrhizae*, *Scorodiosma foetida* and Gramineae. But as soon as the soil loses its fertile humus it produces only a few *Phlomis*, *Alhagi camelorum*, *Psammae*, *Salsolaceae*, *Artemisiae*, *Peganum* and some poppies and *Chamomillae*, but only in the spring. The invading steppe plants appear everywhere in patches in the Turkestan meadows.

The "culture" or "apricot" zone is followed by the prairie belt, in which black-earth plants (*Stipa* and the like) struggle for existence against invading Central Asian forms. And then come the lowlands and deserts with their moving sandy *barbarks*, *thors* and *aklys* (see TRANS-CASPIAN REGION). Two species of poplar (*P. prinus* and *P. diversifolia*), *Elaeagnus angustifolia*, the ash, and a few willows grow along the rivers. Large areas are wholly destitute of vegetation, and after crossing 100 m. of such a desert the traveller will occasionally come upon a forest of *saksau* (*Arbutus*; *Ammodendron*). Contorted stems, sometimes of considerable thickness, very hard, and covered with a grey cracked bark, rise out of the sand, bearing green plumes with small greyish leaves and pink fruit. Sometimes the tree is a mere knot peeping above the sand with a *sheaf* of thin branches. In spring, however, the steppe assumes quite another aspect, being clothed, except where the sands are shifting, with an abundance of vegetation. Persian species penetrate into Bokhara and the region of the upper Amu.

Vegetable Products.—As already stated the climate of Turkestan varies considerably from north to south. In Akmolinsk and Semir-ychenski most of the kinds of corn which characterize Middle Russia are grown. South of the Chu and the Syr-darya gardening is a considerable industry; and, although rye and wheat continue to be the chief crops, the cultivation of the apple, and especially of the apricot, acquired importance. Attempts are also made to cultivate the vine. The inhabitants of the neighbourhood of Tashkent and Samarland, as well as those of the much more northern but better sheltered Kulja oasis, add the cultivation of the almond, pomegranate and fig. Vines are grown and cotton planted in those districts. Finally, about Khojent and in Ferghana, where the climate is milder still, the vine and the pistachio tree cover the hills, while agriculture and horticulture have reached a high degree of perfec-

tion. Successful attempts are being made to grow the tea-plant in the Transcaspien region. Large numbers of oleaginous plants are cultivated, such as sunflower.

Agriculture.—The arable land, being limited to the irrigated terraces of loess, occupies little more than 2% of the whole area of West Turkestan. The remainder is divided between pasture land (less than 44%) and desert (54%). Owing to a very equitable distribution of irrigation water in accordance with Moslem law, agriculture and gardening have reached a high stage of development in the oases. Altogether close upon 4,000,000 acres are irrigated, and the crops are usually taken every year. Wheat, barley, millet, pea, lentils, rice, sorghum, lucerne and cotton are the chief agricultural products. Carrots, melons, vegetable marrows, cucumbers and onions are extensively grown. Rye and oats are cultivated at Kazalinsk and Kopal. Corn is exported. Owing to the irrigation, total failure of crops and consequent famines are unknown, unless among the Kirghiz shepherds. The kitchen gardens of the Mohammedans are, as a rule, admirably kept. Potatoes are grown only by the Russians. The cultivation of cotton is extending rapidly—from 1300 acres in 1883 to 531,000 acres in 1902, of which 402,000 acres were in Ferghana. Sericulture, a growing industry, is chiefly carried on in Ferghana, whence silk cocoons are an important item of export, the output having doubled between 1892 and 1903 (3869 tons). Livestock breeding is extensively pursued. The flocks of sheep on the Kirghiz steppe are so large that the proprietors themselves do not know their exact numbers.

Minerals.—The mineral wealth of Turkestan is considerable. Traces of auriferous sands have been discovered at many places, but the percentage of gold is too poor to make the working remunerative. Silver, lead and iron ores occur in several localities; but the want of fuel is an obstacle to their exploitation. The vast coal-beds of Kulja and some inferior ones in Samarkand are not seriously worked. The petroleum wells of Ferghana and the beds of graphite about Zairam-ore are neglected. There are abundant deposits of gypsum, alum, kaolin, marble and similar materials. Asphalt is obtained in Ferghana. Notwithstanding the salt springs of Ferghana and Syr-darya, the salt lakes of the region, and the rock-salt strata of the Alexander Mountains, salt is imported.

Industry and Trade.—Turkestan has no manufacturing industry carried on by means of machinery, except distilleries and establishments for dressing raw cotton. These last have greatly increased in number; over a score are driven by steam and about a hundred by water. But there is a great variety of artisan work, such as copper and brass, paper, knives (at Bokhara), silver filigree, shoes, caps (at Samarkand and Andijan) and carpets; but most of these have been for some time declining and now stand at a rather low level. Trade is very actively carried on. Tashkent and Bokhara are the chief commercial centres, the principal articles of export to Russia, via Orenburg and Semipalatinsk, being raw cotton and silk, cattle and their products, while manufactured wares are imported in return. There is also an import and export trade to and from Urumchi and China, via Kulja and Ak-su.

Population.—Turkestan has been the theatre of so many migrations and conquests that its present population could not fail to be very mixed. Both Aryans and Mongols have their representatives there, the former settled for the most part, the latter chiefly nomad. The Ural-Altians are numerically the predominant element, and consist of Turkomans, Kirghiz, Uzbeks and Sarts. The Turkomans inhabit chiefly the Transcaspien region. They number less than a quarter of a million. The Kara-Kalpaks ("Black Bonnets") number about 104,000. They are supposed to be recent immigrants to Syr-darya, having come from the former Bulgarian Empire on the middle Volga. Their language and habits are the same as those of the Kirghiz; but for the last century and a half they have had some acquaintance with agriculture. Their pacific temper exposed them to the raids of the Kirghiz, who compelled them first to settle in Dzungaria, then to move their dwellings several times, and ultimately (in 1742) to recognize the sovereignty of Russia. Even since that time they have been driven by the persecution of their old enemies to cross the Aral-Caspian steppes and seek refuge near Astrakhan. The real masters of the steppes and highlands of Turkestan are the Kirghiz, of whom there are two branches—the Kazak (Cossack) Kirghiz, who number about 3,787,000, and the Kara (Black) Kirghiz or Burut, who number nearly 202,000. The Uzbeks, who played a predominant political part in Turkestan before the Russian conquest, are of Turko-Tatar origin and speak a pure Jagatai (Turkish) dialect; but they are mixed to a great extent with Persians, Kirghiz and Mongols. They are subdivided into clans, and lead a semi-nomadic life, preserving most of the attractive features of their Turkish congeners—especially their honesty and independence. They number some 726,500 in

K.)

TURKESTAN, or **HAZRET**, a town of Russian Turkestan, in the province of Syr-darya, on the railway from Orenburg to Tashkent, from which it lies 165 m. to the N.N.W. Pop. (1897), 11,592. It lies on the right bank of the Syr-darya river, 20 m. from it, at an altitude of 833 ft. It has a very old mosque of the saint Hazret-Yassavi, which attracts many pilgrims. It is an important dépôt for hides, wool and other produce of cattle-breeding. The town was captured by the Russians in 1864.

TURKEY. The Turkish or Ottoman Empire comprises Turkey in Europe, Turkey in Asia, and the vilayets of Tripoli and Barca, or Bengazi, in North Africa; and in addition to those provinces under immediate Turkish rule, it embraces also certain tributary states and certain others under foreign administration. Turkey in Europe, occupying the central portion of the Balkan Peninsula, lies between 38° 46' and 42° 50' N. and 19° 20' and 29° 10' E. It is bounded on the N.W. by Montenegro and Bosnia, on the N. by Servia and Bulgaria, on the E. by the Black Sea and the Bosphorus, on the S. by the Sea of Marmora, the Dardanelles, the Aegean Sea and Greece, and on the W. by the Ionian and Adriatic Seas. Turkey in Asia, fronting Turkey in Europe to the south-east, and lying between 28° and 41° N. and 25° and 48° E., is bounded on the N. by the Black Sea, on the N.W. by the Bosphorus, the Sea of Marmora and the Dardanelles, on the W. by the Aegean Sea, on the E. by Persia and Transcaucasia, and on the S. by Arabia and the Mediterranean. So far as geographical description is concerned, the separate articles on ASIA MINOR, ALBANIA, ARMENIA, and other areas mentioned below—constituting the Turkish Empire—may be consulted. (For maps of Asiatic Turkey, see ARABIA; ARMENIA; ASIA MINOR; PALESTINE; SYRIA.)

The possessions of the sultan in Europe now consist of a strip of territory stretching continuously across the Balkan Peninsula from the Bosphorus to the Adriatic (29° 10' to 19° 20' E.), and lying in the east mainly between 40° and 42° and in the west between 39° and 43° N. It corresponded roughly to ancient Thrace, Macedonia with Chalcidice, Epirus and a large part of Illyria, constituting the present administrative divisions of Stambul (Constantinople) including a small strip of the opposite Asiatic coast, Edirne (Adrianople), Salonica with Kossovo (Macedonia), Imnina (parts of Epirus) and Thessaly; Shkodra (Scutari or upper Albania). To these must be added the Turkish islands in the Aegean usually reckoned to Europe, that is, Thasos, Samothrace, Imbros and, in the extreme south, Crete or Candia. In December 1898, however, Crete was granted practical independence, under the protection of Great Britain, France, Italy and Russia (see CRETE), and the suzerainty of the sultan is purely nominal.

Asiatic Turkey.—The mainstay of the Ottoman dynasty is the Asiatic portion of the empire, where the Mahomedan religion is absolutely predominant, and where the naturally vigorous and robust Turki race forms in Asia Minor a compact mass of many millions, far outnumbering any other single ethnical element and probably equalling all taken collectively. Here also, with the unimportant exception of the islands of Samos and Cyprus and the somewhat privileged district of Lebanon, all the Turkish possessions constitute vilayets directly controlled by the Porte. They comprise the geographically distinct regions of the Anatolian plateau (Asia Minor), the Armenian and Kurdish highlands, the Mesopotamian lowlands, the hilly and partly mountainous territory of Syria and Palestine and the coast lands of west and north-east Arabia. Asiatic Turkey is continuous on the east with Russia and Persia; in the south-west it encloses on the west, north and north-east the independent part of Arabia. Towards Egypt the frontier is a line drawn from Akaba at the head of the Gulf of Akaba north-westwards to the little port of El Arish on the Mediterranean. Elsewhere Asiatic Turkey enjoys the advantage of a sea frontage, being washed in the north-west and west by the Black, Aegean and Mediterranean, in

the south-west by the Red Sea, and in the south-east by the Persian Gulf.

Turkey's Arabian possessions comprise, besides El-Haama on the Persian Gulf, the low-lying, hot and insalubrious Tehama and the south-western highlands (vilayets of Hejaz and Yemen) stretching continuously along the east side of the Red Sea, and including the two holy cities of Mecca and Medina.

African Territories.—Turkey in Africa has gradually been reduced to Tripoli and Barca. Egypt, though nominally under Turkish suzerainty, has formed a practically independent principality since 1841, and has been *de facto* under British protection since 1881.

Population.—The total population of the Turkish Empire in 1910, including Egypt and other regions nominally under the sultan's suzerainty, was 36,323,539, averaging 25 to the square mile; in the provinces directly under Turkish government, 25,926,000.

The following towns have over 50,000 inhabitants each: Constantinople, 1,150,000; Smyrna, 250,000; Bagdad, 145,000; Damascus, 145,000; Aleppo, 122,000; Beirut, 118,000; Adrianople, 81,000; Brusa, 76,000; Jerusalem, 56,000; Caesarea Mazaca (Kaisariyah), 72,000; Kerbela, 65,000; Moosattir, 53,000; Mosul, 61,000; Mecca, 60,000; Hama, 60,000; Sana, 58,000; Urfa, 55,000; and Marash, 52,000.

Race and Religion.—Exact statistics are not available as regards either race or religion. The Osmanlis or Turks (*q.s.*) are supposed to number some 10 millions, of whom 1½ million belong to Turkey in Europe. Of the Semitic races the Arabs—over whom, however, the Turkish rule is little more than nominal—number some 7 millions, and in addition to about 300,000 Jews there is a large number of Syrians. Of the Aryan races the Slavs—Serbs, Bulgarians, Pomaks and Cossacks—and the Greeks predominate, the other representatives being chiefly Albanians and Kurds. The proportion borne to one another by the different religions, as estimated in 1910, is: 50% Mussulman, 41% Orthodox, 6% Catholic, 3% all others (Jews, Druses, Nestorians, &c.). In the European provinces about two-thirds of the population are Christian and one-third Mahomedan. Full and fairly accurate statistics are available for a considerable portion of Asiatic Turkey. Out of a population of 13,241,000 (1896) in Armenia, Kurdistan and Asia Minor, 10,030,000 were returned as Mahomedans, 1,144,000 as Armenians, 1,818,000 as other Christians, and 249,000 as Jews. There are also about 300,000 Druses and about 200,000 Gipsies. The non-Mussulman population is divided into *millet*s, or religious communities, which are allowed the free exercise of their religion and the control of their own monasteries, schools and hospitals. The communities now recognized are the Latin (or Catholic), Greek (or Orthodox), Armenian Catholic, Armenian Gregorians, Syrian, and United Chaldee, Maronite, Protestant and Jewish. The table on the following page, for which the writer is indebted to the kindness of Carolidi Effendi, formerly professor of history in the university of Athens, and in 1910 deputy for Smyrna in the Turkish parliament, shows the various races of the Ottoman Empire, the regions which they inhabit, and the religions which they profess.

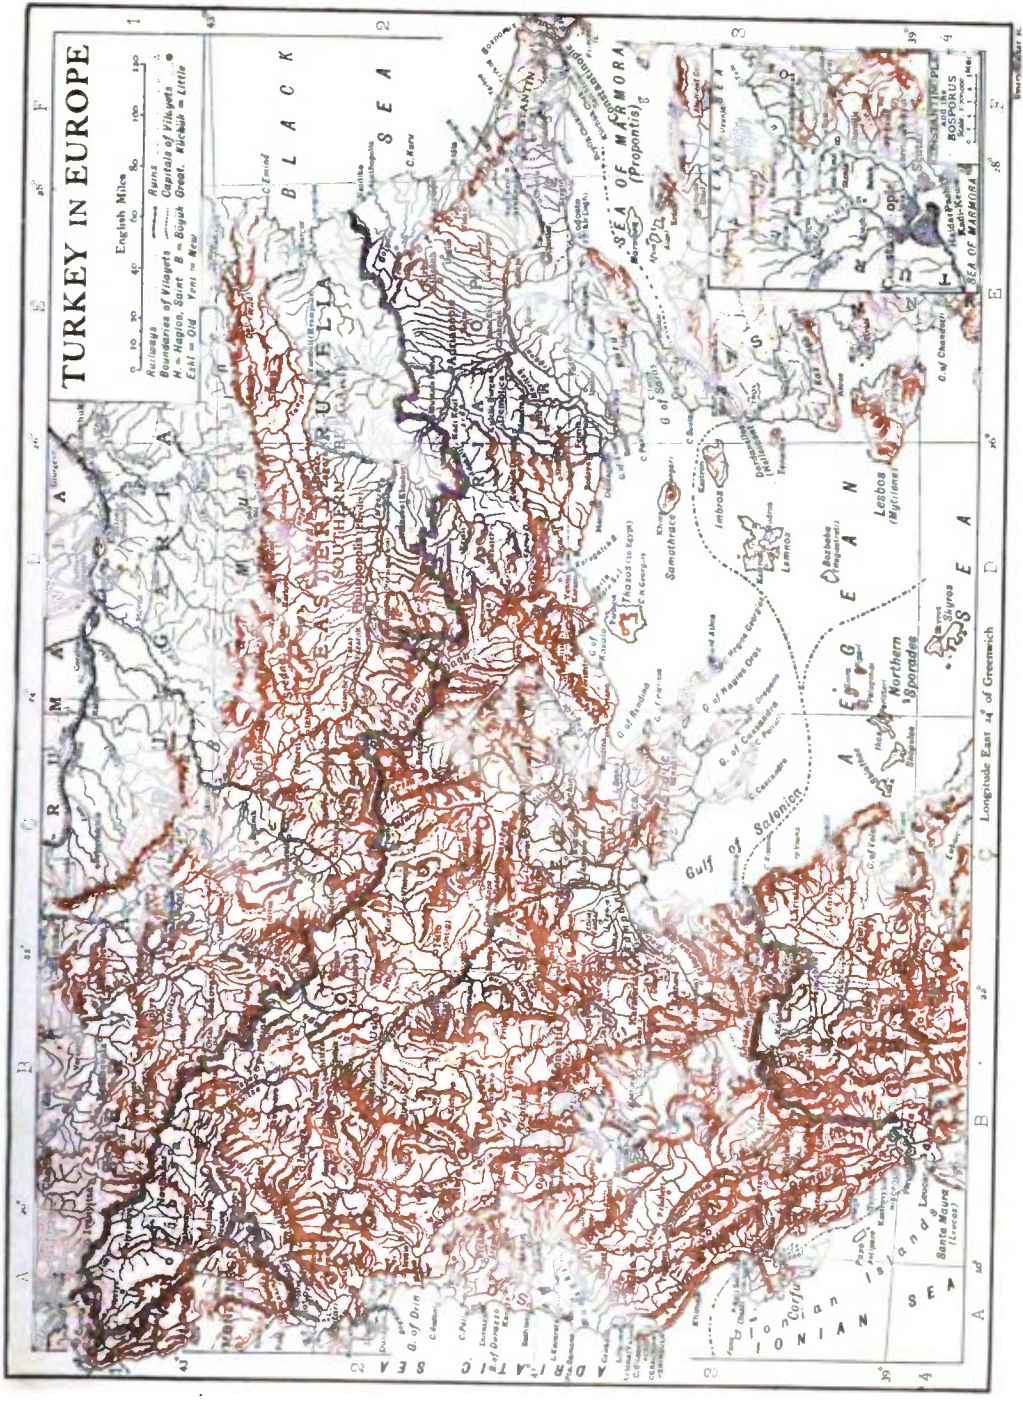

Administration.—Until the revolution of 1908, with a very short interval at the beginning of the reign (1876) of the deposed sultan Abd-ul-Hamid, the government of Turkey had been essentially a theocratic absolute monarchy. It was subject to the direct personal control of the sultan, who was himself a temporal autocrat, which he now is not, and the most generally recognized caliph, that is, "successor," of the Prophet, and consequently the spiritual head of by far the greater portion of the Moslem world—as he still is. Owing principally to the fact that the system of the caliph Omar came to be treated as an immutable dogma which was clearly not intended by its originator, and to the peculiar relations which developed therefrom between the Mussulman Turkish conquerors and the peoples (principally Christian) which fell under their sway, no such thing as an Ottoman nation has ever been created. It has been a juxtaposition of separate and generally hostile peoples in territories bound under one rule by the military sway of a dominant race. Various endeavours have been made since the time of Selim III. (1789-1807), who initiated them, to break down the barriers to the formation of a homogeneous nation. The most earnest and

Races.	Regions inhabited, or Vilayets.	Religions.
Albanians	Iannina, Scutari of Albania, Kossovo, Monastir	Mussulman, Orthodox, Catholic
Bulgarians	Salonica, Kossovo, Monastir	Orthodox (dis-senting)
Servians	Kossovo	Orthodox
Greeks	Constantinople, Adrianople, Salonica, Monastir, Kossovo, Janina, Archipelago, Vilayets of Asiatic Turkey, (Huitavendighiar, Aidin, Konia, Angora, Kastamuni, Trebizond, Sivas, Adana Syria, Aleppo, Sanjak of Jerusalem) Crete	Orthodox and partly Greco catholic
Kutzo-Vlachs (See MACEDONIA)	Monastir, Iannina	Orthodox
Turks	The whole of European Turkey, Vilayets of Asia Minor. (Bitlis, Van, Mamuret-ul-Aziz, part of Mosul and certain islands of Vilayet of the Archipelago, of Cyprus, Crete)	Mussulman
Lazes	Trebizond and throughout the whole of Eastern Asia Minor	Mussulman and Orthodox
Kurds	Erzerum, Sivas, Scert, Angora, Mosul	Mussulman
Circassians	Spread over the whole of Asia Minor	Mussulman
Avchar	Adana, Angora, Sivas	Mussulman
Arabs	Adana, Aleppo, Syria, Bagdad, Sanjak of Jerusalem, Hejaz, Yemen, Beirut, Basna	Mussulman
Armenians	Constantinople and spread over the other Vilayets of Turkey in Europe; also Sivas, Angora, Trebizond, Adana, Erzerum, Billis, Manuret-ul-Aziz, Mosul, Aleppo, Van	Gregorian and Catholic
Jews	Spread through Turkey in Europe and Asia, and largely congregated in the Sanjak of Jeru-salem, and in the Vilayets of Bagdad, Mosul, Syria, Beirut.	Jew
Samaritans	Only in the Sanjak of Nap-luze (Vilayet of Beirut)	Samaritan Jew
Gipsies	Spread throughout the whole empire	Mussulman
Chaldeans or Nestorians, speaking partly Syrochaldaic and partly Arabic (Syro-chaldaic in their churches)	Bagdad, Mosul and partly Aleppo, Beirut and Manu-ret-ul-Aziz	Nestorian Christian
Melchites, or Syrian Greco-Catholics (Greek in feel-ing, speaking Arabic)	Beirut, Aleppo, Syria	United Ortho-dox
Jacobite Syrians, speaking Arabic and partly Syrian (Syrian in their churches)	Beirut, Syria, Aleppo, Mosul, Mamuret-ul-Aziz	Monophysite and Jacobite
Monites (speaking Arabic and in their churches Syrian)	Mt Lebanon, Beirut	Monophysite (Catholic monothelite)
Druses Mendaites or Ben-i-Yahya	Mt Lebanon, Sanjak of Hauran, Basra	Druse Sabacan; or of the sect of the son of John the Baptist (Ben-i-Yahya) whom they regard as their only prophet.
Yezzites	Mosul, Bagdad, Basra	Yezzite (Mahom-medan sect)

important of these attempts under Abd-ul-Mejid (1839-1861) proved, however, for various reasons abortive. So also did the "Midhat Constitution" promulgated by Abd-ul-Hamid almost immediately after his accession to the throne, owing largely to the reactionary spirit at that time of the *Ulema* and of the sultan's immediate advisers, but almost, if not quite, in equal measure to the scornful reception of the Constitution by the European powers. The *Ulema* form a powerful corporation, whose head, the Sheik-ul-Islam, ranks as a state functionary almost co-equal with the grand vizier. Until quite recent times the conservative and fanatical spirit of the *Ulema* had been one of the greatest obstacles to progress and reform in a political system in which spiritual and temporal functions were intimately interwoven. Of late years, however, there has been a gradual assimilation of broader views by the leaders of Islam in Turkey, at any rate at Constantinople, and the revolution of 1908, and its affirmation in the spring of 1909, took place not only with their approval, but with their active assistance. The theoretical absolutism of the sultan had, indeed, always been tempered not only by traditional usage, local privilege, the juridical and spiritual precepts of the Koran and the *Sunnah*, and their *Ulema* interpreters, and the privy council, but for nearly a century by the direct or indirect pressure of the European powers, and during the reigns of Abd-ul-Aziz and of Abd-ul-Hamid by the growing force of public opinion. The enthusiastic spirit of reform which heralded the accession of the latter sultan never altogether died out, and from about the last decade of the 19th century has been rapidly and effectively growing in force and in method. The members and sympathizers of the party of reform who styled themselves "Young Turks," working largely from the European centres and from the different points in the Turkish Empire to which the sultan had exiled them for the purpose of repression—their relentless persecution by the sultan thus proving to be his own undoing—spread a powerful propaganda throughout the Turkish Empire against the old régime, in the face of that persecution and of the open and characteristic scepticism, and indeed of the hostile action, of some of the European powers. This movement came to a head in the revolution of 1908. In July of that year the sultan Abd-ul-Hamid capitulated to the Young Turks and restored by Iradé (July 24) the constitution which he had granted in December 1876 and suspended on the 14th of February 1878. A reactionary movement started in April 1909 was promptly suppressed by the Young Turks through the military occupation of Constantinople by Shevket Pasha and the dethronement of Abd-ul-Hamid, who was succeeded by his younger brother Reshad Effendi under the title of Mahommed V. A new constitution, differing from that of Abd-ul-Hamid only in some matters of detail, was promulgated by imperial Iradé of the 5th of August 1909.

In temporal matters the sultan is a constitutional monarch, advised by a cabinet formed of executive ministers who are the heads of the various departments of state, and who are responsible to the elected Turkish parliament. All Turkish subjects, of whatever race or religion, have equal juridical and political rights and obligations, and all discrimination as to military service has been abolished. The sultan remains the spiritual head of Islam, and Islam is the state religion, but it has no other distinctive or theocratic character. The grand vizier (*sadr-acam*), who is nominated by the sultan, presides *ex officio* over the privy council (*mejlis-i-khass*), which, besides the Sheik-ul-Islam, comprises the ministers of home and foreign affairs, war, finance, marine, commerce and public works, justice, public instruction and "pious foundations" (*evkaf*), with the grand master of ordnance and the president of the council of state.

For administrative purposes the immediate possessions of the sultan are divided into vilayets (provinces), which are again subdivided into sanjaks or mutessarifliks (arrondissements), these into kazas (cantons), and the kazas into nahîes (parishes or communes). A vali or governor-general, nominated by the sultan, stands at the head of the vilayet, and on him are directly dependent the kaimakams, mutassarifis, deftardars and other administrators of the minor divisions. All these officials unite

in their own persons the judicial and executive functions, under the "Law of the Vilayets," which made its appearance in 1861, and purported, and was really intended by its framers, to confer on the provinces a large measure of self-government, in which both Mussulmans and non-Mussulmans should take part. It really, however, had the effect of centralizing the whole power of the country more absolutely than ever in the sultan's hands, since the Valis were wholly in his undisputed power, while the *ex officio* official members of the local councils secured a perpetual Mussulman majority. Under such a system, and the legal protection enjoyed through it by Ottoman functionaries against evil consequences of their own misdeeds, corruption was rife throughout the empire. Foreigners settled in the country are specially protected from exactions by the so-called Capitulations (*q.s.*), in virtue of which they are exempt from the jurisdiction of the local courts and amenable for trial to tribunals presided over by their respective consuls. Cases between foreigners of different nationalities are heard in the court of the defendant, and between foreigners and Turkish subjects in the local courts, at which a consular dragoman attends to see that the trial is conducted according to law. (See further, as regards Turkish administration, the account given under *History* below, regarding the reforms instituted under the sultan Abd-ul-Mejid in 1839.)

Education.—The schools are of two classes: (1) public, under the immediate direction of the state; and (2) private, conducted either by individuals or by the religious communities with the permission of the government, the religious tenets of the non-Mussulman population being thus fully respected. State education is of three degrees: primary, secondary and superior. Primary education is gratuitous and obligatory, and superior education is gratuitous or supported by bursaries. For primary education there are three grades of schools: (1) infant schools, of which there is one in every village; (2) primary schools in the larger villages; (3) superior primary schools. Secondary education is supplied by the grammar school, of which there is one in the capital of every vilayet. For superior education there is (1) the university of Constantinople, with its four faculties of letters, science, law and medicine; and (2) special schools, including (a) the normal school for training teachers, (b) the civil imperial school, (c) the school of the fine arts and (d) the imperial schools of medicine.

Public instruction is much more widely diffused throughout the empire than is commonly supposed. This is due partly to the Christian communities, notably the Maronites and others in Syria, the Anatolian and Rumelian Greeks, and the Armenians of the eastern province and of Constantinople. Under the reformed constitution (Aug. 5, 1909) education is free, and measures have been taken largely to extend and to co-ordinate the education of all "Ottomans," without prejudice to the religious educational rights of the various religious communities. Primary education is obligatory. Among the Christians, especially the Armenians, the

Greeks of Smyrna and the Syrians of Beirut, it has long embraced a considerable range of subjects, such as classical Greek, Armenian and Syriac, as well as modern French, Italian and English, modern history, geography and medicine. Large sums are yearly contributed for the establishment and support of good schools, and the cause of national education is seldom forgotten in the legacies of patriotic Anatolian Greeks. Much educational work has also been done by American colleges, especially in the northern provinces of Asia Minor, in conjunction with Robert College (Constantinople).

Army.—In virtue of the enactments of May 1880, of November 1886, of February 1888 and of December 1903, military service has been obligatory on all Mussulmans, Christians having been excluded but under obligation of paying a "military exoneration tax" of £150 for 135 males between the ages of 15 and 75. Under the new régime this system, which had greatly cramped the military strength and efficiency of the Ottoman Empire, has been changed, and all "Ottomans" are now subject to military service. Under certain conditions, however, and on payment of a certain exoneration tax, exemption may still be purchased. The revision of the whole military system was undertaken in 1910, especially as regards enrolment and promotion of officers, but, as things then stood, the term of service was twenty years (from the age of 20 to the age of 40), for all Ottoman male subjects: active service (*muasaff*) nine years, of which three with the colours (*nizam*), in the case of infantry,

four in the case of cavalry and artillery; six and five respectively in the reserve (*ikhtiat*); Landwehr (*redif*) nine years; territorial (*mustahfiz*) two years. In case of supreme necessity all males up to 70 years of age can be called upon to join the colours. There are certain recognized rights to exemption from military service, such as some court officials, state officials, students in normal schools, medicine and law colleges, &c. The redifs form the principal part of the army in time of war, and are divided into two classes; *Class I.* comprises all men in the service who have completed their time with the *nizam*. In peace-time it is composed of weak *cadres*, on which falls the duty of guarding magazines and stores, and of carrying through musketry instruction and drill of the rank and file of the *ikhtiat* and the *redif*. *Class II.* was first established in 1898 under the name of *ilaweh*, and became "redif, class II." in 1903. This class is distributed in very weak *cadres* in time of peace. In time of war, it is completed by all troops not serving with the *nizam*, the *redif* class I. or the *mustahfiz*. As the organization proceeded, and stronger *cadres* were formed, the *redif* class II. would become completely absorbed in class I. The *mustahfiz* have no *cadres* in peace-time.

The army is divided into seven army-corps (*ordus*), each under the command of a field marshal, and the two independent commands of Tripoli (Africa) and the Hejaz. The headquarters of the *ordus* are I., Constantinople; II., Adrianople; III., Salonica; IV., Erzerum; V., Damascus; VI., Bagdad; VII., Yemen; 15th division, Tripoli; 16th division, Hejaz. Only the first six army-corps have, however, their proper establishment: the seventh *ordu* and the commands of Tripoli and the Hejaz have only garrison troops, and are fed by drafts from the first six *ordus*. Each *ordu* territory, from I. to VI., is composed of 8 *redif* brigade districts of 2 regimental districts of 4 battalion districts apiece, each *ordu* thus counting 64 battalion districts. The total strength of the Ottoman army in 1904 was returned at 1,795,350 men all told, made up as follows: (1) Active (4 years' service) 230,408 (called), reserve (*ikhtiat*) 251,511 (called), total 481,919; (2) *nizam* (class I., completely trained) 337,026 (called); (3) *redif* (class II., not completely trained) from 21-29 years old, 585,846; from 30-38 years old, 301,563; total 977,409 (uncalled); (4) *mustahfiz*, trained 53,715 (called), untrained 40,286 (uncalled), total 94,001.

The strength of the different arms is given as follows:—

Infantry.—79 *nizam* infantry regiments 1 to 80 (4 is missing), each regiment consisting of four battalions of four companies apiece. Allowing for certain battalions unformed, there are altogether 309 *nizam* battalions; 20 separate chasseur battalions, of four companies each; 4 special chasseur battalions stationed on the Bulgarian frontier—total, 333 battalions in the first line. There are 96 infantry battalions of *redif* class I.; each regiment composed of 4 battalions—total 384 battalions. (In 1904 the 4th battalion of the 94th regiment, and regiments 95 and 96 had not yet been formed, but it was stated, had by 1910 been made good.) The projected strength of *redif* class II. was 172 regiments of 4 battalions each—total, 688 battalions. At the end of 1904 the organization of this class was stated as completed in Turkey in Europe at 40 battalions with a total of 160 regiments; how far the organization had progressed in 1910 in Asiatic Turkey was not known.

The following table shows the war strength of battalions, and the total war strength of the infantry arm:—

Class.	War Strength of Battalions.				Total War Strength of Infantry.			
	Officers.	N.C.O.'s and Men.	Draft Animals.	Rifles.	Officers.	N.C.O.'s and Men.	Draft Animals.	Rifles.
Special Chasseurs	26	800	200	650	520	16,000	4,000	13,000
Nizam	24	700	106	650	7,896	230,300	34,874	213,850
Redif I.	24	900	106	850	10,320	337,500	39,750	318,750
Redif II.	24	800	106	750	16,512	550,400	72,968	515,000
Mustahfiz	8-15	400-600	—	400-600	1,760	98,000	—	98,000

The troops are armed principally with Mauser repeating rifles (models 1887 and 1890) of which there are 1,120,000 issued and in store; there are also 510,000 Martini-Henry rifles in reserve.

Cavalry.—Cavalry of the Guard: 1 regiment "Ertogrul" or 3 squadrons, 2 regiments of hussars of 5 squadrons each, and 1 regiment of lancers of 5 squadrons. *Nizam Cavalry*: 38 regiments of 5 squadrons each, or 190 squadrons in all.

Redif Cavalry.—12 regiments of 4 squadrons each, or 48 squadrons in all, attached to the first three *ordus*. It was further proposed to appoint one regiment of *redif* cavalry to each *redif* division. On war footing the strength of a squadron of *redif* cavalry is 6 officers, 100 men, 80 horses (Ertogrul—140 men, 135 horses). The *nizam* cavalry is incorporated with the first six *ordus*: one cavalry division of 3 brigades of 2 regiments each being appointed to each *ordu*. The *redif* cavalry is not organized with large units, and in time of war would be employed as divisional troops. The total war strength of the cavalry is 54 regiments (210 squadrons); 1580 officers, 26,800 men, 21,900 horses. The cavalry is armed with repeating carbines (the N.C.O.'s with repeating revolvers) and swords.

Artillery.—From ancient times the artillery has formed an

altogether independent command in the Turkish army. The grand master of ordnance is co-equal with the minister of war, and his department is classed separately in the budget; the artillery establishments, parts of the infantry and of the technical corps, and even hospitals are placed under his direct orders. The artillery is divided into (a) field artillery, horse artillery, mountain artillery and howitzer regiments; (b) fortress artillery; (c) artillery depôts. All artillery troops are nizam: there is no second line. On principle an ordu would have with it 30 batteries of field artillery, 3 batteries of horse artillery and 3 batteries of mountain artillery, or in all 36 batteries with 216 guns, all batteries being 6 guns strong. But the unequal strength of the ordnance and political and other reasons have prevented this organization from being carried out.

On war-footing each field battery has 4 officers, 100-120 N.C. officers and men, 100-125 horses and draught animals, 3-9 ammunition wagons; each horse battery, 4 officers, 120 N.C. officers and men, 100 horses, &c.; 3 ammunition wagons; each mountain battery, 3 officers, 100 N.C. officers and men, 87 horses, &c.; each howitzer battery, 4 officers, 120 N.C. officers and men, 100 horses, &c., 3 ammunition wagons.

In 1904 the total strength of the artillery was given as 198 field batteries (1888 guns), 18 horse batteries (108 guns), 40 mountain batteries (240 guns) and 12 howitzer batteries (72 guns): total 268 batteries (1608 guns). The guns are of various Krupp types. The ammunition train counts 1254 wagons. On a war-footing the strength of the artillery troops is 1032 officers and 29,380 men.

Technical Troops.—These are formed into battalions of pioneers, railway troops, telegraph troops, sappers and miners, &c.; in all 11 battalions (55 companies) numbering 245 officers and 10,470 men. Other non-combatant troops, such as military train, medical corps, &c., are undergoing reorganization. (For the history of the Turkish army, see ARMY, § 98.)

Navy.—The Turkish sea-power, already decayed owing to a variety of causes (for the effect of the revolt of the Greek islanders see GREEK INDEPENDENCE, WAR OP), was shattered by the catastrophe of Sinope (1853). Abd-ul-Aziz, however, with the aid of British naval officers, succeeded in creating an imposing fleet of ironclads constructed in English and French yards. Sultan Abd-ul-Hamid, on the other hand, pursued a settled policy of reducing the fleet to impotency, owing to his fear that it might turn against him as it had turned against Abd-ul-Aziz. He added, it is true, a few torpedo boats and destroyers, but he promptly had them dismantled on arrival at Constantinople. These were refitted, a cruiser ordered from Samp's shipyard (America) and another from W. G. Armstrong, Whitworth & Co. and the battleship "Mesudiyeh" (9100 tons displacement) reconstructed by the firm of Ansaldo (Genoa) in 1902, and re-armed by Vickers, Sons & Maxims, formed the only really effective war-ships at the disposal of Turkey in 1910, although a few armoured ships in addition might still serve for coast defence at a pinch, and a few more for training ships. Taking all into account, the available strength of the fleet might be put at 7 armoured-clad ships, of which the "Mesudiyeh" was one, the six others varying in displacement from 2400 to 6400 tons; two cruisers (unarmoured) of 3600 tons displacement; some 18 gunboats; 12 destroyers, 16 first-class torpedo boats and 6 second-class torpedo boats. There were also two Nordenfeldt submarine boats of doubtful efficiency.

Up to 1908 the personnel was found by yearly drafts of two to three thousand men from army recruits designated by the minister of war; the term of service was 12 years, of which 5 were in the first line, 3 in the reserve, 4 in the coastguard. The peace cadres (including 2 battalions of marines and 4 battalions of mechanics) were supposed to comprise 12,500 men on peace-footing, to be increased on declaration of war to 37,000; but these cadres were mainly on paper.

Under the "new régime" the Turkish government displayed considerable energy in reconstructing and reorganizing the sea-power of the empire. New construction to an amount of £15,000,000, repayable over ten years at the rate of £1,500,000 a year by a national subscription guaranteed by the government, had by 1910 been voted by parliament. The programme of construction which this initial expenditure was to cover was fixed at two battleships of about 16,000 tons displacement, one armoured cruiser of about 12,000 tons displacement, some few auxiliary vessels (destroyers and gunboats), and a floating dock to lift about 17,000 tons. The main armaments of the battleships was to be three pairs of 12-in. guns in three turrets, and three pairs of 9.2-in. in three turrets. The secondary armament was to be sixteen 4-in. Q.F. guns, and a few smaller guns (boat and field). The armoured cruiser was to carry four pairs of 9.2-in. guns in four turrets as main armament, and fourteen 4-in. Q.F. guns, and a few boat and field guns as secondary armament. British naval officers were engaged for training the personnel, and to assist in the reorganization of the fleet.

Communications.—A considerable hindrance to the development of the empire's resources has been the lack of an adequate system of communications; but although it is still deficient in good roads, much has been done of late years to develop railways, extend canals and improve river communications. From 1250 in 1885, of which 903 were in Europe and 347 in Asia, the mileage of railways had increased to some 4440 in 1909, of which 1377 are in Europe, 1810 in Asia Minor, 418 in Syria and 835 fall to the share of the Hejaz railway, XXVII B

including the Ed-Dera-Haifa branch. The construction of this last line is one of the most remarkable achievements of the reign of Abd-ul-Hamid. It may be said to be an absolutely autochthonous enterprise, no recourse having been had to foreign capital to find the means requisite for construction and equipment, which were provided by means of a "national subscription"—not entirely voluntary—and from other sources which, although the financial methods were not strictly orthodox, were strictly Turkish. The line was designed, surveyed and constructed by Turkish engineers—employing Ottoman navvies and labourers—in a highly efficient and economical manner, the average cost per mile having been £2230, although considerable engineering difficulties had to be overcome, especially in the construction of the Haifa branch. The line, stations, sheds and stores are all solidly built, and the rolling stock is sufficient and of the best quality (see further under Finance, below).

Production and Industries.—The Ottoman Empire is renowned for its productiveness, but enterprise and skill in utilizing its capabilities are still greatly lacking. For the introduction of improvements something, however, was done by the creation in 1892 of a special ministry of agriculture, to which is attached the department of mines and forests, formerly under the minister of finance. Since the year named an agricultural bank has been established, which advances money on loan to the peasants on easy terms. Schools of agriculture have been opened in the chief towns of the vilayets, and in connexion with those schools, and elsewhere throughout the empire, model farms have been instituted, where veterinary instruction can also be obtained.

To prevent the gradual destruction of the forests by unskillful management and depredations, schools of forestry have been founded, and means have been taken for regulating the cutting of wood and for replanting districts that have been partially denuded. About 21 millions of acres are under wood, of which over 3 millions are in European Turkey.

Wheat, maize, oats, barley and rye are the chief agricultural products. The culture of cotton is making rapid progress, immigrants who receive a grant of land being obliged to devote one-fourth of it to cotton culture. Tobacco is grown all over the empire, the most important market for it being Smyrna. Opium is mainly grown in Anatolia. All the more common fruit-trees flourish in most districts. In Palestine and elsewhere there is a large orange trade, and Basra, in Turkish Arabia, has the largest export of dates in the world. The vine is largely cultivated both in Europe and Asia, and much Turkish wine is exported to France and Italy for mixing purposes. The chief centres of export are Adrianople (more than half), Constantinople and Smyrna, the others being Brusa, Beirut, Ismid, Mytilene and Salonica. Under the auspices of the Ottoman public debt administration silk culture is also carried on with much success, especially in the vilayets of Brusa and Ismid. In 1888 a school of sericulture was founded by the public debt administration for the rearing of silkworms according to the Pasteur method. The production of salt is also under the direction of the public debt administration. About a fourth of the salt produced is exported to foreign countries, and of this about three-fourths goes to British India. Since 1885 great attention has been paid to the sponge fisheries of Tripoli, the annual value of which is about £30,000. With its extensive sea-coast, and its numerous bays and inlets, Turkey has many excellent fishing-grounds, and the industry, the value of which is estimated at over £200,000 a year, could be greatly developed. Its general progress may be seen in the increase of the fishery revenue—derived from duties, permits, &c.—of the public debt administration. Among other important productions of the Ottoman Empire are sesame, colesseed, castor oil, flax, hemp, aniseed, mohair, saffron, olive oil, gums, scammony and liquorice. Attar of roses is produced in large quantities both in European and Asiatic Turkey, and to aid in furthering the industry numerous rose plants are distributed gratuitously. The empire is rich in minerals, including gold, silver, lead, copper, iron, coal, mercury, borax, emery, zinc; and only capital is required for successful exploitation. The silver, lead and copper mines are mainly worked by British capital. The more special industries of Turkey are tanning, and the manufacture of muslin, velvet, silk, carpets and ornamental wools.

Shipping and Commerce.—The figures obtainable with respect to shipping are approximate, the statistical data not being altogether complete. In 1890-1891 the number of steamers that entered and cleared Turkish ports was 38,601, and of sailing vessels 140,726, the total tonnage of both classes of vessels being 30,509,861. In 1897-1898 the number of steamers was 39,680 of 32,446,320 tons, the number of sailing vessels being 134,059 of 2,207,137 tons, thus giving a total tonnage of 34,653,457. In 1904-1905 the number of steamers was 49,235 of 44,180,000 tons, and of sailing vessels 133,706, with a tonnage of 2,506,000 tons, the total tonnage being thus 46,686,000 tons. In 1909 the total tonnage was 43,060,515. About a third of the tonnage belongs to British vessels. The number of steamships belonging to Turkey in 1899-1900 was 177 of 55,938 tons, as

compared with 87 of 46,498 tons in 1897-1898, the number of sailing vessels in the same years being respectively 2205 of 141,055 tons and 1349 of 252,947 tons. The following tables show the total value of exports and imports arranged according to countries of origin or destination for 1905-1906 and 1908-1909; the same information for the year 1905-1906 with respect to the principal ports of the empire, and the tonnage of vessels cleared thereat during the year 1908-1909; and the value of the principal articles imported and exported for the year 1905-1906.

FINANCE

Preliminary Sketch.—From the outset of their history the Osmanli Turks adapted to their own needs most of the political, economic and administrative institutions which existed before them. Primarily their system was based on the great principles enunciated by the immediate successors of the Prophet, especially by Omar, involving the absolute distinction between, and impartiality of treatment of, the Mussulman conquerors and the

¹ As Dedeagatch is gaining, and will gradually gain, importance, it has been included in this table.

ness which they conquered; and from this point of view a careful study of the financial history of Turkey will afford most valuable insight into the Eastern Question.

In reward for the brilliant services rendered him by Ertoğrul (the father of Osman) and by Osman himself, Ala-ud-din, the last of the Seljuk sultans, conferred certain provinces in fief upon these two great warriors. They in their turn distributed the lands so acquired among their sons and principal emirs on strictly feudal principles, the feudatory lands being styled *siamet* and *timar*, a system long continued by their successors in regard to the territories which they conquered. The conquered peoples fell into an inferior caste, made to work for, and to pay for the subsistence of, their conquerors, as under the Arab domination: the principal taxes exacted from them were the *kharaç*, a tax of indeterminate amount upon realty, based on the value of lands owned by unbelievers—in contradistinction to the tithe [*şahîr*] which was a tax of fixed amount upon lands owned by believers—and levies in payment of the privilege of gaining means of existence in a Mussulman country, and the *ziyâye*, a compulsory payment, or poll-tax, to which believers were not subjected, in lieu of military service. The conquerors were feudatories of the reigning prince or sultan, and their payments consisted principally in providing fighting forces to make up the armies of the prince. The *kharaç*, the *ziyâye*, and the whole feudal system disappeared in theory, although its spirit, and indeed in some respects its practice, still exists in fact, during the reforming period initiated by Sultan Selim III., culminating in the Tanzimat-i-Khairiyé (1839) of Abd-ul-Mejid, and the Hatt-i-Humayun issued by the same sultan (1856). The administration of the state revenues was managed by a government department known as the Beit-ul-Mal or Maliyê, terms generally employed throughout Islamic countries since the commencement of Islam. But the entire financial authority resided in the sultan as keeper, by right, of the fortune of his subjects. The public revenues were passed under three principal denominations: (1) the public treasury; (2) the reserve, into which was paid any surplus of revenues over expenses from the treasury; (3) the private fortune (civil list) of the prince. Expenditure, as under the Seljuk sultans, was defrayed partly in cash, partly in "assignments" (*kasnâle*).

The Osmanli sultans, as also the Mamelukes and the Seljuks, were accustomed to give largesse to their military forces on their accession to the throne, or on special occasions of rejoicing, a custom which still is practised in form, as for instance on the first day of the year, on the birthday of the Prophet (*mesûûd*). Largesse was especially given on the field of victory, and was, moreover, liberally distributed to stifle sedition and mutiny among the troops, the numerical strength of which was continually increased as the empire enlarged its borders. This vicious system, grafted as it was upon an inefficient administration, and added to the weight of a continually depreciated currency, debased both by ill-advised fiscal measures and by public cupidity, formed one of the principal causes of the financial embarrassments which assailed the treasury with ever increasing force in the latter part of the 16th and during the 17th and 18th centuries. The Turkish historian, Kutchi Bey, attributes the origin of the decline of the empire to the reign of Selaiman the Magnificent (1520-1566), when the conversion of many *emiriyé* lands into *wakufs* was effected, and the system of farming out revenues first introduced. Impoverished by these different causes, as well as by prodigal extravagance in interior expenditure, by shameless venality among the ruling classes, and by continual wars, of which the cost, whether they were successful or not, was enormous, the public treasury was frequently empty. So long as the reserve was available it was drawn upon to supply the void; but when that also was exhausted recourse was had to expedients, such as the borrowing, or rather seizure, of the *wakuf* revenues (1622) and the sale of crown properties; then ensued a period of barefaced confiscation, until, to restore public confidence in some measure, state budgets were published at intervals, viz. the partial budget of Aisay-Ali (in 1018 or A.D. 1609), the budget of Ali Aga (in 1064, or 1653) and that of Eyubi Effendi (in 1071, or 1660). At this time (1657-1681) the brilliant administration of the two Kuprulis restored temporary order to Ottoman finance. The budget of Eyubi Effendi is particularly interesting as giving the statement of revenue and expenditure for an average year, whereas the budget of Aisay-Ali was a budget of expenditure only, and even in this respect the budget of Eyubi Effendi is far more detailed and complete. The budget of Ali Aga is almost identical with that of Eyubi Effendi, and is worthy of special note for the conclusions which accompanied it, and which although drawn up 250 years ago, described with striking accuracy some of the very ill from which Turkish finance was suffering throughout the reign of Abd-ul-Hamid.

