The defences of Antwerp were designed, as the strategic centre of the national defence of Belgium, for an entrenched camp for 100,000 men. The length of the enceinte is about 9 m. The detached forts, which on the sides not defended by inundation are about 1½ m. apart and from 2 to 3 m. in front of the enceinte, are powerful works, arranged for a garrison of 1000 men. They have each a frontal crest-line of over 700 yds. and are intended for an armament of 120 guns and 15 mortars.

The general arrangement of the fronts of the enceinte should be compared with the earlier German type of Posen. It will be noticed that while the large casemated caponier at Posen breaks the enceinte and flanks it both without and within, at Antwerp the caponier is detached—a much sounder arrangement—and flanks the front only. The defence of the faces rests on the width of the wet ditches and on the flanking power of the caponier; there is no attempt to add to it by *fausse-braye* or detached wall. The dimensions are everywhere very generous, allowing free movement for the troops of the defence; the covered way is 22 yds.

FIG. 40.—Sections of fig. 39.

wide and there is a double terreplein on the face. The parapet of the face is 27 ft. thick. The masonry of the casemate guns in the caponier, first flank and low battery, is protected by earth, *à la Haxo*.

In 1859 Austria acknowledged the influence of the new artillery with some new forts at Verona. The detached forts built by Radetzky in 1848 were only from 1000 to 2000 yds. distant from the ramparts. Those now added, of which fig. 41 is an example, were from 3000 to 4000 yds. out.

In the same year the land defences of some of the British dockyards were taken in hand. These first serious attempts at

FIG. 41.—Austrian Fort at Verona.

permanent fortification in England were received with approval on the continent, as constituting an advance on anything that had been done before. The detached forts intended to keep an enemy outside bombarding distance were roomy works with small keeps. The parapets were organized for artillery and the ditches were defended by caponiers or counterscarp galleries. The forts were spaced about a mile apart and arranged so as to support each other by their fire.

The sieges of the Franco-German War of 1870 are alluded to in the section below dealing with the "Attack of Fortresses."

Period from 1870 to 1885. As regards their effect on the designs of fortification the most important thing to note is the distance to which it was thought necessary to throw out the detached forts. These distances were of course influenced by the character of the ground, but for the most part they were very largely increased.

Thus at Paris the fort at St Cyr was 18,000 yds. from the enceinte; at Verdun the distances varied from 2300 to 12,000 yds.; at Belfort the new forts were from 4500 to 11,500 yds. out; at Metz 2300 to 4500; and at Strassburg 5200 to 10,000. One result of these increased distances was of course to increase very largely the length of the zone of investment, and therefore the strength necessary for the besieging force.

As regards the character of the works, the typical shape adopted both in France and Germany was a very obtuse-angled lunette, shallow from front to rear. The German type had one parapet only, which was organized for artillery and heavily traversed, the living casemates being under this parapet. The ditch defence was provided for by caponiers and a detached wall (see fig. 42).

The French forts had two parapets, that in the rear being placed over living casemates (in two tiers, as shown in the section of fig. 43 by a dotted line), and commanding the front one. There was a long controversy as to whether the artillery of the fort should be on the upper or the lower parapet, the advocates of the upper parapet attaching great importance to the command that the guns would have over the country in front. The other school, objecting to having guns on the skyline, preferred to

sacrifice the command and place them on the lower parapet, as in fig. 43, the infantry occupying the upper parapet. It will be observed that the bastioned trace is abandoned, the ditches, like those of the German fort, being defended by caponiers.

While a great deal of work was done on these lines, a very active controversy had already begun on the general question as to whether guns should be employed in forts at all. Some

FIG. 42.—German Fort about 1880.

declared that the accuracy and power of artillery had already developed so far, that guns in fixed and visible positions must needs be put out of action in a very short time. The remedy proposed by these was the removal of the guns from the forts into "wing-batteries" which should be less conspicuous; but soon the broader idea was put forward of placing the guns in concealed positions and moving them from one to another by means of

FIG. 43.—French Fort about 1880.

previously prepared roads or railways. Others declared that there was no safety for the guns outside the forts, and that the use of steel turrets and disappearing cupolas was the only solution of the difficulty. General Brialmont, who had by this time become the first European authority on fortification questions, ranged himself on the side of the turrets. The younger

school were largely in favour of mobility and expressed themselves eagerly in a shower of pamphlets.

It was at this juncture that a new factor was introduced, namely, the obus-torpille, or long shell with high-explosive bursting charge. With its appearance we say good-bye to the old school and enter upon the consideration of the fortification of to-day.

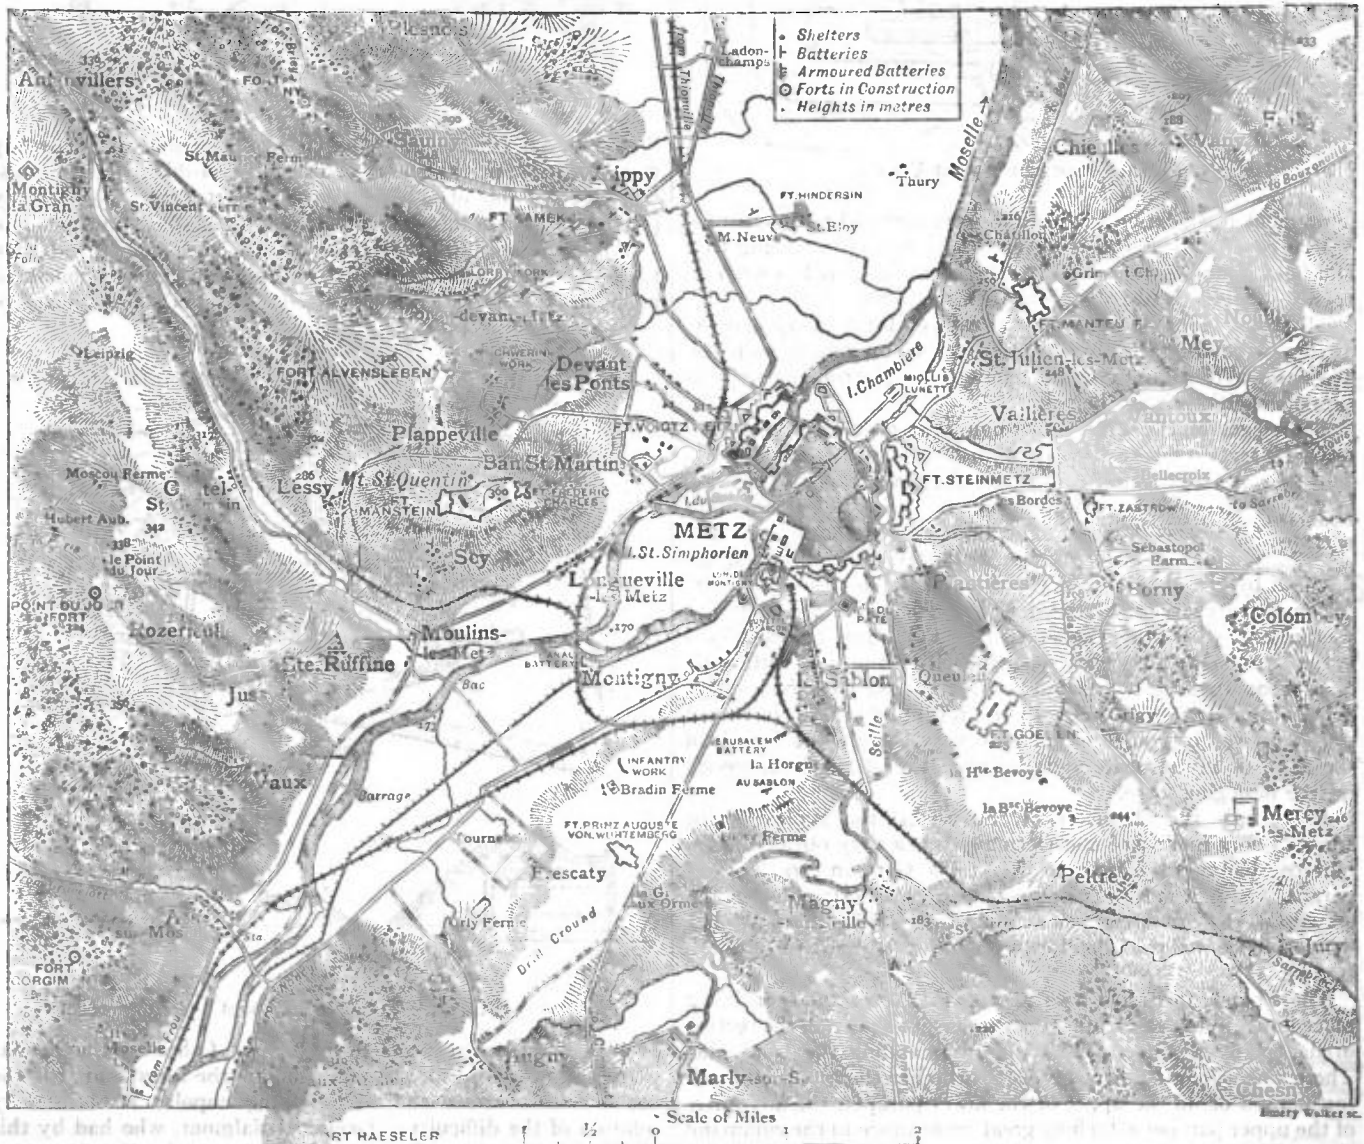

II. MODERN PERMANENT FORTIFICATION

Modern fortification dates by universal consent from 1885. The Germans had begun experiments a year or two before this, with long shell containing large charges of gun-cotton. But it was the experiments at Fort Malmaison in France in 1886 that set the military world speculating on the future of fortification. The fort was used as a target for 8-in. shell of five calibres length containing large charges of melinite. The reported effects of these made a tremendous sensation, and it was thought at first that the days of permanent fortification were over. Magazine casemates were destroyed by a single shell, and revetment walls were overturned and practicable breaches made by two or three shells falling behind them. It must be remembered, however, that the works were not adapted to meet this kind of fire. The casemates had enough earth over them to tamp the shell thoroughly, but not enough to prevent it from coming into contact with the

masonry, and the latter was not thick enough to resist the explosion of the big charges. Other experiments were made in the same direction in Germany, Holland, Belgium and Austria. The Germans used shell containing from 60 to 130 lb of high explosive.

After the first alarm had subsided foreign engineers set about adapting their works to meet the new projectiles. Revetments were enormously strengthened, and designed so that their weight resisted overturning. Concrete roofs were made from 6 to 10 ft. thick, and in many cases the surface of the concrete was left bare so as to expose a hard surface to the shell without any earth tamping. The idea of cupolas and shielded guns gained ground, and is now practically accepted all over the continent of Europe. In many cases the main armament, in some only the safety armament (see below), is in cupolas in the forts.

But meanwhile Europe had been flooded with literature on the subject, and the whole policy of fortification as well as its minutest details were discussed *ab ovo*. The extremists of both sides revelled in their opportunity. Some declared that, with the use of heavy guns and armour, fortresses could be made stronger than ever. Others held that modern fortresses were far too expensive, that their use led to strategic mistakes, and (arguing from certain well-known examples) that extemporized field defences could offer as good a resistance as permanent works.

From Plessix and Legrand's *Manuel complet de la fortification*, by permission.

FIG. 44.—Metz in 1890.

European military opinion generally is now more or less agreed on the following lines:—

1. Important places must be defended by fortresses.
2. Their girdle of forts must be far enough out to prevent the bombardment of the place.
3. An enceinte is desirable, but need not be elaborate.
4. A few guns (called "safety armament") should be in the forts, and these must be protected by armour.
5. The bulk of the artillery of the defence should be outside the forts; the direct-fire guns preferably in cupolas, the howitzers in concealed positions.
6. The forts should be connected by lines of entrenched infantry positions and obstacles, permanent bomb-proof shelters being provided for the infantry.
7. There should be ample communications—radial and peripheral—between the place and the forts, both by road and rail.
8. Special lines of communication—such as mountain passes—should be closed by barrier forts.

These considerations will now be taken somewhat more in detail, but first it will be useful to deal with the plan of Metz in 1899 (fig. 44).

Here the fortifications of successive periods can be readily recognized. First the old enceinte, unaltered by the Germans and now *déclassée*. Next the detached forts, begun by the French engineers in 1868 and still unfinished in 1870, can be readily recognized by their bastioned trace. Among them are Fort Manteuffel, formerly St Julien, and Fort Goeben (fig. 45), formerly Queuleu. These were not altered in their general lines.