Apart from unimportant modifications, the form of the budget must have remained unchanged until the organic reforms of Selim III., while its complete transformation into European shape dates only from the year 1278 (1862), when Fuad Pasha attached a regular budget to his report on the financial situation of the empire. Since that time there had been no further change worth noting until the "new régime" was established in 1908. Although the publication of the budget had only taken place at very irregular intervals, it must also be observed that the published budgets were by no means

accurate. From the time of Eyubi Effendi until the end of the grand vizierate of Ibrahim Pasha (1730), the empire experienced periodical relief from excessive financial distress under the series of remarkable grand viziers who directed the affairs of state during that time, but the recovery was not permanent. Ottoman arms met with almost systematic reverses; both the ordinary and the reserve treasuries were depleted; a proposal to contract a foreign loan (1783) came to nothing, and the public debt (*dayem-i-muammariyé*) was created by the capitalization of certain revenues in the form of interest bearing bonds (*sehims*) issued to Ottoman subjects against money lent by them to the state (1785). Then came forced loans and debased currency (1788), producing still more acute distress until, in 1791, at the close of the two years' war with Russia, in which the disaster which attended Ottoman arms may be largely ascribed to the penury of the Ottoman treasury, Selim III., the first of the "reforming sultans," attempted, with but little practical success, to introduce radical reforms into the administrative organization of his empire. These endeavours were continued with scarcely better result by each of the succeeding sultans up to the time of the Crimean War, and during the whole of the period the financial embarrassment of the empire was extreme. Partial relief was sought in the continual issue of debased currency (*heslik*, *atilik* and their subdivisions), of which the excess of nominal value over intrinsic value ranged between 33 and 97%, and finally paper money (*kurum*) which was first issued in 1839, bearing an interest of 8%, reduced in 1842 to 6%, such interest being paid on notes of 500 piastres, but not on notes of 20 or 10 piastres, which were issued simultaneously. Finally, usage of paper money was restricted to the capital only, and in 1842 this partial reform of the paper currency was followed by a reform of the metallic currency, in the shape of an issue of gold, silver and copper currency of good value. The gold coins issued were 500, 250, 100, 50, and 25 piastres in value, the weight of the 100-piastre piece (Turkish pound), 7.216 grammes, .916 fine. The silver coins were of 20, 10, 5, 2, 1 and 1/2 piastre in value, the 20-piastre piece weighing 24.055 grammes, .830 fine. The copper money was in pieces of a nominal value of 40, 20, 10, 5 and 1 para, 40 paras being equal to 1 piastre. In 1841 further attempts were made to withdraw the paper money from circulation, but these were interrupted by the Crimean War, and the government was, on the contrary, obliged to issue notes of 20 and 10 piastres. Finally, at the outbreak of the Crimean War Turkey was assisted by her allies to raise a loan of £3,000,000 in London, guaranteed by Great Britain and France; in 1855 an organic law was issued regulating the budget, and in the same year a second guaranteed loan of £5,000,000 was contracted in London by Great Britain. In 1857 an interest loan of 150,000 purses of bonds (*esham-i-muammar*), repayable in ten years and bearing 8% interest, was raised; the term of repayment was, however, prolonged indefinitely. In the same year another series of bonds (*hasinê lakrili*), bearing 6% interest, and repayable in 1861, was issued; in 1861 the term of reimbursement was prolonged until 1875. In 1858 a third loan was contracted in Great Britain for £5,000,000, and thereafter foreign loans followed fast on one another in 1860, 1862, 1863, 1864, 1865, 1869, 1872, 1873 and 1875, not to mention the two Egyptian tribute loans raised on Egyptian credit in 1871 and 1877. In 1859 the settlement of palace debts gave rise to the issue of 1,000,000 purses of new interior bonds (*esham-i-jedid*) spread over a period of three years, repayable in twenty-four years, and bearing interest at 6%. Further 6% bonds, repayable in ten years, and styled *sergis*, were issued in the same year. Seeing the rapid increase of the financial burdens of the state, a commission of experts, British, French and Austrian, was charged, (1860) with setting the affairs in order, and with their assistance Fuad Pasha drew up the budget accompanying his celebrated report to the sultan in 1862. Meanwhile *kasimé* was being issued in great quantities (about 60,000 purses a month) and fell to a discount (December 1861) of 75%. In 1862 further *sehims* were issued, and these and the loan of 1862 (£8,000,000) were devoted to the withdrawal of the *kasimé*. Later, however, the *kasimé* was again issued in very large amounts, and the years succeeding 1872 up to the Russian War (1877) presented a scarcely interrupted course of extravagance and financial disorder, the result of which is described below.

The Budget was supposed to be drawn up according to an excellent set of regulations sanctioned by imperial decree, dated the 6th of July 1290 (1875), of which the first article absolutely prohibited the increase, by the smallest sum, of any of the expenses, or the abandonment of the least iota of the revenues fixed by the budget. Under these regulations the revenues were divided into two categories, viz. the direct and the indirect. The first category included the "imposts" properly so called, the fixed contributions (*fedavacac fizes*) to be paid by the "privileged provinces," and the military exoneration tax. In the second were comprised tithes, mine-royalties, forests and domains, customs, sheep-tax, tobacco, salt, spirits, stamps and "various." The expenses were also divided into two categories—(1) "Periodic and fixed" expenditure, which admitted of neither reduction nor delay; and (2) the credits allowed to the various departments of state, which might be increased or diminished according to circumstances. The expenditure of the first category was made up of the service of foreign loans, of the general debt, of the donations replacing *siamet* and *timar* (military fiefs) and of fixed contributions such as *wakufs*. In the second category were

included the imperial civil list, the departments of the Sheikh-ul-Islam and of religious establishments, the ministries of the interior, war, finance, public instruction, foreign affairs, marine, commerce (including mines and forests), and public works, and, finally, of the grand master of ordnance. For every province (*vilayet*) a complete budget of receipts and expenditure was drawn up by its *defterdar* (keeper of accounts) under the supervision of the *vahi* (governor); this budget was forwarded to the minister of finance, while each state and ministry of department received communication of the items appertaining to it. Each ministry and department then sent in a detailed budget to the Sublime Porte before the end of November of each year. (The Turkish financial year is from the 1st of March to the 28th of February o.s.) The Sublime Porte forwarded these budgets, with its own added thereto, to the minister of finance, who thereupon drew up a general budget of receipts and expenses and addressed it to the Sublime Porte before the 15th of December. This was summarily considered by the council of ministers, and then referred to the budget commission, which was to be composed not only of State functionaries, but of private persons "worthy of confidence, and well versed in financial matters," and which was invested with the fullest powers of investigation and inquiry. The report drawn up by the commission on the results of its labours was submitted to the Council of Ministers, which then finally drew up a general summary of the definitive budget and submitted it by *mazbata* (memorandum) for the imperial sanction. When this sanction had been accorded the budget was to be published. The remaining regulations set forth the manner in which extra-budgetary and extraordinary expenses were to be dealt with, and the manner in which the rectified budget, showing the actual revenues and expenditure as proved at the close of the year was to be drawn up with the assistance of the state accounts department (*divân-i-mouhassebat*). This rectified budget, accompanied by an explanatory memorandum, was examined by the budget commission and the Council of Ministers, and submitted for the imperial sanction, after receiving which it was ordered that both be published. Special instructions and regulations determined the latitude left to each department in the distribution of the credits accorded to it among its various heads of expenditure, the degree of responsibility of the functionaries within each department and the relations regarding finance and accounts between each department and its dependencies. These regulations provide carefully and well for all contingencies, but unfortunately they were only very partially carried out. It may indeed be said that it was only the *precisive* budget (*anglicé*, the estimates) that received any approximately proper care on the lines laid down, while the rule that both the estimates and the definite budget (at the close of each year) should be published was almost wholly bonoured in the breach; until 1909, when the Constitution had been re-established the budget had only twice been published, in 1880 and 1897, since the regulations were put into force. Not only were the budgets not published, but no figures whatever were allowed to transpire in regard to the true position of the Turkish treasury—which laid the accuracy of even the limited number of budgets published open to suspicion.

All this has now been changed, and the above regulations are conscientiously carried out with the differences in procedure necessary for compliance with constitutional methods, and with the submission of the Budget to the houses of parliament. The Budget is now published in full detail and that for the year 1306 (1910-1911), with the explanatory memorandum which prefaces it, is an admirable work, mercifully exposing the financial shortcomings and sins of the previous system, or rather want of system, while unshrinkingly facing the difficulties which the present government has inherited. The account thus presented to us of what the previous confusion was, underlines and attests the summary exposition of it given in the last edition of this work. It was there stated that, on the most favourable estimate, the normal deficit of the Turkish treasury was £2,725,000, (upwards of £1,170,000 below the truth as now declared) and the following observations were appended:—

"This budget represents the normal situation of Ottoman finance; it does not tally with the budget published in 1897, which was prepared with a special object in view, and was obviously full of inaccuracies, nor indeed does it agree with figures which could be officially obtained from the Porte. It is, however, compiled from the best sources of information, and it exaggerates nothing. The formidable deficit is met principally in three ways. (1) By leaving the salaries of state officials and the army unpaid. In many parts of the empire the soldiers rarely receive more than eight months' pay in the year, although in Constantinople the arrears are not so large. The reverse is the case with the civil officials, whose salaries in the provinces are paid most regularly. In Constantinople, owing to their being there, they are not so regular, the average arrears are from two to three months' pay, and from one to three in the provinces. (2) By the enormous military salaries average annual of 100,000 francs, both

public and from individuals. By financial expedients of this kind payments were effected by the treasury in fifteen years (1881-1896) amounting to £11,666,000 or at the rate of nearly £180,000 per annum. (3) By anticipating the revenues of future years. This is the method so frankly condemned by Ali Aga, as was seen above, in 1653. Delegations (*havale*) are granted on the provincial treasuries for one or two years in advance, sometimes for a series of years, in order to pay pressing debts too heavy to be met in a single payment. No better description of the financial distress and disorder of the empire can be given than that set forth in the official report of the budget commission of 1888. "It has hitherto been considered necessary owing to financial embarrassment, to commence financial years with unbalanced budgets. Later, without taking into consideration the effective amounts in cash at the disposal of the vilayets, considerable sums were drawn upon them, by means of *havales*, out of proportion to their capacity. For these reasons, during the last two or three months of the financial year, the vilayets have not a para to remit to the central administration, and it has been considered imperatively necessary to draw on the revenues of the following year. Thus, especially during the last two years, urgent extraordinary expenses have been perforce partially covered by the proceeds of the ordinary revenues, the revenues of 1303 (1887) were already considerably anticipated in the course of 1302 (1886). The former year naturally felt the effect of this, and the tithes which should have been encashed in the last months of the year were discounted and spent several months in advance. Moreover, in order to meet to some extent the deficit arising as well from the accumulation of arrears of state departments since 1300 (1884) as, to a large degree, from gross deficiencies due to the neglect of the civil officials of the government to encash the revenues—to meet, further, the needs of the central administration, and above all, the urgent military expenses of the empire, and to provide a guarantee for bankers and merchants in business relations with the government and the treasury, part of the revenues of 1304 were perforce spent in 1303." This commission proved the deficit of the year to be £4,370,000. It set out also at length the very defective and disorderly condition of the state accounts. During the finance ministry of Agop-Pasha (1889 to 1894) a good deal was done to set matters in order, but most of the ground then gained has since been lost."

To this may be added a short extract from the Explanatory Preface to the Finance Bill for the year 1910-1911. After pointing out the immense difficulties which he had had to encounter owing to the absence of any regular accounts, and above all of any of "those statistics which constitute the soul, indeed the very life of a public administration," and that it was therefore impossible for him to pretend that he had been able to free himself altogether from the effects of the past, the minister continues; "every time we have endeavoured to have recourse to the previous elements of appreciation, we found ourselves faced by the chaos which characterized former years. We have sometimes ascertained things so strange that we cannot forbear expressing our astonishment at the idea that a great power such as ours could maintain itself under such conditions." M. Ch. Laurent, the financial adviser to the Turkish government, stated in a lecture on Turkish Finance, delivered in Paris on the 22nd of April 1910, that the Ministry of Finance has now been largely reorganized. Officials, he says, with grand titles and no responsible duties have been abolished, and departments with responsible chiefs created. The agents of the finance ministry, instead of being mere clerks, are now employed in "the assessment and collection of taxes, the control of expenditure, the preparation and execution of the budget, the estimates of the necessary cash required at different points of the empire—all that, in fine, constitutes the real financial administration of a great empire." Laurent points out that direct taxes furnish 54% of the revenues of the empire, that agriculture is accordingly very heavily taxed, and that the tax on realty is both excessive and unfairly administered. The summary history given above of the origin of the system of taxation prevailing in Turkey explains how this came about. Reform of this system, and, further, very necessary reforms of the methods of collection of the wines and spirits revenue (which is protection taxed upside down, the home-growers being far more heavily taxed than importers), and of the customs (in which almost every possible administrative sin was exemplified), were also undertaken. Three bills, moreover, were presented to parliament, the first regulating Public Accountancy, the second regulating the Central Accounts Department, and the third the service of the Treasury. By this last the centralization of receipts and

expenditure and the movement of funds in the provinces were to be confided to the Imperial Ottoman Bank, which extended and perfected its own organization for the purpose.

Passing now to the examination of the budget, it should be observed that the method of estimating the revenues—a matter of great difficulty owing to the previous want of method—is described by Laurent as follows: "For every nature of receipts the total effective collections for the five last known years were set out, the averages were taken of these and the increase or decrease of the yearly average of those same years was worked out and added to or deducted from the figure previously obtained. The only exception made to this rule was in the case of revenues showing a yearly increase, such as Post Office revenue, tobacco, salt, for which were taken the figures of 1323 (1907) increased by a certain average." The expenditure was arrived at in the manner previously described—and when the general budget came to be made up the severest pruning was found necessary, the original demands of the various ministries and departments having resulted in a deficit of upwards of £70,000,000. It is thought better here, for the sake of clearness, to reserve observations on revenues specially assigned to the international administration of the Ottoman Public Debt, and on the expenditures of that administration, and to deal with that subject separately, while, however, including the total figures of both in the general figures in order to reproduce exactly the totals shown in the budget of the empire. The principal items of revenue and expenditure are as follows, the figures being taken from the published budget above-mentioned.

Revenue. Direct Taxes.—The tax on realty (*vergi*) is estimated to yield £2,590,420. Duties on profession (*kemali*) consist (a) of a fixed duty leviable at rates declared in a schedule forming part of the special law (Dec. 8, 1907) regulating the tax, and (b) of a proportional duty at the rate of 3% on the value of buildings occupied by companies or individuals in the prosecution of their business; of 3% on salaries (subject to certain deductions) of employes of such companies and individuals; and on government contractors and revenue farmers, at the rate of 3% of 10% of the value of contracts filled and of revenues farmed. The law is defective and unfair in its incidence, and it is not applicable to foreigners. The government promised in 1910 to remedy the law with the assent of the Great Powers, and, if successful in its negotiations, to present an amended law. The duties are estimated to produce £1,393,107; other professional taxes £1,10,887—together £1,503,994. A Military Exemption tax "is levied on male Ottoman subjects between the ages of 15 and 75 to the amount of £50 for 135 persons—certain exceptions such as priests, religious orders, &c. are allowed. The estimated revenue from this source is £11,289,612." Prestations "are payments in lieu of services (apart from military service) to the state, such as maintenance of highways, &c.—in effect, purchase of exemption from forced labour. These duties vary in different parts of the empire: in the vilayets of Constantinople, Bagdad and Adrianople, and in the sanjaks of Bigha and Tchatalja the day's work is calculated at 5 piastres (about 11d.); in the vilayets of Aleppo, Trebizond, Angora, Iannina, Konia, Sivas and Kastamuni at 4 piastres (about 9d.); and in most other parts of the empire at 3 piastres (about 7d.). These taxes were formerly levied either in cash or in kind: it has now been decided to levy them in cash only, although this change was expected to cause some arrears. Allowing for these, the estimated revenue is £1,553,938. The "tax on sheep, camels, buffaloes and hogs" (*aghnam*, meaning literally "sheep," but for taxing purposes the other animals are included under the same name), formed originally part of the "tithes." It was transformed long since into a fixed amount per head of the animals taxed, which amount varies according to the region in which the tax is levied, the highest tariff being in the sanjak of Jerusalem (7½ piastres) and the lowest in the Yemen (½ piastre). The estimated receipts are, from sheep £1,790,720, from camels and buffaloes £1,445,220, and from hogs £1,889,000, or together £1,814,120; and the direct descendant of the *kharaç* already alluded to above. It should here be noted that, from the fiscal point of view, the reforms instituted at the commencement of the 19th century may be summarized thus. In permanent remuneration of certain services to be rendered to the state, the sovereign assigned to civil or military functionaries territorial regions for the purpose, and with the power, of collecting land taxes imposed by Mussulman and Imperial law, i.e. the *kharaç* or tithes, and transfer and succession duties. The tithes were originally based on one-tenth of the agricultural produce of the country, but this proportion was gradually raised under the euphemistic pretence of "public instruction," but really, under financial pressure, to 12% and again in 1900 for military "equipments" (*Tejizat-i-Askeriyeh*) by a further 1% to 12½. This last surtax, which produces about £1,700,000 per annum, was specially affected to a loan, known as the *Tejizat-i-Askerieh* of 1905," of £7,640,000, by virtue of a contract between the government and the Deutsche Bank (April 17, 1905). The estimated receipts from the "Tithes" (including tobacco and silk, both hypothecated to the Public Debt Administration) are £16,731,107. The remaining taxes under the category "direct" are the forest-dues (generally speaking 15% of the value of wood cut), estimated to produce £11,30,094; the mining dues (being a fixed duty of 10 piastres per 10,000 sq. metres of the superficial area covering the mine, and a proportional duty varying from 1% to 20% of the gross value of metal contained in the ore, according to the kind of metal and the method of extraction of the ore), £145,141; and tax-papers (*Tezkeres*), £158,434. The total "direct taxes" (inclusive of tobacco and silk tithes) are thus estimated to amount to £13,725,892.

Section II. of the budget is composed entirely of revenues from *stamp-dues*. Of these, commercial stamps are among the revenues specifically hypothecated to the Public Debt Administration, £1,460,079; the others, consisting of legal stamps of various kinds, registration and transfer-dues, &c., are estimated to produce £1,633,373 forming a combined total of £11,134,422.

Under Section III. fall the "indirect contributions" as now reclassified. The first revenue specified among these in the budget is that accruing from the wine and spirit duties which is again among those assigned to the Public Debt, £1,283,079. Licenses for sale of Tumbeki, a variety of Persian tobacco used for the *narghila*, £1,204,660. By far the most important "indirect" revenue is that produced by the customs, consisting of import, export and transit duties, and various unspecified receipts. Under the old commercial treaties which lapsed about 1890—but which have been maintained "provisionally" in force until one or other of the great powers consents to set a term to the negotiation of fresh treaties—an *ad valorem* duty of 8% was imposed on all articles imported into the Turkish empire. In 1905 financial resources had to be found for the special administration of the three European vilayets as insisted upon by the powers, and to this end the Porte initiated negotiations with the latter to increase the import duties by 3%. As is usual in Turkey, this opportunity was seized for the demand of redress of grievances by such powers as considered they had any, and the negotiations were protracted until July 1907, when France finally gave in her adhesion. Since then the import duties have been collected at the rate of 11% *ad valorem* under the supervision of the Public Debt Administration, the bondholders having certain rights, under the decree of Muharef, described below, over any increase of revenue arising from modification of the commercial treaties. By the provisions of the "Annex Decree," also described below, three-quarters of the additional revenue is assigned to the Turkish government, and one-quarter to the Public Debt Administration to swell the sinking-fund. Fresh negotiations were also undertaken to increase the import-duties by a further 4% in order to balance the deficit shown in the budget. In the year 1910-1911 the import duties were estimated to produce £13,980,395, the transit duties £1,202,275, and the export duties 1% *ad valorem*, which it was hoped the government might soon afford to abolish (£1,688,993—total customs revenue, £14,217,752). The remaining "indirect contributions" are port and lighthouse dues, £1,484,226. Sanitary taxes, £1,202,519, and fisheries and sporting licences affected to the service of the public debt, £1,533,990. The revenues figuring under "indirect contributions" thus reach a total of £14,825,812.

Monopolies form Section IV. of the budget, and include in the first place the salt revenue (£11,227,750), which is assigned to the Public Debt Administration, and tobacco revenues of which the larger part, £1,865,737, is assigned to the same administration, the total (including share of Tumbeki profits) producing £19,657,754; the remaining monopolies are: fixed payments from the Tumbeki Company, £1,400,000; explosives, £1,063,323; seigniorage (Mint), £1,046,660; and posts and telegraphs, £1,912,159. The "Monopolies" thus render a total revenue of £13,262,424.

Section V. includes receipts from commercial and industrial undertakings belonging to the state. These are the Hejaz railway, £1,152,000; the Dolma-Baghche gas-works, £159,130; technical school, £1,853,660; the Tigris and Euphrates steamships, £1,625,513; and mines (Heraclea coal and other), £1,120,710; forming a combined total of £1,402,889.

Section VI. is composed of receipts from "State Domains" of which a large proportion was formerly included in the civil list. Under the deposed sultan the Civil List Administration had encroached in every direction not only on the revenues properly accruing to the state, but upon private and upon state property in most parts of the empire. This it is explained in the preface to the budget that the revenues "proceeding from the deposed sultan" are not classed together under one heading, but that they have been apportioned to the various sections under which they should fall "whether taxes on house property or property not built upon, tithes, agnam, forests, mines, cadastre, sport, military equipment, private domains of the state, various receipts, proceeds of sales, &c.—a truly comprehensive list which by no means set a limit to the private resources of Abd-ul-Hamid II., who looked upon the customs also as a convenient reserve on which he could, and did, draw when his privy purse was short of money. Apart from the sources of revenue specified above, of which the amounts actually transferred from the civil list are not stated, the total is estimated to produce £1513,651. In the previous

It should be noted that the classification of the revenues included respectively under the "direct" and "indirect" categories has now been quite properly changed, the sheep-tax, tithes, mining royalties and forest royalties being comprised under "direct taxes"; stamps and registration duties are placed in a special category, and salt and tobacco under "monopolies."

had been a special heading, "Proceeds of Domains transferred from the Civil List," estimated to produce £T620,233, which may have been intended to include all the various receipts above enumerated.

Section VII., formed of the tributes or dependencies of which the two principal are the Egyptian, £T765,000, and that of Cyprus, £T102,500 (assigned to the public debt) comprises a total revenue of £T871,316. Finally, various receipts of which the principal separately specified are government share of railway receipts (Oriental railways and Smyrna-Cassaba railway), £T201,710, and "subscriptions" for the Hejaz railway, £T264,600, form Section VIII.

The total revenues of the empire are thus estimated to produce £T25,848,332, and seeing the careful and moderate manner in which the estimates have been framed, this may be looked upon rather as a minimum than a maximum. The minister of finance stated in his budget speech to parliament, delivered on the 23rd of April 1910, that the revenues for the year 1909-1910, which had been estimated to produce £T25,000,000, had as a matter of fact produced £T26,500,000.

Expenditure. Ministry of Finance.—The first item of expenditure shown in the budget is the service of the public debt, amounting to £T8,288,394. The Public Debt Administration plays so considerable a part in the finances of the Ottoman Empire, and its history is of such importance that a special section of this article will be devoted to it below. Under the budgetary heading "Public Debt" is included, as it should be, all expenditure in connexion not only with the public debt proper, but also with advances from banks and others, railway guarantees, an account of which will also be found below, and all capitalized liabilities, as far as known, contracted by the state.

It is explained in the preface to the budget that one of the abuses of the previous régime had been to obtain advances from credit establishments at high rates of interest varying from 7% to 9% when it was found impossible to issue a public loan. The rates on these advances have now been generally reduced to 6% with the exception of that on the advances from the lighthouse administration, which refused to allow any reduction below 7%. In the years 1908-1909 the advances were reduced by £T688,000, in addition to repayments allowed for in the budget, and the credit agreed for the year 1909-1910 is £T663,000, as compared with £T1,160,000 for the previous year. In the year 1910-1911 the outstanding advances were to be so far paid off that the credits to be opened under this head would be still further reduced by £T500,000.

The civil list has been reduced to the definite amount of £T443,880, which, without the consent of parliament, cannot be increased. The sultan receives an annual allocation for himself and household of £T240,000, the crown prince one of £T24,000, and a sum of £T153,000 is assigned to the Imperial princes and the sultanas. The deposed sultan was allowed £T12,000 a year, and a similar amount was set aside to provide dowries for two sultanas who were just about to be married. The debts of the former are stated in the preface to the budget to be very large, and as payments are effected fresh creditors present themselves with undeniable vouchers in their hands, causing much embarrassment to the minister of finance: no figures, however, are given. The Finance Bill provides that these debts are to be paid out of supplementary credits.

Under the reformed constitution every senator is entitled to a salary of £T100 per month, any remuneration which he may receive from the government for other services to be deducted from the senatorial allowance which, however, it may of course exceed. Deputies are allowed £T300 for each session of parliament, and £T50 per month in addition should the session exceed its legal duration. They are further allowed travelling expenses from and to their constituencies on the basis of rules governing journeys of functionaries receiving a monthly salary of £T50. The amount reserved in the budget for these purposes is £T181,871.

The ministry of finance absorbs £T2,989,600. In this are included the expenses of the administration of both the central and provincial departments of the finance ministry, the mint, charitable allowances, expenses and presents in connexion with the holy cities (£T121,410), pension funds of state officials (£T628,038), administrative allowance made to the agricultural bank (£T25,380) and various other expenses. Various administrative reforms were in hand in 1910-1911, by which it was expected considerably to reduce the credits demanded by the finance ministry—especially those in connexion with the holy cities. Special attention was called by the minister to the fact that the system of contributions of officials to the pension funds has been modified, the deduction from salaries being now 10% instead of 5%, and the contributions to the funds being made as to one-third by the treasury, and two-thirds by the officials, instead of the reverse as formerly; the economy effected is about £T300,000. A credit of £T7,124 is allowed for the central accounts department. The total credits for the ministry of finance are, then, as follows: Ottoman public debt, £T8,288,394; House of Osman, £T443,880; legislative class, £T201,710;

treasury, £T2,989,600; central accounts department, £T7,124; forming an aggregate of £T11,920,869.

Indirect contributions, or more familiarly "customs," are allowed a credit of £T512,670. The minister of finance points out the immense importance of the thorough reorganization of the customs administration. The services of a first-rate English expert (Mr R. F. Crawford) were obtained, and much has been done at Constantinople, but the provincial customs offices are still lamentably defective. These were immediately to be taken in hand, and considerable sums are being voted for repairs of existing customs buildings and the construction of new buildings. The reforms already accomplished have resulted in a marked increase in the customs revenues.

Posts and telegraphs, which absorbed a credit of £T782,839 in 1910-1911, have also long been in urgent need of extension and better administration. An additional credit of £T90,000 was granted, as compared with the previous year, and increased expenditure was foreshadowed for the future; on the other hand, it was confidently expected that the post office receipts would increase in far more rapid ratio than the expenditure.

The ministry of the interior was estimated to require £T1,157,230. This sum covered "immigration expenses," i.e. assistance given in settling Mussulmans immigrating from provinces detached from the Ottoman Empire. There can be no doubt that this expenditure is remunerative, since many rich regions of Asia Minor have long suffered from want of population.

Military expenditure, including the three departments of war, is as follows: the army (excluding artillery), £T8,280,452; ordnance, £T356,439; and gendarmerie, £T1,694,778. As regards the first of these, it is curious to observe that the budget decree of 1880 stringently limited the peace strength of the Ottoman army to 100,000 men, "including officers and generals," in order to put a stop to the rapidly increasing military expenditure; but this was merely the expression of a pious wish, at a time when European financial good will was indispensable, that expenditure might be kept down. No real attempt has ever been made to observe the decree, and indeed observance has been impossible seeing the dangers which never cease to menace the empire. To some extent the real level of military expenditure has been masked by the separation of certain payments into "extraordinary" expenditure, a course which, it is understood, has not been followed in the budgets of the "new régime," and which will not be revived. It should however, be remarked that out of an "extraordinary" budget, which will be mentioned below, sums of £T709,305 and of £T27,827 were allocated to the ministry of war and the ordnance department respectively in 1909. It is not expected that military expenditure can be much reduced, except in the direction of supply contracts, which have been the cause in the past of iniquitous waste of means.

The official budget shows a credit for admiralty expenditure of £T1,000,327, which is apparently less than that for the previous year by some £T220,000. This, however, is not a real decrease, salaries of functionaries not on the active list having been removed to the region of supplementary credits, as are those of civil departments. As a matter of fact, the marine budgets of the two years are almost identical. The vote of £T500,000 a year for ten years for the reconstruction of the Ottoman navy by "national subscription," as already mentioned, was not included in the official budget, nor was there any allusion to it in the preface to the memorandum. The minister of finance did, however, allude to it in his budget speech, (April 23, 1910), and stated that four destroyers purchased in Germany had been paid for from the national subscription only, without touching the ordinary state revenues. It should be added that the Greek War (1897) revealed to the sultan the decrepit state into which the Ottoman navy had fallen, and considerable "extraordinary" expenditure—much of which was wasted—has been incurred since (and including) 1902 to put the least out-of-date warships into a serviceable condition.

The ministry of commerce and of public works absorbed £T883,161 a reduction of some £T180,000 on the previous year. The government acknowledges the unavoidable necessity of greatly extending and improving the internal communications of the country, but cannot see its way to doing so satisfactorily out of the ordinary resources of the country. This question was being seriously studied, and it was hoped that a comprehensive scheme would be presented ere long. The Hejaz railway figures in the budget for £T350,180, and it is explained that this will not only cover working expenses, but also the final completion of the line.

Floating Debt.—This is really an accretion of undetermined liabilities which has been indefinitely, and probably alternately, advancing and receding for a great number of years, and which no previous minister of finance, or Turkish government, had the courage to face. Now and then it has been dealt with piecemeal, when some particular class of creditors has become too pressing, but it is more than probable that the piece got rid of has been more or less rapidly replaced by fresh liabilities occasioned by budgetary deficits, or by the mere accumulation of interest on debts allowed to run on.

In March 1907 the floating debt was calculated by a financial authority in the *Fortnightly Review* to amount to upwards of £155,000,000, which might be composed of £125,000,000 since a large proportion was certainly composed of salaries in arrear and other items of a similar kind which the government would never, under any circumstances, make good. Laurent tells us that the present government having found it absolutely impossible to arrive at even an approximate estimate of this "occult debt," recourse was had, in order to fix it, to the creditors themselves, and a short act of parliament was passed declaring all debts prescribed which should not be claimed by a fixed date. In consequence of this 560,000 claims were received, and a first examination showed that the aggregate amount reached by these claims was not less than £113,000,000. Considering the dilatory methods of Orientals, even when they are creditors, it is doubtful whether this sum adequately covers the whole of the claims outstanding, and it may be found difficult, even for a parliament, to refuse claims which should equitably be admitted and which may be preferred later. High authority in Constantinople put the true amount of the floating debt in 1910-1911 at the amount previously estimated, viz. £125,000,000. No provision was then made in the budget to meet these liabilities, nor did the minister in his prefatory memorandum make any allusion to them; in his budget speech, however, he announced that a scheme for dealing with them would be presented with the budget for 1911-1912. Under the heading "Floating Debt" in the budget for 1910-1911 are placed the advances before described.

No other items in the budget call for special remark, but in order that the information given may be complete, each head of expenditure is shown separately below, and the budget for 1910-1911, as first placed before the Turkish parliament, presents the following picture, from which it may be observed that the public debt absorbs 26% of the revenue, war service 38% and civil services 30%.

This deficit was increased, by the action of parliament, to £19,678,000. Almost immediately after the budget was drawn up a change of government took place, and largely owing to this fact the parliamentary budget commission introduced various modifications on the expenditure side of the account, which increased the estimated deficit to the amount just mentioned.¹ The principal increase is due to the war departments, according to the budget speech of the minister of finance (April 23, 1910), although he states that some

¹ On the 25th of June 1910 the chamber finally passed the budget for 1910-1911. The figures were as follows:—

Ordinary expenditure, £123,997,000; extraordinary expenditure, £12,696,000; revenue £126,015,000, leaving a deficit of £19,678,000, which was brought up to over £10,500,000 by special credits for the pension fund, the payment of debts incurred by Abdul-Hamid and indemnities to officials. On the other hand, the minister of finance reckoned that the revenue would probably show an increase of £1,500,000, while about £12,000,000 of expenditure would remain undisturbed, which, with a reserve of £12,000,000 from 1909, would reduce the deficit to roughly £15,000,000.

increase is apparent in all departments. The actual figures of the increase are not, however, given. Exaggerated importance must not be attributed to the swollen deficit. The demands of the various departments of state had been much cut down, and according to the minister of finance's own statement much of the reduction was merely unavoidable expenditure deferred; the fact that some of this expenditure, which had been jealously scrutinized, was to be undertaken at once, meant that demands on future years would be relatively reduced. A loan of £17,040,000 was arranged with a German group headed by the Deutsche Bank. This loan followed upon one of £14,700,000 in 1908, and another of £17,000,000 in 1909 (of which the service is provided by the revenues assigned to the Russian War indemnities amounting to £1350,000 per annum, of which payment has been deferred for forty years), the year 1909 having shown a realized deficit of about that amount—a condition of affairs which would appear alarming were it not that the Turkish Empire was passing through absolutely abnormal times, and was attempting to convert the unstable morass of disorder, ineptitude and corruption left by the previous system into a solid foundation for good and orderly constitutional government. With the two previous loans above mentioned, £15,500,000 capital liabilities were paid off, the work of reorganization had made considerable progress, and £12,000,000 remained in hand at the beginning of 1910-1911 to continue it. As before stated reorganization was quickly followed by a marked increase of revenue, and it seemed probable that the forecast of the minister of finance that within a comparatively short time that increase would amount to £15,000,000 was not excessive. Negotiations were undertaken to increase the customs import duties by a further additional 4%. This measure would produce about £11,250,000 per annum.

Further expenditure was voted in the course of 1909, to be met by an extraordinary budget. On the receipts side of this budget were comprised the Austrian indemnity for the annexation of Bosnia and Herzegovina (£12,500,000), cash and securities belonging to the deposed sultan (£11,600,000), sale of old guns (£1300,000), sale of lands and other property recovered from civil list encroachments (£1908,000), and finally the unexpected balance of the proceeds of the 1908 loan (£1655,000), the whole forming an aggregate total of £15,963,000. It was intended to assign to the war department £13,804,918, to the grand master of ordnance £1358,108, to the admiralty £193,912, and to the ministry of finance £12,443,202 for the payment of the war indemnities in Thessaly and other urgent liabilities, the estimated aggregate extraordinary expenditure thus amounting to £16,700,140. Some of the assets above mentioned proved, however, not to be easily realizable. Ready buyers were not found for the state lands, and the sale of the ex-sultan's securities was disputed by the German Reichsbank which had them deposited, while the government did not consider it good policy to sell the Anatolian railway shares, which it seized at Vildia, so that only £1450,000 were encashed by the ministry of finance from these sources. Of the sums really received the ministry of finance expended some £13,600,000, in payment of the Greek indemnity, in repayment of £11,000,000 of advances to the treasury and by assigning the credit voted to the ordnance department, and it was stated that these payments exhausted the extraordinary resources so far as it has been possible to realize them.

Collection of Taxes.—The Ottoman Empire possesses a very complete system of local self-government within certain limits. Every village or town district has a kind of mayor (*mukhtar*) appointed by election and approved by the official provincial authorities, and a "council of ancients" whose members are elected directly. The taxes are collected by means of the *mukhtars*, termed for this purpose *kabs-i-mal* (receiver of treasure), and under the supervision of *gendarmes* specially named, termed *tahsildars* (collectors). The official authorities provide lists of all the taxes to be collected to the *tahsildars*, who hand them, against formal receipt, to the *kabs-i-mals*. The latter are bound to pay in to the local authorities all sums collected in five days in town districts, and in fifteen days in villages, if under 1500 piastres; sums of 1500 piastres and over are paid in at once. The *tahsildars* check the accounts of the *kabs-i-mals*, and, if they discover peculations of the *kabs-i-mals* (department), all the electors of a *mukhtar* are, *ipso facto*, joint sureties for him. If the tax-payer declines to pay his due, he is brought before the proper authorities by the *tahsildar*; if he persists in his refusal, all his goods, except those indispensable for his dwelling and the pursuit of his trade, are sold by auction, without recourse to a judgment by tribunal. If he has no goods which may be seized, he may be summarily imprisoned for a term not exceeding 91 days; two imprisonments for the same debt are not permitted. The military exemption tax is not collected as above, but by the spiritual chiefs of the various religious communities. None of the above regulations apply to Constantinople, where no military exemption tax is imposed, and where separate official regulations for the collection of taxes are in force. The system of farming out the revenues is admitted, and is almost invariably followed in the case of the tithes. When this is done, the revenues to be farmed are put up to public auction and sold to the highest bidder, provided he can prove himself amply solvent and produce sufficient sureties. Elaborate regulations apply to this method of collection to secure the state revenue.

from the farmers, who, on the other hand, are entitled to full official assistance to enforce their rights.

Assessment of Taxes.—For the purposes of assessment the taxes may be divided roughly into two classes: (1) variable taxes; (2) non-variable taxes. Under the first head would be included proportional taxes dependent upon the value of the property taxed; under the second, taxes whose amount does not depend upon that value. The first class contains such revenues as the *emlak vergisi* (duty on realty), *ashâr* (tithes), *temellü* (professional tax), &c. In all such cases the taxable values are fixed by a commission of experts, sometimes chosen by the tax-payers themselves, sometimes by the official authorities; in all cases both tax-payers and authorities are represented on the commissions, whose decisions may be appealed against, in last resort, to the council of state at Constantinople, whose decision is final. Revenues composing the second class such as the *tapu* (registration tax) do not vary, unless by special decree, and the assessment is automatic.

The systems, both of assessment and collection, were equitable and far from oppressive in theory. In practice they left almost everything to be desired. The officials, already too numerous and underpaid, frequently, as has been stated above, found such pay as they had far in arrear. They were therefore naturally open to bribery and corruption, with the result that, while the rich often got off almost scot free, the poor were unduly taxed, and often cruelly oppressed by the tax collectors and farmers of revenue. In all departments there ensued, thus, an alarming leakage of revenue, amounting, it was credibly estimated, to quite 40%. The new government energetically proceeded to remedy this state of affairs.

International Administration of the Ottoman Debt.—In consequence of the piling up of the exterior public debt as described above, it amounted after the issue of "general debt" in 1875 to £190,750,000, and swallowed up annually upwards of £110,000,000, or nearly half the revenue of the empire as it was then constituted. The revolt of various disaffected provinces brought matters to a climax; in September 1875 one-half of the service of the interest was suspended, paper certificates known as "Ramazans" (since they were issued in the Arabic month of that name) being issued for that half in lieu of cash, and in the following March it was suspended altogether. After the war with Russia, in order to obtain credit from the Imperial Ottoman Bank and local financiers, who refused any further accommodation unless their previous and further advances were amply secured, revenues known as the "six indirect contributions" were handed over to a committee of local bankers (by decree of Nov. 22, 1879), to be administered and collected directly by them. These "six indirect contributions" were the revenues from tobacco, salt, wines and spirits, stamps (commercial), certain specified fisheries, and the silk tithes in specified provinces. Two years later, partly in view of the recommendations of the Congress of Berlin, partly to overcome insuperable difficulties in obtaining any kind of credit, the sultan authorized the Sublime Porte to issue an invitation to the various bondholders' committees in Europe to send delegates to Constantinople for the purpose of negotiating a resumption of payments. These "committees" were the "Council of Foreign Bondholders" for Great Britain, the Imperial Ottoman Bank and its "group" for France, Herr S. Bleichröder for Berlin, the Credit-Anstalt and its "group" for Austria-Hungary, and the Chamber of Commerce and of Arts of Rome for Italy. The Dutch bondholders placed their interests in the hands of the British council. Russia declined to countenance the negotiations in any way. Delegates from the various committees assembled in Constantinople in the early summer of 1881. The commission formed by them in conjunction with the delegates of the Sublime Porte is more generally known as the "Valfrey-Bourke commission," from the leading parts played by the Right Hon. R. Bourke (Lord Connamara), the British delegate, and M. Valfrey, the French delegate. The outcome of the negotiations was the issue of an imperial decree, known as the "Decree of Muharem," owing to its bearing the date (Turkish style) of the 28th of Muharem (Dec. 20) 1281. By this decree the outstanding capital of the exterior debt, to which were added the Ramazan certificates above mentioned, and all interest fallen due, making a grand total of £252,800,000, was scaled down to £106,437,234 (£117,080,953). On this reduced capital a minimum interest of 1% was to be paid, the rate of interest to be increased by quarters per cent. as the revenues set aside for the service of the reduced

debt permitted. For purposes of sinking fund the old loans were combined into four groups:¹ group i. containing the 1858 and 1862 loans, with a reduced nominal capital of £17,902,259; group ii. the 1860, 1863, 1864 and 1872 loans, with a reduced nominal capital of £111,265,153; group iii. the 1865, 1869 and 1873 loans, with a reduced nominal capital of £133,915,762, and group iv. the "general debt," of which the last issue was in 1875, with a reduced nominal capital of £148,365,236, and the "lottery bonds" (railway loan), with a reduced nominal capital of £15,632,548, the total of group iv. being thus £163,997,784. As security for the service of the new reduced debt it was provided that an international council should be formed, composed of one delegate each from the bondholders of the United Kingdom, France, Germany, Austria-Hungary, Italy and Turkey, and one representing the "priority bondholders," a term which will be explained later. On this council the Turkish government has the right of naming an imperial commissioner with "consultative voice," i.e. no voting power, but the right to express his opinion on the proceedings of the council, who would make all reports he considered necessary to his government. The government was empowered also to name controllers to whom all the accounts of the administration should be open for inspection on demand. In all other respects the council, provided that it kept within the limits of the laws the administration of which was entrusted to it, was to be entirely independent of the Ottoman government, free to appoint and dismiss its own officials from highest to lowest, and to carry on its administration on such lines as it thought best. Proposals made by the council for the modification and improvement of the existing laws and regulations which concerned it were to receive an answer from the government within six months; this provision has remained a dead letter. Any difference between the government and the council, if not possible of adjustment, was to be settled by arbitration.

To this council, with these extended powers, was handed over the absolute administration, collection and control of the "six indirect contributions" above enumerated, for the benefit of the bondholders, and in addition, it was to encash for the same purpose bills on the customs, to be drawn half-yearly in its favour by the minister of finance, amounting annually to £180,000, representing the tax on Tumbeki (£150,000) and the surplus revenue of Cyprus (£130,000); and the Eastern Rumelian annuity, originally fixed at £245,000, but gradually reduced by force of circumstances, until after frequent suspensions of payment it reached in 1897 the level of £112,000, and has, since the declaration of Bulgarian independence, been definitely stopped. In order to assist the young kingdom of Bulgaria, which could only with great difficulty and with much damage to its resources have found means to indemnify Turkey for this serious breach of treaty engagements, the Russian government intervened, and proposed as compensation to the Turkish government the deferment for forty years of the annual payment (£1350,000) of the 1877 war indemnity. This proposal was accepted by the Turkish government, which undertook to continue the annual payment of £114,000 to the public debt administration until the extinction of the debt. The public debt council consented with good grace, although the minister of finance, by omitting to consult that council during the progress of negotiations, lost sight of the fact that a sum of £187,823 was due to the public debt administration on account of arrears of the Eastern Rumelian annuity up to December 1887, and that a further sum of £1430,747 was due by the Bulgarian to the Turkish government itself in compensation for the Ruscuk-Varna railway under the Treaty of Berlin. As pointed out by Sir Adam Block, the representative of the British and Dutch bondholders, in his report for 1908-1909, the above arrangement would have been prejudicial to the bondholders had the public debt not been "unified" (as described below) since, however, as a result of that unification, the ceded revenues now produced a sum more than sufficient for the service of the debt, it was only the surplus of revenue reverting to the government which was affected. There were further handed over, under the Muharem decree, to the public debt council, the tribute of Bulgaria, the amount of which has never even been fixed, but as compensation for which the tobacco tithes up to a yearly amount of £100,000 was ceded to the council in the same conditions as the "six indirect contributions"; the proportional shares (generally known as the "contributive

¹ For simplicity's sake, the lottery bonds having a special treatment different from that of the rest of the loans, these groups, when the new bonds of the reduced debt were exchanged against the old bonds of the original loans, became "series" thus: Series A, group i.; series B, group ii.; series C, group iii.; series D, group iv. and lottery bonds.

parts) of the Ottoman public debt to be borne by Bulgaria, Servia, Greece and Montenegro, which according to the Treaty of Berlin were to be adjudged by the representatives of the Great Powers at Constantinople, one of whom (the Russian) never succeeded in obtaining his instructions, and which therefore have never been fixed; and, finally, the excess of revenue resulting from a revision of the commercial treaties. The ceded revenues, exclusive of the "contributive parts" and the excess from commercial treaties, were estimated by Bourke. In his report to the bondholders on the decree of Muharrem, at £1,812,362 (£1,993,818). A substantial reduction however, had to be made in favour of the 3% "priority bonds," which were bonds issued to the local banks before mentioned in satisfaction of their claims, and formed an annual first charge of £1,590,000 on the whole of the revenues ceded to the bondholders; the capital amount of the "priority bonds" was £8,169,866, which was to be extinguished by 1906. Four-fifths of the net product of the revenues, after deduction of the first charge of £1,590,000, was to be applied to the service of the interest on the new reduced debt, and provided that the four-fifths were sufficient to allow the distribution of 1% interest, one-fifth was to be devoted to sinking fund; but this latter fifth was to be reduced, if necessary, by an amount sufficient to maintain the rate of interest at 1%. The interest on bonds amortized was to be added to the funds available for sinking fund. The sinking fund was to work as follows: First 1% on the whole reduced capital was to be applied to group i.; until there were any surplus this was to be applied to group ii., until that also received the same full 1%, and so on for group iii. and group iv., until the whole sinking fund amounted to 1% on the reduced capital. It was to be applied by redemption at the best price possible on the market, until that price stood at £166-66, when, if the rate of interest served were 1%, it was to proceed by drawings; if the interest were anything more than 1%, and less than 3%, the limit of price for redemption was to be raised to £75; if the interest were between 3% and 4% inclusive, the limit was to be raised to par. Any surplus of revenue beyond that necessary to provide 4% interest, and 1% sinking fund was to be handed over to the government. The lottery bonds receive a special treatment both in regard to interest and sinking fund; full information as to the intricate arrangements made for these bonds will be found in the decree of Muharrem and the published reports of the council of administration of the Ottoman public debt. In 1890 the sinking fund was increased by the conversion of the "priority loan" into a 4% loan and the extension of the term of its redemption for 15 years. In this manner an annuity of £1,159,500 was set free, of which £11,000 per annum was allotted as "extraordinary sinking fund" to series A and £149,500 per annum each to series B, C and D; the lottery bonds were originally excluded from this arrangement, and special compensation was granted to these later. Each series receives the benefit of the interest on bonds belonging to it amortized by this special annuity. Thus, in the financial year 1900-1901 the total amount of the fund had risen from £1,159,500 to £1,231,500.

The arrangement set forth in and sanctioned by the decree of Muharrem on the whole worked admirably. Gradually, however, it became apparent that it would be desirable to give Turkish state securities, of which those governed by the decree of Muharrem formed the principal part, a better standing in European financial markets than was possible for bonds bearing so low a rate of interest; to obliterate thus, as far as possible, the effects of the past bankruptcy; and, further, to give the Turkish government a joint interest with the bondholders in the progress of the ceded revenues. The French bondholders, who hold by far the largest proportion of Turkish securities, took the principal initiative in this matter, and, after protracted negotiations with the Turkish government and the other "syndicates" of bondholders, they succeeded, in 1903, in obtaining the following modifications of the original decree of Muharrem.

Series B, C and D (series A having already been completely redeemed by the action of the sinking fund) were replaced by the creation of new 4% bonds to a nominal amount of £1,327,737,772, with a sinking fund of 0.45% per annum, bearing identical rights and privileges, and ranking immediately after, the priority bonds. The rates at which the series were respectively exchanged against the new unified bonds were £100 series B against £70 unified, £100 series C against £82 unified and £100 series C against £37, 10s. unified. Bonds of the old series not presented for exchange within a period of fifteen years are prescribed. The amortization is to proceed by purchase when the unified bonds are below par, and when at or above par, by drawings. Coupons and drawn bonds not presented within six and fifteen years respectively of their due dates of payment are prescribed. Interest on amortized bonds goes so well to the sinking fund. When the net product of the ceded revenues amounts to £12,157,375, the surplus is divisible as to 75% to the Turkish government and 25% to the public debt administration. A variation from this was provided as soon as the priority bonds should become extinct; but these bonds having since been repaid (as mentioned below) by a further issue of unified bonds, this variation lapses. The above 25% is to be employed as additional sinking fund for the unified debt and lottery bonds, in the proportion of 60% and 40% respectively. A reserve fund was created of which the nucleus was the sum already standing

to the credit of the "Reserve fund for increasing the rate of interest" (£11,113,865), plus £1,300,000 at least in cash by the issue of sufficient unified bonds to produce that amount and the sum of £150,000 to be paid by the government to the public debt at the rate of £115,000 per annum. It should be added that the total issue was made sufficient to reserve also £11,460,000 for expenses, after taking into account £100,000 in cash paid by the government to the public debt administration out of the said issue. The reserve fund was created primarily to make good any deficiency in the revenues below the amount required to pay the interest due. If such drafts upon the reserve fund become necessary they are to be made good in the following years out of the surplus above mentioned. The reserve fund is increased by the interest it may earn, but when the capital amount of the fund reaches £12,000,000 the interest earned is merged in the general receipts of the public debt administration. As soon as the unified debt is reduced to £16,000,000 the reserve fund is to be reduced to £11,000,000, the surplus over this last amount being paid to the government. The unified bonds and coupons are exempt from all Turkish taxation existing or to come. Further special stipulations regarding the Turkish lottery bonds were made, but these are, as before, omitted. They will be found in art. x. of the "Annex-Decree" of September 1-14, 1903, which gave the modifications to the Muharrem decree here described force of law. Finally the Imperial Ottoman government reserved to itself the right of paying off the whole unified debt at par at any moment, and all the dispositions of the decree of Muharrem not modified by the new "Annex-Decree" were formally confirmed and maintained. In 1906 a further modification took place in the shape of the final and complete repayment of the priority bonds by the additional issue of £19,537,000 of unified bonds for the purpose, taken firm by the Ottoman bank at 86. The rate at which the exchange was effected was par with a cash bonus of 6%. The previous annuity required for the service of these bonds having been £149,500, and the additional charge for the service of the unified debt as a result of the operation being £1424,396, while the government received £1,272,600 in cash for its own purposes, there was a slight immediate advantage to be found in it: as, however, the priority debt would have been completely extinguished in 1932, the financial wisdom of the change is not apparent.