From Plessix and Legrand's *Manuel complet de la fortification*, by permission.

FIG. 45.—Fort Goeben, Metz.

This early line of detached forts, less than 3000 yds. from the enceinte, was completed by the Germans with forts of polygonal type such as Fort Prinz August. The hill of St Quentin (fig. 46), a very important point, was converted into a fortified position, with two forts and connecting parapets, and a communication running north to Fort Alvensleben.

The arrangement of wing batteries in connexion with the forts can be clearly noted at Fort Manteuffel. These are reinforced by other batteries either for the defence of the intervals or to dominate important lines of approach such as the valley of the Moselle (canal battery at Montigny). To these were added later armoured batteries.

There are also infantry positions, shelters and magazines in connexion with this line.

Finally some new forts of modern type were commenced in 1899 at about 9000 yds. from the place.

Leaving out of consideration at present the strategic use of **Fortresses**, the places which, as mentioned above, are intrinsically worth being defended as fortresses are:—

- (a) Centres of national, industrial or military resources.
- (b) Places which may serve as *points d'appui* for manœuvres.
- (c) Points of intersection of important railroads.
- (d) Bridges over considerable rivers.
- (e) Certain lines of communication across a frontier.

Examples of (a) are Paris, Antwerp, Lyons, Verdun. Again for (a) and (b), as is pointed out by Plessix and Legrand, Metz in the hands of the Germans may serve both as a base of supplies and a *point d'appui* for one flank. Strassburg is a bridge-head giving the Germans a secure retreat across the Rhine if beaten in the plains of Alsace, and an opportunity of resuming the offensive when they have re-formed behind the river.

The distance of detached forts from the place depends on the range of the siege artillery and the distance at which it can usually be established from the forts, and is variously given by different continental writers at from 4 to 9 km. (4500 to 10,000 yds.). The bombarding range of siege howitzers with heavy shells is considered to be about 8000 yds., and if it is possible for them to be emplaced within say 2000 yds. of the forts, this would give a minimum distance of 6000 yds. from the forts to the body of the place. Some writers extend the minimum distance to 7 km., or nearly 8000 yds. In practice, however, it must happen that the position of the forts is determined to a very large extent by the lie of the ground. Thus some good positions for forts may be found within 4000 or

The ring of detached forts.

From Plessix and Legrand's *Manuel complet de la fortification*, by permission.

FIG. 46.—St Quentin position, Metz.

5000 yds. of the place, and no others suitable on the same front within 15,000 yds. In that case the question of expense might necessitate choosing the nearer positions. Some examples of the actual distances of existing forts have already been given. Others, more recent, are, at Bucharest 7-10 km., Lyons 8-10½, Copenhagen 7-8 and Paris 14-17. *Strategic pivots* are in a different category from other fortresses. While not necessarily protected from bombardment, they may yet have one or two forts thrown out from 9 to 12 km., to get advantage of ground. Such are Langres, Epinal and Belfort.

The Enceinte.—The desirability of this is almost universally allowed; but often it is more as a concession to tradition than for any solid reason. The idea is that behind the line of forts, which is the main defensive position, any favourable points that exist should be provisionally fortified to assist in a "step-by-step" defence; and behind these again the body of the place should be surrounded by a last line of defence, so that the garrison may resist to the last moment. It may be remarked that apart from the additional expense of an enceinte, such a position would not, under modern conditions, be the most favourable for the last stages of a defence. Again, there is the difficulty that it is practically impossible to shut in a large modern town by a continuous enceinte. It has been proposed to construct the enceinte in sections in front of the salient portions of the place. This system of course abandons several of the chief advantages claimed for an enceinte.

In actual practice enceintes have been constructed since 1870 in France and other countries, consisting of a simple wall 10 or 12 ft. high with a banquette and loopholes at intervals. This of course can only be looked upon as a measure of police. For war purposes, in face of modern artillery, it is a *reductio ad absurdum*.

The Safety Armament.—If the bulk of the artillery is to be placed in positions prepared on the outbreak of war, it is considered very necessary that a few heavy long-range guns should be permanently in position ready at any moment to keep an enemy at a distance, forcing him to open his first batteries at long range and checking the advance of his investment line. Such guns would naturally be in secure positions inside the forts, and if they are to be worked from such positions they must have armour to shield them from the concentrated fire of the numerous field artillery that a besieger could bring to bear from the first.

Artillery outside the forts constitutes the most important part of the defence, and there is room for much discussion as to whether it should have positions prepared for it beforehand

or should be placed in positions selected as the attack develops itself. On the one hand the preparation of the positions beforehand, which in many cases means the use of armour and concrete, increases very largely the initial expense of the defence, and ties the defender somewhat in the special dispositions that become desirable once the attack has taken shape. Moreover, such expenditure must be incurred on all the fronts of the fortress, whereas the results would only be realized on the front or fronts actually attacked. On the other hand much time and labour are involved in emplacing heavy and medium artillery with extemporized protection, and this becomes a serious consideration when one remembers how much work of all kinds is necessary in preparing a fortress against attack. Again, to avoid the danger of a successful attack on the intervals between the forts before their defences have been fully completed, the fire of the guns in the intermediate positions might be urgently required. The solution in any given case would no doubt depend on the importance of the place. In most cases a certain amount of compromise will come in, some preparation being made for batteries, without their being completed. Armoured batteries of whatever kind must in any case be prepared in peace time. It should not be overlooked that as, whatever theories may exist about successive lines of defence, the onus of the defence will now lie on the fort line, just as it formerly did on the enceintes, so that line should be fully prepared, and should not have to commence its fight in a position of inequality.

Defence of Intervals of Forts.—The frontal fire of the batteries in the intervals and the flanking fire of some of the guns in the forts will play an important part, but the main reliance should be on infantry defence. A fully prepared fortress would have practically a complete chain of infantry fighting positions and obstacles between the forts, at all events on the fronts likely to be seriously attacked. The positions would consist largely of fire trenches, with good communications; but it is pretty generally recognized that there

must be some *points d'appui* in the shape of redoubts or infantry forts, and also bomb-proof shelter for men, ammunition and stores near the fighting line. This is usually included in the redoubts. If they are to resist the heaviest shell, such shelters must be built in peace time.

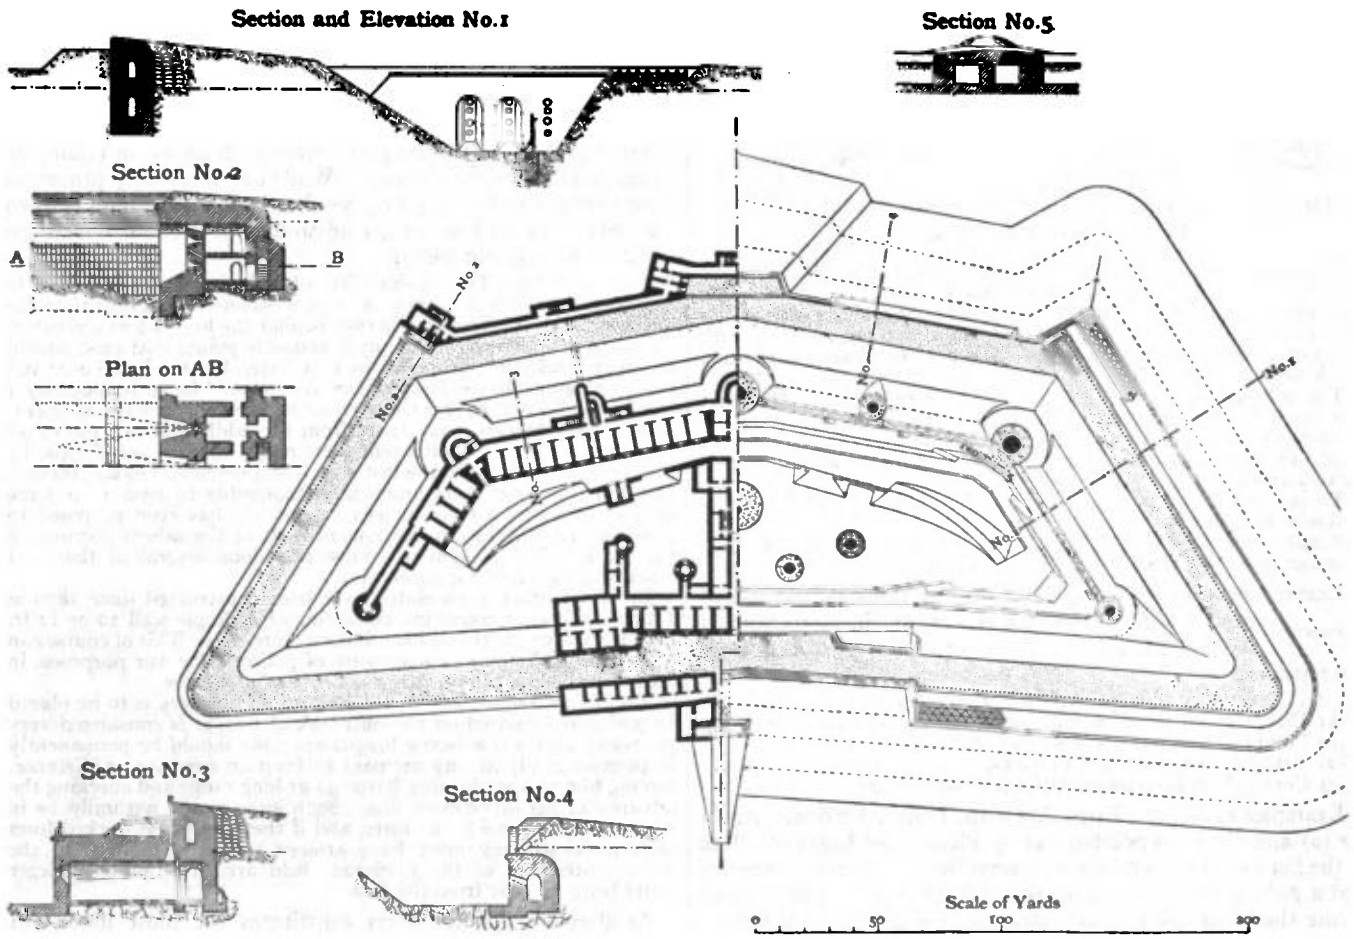

Communications are of the first importance, not merely to facilitate the movement of the enormous stores of ammunition and materials required in the fighting line, but also that defenders may fully utilize the advantage of acting on interior lines. They should include both railways and roads running from the centre of the place to the different sectors of defence, and all round, in rear of the line of forts; also ample covered approaches to the fighting line. Concealment is essential, and where the lie of the ground does not help, it must be got from earth parapets or plantations.

The principal use of barrier forts is in country where the necessary line of communication cannot be easily diverted. For instance, in a comparatively flat country a barrier fort commanding a road or railway is of little use because roads may be found passing round it, or a line of railway may be diverted for some miles to avoid it. But in mountainous country, where such diversion is impossible, it will be necessary for the enemy to capture the fort before he can advance; and the impossibility of surrounding it, the few positions from which siege artillery can be brought into play, and the fact that there is practically only one road of approach to be denied, make these positions peculiarly suitable for forts with armoured batteries. Italy makes considerable use of such forts for the defence of frontier passes.

Barrier forts.

General Brialmont's Theoretical Claim for the Defence of a Country.—Before going into details, it is worth while to state the full claim of strategic fortification advanced by General Brialmont, the most thorough of all its advocates. It is as follows:—

- A. Fortify the capital.
- B. Fortify the points where main lines of communication pass a strategic barrier.
- C. Make an entrenched camp at the most important centre of communication in each zone of invasion: and support it by one or two places arranged so as to make a fortified district.