The ceded revenues administered directly by the public debt council have shown remarkable expansion, and may be fairly looked upon as exemplifying what would occur in the general revenues of the empire when good and honest administration and regular payment of officials finally took the place of the carelessness, corruption and irregularity which existed up to the change of régime. The council has not limited its duties to the collection of the revenues placed under its administration, but has taken pains to develop commercially the revenues capable of such development. A large and remunerative export trade in salt to India is now established, whereas formerly not one grain found its way there; the first steps in this direction were taken in 1892 when works were begun to place the great rock-salt salines of Salif, on the coast of the Red Sea, on a commercial footing. The gross receipts from this export trade amounted in the year 1908-1909 to £199,564, and the profits approximately to £112,000, in spite of the contest between Liverpool and Spanish salt merchants on the Calcutta market, which led to a heavy cutting of prices. Pains, moreover, have been taken by the public debt council to develop the sale of salt within the empire. These efforts have been rewarded by the increase of the salt revenue from £1635,000 in 1881-1882, the year preceding the establishment of the council, to £1,075,880 in 1907-1908. Again, in the early years of the administration (1885), the Pasteur system of selection of silk-worms' eggs for the rearing of silk-worms was introduced, and an "Institute of Sericulture" on modern lines was erected (1888) at Brusa for gratuitous instruction in silk-rearing to students from all parts of the empire. Up to the end of 1907-1908, 919 students had received the diploma of the institute, and 465 silk-growers in addition had passed through the course of instruction. These men, returning to their various districts, impart to others the instruction they have received, and thus spread through the regions adapted to sericulture the proper methods of selection and rearing. As a result some 60,000,000 mulberry trees were planted in Turkey during 1890-1910, involving the plantation of about 130,000 acres, and new *magnaneries* and spinning factories sprang up in every direction; while the revenue (silk tithe) increased in the regions administered by the council from £17,000 in 1881-1882 to

£T125,000 in 1906-1907, the value of the silk crop in those regions having thus advanced by over £T1,000,000. But the regions not under its administration benefited at least equally by the methods above described. Thus the total value of the silk tithe in Turkey increased in the period named from about £T20,000 to £T276,500, and the total annual value of the crop from about £T1200,000 to £T2,765,000, or by nearly 2½ millions pounds sterling.

Table A gives the production of the revenues in 1881-1882, the last year of the administration of the "Galata Bankers," the average product of the first, second, third, fourth and fifth quinquennial periods since the public council was established, and of the year 1907-1908.

Table B shows the total indebtedness of the Ottoman Empire, exclusive of tribute loans.

Tobacco Régie.—From the beginning of the year 1884 the tobacco revenue has been worked as a monopoly by a company formed under Ottoman law, styled "La Régie Impériale Contre-essée des Tabacs Ottomans." This company has the absolute monopoly of the manufacture and of the purchase and sale of tobacco throughout the Ottoman Empire, with the exception of the Lebanon and Crete, but exportation remains free. It is bound to purchase all tobacco not exported at prices to be agreed between itself and the cultivators; if no agreement can be arrived at, the price is fixed by experts. It is obliged also to form entrepôts for the storage of the crops at reasonable distances from each other, and, on certain conditions, to grant advances to cultivators to aid them in raising the leaf. The cultivators, on the other hand, may not plant tobacco without permits from the régie, although the power of refusing a permit, except to known smugglers or persons of notoriously bad conduct, seems to be doubtful; nor may they sell to any purchaser, unless for export, except to the régie, while they are bound to deposit the whole of the tobacco crops which they raise in any one year in the entrepôts of the régie before the month of August of the year following,

TABLE A.—Showing Revenues ceded to Ottoman Public Debt Administration at Various Periods to 1907-1908.

Heads of Revenue.	Last year of Galata Bankers, 1881-1882.	Average for First Five Years of Council of Public Debt, 1882-83, 1886-87. March 1326 (1910), is approximate.

and may not move any tobacco from the place where they cultivate it without the régie's express authority. In order to facilitate supervision, a minimum area of one-half of a *dennum* (a dennum = about one-fourth of an acre) is fixed for ground upon which tobacco may be cultivated; in the suburban districts of Constantinople and some other towns, and in enclosures surrounded by walls and attached to dwelling-houses, it is altogether prohibited. For its privileges the régie has to pay a rent of £750,000 per annum to the government (assigned to bondholders), "even if it has no revenues at all," and after the payment of a dividend of 8% to its shareholders, and certain other deductions, it has to share profits with the government and the bondholders according to a sliding scale agreed upon between the three parties. The régie did badly during the first four years of its existence, owing principally to two causes: (1) its ineffectual power to deal with contraband to which the system described above leaves the door wide open; (2) the admission of other than Turkish tobaccos into Egypt, which deprived it at once of about £1,000,000 per annum. So great were its losses that in the year 1887-1888 it was obliged to write them off by reducing its capital from £2,000,000 to £1,600,000. At the same time it was granted an extension of penal powers, and the losses on *refetch* (duty on tobacco exported to Egypt) were to be partially borne by the public debt administration. Things went better with it from that time until 1894-1895, when, owing to internal troubles in the empire, and the consequent fear of creating worse disorders, by the strict enforcement of the monopoly, the government withdrew most of its support, and contraband enormously increased. The following table shows the movement of the revenue of the régie from the year 1887-1888 to 1908-1909 inclusive:—

Average for 5 years.	Gross receipts from all sources.	Total expenses, including fixed charges.	Net revenue.
	£T	£T	£T
1887-1892	1,924,264	1,735,896	188,368
1892-1897	2,330,786	2,037,190	293,596
1897-1902	2,098,537	1,898,646	199,891
1902-1907	2,511,921	2,104,739	407,182
Year 1907-8	2,660,895	2,146,864	514,031
" 1908-9	2,597,909	2,167,793	430,114

* There was a heavy fall in the receipts in the four years 1895-1896 to 1898-1899 inclusive. The climax was reached in 1897-1898 when the net revenue amounted to only £63,975 as compared with £1,352,000 in 1894-1895, and it did not revert to its previous level until 1902-1903. This was the result of the Armenian massacres, the wholesale emigration of Armenians of all classes, the accompanying profound political unrest throughout the country, and the great extension of contraband which ensued from it.

Negotiations were initiated in 1910 for the prolongation of the concession of the tobacco monopoly, which reaches its term in 1913.

Railway Guarantees.—Up to 1888 the only railways existing in the Turkish Empire (exclusive of Egypt) were, in Europe, the Constantinople-Adrianople-Philippopolis line and the Salonica-Mitrovitza line (finished in 1872); and in Asia Minor, the Smyrna-Aidin (completed in 1866), the Smyrna-Cassaba (completed in 1866), the Constantinople-Ismid (completed in 1872), the Mersina-Adana (completed in 1886). The want of railways in Asia Minor was urgently felt, but no capitalists were willing to risk their money in Turkish railways without a substantial guarantee, and a guarantee of the Turkish government alone was not considered substantial enough. In 1888 it was proposed by the public debt administration to undertake the collection of specified revenues to be set aside for the provision of railway guarantees, the principle to be followed being, generally, that such revenues should consist of the tithes of the districts through which the railways would pass, and that the public debt should hand over the guaranteed railway companies the amounts of their guarantees before transmitting to the imperial government any of the proceeds of the revenues so collected. The government adopted this proposal, and laid down as a principle that it would guarantee the gross receipts per kilometre of guaranteed railways, such gross receipts to be settled for each railway on its own merits. Considerable competition ensued for the railway concessions under this system. The first granted was for the extension of the Constantinople-Ismid railway to Angora to a group of German and British capitalists in 1888. The Germans having bought out the British rights, this concession became a purely German

affair, although a certain proportion of the capital was found in London. Since that time various other concessions have been granted to French and German financial groups, principally the Imperial Ottoman Bank group of Paris and the Deutsche Bank group of Berlin.

The systems of guarantee above described are clearly faulty, since theoretically the railway company which ran no trains at all would, up to the limit of its guarantee, make the largest profits. The concessionaire companies have, however, wisely taken the view that it is better to depend upon their own revenues than upon any government guarantee, and have done their best to develop the working value of the lines in their charge. The economic effect of the railways upon the districts through which they run is apparent from the comparative values of the tithes in the regions traversed by the Anatolian railway in 1889 and 1898 in which years it so happened that prices were almost at exactly the same level, and again in 1908-1909, when they were only slightly higher. Thus in 1889 they produced £T145,378, in 1898 £T215,470, and in 1908-1909 £T281,919.

A different system, still more uneconomic than the kilometric guarantee pure and simple, was adopted in the case of the Bagdad railway. In January 1902 the German group holding the Anatolian railway concession was granted a further concession for extending that railway from Konia, then its terminus, through the Taurus range and by way of the Euphrates, Nisibin, Mosul, the Tigris, Bagdad, Kerbela and Nejed to Basra, thus establishing railway communication between the Bosphorus and the Persian Gulf. The total length, including branches to Adana, Orfa (the ancient Edessa) and other places was to exceed 1550 m.; the kilometric guarantee granted was 15,500 francs (£620). It should be noted that this concession was substituted for one negotiated by the same group, and projected to pass through Diarbekr. This raised strong objections on the part of Russia, and led to the Black Sea Basin agreement reserving to Russia the sole right to construct railways in the northern portion of Asia Minor. The Anatolian railway company, apparently unable to handle the concession above described, initiated fresh negotiations which resulted in the Bagdad railway convention (March 5, 1903). This convention caused much excitement and irritation in Great Britain, owing to the encroachment of German influence sanctioned by it on territories bordering the Persian Gulf, hitherto considered to fall solely within the sphere of British influence. Attempts were made by the German group, assisted by their government, to secure the participation of both Britain and France in the concession. These were successful in France, the Imperial Ottoman Bank group agreeing to undertake 30% of the finance without, however, any countenance from the French government—the "Glarus Syndicate" being formed for apportioning interests. The British government seemed, at one time, rather to favour a British participation, but when the terms of the convention were published, the strongest objection was taken to the constitution of the board of directors which established German control in perpetuity, while it was evident from the general tenor of the convention that a political bias informed the whole; in the end public feeling ran so high that any British participation became impossible.

The financial advantages, however, granted by the Turkish government were singularly favourable to the concessionaires and onerous to itself. The kilometric guarantee of 15,500 francs (£620) was split into two parts, 4500 francs (£180) being granted as the fixed working expenses of the line, all receipts in excess of which amount were to be credited to the Turkish government in reduction of the remaining 11,000 francs (£440) which took the form of an annuity to be capitalized as a 4% state loan redeemable in 99 years, that being the period fixed for the duration of the concession. The line was to be constructed in sections of 200 kilometres (125 m.) each, and as the complete plans and drawings of each were presented at the times and in the order specified in the convention, the government was to deliver to the concessionaires government securities representing the capitalization of the annuity accruing to that section. The capital sum per section was fixed, in round figures, at 54,000,000 francs (£2,160,000), subject to adjustment when the section was completed and its actual length definitely measured up. A minimum net price of 81% was fixed for the realization of these securities on the market. The bonds are secured

on the surplus of the revenues assigned to the guarantee of the Anatolian railway collected by the Public Debt Administration, on the excess revenue, after certain deductions, accruing to the government under the "Annex-Decree of the Decree of Muharram," above described, on the sheep tax of the vilayets of Konia, Adana and Aleppo, and on the railway itself. The first series (£54,000,000 francs or £2,160,000), was duly handed over to the concessionaires in 1903, and was floated in Berlin at 86.4% realizing the sum of £1,868,000. The division of the line into equal sections of 200 kilometres apiece produced at once a somewhat ridiculous result. The little town of Ereğli, some 190 kilometres distant from Konia, presented the only excusable locality for the terminus of the first section, and even that place is 90 kilometres distant from Karaman, the last town of any importance for some hundreds of miles on the way to the Euphrates valley, the country between the two towns being desolate and sparsely inhabited. But the Bagdad Railway Company¹ (the share capital of which is £600,000 half paid up), naturally anxious to earn the whole of the capitalized subvention, completed the construction of the entire 200 kilometres. The line was thus continued to a station taking its name from Bulgurlu, a small straggling village four miles away, between which and Ereğli there is not a single habitation. But even this did not quite complete the distance, and the line was carried on for still another kilometre and there stopped, "with its pair of rails gauntly projecting from the permanent way" (Fraser, *The Short Cut to India*, 1909). The outside cost of construction of the first section, which lies entirely in the plains of Konia, is estimated to have been £625,000; the company retained, therefore, a profit of at least £1 millions sterling on this first part of the enterprise. In the second section the Taurus range is reached, after which the construction becomes much more difficult and costly. On the 2nd of June 1908 a fresh convention was signed between the government and the Bagdad Railway Company providing, on the same financial basis, for the extension of the line from Bulgurlu to Heliç and of the construction of a branch from Tel-Habesh to Aleppo, covering a total aggregate length of approximately 840 kilometres. The principle of equal sections of 200 kilometres was thus set on one side. The payments to the company were to be made in two lump sums forming "series 2 and 3" of the "Imperial Ottoman Bagdad railway loan," series 2 amounting to £4,320,000, which was delivered to the company on the signature of the contract, and series 3 to £4,760,000. The Bagdad railway must for much time be a heavy

weight on the Turkish budget, the country through which it passes— with the exception of the sections passing from Adana to Osmanieh, and from the vilayets Aleppo-Euphrates district (that is, the first point above mentioned, where the line crosses the Euphrates some 60 m. from Bagdad), to the Euphrates valley, the country between the two towns being desolate and sparsely inhabited, while the financial system adopted by the concessionaire company to work for

increasing earnings. It should be mentioned that the Bagdad Railway Company has sublet the working of the line to the Anatolian Railway Company at the rate of £148 per kilometre, as against the £180 per kilometre guaranteed by the Turkish government;

¹ The line from Mustafa-Pasha to Vakarel now lies in the kingdom of Bulgaria.

² Constructed and worked by the State.

³ Extension of Anatolian Railway.

⁴ The Anatolian Railway group (German) has obtained control of the line, which was originally British.

—an additional indication, if any were needed, of the thriftlessness of the latter in the matter. Moreover, the Anatolian railway receives, under the original Bagdad railway convention (1) an annuity of £14,000 per annum for thirty years as compensation for strengthening its permanent way sufficiently to permit of the running of express trains, and (2) a second annuity of £14,000 in perpetuity to compensate it for running express trains—this to begin as soon as the main Bagdad line reaches Aleppo.

It was stated in the preface to the budget of 1910 that the government would grant no more railway concessions carrying guarantees. The amount inscribed for railway guarantees in the budget of 1910 was £746,790. The tables on p. 440 show the respective lengths of the various Ottoman railways open and worked at the end of 1908 and the amount of kilometre guarantees which they carried—and the lengths, &c., of railways worked by the various companies according to the nationality of the concessionaire groups.

Banks.—At the close of the Crimean War a British bank was opened in 1856 at Constantinople under the name of the Ottoman Bank, with a capital of £500,000 fully paid up. In 1863 this was merged in an Anglo-French bank, under a concession from the Turkish government, as a state bank under the name of the *Imperial Ottoman Bank*, with a capital of £2,700,000, increased in 1865 to £4,050,000 and in 1875 to £10,000,000, one-half of which is paid up. The original concession to the year 1893 was in 1875 extended to 1913, and in 1895 to 1925. The bank acts as banker to the government, for which it has a fixed annual commission, and it is obliged to make a permanent statutory advance to the government of £11,000,000, against the deposit by the government of marketable securities bearing interest at a rate agreed upon. The bank has the exclusive privilege of issuing bank-notes payable in gold. Its central office is in Constantinople, and it is managed by a director-general and advisory committee appointed by committees in London and Paris.

The *National Bank of Turkey* (a limited Ottoman Company) is a purely British concern with a capital of £1,000,000, founded by imperial firman of the 11th of April 1909, under the auspices of Sir Ernest Cassel. It is understood that it was originated at the unofficial instigation of both the British and Ottoman governments, with the idea of forming a channel for the more generous investment of British capital in Turkey under the new régime, so that British financial interests might play a more important part in the Ottoman Empire than has been the case since the state bankruptcy of 1876. This bank brought out the Constantinople municipal loan of 1909 (£1,000,000). Other banks doing business in Constantinople are the *Deutsche Bank*, the *Deutsche-Orient Bank*, the *Crédit Lyonnais*, the *Wiener Bank-Verein*, the *Russian Bank for Commerce and Industry*, the *Bank of Mitylene*, the *Bank of Salonica* and the *Bank of Athens*.

Monetary System.—The monetary system presents a spectacle of perplexing confusion, which is a remnant of the complete chaos which prevailed before the reforms initiated in 1844 by Sultan Abd-ul-Mejid. The basis of the system adopted was the double standard with a fixed relation of 1 to 15:09, and free coinage. The unit was the piastre (=2d.), nominally subdivided into 40 paras. The gold pound (18s. 2d.) was equivalent to 100 piastres; the gold pieces struck were £5, £1, £1 and £1; the standard is 0.9163 fine, and the weight 7.216 grammes. The silver coinage consisted of the mejidie (weight 24.055 grammes, 0.830 fine), equivalent to 20 piastres, and its subdivisions 10, 5, 2, 1, and $\frac{1}{2}$ piastre pieces. The altılık, beshlik and metallik currencies struck, the first and last in the reign of Mahmud II. and Abd-ul-Mejid, and the second in the reign of Mahmud only, were not included in the reform; these were debased currencies bearing a nominal value, the altılık of 6, 3, and $\frac{1}{2}$ piastres, the beshlik of 5 and $\frac{1}{2}$ piastres, the metallik of 1, $\frac{1}{2}$ and $\frac{1}{4}$ piastres; they represented the least degree of an age-long monetary depreciation, the original piastre having had a value of about 5s. 7d., which had fallen to 2d. The heavy depreciation in silver causing large losses to the government, free coinage was suspended in 1880, and the nominal value of the mejidie was reduced by decree to 19 piastres (105.26 piastres thus = £1), while in the same year the debased currencies were reduced, altılık, the 6-piastre piece to 5 piastres, the 3-piastre piece to 2 piastres, the 15-piastre piece to 12 piastres; beshlik, the 5-piastre piece to 3 piastres, the 2½-piastre piece to 1½ piastres; metallik, the 1-piastre piece to ½ piastre, the ½-piastre piece to ¼ piastre, the ¼-piastre piece to ¼ piastre—these values representing approximately the intrinsic value of the silver, at mejidie standard, contained in the debased coins. The copper coinage (113,000,000 piastres) and the paper currency (aimée) (1,600,000,000 piastres) referred to in the above paragraph were withdrawn in 1880 by repudiation. The 20-piastre mejidie currency, in spite of the further enormous depreciation of silver since 1880, has scarcely varied in the Constantinople market, but has always remained at a discount of about 3% (between 108 and 109 piastres to the pound) under government control; this is doubtless due to the fact that the demand and supply

of the coins in that market are very evenly balanced. The parity thus working out at 102.60, gold continued to be held away from the treasury, and in 1909 the government decided to accept the Turkish pound at the last named rate. The fractional mejidie coins (5, 2 and 1 piastres) are quoted at a separate rate in the market, usually at a premium over the 20-piastre piece. In the last twelve years of the 19th century the altılık currency was almost entirely withdrawn, and replaced by fractional mejidie; a large proportion of the beshlik has also been withdrawn, but the metallik has not been touched. These debased currencies are usually at a premium over gold owing to the extreme scarcity of fractional coinage. The standard of the altılık is about 0.440 fine, that of the beshlik is 0.185 to 0.225 fine, that of the metallik is 0.170 fine. Foreign gold coins, especially the pound sterling (par value 110 piastres) and the French 20-franc piece (par value 87½ piastres) have free currency. Throughout Arabia and in Tripoli (Africa) the principal money used is the silver Maria Theresa dollar tariffed by the Ottoman government at 12 piastres. The Indian rupee and the Persian kran are widely circulated through Mesopotamia; in Basra transactions are counted in krans, taking as a fixed exchange £1 = 34.15 krans. The general monetary confusion is greatly intensified by the fact that the piastre unit varies for almost every province; thus, while the pound at Constantinople is counted at 108 piastres silver, it is at about 127 piastres for one kind of transaction and 138 for another in Smyrna, 135 piastres at Adrianople, 140 at Jerusalem, and so forth, accounts being kept in "abusive piastres," which exist no longer. In some towns, e.g. Adrianople, small change is often supplemented by cardboard tickets, metal discs, &c., put into circulation by private establishments or individuals of good credit.

A commission (the successor of many) was instituted at the ministry of finance in 1910, to draw up proposals for setting this confusion in order. In his 1910 budget speech the minister of finance, Javid Bey, demanded authority to create a new aluminium coinage of 5, 10, 20 and 40 para pieces, of which he would issue, in the course of three years, a nominal amount of £11,000,000 to those provinces in which there was a great scarcity of small coins. The amounts of Turkish gold, silver and debased coinage in circulation are approximately £16,500,000, in gold, £18,700,000 (340,000,000 piastres at 108) in silver mejidies and fractions, and 200,000,000 piastres in beshlik and metallik.

Tenure of Property.—Real property is held in one of four various ways: either *mülk*, *emiriyé*, *vakuf* or *khalisyé*. (1) *Mülk* is the absolute property of its owner, and can be disposed of by him as he will without restrictions, save those enumerated lower down (*General Dispositions*) as general for all the four classes. *Mülk* property is governed chiefly by the *Shari* (sacred law). A duty of 10 per mille on its estimated value has to be paid on transfer by sale, donation or testament; 5 per mille on transfer by inheritance; and a registration duty on expenses of transfer. (2) *Emiriyé* is practically "public domains." The state may grant land of this category to private persons on payment by the latter of the value of the proprietary right—the tithes, ground-rent (should there be private buildings upon it), and the land-tax. It is administered by imperial functionaries called *arazi-mémur*; it is with the consent of the latter only that the proprietary rights can be sold. These rights are of simple possession, but they are transmissible in certain degrees to the heirs of the possessor. *Emiriyé* cannot be mortgaged, but can be given as security for debt on condition that it be restored when the debt has been repaid. The creditor may demand the *arazi-mémur* to proceed to a forced sale, but the *arazi-mémur* is not obliged to comply with that demand; no forced sale may take place after the decease of the debtor. *Emiriyé* is not transmissible by will, but may be transferred by donation, which returns to the donor should he outlive the beneficiary. Should a proprietor of *emiriyé* plant trees or vines, or erect buildings upon it, with the consent of the state, they are considered as *mülk*; an annual tax representing the value of the tithes on the portions of *emiriyé* thus utilized is levied. The *emiriyé* then becomes *mülk*, with certain restrictions as to transfer dues. A transfer duty of 8% on the estimated value of *emiriyé* is paid on transmission by sale, inheritance or donation, of 2½% on the amount of the debt in case of mortgage or release from mortgage, and of 10% on expenses of registration. A different scale is established for *emiriyé* with *moukataba* (rent paid for *emiriyé* with *mülk* property established upon it). (3) *Vakuf* is "all property dedicated to God, of which the revenue is consecrated to His poor"; or "property of which the usufruct, such as tithes, taxes and rents, is attributed to a work of charity and of public interest." When once a property has been registered as *vakuf* it can never be withdrawn. There are two classes of *vakuf*: (a) Land so declared either directly by the sovereign or in virtue of imperial authority; (b) lands transformed by their proprietors from *mülk* into *vakuf*. The laws and regulations concerning *vakuf* are too intricate to be described; generally it may be said that they form a great obstruction to dealing with a large proportion of the most valuable property in Turkey, and therefore to the prosperity of the country. The *vakufs* are administered by a special ministerial department (*vakuf nazaret*), whose property, on behalf of the state,

land. They were crossing the Euphrates, not far from the castle of Jaber, when the drowning of their leader by accident threw confusion into their ranks. Those who had not yet crossed the river refused, in face of this omen, to follow their brethren; the little band, numbering 400 warriors (according to others, consisting of 2000 horsemen) decided to remain under Ertoghul, son of the drowned leader. Ertoghul first camped at Jessin,

*Ertoghul,
1230-1268.*

east of Erzerum; a second appeal to Ala-ud-din was more successful—the numbers of the immigrants had become too insignificant for their presence to be a source of danger. The lands of Karaja Dagh, near Angora, were assigned to the new settlers, who found there good pasturage and winter quarters. The help afforded by Ertoghul to the Seljukian monarch on a critical occasion led to the addition of Sugut to his fief, with which he was now formally invested. Here Ertoghul died in 1288 at the age of ninety, being succeeded in the leadership of the tribe by his son Osman. When, exhausted by the onslaughts of Ghazan Mahmud Khan, ruler of Tabriz, and one of Jenghiz Khan's lieutenants, the Seljukian Empire was at the point of dissolution, most of its feudatory vassals helped rather than hindered its downfall in the hope of retaining their fiefs as independent sovereigns. But Osman remained firm in his allegiance, and by repeated victories over the Greeks revived the drooping glories of his suzerain. His earliest conquest was Karaja Hissar (1295), where first the name of Osman was substituted for that of the sultan in the weekly prayer. In that year Ala-ud-din Kaiikobad II. conferred on him the proprietorship of the lands he had thus conquered by the sword, and presented him at the same time with the horse-tail, drum and banner which constituted the insignia of independent command. Osman continued his victorious career against the Greeks, and by his valour and also through allying himself with Keussé Mikhal, lord of Harman Kaya, became master of Aintegul, Bilejik and Yar Hissar. His marriage with Mal Khatur, the daughter of the learned sheikh Edbali, has been surrounded by poetical legend; he married his son Orkhan to the beautiful Greek Nilofer, daughter of the lord of Yar Hissar, whom he carried off from her destined bridegroom on her marriage-day; the fruits of this union were Suleiman Pasha and Murad. In 1300 the Seljukian Empire crumbled away, and many small states arose on its ruins. It was only after the death of his protector and benefactor Sultan Ala-ud-din II. that Osman declared his independence, and accordingly the Turkish historian dates the foundation of the Ottoman Empire from this event. Osman reigned as independent monarch until 1326. He pursued his conquests against the Greeks, and established good government throughout his dominions, which at the time of his death included the valleys of the Sakaria and Adranos, extending southwards to Kutaiah and northwards to the Sea of Marmora. Infirmary had compelled him towards the end of his life to depute the chief command to his younger son Orkhan, by whom in 1326 the conquest of Brusa was at last effected after a long siege.

Orkhan's military prowess secured for him the succession, to the exclusion of his elder brother Ala-ud-din, who became his grand vizier. At that time a number of principalities had replaced the Seljukian state.

*Orkhan,
1276-1329.*

Though Yahsha Bey, grandson of Mahommed Karaman Oghlu, had declared himself the successor of the Seljukian sultans, the princes of Aidin, Sarukhan, Menteshé, Kermian, Hamid, Tekké and Karassi declined to recognize his authority, and considered themselves independent, each in his own dominions. Their example was followed by the Kizil Ahmedli Emir Shems-ed-din, whose family was afterwards known as the house of Isfendiar in Kastamuni. The rest of the country was split up among Turcoman tribes, such as the Zulfiakar in Marash and the Al-i-Ramazan in Adana. At his accession Orkhan was practically on the same footing with these, and avoided weakening himself in the struggle for the Seljukian inheritance, preferring at first to consolidate his forces at Brusa. There he continued to wrest from the Greeks the lands which their feeble arms were no longer able to defend. He took Aidos,

Nicomedia, Héntké, and, after a siege, Nicaea; Tarakli and Gemlik fell to his arms, and soon the whole of the shore of the Marmora up to Kartal was conquered, and the Byzantines retained on the continent of Asia Minor only Ala Shehr and Biga. These acquisitions were made between 1328 and 1338; in the latter year Orkhan achieved his first conquest from Mussulman hands by the capture of Karassi, the pretext being the quarrel for the succession on the death of the prince, Ajlan Bey.

At this period the state of the Byzantine Empire was such as to render its powers of resistance insignificant; indeed the length of time during which it held out against the Turks is to be attributed rather to the lack of efficacious means at the disposal of its assailants than to any qualities possessed by its defenders. In Constantinople itself sedition and profligacy were rampant, the emperors were the tools of faction and cared but little for the interests of their subjects, whose lot was one of hopeless misery and depravity. On the death of the emperor Andronicus III. in 1341 he was succeeded by John Palaeologus, a minor; and Cantacuzenus, the mayor of the palace, appealed to Orkhan for assistance to supplant him, giving in marriage to the Ottoman prince his daughter Theodora. Orkhan lent the desired aid; his son Suleiman Pasha, governor of Karassi, crossed into Europe, crushed Cantacuzenus's enemies, and penetrated as far as the Balkans, returning laden with spoil. Thus the Turks learnt the country of the Greeks and their weakness. In 1355 Suleiman crossed over from Aidinjik and captured the fortress of Gallipoli, which was at once converted into a Turkish stronghold; from this base Bulair, Malgara, Ipsala and Rodosto were added to the Turkish possessions. Suleiman Pasha was killed by a fall from his horse near Bulair in 1358; the news so affected his father Orkhan as to cause his death two months later. The institution of the Janissaries (*ç.*) holds a prominent place among the most remarkable events of Orkhan's reign, which was notable for the encouragement of learning and the foundation of schools, the building of roads and other works of public utility.

Orkhan was succeeded by his son Murad. After capturing Angora from a horde of Turkomans encamped there who were attacking his dominions, at first with some success, Murad I. in 1361 Murad prepared for a campaign in Europe. At that time the Greek emperor's rule was confined to the shores of the Marmora, the Archipelago and Thrace. Salonica, Thessaly, Athens and the Morea were under independent Greek princes. The Bulgarians, Bosnians and Servians had at different periods invaded and conquered the territories inhabited by them; the Albanians, original natives of their land, were governed by princes of their own. When, on the death of Cantacuzenus, John Palaeologus remained sole occupant of the imperial throne, Murad declared war against him and conquered the country right up to Adrianople; the capture of this city, the second capital of the emperors, was announced in official letters to the various Mussulman rulers by Murad. Three years later, in 1364, Philippopolis fell to Lala Shahin, the Turkish commander in Europe. The states beyond the Balkan now began to dread the advance of the Turks; at the instigation of the pope an allied army of 60,000 Serbs, Hungarians, Walachians and Moldavians attacked Lala Shahin. Murad, who had returned to Brusa, crossed over to Biga, and sent on Haji Ilbeyi with 10,000 men; these fell by night on the Servians and utterly routed them at a place still known as the "Servians' coffer." In 1367 Murad made Adrianople his capital and enriched it with various new buildings. He continued to extend his territories in the north and west; the king of Servia and the rulers of Kiustendil, Nicopolis and Silistria agreed to pay tribute to the conquering Turk. Lala Shahin Pasha was appointed feudal lord of the district of Philippopolis, and Timur Tash Pasha became beylerbey of Rumelia; Monastir, Perlepe, and parts of Bosnia and Herzegovina were next taken, and the king of Servia consented to furnish to Murad a fixed contingent of auxiliary troops, besides paying a money tribute. In 1381 Murad's son Yilderim Bayezid married R...

daughter of the prince of Kermian, who brought him in dowry Kutaiah and its six dependent provinces. In the same year Bey Shehr and other portions of the Hamid principality were acquired by purchase from their ruler Hussein Bey, as the Karamanian princes were beginning to cast covetous eyes on them; but the Karamanians were unwilling to resign their claims to be heirs of the Seljukian sultans, and not until the reign of Mahommed II. were they finally suppressed. Ali Bey, the prince at this time, took advantage of Murad's absence in Europe to declare war against him; but the Ottoman ruler returning crushed him at the battle of Konia. Meanwhile the king of Bosnia, acting in collusion with the Karamanian prince, attacked and utterly defeated Timur Tash Pasha, who lost 15,000 out of an army of 20,000 men. The princes and kings who had consented to pay tribute were by this success encouraged to rebel, and the Servian troops who had taken part in the battle of Konia became insubordinate. Indignant at the severity with which they were punished, Lazarus, king of Servia, joined the rebel princes. Murad thereupon returned to Europe with a large force, and sent Chenderli Zade Ali Pasha northwards; the fortresses of Shumla, Pravadi, Trnovo, Nicopolis and Silistria were taken by him; Sisman III., rebel king of Bulgaria, was punished and Bulgaria once more subjugated. Ali Pasha then joined his master at Kosovo. Here Lazarus, king of Servia, had collected an army of 100,000 Serbs, Hungarians, Moldavians, Walachians and others. On the 27th of August 1389 the greatest of the battles of Kosovo was fought. A lightning charge of Yilderim Bayezid's dispelled the confidence of the enemy, scattering death and dismay in their ranks. The king of Servia was killed and his army cut to pieces, though the Turks numbered but 40,000 and had all the disadvantage of the position. After the battle, while Murad was reviewing his victorious troops on the field, he was assassinated by Milosh Kablovich, a Servian who was allowed to approach him on the plea of submission.

Murad maintained a show of friendly relations with the emperor John Palaeologus, while capturing his cities. A review held by him in 1387 at Yeni Shehr was attended by the emperor, who, moreover, gave one of his daughters in marriage to Murad and the other two to his sons Bayezid and Yakub Chelebi. These princes were viceroys of Kermian and Karassi respectively; the youngest son, Sauji Bey, governed at Brusa during his father's absence. Led away by evil counsellors, Sauji Bey plotted with Andronicus, son of the emperor, to dethrone their respective fathers. The attempt was foiled; Andronicus was blinded by his father's orders and Sauji was put to death (1387).

After being proclaimed on the field of Kosovo, Bayezid's first care was to order the execution of his brother Yakub Chelebi, and so to preclude any repetition of Sauji's plot. The young prince Andronicus, who had not been completely blinded, sent secretly to Bayezid and offered him 30,000 ducats to dethrone his father John Palaeologus and make him emperor. Bayezid consented; later on John Palaeologus offered an equivalent sum and, since he engaged to furnish an auxiliary force of 12,000 men into the bargain, Bayezid replaced him on the throne. By the aid of these auxiliaries the fort of Ala Shehr was captured (1392), Manuel Palaeologus, son of the emperor, being allowed, in common with many other princes, the privilege of serving in the Turkish army, then the best organized and disciplined force extant. The principalities of Aidin, Menteshe, Sarukhan and Kermian were annexed to Bayezid's dominions to punish their rulers for having joined with the Karamanian prince in rebellion. The exiled princes took refuge with the Kizil Anshull, ruler of Kastaman, who persuaded the Walachians to rebel against the Turks. By a brilliant march to the Danube Bayezid subjugated them; then returning to Asia he crushed the prince of Karassan, who had made head again and had defeated Timur Tash Pasha. Bayezid now consolidated his Asiatic dominions by the capture of Kaisariéh, Sivas and Tocat. The remains of Jenghis Khan's hordes, who had been wandering by the coast of Asia Minor, were surrendered by the prince of Erzingan, and the rest of Asia Minor seemed assured.

On the death of John Palaeologus in 1391 his son Manuel, who was serving in the Turkish army, fled, without asking leave, to Constantinople, and assumed the imperial dignity. Bayezid determined to punish this insubordination: Constantinople was besieged and an army marched into Macedonia, capturing Salonica and Larissa (1395). The siege of the capital was, however, unsuccessful; the pope and the king of Hungary were able to create a diversion by rousing the Christian rulers to a sense of their danger. An army of crusaders marched upon the Turkish borders; believing Bayezid to be engaged in the siege of Constantinople, they crossed the Danube without precaution and invested Nicopolis. While the fortress held out with difficulty Bayezid fell upon the besiegers like a thunderbolt. The first onslaught of the Knights of the Cross did indeed rout the weak irregulars placed in the van of the Turkish army, but their mad pursuit was checked by the steady ranks of the Janissaries, by whom they were completely defeated (1396). King Sigismund of Hungary barely escaped in a fishing boat; his army was cut to pieces to a man; among the prisoners taken was Jean Sans Peur, brother of the king of France. To the usual letter announcing the victory the caliph in Egypt replied saluting Bayezid with the title of "Sultan of the lands of Rum."

After the victory of Nicopolis the siege of Constantinople was resumed, and the tower of Anatoli Hissar, on the Asiatic side of the Bosphorus, was now built. However, by sending heavy bribes to Bayezid and his vizier, and by offering to build a mosque and a Mussulman quarter, and to allow Bayezid to be named in the weekly prayer, Manuel succeeded in inducing Bayezid to raise the siege. The mosque was destroyed later on and the Mussulman settlers driven out. Between 1397 and 1399 Bayezid overran Thessaly, while in Asia his lieutenant Timur Tash was extending his conquests. Meanwhile Timur (Tamerlane) had started from Samarkand on his victorious career. With incredible rapidity his hosts spread and plundered from Bagdad to Moscow. After devastating Georgia in 1401 he marched against the Turks. Some of the dispossessed princes of Asia Minor had repaired to Timur and begged him to reinstate them; accordingly Timur sent to Bayezid to request that this might be done. The tone of the demand offended Bayezid, who rejected it in terms equally sharp. As a result Timur's countless hordes attacked and took Sivas, plundering the town and massacring its inhabitants. Then, to avenge an insult sustained from the ruler of Egypt, Timur marched southwards and devastated Syria, thence turning to Bagdad, which shared the same fate. He then retraced his steps to the northwest. Bayezid had taken advantage of his absence to defeat the ruler of Erzingan, a protégé of Timur. All attempts to arrange a truce between the two intractable conquerors were in vain. They met in the neighbourhood of Angora. Timur's army is said to have numbered 200,000, Bayezid's force to have amounted to about half that figure, mostly seasoned veterans. The sultan's five sons were with the army, as well as all his generals; 7000 Servian auxiliaries under Stephen, son of Lazarus, took part in the battle (1402). Prodiges of valour on the part of Bayezid's troops could not make up for the defection of the newly-absorbed levies from Aidin, Sarukhan and Menteshe who went over to their former princes in Timur's camp. The rout of the Turkish army was complete. Bayezid, with many of his generals, was taken prisoner. Though treated with some deference by his captor, who even promised to reinstate him, Bayezid's proud spirit could not endure his fall, and he died eight months later at Ak Shehr.

After the disaster of Angora, from which it seemed impossible that the Ottoman fortunes could ever recover, the princes fled each with as many troops as he could induce to follow him, being hotly pursued by Timur's armies. ^{Peterburg, 1862-1863.} Only Mussa was captured. Timur reached Brusa, and there laid hands on the treasure of Bayezid; one after another the cities of the Turks were seized and plundered by the Tatars. Meanwhile Timur sent letters after the fugitive sons of Bayezid promising to confer on them their father's dominions, and protesting that his attack had been due merely

to the insulting tone adopted towards him by Bayezid and to the entreaties of the dispossessed princes of Asia Minor. Most of the latter were reinstated, with the object of reducing the Turkish power. Timur did not cross into Europe, and contented himself with accepting some trifling presents from the Greek emperor. After capturing Smyrna he returned to Samarkand (1405). Some years of strife followed between the sons of Bayezid, in which three of them fell; Mussa, seizing Adrianople, laid siege to Constantinople, and Manuel Palaeologus, the emperor, appealed for aid to Mahommed, the other son, who had established himself at Brusa.

In 1413 Mahommed defeated Mussa, and thus remained sole heir to Bayezid's throne; in seven or eight years he succeeded in regaining all the territories over which his father had ruled, whereas Timur's empire fell to pieces at the death of its founder. Two years after his accession Mahommed overcame a rebellion of the prince of Karamania and recaptured his stronghold Konia (1416), and then, turning northwards, forced Mircea, voivode of Walachia, who in the dispute as to the succession had supported Prince Mussa, to pay tribute. The Turkish dominions in Asia Minor were extended, Amasia, Samsun and Janik being captured, and an insurrection of dervishes was quelled. In 1421 the sultan died. His services in the regeneration of the Turkish power can hardly be over-estimated; all agree in recognizing his great qualities and the charm of his character; even Timur is said to have admired him so much as to offer him his daughter in marriage. The honour was declined, and Mahommed took a bride from the house of Zulfikar. Amid the cares of state he found time for works of public utility and for the support of literature and art; he is credited with having sent the first embassy to a Christian power, after the Venetian expedition to Gallipoli in 1416, and the Ottoman navy is first heard of in his reign.

At the time of Mahommed's death his eldest son Murad was at Amasia; and, as the troops had lately shown signs of insubordination, it was deemed advisable to conceal the news of the sultan's death and to send a part of the army across to Asia. The men, however, refused to march without seeing their sultan, and the singular expedient was resorted to of propping up the dead monarch's body in a dark room and concealing behind it an attendant who raised the hands and moved the head of the corpse as the troops marched past. Shortly after Murad's accession the emperor Manuel, having applied in vain for the renewal of the annual subsidy paid him by the late sultan for retaining in safe custody Mustafa, an alleged son of Bayezid, released the pretender. Adherents flocked to him, and for a whole year Murad was engaged in suppressing his attempts to usurp the throne.

At last the armies of sultan and pretender met at Uhubad (Lopadion) on the Rhyndacus in Asia Minor; Mustafa's troops fled at the first onset; Lampeacus, where the pretender took refuge, was captured with the aid of the Genoese galleys under Adorno. Mustafa, who had crossed the strait and fled northwards, was taken, brought to Adrianople, and hanged from a tower of the serai (1422). Murad now laid siege to Constantinople to avenge himself on the emperor, and on the 24th of August the desperate valour of the defenders succeeded in driving back an assault led by a band of fanatical dervishes. The siege was raised, however, not owing to the bravery of the defence, but because the appearance of another pretender, in the person of Murad's thirteen-year-old brother Mustafa, under the protection of the revolted princes of Karamania and Kermian, called the sultan to Asia. Mustafa, delivered up by treachery, was hanged (1424); but Murad remained in Asia, restoring order in the provinces, while his lieutenants continued the war against the Greeks, Albanians and Walachians. By the treaty signed on the 22nd of February 1424, shortly before his death, the emperor Manuel II., in order to save the remnant of his empire, agreed to the payment of a heavy annual tribute and to surrender all the towns on the Black Sea, except Selymbria and Derkos, and those on the river Strymon. Peace was also made at the same time with the despot of Servia and the voivode of

Walachia, on the basis of the payment of tribute. By 1426 the princes of Kermian and Karamania had submitted on honourable terms; and Murad was soon free to continue his conquests in Europe. Of these the most conspicuous was that of Salonica. Garrisoned only by 1500 Venetians, the city was carried by storm (March 1, 1428); the merciful precedent set by Mahommed I. was not followed, the greater part of the inhabitants being massacred or sold into slavery, and the principal churches converted into mosques.

The capture of Salonica had been preceded by renewed troubles with Servia and Hungary, peace being concluded with both in 1428. But those treaties, each of which marked a fresh Turkish advance, were short-lived. The story of the next few years is but a dismal record of aggression and of reprisals leading to fresh aggression. In 1432 the Turkish troops plundered in Hungary as far as Temesvár and Hermannstadt, while in Servia Semendria was captured and Belgrade invested. In Transylvania, however, the common peril evoked by the Turkish incursion and a simultaneous rising of the Vlach peasantry had knit together the jarring interests of Magyars, Saxons and Szeklers, a union which, under the national hero, the voivode János Hunyadi (q.v.), was destined for a while to turn the tide of war. In 1442 Hunyadi drove the Turks from Hermannstadt and, at the head of an army of Hungarians, Poles, Servians, Walachians and German crusaders, succeeded in the ensuing year in expelling them from Semendria, penetrating as far as the Balkans, where he inflicted heavy losses on the Turkish general. Meanwhile, again confronted by a rebellion of the prince of Karamania, Murad had crossed into Asia and reduced him to submission, granting him honourable terms, in view of the urgency of the peril in Europe. On the 12th of July 1444 a ten years' peace was signed with Hungary, whereby Walachia was placed under the suzerainty of that country; and, wearied by constant warfare and afflicted by the death of his eldest son, Prince Ala-ud-din, Murad abdicated in favour of his son Mahommed, then only fourteen years of age, and retired to Magnesia (1444). The pope urged the king of Hungary to take advantage of this favourable opportunity by breaking the truce solemnly agreed upon, and nineteen days after it had been concluded a coalition was formed against the Turks; a large army headed by Ladislaus I., king of Hungary, Hunyadi, voivode of Walachia, and Cardinal Cesarini crossed the Danube and reached Varna, where they hoped to be joined by the Greek emperor. In this emergency Murad was implored to return to the throne; to a second appeal he gave way, and crossing over with his Asiatic army from Anatoli Hissar he hastened to Varna. The battle was hotly contested; but, in spite of the prowess of Hunyadi, the rout of the Christians was complete; the king of Hungary and Cardinal Cesarini were among the killed. Murad is said to have abdicated a second time, and to have been again recalled to power owing to a revolt of the Janissaries. In 1446 Corinth, Patras and the north of the Morea were added to the Turkish dominions. The latter years of Murad's reign were troubled by the successful resistance offered to his arms in Albania by Scanderbeg (q.v.). In 1448 Hunyadi, now governor of Hungary, collected the largest army yet mustered by the Hungarians against the Turks, but he was defeated on the famous field of Kossovo and with difficulty escaped, while most of the chivalry of Hungary fell. Little more than two years later Murad died at Adrianople, being succeeded by his son Mahommed.

After suppressing a fresh revolt of the prince of Karamania, the new sultan gave himself up entirely to the realization of the long-cherished project of the conquest of Constantinople. He began by building on the European side of the Bosphorus the fort known as Rumeli Hissar, opposite that built by his grandfather Bayezid. Tradition avers that but forty days were needed for the completion of the work, six thousand men being employed night and day; guns and troops were hurriedly put in, and all navigation of the Bosphorus was stopped. After completing his preparations, which included the casting of a monster cannon and the manufacture of enormous engines of assault, Mahommed

Mahommed II. the Conqueror, 1481-1481.

began the siege in 1453. Constantine Palaeologus, the last occupant of the imperial throne, took every measure that the courage of despair could devise for the defence of the doomed city; but his appeal to the pope for the aid of Western Christendom was frustrated through the bigoted, anti-Catholic spirit of the Greeks. The defenders were dispirited and torn by sedition and dissensions, and the emperor could rely on little more than 8000 fighting men, while the assailants, 200,000 strong, were animated by the wildest fanatical zeal. The siege had lasted fifty-three days when, on the 29th of May 1453, a tremendous assault was successful; the desperate efforts of the Greeks were unavailing, Constantine himself falling among the foremost defenders of the breach. The sultan triumphantly entered the palace of the emperors, and the next Friday's prayer was celebrated in the church of St Sofia (see ROMAN EMPIRE, LATER).

After some days' stay in Constantinople, during which he granted wide privileges to the Greeks and to their patriarch, the sultan proceeded northwards and entirely subdued the southern parts of Servia. A siege of Belgrade was unsuccessful, owing to the timely succour afforded by Hunyadi (1456). Two years later internal dissensions in Servia brought about the conquest of the whole country by the Turks, only Belgrade remaining in the hands of the Hungarians. The independent princes of Asia Minor were now completely subjugated and their territories finally absorbed into the Turkish dominions; Wallachia was next reduced to the state of a tributary province. Venice having adopted a hostile attitude since Turkey's conquests in the Morea, greater attention was devoted to the fleet; Mytilene was captured and the entrance to the straits fortified. The conquest of Bosnia, rendered necessary by the war with Venice, was next completed, in spite of the reverses inflicted on the Turks by the Hungarian king Matthias Corvinus, the son of János Hunyadi. The Turks continued to press the Venetians by land and sea; Albania, which under Scanderberg had for twenty-five years resisted the Ottoman arms, was overrun; and Venice was forced to agree to a treaty by which she ceded to Turkey Scutari and Kroia, and consented to pay an indemnity of 100,000 ducats (Jan. 25, 1478). The Crimea was next conquered and bestowed as a tributary province on the Tatar khan Mengli Girai. Mahommed now endeavoured to strike a blow at Rhodes, the stronghold of the Knights of St John, preparatory to carrying out his long-cherished plan of conquering Italy. A powerful naval expedition was fitted out, but failed, an armistice and treaty of commerce being signed with the grand master, Pierre d'Aubusson (1479). But a land attack on southern Italy at the same time was successful, Otranto being captured and held for a time by the Turks. In 1481 the sultan was believed to be projecting a campaign against the Circassian rulers of Syria and Egypt, when he died at Gebzé. He is said to have been of a merry and even jocular disposition, to have afforded a generous patronage to learning, and, strange to say for a sultan, to have been master of six languages.

Mahommed II. was the organizer of the fabric of Ottoman administration in the form which it retained practically unchanged until the reforms of Mahmud II. and Abd-ul-Mejid. He raised the regular forces of the country to a total exceeding 200,000; the pay of the Janissaries was by him increased, and their ranks were brought up to an effective of upwards of 12,000. He established the system whereby the lands conquered by the arms of his troops were divided into the different classes of fiefs, or else assigned to the maintenance of mosques, colleges, schools and charitable institutions, or converted into common and pasturage lands. Many educational and benevolent foundations were endowed by him, and it is to Mahommed II. that the organization of the ulema, or legist and ecclesiastical class, is due.

Upon Bayezid II. succeeding to his father a serious revolt of the troops took place, which led to the institution of the regular payment of an accession donative to the Janissaries. At the outset of the reign Bayezid's brother, Prince Jem, made a serious attempt to claim the throne; he was defeated, and eventually took

refuge with the knights of Rhodes, whom Bayezid bribed to keep him in safe custody. The unfortunate prince was led from one European stronghold to another, and, after thirteen years' wandering, died at Naples in 1494 (see BAYEZID II.). Freed from the danger of his brother's attacks, the sultan gave himself up to devotion, leaving to his ministers the conduct of affairs in peace and war. But, though of an unambitious and peace-loving temper, the very conditions of his empire made war inevitable. Even when peace was nominally in existence, war in its most horrible forms was actually being waged. On the northern frontier border raids on a large scale were frequent. Thus, in 1492 the Turks made incursions into Carinthia as far as Laibach, and into Styria as far as Cilli, committing unspeakable atrocities; in 1493 they overran both Styria and Croatia. The Hungarians retaliated in kind, burning and harrying as far as Semendria, torturing and murdering, and carrying off the saleable inhabitants as slaves. In 1494 a crushing victory of the emperor Maximilian drove the Turks out of Styria, which they did not venture again to invade during his reign. In 1496 the temporary armistice between the Poles and Turks, renewed in 1493, came to an end, and John Albert, king of Poland, seized the occasion to invade Moldavia. The efforts of Ladislaus of Hungary to mediate were vain, and the years 1497 and 1498 were marked by a terrible devastation of Poland by the Ottomans; only the bitter winter, which is said to have killed 40,000 Turks, prevented the devastation from being more complete. By the peace concluded in 1500 the sultan's dominions were again extended. Meanwhile, in June 1499, war had again broken out with Venice, mainly owing to the intervention of the pope and emperor, who, with Milan, Florence and Naples, urged the sultan to crush the republic. On the 28th of July the Turks gained over the Venetians at Sapienza their first great victory at sea; and this was followed by the capture of Lepanto, at which Bayezid was present, and by the conquest of the Morea and most of the islands of the archipelago. By the peace signed on the 24th of December 1502, however, the *status quo* was practically restored, the sultan contenting himself with receiving Santa Maura in exchange for Cephalonia.