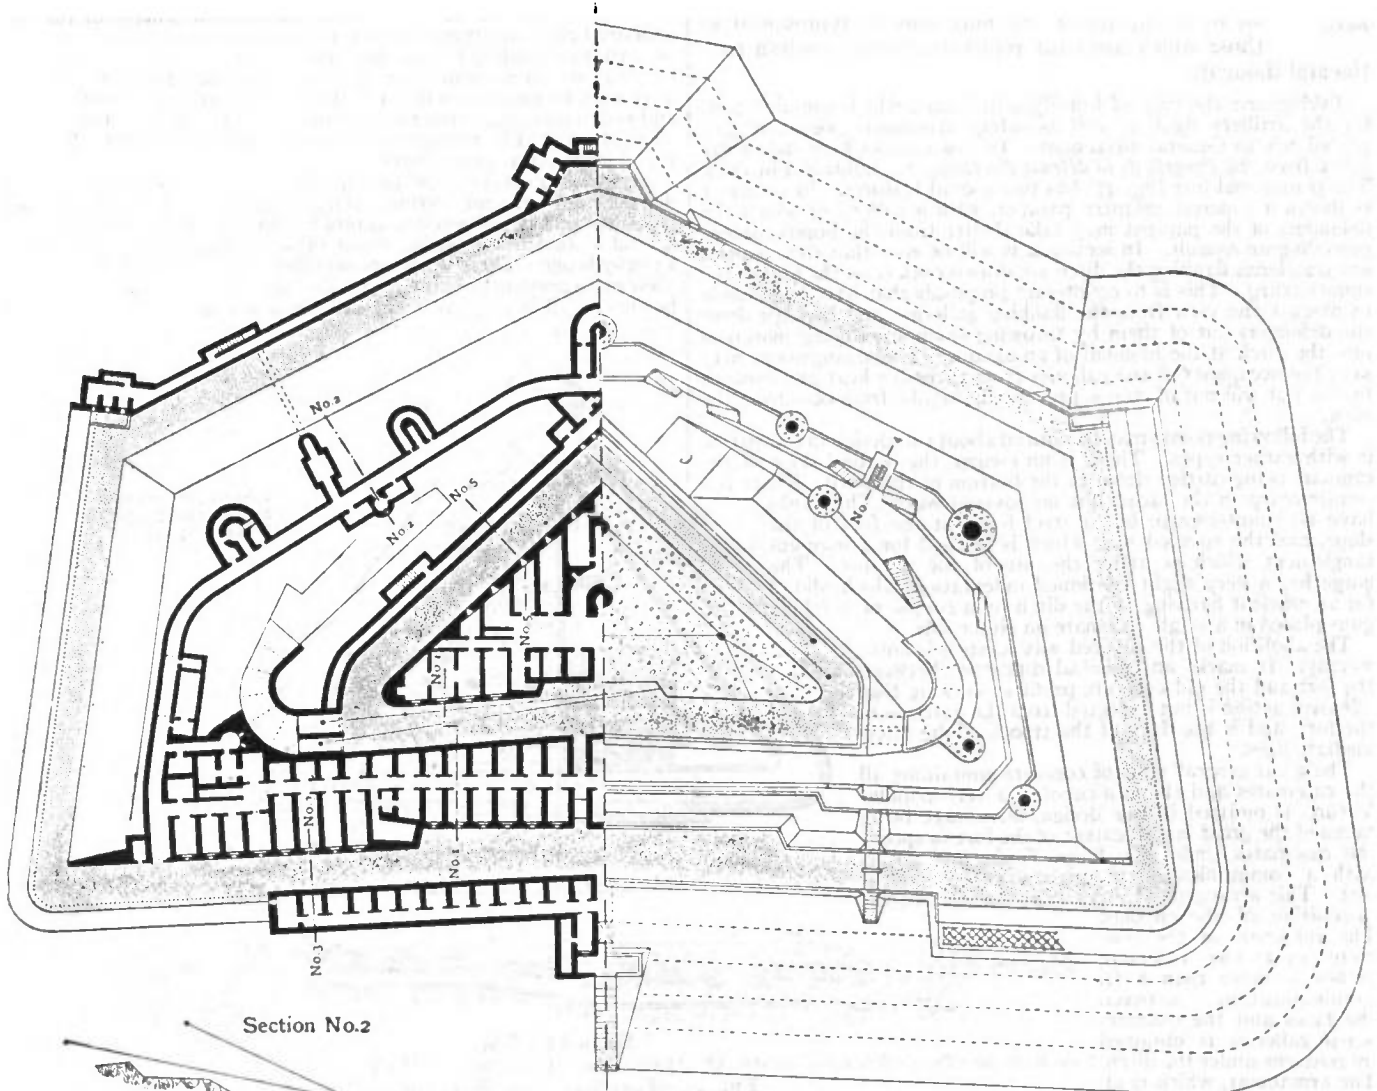

From Brialmont's *Progrès de la défense des États et de la fortification permanente depuis Vauban*, by permission of M. le Commandant G. Meerts.

FIG. 47.

- D. Close with barrier forts the lines necessary to an enemy across mountains or marshes.
- E. Make a central place behind a mountain chain as a pivot for the army watching it.
- F. Defend mountain roads by provisional fortifications.

- G. Make a large place in each theatre of war which is far from the principal theatre, and where the enemy might wish to establish himself.
 - H. Fortify coasts and harbours.
- Objections to these proposals will be readily supplied by the

From Brialmont's *Progrès de la défense des états et de la fortification depuis Vauban*, by permission of Commandant G. Meets.

FIG. 48.

officials of the national treasury and the commanders-in-chief of the active armies.

So many types of detached forts have been proposed by competent authorities, as well as actually constructed in recent years, that it is impossible here to consider all of them, and a few only will be reproduced of those which are most representative of modern continental thought.

Types of detached forts.

Taking first the type of heavily armed fort, which contains guns for the artillery fight as well as safety armament, we must give precedence to General Brialmont. The two works here shown are taken from the *Progrès de la défense des états, &c.*, published in 1898. The pentagonal fort (fig. 47) has two special features. In section 1 is shown a concrete infantry parapet, with a gallery in which the defenders of the parapet may take shelter from the bombardment preceding an assault. In section 2 it will be seen that the counterscarp galleries flanking the ditch are drawn back from the face of the counterscarp. This is to counteract proposals that have been made to obscure the view from the flanking galleries, and perhaps drive the defenders out of them by throwing smoke-producing materials into the ditch at the moment of an assault. The arrangement may save the occupants of the galleries from excessive heat and noxious fumes, but will not of course prevent the smoke from obscuring the view.

The following points may be noticed about this design in comparing it with earlier types. There is no escarp, the natural slope of the rampart being carried down to the bottom of the ditch. There is a counterscarp to the faces, but no covered way. The flanks have no counterscarp, but a steel fence at the foot of the slope, and the covered way which is utilized for a wire entanglement which is under the fire of the parapet. The gorge has a very slight bastioned indentation, which allows for an efficient flanking of the ditch by a couple of machine guns placed in a single casemate on either side.

The abolition of the covered way as such is noteworthy. It marks an essential difference between the fort and the old enceinte profiles; showing that offensive action is not expected from the garrison of the fort, and is the duty of the troops of the intermediate lines.

The great central mass of concrete containing all the casemates and the gun-cupolas, a very popular feature, is omitted in this design, advantage being taken of the great lateral extent of the fort to spread the casemates under the faces, flanks and gorge, with a communication across the centre of the fort. This arrangement gives more freedom to the disposition of the cupolas.

The thickness of the concrete over the casemate arches is more than 8 ft. Communication between the faces and the counterscarp galleries is obtained by posterns under the ditch. From Brialmont's *Progrès de la défense des états, &c.*, by permission of Commandant G. Meeds. The armament, which is all protected by cupolas, is powerful. It consists of two 150-mm. (6 in.) guns, four 120-mm. (4.7 in.) guns, two 210-mm. (8.4 in.) howitzers, two 210-mm. (8.4 in.) mortars, four 57-mm. Q.F. guns for close defence. There is also a shielded electric light projector in the centre.

This fort is a great advance on General Brialmont's designs before 1885. These were marked by great complexity of earth parapets and various *chicanes* which would not long survive bombardment. This type is simple and powerful. It is also very expensive.

The second Brialmont fort (fig. 48) is selected because it shows a keep or citadel, an inner work designed to hold out after the capture of the outer parapet. General Brialmont held strongly to the necessity of keeps for all important works. History of course gives instances of citadels which have enabled the garrison to recapture the main work with assistance, or caused a really useful delay in the progress of the general attack. It affords still more instances in which the keeps have made no resistance, or none of any value. Some think that the existence of a keep encourages the defenders of the main work; others that it encourages the idea of retreat. The British school of thought is against keeps. In any case they add largely to expense.

In the present design the keep is a mass of concrete, which depends for the defence of its front ditches on counterscarp galleries in the main work, the few embrasures for frontal defence being practically useless. Its main function is to prevent the attackers from establishing themselves on the gorge, thus leaving the way open for a reinforcement from outside to enter (assisted by bamboo flying bridges) through the passages left for the purpose in the outer and inner gorge parapets.

As regards the main work, the arrangements for defence of the ditch and the armament are similar to the design last considered.

This parapet has no concrete shelter for the defenders. The casemates are all collected in the keep and the gorge, with a passage all round giving access to the parapet and the cupolas.

Fig. 49 is a German work, Fort Molsheim at Strassburg. This is a simple type of triangular fort. The main mass of concrete rests on the gorge, and is divided by a narrow courtyard to give light and air to the front casemates. The fort has a medium armament for the artillery fight, consisting of four 6-in. howitzers in cupolas. On each face are two small Q.F. guns in cupolas for close defence, for which purpose, it will be seen, there is also an infantry parapet. At the angles are look-out turrets. The ditch has escarp and counterscarp, and is defended by counterscarp galleries at the angles. There is no covered way. The thickness of concrete over the casemates, where it is uncovered, is about 10 ft.

Fig. 50 is Fort Lyngby at Copenhagen. The new Copenhagen defences are very interesting, giving evidence of clear and original thought, and effectiveness combined with economy. There is one special feature worth noting about the outer ring of forts, of which Lyngby is one. These works are intended for the artillery fight only, their main armament being four 6-in. guns (in pairs) and three 6-in. howitzers, all in cupolas. The armament for immediate defence is

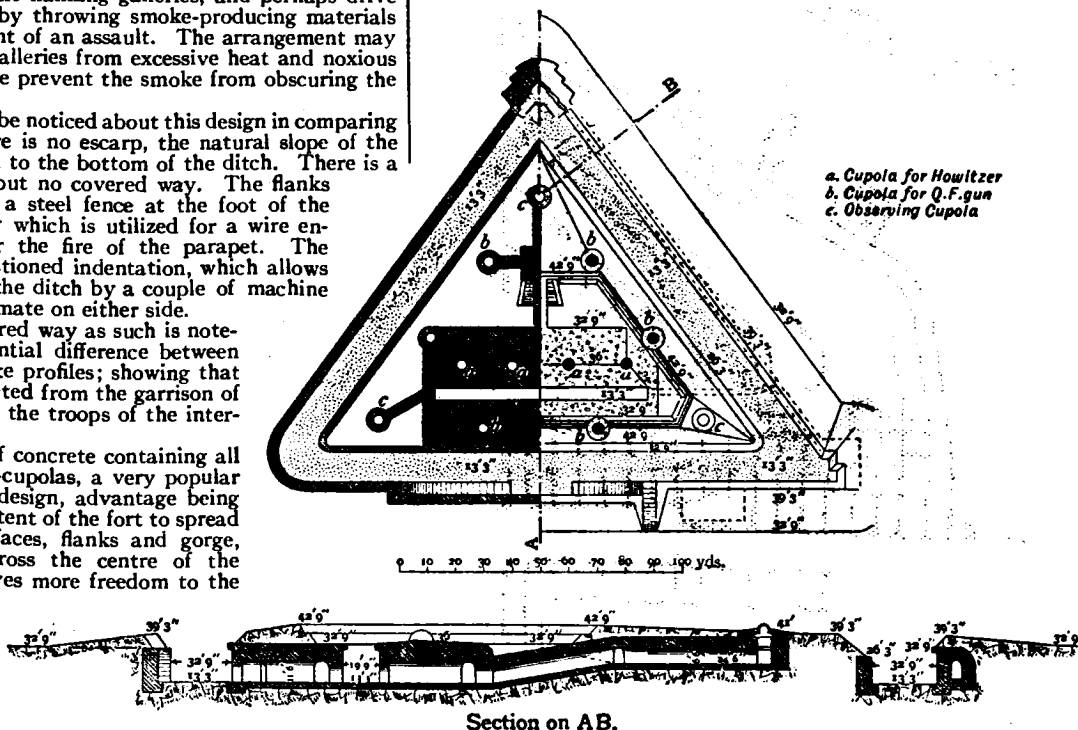

FIG. 49.—Fort Molsheim, Strassburg.

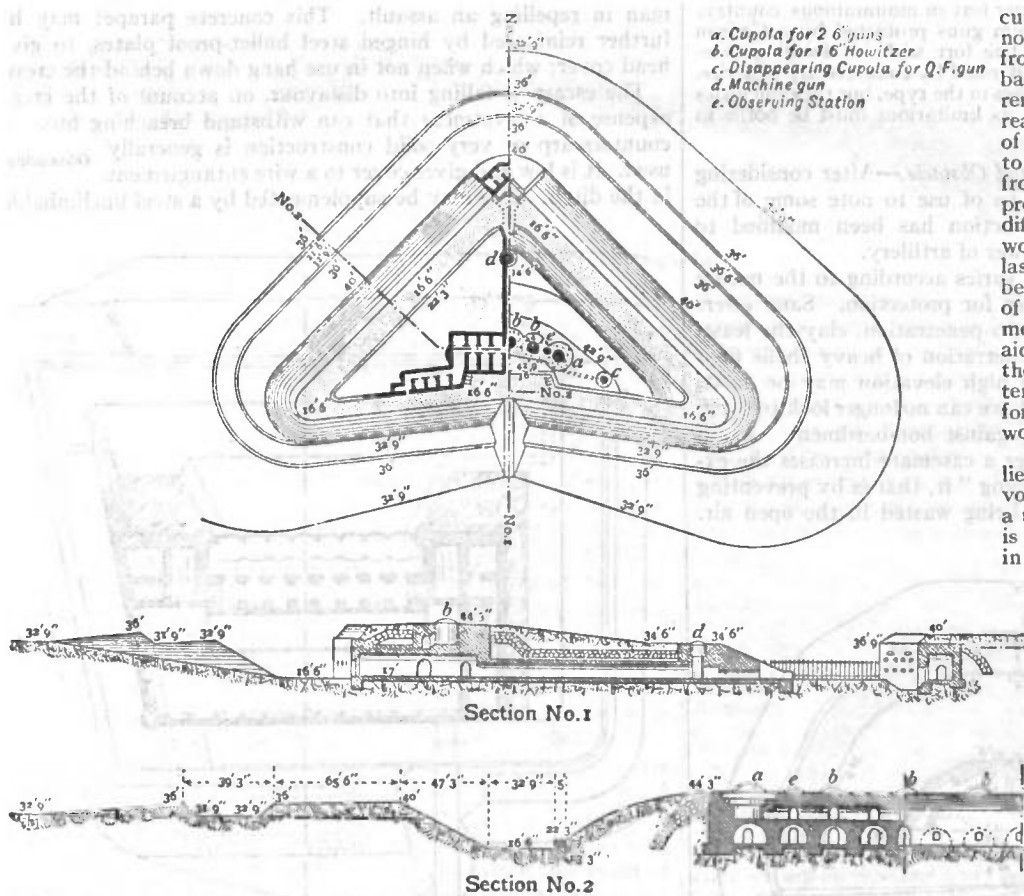

trifling, consisting of only two 57-mm. guns and a machine-gun. There is no provision for infantry defence. The ditch has no escarp or counterscarp, and is flanked by counterscarp galleries at the salient.

It is usual in the case of works so slightly organized for their own defence, and intended only for the long-range artillery fight, to withdraw them somewhat from the front line. The Danish engineers, however, have not hesitated to put these works in the very front line, some 2000 metres in front of the permanent intermediate batteries. The object of this is to force the enemy to establish his heavy artillery at such long ranges that it will be able to afford little assistance to the trench attack of the infantry. The intermediate batteries, being withdrawn, are comparatively safe. They therefore do not require expensive protection, and can reserve their strength to resist the advance of the attack. The success of this arrangement will depend on the fighting strength of the cupolas under war conditions; and what that may be, war alone can tell us.

In the details of these works, besides the bold cutting down of defensive precautions, we may note the skilful and economical use of layers of large stones over the casemates to diminish the thickness of concrete required. The roofs of the casemates are stiffened underneath with steel rails, and steel lathing is used to prevent lumps of concrete from falling on the occupants. The living casemates look out on the gorge, getting plenty of light and air, while the magazines are under the cupolas.

The forts above described are all armed with a view to their taking an important part in the distant artillery fight. The next type to be considered (fig. 51) is selected mainly because it is a good example of the use of concealed flanking batteries, known on the continent as *batteries traditores*, which seem to be growing in popularity.

This design by Colonel Voorduin of the Dutch engineers has a

From Brialmont's *Progrès de la défense des états, &c.*, by permission of Commandant G. Meeüs.
 FIG. 50.—Fort Lyngby, Copenhagen.

medium armament, which is not intended for the artillery duel, but to command the immediate front of the neighbouring forts and the intervals. The fort is long and narrow, with small casemate accommodation. It contains eight 4.7-in. guns. Two of these are in a

the bottom of the ditch is a wire entanglement and the glacis slope is planted with thorns. The thickness of concrete on the casemates is 2 metres (6 ft. 7 in.). This is a strong and simple form of infantry work, but considering its rôle it appears to be needlessly expensive.

cupola concealed from view, though not protected, by a bank of earth in front. The other six are in an armoured battery behind the cupola. It may be remarked that as the cupola gets no real protection from the covering mass of earth, it would be better to be able to utilize the fire of its guns to the front. The *batterie traditore*, if properly protected overhead, would be very difficult to silence, and its flanking fire would probably be available up to the last moment. There is very much to be said both for and against the policy of so emplacing the guns. The immediate defence of the work, with the aid of a broad wet ditch, is easy; but the great mass of concrete, which is intended to form an indestructible platform and breastwork for the infantry, would seem to be a needless expense.

Fig. 52, designed by the Austrian lieutenant field-marshal Moritz Ritter von Brunner (1839-1904), is selected as a type of the intermediate fort which is intended only to be a strong point in the infantry line of defence between

the main forts. It has a protected armament, but this, which consists only of four small Q.F. guns in cupolas, is for its own defence, and not to take part in the artillery duel. There is also a movable armament of four light Q.F. guns on wheels, for which a shelter is provided between the two observatory cupolas. The garrison would be a half company of infantry, for whom casemates are provided in the gorge. The gorge ditch is flanked by a caponier, but there is no flank defence for the front ditch. This is defended by a glacis parapet. At

From Leihner's *Beständige Befestigung*.

FIG. 51.

Fig. 53 is an Italian type of barrier fort in mountainous country. A powerful battery of eight medium guns protected by a Gruson shield commands the approach. The fort with its dwelling casemates is surrounded by a deep ditch flanked by counterscarp galleries. There are certain apparent weaknesses in the type, but the difficulties of the attack in such country and its limitations must be borne in mind.

Modern Details of Protection and Obstacle.—After considering the above types of fort, it will be of use to note some of the details in which modern construction has been modified to provide against the increasing power of artillery.

The penetration of projectiles varies according to the nature of the soil—the lighter the better for protection. Sand offers the greatest resistance to penetration, clay the least. Since, however, the penetration of heavy shells fired from long ranges with high elevation may be 20 ft. or more in ordinary soil, we can no longer look to earth alone as a source of protection against bombardment. Again a moderate quantity of earth over a casemate increases the explosive effect of a shell by “tamping” it, that is by preventing the force of the explosion from being wasted in the open air.

Bomb-proof protection.

From Brialmont's *Progrès de la défense des états, &c.*, by permission of Commandant G. Meëus.

FIG. 52.

We find therefore that in most modern designs the tops of casemates are left uncovered, or with only a few inches of earth over them, in which grass may be grown for concealment.

For the materials of casemates and revetment walls exposed to fire, concrete (*q.v.*) has entirely replaced masonry and brickwork, not because of its convenience in construction, but because it offers the best resistance. The exact composition of the concrete is a matter that demands great care and knowledge. It should be, like an armour plate, hard on the surface and tough within. The great thickness of 10 ft. of concrete for casemate arches, very generally prescribed on the continent in important positions, is meant to meet the danger of several successive shells striking the same spot. To stop a single shell of any siege calibre in use at present, 5 ft. of good concrete would be enough. A good deal is expected from the use of “reinforced concrete” (that is concrete strengthened by steel) both for revetment walls and casemates.

Parapets are frequently made continuous or glacis-wise, that is the superior slope is prolonged to the bottom of the ditch so that the whole rampart can be swept by the fire of the defenders from the crest, and there is no dead ground in front of it. It is also common to build the crest of the parapet in solid concrete, with sometimes a concrete banquette, so that bombardment shall not destroy the line the defenders have to

man in repelling an assault. This concrete parapet may be further reinforced by hinged steel bullet-proof plates, to give head cover; which when not in use hang down behind the crest.

The escarp is falling into disfavour, on account of the great expense of a revetment that can withstand breaching fire. A counterscarp of very solid construction is generally used. It is low and gives cover to a wire entanglement in the ditch. This may be supplemented by a steel unclimbable

From General Rocchi's *Traccia per lo studio della fortificazioni*, by permission.

FIG. 53.

fence, and by entanglements or thorn plantations on the covered way and the lower slopes of the parapet. Entanglements are attached to steel posts bedded in concrete. The upper parts of revetments and the foundations of walls are protected against the action of shells, that falling steeply might act as mines to overturn them, by thick aprons of large stones. Fig. 54 shows most of these dispositions.

Electric search-lights are now used in all important works and batteries. They are usually placed in disappearing cupolas. They are of great value for discovering working parties at night, and lighting up the foreground during an attack; and since only the projector need be exposed, they are not very vulnerable. Their value, however, must not be over-estimated. The most powerful search-light can in no way compare with daylight as an illuminant, and, like all other mechanical contrivances, they have certain marked drawbacks in war. They may give rise to a false confidence; an important light may fail at a critical moment; and in foggy weather they are useless.

The use of armour (see also ARMOUR-PLATES) for coast batteries followed closely upon its employment for ships, for those were the days of short ranges and close fighting, and it seemed natural not to leave the battery in a position of inferiority to

Search-lights.

FIG. 54.

the ship in the matter of protection. In England the coast battery for a generation after the Crimean War was a combination of masonry and iron; and in 1860 Brialmont employed armoured turrets at Antwerp in the forts which commanded the Scheldt. For land defence purposes, however, engineers were very slow to adopt armour. Apart from all questions of difficulty of manufacture, expense, &c., the idea was that sea and land fronts were radically different. It was pointed out that a ship gun, fired from an unsteady platform, had not enough accuracy to strike repeated blows on the same spot; so that a shield which was strong enough to resist a single shot would give complete protection. A battery on a land front, on the other hand, was exposed to an accurate fire from guns which could strike successive blows on the same spot, and break down the resistance of the strongest shield. But in time continental opinion gradually began to turn in favour of iron protection. Practical types of disappearing and revolving cupolas were produced, and many engineers were influenced in their favour by the effect of the big high-explosive shell. Eventually it was argued that, after all, the object of fortification is not to obtain a resisting power without limit, but to put the men and guns of a work in an advantageous position to defend themselves as long as possible against a superior force; and that from this point of view armour cannot but add strength to defensive works.

The question has of course long passed beyond the stage of theory. Practically every European state uses iron or steel casemates and cupolas. German, Danish, Italian and other types of forts so armed have been shown. Recent French types have not been published, but it is known that cupolas are employed; and Velichko, the Russian authority, long an uncompromising opponent of armour, in the end changed his views. These countries have had to proceed gradually, by improving existing fortresses, and with such resources as could be spared from the needs of the active armies. Among the smaller states Rumania and Belgium have entered most freely into the new way. In England, which is less directly interested, opinion has been led by Sir George Clarke, since the publication in 1890 of his well-known book on fortification. Having witnessed officially the experiments at Bucharest in 1885 with a St Chamond turret and a Gruson cupola, he expressed himself very strongly against the whole system. Besides pointing out very clearly the theoretical objections to it, and the weak points of the con-

structions under experiment, he added: "The cost of the French turret was about £10,000 exclusive of its armament, and for this sum about six movable overbank guns of greater power could be provided." In view of the weight that belongs of right to his criticisms it is as well to point out that while this remark is quite true, yet the six guns would require also six gun detachments, with arrangements for supply, &c.; a consideration which alters the working of this apparently elementary sum. The whole object of protection is to enable a few men and guns successfully to oppose a larger number.

At the time when Sir George Clarke's first edition came out, such extravagances were before the public as Mougin's fort; "a mastless turret ship," as he called it, "buried up to the deck-level in the ground and manned by mechanics." Such ideas tended to throw discredit on the more reasonable use of armour, but whether the system be right or wrong, it exists now and has to be taken account of. Nowhere has it been applied more boldly than in Rumania. The defences of Bucharest (designed by Brialmont) consist of 18 main and 18 small forts, with intermediate batteries. The main forts are some 4500 yds. apart, and 11,000 to 12,000 yds. from the centre of the place. The typical armament of a main fort is six 6-in. guns in three cupolas (one for indirect fire), two 8.4-in. howitzers in cupolas, one 4.7-in. howitzer in a cupola, six small Q.F. guns in disappearing cupolas. The total armament of the place (all protected) is eighty-six 6-in. guns, seventy-four 8.4-in. howitzers, eighteen 4.7-in. howitzers, 127 small calibre Q.F. guns in disappearing cupolas, 476 small calibre Q.F. guns in casemates for flanking the ditches. The "Sereth Line" will be described later.