Meanwhile in Asia also the Ottoman Empire had been consolidated and extended; but from 1501 onwards the ambitious designs of the youthful Shah Ismail in Persia grew more and more threatening to its security; and though Bayezid, intent on peace, winked at his violations of Ottoman territory and exchanged friendly embassies with him, a breach was sooner or later inevitable. This danger, together with the growing insubordination of the aged sultan's sons, caused his ministers to urge him to abdicate in favour of Selim, the younger but more valiant. This prince pushed his audacity so far as to attack his father's troops, but the action merely increased his popularity with the Janissaries, and Bayezid, after a reign of thirty-one years, was obliged to abdicate in favour of his forceful younger son; a few days later he died. This reign saw the end of the Mussulman rule in Spain, Turkey's naval power not being yet sufficient to afford aid to her co-religionists. It also saw the first intercourse between a Russian tsar and an Ottoman sultan, Ivan III. exchanging in 1498 friendly messages with Bayezid through the Tatar khan Mengli Girai; the first Russian ambassador appeared at Constantinople three years later.

When he had ruthlessly quelled the resistance offered to his accession by his brothers, who both fell in the struggle for the throne, Selim undertook his campaign in Persia, See Him I., 1612-1620. having first extirpated the Shia heresy, the prevalent sect of Persia, in his dominions, where it threatened to extend. After an arduous march and in spite of the mutinous behaviour of his troops, Selim, crushed the Persians at Chaldiran (1515) and became master of the whole of Kurdistan. He next turned against the Mameluke rulers of Egypt, crushed them, and entering Cairo as conqueror (1517), obtained from the last of the Abbasid caliphs, Motawakkil, the title of caliph (q.v.)

After the fall of the caliphs of Bagdad (1258), descendants of the Abbasids took refuge in Cairo and enjoyed a purely titular authority under the protection of the Egyptian rulers.

for himself and his successors (see *EGYPT: History; Mahomedan Period*). The sultan also acquired from him the sacred banner and other relics of the founder of Islam, which have since been preserved in the Seraglio at Constantinople. Egypt, Syria and the Hejaz, the former empire of the Mamelukes, were added to the Ottoman dominions. Towards the end of Selim's reign the religious revolt of a certain Jellal, who collected 200,000 adherents, was the cause of much trouble; but he was eventually routed and his force dispersed near Tokat. While preparing an expedition against Rhodes to avenge the repulse sustained forty years before by Mahommed II., the sultan died at Orashkeui, near Adrianople, at the spot where he had attacked his father's troops. His reign of eight years had almost doubled the extent of the Turkish dominions.

He was succeeded by his son Suleiman "the Magnificent," in whose long and eventful reign Turkey attained the highest point of her glory. Selim's Asiatic conquests had left his successor free to enter upon a campaign in Europe, after the suppression of a revolt of the governor of Damascus, who had thought to take advantage of the new sultan's accession to restore the independent rule of the Circassian chiefs. In 1521 war was declared against the king of Hungary on the pretext that he had sent no congratulations on Suleiman's accession. Belgrade was besieged and captured, a conquest which Mahommed II. had failed to effect. In the next year an expedition was undertaken against Rhodes, the capture of which had become doubly important since the acquisition of Egypt. The siege, which was finally conducted by the sultan in person, was successful after six months' duration; the forts of Cos and Budrum were also taken. The European war was now renewed; in 1526 the sultan, marching from Belgrade, crossed the Danube and took Peterwardein and Esseg; on the field of Mohács he encountered and defeated the Hungarians under king Louis II., who was killed with the flower of the Hungarian chivalry (see *HUNGARY: History*). Budapest hereupon fell to the Turks, who appointed John Zápolya king of Hungary (1528). But the crown of Hungary was claimed by the archduke Ferdinand, brother of the emperor Charles V., as being king Louis's brother-in-law. This brought Turkey into collision with the great emperor. Moreover, Francis I. of France, who had just been defeated by Charles, sent to the sultan ambassadors and messages dwelling on the danger of allowing Charles's power to become too great, and imploring the assistance of Suleiman as the only means of preserving the balance of power in Europe. Meanwhile Ferdinand's troops captured Budapest, driving out Zápolya, who at once appealed to Suleiman for aid. Suleiman decided against Charles, and marched north (1529). Zápolya joined the Turks at Mohács, and a joint attack was made on Budapest. After five days' siege the Austrians were driven out, and Zápolya was reinstated on the throne of Hungary. The Turks then marched on Vienna, which was bombarded and closely invested, but so valiant was the resistance offered that after three weeks the siege was abandoned (Oct. 14, 1529). Suleiman now prepared for a campaign in Germany and sought to measure himself against Charles, who, however, withdrew from his approach, and little was done save to ravage Styria and Slavonia. In 1533 a truce was arranged, Hungary being divided between Zápolya and Ferdinand.

During the Hungarian campaign the Shia sectaries had been encouraged to revolt, and the Persians had overrun Azerbáiján and recaptured Tabria. Suleiman, therefore, turned his arms against them, reaching Bagdad in 1534, and capturing the whole of Armenia. The naval exploits of Khair-ed-din Pasha (see *BARBAROSSA*) are among the glories of the reign, and led to hostilities with Venice. After capturing Algiers, an attack by this famous admiral on Tunis was repulsed with the aid of Spain, but in the Mediterranean he maintained a hotly-contested struggle with Charles's admiral, Andrea Doria. Venice was in alliance with Charles, and her possessions were consequently attacked by Turkey by land and by sea, many islands, including Syra and Tinos, falling before

Barbarossa's assaults. Corfu was besieged, but unsuccessfully. At Preveza Barbarossa defeated the papal and Venetian fleets under Doria. In 1540 the fort of Castelnuovo, the strongest point on the Dalmatian coast, was taken by the Venetians and recaptured by Barbarossa. Peace was then made on the terms that Turkey should retain her conquests and Venice should pay an indemnity of 300,000 ducats. Friendly relations had subsisted between Suleiman and Ferdinand during the expedition to Persia; but on the death of Zápolya in 1539 Ferdinand claimed Hungary and besieged Budapest with a large force. Suleiman determined to support the claims of Zápolya's infant son, John Sigismund, and in 1541 set out in person. At the end of August he appeared before Budapest, the siege of which had already been raised by the defeat of the Austrians; the infant John Sigismund was carried into the sultan's camp, and the queen-mother, Isabella, was peremptorily ordered to evacuate the royal palace, though the sultan gave her a diploma in which he swore only to retain Budapest during the minority of her son. On the 2nd of September Suleiman entered the city, and to the ambassadors of Ferdinand, who came to offer a yearly sum if the sultan would recognize his claim to Hungary, he replied that he had taken possession of it by the sword and would negotiate only after the surrender of Gran, Tata, Visegrád and Székesfehérvár. The war now continued vigorously by sea and land. The great expedition of the emperor Charles V. against Algiers ended in failure, his fleet being destroyed by a sudden storm (Oct. 31, 1541); and his diplomatic efforts to wean Barbarossa from his allegiance to the sultan fared no better. In 1542 a formal alliance was concluded between Suleiman and Francis I.; the Ottoman fleet was placed at the disposal of the king of France, and in August 1543, the Turks under Barbarossa, and the French under the duke of Enghien, laid siege to Nice. The town surrendered; but the citadel held out until, on the 8th of September, it was relieved by Andrea Doria. Meanwhile on land Suleiman had taken full advantage of the European situation to tighten his grip on Hungary. The attempt of the imperialists, under Joachim of Brandenburg, to retake Budapest (September 1542), failed ignominiously; and in the following year Suleiman in person conducted a campaign which led to the conquest of Sıklós, Gran, Székesfehérvár and Visegrád (1544). Everywhere the churches were turned into mosques; and the greater part of Hungary, divided into twelve sanjaks, became definitively a Turkish province. A truce, on the basis of *uti possidetis*, signed at Adrianople on the 19th of June 1547 for five years, between the sultan, the emperor and Ferdinand I. king of Hungary, recognized the Turkish conquests in Hungary; while, for the portion left to him, Ferdinand consented to pay an annual tribute of 30,000 ducats. John Sigismund was recognized as independent prince of Transylvania and of sixteen adjacent Hungarian counties, Queen Isabella to act as regent during his minority.

Suleiman was now free to resume operations against Persia. In the spring of 1548 he set out on his eleventh campaign, which ended in the capture of Erzerum (August 16) and the conquest of Armenia and Georgia. But the Persian War dragged on, with varying fortune, for years, till after Suleiman had ravaged Persia it was concluded by the treaty—the first between shah and sultan—signed at Amasia on the 29th of May 1555.

Meanwhile the war in Hungary had been resumed. Neither side had been careful to observe the terms of the treaty of 1547; the Turkish pashas in Hungary had raided Ferdinand's dominions, while Ferdinand had been negotiating with Frater Geörgy (see *MARTINUZZI*) with a view to freeing Transylvania from the Ottoman suzerainty. When the sultan discovered that Martinuzzi, who was all-powerful in Transylvania, had actually arranged to hand over the country to Ferdinand, he threw the Austrian ambassador into prison, and in September 1551 sent an army, 80,000 strong, under Mahommed Sokollí over the Danube. Several forts, and the important town of Lippa on the Marosch, fell at once, and siege was laid to Temesvár. This was raised after two months, and Martinuzzi took

advantage of the retirement of the Turks to raise an army and recapture Lippa. Before the surrender of the city, however, he was murdered by Ferdinand's orders on strong suspicion of treachery. The campaign of 1552 was disastrous for the Austrians; the Turks, under the command of Ahmed Pasha, defeated them at Szegebin and captured in turn Vespérm, Temesvár, Szolnok and other places. Their victorious career was only checked, in October, by the raising of the siege of Erlau. In the spring of 1553 the victories of the Persians called for the sultan's presence in the East; a truce for six months was now concluded between the envoys of Ferdinand and the pasha of Budapest, and Austrian ambassadors were sent to Constantinople to arrange a peace. But the negotiations dragged on without result; the war continued with hideous barbarities on both sides; and it was not until the 1st of June 1562 that it was concluded by the treaty signed at Prague by Ferdinand, now emperor. Suleiman kept the possessions he had won by the sword, Temesvár, Szolnok, Tata and other places in Hungary; Transylvania was assigned to John Sigismund, the Habsburg claim to interference being categorically denied; Ferdinand bound himself to pay, not only the annual tribute of 30,000 ducats, but all the arrears that had meanwhile accumulated. Even this treaty, however, was but an apparent settlement. A year passed before the Latin and Turkish texts of the treaty were harmonized; and meanwhile irregular fighting continued on all the borders. In 1564 Ferdinand died, and was succeeded by Maximilian II. The new emperor attacked Tokaj, which was in Turkish possession; the tribute had been allowed again to fall into arrears; and to all this was added that Mahommed Sokolli, the new grand vizier (1565), pressed for new war to wipe out the disgrace of the failure of the Ottoman attack on Malta (May-September 1565). In May 1566 the war broke out, Suleiman, now seventy-two years old, again leading his army in person. In August he laid siege to Szigetvár with 100,000 men; but on the 5th of September, while preparations were being made for a final assault, the sultan died. His death was, however, kept secret, and on the 8th the fortress fell.

The reign of Suleiman the Magnificent marked the zenith of the Ottoman power. At the time of his death the Turkish Empire extended from near the frontiers of Germany to the frontiers of Persia. The Black Sea was practically a Turkish lake, only the Circassians on the east coast retaining their independence; and as a result of the wars with Persia the whole Euphrates valley, with Bagdad, had fallen into the sultan's power, now established on the Persian Gulf. The Venetians had been driven from the Morea and the islands of the Archipelago; and, except a strip of the Dalmatian coast and the little mountain state of Montenegro, the whole of the Balkan peninsula was in Turkish hands. In the Mediterranean, Crete and Malta yet survived as outposts of Christendom; but the northern coasts of Africa from Egypt to Morocco acknowledged the supremacy of the sultan, whose sea power in the Mediterranean had become a factor to be reckoned with in European politics, threatening not only the islands, but the very heart of Christendom, Italy itself, and capable—as the alliance with France against Charles V. had shown—of being thrown with decisive weight into the balance of European rivalries.

The power of the Ottomans at sea was maintained during this period by a series of notable captains, such as Khair-ed-din and his son Hassan, Hiale, Turgud, Sali Reis and Piri Reis. Of these the two last are separately noticed (see *Hassan* and *Piri Reis*), a Croatian who had been brought up to the sea at Sinan as capudan-pasha, and the gallies of Andrea Doria off Tripoli (1570).

the Ottoman sea service. After spending some time as a Genoese galley-slave, he turned corsair and became the terror of the Mediterranean coasts. He seized Mahdia, a strong post on a tongue of land about 43 m. south of Susa in Tunisia, and made this the centre of his piracies till, during his absence raiding the Spanish coasts, it was bombarded and destroyed by an expedition sent by Charles V. (September 10, 1550). Torgud was now summoned to Constantinople to answer for piracies committed on the friendly galleys of Venice; but he sailed instead to Morocco, and there for two years defied the sultan's authority. But Suleiman, who needed the aid of the corsairs against Malta, pardoned him, and he was given the command of the expedition against Tripoli, which he captured. He now turned against Corsica, captured Bastia (August 1553) and on his return to Constantinople, laden with booty and slaves, chastised the insurgent Albanians. He was rewarded by Suleiman with the governorship of Tripoli, which he held till his death. He was killed during the unsuccessful attack on Malta, which he commanded (1565). Sali Reis, also by birth a Christian of Asia Minor, was likewise successful as a corsair; he distinguished himself especially at the capture of Tunis, and succeeded Hassan Barharossa as beylerbey of Algiers.

Other captains carried the Turkish arms down the Arabian and Persian gulfs far out into the Indian Ocean. Of these the most remarkable was Piri Reis, nephew of Kamil Reis, the famous corsair who, under Bayezid II., had swept the Aegean and Mediterranean. Piri sailed into the Persian Gulf, took Muscat, and laid siege to Ormuz. But the approach of the Portuguese fleet put him to flight; some of his vessels were wrecked; and on his return by way of Egypt he was arrested at Cairo and executed. He had compiled a sea-atlas (the *Bahrje*) of the Aegean and Mediterranean seas, every nook and cranny of which he had explored, with an account of the currents, soundings, landing-places, inlets and harbours.

Another literary seaman of this period was Sidi Ali, celebrated under his poetic pseudonym of Katibi (or Katibi Rumi, to distinguish him from the Persian poet of the same name). He was no more successful than Piri or his successor Murad in fighting the elements and the Portuguese in the Persian Gulf; but he was happier in his fate. Driven, with the remnant of his ships, into the Indian Ocean, he landed with fifty companions on the coast of India and travelled back to Turkey by way of Sind, Baluchistan, Khorassan and Persia. He wrote an account of this three years' journey, for which he was rewarded by Suleiman with an office and a pension. He was the author also of a mathematical work on the use of the astrolabe and of a book (*Muhit*, "the ocean") on the navigation of the Indian seas.

At the close of Suleiman's reign the Turkish army numbered nearly 200,000 men, including the Janissaries, whose total he almost doubled, raising them to 20,000. He improved the laws and institutions established by his predecessors and adapted them to the requirements of the age; to him are due important modifications in the feudal system, aimed at maintaining the fields in a really effective condition. The codes of law were by him revised and improved, and he was the first sultan to enter into relations with foreign states. In 1534 Jean de La Forêt, a knight of St John of Jerusalem, came to Constantinople as first permanent French ambassador to the Porte, and in February 1535 were signed the first Capitulations (q.v.) with France.

A short sketch of the administration and state of the country at this time may find place here. Successively transferred from Brusa to Adrianople and thence to Constantinople, the seat of government was at first little more than the camp of a conqueror. After the conquest of the imperial city the sultans began to adopt the pomp and splendour of eastern sovereigns, and largely copied the system, ready to hand, of the Byzantine emperors. Affairs of state were at first discussed at the imperial divan, where the great dignitaries were convened at appointed hours. Until the reign of Mahommed the Conqueror the sultan presided in person; but a rough Anatolian peasant penetrating one day to the council and exclaiming, "Which of you might be the sultan? I've come to make a complaint!" it

Ottoman
Polity in
the 16th
Century.

was thought that in future it would be more consonant with the imperial dignity for the sovereign to remain concealed behind a grating where, unseen, he could hear all that was said. Towards the middle of Suleiman's reign even this practice was abandoned, and the sultans henceforth attended the divans only on the distribution of pay to the troops or the reception of a foreign ambassador, which occasions were usually made to coincide. The divan accompanied the sultan on military expeditions.

As established by Mahommed II., the officials of the state were divided into four classes: (1) administrative; (2) ecclesiastical; (3) secretarial and (4) military. The administration of *kazas*, or cantons, was usually entrusted to the cadis and the holders of the more important fiefs; the *sanjaks*, or departments, were ruled by *alai beys* or *mir-i-livas* (colonels or brigadiers), pashas with one horse-tail: the *vilayets*, or provinces, by *beylerbeys* or *mir-i-mirans* (lord of lords), pashas with two horse-tails: these were all originally military officers, who, in addition to their administrative functions, were charged with the duty of mustering and commanding the feudal levies in war time. Above them were the *beylerbeys* of Anatolia and Rumelia, who served under the orders of the commander-in-chief. The title of vizier was borne by six or seven persons simultaneously; the grand vizier was the chief of these and exercised supreme authority, being invested with the sultan's signet. He often commanded an army in person, and was then given the title of *serdar-ekbrum* (generalissimo); one of the subordinate viziers retained behind as *katmahamam*, or locum tenens. The duties of the other viziers were limited to attending the divan; they were called *kubbe* or *cupola* viziers from the fact that the council met under a cupola; they were pashas with three horse-tails, and were attended by large retinues, having generally achieved distinction as *beylerbeys*. These officers were usually chosen from among the more promising of the youths selected by the *devshirmé*, or system of forced levy for manning the ranks of the Janissaries: hence so many of the statesmen of Turkey were of non-Musulman origin. Besides these members of the secretarial class, such as *nishanjis* and *defterdars*, as well as regular army officers, and occasionally members of the ecclesiastical class, or *ulema*, rose to the rank of vizier.

The highest dignities of the ecclesiastical class were at first the *kazashers*, or military judges, of Europe and Asia; later the office of Sheikh-ul-Islam was created as the supreme authority in matters relating to the Church and the sacred law. Promotion was regular, but was obtainable only by entering at an early age one of the *medresés* or colleges: the student, after passing through the successive degrees of *danishmend*, *mulcim* and *maderris*, became first a molla, then a judge, rising to the higher ranks as fortune and opportunity offered. In the time of Bayezid II. the post of *kاتب-eshraf*, or registrar of the *sherifs*, or descendants of the Prophet, was created.

The secretarial class consisted of six categories: the *nishanjis*, the *defterdars*, the *reis*, the *defter emini*, the *shakk-i-sani* (or second class) *defterdars* and the *shakk-i-salti* (or third class) *defterdars*. The first named were charged with the duty of revising and duly executing the decisions of the divan respecting the assignment of lands to warriors and the apportioning of conquered territories. They were men of great culture, and many historians, poets and writers belong to this class. The *defterdar* was practically the minister of finance. The *reis* was the secretary-general of the divan, and in more modern times became minister for foreign affairs. The *defter emini* kept the registers for the *nishanjis*, whose place he took on emergency, the others, acted as secretaries and clerks.

The military class was divided into two categories: (1) the regular paid troops who were quartered in barracks and were known as "slaves of the palace"; (2) the feudal levies who received no pay and were called upon to serve only in war-time. The Janissaries (*q.s.*) belonged to the first category. The rigid regulations for admission to their ranks were soon relaxed: at the close of the Persian war in 1590 their total amounted to 50,000. The regular troops comprised also armoureds (*jebéji*), from 6000 to 8000 men, and six squadrons of cavalry; these were recruited in the same way as the Janissaries, and their numbers were raised by Murad III. to 20,000. There were also *bostanjis*, or forest-guards, numbering about 5000, besides local troops in distant and frontier provinces, and about 20,000 *akimjis*, or light troops, in Europe, who carried out forays in the enemies' country.

The fiefs were not hereditary, and were held directly from the sultan. On the conquest of a country the lands were apportioned by the *nishanjis*, who first computed the tithe revenue of each village, its population, woods, pasturage, &c.; and divided it into the three classes of *fiefs* (*khâs*, *zamet* and *timar*), or into *kakif* (pious endowments) or pasturage. Any estate with a revenue exceeding 1000 aspres was a *khân*, and was conferred on a prince or on a high dignitary as long as he held his post; for each 5000 aspres of revenue one armed warrior had to be furnished in war. Fiefs with a revenue of from 20,000 to 100,000 aspres were called *ziyâmet* and were conferred on similar terms on inferior officers, usually for life or during good behaviour. Fiefs with a revenue of from 3000 to 20,000 aspres were *timars*, furnishing one armed warrior for every 3000 aspres' revenue; the grant of a fief was conditional on obligatory residence. The peasants owning the land remained undisturbed in their

proprietaryship, paying to their feudal lord the tithe, as well as the fixed duties on transfer, &c. Abuses in the system first began in the time of Khosrev Pasha, Suleiman's grand vizier.

The governors of the more distant provinces enjoyed a considerable amount of independence, which in the case of the Barbary states was more or less complete; these entered into treaties with foreign powers, and by their piratical outrages frequently caused the Porte considerable embarrassment. The *sherif* of the Hejaz, Abu'l-berekât, made submission to Sultan Selim I. After the subjugation of the Yemen, the absorption of the holy places was also attempted, and in Suleiman's reign judges were appointed thither from Constantinople. But it was found politic to continue the office of the grand *sherif* of Mecca in the sherifian family.

The princes of the Crimea were invested with many of the prerogatives of independence, e.g. that of coining money; the ruler of Transylvania was allowed to retain the royal title, nor were Turkish troops quartered in the country. The Danubian principalities were also ruled by native princes until the Phanariote period (see PHANARIOTES).

On the 17th of February 1568, two years after the accession of Suleiman's son Selim, peace was concluded with Austria on the basis of the former terms, the emperor Maximilian having sent ambassadors to congratulate Selim II.,
1564-1574. the new sultan on his accession. A disastrous attack on Astrakhan, with the object of carrying out Sokolli's plan for uniting the Don and the Volga, first brought the Turks into collision with the Russians. Expeditions against the Yemen and Cyprus were successful, but the loss of Cyprus, accompanied as it was by the barbarous murder of the Venetian commander, Marco Antonio Bragadino, by the seraskier pasha Mustafa's orders, in violation of the terms of the capitulation of Famagusta (August 1571), roused the bitter resentment of the Venetians, previously incensed by Turkish raids on Crete. Already, on the 25th of May, had been concluded the holy league between the pope, Venice and Spain for a new crusade against the infidel, in spite of the efforts of France to prevent the adhesion of the republic. Preparations were hurried on and at the end of September the great allied fleet, under Don John of Austria, sailed into the archipelago. On the 7th of October was fought the naval battle of Lepanto, which broke for ever the tradition of the invincibility of the Turks at sea. The immediate results of the battle were not, however, as decisive as might have been expected. In June 1572 a fresh Ottoman fleet of 250 sail took the sea; and the jealousy of the allies and the incompetence of their commanders made any repetition of their former victory impossible. After a series of indecisive engagements Venice broke from the league and, under the mediation of France, concluded a treaty with the Porte practically on the basis of *uti possidetis* (March 7, 1573). With Spain the war continued, and on the 24th of August 1574 Tunis—which had been taken by Don John of Austria in 1572—was recaptured by the Turks, who from this new base proceeded, under Sinan Pasha and Kilij Ali, to ravage Sicily.¹ In the same year Selim II. died. Known in history as the "Sot," he had allowed his able grand vizier Mahommed Sokolli to rule the country.

The character of Murad III., who succeeded his father Selim II. at the age of twenty-eight, was not calculated to arrest the progress of decay within the Ottoman Empire. He was a weakling, swayed by his favourites in the harem, especially by his Venetian wife Safé; and, though he kept Sokolli in office, he was suspicious of the too powerful vizier, whose wise influence he allowed his minions to undermine. Thus eminent servants of the state such as Mustafa Pasha, Sokolli's nephew—who for twelve years had ruled the sanjak of Budapest with conspicuous enlightenment and success—were deposed or executed to make way for the nominees of the harem. In even weightier matters the opinion of the grand vizier was slighted. Thus it was against his advice that, at the beginning of 1578, advantage was taken of the disorders arising on the death of Shah Tahmasp of Persia to attack

¹ It was ten years before a formal truce was signed with Spain (1584); two hundred years passed before the signature of a definitive treaty of peace and commerce (Sept. 14, 1782).

that country. The war lasted for twelve years, during which Tiflis, Shirvan and Daghestan were taken; finally Shah Abbas established himself on the Persian throne and in 1590 made peace with Turkey, who retained her conquests in Georgia, Azerbāijān and Shirvan. But this short-sighted policy is criticized by Turkish historians, who censure Murad III. for thus weakening the neighbouring Mussulman states such as Persia and Daghestan, thereby facilitating Russia's future expansion at their cost. Sokolli's assassination, on the 11th of October 1578, had meanwhile thrown the country into disorder. There was now no authority left to hold in check the corrupt influences of the harem. The avenues to power were through bribery and yet more unspeakable paths; the fiefs which formed the basis of the feudal array were bestowed on favourites' favourites, or sold to the highest bidder, and the sultan himself shared in the corrupt plunder. At last that final expedient of weak governments, the debasing of the coinage, led to a crisis. In 1589 mutinies of troops took place all over the empire, and in the two following years there were several risings of the Janissaries at Constantinople, the pretext being everywhere that the soldiers were being robbed of their pay. At this juncture a fresh crisis in the relations with Austria arose. The peace concluded in 1568 and thrice renewed (in 1573, 1576 and 1584) had not prevented the continuance of raids and forays, from either side of the frontier, that at times assumed the dimensions of regular campaigns. The climax came in 1593. All through the preceding year Hassan "Tilli," beylerbey of Bosnia, had raided in Croatia, taking border fortresses and driving off the inhabitants into slavery. In June 1593, with an army of 30,000 men, he laid siege to Sissek; the Austrian and Hungarian levies hurried to its relief; and on the 22nd the Turks were routed with immense slaughter on the banks of the Kulpa, Hassan himself, with many other boys and two of the imperial princes, being among the slain. Though not yet formally declared, the "long war" was now in full progress. In August, Sinan Pasha, the grand vizier—now eighty years of age—took command of the troops for the Hungarian War and left Constantinople, dragging with him the Austrian ambassador in chains. The capture of Veszprém and of Raab (1594) and the failure of the archduke Matthias to take Gran seemed to promise another rapid victory of the Ottoman arms; but Sinan was ill-supported from Constantinople, the situation was complicated by the revolt of Wallachia and Moldavia, and the war was destined to last, with varying fortunes, for fourteen years. On the 16th of January 1595 Murad III. died.

In spite of the internal corruption which, under Murad III., heralded the decay of the empire, the prestige of the Ottomans in Europe was maintained during his reign. Even the emperor had to be content to be treated by the sultan as an inferior and tributary prince; while France had to suffer, with no more than an idle protest, the insult of the conversion of Catholic churches at Constantinople into mosques. In spite of frequent causes of friction, good relations were maintained with Venice, through the influence of the sultana, Safië, and the capitulations with the republic of St Mark were renewed in 1589. Those with France were also renewed (July 6, 1581); and capitulations were signed for the first time with the grand duke of Tuscany (1578) and with England (1580).¹ In the following year permanent diplomatic relations were established by England with the Porte by the despatch of William Harebone as ambassador, Queen Elizabeth urging as her special claim to the sultan's friendship their common mission to fight "idolators."

The new sultan, Mahommed III., Murad's son, succeeded to the throne at a moment when the Turkish arms were making reverses in Hungary and the

captured in October 1596, and a three days' battle in the plain of Keresztes (Oct. 23 to 26) ended in the disastrous rout of the allied troops under the archduke Maximilian and Sigismund, prince of Transylvania. But the Turks did not profit much by their victory. The new grand vizier, Cicala, by his severity to the soldiers, mainly Asiatics, who had shown cowardice in the battle, drove thousands to desert; and the sultan, who had himself little stomach for the perils of campaigning, returned to Constantinople, leaving the conduct of the war to his generals. The campaign of 1598 began with the loss of Raab, and continued unfavourable to the Turks, who lost Totis, Veszprém and Pápa, and were hard pressed in Budapest. In October want of supplies and a mutiny of the Janissaries compelled the commander-in-chief to retreat into winter quarters at Belgrade. In 1599 the first peace overtures were made, but came to nothing; and the confused fighting of this and the following year culminated in the capture of Kanizsa by the Turks (September 1600). The attempt of the archduke Ferdinand, at the head of 30,000 men, to retake it a year later was defeated. In August 1602 Székesfehérvár again fell into the hands of the Turks; in November the siege of Buda by the archduke Matthias, who had taken Pest by storm, was raised by the grand vizier Hassan.

Trouble had, however, meanwhile broken out in other parts of the Ottoman dominions. The deserters from Cicala's army, distributed in armed bands throughout Asia Minor, had become centres round which all the elements of discontent gathered, and formed the mainstay of the Jellali sectaries who, at this time, rose in insurrection and ravaged Anatolia. In Constantinople, early in 1603, there was, moreover, a serious rising of the spahis; and, finally, in September Shah Abbas of Persia took advantage of what is known in Turkish history as "the year of insurrections" to declare war and reconquer Tabriz. In the midst of this crisis, on the 22nd of December 1603, Sultan Mahommed III. died, and was succeeded by his elder son, Ahmed I., a boy of fourteen.

Though negotiations for peace were at once begun, it was not till three years after Ahmed's accession that the peace of Sitvatorok, concluded on the 11th of November 1606, at last put an end to the war in Europe. By this treaty the annual tribute payable by Austria was abolished, but an indemnity of 200,000 florins was paid "once for all" by the emperor, who was henceforth to be given his proper imperial title (padishah in Turkish official documents. The peace of Sitvatorok (or Zeideva, as it is also called) marks the close of Turkey's period of conquest. No longer haughtily imposed on the vanquished, as was the case with former treaties, it was submitted to the examination and discussion of both parties before being signed. It freed Austria from the humiliating tribute to which the treaty of 1547 had subjected her, and established relations between the two monarchs on a footing of equality. It was thus the first manifest sign of Turkey's decadence from the glory of Suleiman I.'s reign, when King Ferdinand stooped to call the sultan's vizier his brother. For the remainder of the reign the Persian War was continued fitfully, a treaty of peace, signed in 1611, not being observed.

In 1617 the sultan died, and was succeeded by his brother Mustafa; but the latter being declared incompetent to reign, his brother Osman took his place on the throne.

The war in Persia was terminated by the renewal in 1618 of the treaty of 1611, whereby all the conquests effected by Murad III. and Mahommed III. were given up. Peace, however, left the rebellious

Janissaries leisure to engage in plots against the sultan, and in order to occupy them and to remove them from the capital advantage was taken of the king of Poland having intervened in the affairs of Transylvania and the principalities to declare war against him. Osman marched against Kbotin, but failed to capture it, and his unpopularity with the army was increased by rumours that he designed to collect such troops as were loyal to him, under pretence of going on

pilgrimage to Mecca, in order to destroy the Janissaries and reform the country. They therefore rose and dethroned him, soon afterwards putting him to death. For a few months Mustafa was replaced on the throne; when he abdicated in favour of his nephew Murad IV. Turkey seemed to be at the point of dissolution. Profiting by the mutiny of the army, the Persians invaded Turkey, capturing Bagdad; at Constantinople and in the provinces alike anarchy was everywhere prevalent.

This continued until the new sultan had acquired age and experience; but, nine years after his accession, he successfully crushed the military rebels, and thereafter ruled with a severity amounting to bloodthirsty cruelty. In 1638 he marched in person against the Persians and succeeded in recapturing Bagdad. Peace was made in 1639, leaving the Turco-Persian frontier practically as it now stands. In the next year the sultan died at the age of thirty-one, being succeeded by his brother Ibrahim. In his reign the Cossacks were driven from Azov and the expedition against Crete was begun, the immediate cause being the plunder of a Turkish vessel by Maltese corsairs who took their capture to Crete.

War was therefore declared against Venice, to whom Crete belonged (1644), and continued in the island for twenty-five years. The anarchy and misgovernment of Turkey now reached such a pitch that Ibrahim was dethroned and murdered, and his son Mahommed IV. was proclaimed in his stead. For the first eight years of his reign successive grand viziers were unable to restore order to the country. In 1656 Mahommed Kuprili (*q.v.*) became grand vizier, and by dint of firmness and resolution repaired the falling fortunes of the country. The fleet was restored, and recaptured Lemnos and other islands which had passed into the hands of the Venetians; the revolts caused by Kuprili's severity were put down, and tranquillity was re-established in Transylvania. After five years' tenure of office the grand vizier died and was succeeded by his son, Ahmed Kuprili. In 1663 the disturbances which had broken out again in Transylvania led to war with Austria. Ahmed Kuprili attacked the Austrians, at first with success, but was routed by Montecuculi at the battle of St Gotthard Abbey and eventually consented to the treaty of Vasvár (Aug. 10, 1664), by which a twenty years' truce was agreed upon; Transylvania was evacuated by both parties, but remained tributary to Turkey. The Kuprilis, both father and son, had by their haughty and uncompromising demeanour done much to alienate the old-standing friendship with France, and at the battle of St Gotthard 6000 French, under Coligny, fought on the Austrian side. The result was that the Turks in retaliation deprived the Catholics, always under the protection of France, of some of their privileges in connexion with the holy places, which were now granted to the Orthodox Church. Meanwhile the Cretan campaign continued, and here also France lent her aid to the Venetians; this assistance could not, however, prevent the capture of Candia in 1669; on the 5th of September of that year Morosini, the Venetian commander, signed a treaty of peace with the Turks by which, after twenty-five years' warfare, they were placed in possession of the fortress of Candia, and with it of the effective rule over the whole island, Venice retaining only the fortresses of Suda, Grabusa and Spinalonga, and the islets along the coast.

Dissensions among the Cossacks led to the recognition by Turkey of Doroshenko, the hetman of the Sari Kamish, as ruler of the Ukraine; the Zaporog Cossacks, his antagonists, applied for aid to Russia. However, Michael Wiewnowiecki, king of Poland, considering the Ukraine as under his protection, sought to intervene, with the result that Turkey declared war against him (1672). The Turks captured Kamenets, Lemberg and Lublin. Hereupon the Poles sued for peace, and a treaty was signed at Buczacs (Oct. 18, 1672) whereby Podolia was ceded to Turkey, the Ukraine was left to the Cossacks, and Poland agreed to pay to Turkey an annual tribute of 22,000

sequina. But John Sobieski, who succeeded shortly afterwards to the throne of Poland, refused to abide by the terms of this treaty; the war was renewed and continued for four years, when the treaty of Buczacs was reaffirmed at Zuravno by both parties, the tribute clause alone being abrogated (Oct. 16, 1676). A few days later Ahmed Kuprili died.

Doroshenko now deserted the Turkish alliance for the Russian; in consequence an expedition was sent into the Ukraine which was both costly and useless. In 1678 the Turks succeeded in taking Cehrin, but their losses were very heavy, and on the 8th of January 1681 a treaty was signed at Radaza whereby the territory in dispute was ceded to Russia. A revolt of the Hungarian Protestants, in consequence of the persecuting policy of the house of Habsburg, now led to a renewal of the war between Turkey and Austria, due in part to the overweening ambition of Kuprili's successor, Kara Mustafa, who desired to immortalize his tenure of office by some great exploit, and who cherished dreams of founding for himself a western Moslem Empire. The war is blamed by Turkish historians as unjustifiable and untimely, the country needing reform. A vast Turkish army marched to the walls of Vienna and closely beleaguered the imperial city, from which the emperor and his court fled. All hope seemed lost, when by a brilliant feat of arms John Sobieski, king of Poland, drove away the besiegers in hopeless confusion and saved the cause of Christianity, 1683. This was the signal for a general coalition against Turkey; Venice, Poland and the pope allied themselves with the Austrians; Russia, Tuscany and Malta joined in the attack. Turkey now sought for a rapprochement with France, and endeavoured to bring about her intervention in return for concessions as regards the holy places. But the French had just before bombarded Algiers and Tripoli, even menacing Chios (Scio), where some pirates had put in with French captives; and the mediation of France was not very actively exercised. One after another the Hungarian forts were captured by the Austrians; the Venetians were equally successful in Greece and the Morea; the Russians pressed on the Crimea, and Sobieski besieged Kamenets. The troops now mutinied and deposed the sultan, placing his brother Suleiman on the throne. But the disorder in the army and the administration continued, and the advance of the Austrians and the Venetians met with little opposition. In this emergency Mustafa Kuprili (*q.v.*) was appointed grand vizier (1689).

His prudent measures at once re-established some degree of order in the army and the fleet, while he sought by a wise tolerance to improve the position and conciliate the sympathies of the non-Moslem subject races. At first eminently successful, he drove the Austrians across the Danube, recapturing Nish, Vidin, Semendria and Belgrade; repulses were also inflicted on the Venetians and the Russians. In the course of the campaign the sultan died, being succeeded by his brother Ahmed. The successes of the Turks were not maintained, the Austrians inflicting on them a crushing defeat at Siankamen, where Mustafa Kuprili was killed, and driving them from Hungary. After four years of disaster Ahmed died; he was succeeded by his nephew Mustafa. The tide of success now turned again in favour of the Turks, who recaptured Karansebes and Lippa, and at Lugos exterminated by the weight of overwhelming numbers an Austrian force under Field-marshal Count Friedrich von Veterani (1630-1695), the hero of many victories over the Turks, who was killed in the battle. Elsewhere, too, the Ottoman arms were victorious; in February the Venetians suffered a double defeat in the roadstead of Chios, and the island fell into the hands of the Turks. But Prince Eugene's genius restored the Austrian fortunes, and the Turks were utterly routed at Zenta on the Theiss, losing more than 15,000 men (1697).

Russia, driven from Azov in 1695, succeeded in capturing it in the following year; Venice continued to press the Turks; in this condition of affairs Hussein Kuprili (*q.v.*) was called to office; England and Holland urged Turkey to

make peace, and after long negotiations a series of treaties were concluded in January 1699 at Karlowitz, that with Poland being signed on the 16th and those with Austria and Venice on the 26th. The main provisions of these were, that Turkey retained the Banat, while Austria kept Transylvania; Poland restored the places captured in Moldavia, but retained Kamenets, Podolia and the Ukraine; Venice restored her conquests north of Corinth, but kept those in the Morea and Dalmatia. On the 4th, Russia concluded a two years' armistice, but remained in possession of Azov, which was formally ceded to her by the definitive treaty of peace signed at Constantinople on the 13th of June 1700. The peace of Karlowitz marks the definitive termination of Turkey's power of offence in Europe. Apart from the heavy losses which it imposed on her, it constitutes a fresh departure in her history, as putting an end to her splendid isolation and rendering her dependent on the changes of European politics. It is noteworthy also as being the first occasion on which representatives of the mediating powers took part in the peace negotiations. The grand vizier's efforts to take advantage of the peace to introduce order in the country were unavailing; he was driven from office, and disorders ensued which led to the sultan's abdication.

The troubles were not ended by the accession of Ahmed III., and many high dignitaries of state were sacrificed to the lawlessness and insubordination of the Janissaries. *Ahmed III., 1703-1730.* Meanwhile Turkey found herself again involved with Russia. After the defeat of Charles XII. of Sweden at Poltava, this monarch took refuge in Turkey, and was allowed to reside at Bender. The Russians pursued him into Turkish territory; which led to a Turkish declaration of war (1710). The Turks succeeded in surrounding Peter the Great near the Pruth, and his army was menaced with total destruction, when the Turkish commander, the grand vizier Baltaji Mahommed Pasha, was induced by the presents and entreaties of the empress Catherine to sign the preliminary treaty of the Pruth (July 21, 1711), granting terms of peace far more favourable than were justified by the situation of the Russians. These were: the cession to Turkey of Azov with all its guns and munitions, the razing of all the forts recently built on the frontier by Russia, the renunciation by the tsar of all claim to interfere with the Tatars under the dominion of the Crimea or Poland, or to maintain a representative at Constantinople, and Russia's consent to Charles's return to Sweden.¹ It was long, however, before the latter relieved Turkey of his presence. During the campaign Peter had entered into alliance with the hospodars of Moldavia and Wallachia, respectively Demetrius Cantemir and Constantine Brancovano, from whom he had received material assistance. These were naturally dismissed after the defeat of the Russians; the former made good his escape to Russia, the latter was executed. The sultan determined henceforth to appoint Greeks to the principalities as more likely to be subservient to his will than the natives hitherto appointed. This system was continued until the Greek insurrection of 1821.

Russia having thus lost all the advantage gained by the peace of Karlowitz, Venice was next taken in hand, she having invaded the Bosnian frontier and incited the Montenegrins to revolt, besides capturing Turkish ships in the Mediterranean. These acts were held to be infractions of the treaty, and war was declared (1715). The result was the stamping out of the insurrection in Montenegro and the capture of the whole of the Morea. The fleet also took Tinos and Cerigo, as well as the three forts still remaining to the Venetians in Crete. Turkey's action, and the preparations being made for the siege of Corfu, now brought about the intervention of Austria. Charles VI., weary of the war for the Spanish succession, had shortly before concluded the peace of Rastadt (1715) and was anxious that Venice should not be too hardly pressed. He therefore urged Turkey to give up to Venice certain places in Dalmatia as a

compensation for the loss of the Morea. The Porte was at first disposed to comply, but the party of resistance finally prevailed. War was declared against Austria (1716); the fleet sailed for Corfu and the army crossed the Save from Belgrade to Semlin. Near Peterwardein a great battle was fought, in which the Austrians completely routed the Turks; pursuing their advantage they took Temesvár and overran the Banat; in 1717 they captured Belgrade, the Turks retreating to Adrianople. England and Holland now urged their mediation, and after negotiations the treaty of Passarowitz (Pozharcevs in Servia) was signed (July 21, 1718); Venice ceded the Morea to Turkey but kept the strongholds she had occupied in Albania and Dalmatia; Belgrade, Temesvár and Wallachia as far as the Olt were retained by Austria.

Meanwhile relations with Russia continued strained. The peace of 1712 had been concluded only for a term of years, and the neglect of the tsar to carry out its provisions had all but led to a fresh outbreak of hostilities when the intervention of the other powers led in 1713 to the renewal of the treaty; and in November 1720 it was superseded by a treaty of "perpetual peace," signed at Constantinople. But, though the questions at issue between Russia and Turkey in Poland and the northern littoral of the Black Sea were thus for the time settled, the aggressive designs of Russia in the Caucasus and in Persia soon caused a renewal of anxiety at Constantinople. Again war all but broke out; but, through the intervention of France, a treaty of partition was signed at Constantinople on the 23rd of June 1724, whereby the shores of the Caspian from the junction of the Kur and the Arras (Araxes) northwards should belong to Russia, while the western provinces of Persia should fall to the share of Turkey. These provinces had not yet been conquered by Turkey; and, when a part of them had been taken, a treaty was concluded with the Afghan Ashraf Shah, who had risen to supreme power in Persia, by which Turkey should retain them on condition of recognizing him as shah (Oct. 23, 1727). But Nadir Kuli Khan came forward as the champion of Shah Tahmasp II., the rightful ruler, and drove the Turks from these provinces, capturing Tabriz. This news caused consternation at Constantinople; the inevitable revolt of the Janissaries followed, headed this time by one Patrona Khalil, and the sultan was forced to abdicate in favour of his nephew Mahmud. With difficulty the rebellion was suppressed; in 1733 the war with Persia was resumed, and after three years of fighting Nadir succeeded in 1736 in inducing Turkey to recognize him as shah of Persia and to restore the territory captured since the reign of Murad IV.

Russia's designs on Poland now brought about war. On the death of Augustus II., king of Poland (1733), France had put forward as candidate Stanislaus Leszczyński, *War of Polish Succession.* Louis XV.'s father-in-law. Austria and Russia supported Augustus III., elector of Saxony, and the empress Anne marched an army into Poland and compelled the election of her candidate, though Russia had bound herself by the treaty of 1711 and again by that of 1720 to abstain from all interference with Poland. France thereupon declared war against Russia and her ally Austria, and her envoy, the marquis de Villeneuve, urged Turkey to join by representing the danger of allowing Russian influence to extend. Turkey had cause of complaint against Russia for refusing to allow the Crimean troops to march through Daghestan during the Persian campaign, and on the 28th of May 1736, war was declared, in spite of the efforts of England and Holland. The Russians had not waited for the formal declaration of war; and on the very day that this was notified by the hanging out of the horse-tails before the Seraglio at Constantinople a Russian army under Marshal Münnich stormed the ancient wall that guarded the isthmus of the Crimea. While Münnich conducted a systematic devastation of the peninsula, forces were detached under his lieutenants Leontiev and Lascy to attack Kinburn (Kiuburun) and Azov. Both these places fell; and in July of the following year Münnich captured Ochakov.

¹ The definitive treaty was signed at Constantinople on the 16th of April 1712 (renewed June 5, 1713).

Meanwhile the western sea-powers had made earnest efforts to restore peace, and in August 1737 the plenipotentiaries of the combatant powers met at Niemirow to arrange terms under their mediation. But Austria, which had made a great show of seconding their efforts, now began to unmask her real aims, which were to take advantage of Turkey's embarrassments to push her own claims in the principalities and the Balkan Peninsula. To the refusal of the sultan's representatives to concede any of her demands, Austria replied by revealing the existence of an alliance with Russia, which she threatened to make actively offensive if her terms were refused. In November the conferences broke up; in the spring of the following year Austrian divisions advanced simultaneously into Bosnia, Servia and Walachia; and in July the main army, under the prince of Lorraine, crossed the frontier and captured Nish. In spite of this initial success, however, the campaign proved disastrous to the Austrians; and France, which had meanwhile come to terms with the emperor, endeavoured to mediate a peace in conjunction with Sweden and Holland. But the Ottomans, though the negotiations continued throughout 1738, were in no hurry to come to terms; for the tide of war had turned against both Austrians and Russians; Ochakov and Kinburn, were recaptured; and the victorious Turks crossed the Danube and penetrated far into the Banat. Not till the middle of 1739 would they consent to negotiate seriously for peace. The conferences were opened at the close of July in the camp of the grand vizier, who was pressing Belgrade hard and demanded the surrender of the city as a *sine qua non*. This was conceded; on the 1st of September, under the mediation of the French ambassador Villeneuve, the preliminaries were signed; and on the 4th the grand vizier made his formal entrance into the city, where on the 18th the definitive treaties with Austria and Russia were signed. By the former Austria gave up Belgrade and the places on the right bank of the Save and the Danube which she had gained by the treaty of Passarowitz, together with the Austrian portions of Walachia. The treaty with Russia provided that Azov should be razed and its territory devastated to form a barrier, Russia having the right to erect a new fortress at Cherkask, an island in the Don, near Azov, and Turkey to build one on the border of Kuban near Azov. But Taganrog was not to be refortified, and Russia was to have no war-ships on the sea of Azov or the Black Sea. The Kabardias, great and little, were to remain independent, to serve as a barrier between the two empires. By the 12th article the Ottoman government agreed "amicably to discuss" the question of recognizing the tsar's claim to the imperial title, and by the 13th admitted his right to send to Constantinople representatives of whatever rank he might judge fitting (Noradounghian, *Recueil*, i. 258).

Scarcely two years after the signature of the treaty of Belgrade sinister rumours reached Constantinople from Persia, where Nadir Shah, on his return from India, was planning an attack on Mesopotamia. The war, which broke out in 1743, was waged with varying fortunes, and the peace by which it was concluded on the 5th of September 1746, beyond stipulating for a few privileges for Persian pilgrims to the holy places, altered nothing in the settlement arranged ten years before with Murad IV. In the war of the Austrian Succession, which followed the accession of Maria Theresa to the Habsburg throne, Turkey, in spite of the urgency of France, would take no share; and she maintained the same attitude in the disorders in Persia following the death of Nadir Shah.

In 1754 the Sultan Mahmud died. He was succeeded by his brother Osman, whose three years' reign was marked by no political event of special importance. Osman III. was succeeded by his cousin Mustafa. At the outset of his reign negotiations were actively pursued for the conclusion of a treaty with Prussia, to counteract the alliance between France and Austria contracted in 1756; and these resulted in the signature of Capitulations, or a treaty of friendship and commerce (March 22, 1761). The attitude

of the northern powers, however, and especially of Russia, towards Poland was beginning to excite the sultan's liveliest suspicions; and these the accession, in 1762, of the masterful Catherine II. to the Russian throne was not calculated to allay. In 1763, Catherine took advantage of the death of Augustus III. of Poland to force her favourite, Stanislaus Poniatowski, on to the vacant throne. From the committee of patriots at Warsaw complaints and warnings were carried to Constantinople; and the cession of Podolia was offered as the price of a Turkish attack on Russia. The sultan, though inclined to take up the cause of the Polish dissidents, was slow to move, and contented himself for a while with protests and threats. But the aggressive policy of Russia in the direction of the Caspian and Black Seas became more and more evident; complaints reached the Porte of a violation of the neutrality of Kabardia, of a seditious propaganda in Moldavia by Russian monks, and of Russian aid given to the malcontents in Servia and Montenegro. Added to all this was the news of the continual Russian military aggressions in Poland, against which the Catholic confederation of Bar continued to appeal for aid. At last, on the 6th of October 1768, on the refusal of the Russian minister to give guarantees for the withdrawal of the Russian troops from Poland and the abandonment of Russia's claim to interfere with the liberties of the republic, war was declared and the Russian representative was imprisoned in the Seven Towers.

The war that followed marks an epoch in the decay of the Ottoman Empire and in the expansion of Russia. When, in the spring of 1769, the first serious campaign was opened by a simultaneous attack by three Russian armies on the principalities, the Crimea and the buffer state of Kabardia, the Turks, in spite of ample warning, were unprepared. They were hampered, moreover, by an insurrection in the Morea, where a Russian expedition under Orlov had stirred up the Mainotes, and by risings in Syria and Egypt. It was not, however, till September that the fall of Khotin in Bessarabia marked the first serious Russian success. The following year was more fatal. In May the Ottoman fleet was attacked and destroyed off Cheshme, and the Russian war-ships threatened to pass the Dardanelles. In June Romanzov's victory at Kartal made him master of the principalities, and by November the fortresses of Izmail and Kilia, guarding the passage of the Danube, and those of Akkerman and Bender on the Dniester had fallen into the hands of the Russians. The campaign of 1771, which opened with a gleam of success in the capture of Giurgevo, proved yet more disastrous to the Turks, the Russians passing the Danube and completing the conquest of the Crimea. Prussia and Austria now offered their mediation; and in June conferences were opened at Focshani, which led to no result. In the following year a conference, from which the Austrian and Prussian representatives were excluded, was opened at Bucharest (November 1772). In February 1773 the Russian plenipotentiary delivered his ultimatum, of which the most important demands were the cession of Kerch, Yenikale and Kinburn, the free navigation of the Black Sea and Archipelago for Russian trading and war vessels, and the recognition of the tsar's right to protect the Orthodox subjects of the sultan. These conditions were submitted to Constantinople, and rejected after a stormy debate in the divan. The conference of Bucharest now broke up, and the war continued. The successful defence of Varna and Silistria seemed to justify the stubbornness of the Porte.

On the 24th of December 1773 Mustafa III. died, and was succeeded by his brother Abd-ul-Hamid I., a weakling, from whose character nothing could be expected to retrieve the now desperate fortunes of the war. The exhaustion of the treasury was evidenced by the absence of the usual donative to the troops; and the demoralization in both army and court made further resistance useless. At the beginning of July the Russians, under Kamensky, were before Shumla; and a few days later the grand vizier and his army, their communications with the

capital severed, were surrounded in the fortress. Negotiations for peace were now opened and on the 21st of July—chosen by the Russian plenipotentiary as the anniversary of the humiliating convention of the Pruth—the treaty of Kuchuk Kainarji was signed. Its terms were the most onerous as yet imposed on the Ottoman sultans. The Tatars from the frontier of Poland to the shores of the Caspian, including those of the Crimea and Kuban, were declared independent under their own khan of the race of Jenghiz, saving only the religious rights of the sultan as caliph of Islam. Russia, however, retained the fortresses of Kerch, Yenikale and Kinburn, and the desert country between the Bug and the Dnieper, while Ochakov was left to the Turks. Bessarabia, with the fortresses of Akkerman, Izmail and Kilia, was restored to Turkey. Moldavia and Walachia were likewise restored, but under conditions which practically raised them to the position of semi-independent principalities under Russian protection (art. xvi.). Azov and its district were annexed to Russia, and the two Kabardias were transferred subject to the consent of the khan of the Crimea. Russia undertook to evacuate Mingrelia and Georgia. The recognition of the imperial title (*padishah*) was at last conceded to the Russian tsars.

Commerce and navigation in the Black Sea and the Mediterranean were free to both countries. Turkey was to pay a war indemnity of 15,000 purses, the Russian fleet was to withdraw and the islands captured by it to be restored. By article vii. of the treaty the Sublime Porte undertook "to protect the Christian religion and its churches" and conceded to the ministers of Russia the specific right to "make representations in favour of the new church" which, under article xiv. of the same treaty, the Russian government was empowered to build, in addition to the embassy chapel "in the street named Bey Oglu." This article is of great historical importance as forming the basis of the later claim of Russia to possess by treaty the right to protect the Orthodox subjects of the Porte.¹ Poland, the original cause of the war, was not even mentioned in the treaty, having been partitioned in 1772.

After yielding to these hard conditions, Turkey took advantage of her respite to strengthen the frontier defences and to put down the rebellions in Syria and Egypt; some effort was also expended on the hopeless task of reforming the Janissaries. It was not long before Russia showed that it was not the independence but the absorption of the Crimea which she desired. In 1779 a rupture on this account was only averted through the mediation of the French ambassador, coupled with the fact that Turkey was in no condition to enter upon hostilities, owing to the outbreak of plague in her army. The Porte, unable to resist, was obliged to consent to the convention of Ainali Kavak (March 10, 1779) whereby the Russian partisan, Shahin Girai, was recognized as khan of the Crimea, the admission of Russian vessels to navigate Turkish waters was reaffirmed and Russia's right of intervention in the affairs of the Danubian principalities was formally recognized. Five years later Potemkin induced the chiefs of the Crimea and Kuban to hold a meeting at which the annexation of their country to Russia was declared, Turkey giving her consent by a convention, signed at Constantinople, on the 8th of January 1784, by which the stipulations as to the liberty of the Tatars contained in the treaty of Kuchuk Kainarji and the convention of Ainali Kavak were abrogated. In 1786 Catherine made a triumphal progress through the Crimea in company with her ally, Joseph II., who had succeeded to the imperial throne on the death of his mother. These events and the friction caused by mutual complaints of infringements of the treaty stirred up public opinion in Turkey, and the British ambassador lent his support to the war party. In 1788 war was declared, but Turkey's preparations were inadequate and the moment was ill-chosen, now that Russia and Austria were in alliance, a fact of which Turkey became aware only when the hos-

tails were planted for the campaign. The Turks drove back the Austrians from Mehadia and overran the Banat (1789); but in Moldavia Romanov was successful and captured Jassy and Khotin. After a long siege Ochakov fell to Potemkin, and all its inhabitants were massacred. This news affected the sultan so deeply as to cause his death.

Selim, the late sultan's nephew, who succeeded, made strenuous preparations for continuing the war, but his generals were incompetent and his army mutinous; expeditions for the relief of Bender and Akkerman failed, Belgrade was taken by the Austrians, Izmail was captured by Suvorov, and the fall of Anapa completed the series of Turkey's disasters. Sultan Selim was anxious to restore his country's prestige by a victory before making peace, but the condition of his troops rendered this hope unavailing; while Prussia, though on the 31st of January 1790 she had signed an offensive treaty with Turkey,² gave her no help during the war. Accordingly a treaty was signed with Russia at Jassy (Jan. 9, 1792) by which the Crimea and Ochakov were left to Russia, the Dniester was made the frontier in Europe, and the Asiatic frontier remained unchanged. Joseph II. had died, and his successor, Leopold II., was averse from the Russian alliance. Through the mediation of England, Holland and Prussia, Turkey and Austria concluded on the 4th of August 1791 the treaty of Sistova, by which Belgrade and the other conquests made by Austria were restored.

The conclusion of peace was welcomed by Selim as the opportunity for carrying out reforms, of which he thoroughly realized the necessity in every branch of the administration, and especially in the army, to whose defects the disasters of the state were due. Accordingly it was decided to form troops known as *nisam-i-jedid*, affiliated to the Janissaries so as to disarm the jealousy of the latter, properly drilled and wearing a distinctive uniform. The fleet was reorganized, military schools were established, and skilled instructors were obtained from Europe. These reforms excited much opposition, which was at first unheeded. Meanwhile Turkey came into conflict with France. Throughout all the vicissitudes of the Revolution the relations between the two states had remained unimpaired,³ and Turkey had been one of the first countries to recognize the republic. Bonaparte's sudden occupation of Egypt (1798) came therefore as a complete surprise. This expedition was in reality directed against English rule in India. Nelson's destruction of the French fleet at the battle of the Nile disconcerted Bonaparte's plans; he hoped to pursue his designs through Syria, and laid siege to Acre, which, however, successfully held out. Turkey now joined Great Britain and Russia against France.⁴ The Russian and Turkish fleets attacked and took the Ionian Islands, which had become French by the treaty of Campo Formio, and certain towns, hitherto unconquered, on the Albanian coast. An expeditionary force was also sent against Bonaparte, now practically blockaded in Egypt. This was routed and driven into the sea at Abukir (July 15, 1799). For the subsequent operations in Egypt, which ended in its evacuation by the French after the British victory at Alexandria, see *EGYPT: History*.

Meanwhile in Turkey disorder prevailed in almost every province of the empire, and the local governors in many places became entirely independent, oppressing the people under their rule and often driving them to revolt. This was notably the case in Servia, where the temporary domination of Austria, to which the treaty of Sistova (1791) put an end, had had the effect of awakening the national spirit of the people. But no armed manifestation of revolt had taken place until the lawless and savage conduct of the Janissaries, who had made themselves masters of the country, assisted by the notorious governor of Vidin, Pasvan Oglu,

The War with France.

Service Ruling.

and his band of outlaws, drove the peaceful rayas to rebel. The insurgents chose as their captain one George Petrovich, nicknamed Kara Georgi (i.e. Black George), and under his able leadership succeeded in capturing Belgrade and in breaking the power of the Janissaries. The Porte also sent an army against Pasvan Oglu, but after reducing him to submission reinstated him in his government. A serious outbreak took place at Adrianople in 1804, where 20,000 of the new troops had been sent, ostensibly to put down the revolt in Serbia, but really to try to bring about the reform of the European provinces. So strong was the opposition that the troops were recalled, and the anti-reform party was greatly strengthened. The Wahhâbi movement in Nejd now began to assume serious proportions. These religious sectaries attacked and plundered all Mussulmans not conforming to their peculiar tenets; they overran Kerbela and the Hejaz, sacking the holy cities and closing the pilgrim routes. Only in the reign of Mahmud II. were they put down (see WAHHABIS).

In 1802, by a treaty of peace signed at Paris on the 25th of June, France resumed her former terms of friendship with Turkey. Russia, desirous of deriving some return for the support which she had given the sultan during his rupture with the French, induced the Porte to address to her a note in which the right of intervention in the affairs of the principalities, conferred on her by the treaty of Kainarji and reaffirmed in the convention of Ainali Kavak, was converted into a specific stipulation that the hospodars should be appointed in future for seven years and should not be dismissed without the concurrence of the Russian ambassador at Constantinople. In pursuance of this agreement Constantine Ypsilanti was appointed to Wallachia and Alexander Muruzi to Moldavia—both devoted to Russian interests. Their intrigues in favour of the Greek and other revolutionary movements induced the Porte to dismiss them in 1806, contrary to the arrangement of 1802. Russia and England hereupon used threatening language, and Turkey replaced the hospodars. But war was nevertheless declared on the 27th of December 1806, and Russia occupied the principalities. The British ambassador sought by every means in his power to induce Turkey to give way to Russia, going so far as to guarantee the withdrawal of the Russian troops from Moldo-Walachia if the Porte remained at peace, and threatening that if Turkey persisted in her opposition England would join with Russia against her. But France's influence, backed by the strong personality of her ambassador, General Sebastiani, was sufficient to enable the sultan to withstand these arguments, and the British ambassador broke off relations and withdrew to the fleet at Tenedos (February 1807). Helped by a strong south wind, the British war-ships passed up the straits and anchored off the Seven Towers. An ultimatum was presented ordering Turkey within twenty-four hours to dismiss the French ambassador, hand over the Turkish fleet, and make peace with Russia. With Sebastiani's encouragement the Porte resisted these demands; in one day a thousand guns were ranged along both sides of the Bosphorus; and after a stay of ten days the British fleet was ordered to leave, and was considerably damaged by the fire of the forts while passing down.

Meanwhile the sultan's whole efforts were directed towards the reform of the country; the newly-instituted militia was in every respect a success; it grew in numbers, and hopes were entertained that it would gain popularity. But the Janissaries and the corrupt officials were fundamentally opposed to the scheme, and the conservatives joined with them against such reforms of European origin. The rulers of the provinces shared these views; the consequence was disquiet and confusion throughout the empire. At this difficult moment the army was obliged to march to the Danube, leaving the government in the hands of men hostile to reform. In 1807 the garrisons of the Black Sea forts at the entrance of the straits rose in rebellion, headed by one Kabakji Mustafa, and killed their officers. The sultan sought to appease them by pacific means, but the movement

spread to the Janissaries, who insisted upon the abolition of the new troops. But even this concession did not satisfy them; they dethroned Selim and proclaimed his nephew Mustafa. The new sultan was obliged to abolish all the reforms, and during practically the whole of his ^{Mustafa IV., 1807-1809.} fourteen months' reign the Janissaries were in rebellion, even while facing the Russians. All officers who were partisans of the reforms were obliged to take refuge in flight; and Turkey's position would have been desperate but for the conclusion of the peace of Tilsit (July 7, 1807) between Russia and France, to which Turkey also became a party. The army hereupon retired to Adrianople, and the powerful pasha of Rustchuk, Mustafa Bafkradar, who had distinguished himself by his resistance to the Russians, and who thoroughly shared Selim's desire for reform, was now induced by the many officers who held similar views to march on Constantinople to restore Selim to the throne. But he arrived too late; Selim had already been killed; the unworthy Mustafa was put to death, and Mahmud, the sole survivor of the house of Osman, became sultan. Mustafa Bafkradar, who ^{Mahmud II., 1809-1839.} was now raised to the dignity of grand vizier, succeeded in inspiring the Janissaries with a wholesome respect, due to their dread of the 10,000 irregulars known as *kirjalis* by whom he was accompanied. The remnants of the abolished new troops were collected and formed into regiments affiliated to the Janissaries under the name of *seymen-i-jedid*; the dignitaries of state were called upon to take an oath of fidelity and loyalty. The feast of Ramazan hereupon occurring, the grand vizier unwisely allowed his own troops to disperse. Taking advantage of this opportunity, the Janissaries rose by night and besieged the house of the grand vizier, who eventually blew himself up in the arsenal. Fighting became general and extended to the fleet, which bombarded the capital. The Janissaries slaughtered all the "new troops" whom they met, and finally extorted an amnesty from the terrified government.

After the peace of Tilsit an armistice had been agreed upon with Russia (Aug. 24, 1807). Turkey was at this time the only neutral state in Europe; it was of vital importance that she should not be absorbed into the ^{Treaty of Bucharest, 1812.} Napoleonic system, as in that case Russia would have been exposed to a simultaneous attack from France, Austria, Turkey and Persia. Accordingly, though France made every attempt to induce Turkey to adopt her side, the young Stratford Canning succeeded in causing the resumption of the peace negotiations at Bucharest, broken off through Russia's terms being considered too onerous, and followed by the capture of Izmail and Bender. The British diplomatist secured his first triumph in the signature of the treaty of Bucharest (May 28, 1812) whereby Khotim, Bender, Kilia and Akkerman were left to Russia; the frontier was fixed at the Pruth; the Asiatic boundary was slightly modified. The treaties as to the principalities were renewed; and though Serbia was restored to the direct rule of Turkey it was stipulated that clemency was to be observed in the Porte's dealings with the country, which was given the power of regulating its own affairs.

The vagueness of these latter provisions at once gave rise to disputes, and in 1813 the Turkish troops occupied the country. The new pasha of Belgrade appointed one Milosh Obrenovich headman of his own district, but a few years later Milosh raised a successful revolt, drove out the Turks, and re-established Servian semi-independence. Karageorge, who had fled to Austria in 1812, was induced to return, but Milosh caused him to be murdered, and in 1817 was by a popular vote named hereditary prince of Servia.

The affairs of Servia, however, were not the only question left unsettled by the treaty of Bucharest. In the course of the war with Persia Russia had received permission from the Ottoman government to use, for a limited time, the easy road from the Black Sea to Tiflis by way of the valley of the Rion (Phasis) for the transport of troops and supplies, and this permission had been several times renewed. Wishing to make

this important privilege permanent, Russia by secret articles of the Treaty of Bucharest had secured the cession of this district, in return for an undertaking to destroy the forts of Kilia and Izmail on the Danube. But the sultan refused to ratify these articles, and the relations between Russia and Turkey were therefore determined by the patent treaty only, which positively stipulated for the evacuation by the Russians of every spot occupied by them on Turkish soil in Asia. When the Russians showed no signs of withdrawing from the valley of the Rion, the sultan threatened to renew the war, the sole result of which was to reveal the determination of the tsar not to be bullied into concessions. The dispute, at first of little importance, developed in seriousness during the next year or two, owing to the avowed intention of Russia, which by conquest or treaties with independent chiefs had acquired all the high land between the Caspian and the Black Sea, to take possession of the low lands along the coast, between Anapa and Poti, of which the sultan claimed the sovereignty.

Such was the situation when the question of a European guarantee of Turkey was raised at the Congress of Vienna.

In view of the multiple dangers to which the Ottoman Empire was exposed, both from without and from within, and of the serious consequences to the world's peace which would result from its break-up, there was a strong feeling among the powers in favour of such a guarantee, and even the emperor Alexander was willing to agree to it in principle. But nothing could be done until the Porte should have come to terms with Russia as to the Treaty of Bucharest; for, as the British ambassador, Sir Robert Liston, was instructed to point out to the Ottoman government, "it is impossible to guarantee the possession of a territory of which the limits are not determined." With the consent of the tsar, it was proposed to submit the questions at issue to the decision of Great Britain, France and Austria; and the Porte was informed that, in the event of its accepting this arrangement, the powers would at once proceed to guarantee the integrity of the Ottoman Empire. But the sultan could not bend his pride to suffer foreign intervention in a matter that touched his honour, and the return of Napoleon from Elba threw the Eastern Question into the background. The Ottoman Empire thus remained outside the European concert; Russia maintained her claim to a special right of isolated intervention in its affairs; and the renewal of war between Russia and Turkey was only postponed by the preoccupation of Alexander with his dream of the "Confederation of Europe."

Meanwhile, within the Ottoman Empire there was every sign of a rapidly approaching disintegration. In Egypt Mehemet

Ali had succeeded in establishing himself as quasi-independent ruler of the country. By his action during Napoleon Bonaparte's invasion, and later when the British fleet after leaving Constantinople in 1807 proceeded to Egypt, he had to some extent acquired the goodwill of the Turkish government. In 1811 he was called upon by the Porte to put down the Wahhâbi insurgents (see ARABIA, vol. ii. p. 268), his success in this matter, and especially in the recovery of the holy cities, adding greatly to his prestige.

Sultan Mahmud now devoted himself to breaking the overgrown power of the local governors, which had for many years practically annihilated that of the central authority. Their extortions impoverished the whole country, yet the abolition of the system might perhaps have been carried out more gradually and with greater precaution, and Turkey more than once felt the want of their aid, questionable as its value often was. Thus

Ali (q.v.), Pasha of Iannina, the most famous of these, though insubordinate and inclined to intrigue with foreign powers in the hope of making himself independent, had used his influence to keep the Greeks quiet, and it was only after his power had been broken in 1821 that the agitation of the *Heteria* issued in widespread dangerous revolt. The first hope of emancipation from the Turkish yoke had been founded by the Greeks on Peter the Great, who had planned the expulsion of the Turks from the Balkans and had

caused the inscription "Petrus I., Kusso-Graecorum Monarcha" to be placed beneath his portrait engraved at Amsterdam. Catherine II. following in his footsteps, aspired to found a Greek empire, the throne of which was to be occupied by her nephew, Constantine, specially so baptized, and brought up by Greek nurses (see CONSTANTINE PAVLOVICH). During the war of 1770 the Greeks had risen in an abortive rebellion, promptly crushed by the Turks. But the idea of liberation continued to grow, and about 1780 the Society of Friends (*Εταιρία των Φιλανθῶν*) was founded at Bucharest by the fervent patriot and poet, Constantinos Rhigas (q.v.). The secret organization, temporarily checked by Rhigas's arrest and execution in 1798, was revived at Odessa in 1814; it extended throughout Turkey, and in 1820 the insurrection took shape, a favourable opportunity being afforded by the outbreak of hostilities between Ali Pasha and the Porte. (See GREEK INDEPENDENCE, WAR OF.)

On the 6th of March 1821 Prince Alexander Ypsilanti, son of the hospodar Constantine, and a general in the Russian service, crossed the Pruth, proclaiming the revolt of the Greeks against the sultan and the intention to restore the Greek Empire of the East. But in the principalities, where the Vlach peasants regarded the Phanariots as worse oppressors than the Turks, the movement had little chance of success; it was doomed from the moment that the emperor Alexander disavowed Ypsilanti's claim to his support (see ALEXANDER I.). After some initial successes the Greeks were finally routed at the battle of Dragashani (June 19, 1821). It was far otherwise with the insurrection which broke out at the beginning of April in the Morea. The Mussulman population of the Morea, taken unawares, was practically exterminated during the fury of the first few days; and, most fatal of all, the defection of the Greeks of the islands crippled the Ottoman navy by depriving it of its only effective sailors. The barbarous reprisals into which Sultan Mahmud allowed himself to be carried away only accentuated the difficulty of the situation. The execution of the patriarch Gregorios, as technically responsible for the revolt, was an outrage to all Christendom; and it led at once to a breach of diplomatic relations with Russia.

To prevent this breach developing into war was now the chief study of the chanceries. Public opinion throughout Europe was violently excited in favour of the Greeks; and this Philhellenic sentiment was shared even by some of the statesmen who most strenuously deprecated any interference in their favour. For at the outset Metternich was not alone in maintaining that the war should be allowed to burn itself out "beyond the pale of civilization." The mutual slaughter of barbarians in the Levant seemed, even to George Canning, a lesser evil than a renewed Armageddon in Europe; and all the resources of diplomacy were set in motion to heal the rupture between Turkey and Russia. In spite of the emperor Alexander's engagements to the Grand Alliance and the ideal of European peace, this was no easy matter; for the murder of the patriarch was hut the culmination of a whole series of grievances accumulated since the Treaty of Bucharest. Moreover, the Porte was thrown into a suspicious mood by the contrast between the friendly language of the western powers and the active sympathy of the western peoples for the Greeks, who were supported by volunteers and money drawn from all Europe. But, though the sultan remained stubborn, the emperor Alexander, who since the Congress of Laibach had been wholly under Metternich's influence, resisted the clamour of his people for war, and dismissed his Greek minister Capo d'Istria (q.v.). The Congress of Verona (1822) passed without any serious developments in the Eastern Question.

The stubborn persistence of the Greeks, however, dashed Metternich's hope that the question would soon settle itself, and produced a state of affairs in the Levant which necessitated some action. In the instructions drawn up, shortly before his death, for his guidance at Verona, Castlereagh had stated the possibility of the necessity for recognizing the Greeks as belligerents if the war continued. The atrocity of the Ottoman

sea-power had left the archipelago at the mercy of the Greek war-brigs; piracy flourished; and it became essential in the interests of the commerce of all nations to make some power responsible for the policing of the narrow seas. On the 25th of March 1823 accordingly, Canning announced the recognition by Great Britain of the belligerent character of the Greeks.

This roused the emperor Alexander to action, since it seemed as though Great Britain was aiming at ousting Russian influence in the Levant. He suggested a joint intervention of the powers; but the conference, which met at St Petersburg in April 1824, came to nothing, since Turkey and the Greeks alike refused to be bound by its decisions, and Canning would not hear of coercion being applied to either. The sole outcome of the conference was the offer in March 1825 of the joint mediation of Austria and Russia, which the Porte rejected.

Meanwhile Mahmud, realizing the impossibility of crushing the Greek revolt unaided, had bent his pride to ask the help of Mehemet Ali, who was to receive as his reward Crete, the Morea and the pashaliks of Syria and Damascus. The Egyptian fleet and disciplined army were now thrown into the scale; and from the moment when Ibrahim Pasha landed at Modon (Feb. 24, 1825), the fate of the Greeks seemed sealed. The Morea was quickly overrun; in April 1826 Missolonghi fell, after a heroic defence; in June 1827 Athens was once more in the hands of the Turks. Crowds of Greek captives were being sent as slaves to Cairo; and, should the powers not intervene, there was every prospect of Greece being depopulated and colonized with Mussulman negroes and fellahin.

At the close of 1825 an isolated intervention of Russia had seemed probable. A great army was assembled in the south of Russia, and the emperor Alexander had gone to place himself at its head when he died (Dec. 22, 1825). It was to prevent such an intervention that Canning seized the opportunity of the accession of Nicholas I. to send the duke of Wellington to St Petersburg in order to concert joint measures. The result was the protocol of St Petersburg of the 4th of April 1826, by which Great Britain was empowered to offer to the Ottoman government a settlement of the Greek question based on the establishment of Greece as a vassal and tributary state. Should the Porte refuse, the two powers were to take the earliest opportunity, either separately or in common, of establishing a reconciliation on the basis of the protocol.

Russia, meanwhile, had seized the occasion to send to Constantinople an ultimatum demanding satisfaction for her own particular grievances; the Porte resented the intrusion of new *Conventions* demands before the others had been dealt with, and hurried on preparations for war. The reform of *Akkerman* of the army, however, involved the destruction of the Janissaries (*g.v.*), and though their massacre on the 15th of June left the sultan free to carry out his views with regard to the army, it left him too weak to resist the Russian demands. On the 7th of October, accordingly, these were conceded by the Convention of Akkerman. Its terms were: the confirmation of the Treaty of Bucharest and the opening of the navigation of the Black Sea to the Russian flag; a stipulation that the hospodars of Walachia and Moldavia should be elected by the boyars for seven years, their election being confirmed by the Porte which, however, had no power to dismiss them without the concurrence of the Russian ambassador at Constantinople; finally, Serbia's autonomy was recognized, and, save in the fortresses, no Mussulman might reside there.

The Greek question was however, not yet settled. Months passed without any action being taken under the protocol of the 4th of April; and Russia suspected Great Britain of merely using the protocol to prevent her own isolated intervention. The situation was however materially altered by the end of August 1826; for the Greeks, driven to desperation, had formally invited the mediation of England, thereby removing Canning's objection to an unasked intervention. He now invited the co-operation of Russia in representations to the Porte on

the basis of the protocol, and, in the event of its refusal to come to terms, suggested certain measures of coercion. The tsar consented, and proposed that the coercion should take the form of a pacific blockade of the Morea, so as to force Ibrahim, by cutting off his supplies, to evacuate the country. To this Great Britain agreed in principle; for Canning clearly saw the need for yielding on the question of a joint intervention, if the isolated intervention of Russia were to be prevented. In the conference of the five powers of the Grand Alliance opened at London in the early summer of 1827, however, a divergence of views at once became apparent. Austria and Prussia protested against any coercion of the Porte "to serve revolutionary ends" and, failing to carry their views, withdrew from the conference. France thereupon proposed to convert the protocol of the 4th of April into a treaty; Russia and Great Britain agreed; and on the 6th of July the Treaty of London was signed by the three powers.

By the patent articles of the treaty the powers agreed to secure the autonomy of Greece under the suzerainty of the sultan, but without any breach of friendly relations with Turkey. By additional secret articles it was agreed that, in the event of the Porte not accepting the offered mediation, consuls should be established in Greece, and an armistice proposed to both belligerents and enforced by all the means that should "suggest themselves to the prudence" of the high contracting powers. In general it was allowed that these means should be the "pacific blockade" proposed by the tsar. Instructions to this effect were sent to the admirals commanding in the Levant.

The armistice, accepted by the Greeks, was refused by Ibrahim, pending instructions from Constantinople, though he consented to keep his ships in the harbour of Navarino. The Greeks, having put themselves in the *Navarino* right with the powers, were free to continue the war; and the destruction of a Turkish flotilla off Salona on the 23rd of September followed. Ibrahim, taking this as a breach of the convention, set sail from Navarino northwards, but was turned back by Sir Edward Codrington, the British admiral. Then, the Russian and French squadrons having joined, it was determined to put further pressure on the Egyptian commander, and the allied fleets, on the morning of the 20th of October, stood into the bay of Navarino. A chance scuffle led to a battle, and by the evening the Turkish and Egyptian fleets had ceased to exist (see *NAVARINO, BATTLE OF*).

The effect on the passionate sultan of this "unparalleled outrage on a friendly power in time of peace" is easy to imagine. In spite of the weak efforts of the British government to palliate the significance of this "untoward incident," Turkey broke off diplomatic relations with the three powers concerned, and on the 20th of December Mahmud, giving full vent to his rage, issued a *hukm-i-sherif* denouncing the cruelty and perfidy of the Christian powers, declaring the convention of Akkerman null and void, and summoning the faithful to a holy war. The struggle that followed was, however, destined once more to be a duel between Russia and Turkey. Great Britain, when Canning was no longer at the helm of state, had reverted to the traditional policy of preserving Ottoman integrity at all costs; the invitation of the tsar to accept the logical consequences of Navarino was refused; and Russia was left to settle her account with Turkey.

The war that followed proved once more the wonderful resisting power of the Turks. In spite of the confusion due to the destruction of the Janissaries and army *War with Russia* reforms as yet hardly begun, it cost the tsar two hardly fought campaigns before the audacious strategy of General Diebitsch enabled him to dictate the terms of the treaty of Adrianople (Sep. 14, 1829). Meanwhile the other powers had taken advantage of the reverses of the Russian arms to discount the effect of their ultimate victory by attempting to settle the Greek question. In July 1828 France had been commissioned to oust Ibrahim from the Morea; and though by a convention, concluded on the 9th of

August by Codrington with Mehemet Ali, the principle of evacuation by the Egyptian troops had already been settled before the arrival of the French expedition, the Morea remained for the time in French occupation. On the 16th of November a protocol of the London conference placed the Morea, with the neighbouring islands and the Cyclades, under the guarantee of the powers; and on the 22nd of March 1829 another protocol extended the frontier thus guaranteed to the line Arta-Volo and included the island of Euboea. According to this instrument Greece was to be erected into a tributary state, but autonomous, and governed by an hereditary prince chosen by the powers.

The Treaty of Adrianople, by which the Danubian principalities were erected into practically independent states, the treaty rights of Russia in the navigation of the Bosphorus and Dardanelles confirmed, and the districts of Anapa and Poti in Asia ceded to the tsar, included also a settlement of the Greek question on the terms of the protocol of the 22nd of March. This fact, which threatened to give to Russia the whole prestige of the emancipation of Greece, spurred the other powers to further concessions. The acceptance of the principle of complete independence, once more warmly advocated by Metternich, seemed now essential if Greece was not to become, like the principalities, a mere dependency of Russia. On the 3rd of February 1830 was signed a protocol embodying the principle of an independent Greece under Leopold of Coburg as "sovereign prince." This was ultimately expanded, after the fall of the Wellington ministry, into the Treaty of London of the 7th of May 1832, by which Greece was made an independent kingdom under the Bavarian prince Otto. (See GREECE: History.)

Before the final settlement of the Greek question a fresh crisis had arisen in the affairs of Turkey. Her lessened prestige had already received a severe blow from the bombardment and capture of Algiers by the French in 1830, and her position was further embarrassed by revolts in Bosnia and Albania, when news reached Constantinople that Mehemet Ali had invaded Syria (Nov. 1, 1831), nominally in order to punish his enemy Abdullah, pasha of Acre, really in order to take by force of arms the pashaliks of Syria and Damascus promised as a reward for his services in Greece. An account of the collapse of the Turkish power before Mehemet Ali, and of the complicated diplomatic developments that followed, is given in the article MEHEMET ALI. Here it must suffice to say that the recognition of Mehemet Ali's claims, forced on the sultan by France and Great Britain, was followed in 1833 by the signature of the Treaty of Unkiar Skelessi, which seemed to place Turkey wholly in the power of Russia, after which Sultan Mahmud concentrated his energies on creating a force strong enough to crush his rebellious vassal.

At last, in 1839, his eagerness would no longer be restrained, and without consulting his ministers, and in spite of the warnings of all the powers, he determined to renew the war. On the 21st of April the Ottoman army, which had been massed under Hafiz Pasha at Bir on the Euphrates, crossed the stream, by the sultan's orders, and advanced on Damascus. On the 23rd of June it was attacked by Ibrahim at Nezib and annihilated. As for Mahmud, the news of the disaster reached Constantinople when he was unconscious and dying. Early on the 1st of July he was dead, and his son Abd-ul-Mejid, a lad of eighteen, reigned in his stead (see MAHMUD II.).

The Eastern Question had now suddenly once more entered an acute phase. The news of Nezib was immediately followed by that of the treason of Ahmed Pasha, the Ottoman admiral, who, on the plea that the sultan's counsellors were sold to Russia, had sailed to Alexandria and handed over the fleet to Mehemet Ali. With an inexperienced boy on the throne, divided and untrustworthy counsels in the divan, and the defences of the empire shattered, the house of Osman seemed doomed and the Turkish Empire about to dissolve into its elements. If Russia was

prevented from using the Treaty of Unkiar Skelessi for her own purposes, it was essential that the powers should concert measures to deal with the situation. The story of the diplomatic negotiations that followed is told elsewhere (see MEHEMET ALI). Here it may suffice to say that the desire of the emperor Nicholas to break the entente between Great Britain and France led him to waive his special claims under the Treaty of Unkiar Skelessi, and that in the ultimate concert by which the question was settled France, which throughout supported Mehemet Ali, had no part. The intervention of the powers, based on the convention of London of the 15th of July 1840, led to the withdrawal of Ibrahim from Syria, and the establishment by the *firman* of the 13th of February 1841 of Mehemet Ali as hereditary pasha of Egypt under conditions intended to safeguard the sovereign rights of the Ottoman sultan. On the 10th of July the four signatory powers of the convention of London signed a protocol recording the closure of the incident (*protocole de clôture*), and on the 13th France united with them in signing another protocol (*protocole des détroits*) by which the powers engaged to respect the principle proclaimed by the sultan as to the closing of the Dardanelles to foreign warships.

The severe crisis through which the Ottoman Empire had passed accentuated the need for strengthening it by a drastic reform of its system. For such an experiment, though hampered by continual insurrections within and troubles without, Mahmud had done something to pave the way. The destruction of the Janissaries and the suppression of the quasi-independent power of the *derebeys* had removed the worst disturbing elements; the government had been centralized; a series of enactments had endeavoured to secure economy in the administration, to curb the abuses of official power, and ensure the impartiality of justice; and the sultan had even expressed his personal belief in the principle of the equality of all, Mussulman and non-Mussulman, before the law. It was therefore no sudden revolution when, on the 15th of November 1839 Abd-ul-Mejid signaled his accession by promulgating the Tanzimat, or Hatt-i-Sherif of Gulhané, a decree abolishing the arbitrary and unlimited power hitherto exercised by the state and its officials, laying down the doctrine of the perfect equality of all Ottoman subjects of whatever race or creed, and providing for the regular, orderly and legal government of the country and the security of life, property and honour for all its inhabitants. Yet the feelings of dismay and even ridicule with which this proclamation was received by the Mussulmans in many parts of the country show how great a change it instituted, and how strong was the opposition which it encountered among the ruling race. The non-Mussulman subjects of the sultan had indeed early been reduced to such a condition of servitude that the idea of their being placed on a footing of equality with their Mussulman rulers seemed unthinkable. Preserved merely as taxpayers necessary to supply the funds for the maintenance of the dominant and military class, according to a foreign observer in 1571, they had been so degraded and oppressed that they dared not look a Turk in the face. Their only value was from a fiscal point of view, and in times of fanaticism or when anti-foreign sentiment ran high even this was held of little account, so that more than once they very nearly became the victims of a general and state-ordered massacre. Thus Sultan Ibrahim was dissuaded from such a step in 1644 only by the refusal of the Sheikh-ul-Islam to sanction the proceeding. The humane and tolerant measures provided for in the "nizam-i-jedid," or new regulations for the better treatment of the Christians enacted by Mustafa Kuprik during his grand vizierate (1689-1691), did for a time improve the position of the rayas. But the wars with Russia and the Christian powers, and the different risks to which they were exposed, tended to stimulate their feelings of hostility towards the sultan. The Tanzimat, therefore, was a step towards the dawn

Abd-ul-Mejid, 1839-1861.

Reform Policy in Turkey. The Tanzimat.

The reforms introduced by Sultan Mahmud and by the Tanzimat necessitated the remodelling of nearly all the departments of state. Towards the end of Mahmud II.'s reign ministries had been instituted, and a council of ministers had been established, presided over by the grand vizier. In 1837 the "council of the Sublime Porte" and the "supreme council of legal affairs" were established: the latter was the tribunal to which were referred all complaints against officials or claims pending between the state and private individuals; the council of the Sublime Porte was in 1839 transferred to the ministry of commerce; the supreme council of legal affairs after undergoing various modifications was in 1868 absorbed in the council of state. In 1837 a "council of public works" was instituted, converted ten years later into a separate ministry. In 1835 the "ministry of administration" was formed; two years later its title was changed to ministry of the interior. Regulations prescribing the duties of the local governors and officials of all ranks were drawn up only in 1865 and 1870, but since Mahmud's time their functions were exclusively civil and administrative. A regular hierarchical order was elaborated for the official classes, both civil and military, whereby the rank of each person was clearly defined.

The military reorganization dates from the destruction of the Janissaries (June 15, 1826). On that day Aga Hussein Pasha was appointed "Seraaskier (commandant) of the victorious Mahomedan troops"; at first only two divisions were established, quartered respectively at Constantinople and Scutari. In 1833 the reserves were instituted, and three years later reserve commandants were appointed in six principal provinces. In 1843 the *corps d'armée* of Constantinople, Rumelia, Anatolia and Arabia were formed, and a military council was appointed. In 1847 a recruiting law was promulgated, reducing the period of service (until then unlimited in point of time), to five years. Military schools were founded. For the reorganization carried out from 1908 to 1910 see section *Army*, above.

After the Greek revolution the system of manning the navy from the Christian natives of the archipelago and the Mediterranean littoral was abandoned, and recruits for the navy are now selected under the ordinary law. A naval school and a modern factory and arsenal were established. The direction of the police, formerly left to the Janissaries, was formed into a ministry, and a body of gendarmes was instituted. For the financial reforms see the section *Finance*, above.

The ministry of public instruction was established in 1857; until the reign of Selim III. (when a few military schools were established) Education, the only schools had been the colleges of the Ulama and such preparatory schools as had been founded by private munificence.

In 1838 the council of education had been created and several secondary state schools were founded. In 1860 the regulations for public education were promulgated; schools were everywhere opened, and in 1882 a portion of the receipts from certain *charif* were appropriated to their maintenance. As all the preparatory schools founded by the state were for Mussulman children only (the various Christian communities maintaining their own schools, *idadi* or secondary schools were established in 1884 for the instruction of children of all confessions. In 1868 the Imperial Lyceé of Galata Serai was founded; most of the later generation of officials received their education there. Special state schools of medicine, arts, science, crafts, &c., have been created successively, and in 1901 a university was founded. Educational affairs in the provinces are now superintended by special officials.

After the promulgation of the reforms, the judicial duties of the Imperial Divan, which with other functions also exercised those of a kind of supreme court of appeal, were transferred to the Sheikh-ul-Islam. The codification of the civil law, which soon became necessary, was effected by the promulgation in 1859 of the *Mejelle*, or civil code. Commercial and criminal codes, as well as codes of procedure, were drawn up, largely on the basis of the Code Napoléon. The rules regulating the Ulama were amended, a school for judges was founded, and the Sheikh-ul-Islam was charged with the duty of revising all judgments. In 1865 the court system was founded.

Kuttah, to whom the superintendence of judicial affairs was entrusted, received the designation of minister of justice. Turkey had originally maintained consular courts for natives abroad, and appointed such only on special occasions as e.g. the signature of a treaty or the accession of a new sultan. Selim III. was the

first sultan who entered into regular relations with foreign powers, and employed permanent ambassadors; the practice was discontinued at the time of the Greek revolution and the consequent rupture with the powers. Later, during the Egyptian negotiations, ambassadors were accredited to London, Paris and Vienna. Sultan Abd-ul-Aziz's journey to Europe and the return visits paid by foreign princes strengthened Turkey's relations with foreign states.

The ministry of the *Eshak* or pious foundations was established in 1827 and extended ten years later. Such foundations had been created from the earliest times, and the execution of the testator's wishes was generally left to his descendants, under the supervision of some high official designated in the act of endowment. In case of failure in the line of succession an administrator was appointed by the state. But many such foundations fell into disorder, and the ministry was created to exercise the requisite supervision.

Though the provisions of the Tanzimat were not fully observed, they afforded convincing proof that reform was entirely practicable in Turkey. Reforms were effected in every direction; the finances and the army were reorganized, military instructors being procured from Europe; the administration was gradually centralized, and good relations were cultivated with the powers, the only serious international controversy arising in 1848-1849 over the refusal by Turkey, with the support of England, to surrender the Hungarian and Polish insurgents who had taken refuge within her borders. It cannot indeed be said that complete tranquillity prevailed throughout the country meanwhile; disturbances in the principalities and in the Lebanon gave serious trouble, while in 1842 the unsettled state of the Turco-Persian frontier nearly led to war. By the mediation of England and Russia the Treaty of Erzerum was signed (1847) and a frontier commission was appointed. But as the frontier was not definitely demarcated the door was left open for controversies which have occurred frequently up to the present day.

Turkey's progress in the path of reform was viewed with some uneasiness in Russia, the cardinal principle of whose policy since 1829 had been to maintain her own influence at Constantinople by keeping the Ottoman government weak. In favour of this the traditional policy of Peter the Great and Catherine II. had been deliberately given up, and by the secret convention signed at Münchengrätz on the 18th of September 1833 the emperor Nicholas had agreed with his brother sovereigns of the revived "Holy Alliance" to maintain the integrity of Turkey, where Russian influence seemed to have been rendered supreme and permanent by the Treaty of Unkiar Skelessi.

The crisis which ended in 1841, however, materially altered the situation from the Russian point of view. By his concert with the other powers in the affair of Mehemet Ali, the tsar had abdicated his claim to a unique influence at Constantinople, and he began to revive the idea of ending the Ottoman rule in Europe, an idea which he had only unwillingly abandoned in 1829 in response to the unanimous opinion of his advisers. In 1844 he took advantage of his visit to England to propose to British ministers a plan of partition, under which Great Britain was to receive Egypt and Crete, Constantinople was to be erected into a free city, and the Balkan states were to become autonomous under Russian protection. This proposal, as might have been expected, only served to rouse suspicions as to Russia's plans; it was politely rejected, and the whole Eastern Question slumbered, until, early in 1850, it was awakened by an incident trivial enough in itself, but pregnant with future trouble: a quarrel of Catholic and Orthodox monks about the holy places in Palestine.

By the Capitulations signed on the 28th of May 1740 on behalf of Sultan Mahmud I. and Louis XV. "emperor of France," not only French pilgrims to Jerusalem, but all members of "Christian and hostile nations" visiting the Ottoman Empire, had been placed under the protection of the French flag, and by a special article the Frank, i.e. Roman Catholic, ecclesiastics had been guaranteed certain rights in the holy places. These stipulations of the treaty, which were in effect a confirmation of the firm granted in 1620 by Murad IV. to Louis XIII., had fallen into oblivion

Results of Reforms.

Russian Policy since 1829.

The Holy Places.

during the age of Voltaire and the turmoil of the Revolution; and meanwhile, every advance of Russia had been marked by further encroachments of the Orthodox clergy in Palestine on the ancient rights of their Latin rivals. The quarrels of these monks might have been left to the contempt they deserved, had not Napoleon III. seen in the situation an opportunity at once for conciliating the clericals in France and for humiliating Russia, which had given to his title but an equivocal recognition. His ambassador, accordingly, handed in at Constantinople a formal demand for the restitution of the Catholics in all their property and rights. The Ottoman government, seeking to gain time, proposed a "mixed commission" of inquiry; and to this France agreed, on condition that no documents later than 1740 should be admitted as evidence. To this suggestion, which would have excluded the Treaty of Kuchuk Kainarji, the emperor Nicholas replied by a haughty demand that nothing should be altered in the *status quo*. It was now clear that no less an issue was involved than a contest between France and Russia for paramount influence in the East, a contest into which Great Britain would inevitably be dragged. The British government did its best to help the Porte to evolve a compromise on the questions immediately at issue, and in March 1852 a firman was issued, which to Protestants and Mahomedans might well seem to have embodied a reasonable settlement. Concessions were made to one side and the other; and the question of the right of "protection" was solved by the Turkish government itself undertaking the duty. But neither Napoleon nor Nicholas desired a settlement. The French emperor wanted a war for dynastic reasons, the tsar because he conceived his honour to be involved, and because he judged the moment opportune for expelling the infidel from Europe. France, he believed, would never come single-handed to the assistance of Turkey; Austria would be bound at least to benevolent neutrality by "gratitude" for the aid given in 1849; the king of Prussia would sympathize with a Christian crusade; Great Britain, where under the influence of John Bright and Richard Cobden the "peace at any price" spirit seemed to be in the ascendant, would never intervene. Nicholas even hoped for the active sympathy of Britain. Lord Aberdeen made no secret of his dislike for the Turks, and openly expressed his disbelief in the reality of their reforms; and in January 1853 the tsar, in conversation with Sir Hamilton Seymour, the British ambassador at St Petersburg, spoke of the Ottoman Empire as "the Sick Man," and renewed the proposals for a partition made in 1844.

Early in 1853 the Russian army was mobilized, and Prince Menshikov, a bluff soldier devoted to the interests of Orthodoxy and tsardom, was sent to present the emperor's ultimatum at Constantinople. He demanded the recognition of the *status quo* in the holy places, and of the tsar's right, under the Treaty of Kuchuk Kainarji, to the protectorate of all Orthodox Christians in the Ottoman dominions. The Porte, in alarm, turned to Great Britain for advice and assistance. Lord Stratford de Redcliffe, who reached his post at Constantinople shortly after the arrival of Menshikov, at once grasped the essential facts of the situation. The question of the holy places was insignificant in itself—it might be settled if France were granted political compensation elsewhere; that of the protectorate claimed by Russia over the Christians involved the integrity of the sultan's sovereignty. With great address he succeeded in persuading Menshikov to present the two demands separately. On the 22nd of April the French, Russian and British ministers came to an agreement on the question of the holy places; with the result that, when the question of protectorate was raised, Menshikov found himself opposed by the ambassadors of all the other powers. On the 5th of May, nevertheless, in obedience to his peremptory instructions, he presented his ultimatum to the Ottoman government, which, backed now by all the other powers, rejected it. On the 22nd Menshikov and the whole of the Russian diplomatic staff left Constantinople; and it was announced that, at the end of the month, the tsar's troops would enter the Danubian principalities. On

the 22nd of June the Russian army, under Prince Gorchakov, crossed the Pruth, not—as was explained in a circular to the powers—for the purpose of attacking Turkey, but solely to obtain the material guarantees for the enjoyment of the privileges conferred upon her by the existing treaties. The news of this aggression roused intense excitement in England; but the British government still exerted itself to maintain peace. In August a conference of the four powers assembled at Vienna, but the settlement they proposed, which practically conceded everything demanded by Russia except the claim to the protectorate, though accepted by the tsar, was rejected by the Porte, now fallen into a mood of stubborn resentment at the Russian invasion. At the beginning of October Turkey formally declared war; on the 22nd the French and British fleets passed the Dardanelles. Lord Aberdeen still hoped to secure peace, and the Russian government was informed that no *casus belli* would arise so long as Russia abstained from passing the Danube or attacking a Black Sea port. To the emperor Nicholas this was tantamount to a declaration of war; and in effect it was so. On the 30th of November the Russian fleet attacked and destroyed a Turkish squadron in the harbour of Sinope; on the 3rd of January the combined French and British fleets entered the Black Sea, commissioned to "invite" the Russians to return to their harbours.

The emperor Nicholas had been singularly misled as to the state of public opinion in Europe. The news of the affair of Sinope, rather wanton slaughter than a battle, raised excitement in England to fever heat; while the excellent bearing and consistent successes of the Turkish troops during the first months of the campaign on land excited the admiration of all Europe. The belief in the rejuvenation of Turkey seemed to be justified; and when, on the 27th of March 1854, Great Britain and France declared war on Russia, the action of the governments was supported by an overwhelming public opinion. As regards Austria, too, the emperor Nicholas was no less mistaken. If she maintained neutrality, it was due to no impulse of gratitude, and it was far from "benevolent." As the Russians withdrew from the Danubian principalities, Austrian troops occupied them, and by a convention with the Porte the Austrian government undertook to resist by arms any attempt of the Russians to return. So far as the extreme claims of the tsar were concerned, neither Austria nor Prussia was willing to concede them, and both had joined with France and Great Britain in presenting, on the 12th of December 1853, an identical note at St Petersburg, drawn up at the Conference of Vienna, reaffirming the principles of the treaty of 1841. Save for the benevolent neutrality of Prussia, therefore, which enabled her to obtain supplies from the north, Russia was pitted single-handed against a coalition of Turkey, Great Britain and France, to which Sardinia was added later.

The events of the war that followed are told elsewhere (see CRIMEAN WAR). The main operations were confined to the Crimea, where the allied troops landed on the 14th of September 1854, and they were not concluded, in spite of the terrible exhaustion of Russia, till in December 1855 the threatened active intervention of Austria forced the emperor Alexander II. to come to terms. These terms were ultimately embodied in the Treaty of Paris of the 30th of March 1856. Its provisions, held by some to be so unduly favourable to Russia as to justify the question whether she had not been victorious in the war, were as follows: Russia abandoned all pretensions to exercise a protectorate over the Christians in Turkey, or to an exclusive right of interference in the Danubian principalities, to which Benevolence was restored; the navigation of the Danube was made free and placed under the supervision of an international commission; the Black Sea was closed to warships, while open to the commercial flags of all countries; the Asiatic frontier between the two empires remained unchanged; Turkey was admitted to the concert of Europe; all the contracting parties agreed to respect the independence and the integrity of her territory. The result was that the Crimean War was a complete failure for Russia.

large measure of local autonomy for the Christian communities. It was stipulated that Turkey's promises of reform gave no power the right of interference on behalf of the Christians.

The Treaty of Paris was regarded as opening a new era in the progress of Turkey. Admitted on equal terms to the European family of nations, the Ottoman government had given a solemn guarantee of its intention to make the long-promised reforms a reality. But it soon became apparent that the time was scarcely come for liberal measures; and fanatical outbreaks at Jidda (1858) and in Syria (1866) gave proof that the various sections of the population were not yet prepared to act together in harmony. The Syrian disturbances brought about a French occupation, which Fuad Pasha, ably seconded by Ahmed Vefyik Effendi, the Turkish ambassador in Paris, contrived to restrict, and to terminate as soon as possible. The immediate local result was the institution, by a *règlement*,¹ signed at Constantinople on the 6th of September 1864, of autonomy for the Lebanon under a Christian governor appointed by the powers with the concurrence of the Porte, an arrangement which has worked satisfactorily until the present day. In 1859 the Danubian principalities, deliberately left separate by the Congress of Paris, carried out their long-cherished design of union by electing Prince Cuza both in Moldavia and in Walachia, a contingency which the powers had not taken into account, and to which in the end they gave a grudging assent (see RUMANIA).