Different Forms of Protection: Casemate, Cupola, &c.—The broad difference between casemates or shielded batteries and turrets and cupolas is that the former are fixed while the latter revolve and in some cases disappear. The casemate thus has the disadvantages that the arc of fire of the gun, which has to fire through a fixed embrasure or port-hole, is very limited, and that the muzzle of the gun and the port-hole, the weak points of the system, are constantly exposed to the fire of the enemy. The advantage of the casemate lies in its comparative cheapness and the greater strength of a fixed structure. It is well suited for barrier forts (fig. 53) and other analogous positions; and the Italians amongst other nations have so employed it at such places as the end of the Mont Cenis tunnel. Steel and iron casemates are also useful as caponiers for ditch flanking (fig. 55).

Turrets and Cupolas.—The difference between a turret and a cupola is that the former is cylindrical with a flat or nearly flat top and presents a vertical target; while the latter is a flattened

From Leithner's *Beständige Bejestigung*, by permission.

FIG. 55.

dome, the vertical supports of which are entirely concealed. The turret appears to be little used. The object of both forms is at once to give an all-round arc of fire to the guns and to allow of the weak point of the structure, the port-hole and muzzle of the gun, being turned away from the enemy in the intervals of firing. Both usually emerge from a mass of concrete, which is strengthened round the opening by a collar of chilled cast iron about 12 to 15 in. thick.

There are four types of cupolas, viz. (a) Disappearing, (b) Oscillating, (c) Central pivot, (d) On roller rings.

(a) Disappearing cupolas are used chiefly for small quick-firing guns, on account of the expense of the various systems. They can be used for medium guns. The details of the best foreign

Cupolas. systems are secret. (b) The oscillating turret is a Mougin type, in which the turret is supported in the centre by a knife-edge on which it can swing. The oscillation is controlled by powerful springs. The effect of it is that after firing, the front of the cupola with the port-hole swings downwards under cover, and is held there until the gun is ready to fire again. (c) Schumann's centre pivot is understood to be approved in Germany. It has been adopted in Rumania and Belgium for howitzer cupolas. It is only suitable for a single piece; *d* is strong and steady—the best cupola for coast batteries; *c* and *d* are best for rapid fire because they can be loaded without lowering. They are suited for long guns.

The following types are illustrated as being generally representative of the different classes of cupola.

Fig. 56 is a section of Messrs Krupp's typical cupola for one 6-in. gun. The shield is of nickel steel, the collar of cast steel. A small space is left between the cupola and its collar to prevent the possibility of the shield jamming after being damaged. The guns are muzzle-pivoting and thickened out near the muzzle by the addition of a ring, so as to close the port as much as possible. The recoil is controlled within narrow limits both to economize space and to prevent the smoke from the muzzle from getting into the cupola. To facilitate the elevation and depression of the gun (with muzzle pivoting the breech has of course to be moved through a much larger arc than with ordinary mountings) it is balanced by a counterweight. The cupola rests on a roller ring and is traversed by a winch. It can be turned through a complete circle in about one minute.

FIG. 56.—Cupola for 6-in. gun (Friedr. Krupp A.G.).

Fig. 57 shows a Schumann shielded mortar (sphere-mortar, *Kugelmörser*). In this case it will be observed that the cupola is replaced by an enlargement of the encircling collar; and the mortar (8.4-in. calibre) is enclosed in a sphere of cast iron, so as to close completely the opening of the collar in any position.

Fig. 58 shows a Gruson cupola for one 4.7-in. Q.F. howitzer.

Fig. 59 shows a disappearing turret for an electric light projector. Fig. 60 shows a Krupp transportable cupola for a 5.7-cm. gun. This is drawn on a four-wheeled carriage, and when coming into action slides on rollers on to a platform in the parapet. It weighs about 2½ tons, and with carriage and platform about 4 tons.

From Leithner's *Beständige Befestigung*.

FIG. 57.—Gruson Spherical Mortar.

The mechanism of these cupolas is for the most part simpler than it appears. Counterweights and hand winches are much in use for the lighter natures of guns. The armouring of course keeps pace with improvements in manufacture. The chilled cast iron first made popular by the Gruson firm is now little used except for such purposes as the collar round a cupola. Wrought iron, steel and compound plates for the tops of cupolas have all been tried, the most recent Krupp-Gruson designs being of nickel steel.

The sighting in some cases may be done by sights on the gun, with suitable enlargements in the port-hole; in others by sights affixed to the cupola itself (which of course can give horizontal direction only); in others training and elevation are given in accordance with the readings on electric dials, or instructions by telephone or speaking tube. There is of course nothing unreasonable in this in the case of indirect fire guns and howitzers, for if not firing from cupolas they would be behind the shelter of some wood or quarry.

Schumann's System: "Armoured Fronts."—Lieut.-Colonel Maximilian Schumann (1827-1889) of the Prussian engineers, who took a very prominent part in the design and advocacy of armoured defences, eventually produced a system which dispensed entirely with forts and relied on the fire of protected guns. It consists of several lines of batteries for Q.F. guns and howitzers in cupolas. He considered that such batteries would be able to defend their own front, and the infantry garrison was not to be called into action except in the case of the enemy breaking through at some point of the line.

This system was actually adopted by Rumania (1889-1892) for the Sereth Line. There are three routes by which the Russians can enter the country across the Sereth river: through Focshani, Nemolassa and Galatz. These three routes are barred by bridge-heads, those at Focshani, the most important, being on the left bank of the Milkov, a tributary of the Sereth.

The Focshani works consist of 71 batteries arranged on a semicircular front about 12 m. long and from 8000 to 10,000 yds. in advance of the bridges. The batteries are placed in three lines, which are about 500 yds. apart, and are subdivided into groups. The normal group consists of 5 batteries, of which 3 are in the first line, 1 in the second, and 1 in the third. The first-line batteries each contain five small Q.F. guns in travelling

cupolas. The second-line batteries, each six small Q.F. guns in disappearing cupolas. The third-line batteries have one 120-mm. gun in a cupola, and two 210-mm. spherical mortars with Gruson shields. The immediate defence of the batteries consists of a glacis planted with thorn bushes and a wire entanglement.

The fortification of these three bridge-heads are said to have cost about £1,100,000. But the system of "armoured fronts" is never likely to be reproduced, having been condemned by all authoritative continental opinion. Its defects have been summarized by Schroeter as follows: weakness of artillery at long ranges, want of security against a surprise rush, the neglect of the use of infantry in the defence, and the difficulty of command. This last is the most

and that those of the attacker shall have the minimum chances of effecting injury."

Since Sir George Clarke published his first edition in 1890 continental ideas have expanded a good deal. The foregoing statement as to the three categories of defences would be accepted anywhere now: the differences of opinion come in when we reach the stage of classifying under the first head the permanent works to be constructed in peace time. In most countries these would include forts with guns for the artillery duel, forts with safety armaments, fixed batteries with or without armour, and forts for infantry only. Sir George

Infantry redoubts.

FIG. 58.—Cupola for 4.7-in. Howitzer.

serious of all. It is indeed difficult to conceive that any one should expect half-a-dozen expert gunners, each shut up in an iron box with a gun, to stop the rush of a thousand men, even by day. But imagine the feelings of the gunner on the night of a big attack, alone in his box, his nerves already strained by a preliminary bombardment and nights of watching. He hears the sounds of battle all around; he knows nothing of the progress of the attack, but expects everything, and feels every moment the door of his box being opened and the bayonet entering his back. No wise commander would submit his troops to such a test.

Sir George Clarke and Unarmoured Systems.—Before leaving the subject of fortresses it is necessary to consider the ideas of those who, while recognizing the necessity for places permanently organized for defence, prefer to treat them more from the point of view of perfected field defences. It is to the credit of English military science that Sir George Clarke may be taken as the representative of this school of thought. His study of fortification, as he tells us, began with a history of the defence of Plevna (*q.v.*). He was led to compare the resistance made behind extemporized defences at such places as Sevastopol, Kars and Plevna, with those at other places fortified in the most complete manner known to science. From this comparison he drew the conclusion that the true strength of fortification does not depend on great masonry works intricately pieced together at vast expense, but on organization, communications and invisibility. In his 1907 edition he says:—

"Future defences will divide themselves naturally into the following categories: (1) Permanent works wholly constructed in peace time and forming the key points of the position. (2) Gun emplacements, magazines and shelters for men in rear of the main line, all concrete structures and platforms to be completed, though some earthwork may be left until the position is placed in a state of defence. (3) Field works, trenches, &c., guarding the intervals between the permanent defences in the main line, or providing rear positions. These should be deliberately planned in time of peace ready to be put in hand at short notice. The essence of a well-fortified position is that the weapons of the defender shall obtain the utmost possible scope of action,

FIG. 59.—Disappearing Turret for Searchlight.

Clarke will have no armour for guns except in certain special cases of barrier forts. Heavy guns and howitzers requiring permanent emplacements (concrete platforms, &c.) must either be well concealed or be provided with alternative positions. The only permanent works which he admits are for infantry. They are redoubts of simple form intended for 350 or 400 men, with casemate accommodation for three-fourths of that number. Fig. 61 shows the design:—two rows of casemates, one under the front parapet, one under a parados; frontal musketry defence; obstacle consisting of entanglements, mines, &c., with or without escarp and counterscarp.

"The intervals (he says) between the infantry redoubts may be about 2500 yds.; but this will necessarily depend upon the conformation of the ground. Where there are good artillery positions falling within the sphere of protection of the redoubts, large intervals will be permissible. Thus, in the case of an extended line of defence where the ground offers marked tactical features, the idea of a continuous chain of permanent works may be abandoned in favour

FIG. 60.—Transportable Cupola for 5.7-cm. Gun (Friedr. Krupp A.G.).

FIG. 61.

of groups of redoubts guarding the artillery positions. In this case, the redoubts in a group might be distributed on a curve bent back in approximately horse-shoe form.'

The keystones of the close defence of the fighting line in future will undoubtedly be these infantry redoubts, and therefore it is of great interest to compare with the above types two studies put forward by Schroeter (*Die Festung in der heutigen Kriegführung*), one in his first edition in 1898 (fig. 62), and the other in the second in 1905 (fig. 63). In both these defensive arrangements are merely trenches of field profile with entanglements, the command and the obstacle being less than in Sir George Clarke's work; and it will be noticed that in the 1905 type, published after the Russo-Japanese War, the plan is much

less simple and arrangements for close flanking defence have been introduced. But these works of Schroeter's are merely infantry supporting points in a line which contains forts of the triangular type with guns, and armoured batteries, as well as a very complete arrangement of field defences and communications; while Sir G. Clarke's redoubts are the only permanent works giving casemate protection in the front line.