On the 25th of June 1861 Sultan Abd-ul-Mejid died, being succeeded by his brother Abd-ul-Aziz. The new sultan's reign marked, if not the beginning, at least the high tide of that course of improvident and unrestrained expenditure, facilitated by the enthusiasm created in Europe by Turkey's admission to the ranks of the powers which loosened for her the purse-strings of the foreign investor. The viceroy of Egypt, Ismail Pasha, followed his suzerain's example in this respect, and was lavish in his bribes to his imperial overlord to obtain the extension of his own privileges and the establishment in Egypt of succession from father to son; these concessions were granted to him by the *firmans* of the 27th of May 1866 and the 8th of June 1867, in the latter of which the viceroy is addressed for the first time as "khedive." Abd-ul-Aziz is said to have yielded the more readily as being desirous of bringing about a similar alteration in the succession in Turkey, in favour of his own eldest son, Prince Yussuf Izz-ed-din; public opinion was, however, opposed to so sweeping a change, and the succession to the throne in Turkey still goes to the eldest surviving member of the house of Osman. Though the foreign relations of Turkey remained untroubled, disturbances in Servia, Montenegro and Crete continued throughout the "sixties." Servia had long resented the occupation of her fortresses by Turkish troops; frequent collisions arising from this source resulted in June 1862 in the bombardment of Belgrade; some slight concessions were then made to Servia, but it was not until 1867 that, through the mediation of England and other powers, she succeeded in obtaining the withdrawal of the Turkish garrisons. The Cretan insurrection rose to a formidable height in 1868-69, and the active support given to the movement by Greece brought about a rupture of relations between that country and Turkey. The revolt was suppressed, the Turko-Greek conflict was settled by a conference of the powers in Paris, and Crete received a charter of local self-government which for a time pacified the island.²

Abd-ul-Aziz had visited the Paris Exhibition of 1867 and had paid his respects to Queen Victoria, who conferred on him the order of the Garter. In 1869 the visit was returned by many sovereigns and princes on their way to the opening of the Suez Canal, among them being the empress Eugénie. An important event which has passed over without mention is the grant of the *capitulations* of the *capitulations* of the Bulgarian Church from

diplomatic
State Papers.

the jurisdiction of the Greek patriarch of Constantinople. This concession, given under strong pressure from Russia, aroused the deepest resentment of the Greeks, and was the principal factor in the awakening of the Bulgarian national spirit which subsequent events have done so much to develop. Russian influence at Constantinople had been gradually increasing, and towards the end of 1870 the tsar took advantage of the temporary disabling of France to declare himself no longer bound by those clauses of the Treaty of Paris which restricted Russia's liberty of possessing warships on the Black Sea. An international conference convoked in London early in 1871 laid down the principle that treaty engagements were binding, and then proceeded to abrogate this particular engagement. Russia and Turkey thus regained full liberty as regards their naval forces and armaments in the Euxine; the passage of the straits remained interdicted to ships of war.

A reform not unworthy of notice was effected by the law promulgated on the 18th of June 1867 whereby foreigners were for the first time allowed to hold landed property throughout the Ottoman Empire (save in the Hejaz) on condition of their being assimilated to Ottoman subjects, *i.e.* divested of their right to the protection of their own authorities in every respect concerning such property.

Meanwhile in Turkey national bankruptcy was brought within measurable distance by the sultan's extravagance and the incompetence of his ministers; it was staved off only by loans contracted almost annually to pay the interest on their predecessors. External influences and latent fanaticism were active; a serious insurrection broke out in Bosnia and Herzegovina in 1875, and the efforts to quell it almost exhausted Turkey's resources; the example spread to Bulgaria, where abortive outbreaks in September 1875 and May 1876 led to those cruel measures of repression which were known as "the Bulgarian atrocities."³ Mussulman public feeling was inflamed, and an attempt at Salonica to induce a Christian girl who had embraced Islam to return to her faith caused the murder of two foreign consuls by a fanatical mob. The finances of Turkey now collapsed, and the inevitable bankruptcy was declared, whereby more than through any other cause she lost such *Opposition* sympathies as she possessed in western Europe. *of Abd-ul-Aziz.* Turkey's distress was Russia's opportunity; the sultan fell entirely under the influence of General Ignatiev, the tsar's ambassador, and it became evident that the country was hastening to its dissolution. A conspiracy to bring about a change was hereupon formed by certain prominent statesmen, whose leaders were Midhat Pasha, Mehemed Rushdi Pasha and Mahmud Damad Pasha, the husband of a princess of the blood, sister to Prince Murad. These succeeded in gaining over the Sheikh-ul-Islam, and in obtaining from him a *fatwa* for the deposition of Abd-ul-Aziz.

In virtue of this judgment of the supreme legal authority, and with the aid of the fleet, Abd-ul-Aziz was deposed, being shortly afterwards found dead, apparently by his own hand. Murad V. reigned in his stead. But the change of sultans brought no relief to the troubled state: Servia and Montenegro declared war, and in less than three months it had become evident that Murad was incapable of governing.

Murad's brother Abd-ul-Hamid was accordingly proclaimed sultan on the 31st of August 1876. The diplomacy of Europe had been searching in vain since the autumn *Accession* of 1875 for the means of inducing Turkey to institute *of Abd-ul-Hamid II.* effective administrative reforms and to grant to *1876.* its European provinces that autonomy which now

appeared essential. But the new sultan was as averse from accepting any of the formulæ proposed as were his predecessors: Servia and Montenegro were with great difficulty pacified, but it was plain that Russia, whose Slavonic and Orthodox sympathies had been strongly aroused, would soon begin hostilities herself. Turkey now made a show of going even beyond the demands formulated by Europe, and the international conference which met at Constantinople during

³ See Mr Baring's reports in *Parl. Papers* (1878), lxxxi.

the last days of 1876 was started by the salvo of artillery which heralded the promulgation of a liberal constitution, not for the European provinces only, but for the whole empire, and the institution of a Turkish parliament. The decisions of the conference, moderate though they were, in the end requiring merely the nomination of an international commission to investigate the state of the European provinces of Turkey, and the appointment by the sultan, with the approval of the

Russo-Turkish War.

powers, of governors-general for five years, were rejected by the Porte. The statesmen of Europe still continued their efforts to avert a conflict, but to no purpose. On the 24th of April 1877 Russia declared war and her troops crossed the Turkish frontiers. Hostilities were conducted both in Europe and Asia for nearly a year. Rumania joined the Russians, and in Europe no effective opposition was encountered by the invaders until the assaults on Plevna and the Shipka Pass, where the valiant resistance of the Turks won for them the admiration of Europe. By November the defence of the Turks in Asia Minor had entirely collapsed. Plevna surrendered on the 9th of December 1877 after a heroic struggle under Osman Pasha. Thereafter the Russians advanced practically unchecked (see *RUSO-TURKISH WARS*). An armistice and preliminaries of peace were signed on the 31st of January 1878 at Adrianople, and a definitive treaty was concluded at San Stefano on the 3rd of March 1878. Its terms

Treaty of San Stefano.

were: the creation of an autonomous tributary principality of Bulgaria extending from the Black Sea to the Aegean; the recognition by Turkey of the independence of Rumania, Servia and Montenegro, with increased territories; the payment of a war indemnity; the introduction of reforms in Bosnia and Herzegovina; the cession to Russia of Bessarabia and the Dobruja; the opening of the passage of the straits at all times to the merchant vessels of neutral states; and the razing of the fortresses on the Danube.

Great Britain had throughout the war preserved strict neutrality, but, while making it clear from the outset that she could not assist Turkey, had been prepared for emergencies. Turkey's severity in repressing the Bulgarian insurrection had raised up in England a storm of public opinion against her, of which the Liberal opposition had taken the fullest advantage; moreover the suspension of payments on the Ottoman debt had dealt Turkey's popularity a blow from which it had never recovered. But upon the approach of the Russians to Constantinople the British reserves were called out and the fleet was despatched to the Bosphorus. Accordingly, and as her line of retreat might be threatened by Austria, Russia consented to a revision of the Treaty of San Stefano at a congress to be held at Berlin.

Congress of Berlin, 1878.

Before the meeting of this congress, which assembled on the 13th of June 1878, the powers principally interested had arrived at an understanding as to the modifications to be introduced in the treaty, and by a convention concluded with Turkey on the 4th of June 1878 England had undertaken to defend the Asiatic dominions of the sultan by force of arms, provided that his majesty carried out all the necessary reforms, to be agreed upon later, and assigned to England the island of Cyprus, which was however to be restored if Turkey fulfilled her engagements as to reforms and if Russia gave back to her Kars, Ardahan and Batum. On the 13th of July 1878 the Treaty of Berlin was signed: the Great Bulgaria of the San Stefano Treaty was diminished to an autonomous province north of the Balkans, the south-eastern portion, no longer extending to the Aegean, was formed into a self-governing tributary province styled Eastern Rumelia; Turkey abandoned all pretension to suzerainty over Montenegro; Servia and Rumania received their independence (but the last named was made to cede Bessarabia to Russia, receiving instead the Dobruja); the Asiatic frontier was readjusted, Kars, Ardahan and Batum becoming Russian. It was further provided that Bulgaria should pay to Turkey an annual tribute, and should moreover (as well as the other Balkan states receiving accessions of territory at Turkey's expense) bear a portion of the Ottoman debt. The sums payable by the different countries were to be fixed

by the powers; but no effect has so far been given to this reasonable stipulation, which may now be looked upon as null and void. Turkey undertook to pay to Russia a war indemnity of 300,000,000 roubles, and the status of the straits remained unchanged. Measures of reform in Armenia were also provided for; as also the convocation of an international commission for drawing up a reform scheme for the European provinces left to Turkey. The organic law for Crete was to be carried out, and special laws enacted for other parts of Turkey. Bosnia and Herzegovina were handed over to the administration of Austria; Montenegro and Greece received accessions of territory to which only strong pressure coupled with a naval demonstration induced Turkey to consent three years later.

Peace once restored, some attempt was made by Turkey in the direction of complying with her engagements to institute reform. Financial and military advisers were procured from Germany. English officers were engaged to reform the gendarmerie, and judicial inspectors of foreign nationality were to travel through the country to redress abuses. It was not long before the unsubstantial character of all these undertakings became apparent, the parliament was dissolved, the constitution was suspended and its author exiled. Egyptian affairs next threatened complications. In May 1879 the misgovernment of Ismail Pasha and the resulting financial crisis rendered the deposition of the khedive inevitable; in order to anticipate the action of England and France, who would otherwise have expelled the erring viceroy, the sultan deposed him himself; the succession devolved upon his son Mahommed Tewfik Pasha. (For the subsequent history of the Egyptian question see *EGYPT: History*.) The revolt of Arabi Pasha in 1881 broke up the Anglo-French condominium in Egypt and led to outrages at Alexandria followed by a bombardment on the 11th of July 1882. The occupation of the country by Great Britain gradually took a more permanent form, and though negotiations were more than once entered into with Turkey with a view to its termination, these either proved abortive or were rendered so (as e.g. the Drummond-Wolf convention of 1887) by the action of other powers. The Anglo-French agreement of 1904 left England in undisputed mastery.

The financial straits of Turkey after the war became so acute that the sultan was compelled to consent to a measure of foreign control over the finances of the country, the administration of the public debt being established in December 1881. (See *Finance*, above.)

In 1885 the practically bloodless revolution of Philippopolis on the 18th of September united Bulgaria and Eastern Rumelia, severed by the Treaty of Berlin. A conference held at Constantinople sanctioned the union on terms which were rendered acceptable to the sultan; but Said Pasha, who had assisted the sultan in centralizing at Yildiz Kiosk the administration of the country, and who had become grand vizier, was a strong adherent of the policy of armed intervention by Turkey, and the consequence was his fall from office. His successor in the grand vizierate, Kiamil Pasha, was soon called upon to deal with Armenian unrest, consequent on the non-execution of the reforms provided for in the Treaty of Berlin and the Cyprus Convention, which first found vent about 1890. But Kiamil Pasha was not subservient enough to his imperial master's will, and his place was taken by a military man, Jevad Pasha, from whom no independence of action was to be apprehended.

It is from this period that the German ascendancy in Constantinople is noticeable. Railway concessions were given to Germans over the heads of British applicants already in possession of lines from which they were expropriated, thus affording the nucleus of the Bagdad railway (of which Germany obtained the concession in November 1899). (See *BAGDAD*, vol. iii., p. 107.)

From 1890 Crete was frequently the scene of disturbance; the Christian communities in other parts of Turkey began to chafe under the attempt of curtailing of their privileges; about Christmas 1895 the Greek patriots demanded that the churches should be closed.

The Egyptian Question.

The Egyptian Question.

Public Debt.

German Activity in Turkey.

entered upon a serious phase. The Kurds, the constant oppressors of that people, had received official recognition and almost complete immunity from the control of the civil law by being formed into a yeomanry frontier-guard known as the Hamidian cavalry. The troubles arising from this cause and from greater energy in the collection of taxes led the Armenians in outlying and mountainous districts to rise against the authorities. The repression of these revolts in the Sassun district in the autumn of 1894 was effected under circumstances of great severity by Turkish troops and Kurdish irregulars. A commission composed of British, French and Russian officials held an inquiry into the events which had occurred, and early in 1895 England, France and Russia entered actively into negotiations with a view to the institution of reforms. The scheme propounded by the three powers encountered great objections from the Porte, but under pressure was accepted in October 1895. Its acceptance was however the signal for a series of massacres in almost every town of importance throughout Asia Minor, which there is but too strong evidence for suspecting were committed with the connivance of the authorities, and in which upwards of 300,000 persons are computed to have perished. In 1896 Lord Salisbury induced the other powers to unite in urging the execution of the reforms, but no agreement could be come to for the use of coercion, and Europe could but look on and protest. Changes of ministry at Constantinople were powerless to bring about an improvement, and early in 1896 Cretan affairs became so serious as to call for the intervention of the powers. In September yet another Cretan charter of self-government was promulgated. Shortly before, a revolutionary attack by an Armenian band on the Ottoman bank at Constantinople brought about a general massacre of Armenians in the capital (where a widespread revolutionary organization undoubtedly existed), in which at least 3000 victims fell, and the persecution of Armenians became the order of the day.

The neglect of the Porte to carry out all the stipulations of the Cretan arrangement of 1896 led to a renewal of the disturbances, and Greece began to take steps for the invasion of the island; in February 1897 Colonel Vassos sailed from the Piræus with an armed force, intending to proclaim the annexation of Crete to Greece, and Greek troops were massed on the Thessalian frontier. Diplomacy busied itself with fruitless attempts to avert hostilities; on the 17th of April 1897 war was declared by Turkey. The resistance offered by Greece was feeble in the extreme: Europe was obliged to intervene, and Turkey gained a rectification of frontier and a war indemnity of £4,000,000, besides the curtailment by the treaty eventually signed of many privileges hitherto enjoyed by Hellenic subjects in Turkey. But Europe was determined that the Cretan question should be definitely settled, at least for a period of some years, and, after an outbreak at Candia, in which the lives of British troops were sacrificed, the four powers (Germany and Austria having withdrawn from the concert) who had taken over the island *en bloc* handed it over in October 1898 to Prince George of Greece as high commissioner (see CRETE: History).

Crete being thus removed from the scope of her action, Turkey found ample occupation in the almost constant turbulence of the Yemen, of Albania and of Macedonia. After 1892 the revolts, frequently renewed, of the so-called *Irakim* of Sana, necessitated the despatch of large and costly expeditions to Arabia, in which thousands of Turkish troops have fallen in guerrilla warfare or through the inhospitable climate; in Albania disturbance became almost endemic, owing to the resistance offered by the intractable population to successive attempts of the central authority to subject the country to regular administration. The operations of the Turkish Government in these provinces were hampered by the unsettled claims of the various European powers, and the constant interferences of the British and other nations and the Russian Empire. In 1901 the Russian Government, in order to secure the independence of the province, and to prevent the Turkish Government from establishing a permanent military presence in the province, demanded the evacuation of the province by the Turkish Government. The Russian Government also demanded the evacuation of the province by the Turkish Government. The Russian Government also demanded the evacuation of the province by the Turkish Government.

Crete being thus removed from the scope of her action, Turkey found ample occupation in the almost constant turbulence of the Yemen, of Albania and of Macedonia. After 1892 the revolts, frequently renewed, of the so-called *Irakim* of Sana, necessitated the despatch of large and costly expeditions to Arabia, in which thousands of Turkish troops have fallen in guerrilla warfare or through the inhospitable climate; in Albania disturbance became almost endemic, owing to the resistance offered by the intractable population to successive attempts of the central authority to subject the country to regular administration. The Russian Government also demanded the evacuation of the province by the Turkish Government. The Russian Government also demanded the evacuation of the province by the Turkish Government.

encroachments on the hinterland of Aden brought about a dangerous state of tension between Great Britain and Turkey, which had its parallel in 1906 in similar trespasses *Diguloo* by the Ottoman authorities on the Egyptian land *with France* frontier near Akaba. In both cases Turkey eventually *and Britain* yielded; a similar question arose in 1906 with France over the boundaries of the African possessions of the two countries.

But Macedonia was Turkey's chief source of anxiety. That country, left by the Treaty of Berlin with its status unaltered, was in a continued condition of disturbance. The Christian population, who in common with their Muslim *Macedonian* fellow subjects suffered from the defective *Question.* methods of government of their rulers, had at least before them the example of their brethren—Greeks, Bulgarians or Servians—dwelling in independent kingdoms under Christian governments on the other side of the frontier. The hope of eventual emancipation was stimulated by sedulous propagandists from each of these countries; from time to time armed bands of insurgents were manned and equipped in the small neighbouring states, with or without the co-operation of the governments. So long as Stambolov, the energetic Bulgarian statesman, was alive he succeeded in keeping the Bulgarian element quiet, and the peace of the country was less liable to disturbance. But for some years the three rivals in Macedonia, to which a fourth, the Rumanian element, must be added, were in constant strife (see MACEDONIA). A serious Bulgarian insurrection in Macedonia in the autumn of 1903 induced Austria and Russia to combine in formulating the Mürtzsteg reform programme, tardily consented to by Turkey, by which Austrian and Russian civil agents were appointed to exercise a certain degree of control and supervision over the three vilayets of Salonica, Monastir and Kosovo. It was also arranged that foreign officers should be named to reorganize the gendarmerie. An Italian officer, General De Giorgis, was appointed to the chief command in the reorganization, and the three vilayets were apportioned among the great powers into districts, in each of which was appointed a staff officer with a number of subordinate officers of his nationality under his orders. The work of reorganization was efficiently carried out, and the gendarmerie school at Salonica, under British supervision, showed excellent results. But the achievements of the two civil agents were less noteworthy; and in 1905 it was agreed that, in view of the financial necessities of the provinces, the other great powers should each appoint delegates to a financial commission with extensive powers of control in fiscal matters. The Porte opposed the project, and an international naval demonstration and the occupation of Mytilene by the powers became necessary before Turkey gave way in December 1905. Even so it proved impossible to fulfil the Mürtzsteg programme, though the attempt was prolonged until 1908. The Austro-Russian *entente* had then come to an end; and after a meeting between King Edward VII. and the tsar Nicholas II. at Reval, a new scheme of reforms was announced, under the name of the "Reval programme." The enforcement of these reforms, however, was postponed *sine die* owing to the revolution which transformed the Ottoman Empire into a constitutional state; and the powers, anticipating an improvement in the administration of Macedonia by the new government, withdrew their military officers in the summer of 1908.

The Young Turkish party had long been preparing for the overthrow of the old régime. Their central organization was in Paris and their objects were known throughout Europe, but except at Yildiz Kiosk their power was *The Young* almost everywhere underrated. The Porte strove *Turks.* by every means at its disposal to thwart their activity; but elsewhere they were regarded as a body of academic enthusiasts, more noisy than dangerous, who devoted their scanty funds to the publication of seditious matter in Paris or Geneva, and sought to achieve the impossible by importing western institutions into a country fit only to be ruled by the *sherial* and the sword. Such was the opinion held even by experienced diplomatists and by historians. It was strengthened by the fact that the Young

Turks had deliberately abstained from violent action. They had, in fact, learned from events in Russia and Poland that sporadic outbreaks on a small scale would inevitably discredit their cause, and that a successful revolution would require the support of the army. To gain this, an extensive propaganda was carried on by secret agents, many of whom were officers. At the beginning of 1908 a favourable opportunity for action arrived. The Ottoman troops in Arabia were mutinous and unpaid; the Albanians, long the mainstay of Turkish military power in the west, had been irritated by unpopular taxes and by the repressive edicts which deprived them of schools and a printing-press; foreign interference in Crete and Macedonia was resented by patriotic Moslems throughout the empire. In these circumstances the headquarters of the Young Turks were transferred from Paris to Salonica, where a central body, known as the committee of union and progress, was established (1908) to organize the revolution. Most of its members were military officers, prominent among them being Majors Enver Bey and Niazî Bey, who directed the propaganda in Albania and Macedonia. By midsummer the Albanian leaders and the greater part of the Turkish army in Europe had sworn fidelity to the constitution.

On the 25th of May an insurrection broke out in Samos, owing to a dispute between the Samian Assembly and Koppasi Effendi, "prince," or governor of the island. After the port of Vathy had been bombarded by Ottoman war-ships the revolt was easily crushed.

This affair however was of little more than local importance, and the Young Turks were not directly concerned in it. They struck their first blow on the 22nd of July 1908, when Niazî Bey and his troops raised the standard of revolt at Resna, a town on the road from Monastir to Ochrida. On the 23rd the committee of union and progress, under the presidency of Enver Bey, proclaimed the constitution in Salonica, while the second and third army corps threatened to march on Constantinople if the sultan refused to obey the proclamation. On the 24th the sultan yielded, and issued an *irâde*, restoring the constitution of 1876, and ordering the election of a chamber of deputies. Various other reforms, notably the abolition of the spy system and the censorship, were announced soon afterwards. Some of the more unpopular officials associated with the old régime were assassinated, among them Fehim Pasha, the former head of the espionage department, who had been exiled to Brusa in 1907 at the request of the British and German ambassadors. Otherwise the revolution was effected almost without bloodshed; for a time the insurgent bands disappeared in Macedonia, and the rival "nationalities"—Greek, Albanian, Turk, Armenian, Servian, Bulgarian and Jew—worked harmoniously together for the furtherance of common constitutional aims. On the 6th of August Kiamil Pasha, an advanced Liberal, became grand vizier, and a new cabinet was formed, including a Greek, Prince Mavrocordat, an Armenian, Noradounghian, and the Sheikh-ul-Islam.

The success of the Young Turks created a serious situation for the statesmen of Austria-Hungary and Bulgaria. A regenerated Ottoman Empire might in time be strong enough to demand the evacuation of Bosnia and Herzegovina, and to maintain or extend the nominal suzerainty over Bulgaria which the sultan had exercised since 1878. Accordingly, at the beginning of October 1908, the emperor Francis Joseph informed the powers signatory to the treaty of Berlin that the annexation of Bosnia and Herzegovina to the Dual Monarchy had become necessary, and this decision was formally announced in an imperial rescript dated the 7th of October. The independence of Bulgaria was proclaimed on the 5th. The Ottoman government protested to the powers, but it wisely limited its demands to a claim for compensation. Austria-Hungary had from the first undertaken to withdraw its garrisons from the sanjak of Novibazar—an important concession; after prolonged negotiations and a boycott of all Austrian goods exported to Turkey, it also agreed to pay £2,200,000 as compensation for the Turkish crown lands seized in Bosnia

and Herzegovina. This arrangement was sanctioned by the Ottoman parliament, which assented to the annexation on the 6th of April 1909 and recognized the independence of Bulgaria on the 19th of April, the Russian government having enabled Bulgaria to pay the indemnity claimed by Turkey on account of the Eastern Rumelian tribute and railways (see BULGARIA: History). On the 3rd of February 1910 the Porte accepted a Bulgarian proposal for a mixed commission to delimit disputed sections of the Turco-Bulgarian frontier, and in March King Ferdinand visited Constantinople.

Meanwhile the Young Turks were confronted with many difficulties within the empire. After the first fervour of enthusiasm had subsided the Christian nationalities in Macedonia resumed their old attitude of mutual jealousy, the insurgent bands began to reappear, and the government was in 1909-1910 forced to undertake the disarmament of the whole civil population of the three vilayets. In Albania serious discontent, resulting in an insurrection (May-September 1909), was caused by the political rivalry between Greeks and Albanians and the unwillingness of the Moslem tribesmen to pay taxes or to keep the peace with their neighbours, the Macedonian Serbs. In Asia Minor the Kurdish troops under Ibrahim Pasha revolted, and, although they were defeated with the loss of their commander, the Kurds continued to attack indiscriminately the Turks, Nestorians and Armenians; disturbances also broke out among the other reactionary Moslems of this region, culminating in a massacre of the Armenians at Adana. In Arabia Raîb Pasha, the Turkish commander-in-chief, joined the enemies of the new régime; he was defeated and captured in the autumn of 1908, but in the following year frequent raids upon the Hejaz railway were made by Bedouin tribesmen, while a Mahdist rebellion broke out and was crushed in Yemen.

More serious than any of these local disturbances was the counter-revolution in Constantinople itself, which began with the revolt of Kiamil Pasha, the grand vizier, against the authority of the committee of union and progress. Kiamil Pasha was forced to resign (Feb. 14, 1909) and was succeeded by Hilmi Pasha, ex-high commissioner of Macedonia. Strife then arose between the committee and the Liberal Union, a body which mainly represented the Christian electorate, and on the 5th of April Hassan Fehmi Effendi, who edited the *Serbesti*, the official organ of the union, was assassinated. He was an Albanian, and his fellow countrymen in the Constantinople garrison at once made common cause with the opponents of the committee. Mutinous troops seized the parliament house and the telegraph offices; the grand vizier resigned and was succeeded by Tewfik Pasha (April 14); and delegates were sent by the Liberal Union, the association of Ulama and other bodies to discuss terms with the committee. But Abd-ul-Hamid had issued a free pardon to the mutineers, and the committee had now decided that the new régime would never be secure while the sovereign favoured reaction. They refused to treat with the delegates, and despatched 25,000 men under Mahmud Shevket to Constantinople.

The senate and chamber met at San Stefano, and, sitting jointly as a National Assembly, issued a proclamation in favour of the committee and its army (April 22, 1909), by which Constantinople was now invested. Part of the garrison remained loyal to the sultan, but after five hours of severe fighting Shevket Pasha was able to occupy the capital (April 25). The National Assembly met in secret session two days later, voted unanimously for the deposition of Abd-ul-Hamid II., and chose his younger brother Mohammed Reshad Effendi (b. Nov. 3, 1844) as his successor, with the style of Mahommed V. Abd-ul-Hamid II. was removed to Salonica on the 28th, and on the 10th of May the new sultan was formally invested with the sword of Osman. Hilmi Pasha again became grand vizier, but resigned on the 28th of December 1909, when he was succeeded by Hakki Bey. On the 5th of August 1909 the new constitution described above was

The Reaction in the Provinces.

The Revolution of 1908.

Bosnia and Bulgaria.

The New Régime.

promulgated by imperial *iradé*; parliament was prorogued for three months on the 27th, and during the recess the committee of union and progress met at Salonica and modified its own rules (Oct. 23), ceasing thenceforward to be a secret association. This was regarded as an expression of confidence in the reformed parliament, which had laid the foundation of the important financial and administrative reforms already described. On the 13th of September 1909 the Macedonian international commission of finance met for the last time; its members were reappointed to a higher finance board for the whole empire, under the presidency of Djavid Bey. Ch. Laurent had already been nominated financial adviser to the empire (Sept. 16, 1908), while Sir William Willcocks became head of the irrigation department; the reorganization of the army was entrusted to the German General von der Goltz, that of the navy to Admiral Sir Douglas Gamble (resigned Feb. 1, 1910).

The evacuation of Crete by the four protecting powers was followed in 1909 by renewed agitation. Turkey was willing to concede the fullest local autonomy, but not to abandon its sovereign rights over the island. In July 1909, however, the Greek flag was hoisted in Canea and Candia, and it was only lowered again after the war-ships of the protecting powers had been reinforced and had landed an international force. The Cretan administrative committee swore allegiance to the king of the Hellenes in August, and again, after a change of government, at the end of December 1909. This situation had already given rise to prolonged negotiations between Greece and Turkey. It also contributed towards the conclusion of an *entente* between Turkey and Rumania in the summer of 1910. Both of these powers were interested in preventing any possible accession of territory to the Bulgarian kingdom; and Rumania (*q.v.*) had for many years been a formidable opponent of Hellenism among the Macedonian Vlachs. Greece and Crete were thus confronted with what was in effect a defensive alliance between Turkey and Rumania. The Cretans had insisted upon their demand for union with Greece and had elected three representatives to sit in the Greek national assembly. Had this act been ratified by the government at Athens, a war between Greece and the Ottoman Empire could hardly have been avoided; but a royal rescript was issued by the king of the Hellenes on the 30th of September 1910, declaring vacant the three seats to which the Cretan representatives had been elected; the immediate danger was thus averted.

BIBLIOGRAPHY.—(1) *General Historical Works*: The monumental *Geschichte des Osmanischen Reiches*, by J. von Hammer Purgstall (1st ed., 10 vols., Vienna, 1827-1835; 2nd ed., 4 vols., Pest, 1840; French trans., by J. J. Hellert, 16 vols., Paris, 1835-1843), is still the standard work until the conclusion of the treaty of Kuchuk Kai'narji (1744), at which date it stops. Founded upon it are Sir E. S. Creasy's *History of the Ottoman Turks* (London, 1878) and S. Lane-Poole's *Turkey in the "Story of the Nations Series"* (London, 1888); Sutherland Menzies's *Turkey, Old and New* (2 vols., 1880) is derived chiefly from French sources and is less accurate and unbiased. An excellent and impartial history in Turkish is the *Tarih-i İslâhî-İ Osmanî*, by Abdurrahman Şeref (Constantinople, A.H. 1315-1318 = A.D. 1897-1900). *The Balkans*, by W. Miller (London, 1899), in the "Story of the Nations Series," deals with Turkey's relations with the Balkan states. Halil Canem's *Les Sultans ottomans* (2 vols., Paris, 1902) contains much that is interesting, if not always entirely trustworthy.

(2) *Monographs*: Much information on modern Turkish history and politics will be found in the works dealing primarily with topography, finance, law and defence, which have been cited above. See also S. Lane-Poole, *Life of Lord Stratford de Redcliffe* (2 vols., London, 1888); A. Vandal, *Mémoires du marquis de Noailles* (French ambassador at Constantinople from 1670 to 1678); E. Engelhardt, *La Turquie et le Tansimat* (Paris, 1882); E. Diarault, *La Question d'Orient depuis ses origines jusqu'à nos jours* (Paris, 1898); V. Bérard, *La Turquie et l'Hellénisme* (Paris, 1897); idem, *Le Sultan, l'Islam et les Puissances* (Paris, 1907); idem, *La Révolution turque* (1909).

(3) *Official Publications and Collections of Treaties*: Sir E. Hertzel's *Treaties Regulating the Trade, &c., between Great Britain and Turkey* (London, 1875) presents a summary of all the principal treaties between Turkey and other states; see also Gabriel Effendi Noradoughlian, *Recueil d'actes internationaux de l'empire ottoman, 1300-1789*, t. i. (Paris, 1897). Much valuable information is to

be obtained from parliamentary papers. These are too numerous for detailed mention, but the following periods may be cited as the most interesting: 1833-1841 (Egyptian question); 1849-1859 (Crimean War and the events by which it was preceded and followed); 1868-1869 (Cretan insurrection); 1875-1881 (Bosnian and Herzegovinian insurrection, Russo-Turkish War, Berlin treaty and subsequent events); 1885-1887 (union of Eastern Rumeilia with Bulgaria); 1889-1890 (Cretan disturbances); 1892-1899 (Armenian and Cretan affairs); 1902-1907 (Macedonia); 1908-1910 (revolution and reform). Some analysis of the unpublished documents in the record office, for the period 1815-1841, by W. Alison Phillips, will be found in the bibliographies to chs. vi. and xvii. of vol. x. of the *Cambridge Modern History*. (X.)

Literature.

In all literary matters the Ottoman Turks have shown themselves a singularly uninventive people, the two great schools, the old and the new, into which we may divide their literature, being closely modelled, the one after the classics of Persia, the other after those of modern Europe, and more especially of France. The old or Persian school flourished from the foundation of the empire down to about 1830, and still continues to drag on a feeble existence, though it is now out of fashion and cultivated by none of the leading men of letters. These belong to the new or European school, which, in spite of the bitter opposition of the partisans of the old Oriental system, has succeeded, partly through its own inherent superiority and partly through the talents and courage of its supporters, in expelling its rival from the position of undisputed authority which it had occupied for upwards of five hundred years. For the present purpose it will be convenient to divide the old school into three periods, which may be termed respectively *ON School*. Of these the first extends from the early days of the empire to the accession of Suleimân I., 1501-1520 (700-926); the second from that event to the accession of Mahmûd I., 1520-1730 (926-1143); and the third from that date to the accession of 'Abd-ul-'Azîz, 1730-1861 (1143-1277).

The works of the old school in all its periods are entirely Persian in tone, sentiment and form. We find in them the same beauties and the same defects that we observe in the production of the Iranian authors. The formal elegance and conventional grace, alike of thought and of expression, so characteristic of Persian classical literature, pervade the works of the best Ottoman writers, and they are likewise imbued, though in a less degree, with that spirit of mysticism which runs through so much of the poetry of Irân. But the Ottomans did not stop here: in their romantic poems they chose as subjects the favourite themes of their Persian masters, such as Leyli and Mejnân, Khusev and Shirin, Yûsuf and Zuleykâh, and so on; they constantly allude to Persian heroes whose stories occur in the *Shâh-Nâmâ* and other store-houses of Iranian legendary lore; and they wrote their poems in Persian metres and in Persian forms. The *mesnevi*, the *kasida* and the *ghazel*—all of them, so far at least as the Ottomans are concerned. Persian—were the favourite verse-forms of the old poets. A *mesnevi* is a poem written in rhyming couplets, and is usually narrative in subject. The *kasida* and the *ghazel* are both monorhythmic: the first as a rule celebrates the praises of some great man, while the second discourses of the joys and woes of love. Why Persian rather than Arabian or any other literature became the model of Ottoman writers is explained by the early history of the race (see *Turks*). Some two centuries before the arrival of the Turks in Asia Minor the Seljûks, then a mere horde of savages, had overrun Persia, where they settled and adopted the civilization of the people they had subdued. Thus Persian became the language of their court and government, and when by-and-by they pushed their conquests into Asia Minor, and founded there the Seljûk Empire of Rûm, they carried with them their Persian culture, and diffused it among the peoples newly brought under their sway. It was the descendants of those Persianized Seljûks whom the early Ottomans found ruling in Asia Minor on their arrival there. What had happened to the Seljûks two centuries before happened to the Ottomans now: the less civilized race adopted the culture of the more civilized; and, as the Seljûk Empire fell to pieces and the Ottoman came gradually to occupy its place, the sons of men who had called themselves Seljûks began thenceforth to look upon themselves as Ottomans. Hence the vast majority of the people whom we are accustomed to think of as Ottomans are so only by adoption, being really the descendants of Seljûks or Seljûkian subjects, who had derived from Persia whatever they possessed of civilization or of literary taste. An extraordinary love of precedent, the result apparently of conscious want of original power, was sufficient to keep their writers loyal to their early guide for centuries, till

at length the allegiance, though not the fashion of it, has been changed in our own days, and Paris has replaced Shiráz as the shrine towards which the Ottoman scholar turns. While conspicuously lacking in creative genius, the Ottomans have always shows themselves possessed of receptive and assimilative powers to a remarkable degree, the result being that the number of their writers both in prose and verse is enormous. Of course only a few of the most prominent, either through the intrinsic merit of their work or through the influence they have had on that of their contemporaries, can be mentioned in a brief review like the present. It ought to be premised that the poetry of the old school is greatly superior to the prose.

Ottoman literature may be said to open with a few mystic lines, the work of Sultán Veled, son of Mauláná Jelál-ud-Din, the author of the great Persian poem the *Mahnavé*. Sultán Veled flourished during the reign of 'Osmán I., though he did not reside in the territory under the rule of that prince. Another mystic poet of this early time was 'Ashik Pasha, who left a long poem in rhyming couplets, which is called, inappropriately enough, his *Dívân*. The nocturnal expedition across the Hellespont by which Suleimán, the son of Orkhan, won Gallipoli and therewith a foothold in Europe for his race, was shared in and celebrated in verse by a Turkish noble or chieftain named Gházi Fázil. Sheikhí of Kermyán, a contemporary of Mahommed I. and Murád II., wrote a lengthy and still esteemed *mesnevi* on the ancient Persian romance of Kháurev and Shirin; and about the same time Yaziji-oghlu gave to the world a long versified history of the Prophet, the *Mubannediya*. The writers mentioned above are the most important previous to the capture of Constantinople; but there is little literature of real merit prior to that event. The most notable prose work of this period is an old collection of stories, the *History of the Forty Verses*, said to have been compiled by a certain Sheikh-záda and dedicated to Murád II. A few years after Constantinople passed into the hands of the Ottomans, some ghazels, the work of the contemporary Tatar prince, Mir 'Ali Shir, who under the *nom de plume* of Neváyi wrote much that shows true talent and poetic feeling, found their way to the Ottoman capital, where they were seen and copied by Ahmed Pasha, one of the viziers of Mahommed II. The poems of this statesman, though possessing little merit of their own, being for the most part translations from Neváyi, form one of the landmarks in the history of Ottoman literature. They set the fashion of ghazal-writing; and their appearance was the signal for a more regular cultivation of poetry and a greater attention to literary style and to refinement of language. In Sinán Pasha (d. 1420), another minister of Mahommed the Conqueror, Ottoman prose found its first exponent of ability; he left a religious treatise entitled *Tasarru'ât* (Supplications), which, notwithstanding a too lavish employment of the resources of Persian rhetoric, is as remarkable for its clear and lucid style as for the beauty of many of the thoughts it contains. The most noteworthy writers of the Conqueror's reign are, after Ahmed and Sinán, the two lyric poets Nejâti and Záti, whose verses show a considerable improvement upon those of Ahmed Pasha, the romantic poets Jemâli and Hamdi, and the poetesses Zeyneb and Mihri. Like most of his house, Mahommed II. was fond of poetry and patronized men of letters. He himself tried versification, and some of his lines which have come down to us appear quite equal to the average work of his contemporaries. Twenty-one out of the thirty-four sovereigns who have occupied the throne of 'Osmán have left verses, and among these Selim I. stands out, not merely as the greatest ruler, warrior and statesman, but also as the most gifted and most original poet. His work is unhappily for the greater part in the Persian language; the excellence of what he has done in Turkish makes us regret that he did so little. The most prominent man of letters under Selim I. was the legist Kemâl Pasha-záda, frequently called Ibn-Kemâl, who distinguished himself in both prose and verse. He left a romantic poem on the loves of Yûsuf and Zuleykha, and a work entitled *Nigârîstán*, which is modelled both in style and matter on the *Gulistan* of Sa'di. His contemporary, Meshîf, whose beautiful verses on spring are perhaps better known in Europe than any other Turkish poem, deserves a passing mention.

With the accession of Selim's son, Suleimán I., the classical period begins. Hitherto all Ottoman writing, even the most highly finished, had been somewhat rude and uncouth; but now a marked improvement becomes visible alike in the manner and the matter, and authors of greater ability begin to make their appearance. Fuzûli (d. 1563), one of the four great poets of the old school, seems to have been a native of Bagdad or its neighbourhood, and probably became an Ottoman subject when Suleimán took possession of the old capital of the caliphs. His language, which is very peculiar, seems to be a sort of mixture of the Ottoman and Aserbaïjan dialects of Turkish, and was most probably that of the Persian Turks of those days. Fuzûli showed far more originality than any of his predecessors; for, although his work is naturally Persian in form and in general character, it is far from being a mere echo from Shiráz or Isfahán. He struck out a new line for himself, and was a source of inspiration to no previous poet. An intense and passionate ardour, and a sense of the most remarkable as well as of the most beautiful of his style; for, while

few even among Turkish poets are more artificial than he, few seem to write with greater earnestness and sincerity. His influence upon his successors has scarcely been as far-reaching as might have been expected—a circumstance which is perhaps in some measure owing to the unfamiliar dialect in which he wrote. Besides his *Dívân*, he left a beautiful *mesnevi* on the story of Leyli and Mejnûn, as well as some prose works little inferior to his poetry. Báki (d. 1599), of Constantinople, though far from rivaling his contemporary Fuzûli, wrote much good poetry, including one piece of great excellence, an elegy on Suleimán I. The Ottomans have as a rule been particularly successful with elegies; this one by Báki has never been surpassed. Rúhi, Lámi'i Nev'i, the jannisyar Yahya Beg, the mufti Ebû-Su'ûd and Selim II. all won deserved distinction as poets. During the reign of Ahmed I. arose the second of the great poets of the old Ottoman school, Nev'i of Erzerum, who owes his pre-eminence to the brilliance of his *kasidas*. But Nev'i could revile as well as praise, and such was the bitterness of his satires that certain influential personages who came under his lash induced Murád IV. to permit his execution. Nev'i, who, like Fuzûli, formed a style of his own, had many to imitate him, of whom Sabri Shâkir, a contemporary, was the most successful. Nâ'ili, Jevri and Fehim need not detain us; but Nâbi (d. 1712), who flourished under Ibrahim and Mahommed IV., calls for a little more attention. This prolific author copied, and so imported into Ottoman literature, a didactic style of ghazal-writing which was then being introduced in Persia by the poet Sa'ib; but so closely did the pupil follow in the footsteps of his master that it is not always easy to know that his lines are intended to be Turkish. A number of poets, of whom Seyyid Vehbí, Râghib Pasha, Rahmî of the Crimea, Kelim and Sâmî are the most notable, took Nâbi for their model. Of these, Sâmî is remarkable for the art with which he constructed his ghazels. Among the writers of this time who did not copy Nâbi are Sâbit, Râsik and Tálib, each of whom endeavoured, with no great success, to open up a new path for himself. We now reach the reign of Ahmed III., during which flourished Nedim, the greatest of all the poets of the old school. Little appears to be known about his life further than that he resided at Constantinople and was alive in the year 1727 (A. H. 1140). Nedim stands quite alone: he copied no one, and no one has attempted to copy him. There is in his poetry a joyousness and sprightliness which at once distinguishes it from the work of any other Turkish author. His ghazels, which are written with great elegance and finish, contain many graceful and original ideas, and the words he makes use of are always chosen with a view to harmony and cadence. His *kasidas* are almost equal to his ghazels; for, while they rival those of Nev'i in brilliancy, they surpass them in beauty of diction, and are not so artificial and dependent on fantastic and far-fetched conceits. The classical period comes to an end with Nedim; its brightest time is that which falls between the rise of Nev'i and the death of Nedim, or, more roughly, that extending from the accession of Ahmed I. 1603 (1012), to the deposition of Ahmed III., 1730 (1143).

We will now glance at the prose writers of this period. Under the name of *Humâyûn Nâma* (Imperial Book) 'Ali Chelebi made a highly esteemed translation of the well-known Persian classic *Amâr-i Sukeyst*, dedicating it to Suleimán I. Sa'd-ud-Din (d. 1599), the preceptor of Murád III., wrote a valuable history of the empire from the earliest times to the death of Selim I. This work, the *Tâj-ut-Tevârikh* (Crown of Chronicles), is reckoned, on account of its ornate yet clear style, one of the masterpieces of the old school, and forms the first of an unbroken series of annals which are written, especially the later among them, with great minuteness and detail. Of Sa'd-ud-Din's successors in the office of imperial historiographer the most remarkable for literary power is Na'imî. His work, which extends from 1591 (1000) to 1659 (1070), contrasts strongly with that of the earlier historian, being written with great directness and lucidity, combined with much vigour and picturesqueness. Evliya, who died during the reign of Mahommed IV., is noted for the record which he has left of his travels in different countries. About this time Tash-kopri-záda began and 'A'â-ullah continued a celebrated biography of the legists and sheikhs who had flourished under the Ottoman monarchs. Háji Khalifa, frequently termed Kâtib Chelebi, was one of the most famous men of letters whom Turkey has produced. He died in 1658 (1068), having written a great number of learned works on history, biography, chronology, geography and other subjects. The Persianizing tendency of this school reached its highest point in the productions of Veysi, who left a *Life of the Prophet*, and of Nergisî, a miscellaneous writer of prose and verse. Such is the intentional obscurity in many of the compositions of these two authors that every sentence becomes a puzzle, over which even a scholarly Ottoman must pause before he can be sure he has found its true meaning. The first printing-press in Turkey was established by an Hungarian who had assumed the name of Ibrahim, and in 1728 (1141) appeared the first book printed in that country; it was Vanqulî's Turkish translation of Jevhen's Arabic dictionary.

Coming now to the post-classical period, we find among poets worthy of mention Beligh, Nevres, Hishmet and Sunbul-záda Vehbí, each of whom wrote in a style peculiar to himself. Three poets of note—Pertev, Nesbet and Sheikh Ghâlib—flourished under Selim III. The last-named is the fourth great poet of the old

Classical
Prose
Writers.

school. *Huss u 'Ashb* (Beauty and Love), as his great poem is called, is an allegorical romance full of tenderness and imaginative power. Ghâlib's style is as original as that of Fuzuli. Neft or Nedim. The most distinguished prose writers of this period are perhaps Râshid, the imperial historiographer, 'Aim, who translated into Turkish two great lexicons, the Arabic *Kâmûs* and the Persian *Burhân-i Kâfî*, and Kâni, the only humorous writer of merit belonging to the old school.

When we reach the reign of Mahmûd II., the great transition period of Ottoman history, during which the civilization of the West began to struggle in earnest with that of the East.

Transition Period. We find the change which was coming over all things Turkish affecting literature along with the rest, and preparing the way for the appearance of the new school. The chief poets of the transition are Fâzil Bey, Wâsîf, notable for his not altogether unhappy attempt to write verses in the spoken language of the capital, 'Izzet Molla, Pervez Pasha, 'Akif Pasha, and the poetesses Fitnet and Leylâ. In the works of all of these, although we occasionally discern a hint of the new style, the old Persian manner is still supreme.

More intimate relations with western Europe and a pretty general study of the French language and literature, together with the steady progress of the reforming tendency fairly started under Mahmûd II., resulted in the birth of the new or modern school, whose objects are truth and simplicity.

Modern School. In the political writings of Reshid and 'Akif Pashas we have the first clear note of change; but the man to whom more than to any other the new departure owes its success is Shînâfî Effendi, who employed it (1850) for poetry as well as for prose. The European style, on its introduction, encountered the most violent opposition, but now it alone is used by living authors of repute. If any of these does write a pamphlet in the old manner, it is merely as a *tour de force*, or to prove to some faithful but clamorous partisan of the Persian style that it is not, as he supposes, lack of ability which causes the modern author to adopt the simpler and more natural fashion of the West. The whole tone, sentiment and form of Ottoman literature have been revolutionized by the new school: varieties of poetry hitherto unknown have been adopted from Europe; an altogether new branch of literature, the drama, has arisen; while the sciences are now treated and seriously studied after the system of the West. Among writers of this school who have won distinction are Ziyâ Pasha, Jevdet Pasha, the statesman and historian, Ekrem Bey, the author of a beautiful series of miscellaneous poems, *Zemzema*, Hâmid Bey, who holds the first place among Ottoman dramatists, and Kemâl Bey (d. 1878), the leader of the modern school and one of the most illustrious men of letters whom his country has produced. He wrote with conspicuous success in almost every branch of literature—history, romance, ethics, poetry and the drama; and his influence on the Young Turk party of later days was profound. (For the Turkish language see **TURKS**.)

(E. J. W. G.)

The *magnus opus* in English on Turkish poetry is E. J. W. Gibb's *History of Ottoman Poetry* (5 vols., 1900-8, vol. v. ed. E. G. Browne).

TURKEY, an abbreviation for Turkey-Cock or Turkey-Hen as the case may be, a well-known large domestic gallinaceous bird. How it came by this name has long been a matter of discussion, for it is certain that this valuable animal was introduced to Europe from the New World, and in its introduction had nothing to do with Turkey or with Turks, even in the old and extended sense in which that term was applied to all Mahomedans. But it is almost as unquestionable that the name was originally applied to the bird which we know as the guinea-fowl (*q.v.*), and there is no doubt that some authors in the 16th and 17th centuries curiously confounded these two species. As both birds became more common and better known, the distinction was gradually perceived, and the name "turkey" became restricted to that from the New World—possibly because of its repeated call-note—to be syllabled *turk, turk, turk*, whereby it may be almost said to have named itself (cf. *Notes and Queries*, 6th series, vol. iii. pp. 23, 369). But even Linnaeus could not clear himself of the confusion, and unhappily misapplied the name *Meleagris*, undeniably belonging to the guinea-fowl, as the generic term for what we now know as the turkey, adding thereto as its specific designation the word *gallopavo*, taken from the *Gallopavo* of C. Gesner,

who, though not wholly free from error, was less mistaken than some of his contemporaries and even successors.¹

The turkey, so far as we know, was first described by Oviedo in his *Sumario de la natural historia de las Indias* (cap. xxxvi.), said to have been published in 1527. He, not unaturally, includes both curassows and turkeys in one category, calling both "Pavos" (peafowls); but he carefully distinguishes between them, pointing out among other things that the latter make a wheel (*hacen la rueda*) of their tail, though this was not so grand or so beautiful as that of the Spanish "Pavo," and he gives a faithful though short description of the turkey. The chief point of interest in his account is that he speaks of the species having been already taken from New Spain (Mexico) to the islands and to Castilla del Oro (Daríen), where it bred in a domestic state among the Christians. Much labour has been given by various naturalists to ascertain the date of its introduction to Europe, to which we can at present only make an approximate attempt; but after all that has been written it is plain that evidence occurs to show that the bird was established in Europe by 1530—a very short time to have elapsed since it became known to the Spaniards, which could hardly have been before 1518, when Mexico was discovered. The possibility that it had been brought to England by Cabot or some of his successors earlier in the century is not to be overlooked, and reasons will presently be assigned for supposing that one of the breeds of English turkeys may have had a northern origin;² but the oft-quoted ditch first given in Baker's *Chronicle* (p. 298), asserting that turkeys came into England in the same year—and that year by reputation 1524—as crabs, pickerels and other commodities, is wholly untrustworthy, for we know that both these fishes lived in the country long before, if indeed they were not indigenous to it. The earliest documentary evidence of its existence in England is a "constitution" set forth by Cranmer in 1547, which Hearne first printed (*Leland's Collectanea*, 2d ed., vol. vi. p. 38). This names "Turkey-cocke" as one of the "greater fowles" of which an ecclesiastic was to have "but one in a disse," and its association with the crane and swan precludes the likelihood of any confusion with the guinea-fowl. Moreover the comparatively low price of the two turkeys and four turkey-chicks served at a feast of the sergeants-at-law in 1555 (*Dugdale, Origines*, p. 135) points to their having become by that time abundant, and indeed by 1573 Tusser bears witness to the part they had already begun to play in "Christmas husbandlie fare." In 1555 both sexes were characteristically figured by Belon (*Oyseaux*, p. 249), as was the cock by Gesner in the same year, and these are the earliest representations of the bird known to exist.

As a denizen of the poultry-yard there are at least two distinct breeds, though crosses between them are much commoner than purely-bred examples of either (see **POULTRY**). That known as the Norfolk breed is the smaller of the two, and is said to be the less hardy. Its plumage is black. The chicks also are black, with occasionally white patches on the head. The other breed, called the Cambridge, is much more variegated in colour, and some parts of the plumage have a bright metallic gloss, while the chicks are generally mottled with brownish grey. This has been much crossed with the American Bronze, the largest of all, which has the beautiful metallic plumage of the wild bird, with the

¹ The French *Cog* and *Ponde d'Inde* (whence *Dindon*) involve no contradiction, looking to the general idea of what India then was. One of the earliest German names for the bird, *Kalkuttisch Hain* (whence the Scandinavian *Kalkon*), must have arisen through some mistake at present inexplicable; but this does not refer, as is generally supposed, to Calcutta, but to Calicut on the Malabar coast (cf. *Notes and Queries*, 6th series, vol. x. p. 185).

² Purchas (*Pilgrimes*, iii. 995) in 1625 quoted both from this and from the same author's *Hystoria general*, said to have been published a few years later.

³ The bibliography of the turkey is so large that there is here no room to name the various works that might be cited. Recent research has failed to add anything of importance to what has been said on this point by Buffon (*Oyseaux*, ii. 132-162), Pennant (*Arctic Zoology*, pp. 291-300)—an admirer of the summary—and Broderip (*Zoological Recreations*, pp. 120-137)—not that all their statements can be wholly accepted. Barrington's essay (*Miscellanies*, pp. 127-151), to prove that the bird was known before the discovery of America and was transported thither, is an ingenious piece of special pleading which his friend Pennant did him the real kindness of ignoring.

⁴ In 1672 Josselin (*New England's Rarities*, p. 9) speaks of the settlers bringing up "great store of the wild kind of turkeys, which remain about their houses as tame as ours in England." The bird was evidently plentiful down to the very seaboard of Massachusetts, and it is not likely to have been domesticated by the Indian tribes there, as, according to Hernandez, it seems to have been by the Mexicans. It was probably easy to take alive, and, as we know, capable of enduring the voyage to England.

Mexican form of which it quite agrees in colour. White, pied and buff turkeys are also often seen, and if care be taken they are commonly found to "breed true." Occasionally turkeys, the cocks especially, occur with a top-knot of feathers, and one of them was figured by Albin in 1738. It has been suggested with some appearance of probability that the Norfolk breed may be descended from the northern form, *Meleagris gallopavo* or *americana*, while the Cambridge breed may spring from the southern form, the *M. mexicana* of Gould (*Proc. Zool. Society*, 1856, p. 61), which indeed it very much resembles, especially in having its tail-coverts and quills tipped with white or light ochreous—points that recent North American ornithologists rely upon as distinctive of this form. If this supposition be true, there would be reason to believe in the double introduction of the bird into England at least, as already hinted, but positive information is almost wholly wanting.¹ The northern form of wild turkey, whose habits have been described in much detail by all the chief writers on North American birds, is now extinct in the settled parts of Canada and the eastern states of the Union, where it was once so numerous; and in Mexico the southern form, which would seem to have been never abundant since the conquest, has been for many years rare. Farther to the south, on the borders of Guatemala and British Honduras, there exists a perfectly distinct species, *M. ocellata*, whose plumage almost vies with that of a peacock in splendour, while the bare skin which covers the head is of a deep blue studded with orange caruncles (*Proc. Zool. Society*, 1861, pl. xl.).

The genus *Meleagris* is considered to enter into the family Phasianidae, in which it forms a subfamily Meleagrinae, peculiar to North and Central America. The fossil remains of three species have been described by Professor Marsh—one from the Miocene of Colorado, and two, one much taller and the other smaller than the existing species, from the post-Pliocene of New Jersey. Both the last had proportionally long and slender legs. (A. N.)

TURKI, strictly speaking an Arabic or Persian adjective formed from Turk, used by European writers in two rather different senses. (1) It is applied to tribes or languages which are Turkish as opposed to Aryan, Semitic, &c. (2) It is used as the special designation of the tribes and languages of Kashgaria and Eastern Turkestan. (See **TURKS**.)

TURKOMAN, a name applied to certain Turkish tribes still nomad or only recently settled in Transcaspias and northern Afghanistan and Persia. (See **TURKS**.)

TURKS AND CAICOS ISLANDS, a group in the British West Indies. They belong geographically to the Bahamas and lie between 21° and 22° N. and 71° and 72° 37' W. They are of coral and sand formation, their combined area being 169 sq. m. The Turks Islands, taking their name from a species of cactus having the appearance of a turbaned head, are nine in number, but Grand Turk (10 sq. m.) and Salt Cay (5½ sq. m.) are the only two of any size. The town of Grand Turk, on the west of the island of that name, is the seat of government and a port of registry. Salt Cay has a good harbour.

The Caicos Islands lie to the north-west of Turks Islands and are seven in number. Cockburn Harbour on South Caicos, 22 m. from Grand Turk, is the principal settlement and a port of entry. The climate, though somewhat relaxing, is healthy, but there is a scarcity of drinking water, the average annual rainfall being only 27½ in. The mean temperature is 82° F., but owing to the sea breezes the climate is never oppressive. Salt raking is the staple industry. Sisal hemp is grown, sponges are found in some quantities off the coast and there are four sponge-curing factories on the Caicos Islands. Pink pearls are occasionally found. The exports, chiefly to the United States, include salt, sponges and sisal hemp. Grand Turk is in cable communication with Bermuda and with Kingston, Jamaica, some 420 m. to the S.W.

The islands were uninhabited when, about 1678, the Bermudians began to visit them to rake the salt found in the ponds. These visits became annual and permanent settlements were made. In

1710 the British were expelled by the Spaniards, but they returned and the salt trade (largely with the American colonies) continued to be carried on by the Bermudians despite attacks by Spaniards and French, and counter-claims to the islands by the British authorities at the Bahamas, who about 1765 made good their claim. In 1799 the islands were given representation in the Bahamas Assembly, and they remained part of that colony until 1848, when on the petition of the inhabitants they were made a separate colony under the supervision of the governor of Jamaica. This arrangement proving financially burdensome the islands were in 1873 definitely annexed to Jamaica. They are governed by a commissioner assisted by a nominated legislative board. The census of 1901 showed a total population of 5287, of whom 342 were whites, the rest being negroes or mulattoes; 1751 of the inhabitants lived in Grand Turk Island.

See J. N. Bellin, *Description géographique des débouchements nord de St Dominique* (1768); the *Jamaica Handbook* (London, yearly) and Sir C. P. Lucas, *Historical Geography of the British Colonies*, vol. ii. (2nd ed., Oxford, 1905).

TURKS. The words "Turk" and "Turkish" are used in three senses, political, linguistic and ethnological. Politically, Turk means a Mahomedan subject of the sultan of Turkey. In the East at any rate it is not employed in speaking of Christians, and its application to Arabs, Albanians, Kurds, &c., living in Turkey, though not unusual, is hardly correct. The linguistic use of the name, by which it designates a well-marked division of the Ural-Altai languages and their speakers, is the most satisfactory. The languages in question are easily identified and defined (see below), and there can be little doubt that they were spoken by the vast majority of the people called Turks since the 6th century of the Christian era. Ethnographically, the use of the word presents difficulties, for it is not easy to differentiate the Turks by physique or customs from allied tribes such as the Finno-Ugrians, Mongolians and Manchus. The Bashkirs, who are probably of Finno-Ugrian stock, speak a Turkish language, and the Magyars, who speak a Ugrian language, have many Turkish characteristics. At the present day there is no difficulty in making a practical distinction between Turks and Mongols. The former speak Turkish languages, are Moslems by religion, live almost entirely in the western half of Asia and fall within the Arabic, and to some extent the European, sphere of influence; the latter speak Mongolian languages, are Buddhists by religion, live in the eastern half of Asia and fall within the sphere of Chinese influence. Yet both Turkish and Mongol traditions represent the two nations as descended from two brothers: Jenghiz Khan, the founder of the Mongol power, must have had large numbers of Turks in his armies, for the chief traces left in Europe of the Mongol invasions are the settlements of Turkish-speaking Tatars in Russia; and the name of his son, Jagatai, is commonly used for a Turkish dialect and khanate in the regions of the Oxus. In Central Asia the distinctions between tribes, nations and races are unusually fluid: we are dealing with predatory nomads for ever fighting with one another or with the settled populations round them. The conquerors enslaved the men and married the women of the conquered, a successful leader attracted round his standard men of different tribes and languages. The corps of janissaries instituted by the Turks in Europe is no doubt an illustration of what happened during many centuries in Asia. The Turks after taking Constantinople claimed from the Christian population a certain number of male children, who were brought up as Turkish soldiers with few ties or principles except obedience to their officers. There was thus a large class, of Turkish speech and Turkish habits, who had absolutely no Turkish blood in their veins. In addition to this, intermarriage has taken place to so large an extent that the modern Turks are almost entirely European in physique. Similarly, no doubt, among the hordes of Central Asia the youths of conquered tribes were absorbed and assimilated by the conquerors and lost their original language. Such transformations were facilitated by the fact that there was no great difference in the manners and customs of these tribes. They were all nomadic, mostly horsemen, and rapacious. As they settled down from time

¹ For results of a comparison of the skulls of wild and domesticated turkeys, see Dr. Henslow, in *Journ. of Comp. Medicine and Surgery*, 1861.

to time they borrowed a good deal from their more civilized neighbours, but their natural manner of life was simple and untrammelled. The Turkish-speaking tribes were apparently the most mobile and adventurous. Starting from the confines of China they reached India, Algeria and the walls of Vienna. They probably formed a large contingent in the hordes of Jenghiz and of the Huns, and perhaps the Petchenege, Avars and Comans all belonged to this group. In comparison with them the Mongol and Manchu-speaking tribes, though conquerors in the East on no mean scale, seem stationary and inactive, while the Finno-Ugrians are nomad hunters rather than warriors. To the honour of the Turks it must be said that, bad as is their administration when judged by European standards and especially when applied to Europeans, the empires of the Seljuks, Osmanlis and Moguls which they founded rise far above the ordinary standard of ephemeral Oriental dynasties.

The effect of Turkish invasions has been in the main destructive, but they have also played a considerable part in transporting both ideas and commodities from one end of the old world to the other. The achievement by which they are best known—the transplantation of Mahommedanism on to European soil—is a remarkable, though not successful, feat of this kind. But they are also largely responsible for the introduction of Mahommedanism into India, for carrying Nestorian Christianity and Persian fire-worship into China, and for the overland intercourse between China and India which fostered if it did not introduce Chinese Buddhism. They exported Chinese silk to Byzantium, and the most ancient Buddhist temple in Japan contains Persian objects which must have been brought across Asia by their caravans.

Divisions.—At the present day the name Turk is applied primarily to the people who have conquered Constantinople and the regions known as Turkey, but the following may be classed as Turkish in the sense of belonging to the same group linguistically and to some extent racially:—

1. *The Yakuts* are a Siberian tribe who inhabit the country near the banks of the middle and lower Lena, including Yakutsk and Verkhoyansk on the Yana. Their language is purely Turkish, though differing considerably from the more western Turkish idioms, but they have largely intermingled with the Tunguses. They are said to be industrious and skilful alike as artisans, traders and agriculturists. They are nominal Christians, but preserve much of their old nature worship.

2. *Tatar (q.v.) or Tartar* is a popular name which in its most correct sense is applied to Turkish-speaking Moslems in Russia, who number over three millions and are mostly remnants of the Mongol invasion which took place in the 13th century. But it is also extended rather loosely to various tribes in Siberia and elsewhere who speak Mongolian, Finnish or other languages.

The following classes of Tatars speak Turkish languages: (a) The Kazan Tatars, numbering perhaps a million. Their centre is in the government of Kazan, but they extend down both banks of the Volga as far as the government of Saratov. (b) The Astrakhan Tatars, numbering only about 10,000. (c) The Bashkirs, whose headquarters are in the government of Ufa. They appear to be a tribe of Finnish origin who have adopted a Turkish language. (d) The Tatars of the Crimea, sometimes called the Krim or Nogai Tatars, who occupied the Crimea in the 13th century and had a considerable empire from the 15th to the 17th century. There are also Nogai Tatars in the Caucasus and Kulan country. (e) There are considerable bodies of Tatars in Rumania and Bulgaria, who appear to be Nogais who have emigrated from the Crimea, Bessarabia and other parts of Russia. (f) The Tatars of the Caucasus seem to be for the most part Azerbaijani Turks mingled with Armenian, Georgian, Lesghian and other blood. But the name is often loosely applied to any Mahommedan Caucasian tribe.

3. *Kirghis (q.v.)*, nomadic tribes amounting to about three million souls who are found chiefly in Asiatic Russia. They fall into two chief divisions. (a) The Kazaks, who inhabit the northern and eastern parts of the Aral-Caspian basin, including the government of Orenburg. They do not call themselves Kirghiz, and apparently the name has been given them by the Russians in order not to confuse them with the Cossacks. (b) The Kara-Kirghiz, who are the less numerous division, live in Dzungaria, in the Altai, about lakes Balkash and Issyk-kul, and extend southwards to the Pamirs and the sources of the Oxus. Some

of them inhabit Chinese territory. Both divisions live chiefly on the produce of their herds. Their chief drink is *koumiss*, or fermented mare's milk.

4. *The Kara-Kalpaks (q.v.)* or Black-caps, who inhabit the south-eastern shores of the sea of Aral, are sometimes classed with the Kirghiz, but seem to be a separate branch of the Turki stock. They are a feeble race, apparently in process of extinction, and now number only about 50,000.

5. *Uzbek* is a political and not an ethnological denomination. It is derived from Uzbek Khan of the Golden Horde (1312-1340), and was subsequently used at the beginning of the 16th century to designate the adherents of Shaibani Khan. Finally it was employed as the name of the ruling tribes in the Central Asian khanates (much like Osmanli in Turkey), in opposition to Kirghiz and Sarts, as well as to non-Turkish tribes. The Uzbeks are accordingly a mixed race, but the elements of which they are composed are mostly Turkish. Their numbers have been estimated at about two millions. They are mostly agriculturists or dwellers in cities, not nomads.

6. *Sart* is the name commonly given to the Turkish-speaking urban population of the Central Asian khanates. It is opposed to Tajik, which denotes the agricultural, Iranian-speaking population, but both words are used very loosely and have come to mean little more than town and country people. Sart and Uzbek are also opposed in the meanings of common people and aristocracy, but many Sarts claim Uzbek descent. The word is hardly suitable for scientific use, but is employed by Russian writers as the name of the Turkish language spoken in Bokhara, Samarkand and Ferghana.

7. The various Turkish tribes found on the eastern slopes of the Tian Shan, in Kashgar, Yarkand, Khotan, &c., are the descendants of the ancient *Uighurs* or *Outighours*. These people were probably the most eastern branch of the Turks who remained behind when the first westward movements were made, but subsequently moved westward themselves. They ruled in Kashgaria from the 10th to the 12th centuries, and, like other branches of the Turks, adopted Mahommedanism. They continued, however, to use a variety of the Syriac alphabet introduced by Nestorian missionaries, and a book, the *Kudatku Bilik*, composed in their language about 1065, is extant. The Taranchis, an agricultural tribe of the Ili basin, seem also to belong to this group. The Turkish spoken in Kashgaria, &c., is often distinguished as Turki.

8. *Mogul, Moghul or Mughal*, appears to be the same word as Mongol, but is commonly restricted to the tribes who invaded northern India from Ferghana in 1526 under Baber (or Babar) and established the Mahommedan Empire of Delhi. Memoirs written by Baber in Jagatai Turkish are extant.

9. The *Koibals* and *Karagasses* of the upper Yenisei are perhaps of Finnish stock, but they speak languages akin to the Kashgarian Turki. They are sometimes called Tatars.

10. *Turkoman or Turkman* is the name usually given to the nomadic tribes who inhabit the country between the Caspian and the Oxus. They appear to be a branch of the Western Turks and not essentially different from the Osmanlis or Azerbaijani, except that until the Russian occupation of Merv they remained in the condition of predatory horse-riding nomads, much feared by their neighbours as "man-stealing Turks."

They are divided into many tribes, of which the principal are (a) The *Chaudurs* in the north-western part of the Ust-Urt and near the Kara-bog haz Gulf. (b) The *Yomuts* or *Yamuds* extending from Khiva across the Ust-Urt and along the shore of the Caspian to Persia. (c) The *Goklans* or *Goklens* settled in the Persian province of Astarabad. They are said to be the most civilized and friendly of all the Turkomans. (d) The *Tekkes*, who were the most important tribe when the Russians conquered Transcaspia. They are first heard of in the peninsula of Mangishlak, but were driven out by the Kalmecks in 1718, and subsequently occupied the Akhal and Merv oases. The Russians inflicted a crushing defeat on them at Geok-Tepe in 1881. (e) The *Sakars* inhabit the left bank of the Oxus near Charju. (f) The *Sariks* are found in the neighbourhood of Panjdat and Yulatan. (g) The *Salars*, an old and important tribe, suffered much in the course of fights with the Tekkes and in 1857 migrated to Zarabad in Persian territory near the Hari-rud. (h) The *Ersaris* are now chiefly found

near Khoja Salih. They were once a very important tribe on the upper Oxus. (i) The *Alt-elis* live near Andkhui.

11. The Turkish nomads scattered over Persian territory are often known by the name of *Azerbaijanis* or *Adharbaijanis*, though this name is strictly applicable only to the inhabitants of the province of Azerbaijan (*q.u.*), of which Tabriz is the capital. They are the descendants of various bodies of Turks who have wandered into Persia at various times, but more particularly of the Ghuzz tribes (the *Oúox* of the Greeks) who invaded it during the Seljuk period. They are also known as *llät* or *lliyät*, meaning tribes, and each tribe has its own chieftain or *llkhani* appointed by the shah.

Among the tribes are (1) The *Kajars*, who dwelt in Transcaucasia until Abbas the Great (1585-1628) forced a portion of them to settle near Astarabad. The present dynasty of Persian Shahs comes from this tribe. (2) The *Ajshars* or *Awshars* are a very numerous tribe in the province of Azerbaijan. Another division of them is found in the Anti-taurus. (3) The *Shekabis* and *Shah-seven*. The latter is a political name which has become hereditary. "those who love the shah," i.e. partisans of the Safawil dynasty (1499-1736), and of the Shiite faith. (4) The *Karakoyunlu* living near the town of Khoi. In the south of Persia are found (5) the *Abulwerdis*, (6) the *Kara-Gözü*, (7) the *Bakaris*, (8) the *Inamli* and (9) the *Kashkai*. These last perhaps include the Khalaches or Khalaj who were already settled near Herat before the arrival of the Seljuks, and from whom sprang the Indian dynasty known as Khalji (1290-1320).

12. The Turks now inhabiting the Turkish Empire fall into various categories and have entered it at various times.

a. The *Osmanlis* or *Ottomans*. This word is loosely used to mean any Mahomedan subject of the sultan, though even then it is not generally extended to Arah and Albanians. Used more strictly it means the clan of Osman and their descendants as opposed to Seljuks and other Turks. The name is genealogical rather than ethnic; for though the exploits of the Osmanlis have given them an importance in modern history far exceeding that of all the other tribes, they are not distinguished from them in language or customs. According to tradition the clan came from Khorasan, supported the Seljuks and received in return the fief of Eskishehr. In the 14th century they took Brusa from the Byzantine Empire and established a kingdom there which withstood the shock of Timur's invasion (1402). In 1453 they captured Constantinople. Until recently Turkish Mahomedans always employed the words *Osmanli* and *Osmanlija* to describe themselves and their language, and avoided the expressions *Türk* and *Türkche* as signifying semi-civilized tribes, but in the last twenty years the older words have again come into use as national designations.

b. There must be many Turks in the Ottoman dominions who have no claim to be called Osmanlis in the strict sense. Byzantine authors mention a colony of 30,000 Turks on the river Vardar in Macedonia as early as the 9th century, and many Turks in Europe are still called *Koniots* or *Konariots* and claim to be descendants of the Seljuks. After the defeat of the emperor Romanus at Manzikert (1071) Turkomans and Turks of every description poured into Asia Minor. The Tatars of the Dobrudja also seem to be an ancient settlement.

c. The *Kizil-Bash*, or red-heads, who are found in the plains of Asia Minor about Angora, Tokat and Karahissar, differ somewhat from the surrounding Turkish population in both physique and customs. They appear to be immigrants from Persian territory, where some of them still remain. They are industrious agriculturists and their women enjoy unusual freedom. They call themselves *Eski-Türk* or old Turks, and have a secret religion in which Shiite tenets seem to be combined with older pagan (or possibly Christian) elements.

d. In various parts of western and northern Asia Minor, particularly the plains of Cilicia, are found several tribes called by the Turks *Yürük* or *Yörük*. One of these is the *Yürük* near Smyrna. They are a people of nomadic habits, of a tall and a fine physique, and their women enjoy unusual freedom. They do not appear to be immigrants from Persian territory. The *Kizil-Bash*, they are said to be a branch of the *Yürük*.

Besides these there are many other Turkish tribes who may have been in Persia before the Seljuk conquest.

records no certain conclusion is possible. Such are the Huns Epthalites, Avars, Bulgars, Khazars, Comans and Petchenegs. The name Hun is perhaps identical with the Chinese Hiong-nu or with the Turkish word for ten, *on* or *un*, meaning the ten tribes. Of the Avars really nothing is known: they were an extremely barbarous people who made no settlements and disappeared as suddenly as they came. They have been identified with the Jwen-Jwen of the Chinese. The name of the Khazars has a Turkish sound: they were a relatively civilized people and had a kingdom in the neighbourhood of Astrakhan and the north Caspian which lasted for several centuries. The original Bulgarians were certainly not Slavs, though they acquired a Slavonic language, but it is more probable that they were Finno-Ugrians than Turks. The Petchenegs, also called *Harğwac* or *Harğwacra* in Greek and *Bissen* in Latin, are said to have been driven into Europe from the lower Ural by the Ghuzz (*Oúox*) at the end of the 9th century, and wandered about the northern frontiers of the Byzantine Empire for about 300 years. Perhaps some of them settled in Hungary and Bulgaria. They were, like the Avars, very barbarous and were probably Turks, for Anna Comnena says they spoke the same language as the Comans. This dialect is known by the so-called *Codex Cumanicus*. Coman or Kuman is a name given by Europeans to the tribes who occupied Moldavia and the adjacent regions in the middle ages. Rubruquis speaks of the Coman Kipchaks, and it is probable that the Comans were a hybrid Turkish tribe.

History.—The invasions and conquests of the later Turkish dynasties form an important part of the history of the world and are treated in such articles as **TURKEY**; **SELJUKS**; **TIMUR**; **MOGULS**. Here it is proposed to sketch the earlier wanderings and agglomerations (for they can hardly be called kingdoms) of Turkish tribes in eastern and central Asia. Much new information on this subject has been made accessible in the last twenty years by the discovery near the river Orkhon, to the south of Lake Baikal, of Turkish inscriptions dating from the 8th century A.D., and by the publication of materials furnished by Chinese writers. But authorities are still not entirely agreed as to the chronology of the events recorded or the identity of the names which appear in Turkish, Greek and Chinese forms, so that the following summary is for many periods tentative.

From 1400 B.C. onwards, but especially about 200 B.C., Chinese history contains notices of warlike nomads called Hiong-nu or Hsiung-nu, who were a danger to the empire. Their political power broke up in the early centuries of this era before the advance of the Sien-pi and Tobas, who appear to have been Tunguses, and from whom arose the Wei dynasty of northern China. In A.D. 433 a Hiong-nu clan called Asena or A-sbi-nä, disliking the rule of the Wei, moved eastwards and sought the protection of a people called Jw-Jen or Jwen-Jwen, who were also a kind of Hiong-nu. They are the Geougen of Gibbon and others, and their identity with the Avars has been affirmed and disputed with equal confidence. The Asena served the Jwen-Jwen as workers in iron and lived not far from the modern city of Shan-Tan in Kan-sub. In this neighbourhood was a hill called from its shape *Türkü*, *Dürkü* or *Tu-chüeh*, meaning helmet, and this is said to be the origin of the national name which has become so celebrated. The name *Tu-Kiue* (*Tou-Kiue*) or *Turk* is first used by the Chinese in recording the events of A.D. 545, and the following years, when the Turks, or descendants of the Asena, revolted against the Jwen-Jwen. These latter were crushed and disappear from history, at least under that name. The victorious Turks advanced across their territory, came into collision with the Ephthalites or Epthalites, whom they defeated, and are heard of on the Oxus about A.D. 560. The period 546-582 marks the first brilliant epoch of early Turkish history. The tribes were not divided and made the most astonishing advance under Tumen (who took the title of Ili-Khan), his brother Itsämi or She-ti-mi (perhaps the Stembis of Greek writers), his son Mokan and Itsämi's son Tardu or Ta-t'eu. Though fifty years before only a servile clan in China, they sent an embassy in 567 to the East Roman emperor Justin II., as related by Menander (C. Müller: *Fragm. hist. Græc.*, vol. iv.). The object of this mission was to open up commercial relations, especially in connection with the West, and to co-operate with the Greeks against the Persians, because the latter wished to make the Oxus the only outlet for the silk trade, and with that view to hamper the communications of the Turks with Western Europe. The ruler who sent this embassy is called in Greek

Silziboulos or Dilziboulos, corresponding to the Sinjibu of Arab chroniclers and perhaps representing Sin-jagbu in old Turkish, the latter part being a title. He has been identified with Istāmi. Justin sent an envoy to him in return a certain Zemarik, who visited the khan at Ektel or Ektag (? Ak-dagh), and several subsequent embassies were exchanged. In 598 the khan Tardu wrote to the emperor Maurice, and in 620-28 the Turks assisted Heraclius in his campaigns against Persia. Meanwhile the Turks had themselves split into two divisions with separate princes. A tendency towards division, very natural in so loose and extended a community, had been visible for some time, and the rupture was precipitated in 583 by the jealousy of Ta-lo-pien or Dalobian, who was angry at not being chosen khan. For a century and a half or so we hear of two khanates: the northern Turks, living near Lake Baikal and the southern tributaries of the Yenisei, and the western¹ Turks, who appear to have had two headquarters, one near Urumbchi and one near Aulieata, north of Tashkent. But their conquests, or at least their successful raids, extended very much farther to the west and south. In 630 the Chinese pilgrim Yuan Chwang (Hsüan Tsang) was well received by their khan, T'ung-she-ho, who exercised some kind of authority from Turfan to Merv. The Chinese followed a consistent policy of spreading dissension among these dangerous tribes and of supporting the factions which were weak or distant against those who were strong or near. Accordingly they were friendly to the western Turks until they had conquered the northern Turks. This western branch lasted until about 750 as a political name. From about 550 till 650 they were independent, and, as mentioned, allies of the east Roman Empire against the Persians. But about 650 the politics of the Nearer East were transformed by the conquests of the Arabs following on the preaching of Mahomet. After subduing Persia in 639 they spread to Transoxiana. At the same time dissension prevailed among the western Turks themselves: the five tribes called Nu-she-pi, who lived west of Issyk-kul, quarrelled with the five tribes called Tu-lu living to the east of it. The Chinese fomented the quarrel, and in 659 were able to declare that they annexed the whole territory of the western Turks, including at least Dzungaria, Tashkent, Ferghana, Bokhara, Khulm, Badakshan, Ghazni, Bamian, Udyana, Wakhan and Karateghin. But it would seem that neither the Turkish occupation nor the Chinese annexation of most of these countries was effective. From 650 to 750 the possession of them was disputed not only by the Turks and Chinese but by the Tibetans in the east and the Arabs in the west. In the west, the campaigns of Qotiba b. Moslim or Kutaiba (705-14) completed the Mahomedan conquest of Transoxiana (see CALIPHATE, sect. B § 6). In the east the really effective power seems to have been exercised by a new Turkish tribe called Turgāsh, who had capitals at Tokmak and in Ili.

For the history of the northern Turks our only authorities are the Orkhon inscriptions and Chinese writers. The half-century following on the division was prosperous for the northern as well as for the western Turks, and they menaced China; but in 630 the Chinese conquered them. This is the Chinese servitude mentioned in the inscriptions. In 682 Kutluk (also called Elteris, which seems to be a title) re-established a Turkish state on the Orkhon. He was succeeded by his brother Kapagan (or Me-Chuo), who subdued the Turgāsh, or perhaps merely drove them southwards, early in the 8th century, and was succeeded by Bilgä Kagan of the inscriptions.

This northern khanate was destroyed by a coalition of the Karluk, Uighur and Basmal in 744. These peoples, like the Turgāsh, appear to have been Turkish; for though Turk was originally the name of the clan whose destinies in its northern and western branches have just been sketched, yet there is no objection to the usage by which it is extended to the descendants

of similar clans with similar customs and as far as is known similar languages. A succession of these pressed forwards from the east. When first heard of, the Karluk inhabited the country on the Irtysh and the Urungu, and subsequently occupied Teles and Tokmak. The Uighurs belonged to the group of tribes known as Töfös or T'ie-le and established themselves at Balassagun (also known by the forms Kara-Balghasun, Kara-Balgassun and Balagasun: see KARAKORUM). This brings us to the middle of the 8th century. For the next two hundred years the Turkish element in Central Asia, though it must have been numerous, does not cut any figure in history, which is filled with the chronicles of Arab and Persian dynasties (see CALIPHATE; SAMANIDS), but in the 10th century we begin to hear of it again. Turkish adventurers founded the dynasty of Ghaznevids at Ghazni, and there was a Uighur kingdom in the east comprising Kashgar and Khotan. Boghra Khan, the ruler of this kingdom, was converted to Islam at the end of the 10th century, and it continued under various branches of Uighurs until 1120. An interesting memorial of this period is the book *Kudatku Bükik* (see below). More important politically is the rise of the Seljuks. They were the princely family of the Kabaks, who were a section of the group of tribes called Ghuzz (Oghuz, Oğuz), and are heard of in Transoxiana about 985. Their chieftains Toghrul and Chakir drove the Ghaznevids to India and established themselves as protectors of the Abbasid caliph, who formally ceded his temporal power to them. (For the history of the dynasty see SELJUKS.) Alp Arslan, the son of Chakir, defeated the Byzantines at Manzikert (1071), and prepared the way for the Ottoman conquests. His son Malik Shah ruled over nearly all the modern Turkey in Asia, and as far as the frontiers of China. On his death in 1092 his empire broke up into several pieces. Konia became the capital of the sultanate of Asia Minor and various Seljuk dynasties established themselves in Kerman, Irak and Syria. A new Turkish power was founded by the khans of Khiva, who are known as the Khwarizm-shahs. They were originally vassals of the Seljuks, with the title of tasdar or ewer-bearer, but became independent and conquered Khorasan and Irak. They had, however, to contend with yet another new arrival from the east, the Karakitais. These also were probably Turks, and were pushed westwards from China by the Kins. They conquered Kashgar, Khotan, Yarkand and later Transoxiana, pushing the Ghuzz tribes before them into Persia and Afghanistan. Their prince bore the title of gur-khan, and the Khwarizm shahs did homage to him till 1208, when they unsuccessfully revolted. But all these squabbling principalities were swept away in 1219 by the extraordinary wave of invasion which surged across Asia to Europe under Jenghiz Khan (q.v.). After the death of Jenghiz his conquests were divided, and Transoxiana, Kashgar, Badakshan, Balkh and Ghazni were given to his second son Chagatai or Jagatai. Jenghiz and his family must have been Mongols, but the name Jagatai passed to the population and language of the countries about the Oxus. It does not appear that they ever ceased to be Turkish in speech and customs. The hordes of Jenghiz must have comprised a considerable Turkish element; the Mongols had no inclination to settle in cities, and Jagatai himself lived near Kulja in the extreme east of his dominions. Though the cities in western Central Asia suffered severely the people were not Mongolized, and Mahomedan learning even flourished. But otherwise the whole history of the Jagatai khanate, which lasted from 1234 to 1370, is a confused record of dissensions with frequent intervals of anarchy. In 1321 it split into two khanates, Transoxiana and Dzungaria, and in 1370 collapsed before Timur. This great conqueror (1333-1404), who like Jenghiz had an extraordinary power of collecting and leading the hordes of Central Asia, was a native of the district of Samarkand and a Turk by descent. He conquered successively Dzungaria (1370), Persia and the Caucasus (1390), the Kipchaks on the Volga (1395), and Northern India (1398). He then invaded Syria and Asia Minor, where he defeated but did not annihilate the Osmanlis. The house of Timur did not retain his more distant conquests, but they ruled at

¹ No better name seems forthcoming, but western Turks is a most inconvenient designation because it is also used (and equally correctly) to signify the Osmanlis and Seljuks as opposed to the Turks of Transoxiana and Kashgar.

Samarkand until 1499 with the usual struggles between different branches of the family. Their possessions included, at least from time to time, the northern parts of Afghanistan and Persia, as well as Transoxiana and Turkestan. They were one of the most enlightened and cultivated of Turkish dynasties. They beautified the cities of Central Asia and were patrons of literature. The literary languages were as a rule Arabic or Persian; Turkish was used more rarely and chiefly for poetry.

The Timurids were overthrown and succeeded by the Shaibani dynasty, a branch of the house of Juji, Jenghiz Khan's eldest son, to whom his father had assigned dominions in the region north of the kingdom of Jagatai. About 1465 a number of this clan migrated into the Jagatai khanate. They were given territory on the Chu River and were known as Uzbegs. About 1500 their chief, Mahommed Shaibani or Shahi Beg, made himself master of Transoxiana and founded the Uzbek power. The chief opponent of the Uzbegs in their early days was Baber, who represented the house of Timur in the fifth generation, but he ultimately led his armies in another direction and invaded India (1526), where he founded the Mogul Empire, a far more important state than the principalities of the Oxus. The Shaibanis continued to rule in these latter till 1583, and were followed by the houses of Astrakhan and Mangit; but it is not necessary to continue here the complicated chronicles of these dynasties.

The Osmanlis, or house of Osman, the founders of the present Turkish Empire, appear to have been a clan similar to the early Seljuks or the present Turkomans of Transcaspia, who migrated into Asia Minor from Khurasan and made the neighbourhood of Brusa their headquarters. Their conspicuous position in history is mainly due to the fact that they attained pre-eminence very late and in districts very near Europe. Except for the invasion of Timur they did not suffer from the attacks of other Turks and they were able to concentrate their strength on the conquest of the decrepit Byzantine Empire.

Customs, Civilization, Religion, &c.—The Turks are imitative rather than original, and, in all their branches, have assimilated to some extent the nearest civilization whenever they have settled down. Up to the 7th century their only culture consisted of some scraps of Chinese and Indian civilization. Subsequently both the eastern and western states which they founded adopted Perso-Arabic civilization and Mohammedanism. The Osmanlis have also been affected by Byzantine and west European influences.

Chinese historians and the Turkish inscriptions of the Orkhon and Yenisei give us a good deal of information respecting the earlier condition of these tribes. We are told that the Hiung-nu lived on horseback and moved about from place to place in search of fresh pasture. They possessed horses, cattle and sheep and also camels. They had no towns or villages and no agriculture and they never stayed long in one camp, but during their halts a special piece of land was assigned to each tribe and each tent. They were ignorant of writing. The children were taught to ride and shoot, and the adults were expert archers. Their food was flesh and milk and their clothing the skins of animals. They were polygamous and a son married his deceased father's wives, except his own mother. It is expressly stated that old people were despised and neglected, but this barbarous trait disappeared from the manners of the later Turks.

Of the Turks in the 6th century the Chinese writers give a rather more flattering account. They had numerous grades of rank, and when their khan was invested with the supreme power he was carried in a carpet. When troops were levied or taxes collected, the required amount was carved on a piece of wood marked with a golden arrow as a sign of authority. Their punishments were severe. Marriage was by arrangement with the parents, not capture. The dead were kept for some time after death and the mourners gashed their faces. They sacrificed to heaven and to the spirits of their ancestors. Their amusements included singing antiphonally, playing dice and drinking *koumiss* till they were drunk. They had a written alphabet (derived from India or Syria) and a duodenary cycle of months, which were designated by the names of animals.

These were perhaps the ancestors of the Uzbegs, who were found in carts with high wheels; they were a nomadic and warlike and civilized people, but capable of being tamed.

In the Orkhon inscriptions the Chinese are mentioned, only in connection with the occupation of the country. The Chinese are mentioned as being to see that they are carefully

for glory which animate these compositions are very noticeable and also the implied obligation of the rulers to see to the prosperity of the people. The existence of the tombs and of inscriptions in Chinese characters as well as in an alphabet of Aramaic origin, and the mention of gold, silver, silk and precious objects show that the builders had looted, so to speak, a certain amount of fragmentary civilization from their neighbours. The chief deity is Heaven or Tangri (still used in Osmanli Turkish as the equivalent of Allah), who gives the kingdom to the kagans and cares for the name and reputation of the Turkish people. There are also spirits of the earth and waters. All this is very like the earliest Chinese religion. Funeral ceremonies were evidently elaborate and the cycle of years named after animals was used for chronology.

The Chinese pilgrim Hsuan Tsang was entertained by She-hu (perhaps a title), kagan of the Western Turks, near Tokmak about A.D. 630. He left an account of the barbaric splendour of his reception and alludes to the number of horses, the gold embroidery of the kagan's tent, the silk robes of his retinue, and the use of wine and music. He says the Turks were fire-worshippers and would not sit on wooden seats.

It is probable that before they were converted to Islam the Turks practised in a desultory manner Buddhism, fire-worship and Nestorian Christianity, though they never wholly accepted any of them. An interesting trace of Buddhism remains in the names Shaman and Shamanism. It would appear that the Indian word *Sramana* or *Samana* was applied to the wizards and exorcizers of the older Turkish superstition. Recent investigations have discovered the existence of a considerable Buddhist civilization at Khotan, but the time when it flourished it would appear that the mass of the population was of Iranian affinities and that the Turkish element was small.

The *Kudatku Bilik* (about 1065) gives a picture of life in Eastern Turkestan after the conversion to Islam, but still showing many traces of Chinese influence. But after this period nearly all the Turks (except a few obscure tribes like the Yakuts) adopted the Perso-Arabic civilization. Some however, such as the Kirghiz, Turkomans and Yürüks of Asia Minor, have not yet abandoned the nomadic life. The Turks seem to be everywhere characterized by their innate sense of discipline and their submissiveness to their own authorities; councils or assemblies have rarely assumed importance among them; sovereigns and even dynasties (except the house of Osman) have often been removed by violence, but the despotic form of government has never failed to secure obedience. But equally important, as explaining their military successes, is the fact, noticed alike by ancient Chinese historians and modern European officers, that the ordinary Turkish soldier has in military matters an unusual resourcefulness and power of initiative which, without impairing discipline, renders him independent of his officers.

Language.—The Turkish or Tatar-Turkish languages belong to the Ural-Altaic family. Both nominal and verbal forms are built up solely by the addition of suffixes, and the law of vowel harmony is strictly observed. Hard and soft vowels cannot occur in the same word, and there is a tendency to assimilate the vowels of the suffix to those of the root; thus *pederiniz*, your father, but *dosunuz*, your friend. From the Mongol-Manchu languages the Turkish group is distinguished by its much more developed system of inflexion, particularly in the verbs, by its free use of pronominal suffixes, and by its more thoroughly agglutinative character. The stem with its suffixes forms a single compound word, whereas in Mongol the suffixes often seem quasi-independent. In all these features Turkish resembles the Finno-Ugric languages, but it diverges from them in having a much simpler system of cases and different phonetics, in the absence of many peculiarities such as the incorporation of the pronominal object in the verb, and in the development of some special forms, such as the expression of negation by inserting a suffix after the verbal root (*yardim*, I wrote, *yazmadim*, I did not write). The grammatical forms are more agglutinative and less inflexional than in Finnish; though they are single words, the root does not change and the elements can be easily separated, which is not always the case in Finnish. Compare the Turkish *györdünüz*, "you saw," from the root *györ*, with the equivalent Finnish *näitte* from *näät*. The *györ* in the root and suffixes is much more thorough in the Turkish than in the Finnish. The Turkish thus stands midway between Mongol and Finnish in the development of the agglutinative principle. Also, the *györ* in the root and suffixes is much more thorough in the Turkish than in the Finnish or Hungarian.

The divergence between Turkish and Mongol, and the influence of Chinese on the latter, the former seems real, though not superficial. The suffixes, and construction of sentences all show a

general similarity, and the verb in Buriat, which differs from other Mongol languages, exhibits a development parallel to Turkish.

The want of resemblance in vocabulary between the three classes of languages is remarkable. The numerals, for instance, in Turkish, Mongol and Finno-Ugric are entirely different, and considerable changes have to be assumed before the identity of words can be proved. A comparison of Turkish words with Mongol equivalents makes it probable that the former are in many instances contractions: thus *dagh*, mountain, *yol*, road, correspond to the Mongol *daboga*, *yabudal* and perhaps represent an earlier *taogah* and *yawol*. The best-known Turkish languages, particularly Osmanli, have borrowed an enormous number of Arabic and Persian words which disguise the characters of the native vocabulary and to some extent affect the grammar.

Compared with the Finno-Ugric group, the Turkish languages are remarkably uniform. Indeed, allowing for the lapse of time and the importation of foreign words, it is hardly an exaggeration to say that from the Lena to Constantinople, from the Orkhon inscriptions till now, we have merely one language in different dialects. The native vocabulary and grammar remain substantially the same. The linguistic type is evidently strongly individual and persistent, and its separation from Mongol, &c., is probably very ancient.

Radlov divides the Turkish languages or dialects into four groups, according to their phonetic system. (1) Eastern: Altai, Baraba, Lebed, Tuba, Abakan, Kükürk, Soyon, Karagass and Uighur. (2) Western: Kirghiz, Bashkir, Irtysh and Volga dialects. (3) Central Asiatic: Jagatai, Baranji, &c. (4) Southern: Turkmani, Aserbaijani, Krimm, Anatolisch Osmanli. But this classification does not seem entirely satisfactory. As one passes across Asia from the Yakuts, through Kashgar, Turkestan and Aserbaijani to Constantinople, the pronunciation of the Turkish languages becomes decidedly softer, the suffixes become more intimately united with the words to which they are appended (approaching though not attaining the unity of Finnish inflexions), and the verbal forms grow more numerous and more complicated. Thus in the east we find *sin*, *si*, *ga* as suffixes for the genitive, accusative and dative, and *man* for that of the first personal pronoun (e.g. *dumman*, I stand or I am) corresponding to *-in*, *-i*, *-a* and *-im* in Osmanli, which have clearly assumed the character of inseparable terminations more completely than the older forms. Osmanli possesses more copious verbal forms than the other dialects, some of which (such as the future in *-işib*) seem to be recent formations. On the other hand, the dialects of Turkestan use in speaking, though not in writing, forms which indicate a process of composition followed by contraction, more remarkable than any change which has taken place in the west. For instance, *wopit*, a contraction of *bolup istit*, is said to be currently used in Khokand for "has become." Yakut (which can still be best studied in Böhtlingk's excellent grammar of 1851) is the dialect which is most distinct from the others, but does not appear always to preserve the oldest forms. Thus it has lost the genitive, which is replaced by a pronominal periphrasis (e.g. *äris äis-a*, horse head-his, i.e. horse's head), and has verbal forms like *bisabin*, I cut, *bisappin*, I do not cut, apparently standing for *bisarbin*, *bisappin*. The negative suffix is *pa* not *ma*. The resemblance between the Turkish dialects is increased by the fact that they are nearly all written in a somewhat artificial and standardized form which imperfectly represents the variety existing in conversational speech.

Several alphabets have been employed to write Turkish. (1) Arabic characters are everywhere used by Mahomedan Turks, almost without exception; yet this alphabet is extremely ill suited to represent Turkish sounds. It cannot distinguish the hard and soft vowels, so that *öds*, "he was" is written in the same way as *ödsä*, "he died." In some cases the consonants indicate the character of the vowels which are to be supplied after them, hard consonants being followed by hard vowels and soft by soft. Thus the word *spelit* with the letters *haf, re*, he is pronounced as *hara*, but that *spelit* with *haf, re*, he as *herra*. Further the orthography often follows an antiquated pronunciation and the letters have many sounds. Thus the single letter *kef* can be used to express *k*, *ky*, *g*, *zy*, *y*, *v*, *w* and *n*. The result is that pure Turkish words written in Arabic letters are often hardly intelligible even to Turks and it is usual to employ Arabic synonyms as much as possible because there is no doubt as to how they should be read. Osmanli documents are often little more than a string of Arabic words with Turkish terminations.

(2) The Uighurs and Eastern Turks used in the middle ages a short alphabet of fourteen letters derived from a Syriac source and probably introduced among them by Nestorian missionaries; similar characters may also have been employed by Manichaeans. The Mongol and Manchu alphabets represent further variations of this writing. Though very like the modern Nestorian, it is in some respects more nearly allied to the Estrangelo and Syro-Palestinian alphabets of the 6th and 7th centuries. The most important

document in this alphabet is a MS. preserved at Vienna of the *Kudatlu Bilih*, "The Blessed or Fortunate Knowledge," a poem composed at Kashgar about 1065. A colophon states that the MS. was written at Herat in 1465, and that it is a copy of one written in 1085. Inscriptions in a similar alphabet have also been found in China.

(3) The most interesting forms of Turkish writing are those used on the inscriptions found in Siberia near the Yenisei and Orkhon rivers. For some time it has been known that stones bearing inscriptions as well as roughly carved figures and hunting scenes were to be found on the upper waters of the Yenisei, particularly near its tributary the Abakan in the district of Minusinsk. They were first venerated by the Soyotes inhabiting the region. They were first discovered by Messerschmidt in 1722, and some of them were represented in the plates of Strahlenberg's *Das nord. und östliche Theil von Europa und Asia* (1730). They were generally attributed to Scythians or Chudes. The knowledge of them did not much advance until the researches of Caströn (1847) and the Finnish Society of Archaeology, which in 1880 published the text of thirty-two, chiefly from the Übat, Ulukem, Altynkul and Tes. Even more interesting are the monuments discovered in 1889 and known as the Orkhon or Kosho-Taïdam inscriptions, as they were found in Mongolia to the south of Lake Baikal, between the river Orkhon and Lake Kosho-Taïdam. The most important are a mortuary inscription in Turkish and Chinese, bearing a date corresponding to 733, in honour of Kül-tegin, and another recounting the exploits of Bilgä Kagan. A third inscription at Kara-Balgassun probably dates from 800-805. The inscriptions were deciphered and translated by Thomsen and Radlov, and Donner examined the origin of the alphabet. He came to the conclusion that the Yenisei alphabet is rather older than that of the Orkhon inscriptions, and that both are derived from the Aramaic alphabet and most nearly allied to the variety of it used on the coins of the Sassanid dynasty. In the 3rd century A.D. a section of the Kirghis who subsequently moved northwards, were in West Sogdiana and in touch with the Yüeh Chi, who had been for some time in contact with Persia. The old Turkish characters bear a superficial resemblance to runes; the Yenisei letters have the simplest shapes, those of Kara-Balgassun the most complicated. But they are mostly traceable to Aramaic prototypes and have no connexion with Scandinavia. The vowels are generally omitted, even at the beginning of words, and, as in the modern Turkish method of using the Arabic alphabet, their quality is often indicated by the consonants, many of which have two forms, one used with soft the other with hard vowels. Thus *bar* and *bar* are differentiated not by the vowels but by the consonants employed to write them.

(4) Turkish-speaking Armenians and Greeks often write it in their own alphabets. Turkish newspapers printed in Armenian characters are published in Constantinople, and Greek characters are similarly employed in several parts of Asia Minor.

We may add the historians of the Mongols—D'Ohsson, Howarth and others—the numerous journals of travellers amongst Turkish peoples, and several articles in the *Russische Revue*; *Journ. Royal Asiatic Soc.*; *Revue orientale pour les études Orientaliques*, and other Oriental periodicals; Skrine and Ross, *Heart of Asia* (1899); Cahun, *Turcs et Mongols* (Paris, 1896); E. H. Parker, *A Thousand Years of the Tartars* (1895), and numerous articles, especially in the *Asiatic Quarterly* by the same author on Chinese accounts of these tribes; Chavannes, *Les Tou-hiue occidentaux* (St Petersburg, 1903).