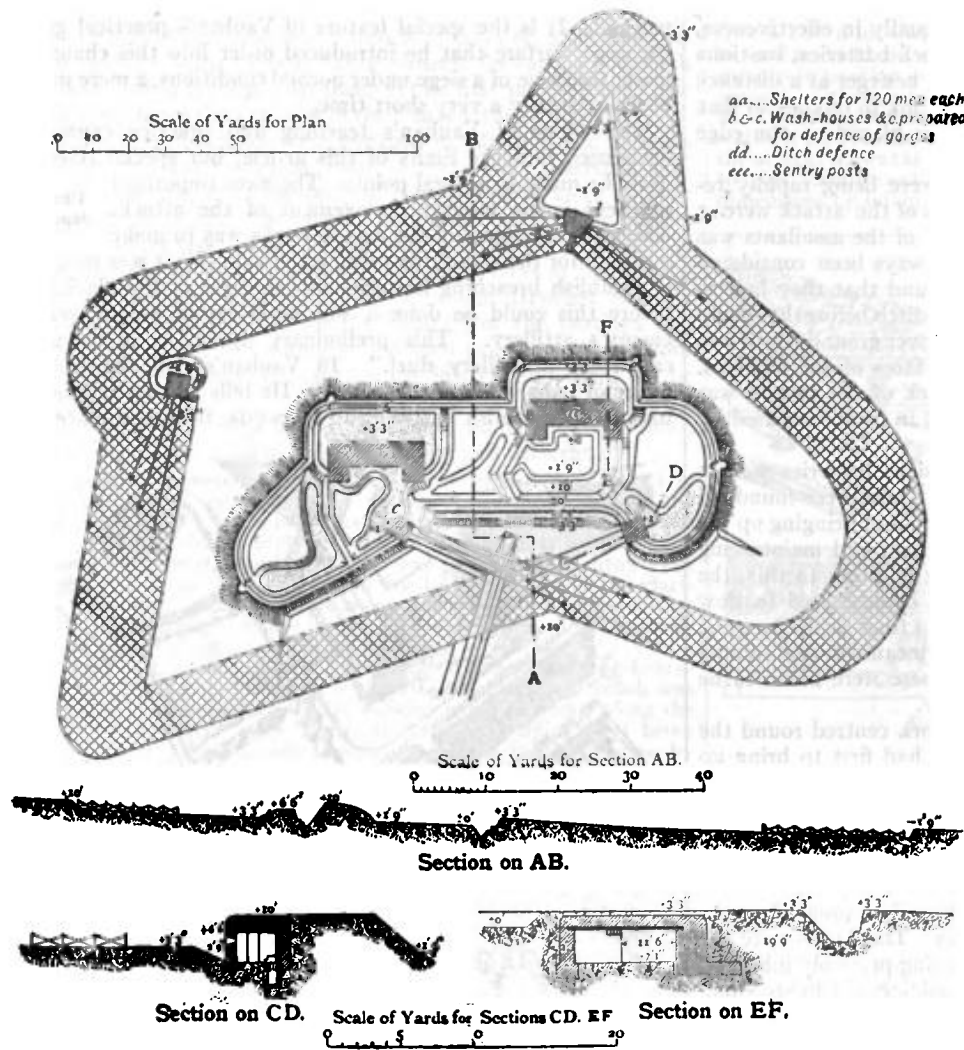

The comparative merits of either design for an infantry redoubt are not of much importance. It is agreed that the main line of defence must consist of a more or less continuous line of field defences and obstacles, and that at some points in the line there should be infantry supporting points with bomb-proof protection capable of resisting big shells. The open question is, what additional works, if any, are required for the artillery, whether for the medium and heavy guns that will take part in the "artillery duel," or for the lighter natures that will help in the close fight and defence of the intervals. Is it best for the defenders to rely on armoured protection or on concealment for his guns?

Official opinion outside England has certainly sanctioned armour, since all over the continent it is to some extent adopted in practice. National practice is usually based on the advice of the most distinguished officers of the day, and therefore it is unsafe to condemn it hastily. Sir George Clarke and those who are with him—and they are many, both in Great Britain and abroad—object entirely to armour. He says (*Fortification*, ed. 1907, p. 96): "The great advantage possessed by the attack in all ages has been the employment of a mobile artillery against armaments cribbed, cabined and confined by fortification. It is necessary to perpetuate this advantage?" Of course the effect of long-range weapons, in increasing the length of front that can be held by a given force, has given much greater

FIG. 63.

freedom of action to the defence and this should be taken full advantage of.

The argument as to the vulnerability of shielded guns is not at present strong. Sir George says (*ib.* p. 94), "If the high angle fire . . . is ever to find a favourable opportunity, it will surely be against a cupola, the site of which can generally be determined with accuracy." On the other hand he says (p. 90), "During the long and costly experiments carried on at Bucharest in 1885-1886, 164 rounds were fired from the Krupp 21 cm. mortar at targets of about 40 sq. metres area" (about 430 sq. ft.) "without obtaining a single hit. The range was 2700 yds.; the targets were towers built upon a level plain; the shooting conditions were ideal, and the fall of each shell was telephoned back to the firing point; but it must have been evident to the least instructed observer that to attempt to group 6 or 8 shells on an invisible area 2 metres square would have been absolutely futile." These facts are adduced to prove that it is not necessary to give great thickness to concrete casemates, to resist successive bursts of shells in the same place; but surely they are equally applicable to cupolas. Again (p. 252), "The experience gained at Port Arthur was not altogether encouraging as regards the use of high angle fire. The Russian vessels in the harbour were sunk by opening their sea-valves. . . . Fire was subsequently directed upon them from 11 in. howitzers at ranges up to about 7500 yds. This was deliberate practice from siege batteries at stationary targets; but the effect was distinctly disappointing." The cupolas therefore can hardly be considered ideal targets; and the probability is that they would hold their own against both direct and indirect fire for a long time. There are other

and stronger arguments against the general use of them, all of which are clearly set forth by Sir George Clarke.

The worst objections to the cupola are the military disadvantages of isolation and immobility, and the multiplication of mechanical arrangements. For a successful round from a disappearing cupola, the elevating and traversing arrangements, the elevating and loading gear of the gun, and the telephone communication, must all be in good order. At night the successful co-operation of the searchlight is also in many cases necessary.

The teaching of history is all against immobile mechanical defences. Initiative, surprise, unforeseen offensive action, keeping the besieger in ignorance of the dispositions of the garrison, and of what progress he is making; all these, with their influence on the morale of both sides, tend towards successful defences and do not point towards the use of armour.

It may further be said that the use of armour as a general rule is unnecessary, because a concealed battery is a protected one; and with the long ranges now usual for heavy guns and howitzers, there is not generally much difficulty about concealment.

In the opinion, however, of the present writer an exception must be made for guns intended to flank the line of defence, which would generally need bomb-proof over-head cover. Further, when we leave theory and come to the consideration of actual problems of defence, it will often be found that it is necessary to place guns in certain positions where good

concealment cannot be got. In such cases some form of protection must be given if the guns are to engage the concealed batteries of the attack.

III. THE ATTACK OF FORTRESSES

In considering the history of siegecraft since the introduction of gunpowder, there are three main lines of development to follow, viz. the gradually increasing power of artillery, the systematizing of the works of attack, and in recent times the change that has been brought about by the effect of modern small-arm fire.

Cannon appear to have been first used in sieges as mortars, to destroy hoardings by throwing round stones and barrels of burning composition. Early in the 15th century we find cannon throwing metal balls, not only against hoarding and battlements, but also to breach the bases of the walls. It was only possible to work the guns very slowly, and archers or crossbowmen were needed in support of them, to drive the defenders from the crenellations or loopholes of the battlements. At that period the artillery was used in place of the medieval siege engines and in much the same manner. The guns of the defence were inaccurate, and being placed high on the walls were made ineffective by bad mountings, which did not allow of proper depression. The besieger therefore could place his guns close to the walls, with only the protection of a few large gabions filled with earth, set up on the ground on either side of the muzzle.

In the course of the 15th century the power of artillery was largely increased, so that walls and gates were destroyed by it in an astonishingly short time. Three results shortly followed.

The guns of the defence having gained equally in effectiveness, greater protection was needed for the attack batteries; bastions and outworks were introduced to keep the besieger at a distance from the inner walls; and the walls were sunk in ditches so that they could only be breached by batteries placed on the edge of the glacis.

Early in the 16th century fortresses were being rapidly remodelled on these lines, and the difficulties of the attack were at once very much increased. The tendency of the assailants was still to make for the curtain, which had always been considered the weak point; but the besiegers now found that they had to bring their guns right up to the edge of the ditch before they could make a breach, and in doing so had to pass over ground which was covered by the converging fire from the faces of the bastions. Towards the end of the century the attack of the curtain was delayed and the cross-fire over the ground in front increased by the introduction of ravelins.

The slight gabion protection for the siege batteries was at first replaced by strong timber shelters. These were found inadequate; but a still greater difficulty was that of bringing up the siege guns to their positions, emplacing them and maintaining communication with them under fire. In addition to this, the guns of the defence until they could be overpowered (a slow process) dominated a wide belt of ground in front of the fortress; and unless the besiegers could find some means of maintaining a strong guard close to their batteries these were liable to be destroyed by sorties from the covered way.

Gradually the whole problem of siege work centred round the artillery. The besiegers found that they had first to bring up enough guns to overpower those of the defence; then to advance their guns to positions from which they could breach the walls; and throughout these operations to protect them against sorties. Breaches once made, the assault could follow on the old lines.

The natural solution of the difficulty of approach to the battery positions was the use of trenches. The Turks were the first to make systematic use of them, having probably inherited the idea from the Eastern Empire. The soldiers of Christendom, however, strongly disliked digging, and at first great leaders like Bayard and Montluc had themselves to use pick and shovel, to give their men an example. In due course the necessity of the trenches was recognized, but the soldiers never took kindly to them, and the difficulty was dealt with in a manner reminiscent of the feudal ages, by impressing large bodies of peasantry as workmen whenever a siege was in contemplation.

Through the 16th and most of the 17th century, therefore, we find the attack being conducted by means of trenches leading to the batteries, and supported by redoubts often called "places of arms" also made by trench work. During this period the result of a siege was always doubtful. Both trenches and batteries were arranged more or less at haphazard without any definite plan; and naturally it often happened that offensive action by the besieged against the trenches would disorder the attack and at times delay it indefinitely. Fig. 64, taken from a late 17th-century print by de Fer of Paris, gives a good idea of the general practice of that day when Vauban's methods were not yet generally known.

Another weak point about the attack was that after the escarp walls had been strengthened to resist artillery fire as has been described, there was no clear idea as to how they should be breached. The usual process was merely an indiscriminate pounding from batteries established on the crest of the glacis. Thus there were cases of sieges being abandoned after they had been carried as far as the attempt to breach.

It is in no way strange that this want of method should have characterized the attack for two centuries after artillery had begun to assert its power. At the outset many new ideas had to be assimilated. Guns were gradually growing in power; sieges were conducted under all sorts of conditions, sometimes against medieval castles, sometimes against various and widely-differing examples of the new fortification; and the military systems of the time were not favourable to the evolution of

method. It is the special feature of Vauban's practical genius for siege warfare that he introduced order into this chaos and made the issue of a siege, under normal conditions, a mere matter of time, usually a very short time.

The whole of Vauban's teaching and practice cannot be condensed into the limits of this article, but special reference must be made to several points. The most important of these is his general arrangement of the attack. *Vauban's teaching.* The ultimate object of the attack works was to make a breach for the assaulting columns. To do this it was necessary to establish breaching batteries on the crest of the glacis; and before this could be done it was necessary to overpower the enemy's artillery. This preliminary operation is nowadays called the "artillery duel." In Vauban's day the effective range of guns was 600 to 700 yds. He tells us that it was customary to establish batteries at 1000 yds. from the place, but

FIG. 64.—Siege-works of the 17th century.

that at that range they did little more than make a great deal of noise. The first object of the attack, therefore, after the preliminary operations of investment, &c., had been completed, was to establish batteries within 600 or 700 yds. of the place, to counter-batter or enfilade all the faces bearing on the front of attack; and to protect these batteries against sorties. After the artillery of the defences had been subdued—if it could not be absolutely silenced—it was necessary to push trenches to the front so that guns might be conveyed to the breaching positions and emplaced there in batteries. Throughout these processes it was necessary to protect the working parties and the batteries against sorties.

For this purpose Vauban devised the *Places d'armes* or *lignes parallèles*. He tells us that they were first used in 1673 at the siege of Maestricht, where he conducted the attack, and which was captured in thirteen days after the opening of the trenches. The object of these parallels was to provide successive positions for the guard of the trenches, where they could be at hand to repel sorties. The latter were most commonly directed against the trenches and batteries, to destroy them and drive out the working parties. The most vulnerable points were the heads of the approach trenches. It was necessary, therefore, that the guard of the trenches should be in a position to reach the heads of the approaches more quickly than the besieged could do so from the covered way. This was provided for as follows.

The first parallel was usually established at about 600 yds. from the place, this being considered the limiting range of action

of a sortie. The parallel was a trench 12 to 15 ft. wide and 3 ft. deep, the excavated earth being thrown forward to make a parapet 3 or 4 ft. high. In front of the first parallel and close to it were placed the batteries of the "first artillery position."

While these batteries were engaged in silencing the enemy's artillery, for which purpose most of them were placed in prolongation of the faces of the fortress so as to enfilade them, the "Approach Trenches" were being pushed forward. The normal attack included a couple of bastions and the ravelin between, with such faces of the fortress as could support them; and the approach trenches (usually three sets) were directed on the capitals of the bastions and ravelin, advancing in a zigzag so arranged that the prolongations of the trenches always fell clear of the fortress and could not be enfiladed.

Fig. 65, taken from Vauban's *Attack and Defence of Places*, shows clearly the arrangement of trenches and batteries.

After the approach trenches had been carried forward nearly half-way to the most advanced points of the covered way, the "second parallel" was constructed, and again the approach trenches were pushed forward. Midway between the second parallel and the covered way, short branches called *Demi-parallels* were thrown out to either flank of the attacks: and finally at the foot of the glacis came the third parallel. Thus there was always a secure position for a sufficient guard of the trenches. Upon an alarm the working parties could fall back and the guard would advance.

Trenches were either made by *common trenchwork*, *flying trenchwork* or *sap*. In the first two a considerable length of trench was excavated at one time by a large working party extended along the trench: flying trenchwork (formerly known as flying sap) being distinguished from common trenchwork by the use of gabions, by the help of which protection could be more quickly obtained. Both these kinds of trenchwork were commenced at night, the position of the trench having been previously marked out by tape. The "tasks" or quantities of earth to be excavated by each man were

trench 1 ft. 6 in. wide and deep. To protect the head of the trench he had a shield on wheels, under cover of which he placed the gabions in position one after another as the sap-head progressed. Other men following strengthened the parapet with fascines, and increased the trench to a depth of 3 ft., and a width of 2 ft. 6 in. to 3 ft. Fig. 66, taken from Vauban's treatise on the attack, shows the process clearly. The sap after being completed to this extent could be widened at leisure to ordinary trench dimensions by infantry working parties.

FIG. 66.—Sapping (Vauban).

As the work at the sap-head was very dangerous, Vauban encouraged his sappers by paying them on the spot at piecework rates, which increased rapidly in proportion to the risk. He thus stimulated all concerned to do their best, and reckoned that under average conditions he could depend on a rate of progress for an ordinary sap of about 50 yds. in 24 hours.

It is interesting to compare the more recent method of sapping with that above described (fig. 67 taken from the *Instruction in Military Engineering*, 1896). It is no longer possible to place gabions in position at the sap-head under fire. Accordingly the leading sapper excavates to the full depth of 4 ft. 6 in., and the rate of progress is retarded proportionately, so that an advance of only 15 to 30 yds. in 24 hours can be reckoned on instead of 50. The head of the sap is protected by a number of half-filled sandbags, which the leading sapper throws forward as he goes on.

The nearer the approaches drew to the covered way, the more oblique became the zigzags, so that little forward progress was made in proportion to the length of the trench. The approaches were then carried straight to the front, by means of the "double sap," which consisted of two single saps worked together with a parapet on each side (fig. 68). To protect these from being enfiladed from the front, traverses had to be left

at intervals, usually by turning the two saps at right angles to right or left for a few feet, then forward, and so on as shown in fig. 69, the distance apart of these traverses being of course regulated by the height from which the enemy's fire commanded the trench.

The later stages in the attack are illustrated in fig. 70. From the third parallel the attack was pushed forward up the glacis by means of the double sap. It was then pushed right and left along the glacis, a little distance from the crest of the covered way. This was called "crowning" the covered way,

FIG. 65.—Regular Attack (Vauban).

so calculated that by daybreak the trench would afford a fair amount of cover. Flying trenchwork was generally used for the 2nd parallel and its approaches, and as far beyond it as possible. In proportion as the attack drew nearer to the covered way, the fire of the defenders' small-arms and wall-pieces naturally grew more effective, though by this time most of their artillery would have been dismantled by the fire of the siege batteries. It therefore became necessary before reaching the 3rd parallel to have recourse to sap.

Sapping required trained men. It consisted in gradually pushing forward the end of a narrow trench in the desired direction. At the sap-head was a squad of sappers. The leading man excavated a

and on the position thus gained breaching batteries were established in full view of the escarp. While the escarp was being breached, if it was intended to use a systematic attack throughout, a mine gallery (see *Mining* below) was driven under the covered way and an opening made through the counterscarp into the ditch. The sap was then pushed across the ditch, and if necessary up the breach, the defenders' resistance being kept under by musketry and artillery fire from the covered way. The ravelin and bastions were thus captured successively, and where the bastions had been retrenched the same methods were used against the retrenchment.

Vauban showed how to breach the escarp with the least expenditure of ammunition. This was done by making, with successive shots placed close together (which was feasible even in those days from a position so close as the crest of the covered way) horizontal and vertical cuts through the revetment wall. The portion of revetment enclosed by the cuts being thus detached from support was overturned by the pressure of the

FIG. 67.—“Deep” Sap.

earth from the rampart. Ricochet fire was also the invention of Vauban. He showed how, in enfilading the face of a work, by using greatly reduced charges a shot could be made to drop over the crest of the parapet and skim along the terreplein, dismounting guns and killing men as it went.

The constant success of Vauban must be ascribed to method and thorough organization. There was a deadly certainty about his system that gave rise to the saying “Place assiégée, place prise.” He left nothing to chance, and preferred as a rule the slow and certain progress of saps across the ditch and up the breach to the loss and delay that might follow an unsuccessful assault. His contemporary and nearest rival Coehoorn tried to shorten sieges by heavy artillery fire and attacks across the open; but in the long run his sieges were slower than Vauban's.

So much a matter of form did the attack become under these conditions, that in comparing the supposed defensive powers of different systems of fortification it was usual to calculate the number of days that would be required in each case before the breach was opened, the time being measured by the number of hours of work required for the construction of the various trenches and batteries. It began to be taken as a matter of course that no place under any circumstances could hold out more than a given number of days; and naturally, when the whole question had become one of formula, it is not surprising to find that places were very often surrendered without more than a perfunctory show of resistance.

The theory of defence at this time appeared to be that since it was impossible to arrest the now methodical and protected progress of the besiegers' trenches, no real resistance was possible until after they had reached the covered way, and this idea is at the root of the extraordinary complications of outworks and multiplied lines of ramparts that characterized the “systems” of this period. No doubt if a successor to Vauban could have

brought the same genius to bear on the actual defence of places as he did on the attack, he would have discovered that the essence of successful defence lay in offensive action outside the body of the place, viz. with trench against trench. For want of such a man the engineers of the defence resigned themselves contentedly to the loss of the open ground outside their walls, and relied either upon successive permanent lines of defence, or if these did not exist, upon extemporized retrenchments, usually at the gorge of the bastion.

It is curious that such experienced soldiers as most of them were should not have realized the fatal effect upon the minds of the defenders which this almost passive abandonment of line after line must needs produce. Even a civilian—Machiavelli—had seen into the truth of the matter years before when he said (*Treatise on the Art of War*, Book vii.):

“And here I ought to give an advice . . . to those who are constructing a fortress, and that is, not to establish within its circuit fortifications which may serve as a retreat to troops who have been driven back from the first line. . . . I maintain that there is no greater danger for a fortress than rear fortifications whither troops can retire in case of a reverse; for once the soldier knows that he has a secure retreat after he has abandoned the first post, he does in fact abandon it and so causes the loss of the entire fortress.”

It must, however, be remembered that in those days when soldiers were mostly of a separate or professional caste, the whole thing had become a matter of business. Fighting was so much regulated by the laws and customs of war that men thought nothing of giving up a place if, according to accepted opinion, the enemy had advanced so far that they could no longer hope to defend it successfully. Once this idea had set in it became hopeless to expect successful defences, save now and then when some officer of very unusual resolution was in command. This is the real reason for the feeble resistance so often made by fortresses in the 17th and 18th centuries, which has been attributed to inherent weakness in fortifications.

Custom exacted that a commandant should not give up a place until there was an open breach or, perhaps, until he had stood at least one assault. Even Napoleon recognized this limitation of the powers of the defence when in the later years of his reign he was trying to impress upon his governors the importance of their charge. The limitation was perfectly unnecessary, for history at that time could have afforded plenty of instances of places that had been successfully defended for many months after breaches were opened, and assault after assault repulsed on the same breach. But the same soldiers of the 17th and 18th centuries who had created this artificial condition of affairs,

FIG. 68.—Double Sap.

FIG. 69.—Direct advance by Double Sap.

established it by making it an understood thing that a garrison which surrendered without giving too much trouble after a breach had been opened should have honourable consideration; while if they put the besiegers to the pains of storming the breach, they were liable to be put to the sword.

It has been necessary to dwell at some length on the siegecraft of Vauban and his time, not merely for its historical interest, but because the system he introduced was practically unaltered until the end of the 19th century. The sieges of the Peninsular War were conducted on his lines; so was that of Antwerp in 1830; and as far as the disposition of siege trenches was concerned, the same system remained in the Crimea, the Franco-German War and the Russo-Turkish War. The sieges in the Napoleonic wars were few, except in the Iberian peninsula. These last differed from those of the Vauban period and the 18th century in this, that instead of being deliberately undertaken with ample means, against fortresses that answered to the requirements of the time, they were attempted

at that time (*Journals of Sieges in Spain, 1811 to 1814*). Sir John Jones summarizes his own experience in Spain and the data accumulated by practical engineers in former sieges from the time of Vauban onwards, in the following conclusions: The actual work of entrenching, sapping, &c., on the front attacked was much the same whether the fortress contained 5000 or 10,000 men. On the other hand the guard of the trenches was proportionate to the fighting men inside the fortress. (The total number of men had of course to be sufficient to allow three or four complete shifts or "reliefs" for all work and duties.) Adding a proportion of men for camp and other duties, he calculates, for the vigorous siege of an ordinary place situated in open country and containing 5000 men, a corps of 32,080 effectives, and remarks further that this force would be greatly exhausted after a month's service. The same place held by 10,000 would call for a besieging army of 50,830 men (guards and duties increasing, but not working parties). Thus the besieger should if possible have a superiority of 7 to 1 if the garrison numbered 5000, 6 to 1 if 10,000 and 5 to 1 if 15,000 and so on. As regards artillery, he should have as many, and if possible twice as many, guns as those of the defender on the front of attack, as well as howitzers for sweeping every line subject to enfilade and mortars for destroying traverses, &c. Later in the siege, more howitzers and mortars to clear the

covered way and places of arms, and finally, after the covering of the covered way, fifty additional battering guns would be required. It is apparent from this that the practical engineers of the day looked upon a siege as a serious matter, and did not find permanent fortifications wanting in defensive strength.

During the long peace that followed the Napoleonic wars, one advance was made in siegecraft. In England in 1824 successful experiments were carried out in breaching an unseen wall by curved or indirect fire from howitzers. At Antwerp in 1830 the increasing power and range of artillery, and especially of howitzers, were used for bombarding purposes, the breaches there being mostly made by mines. Then came one of the world's great sieges; that of Sevastopol in 1854-1855 (see CRIMEAN WAR). The outstanding lesson of Sevastopol is the value of an active defence;

FIG. 70.—Later Stages of the Attack (Vauban).

with inadequate forces and materials, against out-of-date works. The fortresses that Wellington besieged in Spain had rudimentary outworks, and escarps that could be seen and breached from a distance. At that time, though the power of small arms had increased very slightly since the last century, there had been a distinct improvement in artillery, so that it was possible to breach a visible revetment at ranges from 500 to 1000 yds. Wellington was very badly off for engineers, siege artillery and material. Trench works could only be carried out on a small scale and slowly. Time being usually of great importance, as in the first two sieges of Badajoz, his technical advisers endeavoured to shorten sieges by breaching the escarp from a distance—a new departure—and launching assaults from trenches that had not reached the covered way. Under these circumstances the direct attacks on breaches failed several times, with great loss of life. Wellington in one or two earlier despatches reflected on his engineers for not establishing their batteries on the crest of the glacis. The failures are, however, clearly due to attempts to push sieges to a conclusion without proper preparation.

So much has been written of late years in criticism of the fortification to what may be called the Vauban period that it is important to note what were the preparations considered necessary for a siege

of going out to meet the besieger, with countertrench and countermine. This lesson has increased in value for us in proportion to the increased power of the rifle.

In comparing the resistance made behind the earthworks of Sevastopol with the recorded defences of permanent works, it is essential to remember that the conditions there were quite abnormal. Sir John Jones has told us what the relative forces of besiegers and besieged should be, and the necessary preponderance of artillery for the attack. The following quotations may be added:

"The siege corps should be sufficiently strong—(1) To invest the fortress completely, and maintain the investment against all the efforts of the garrison. (2) If a regular siege is contemplated, to execute and guard all the siege works required for it. Complete investment may sometimes be impossible, but experience has repeatedly shown that the difficulties of a siege are enormously increased if the garrison are able to draw fresh troops and supplies from outside, and to rid themselves of their sick and wounded" (Lewis). Again as regards artillery: "In a regular attack, where every point is gained inch by inch, it is impossible to succeed without overpowering the defensive artillery"; and "it is useless to attempt to sap near a place till its artillery fire is subdued . . ." (Jones).

These conditions were so far from being fulfilled at Sevastopol that (a) there was no investment—in fact the Russians came nearer to investing the Allies; (b) the Russians had the preponderance in guns almost throughout; (c) the Russian force in and about Sevastopol was numerically superior to that of the Allies. We must add to this that Todleben had been able to get rid of most of his

civilian population, and those who remained were chiefly dockyard workmen, able to give most valuable assistance on the defence works. The circumstances were therefore exceptionally favourable to an active defence. The weak point about the extemporized earthworks, which eventually led to the fall of the place, was the want of good bomb-proof cover near the parapets.