(b). For the study of Turkish dialects the subjoined books may be used. (1) *Osmanli*: the grammars, dictionaries and chrestomathies of Wells (1880), A. Wahrund (1884) and Redhouse (1890). (2) *Uighur*: the works of Klaproth; Abel Rémusat, *Recherches sur les langues turques* (Paris, 1820); Vambéry, *Uigurische Sprachmonumente und das Kudatlu Bilih* (Innsbruck, 1870), and a newer edition by W. Radlov (St Petersburg, 1900). (3) *Jagatai*: the dictionary of Pavet de Courteille and Vambéry, *Jagataische Sprachstudien* (Leipzig, 1867). (4) *Eastern Turki*: Shaw's grammar and vocabulary (*Journ. Roy. As. Soc. of Bengal*, 1877). (5) *Tatar dialects*: the grammars of Kasimbe-Zenker (Leipzig, 1848), Ilmjinski (Kazan, 1869) and Radlov (Leipzig, 1882); *Dictionary of Trojanski* (Kazan, 1833); the chrestomathies of Bérésine (Kazan, 1857), Terentiev and especially Radlov, *Proben der Volkslitteratur der türkischen Sämme Süd-Sibiriens* (St Petersburg, 1872). (6) *Yakut*: Böhtlingk, *Die Sprache der Jakuten* (St Petersburg, 1851); Radlov, *Yakutische Sprache der ihrem Verhältnis zu den Turksprachen* (1908). (7) *Inscriptions*: *Scriptaë fennlandicae d'archæologie*; *Inscriptions de l'énisei* and several works by O. Donner, W. Radlov and V. Thomsen—especially Thomsen, *Inscriptions de l'Orkhon déchiffrées* (Helsingfors, 1896); Donner, *Sur l'origine de l'alphabet turc* (Helsingfors); Radlov, *Die alt-türkische Inschriften der Mongolei* (St Petersburg, 1897); Marquardt, *Chronologie der alt-türkischen Inschriften* (1898).

(C. E.)

TURLE, JAMES (1802-1882), English organist and composer, was born at Taunton, Somerset, and started as a choir boy at Wells Cathedral. In 1817 he became a pupil in London of the organist at Westminster Abbey, and after acting as deputy for some years he succeeded to this post himself in 1831 and held it till his death. He and Sir John Goss, the organist at St Paul's, had been fellow-pupils in London as boys. Turle was a great organist in his day, and composed a good deal of church music which is still well known. His son Henry Frederic Turle (1835-1883) was editor of *Notes and Queries*.

TURMERIC (from Fr. *terre mérite*, turmeric, Lat. *terra merita*, deserved, i.e. excellent earth; Skeat suggests that it is a barbarous corruption, perhaps of Arabic *karkam*, *kurkum*, saffron or curcuma), the tuberous root of *Curcuma longa*, L., an herbaceous perennial plant belonging to the natural order Zingiberaceae. It is a native of southern Asia, being cultivated on a large scale both on the mainland and in the islands of the Indian Ocean. Turmeric has been used from a remote period both as a condiment and as a dyestuff, and to a more limited extent as a medicine (now obsolete). In Europe it is employed chiefly as a dye, also as an ingredient in curry powder and as a chemical test for alkalies. The root is prepared by cleaning it and drying it in an oven. There are several varieties (Madras, Bengal, Gopalpur, Java, China and Cochín turmeric), differing chiefly in size and colour and to a slight degree in flavour. Some of these consist exclusively of the ovate central tubers, known as "bulbs," or "round turmeric," and others of the somewhat cylindrical lateral tubers, which are distinguished in trade as "fingers," or "long turmeric." Both are hard and tough, but break with a short resinous or waxy fracture, which varies in tint from an orange brown to a deep reddish brown. The colour is due to *curcumin*, $C_{14}H_{16}O_7$, of which the drug contains about 0.3%. When pure it forms yellow crystals having a vanilla odour and exhibiting a fine blue colour in reflected light. It is soluble in alcohol, in chloroform and in alkaline solutions, but only sparingly in water. Paper tinged with a tincture of turmeric exhibits on the addition of an alkali a reddish brown tint, which becomes violet on drying. This peculiarity was pointed out by H. A. Vogel in 1815, and since that date turmeric has been utilized as a chemical test for detecting alkalinity. It is of no therapeutic value. In Sierra Leone a kind of turmeric is obtained from a species of *Canna*.

TURNÉBUS, ADRIANUS [ADRIEN TURNÈBE] (1512-1565), French classical scholar, was born at Les Andelys in Normandy. At the age of twelve he was sent to Paris to study, and attracted great notice by his remarkable abilities. After having held the post of professor of belles-lettres in the university of Toulouse, in 1547 he returned to Paris as professor (or royal reader) of Greek at the Collège Royal. In 1552 he was entrusted with the printing of the Greek books at the royal press, in which he was assisted by his friend, Guillaume Morel (q.v.). He died of consumption on the 12th of June 1565. His works chiefly consist of philological dissertations, commentaries (on Aeschylus, Sophocles, Theophrastus, Philo and portions of Cicero), and translations of Greek authors into Latin and French. His son, Étienne, published his complete works, in three volumes (Strassburg, 1600), and his son Adrien his *Adversaria*, containing explanations and emendations of numerous passages in classical authors.

See *Oratio funebris* by Léger du Chesne (Leodegarius a Querc.) prefixed to the Strassburg edition; L. Clément, *De Adriani Turnæbi præfationibus et poematis* (1899); J. E. Sandys, *History of Classical Scholarship* (1908) iii.

TURNER, CHARLES (1773-1857), English engraver, was born at Woodstock in 1773. He entered the schools of the Royal Academy in 1795; and, engraving in stipple in the manner of Bartolozzi, he was employed by Alderman Boydell. His engraved plates, however, are in mezzotint, a method which he learned from J. M. W. Turner's "Wreck" and twenty other plates in the *studiorum*, Reynolds's "Marathon," and the *best* of Raeburn's best portraits, including that of the Duke of Devonshire. Lord Newton, Dr Hamilton, and the Duke of Devonshire, and John Robinson, and Dr A. S. Murray, were among his pupils.

Shee and Owen. He was an admirable engraver, large, broad and masterly in touch; and he reproduced with great fidelity the characteristics of the various painters whose works he translated into black and white. In 1828 he was elected an associate of the Royal Academy. He died on the 1st of August 1857.

TURNER, SIR JAMES (1615-1686), Scottish soldier and military writer, was educated with a view to his entering the Church, but early showed his preference for the profession of arms by enlisting in the Swedish army, then the most famous training-school in Europe. He saw considerable service in the Thirty Years' War, and in 1640 returned to Scotland as a captain. It was not long before he secured employment, and as a major he accompanied the Scottish army in its invasion of England in the same year, successfully avoiding the imposition of the "Covenant" as a test. With Lord Sinclair's regiment Major Turner served in Ulster, and subsequently, after failing to join Montrose's army, accompanied the Scottish army until Naseby practically ended the Civil War. Turner was often with Charles I. during his detention at Leslie's headquarters, and continually urged him to escape. Up to this time he had served against the king, but always with some repugnance, and he welcomed the opportunity when in 1648 the cause of the king and the interests of the Scottish nation for the moment coincided. In the disastrous campaign which followed Turner was at Hamilton's headquarters, and it was owing to the neglect of his advice that the rout of Preston took place. Taken in the final surrender at Uttoxeter, he spent some time in captivity, but in 1649 was released and sent abroad. He was unable for want of means to reach Montrose in time to join in the final venture of the noblest of the Royalist commanders, but he landed in Scotland on the day before Dunbar, and in the grave crisis that followed was a welcome ally. As a colonel and adjutant-general of foot he was with Charles II. at Worcester. In that battle he was captured, but regained his liberty, and after many adventures escaped to the Continent, where for some years he was engaged in various Royalist intrigues, conspiracies and attempted insurrections. At the Restoration he was knighted, and in 1662 he became a major in the Royal Guards. Four years later, as a district commander in Scotland, he was called upon to deal severely with Covenanting disturbances. Though not, it appears, unjust, his draughting methods eventually led to his being deprived of his command. The rest of his life was spent in retirement. A pension was granted to him by James II. in 1685. In 1683 he had published his *Pallas armata*, *Military Essays of the Ancient Grecian, Roman and Modern Art of War*, one of the most valuable authorities for the history of military sciences.

TURNER, JOSEPH MALLORD WILLIAM (1775-1851), English painter, was born in London on the 23rd of April 1775. His father, William Turner, a native of Devonshire, kept a barber's shop at 26 Maiden Lane, in the parish of St Paul's, Covent Garden. Of the painter's mother, Mary Marshall or Turner, little is known; she is said to have been a person of ungovernable temper and towards the end of her life became insane. Apparently the home in which Turner spent his childhood was not a happy one, and this may account for much that was unsocial and eccentric in his character. The earliest known drawing by Turner, a view of Margate Church, dates from his ninth year. It was the about this time that he was sent to his first school at New Brentford. Of education, as the term is generally understood, he received but little. His father taught him to read, and this and a few months at New Brentford and afterwards at Margate were all the schooling he ever had; he never mastered his native tongue, nor was he able in after life to learn any other language. Nevertheless this lack of education was a great advantage, as it was a legendary fact that the painter's mind was not so much affected by the artificiality of the school as that of the ordinary child. His father's death in 1789, when he was only thirteen, seems to have been a great loss to him.

At the age of fourteen he was apprenticed to the architect Thomas Baskett, and in the thirteenth year his father's death put an end to his architectural career. He then spent some time in the studio of the painter John Flaxman, and in 1794 he was introduced to the painter George Stubbs, from whose studio he was sent to the painter John Flaxman, a floral painter and a perspective draughtsman.

and from Hardwick, an architect. He also attended Paul Sandby's drawing school in St Martin's Lane. Part of his time was employed in making drawings at home, which he exhibited for sale in his father's shop window, two or three shillings being the usual price. He coloured prints for engravers, washed in backgrounds for architects, went out sketching with Girtin, and made drawings in the evenings for Dr Munro "for half a crown and his supper." When pitted in after life for the miscellaneous character of his early work, his reply was "Well and what could be better practice?" In 1789 Turner became a student of the Royal Academy. He also worked for a short time in the house of Sir Joshua Reynolds, with the idea, apparently, of becoming a portrait painter; but, the death of Reynolds occurring shortly afterwards, this intention was abandoned. In 1790 Turner's name appears for the first time in the catalogue of the Royal Academy, the title of his solitary contribution being "View of the Archbishop's Palace, Lambeth." About 1792 he received a commission from Walker, the engraver, to make drawings for his *Copper-Plate Magazine*, and this topographical work took him to many interesting places. The natural vigour of his constitution enabled him to cover much of the ground on foot. He could walk from 20 to 25 m. a day with ease, his baggage at the end of a stick, making notes and memoranda as he went. He rose early, worked hard all day, wasted no time over his simple meals, and his homely way of living made him easily contented with such rude accommodation as he chanced to find on the road. A year or two after he accepted a similar commission to make drawings for the *Pocket Magazine*, and before his twentieth year he had travelled over many parts of England and Wales. None of these magazine drawings is remarkable for originality of treatment or for artistic feeling.

Up to this time Turner had worked in the back room above his father's shop. His love of secretiveness and solitude had already begun to show itself. An architect who often employed him to put in backgrounds to his drawings says, "he would never suffer me to see him draw, but concealed all that he did in his bedroom." On another occasion, a visitor entering unannounced, Turner instantly covered up his drawings, and, in reply to the intimation, "I've come to see the drawings for—," the answer was, "You shan't see 'em, and mind that next time you come through the shop, and not up the back way." Probably the increase in the number of his engagements induced Turner about this time to set up a studio for himself in Hand Court, not far from his father's shop, and there he continued to work till he was elected an associate of the Royal Academy (1799).

Until 1792 Turner's practice had been almost exclusively confined to water colours, and his early works show how much he was indebted to some of his contemporaries. There are few of any note whose style he did not copy or adopt. His first exhibited oil picture appeared in the Academy in 1792. In 1794-1795 Canterbury Cathedral, Malvern Abbey, Tintern Abbey, Lincoln and Peterborough Cathedrals, Shrewsbury, and King's College Chapel, Cambridge, were among the subjects exhibited, and during the next four years he contributed no less than thirty-nine works to the Academy. In the catalogue of 1798 he first began to add poetic quotations to the titles of his pictures; one of the very first of these—a passage from Milton's *Paradise Lost*—is in some respects curiously prophetic of one of the future characteristics of his art:—

"Ye mists and exhalations that now rise
From hill or steaming lake, dusky or grey
Till the sun paints your fleecy skirts with gold,
In honour of the world's great author rise."

This and several other quotations in the following years show that Turner's mind was now occupied with something more than the topographical element of landscape, Milton's *Paradise Lost*, Thomson's *Seasons* being laid under frequent contributions. Descriptions of sunrise, sunset, twilight or thunder-storms. Turner's first visit to Yorkshire took place in 1797. It embraced his powers and possibly helped to change the mind of the painter. Until then his work had shown very little of the higher sense of the term: he was little more than an instinctive and tolerably accurate topographer; but

even under these conditions he had begun to attract the notice of his brother artists and of the critics. England was, at the time, at a low point both in literature and art. Among the artists De Louthembourg and Morland were almost the only men of note left. Hogarth, Wilson, Gainsborough and Reynolds had passed away. Beechey, Bourgeois, Garvey, Farington—names well-nigh forgotten now—were the Academicians who painted landscape. The only formidable rivals Turner had to contend with were De Louthembourg and Girtin, and after the death of the latter in 1802 he was left undisputed master of the field.

It is not, therefore, surprising that the exhibition of his works in 1798 was followed by his election to the associateship of the Royal Academy. That he should have attained to this position before completing his twenty-fourth year says much for the wisdom and discernment of that body, which further showed its recognition of his talent by electing him an Academician four years later. Turner owed much to the Academy. Ruskin says, "It taught him nothing." Possibly it had little to teach that he had not already been able to learn for himself; at all events it was quick to see his genius and to confer its honours, and Turner, naturally generous and grateful, never forgot this. He enjoyed the dignity of Academician for nearly half a century, and during nearly the whole of that period he took an active share in the direction of the Academy's affairs. His speeches are described as "confused, tedious, obscure, and extremely difficult to follow"; but at council meetings he was ever anxious to allay anger and bitter controversy. His opinions on art were always listened to with respect; but on matters of business it was often difficult to know what he meant. His friend Chantrey used to say, "He has great thoughts, if only he could express them." When appointed professor of perspective to the Royal Academy in 1808, this painful lack of expression stood greatly in the way of his usefulness. Ruskin says, "The zealous care with which Turner endeavoured to do his duty is proved by a series of large drawings, exquisitely tinted, and often completely coloured, all by his own hand, of the most difficult perspective subjects, illustrating not only directions of line, but effects of light, with a care and completion which would put the work of any ordinary teacher to utter shame." In teaching he would neither waste time nor spare it. With his election to the associateship of the Academy in 1799 Turner's early struggles may be considered to have ended. He had emancipated himself from back work, had given up making topographical drawings of castles and abbeys for the engravers—drawings in which mere local fidelity was the principal object—and had taken to *composing* as he drew. Local facts had become of secondary importance compared with effects of light and colour. He had reached manhood, and with it he abandoned topographical fidelity and began to paint his dreams, the visionary faculty—the true foundation of his art—asserting itself, nature being used to supply suggestions and materials.

His pictures of 1797-1799 had shown that he was a painter of no ordinary power, one having much of the poet in him, and able to give expression to the mystery, beauty and inexhaustible fullness of nature. His work at this period is described by Ruskin as "stern in manner, reserved, quiet, grave in colour, foreful in hand."

Turner's visit to Yorkshire in 1797 was followed a year or two later by a second, and it was on this occasion that he made the acquaintance, which afterwards ripened into a long and staunch friendship, of Fawkes of Farnley Hall. From 1803 till 1820 Turner was a frequent visitor at Farnley. The large number of his drawings still preserved there—English, Swiss, German and Italian, the studies of rooms, outhouses, porches, gateways, of birds shot while he was there, and of old places in the neighbourhood—prove the frequency of his visits and his affection for the place and for its hospitable master. A caricature, made by Fawkes, and "thought by old friends to be very like," shows Turner as "a little Jewish-nosed man, in an ill-cut brown tail-coat, striped waistcoat, and enormous frilled shirt, with feet and hands notably small, sketching on a small piece of paper, held down almost level with his waist." It is evident from all the accounts

given that Turner's personal appearance was not of a kind to command much attention or respect. This may have pained his sensitive nature, and led him to seek refuge in the solitude of his painting room. Had he been inclined he had abundant opportunity for social and friendly intercourse with his fellow men, but he gradually came to live more and more in a state of mental isolation. Turner could never make up his mind to visit Farnley again after his old friend's death, and his voice would falter when he spoke of the shores of the Wharfe.

Turner visited Scotland in 1800, and in 1801 or 1802 he made his first tour on the Continent. In the following year, of the seven pictures he exhibited, six were of foreign subjects, among them "Bonneville," "The Festival upon the Opening of the Vintage of Mâcon," and the well-known "Calais Pier" in the National Gallery. The last-named picture, although heavily painted and somewhat opaque in colour, is magnificently composed and full of energy.

In 1802, the year in which Turner became a Royal Academician, he took his father, who still carried on the barber business in Maiden Lane, to live with him. The old man lived in his son's house for nearly thirty years, making himself useful in various ways. It is said that he used to prepare and strain his son's canvases and varnish them when finished, which may explain a saying of Turner's that "his father used to begin and finish his pictures for him." He also attended to the gallery in Queen Anne Street, showed in visitors, and took care of the dinner, if he did not himself cook it. Turner was never the same man after his father's death in 1830, living a life of almost complete isolation.

In 1804 Turner made a second tour on the Continent, and in the following year painted the "Shipwreck" and "Fishing Boats in a Squall" (in the Ellesmere collection), seemingly in direct rivalry of Vandervelde, in 1806 the "Goddess of Discord in the Garden of the Hesperides" (in rivalry of Poussin), and in 1807 the "Sun rising through Vapour" (in rivalry of Claude).¹ The last two are notable works, especially the "Sun." In after years it was one of the works he left to the nation, on the special condition of its being hung beside the Claudes in the National Gallery. In this same year (1807) Turner commenced his most serious rivalry. Possibly it arose out of a desire to break down Claude worship—the then prevailing fashion—and to show the public that there was a living artist not unworthy of taking rank beside him. That the *Liber studiorum* was suggested by the *Liber veritatis* of Claude, and was intended as a direct challenge to that master, is beyond doubt. There is, however, a certain degree of unfairness to Claude in the way in which the challenge was given. Claude made drawings in brown of his pictures as they left the easel, not for publication, but merely to serve as private memoranda. Turner's *Liber* drawings had no such purpose, but were intended as a direct appeal to the public to judge between the two artists. The first of the *Liber* drawings was made in the autumn of 1806, the others at intervals till about 1815. They are of the same size as the plates and carefully finished in sepia. He left over fifty of these to the National Gallery. The issue of the *Liber* began in 1807 and continued at irregular intervals till 1819, when it stopped at the fourteenth number. Turner had resolved to manage the publishing business himself, but in this he was not very successful. He soon quarrelled with his engraver, F. C. Lewis, on the ground that he had raised his charges from five guineas a plate to eight. He then employed Charles Turner, who agreed to do fifty plates at the latter sum, but, after finishing twenty, he too wished to raise his price, and, as a matter of course, this led to another quarrel. Reynolds, Dunkarton, Lupton, Say, Dawe and other engravers were afterwards employed—Turner himself etching

and mezzotinting some of the plates. Each part of the *Liber* contained five plates, the subjects, divided into "historical," "pastoral," "marine," &c., embracing the whole range of landscape art. Seventy-one plates in all were published (including one as a gift of the artist to his subscribers); ten other plates—more or less completed—intended for the fifteenth and sixteenth numbers were never published, the work being stopped for want of encouragement. Absence of method and business habits may account for this. Turner is said to have got up the numbers in his own house with the help of a female servant. The plates, which cost the subscribers only five shillings apiece, were so little esteemed that in the early quarter of the 19th century they were sometimes used for lighting fires. So much has fashion, or public taste, changed since then that a fine proof of a single plate has sold for £210. The merit of the plates is unequal; some—for example, "Solway Moss," "Inverary Pier," "Hind Head Hill," "Ben Arthur," "Rizpah," "Junction of the Severn and Wye" and "Peat Bog"—are of great beauty, while a few are comparatively tame and uninteresting. Among the unpublished plates "Stonehenge at Daybreak," "The Stork and Aqueduct," "The Via Mala," "Crowhurst," and "Moonlight off the Needles" take a high place. The *Liber* shows strong traces of the influence of Cozens and Girtin, and, as a matter of course, of Claude. In most of the designs the predominant feeling is serious; in not a few, gloomy, or even tragic. A good deal has been written about Turner's intention, and the "lessons" of the *Liber studiorum*. Probably his only intention in the beginning was to show what he could do, to display his art, to rival Claude, perhaps to educate public taste, and at the same time make money. If lessons were intended they might have been better conveyed by words. "Silent always with a bitter silence, disdaining to tell his meaning"—such is Ruskin's explanation; but surely Turner had little reason for either silence or contempt because the public failed to see in landscape art the means of teaching it great moral lessons. The plates of the *Liber* contain an almost complete epitome of Turner's art. It is supposed that his original intention had been that the *Liber* should consist of one hundred plates, and drawings for that number exist, but there was no public demand for them. Already in this work are seen strong indications of one of his most remarkable characteristics—a knowledge of the principles of structure in natural objects; mountains and rocks are drawn, not with topographical accuracy, but with what appears like an intuitive feeling for geological formation; and trees have also the same expression of life and growth in the drawing of stems and branches. This instinctive feeling in Turner for the principles of organic structure is treated of at considerable length in the fourth volume of *Modern Painters*, and Turner is there contrasted with Claude, Poussin, and some of the Dutch masters, greatly to their disadvantage.

After 1797 Turner was little concerned with mere topographical facts: his pictures might be like the places represented or not; much depended on the mental impression produced by the scene. He preferred to deal with the spirit, rather than with the local details of places. A curious example of the *reasonableness* accompanying his exercise of the imaginative faculty is to be found in his creations of creatures he had never seen, as, for example, the dragon² in the "Garden of the Hesperides" and the python in the "Apollo," exhibited in 1811. Both these monsters are imagined with such vividness and reality, and the sense of power and movement is so completely expressed, that the spectator never once thinks of them as otherwise than representations of actual facts in natural history. It needs but a little comparison to see how far Turner surpassed all his contemporaries, as well as all who preceded him, in these respects. The imaginative faculty he possessed was of the highest order, and it was further aided by a memory of the most retentive

¹ This spirit of rivalry showed itself early in his career. He began by pitting himself against his contemporaries, and afterwards against the masters, notably Vandervelde and Claude. During the latter part of his life he kept up a constant rivalry with artists living in France, continuing his study of nature, and, while he was in Italy, of the works of the ancients, was accumulating that store of knowledge which in after years he was to use to such purpose.

True beauty and reality are to be found in the works of the ancients, and it was further aided by a memory of the most retentive

and unerring hand. A good illustration of this may be seen at Farnley Hall in a drawing of a "Man-of-War taking in Stores." Some one, who had never seen a first-rate, expressed a wish to know what it looked like. Turner took a blank sheet of paper one morning after breakfast, outlined the ship, and finished the drawing in three hours, young Fawkes, a son of the house, sitting beside him from the first stroke to the last. The size of this drawing is about 16 in. by 11 in. Ruskin thus describes it:—

"The hull of a first-rate occupies nearly one half of the picture to the right, her bows toward the spectator, seen in sharp perspective from stem to stern, with all her port-boles, guns, anchors and lower rigging elaborately detailed, two other ships of the line in the middle distance drawn with equal precision, a noble breezy sea, full of delicate drawing in its waves, a store ship beneath the hull of the larger vessel and several other boats, and a complicated cloudy sky, all drawn from memory, down to the smallest rope, in a drawing-room of a mansion in the middle of Yorkshire."

About the year 1811 Turner paid his first visit to Devonshire, the county to which his family belonged, and a curious glimpse of his simple manner of life is given by Redding, who accompanied him on some of his excursions. On one occasion they spent a night together in a small road-side inn, Turner having a great desire to see the country around at sunrise.

"Turner was content with bread and cheese and beer, tolerably good, for dinner and supper in one. In the little sanded room we conversed by the light of an attenuated candle and some aid from the moon until nearly midnight, when Turner laid his head upon the table and was soon fast asleep. Three or four hours' rest was thus obtained, and we went out as soon as the sun was up to explore the surrounding neighbourhood. It was in that early morning Turner made a sketch of the picture 'Crossing the Brook.'" In another excursion to Borough Island, "the morning was equally and the sea rolled boisterously into the Sound. Off Stakes Point it became stormy; our Dutch boat rode bravely over the furrows. Two of the party were ill. Turner was all the while quiet, watching the troubled scene. Bolt Head, to seaward, against which the waves broke with fury, seemed to absorb his entire notice, and he scarcely spoke a syllable. While the fish were getting ready Turner mounted nearly to the highest point of the island rock, and seemed writing rather than drawing. The wind was almost too violent for either purpose."

This and similar incidents show how careless of comfort Turner was, and how devoted to his art. The tumult and discomfort by which he was surrounded could not distract his powers of observation; and some thirty years later there is still evidence of the same kind. In the catalogue of the exhibition of 1842 one of his pictures bears the following title, "Snow-Storm: steam-boat off a harbour's mouth making signals in shallow water, and going by the lead. The author was in that storm the night the 'Ariel' left Harwich."

From 1813 till 1826, in addition to his Harley Street residence, Turner had a country house at Twickenham. He kept a boat on the river, also a pony and gig, in which he used to drive about the neighbouring country on sketching expeditions. The pony, for which Turner had a great love, appears in his well-known "Frosty Morning" in the National Gallery. He appears to have had a great affection for animals, and one instance of his tenderness of heart is given by one who often joined him in the amusement of fishing, of which Turner was very fond. "I was often with him when fishing at Petworth, and also on the banks of the Thames. His success as an angler was great, although with the worst tackle in the world. Every fish he caught he showed to me, and appealed to me to decide whether the size was worth him to keep it for the table or to return it to the river; and he was often almost touching, and he always gave the benefit of the doubt."

Turner commenced the series of drawings, forty in number, for "Cooke's Southern Coast. This work was not published until 1826. The price he at first received for these drawings was £13, 2s. 6d. The first drawing, 'Crossing the Brook,' appeared in the Academy of 1815. It is a typical example of Turner's art at this period, showing a transition from his earlier style to that of his mature years. It represents a piece of Devonshire scenery, near Farnley Hall. On the left is a group of tall pine-

trees, beautifully designed and drawn with great skill and knowledge of structure; in the foreground a couple of children, with a dog, carrying a bundle in its mouth across the brook; and beyond, a vast expanse of richly-wooded country, with glimpses of a winding river, an old bridge, a mill, and other buildings, and, in the far distance, the sea. Both in design and execution this work is founded upon Claude. Some critics consider it one of Turner's greatest works; but this is open to question. It can hardly be called a work in full colour: it is limited to greys and quiet greens for the earth and pale blues for the sky. It is a sober but very admirable picture, full of diffused daylight, and in the painting of its distance better than any master who had preceded him. The fascination of the remote, afterwards so distinctive an element in Turner's pictures, shows itself here. Perhaps nothing tests the powers or tries the skill of the landscape painter more severely than the representation of distant effects. They come and go so rapidly, are often in a high key of light and colour, and so full of mystery and delicacy, that anything approaching to real imitation is impossible. Only the most retentive memory and the most sensitive and tender feeling will avail. These qualities Turner possessed to a remarkable degree, and as his powers matured there was an ever-increasing tendency in his art to desert the foreground, where things were definite and clear, in order to dream in the infinite suggestiveness and space of distances. "Dido Building Carthage" also belongs to this period. It hangs beside the Claudes in the National Gallery. It pertains to the old erroneous school of historical painting. Towering masses of Claudesque architecture piled up on either side, porticoes, vestibules, and stone pines, with the sun in a yellow sky, represent the Carthage of Turner's imagination. With all its faults it is still the finest work of the class he ever painted. Carthage and its fate had a strange fascination for him. It is said that he regarded it as a moral example to England in its agricultural decline, its increase of luxury, and its blindness to the insatiable ambition of a powerful rival. He returned again to this theme in 1817, when he exhibited his "Decline of the Carthaginian Empire: Hostages Leaving Carthage for Rome"—a picture which Ruskin describes as "little more than an accumulation of academy student's outlines coloured brown."

In 1818 Turner was in Scotland making drawings for the *Provincial Antiquities*, for which Sir Walter Scott supplied the letterpress, and in 1819 he visited Italy for the first time. One of the results of this visit was a great change in his style, and from this time his works became remarkable for their colour. Hitherto he had painted in browns, greys and blues, using red and yellow sparingly. He had gradually been advancing from the sober grey colouring of Vandervelde and Ruysdael to the mellow and richer tones of Claude. His works now begin to show a heightened scale of colour, gradually increasing in richness and splendour and reaching its culminating point in such works as the "Ulysses," "Childe Harold's Pilgrimage," "The Golden Bough," and "The Fighting Téméraire." All these works belong to the middle period of Turner's art (1820-1830), when his powers were entirely developed and entirely unabated. Much of his most beautiful work at this period is to be found in his water-colour drawings: those executed for Whitaker's *History of Richmondshire* (1819-1821), for Cooke's *Southern Coast* (1814-1826), for *The Rivers of England* (1824), for *England and Wales* (1829-1838), *Provincial Antiquities* (1826), *Rogers's Italy* (1830), *Scott's Works* (1834), and *The Rivers of France* (1832-1835) are in many instances of the greatest beauty. Of the Richmondshire drawings Ruskin says, "The foliage is rich and marvellous in composition, the rock and bill drawing insuperable, the skies exquisite in complex form."

But perhaps one of the greatest services Turner rendered to the art of England was the education of a whole school of

¹ "Crossing the Brook" was a great favourite with Turner. It was painted for a patron, who, dissatisfied with it, left it on the painter's hands. The price asked (£500) seems to have been part of the objection. Turner subsequently refused an offer of £1600 for it.

engravers. His best qualities as a teacher came from the union of strength and delicacy in his work; subtle and delicate tonality was almost a new element for the engraver to deal with, but with Turner's teaching and careful supervision his engravers by degrees mastered it more or less successfully, and something like a new development of the art of engraving was the result. No better proof can be found of the immense advance made than by comparing the work of the landscape engravers of the pre-Turnerian period with the work of Müller, Goodall, Willmore, Cooke, Wallis, Lupton, C. Turner, Brandard, Cousen, and others who worked under his guidance. The art of steel engraving reached its highest development in England at this time. Rogers's *Italy* (1830) and his *Poems* (1834) contain perhaps the most beautiful and delicate of the many engravings executed after Turner's drawings. They are vignettes,¹ a form of art which Turner understood better than any artist ever did before—perhaps, we might add, since. "The Alps at Daybreak," "Columbus Discovering Land," and "Datur Hora Quieti" may be given as examples of the finest.

In 1828 Turner paid a second visit to Italy, this time of considerable duration, on the way visiting Nîmes, Avignon, Marseilles, Genoa, Spezzia and Siena, and in the following year he exhibited the "Ulysses Deriding Polyphemus," now in the National Gallery. It marks the beginning of the central and best period of Turner's power. This work is so well known that description is hardly needed. The galley of Ulysses occupies the centre of the picture; the oars are being thrust out and the sailors flocking up the masts to unfurl sail, while Ulysses waves the blazing olive tree in defiance of the giant, whose huge form is seen high on the cliffs above; and the shadowy horses of Phœbus are traced in the slanting rays of the rising sun. The impression this picture leaves is one of great power and splendour. The painting throughout is magnificent, especially in the sky. Leslie speaks of it as "a poem of matchless splendour and beauty." From this period onward till about 1840 Turner's life was one of unceasing activity. Nothing is more astonishing than his prodigious fertility; he rose early, worked from morning till night, entirely absorbed in his art, and gradually became more and more solitary and isolated. Between 1829 and 1839 he sent fifty-five pictures to the Royal Academy, painted many others on private commission, made over four hundred drawings for engravers, besides thousands of studies and sketches from nature. His industry accounts for the immense quantity of work he left behind him. There is not the slightest evidence to show that it arose from a desire to make money, which he never cared for in comparison with his art. He has been accused, perhaps not without some cause, of avarice and meanness in his business dealings, and many stories are told to his discredit. But in private he often did generous things, although owing to his reserved disposition his virtues were known only to a few. His faults on the other hand—thanks to the malice, or jealousy, of one or two individuals—were freely talked about and, as a matter of course, greatly exaggerated. "Keep it, and send your children to school and to church," were the words with which he declined repayment of a considerable loan to a poor drawing-master's widow. On another occasion, when interrupted in his work, he roughly chid and dismissed the applicant, a poor woman; but she had hardly left his door before he followed her and slipped a £5 note into her hand. His tenants in Harley Street were in arrears for years, but he would never allow his lawyer to distraint; and if further proof of his generosity were needed his great scheme for bettering the condition of the unfortunate in his own profession should suffice. On one occasion he is known to have taken down a picture of his own from the walls of the Academy to make room for that of an unknown artist.

¹ "Of all the artists who ever lived I think it is Turner who has the vignette most exquisitely, and, if it were possible, I should say that there was nothing harsh or rigid in his work, but that it melted into each other tenderly, and that the sense of gradation was the most perfect." (Hamerton).

The first of Turner's Venetian pictures ("Bridge of Sighs, Ducal Palace and Custom House, Venice, Canaletti Painting") appeared in the Academy in 1833. Compared with the sober, prosaic work of Canaletti, Turner's pictures of Venice appear like poetic dreams. Splendour of colour and carelessness of form generally characterize them. Venice appeared to him "a city of rose and white, rising out of an emerald sea against a sky of sapphire blue." Many of these Venetian pictures belong to his later manner, and some of them, "The State Procession bearing Giovanni Bellini's Pictures to the Church of the Redeemer" (exhibited in the Royal Academy, 1841), "The Sun of Venice Going to Sea" (1843), "Approach to Venice" (1844), and "Venice, Evening, Going to the Ball" (1845), to his latest. As Turner grew older his love of brilliant colour and light became more and more a characteristic. In trying to obtain these qualities he gradually fell into an unsound method of work, treating oil as if it had been water-colour, using both indiscriminately on the same canvas, utterly regardless of the result. Many of his finest pictures are already in a ruined state, mere wrecks of what they once were.

"The Fighting Téméraire Tugged to her Last Berth to be Broken Up" was exhibited in the Academy of 1839. By many it is considered one of his finest works. Turner had all his life been half a sailor at heart: he loved the sea, and shipping, and sailors and their ways; many of his best pictures are sea pieces; and the old ships of Collingwood and Nelson were dear to him. Hence the pathetic feeling he throws around "The Fighting Téméraire." The old three-decker, looking ghostly and wan in the evening light, is slowly towed along by a black, fiery little steam tug—a contrast suggesting the passing away of the old order of things and the advent of the new; and behind the sun sets red in a thick bank of smoke or mist. "The Slave Ship," another important sea picture, was exhibited in the following year, and in 1842 "Peace: Burial at Sea," commemorative of Wilkie.

Turner had now reached his sixty-seventh year, but no very marked traces of declining power are to be seen in his work. Many of the water-colour drawings belonging to this period are of great beauty, and, although a year or two later his other powers began to fail, his faculty for colour remained unimpaired almost to the end. He paid his last visit to the Continent in 1843, wandering about from one place to another, and avoiding his own countrymen, an old and solitary man. At his house in Queen Anne Street they were often ignorant of his whereabouts for months, as he seldom took the trouble to write to any one. Two years later (1845) his health gave way and with it both mind and sight began to fail. The works of his declining period exercised the wit of the critics. Turner felt these attacks keenly. He was naturally kind-hearted and acutely sensitive to censure. "A man may be weak in his age," he once remarked, "but you should not tell him so."

After 1845 all the pictures shown by Turner belong to the period of decay—mere ghosts and shadows of what once had been. In 1850 he exhibited for the last time. He had given up attending the meetings of the Academicians; none of his friends had seen him for months; and even his old house-keeper had no idea of his whereabouts. Turner's mind had evidently given way for some time, and with that love of secrecy which in later years had grown into a passion he had gone away to hide himself in a corner of London. He had settled as a lodger in a small house in Chelsea, overlooking the river, kept by his old Margate landlady, Mrs Booth. To the children in the neighbourhood he was known as "Admiral Booth." His short, sailor-like figure may account for the idea that he was an impoverished old naval officer. He had been ill for some weeks, and on the Queen Anne Street housekeeper at last discovered his place she found him sinking, and on the 19th of December 1851, he died. He was buried in St Paul's Cathedral, and a wish he had expressed before he had amassed his fortune, that he should be buried in the "maintenance and care of the poor in England, and of the poor in Italy." His pictures be

bequeathed to the nation, on condition that they were exhibited in rooms of their own, and that these rooms were to be called "Turner's Gallery." The will and its codicils were so confused that after years of litigation, during which a large part of the money was wasted in legal expenses, it was found impossible to decide what Turner really wanted. A compromise was effected in which the wishes of everybody, save those of the testator, were consulted, his next-of-kin, whom he did not mean to get a single farthing, inheriting the bulk of his property. The nation got all the pictures and drawings, and the Royal Academy £20,000.

If Turner had died early his reputation as an artist would have been very different from what it ultimately became. He would not have been recognized as a colourist. It was only after the year 1820 that colour began to assert itself strongly in his work. He painted for many a year in greys and greens and browns, went steadily through "the subdued golden chord," and painted yellow mists and suns rising through vapour; but as time went on that was no longer enough, and he tried to paint the sun in his strength and the full glories of sunshine. The means at the painter's disposal are, however, limited, and Turner, in his efforts after brilliancy, began to indulge in reckless experiments in colour. He could not endure even the slightest restraints which technical limitations impose, but went on trying to paint the unpaintable. As a water-colour painter Turner stands pre-eminent; he is unquestionably the greatest master in that branch of art that ever lived. If his work is compared with that of Barrett, or Varley, or Cozens, or Sandby, or any of the earlier masters, so great is Turner's superiority that the art in his hands seems to be lifted altogether into a higher region.

In 1843 a champion, in the person of John Ruskin, arose to defend Turner against the unjust and ignorant attacks of the press, and what at first was intended as a "short pamphlet, reproaching the manner and style of these critics," grew into the five volumes of *Modern Painters*. Ruskin employed all his eloquence and his great critical faculty to prove how immeasurably superior Turner was to all who had ever gone before, hardly restricting his supremacy to landscape art, and placing him among the "seven supreme colourists of the world."

Like most men of note, Turner had his enemies and detractors, and it is to be regretted that so many of the stories they set in circulation against his moral character should have been repeated by one of his biographers, who candidly admits having "spared none of his faults," and excuses himself for so doing by "what he hopes" is his "undeviating love of truth." The immense quantity of work accomplished by Turner during his lifetime, work full of the utmost delicacy and refinement, proves the singularly fine condition of his nervous system, and is perhaps the best answer that can be given to the charge of being excessively addicted to sensual gratification. In his declining years he possibly had recourse to stimulants to help his failing powers, but it by no means follows that he went habitually to excess in their use. He never lost an opportunity of doing a kindness, and under a rough and cold exterior there was more good and worth hidden than the world imagined. "During the ten years I knew him," says Ruskin, "years in which he was suffering most from the evil-speaking of the world, I never heard him say one depreciating word of any living man on any work; I never saw him look an unkind or blameful look; I never knew him let pass, without sorrowful remonstrance, an endeavour at mitigation, a blameful word spoken by any man. Of no man, but Turner, whom I have ever known say this." Twice during his earlier days there are instances leading to the belief that he had the hope of a better life; but on both occasions it ended in disappointment, and after his father died was cheerless and solitary.

Turner have been written, one by Thorbury. The work of the latter deserves the credit it gives a clear and consistent history of the artist, characterized by refined thought and critical little book by W. Cosmo Monkhouse may also

be noticed. Books upon Turner continue to appear, although it is scarcely to be expected that they can add to the facts already known about him. *Turner and Ruskin* an exposition of the work of Turner from the writings of Ruskin, edited with a biographical note on Turner by Frederick Wedmore, in two volumes, with ninety-one illustrations, was published by George Allen in 1900. Perhaps the most important recent work upon his art is Sir Walter Armstrong's *Turner* (1901), which deals at considerable length with the events of his life, and with his pictures in oil and his drawings in water-colour. It also gives so far as possible a list of his oil pictures, and for the first time a pretty full list of his water colours, although the great painter's works in both media are so numerous that it would be impossible to say that either is complete. See also J. M. W. Turner, by W. L. Wyllie, A.R.A. (1905). The great authority on the *Liber Studiorum* is W. G. Rawlinson (*Turner's Liber Studiorum*, 2nd ed., 1906). (C. R.E.)

TURNER, NAT (1800-1831), the negro leader of a slave insurrection in Virginia, known as the "Southampton Insurrection," was born in Southampton county, Virginia, in 1800. From his childhood he claimed to see visions and hear voices, and he became a Baptist preacher of great influence among the negroes. In 1828 he confided to a few companions that a voice from heaven had announced that "the last shall be first," which was interpreted to mean that the slaves should control. An insurrection was planned, and a solar eclipse in February 1831 and peculiar atmospheric conditions on the 13th of August were accepted as the signal for beginning the work. On the night of the 21st of August 1831, with seven companions, he entered the home of his master, Joseph Travis, and murdered the inmates. After securing guns, horses and liquor they visited other houses, sparing no one. Recruits were added, in some cases by compulsion, until the band numbered about sixty. About noon on the 22nd they were scattered by a small force of whites, hastily gathered. Troops, marines and militia were hurried to the scene, and the negroes were hunted down. In all thirteen men, eighteen women, and twenty-four children had been butchered. After hiding for several weeks Nat was captured on the 30th of October and was tried and hanged, having made, meanwhile, a full confession. Nineteen of his associates were hanged and twelve were sent out of the state. The insurrection, which was attributed to the teachings of the abolitionists, led to the enactment of stricter slave codes.

See S. B. Weeks, "Slave Insurrections in Virginia," in *Magazine of American History*, vol. xxxi. (New York, 1891), and W. S. Drewry, *The Southampton Insurrection* (Washington, 1900).

TURNER, SHARON (1768-1847), English historian, was born in Pentonville, London, on the 24th of September 1768. His parents came from Yorkshire. He was educated at a private school kept by Dr Davis in Pentonville, and was articled to a solicitor in the Temple in 1783, and when his master died in 1789 he continued the business. He remained in business at first in the Temple, and later in Red Lion Square till 1829, when failing health compelled him to retire. He settled for a time at Winchmore Hill, but afterwards returned to London, and died in his son's house on the 13th of February 1847. In early boyhood he had been attracted by a translation of the "Death Song of Ragnar Lodbrok," and was led by this boyish interest to make a study of early English history in Anglo-Saxon and Icelandic sources. He devoted all the time he could spare from his business to the study of Anglo-Saxon documents in the British Museum. The material was abundant and had hitherto been neglected. When the first volume of his *History of England from the earliest times to the Norman Conquest* appeared in 1799, it was at once recognized as a work of equal novelty and value. The fourth volume appeared in 1805. He also published a continuation (*History of England during the Middle Ages*), a *Modern History of England*, a *Sacred History of the World*, and a volume on *Richard III.* (1845), and he was the author of pamphlets on the copyright laws (1813).

His son, Sydney Turner (1814-1879), educated at Trinity College, Cambridge, took orders, was known as a strong partisan of reformatory schools, and died rector of Hempstead in Gloucestershire.

TURNER, WILLIAM (d. 1568), English divine, botanist and physician, was born at Morpeth in Northumberland, and was

educated at Pembroke Hall, Cambridge, where he was elected junior fellow in 1530. He learnt Greek from Nicholas Ridley, and, hearing Hugh Latimer preach, threw in his lot with the new faith. In 1538 he published his *Libellus de re herbaria*, and in 1540 set out to preach in different places. For doing this without a licence he suffered imprisonment, and on his release travelled in Holland, Germany, Italy and Switzerland, always increasing his knowledge of botany and medicine, collecting plants, and writing books on religion which were so popular in England that they were forbidden by proclamation in July 1546. On the accession of Edward VI. he became chaplain and physician to the duke of Somerset and in 1550 prebendary of York. In November 1550 he was made dean of Wells, but in 1553 was deprived, and during Queen Mary's reign lived at various places in Germany, mostly along the Rhine. Returning to England in 1558 he regained his deanery, and did all he could to disparage episcopacy and ceremonial, and to bring the Anglican Church into conformity with the Reformed Churches of Germany and Switzerland. On the complaint of his bishop, Gilbert Berkeley, he was suspended for Nonconformity in 1564. He passed his last days in Clutched Friars, London, and died on the 7th of July 1568. Turner was a sound and keen botanist, and introduced lucerne into England. He was a racy writer, a man of undoubted learning, and a vigorous controversialist.

TURNHOUT, a town of Belgium, in the province of Antwerp, 26 m. N.E. of that city. Pop. (1904), 22,162. It carries on an active industry in cloth and other manufactures. There is a breeding establishment for beeches. The hôtel de ville was formerly a palace of the dukes of Brabant. Two miles west of Turnhout is the curious penal or reformatory colony of Merxplas (pop. in 1904, 2827). The system of this establishment is to allow certain approved prisoners to follow their usual occupations within a defined area. The persons detained have complete liberty of movement, subject to the two conditions that they are under the supervision of guardians and are not allowed to cross the boundaries of the settlement. They also wear a distinct dress, and each prisoner bears a number.

TURNIP, *Brassica campestris*, var. *Rapa*, a hardy biennial, found in cornfields in various parts of England. It has been cultivated from a remote period for its fleshy roots. The tender growing tops are also used in spring as a green vegetable. The so-called "root" is formed by the thickening of the primary root of the seedling together with the base of the young stem (hypocotyl) immediately above it. The great mass of the "root" consists of soft "wood" developed internally by the cambium layer and composed mainly of thin-walled, un lignified, wood-parenchyma. The stem remains short during the first year, the leaves forming a rosette-like bunch at the top of the "bulb"; they are grass-green and bear rough hairs. In the second season the bud in the centre of the rosette forms a strong erect branched stem bearing somewhat glaucous smooth leaves. The stem and branches end in corymbose racemes of small, bright yellow flowers, which are succeeded by smooth, elongated, short-beaked pods.

The varieties of turnip are classified according to their shape as (1) long varieties, with a root three or more times as long as broad; (2) tankard or spindle-shaped varieties, with a root about twice as long as broad; (3) round or globe varieties with an almost spherical root; (4) flat varieties with a root broader than long; there are also many intermediate forms. Turnips are also grouped according to the colour of the upper part of the root which comes above ground, and according to the colour of the flesh, which is white or yellow. The yellow-fleshed varieties, many of which are probably hybrids between the turnip and swede, are more robust, of slower growth and superior feeding value to the white-fleshed turnips, and are less injured by frost.

The swede-turnip, *Brassica campestris*, var. *Napo-brassica*, differs from the turnip proper in having the first foliage-leaves glaucous, not grass-green, in colour, and the later leaves smooth and glaucous; the root bears a distinct neck with well-marked leaf-scars, the flesh is yellow or reddish-orange, firmer

nutritious, and the roots keep much better during winter. The flowers are larger and buff-yellow or pale orange in colour and the seeds are usually larger and darker than in the turnip.

Turnips should be grown in a rich friable sandy loam, such as will produce medium-sized roots without much aid from the manure heap, and are better flavoured if grown in fresh soil. In light dry soils well decomposed hotbed or farmyard manure is the best that can be used, but in soils containing an excess of organic matter, bone dust, superphosphate of lime, wood-ashes or guano, mixed with light soil, and laid in the drills before sowing the seed, are beneficial by stimulating the young plants to get quickly into rough leaf, and thus to grow out of reach of the so-called turnip fly or turnip flea (*Phyllotreta*). To get rid of this pest, it has been found beneficial to dust the plants with quicklime, and also to draw over the young plants nets smeared with some sticky substance like treacle, by which large numbers will be caught and destroyed. It has been also recommended as a palliative to sow thick in order to allow for a percentage of loss from this and other causes, but this is inadvisable, as overcrowding is apt to render the plants weak. As a preventive, gas-lime may be scattered over the surface after the seed has been sown. Lime is also effective against the disease known as "finger and toe" (q.v.).

The first sowing should be made on a warm border, with the protection of a frame or matted hoops, in January or February; the second on a well-sheltered border in March, after which a sowing once a month will generally suffice. In May and June the plot should be in a cool moderately shaded position, lest the plants should suffer from drought. The principal autumn and winter sowings, which are the most important, should be made about the end of June in the northern districts, and in the beginning of July in warmer districts; a small sowing may be made at the end of August to come in before the spring-sown crops are ready. If the weather is showery at the time of sowing, the seed quickly germinates, and the young plants should be kept growing quickly by watering with rain or pond water and by surface stirrings. The drills for the earliest sorts need not be more than 15 in. apart, and the plants may be left moderately thick in the row; the late crops should have at least 2 ft. between the rows, and be thinned to 12 in. in the row, a free circulation of air about them being very important in winter. As a precaution against prolonged periods of severe weather it has been recommended to lay the finest roots in rows, covering them well with soil, and leaving intact the whole of the foliage. The very latest sown crops of half-grown roots will prolong the supply until the earliest spring-sown crops are fit for use.

TURNPIKE, a pike or pointed bar or stake which turns or revolves, hence the name given to a form of barrier consisting of three or more horizontal bars, with one end sharpened, revolving on a pivot. Such barriers were used across roads, and, when tolls were exacted from passengers along highways to raise the money for the upkeep of the roads, the name, though not the form, was given both to the toll-gates set up at different places where the tolls were collected, and to the highways repaired under the system (see HIGHWAY).

A "turnstile," consisting of a vertical post with projecting, revolving arms, is another form of barrier, placed by the side of a gate across a road, or across a path to prevent the passage of all except foot passengers, or at the entrance to any building, park or other place as a means of controlling the admission of people, of collecting admission money and the like.

TURNSTONE, the name long given¹ to a shore-bird, from its habit of turning over with its bill such stones as it can to seek its food in the small crustaceans or other animals lurking beneath them. It is the *Tringa interpres*² of Linnaeus and *Streptopus interpres* of most later writers, and is remarkable as being perhaps the most cosmopolitan of birds; for, though properly belonging to the northern hemisphere, there is scarcely a sea-coast in the world on which it may not occur; it has been obtained from Spitzbergen to the Strait of Magellan and from Point Barrow to the Cape of Good Hope and New Zealand—examples from the southern hemisphere being, however, almost invariably in a state of plumage that shows, if not immaturity, yet an inaptitude for reproduction. It also, though rarely but commonly, resorts

¹ The name seems to appear first in *Tringa interpres* (p. 231) in 1676; but it has been used since that time which name a drawing of the bird is given by St. Thomas Brown.

² *Tringa interpres*.

to the margins of inland rivers and lakes; but it is very rarely seen except near water, and salt water for preference.