The Franco-German War of 1870 produced no great novelty. The Germans were not anxious to undertake siege operations when it could be avoided. In several cases minor fortresses surrendered after a slight bombardment. In others, after the bombardment failed, the Germans contented themselves with establishing a blockade or detaching a small observing force. By far the most interesting siege was that of Belfort (*q.v.*). Here Colonel Denfert-Rochereau employed the active defence so successfully by extemporizing detached redoubts and fortifying outlying villages, that he obliged the besiegers (who, however, were a small force at first) to take up an investing line 25 m. long; and succeeded in holding the village of Danjoutin, 2000 yds. in advance of the enceinte, for two months after the siege began. He also used indirect fire, withdrawing guns from the ramparts and placing them in the ditches, in the open spaces of the town, &c. At Paris the French found great advantage in placing batteries in inconspicuous positions outside the forts. Their direct fire guns were at a disadvantage in being fired through embrasures. These had served their purpose when artillery fire was very inaccurate, but had now for a long time been recognized by the best engineers as out of date. The Germans since the siege of Düppel in 1864 had mounted their siege guns on "overbank" carriages; that is, high carriages which made it possible to fire the guns over the parapet of the battery without embrasures. The guns in the Paris forts which were further handicapped by conspicuous parapets and the bad shooting of the gunners were easily silenced.

At Strassburg indirect fire against escarps was used. The escarp of Lunette 53 was successfully breached by this method. The breaching battery was 870 yds. distant, and the shot struck the face of the wall at an angle (horizontally) of 55°, the effect being observed and reported from the counterscarp. 1000 rounds from 60-pounder guns sufficed to make a breach 30 yds. wide.

Fig. 71 is a good example of the attack in the late stages. It will be observed that batteries for mortars and field guns are established in the captured lunettes. The narrow wet ditch of Lunette 53 was crossed by a dam of earth and fascines, the headway protected by a parapet or screen of sandbags.

Lunette 52 was unrevetted, and its ditch was more than 60 yds. wide, and 6 to 9 ft. deep. . . . It was determined to effect the passage by a cask bridge, for which the casks were furnished by breweries near at hand. . . . The formation of the bridge was begun at nightfall. A pioneer swam across, hauled over a cable, and made it fast to the hedge on the berm. Four men were stationed in the water, close to the covered way, the casks were rolled down to them one after the other, and fitted with saddles, so as to form piers. . . . these piers were successively boomed out along the line of the cable. . . . In two hours the bridge was finished, and the lunette was entered. . . . The work had not been discovered by the besieged, and the formation of lodgments inside the lunette was already begun, when the noise made by some troops in passing the bridge attracted attention, and drew a fire which cost the besiegers about 50 men. A dam was afterwards substituted for the bridge, as it was repeatedly struck by shells." (*R.E. Professional Papers*, vol. xix.)

It is curious to realize that this happened at so recent a time. Such operations would be impossible now, as long as any defending guns remained in action.

On the whole it may be said that siegecraft gained practically nothing from the Franco-German War. The Russo-Turkish war taught less, Plevna (*q.v.*) having been defended by field works and attacked by the old-fashioned methods. For the last ten years of the 19th century military opinion was quite at a loss as to how the sieges of the future would work out. As guns and projectiles continued to improve the "attaque brusquée" proposed by von Sauer had many adherents. It was thought that a heavy bombardment would paralyse resistance and open the way for an attack, to be delivered by great numbers and with special appliances for crossing obstacles. Others thought that the strength of the defence, as manifested by the Plevna field works,

would be greater than ever when the field works were backed by permanent works, good communications and the resources of a fortress. One thing was obvious—namely, that as long as the artillery of the place, of even the smallest calibres, remained unsubdued, the difficulty of trenchwork and sapping would be enormously increased, and no one seemed to have formed a clear conception of how that difficulty was to be met. A lecture delivered in Germany about 1895 is worth quoting as a fair example of the vagueness of idea then prevailing: "For the attack, the following is the actual procedure: Accumulation and preparation of material for attack before the fortress: advance of attacking artillery, covered by infantry. Artillery duel. Throwing forward of infantry: destruction of the capability for defence of the position attacked; when possible by long-

From *Textbook of Fortification*, by permission of the Controller H.M. Stationery Office.

FIG. 71.—Strassburg, Lunettes 52 and 53, 1870.

range artillery fire, otherwise by the aid of the engineers. Occupation of the defensive position. Assault on the inner lines of the fortress." That seemed quite a simple prescription, but the necessary drugs were wanting. And even since Port Arthur great uncertainty as to the future of the attack remains.

Modern artillery has much simplified the construction of siege batteries. Formerly siege batteries and rampart batteries opposed each other with direct fire at ranges not too long for the unaided human eye, and the shells, travelling with low velocity, bit into the parapets, and, exploding, produced their full effect. Accordingly the task of the gunners was, by accurate fire, to destroy the parapets and embrasures, and to dismount the guns. The parapets of siege batteries were therefore made from 18 to 30 ft. thick, and the construction of such batteries, with traverses, &c., involved much work. The height of parapet necessary for proper protection being 7 ft. 6 in. to 8 ft., a great deal of labour could be saved by sinking the gun-platforms about 4 ft. below the surface level, but of course this was only possible where rock or water were not near the surface.

The effect of modern projectiles was to reduce the thickness of earth necessary for parapets. High velocity projectiles are very easily deflected upwards by even a slight bank of earth. This is

Franc-German War.

Modern siege warfare.

especially the case with sand. Loose earth is better than compacted earth, and clay offers the least resistance to penetration. These facts were taken note of in England more than on the Continent in the design of instructional siege batteries.

The construction of batteries is moreover vastly simplified by the long ranges at which artillery will fight in future. It will as a rule be possible to place howitzer batteries in such positions that even from balloons it will be difficult to locate them; and even direct fire batteries can easily be screened from view. This renders parapets unnecessary, and probably no more protection will be used than light splinter-proof screens to stop shrapnel bullets or fragments of common shell. Moreover batteries can be constructed at leisure and by daylight.

The most important point about the modern battery is the gun platform for the larger natures of guns and howitzers. These require very solid construction to resist the heavy shock of discharge. Not long ago it was thought that the defence would have larger ordnance than the attack, as anything heavier than an 8 in. howitzer required a concrete bed, which could not be made at short notice. The Japanese, however, at Port Arthur made concrete platforms for 11 in. howitzers. It may be remarked that difficulties which loom largely in peace are often overcome easily enough under the stress of war.

Another gain to the attack is in connexion with magazines. The old powder magazines were particularly dangerous adjuncts to batteries, and had to be very carefully bomb-proofed. Such propellants as cordite, however, are comparatively harmless in the open. They are very difficult to detonate, and if set on fire do not explode like gunpowder. It is therefore unnecessary to provide bomb-proof magazines for them in connexion with the batteries.

In future sieges the question of supply will be more important than it has ever been. Leaving out of the question the bringing up of supplies from the base of operations, the task of distribution at the front is a very large one. The Paris siege manoeuvres of 1894 furnish some instructive data on this point. The main siege park was at Meaux, 10 m. from the 1st artillery position, and the average distance from the 1st artillery position to the principal fort attacked was 5000 yds. The front of attack on Fort Vaujours and its collateral batteries covered 10,000 yds. There were 24 batteries in the 1st artillery position; say 100 guns, spread over a front of 4000 yds. To connect Meaux with the front, the French laid some 30 m. of narrow gauge railway largely along existing roads. The line was single, with numerous branches and sidings. They ran 11 regular trains to the front daily and half-a-dozen supplementary. The amount of artillery material sent up was over 5000 tons, without any projectiles; but it can easily be imagined that large demands were also made on transport for other purposes. For instance, one complete bakery train was sent up daily. The amount of ammunition sent up would be limited only by the power of transporting it. A siege train of 100 pieces could probably dispose of from 500 to 1000 tons of ammunition a day, at the maximum rate of firing.

But the most important question affecting the sieges of the future (putting aside accidental circumstances) will be the configuration of the ground. Assuming that local conditions do not specially favour the artillery of either side, it is highly probable that the artillery duel will result in a deadlock. If the besiegers' guns do not succeed in silencing those of the defence from the 1st or distant artillery position (which, whether they are in cupolas or in concealed positions, will in any case be an extremely difficult task), it will be necessary for the infantry to press in; to feel for weak points, and to fight for those that offer better positions for fire and observation. In doing this they will have to face the defenders' infantry, entrenched, backed by their unsilenced guns, and having secure places of assembly from which to deliver counter-attacks. The distance to which they can work forward and establish themselves under these conditions will depend on the ground. It will then be for the engineers to cross the remaining space by sap. This, under present conditions, will be a tedious process, and may even take long enough to cause the failure of the siege.

As to the manner of the sap, it will certainly be "deep," as long as the defence retains any artillery power. When the 4 ft. 6 in. sap already described was first introduced, it was known as a "deep sap"; but the sieges of the future will probably necessitate a true deep sap, that is one in which the whole of the necessary cover is got below the surface of the earth.

Such a sap may consist of an open trench, about 6 ft. deep, the whole of the excavated earth being carried away through the trench to the rear; or a blinded trench, covered in as it progresses by splinter-proof timbers and earth; or a tunnelled trench, leaving a foot or so of surface earth undisturbed. In either case nothing should be visible from the front to attract artillery fire. As the sap is completed, it will sometimes be necessary to add a slight parapet in places, to give command over the foreground for the rifles of the guard of the trenches.

The sap will have to be pushed up quite close to the defenders' trenches and obstacles. After that further progress must either be made by mining, or as seems very probable, by getting the better of the defenders in a contest with shells from short-range mortars.

Just as in the feudal ages a castle was built on some solitary eminence which lent itself to the defensive methods of the time, so in the future the detached forts and supporting points in the girdle

of a fortress will be sited where smooth and gentle slopes of ground give the utmost opportunity to the defenders' fire, and the least chance of concealment to the enemy. There will be considerable latitude of choice in the defensive positions; though not, of course, the same latitude as when the existence of a precipitous hill was the *raison d'être* of the castle. In some places, as at Port Arthur, the whole country-side may by reason of its steep and broken slopes be unfavourable to the defence, though even then genius will turn the difficulties to account. But wherever it is possible the defender will provide for a space of 1000 yds. or so, swept by fire and illuminated by searchlights, in front of his lines. That space will have to be crossed by sap, and it needs little imagination to realize how great the task will be for the besieger.

There are other modern methods of siege warfare to be noticed, the use of which is common to besiegers and besieged. Much is expected of balloons; but the use of these in war is unlikely to correspond to peace expectations. They must be kept at a considerable distance from the enemy's guns, a distance which will increase as the means of range-finding improve; and as the height from which they can observe usefully is limited, so is the observers' power to search out hidden objects behind vertical screens. Thus, suppose a captive balloon at a height of 2000 ft., and distant 4000 yds. from an enemy's howitzer battery: and suppose the battery placed behind a steep hill-side or a grove of trees, at such a distance that a shell fired with 30° elevation can just clear this screen. The line of sight from the observer to the battery is inclined to the horizontal at $\frac{2000}{3 \times 4000}$ that is $\frac{1}{6}$, or roughly 10°. It is obvious, therefore, that the observer cannot see the battery.

Balloon observers are expected to assist the batteries by marking the effects of their fire. For this to be done on any practical scale a balloon would be required for each battery: that is, for only 100 guns, some 20 or 25 balloons. These would require an equal number of highly skilled observers (of whom there are not too many in existence), besides the other balloon personnel and accessories, and the means of making gas, which is too much to expect, even if an enemy were obliging enough to give notice of his intentions.

Telephones and all other means of transmitting intelligence rapidly are now of the utmost importance to both attack and defence. Maps marked with numbered squares are necessary for directing artillery fire, especially from cupolas. Organization in every branch will give better results than ever before, and the question of communication and transport from the base of supplies right up to the front needs detailed study, in view of the great weight of ammunition and supplies that will have to be handled.

The use of light mortars for the trenches, introduced by Coehoorn and revived with extemporized means at Port Arthur, needs great attention. It may be prophesied that the issue of important sieges in the future, when skilfully conducted on both sides with sufficient resources, will depend mainly on the energy of the defenders in trench work, on mining and countermining in connexion with the trenches, and on the use of light mortars made to throw large charges of high explosive for short distances with great accuracy.

For a brief narrative of the siege of Port Arthur in 1904, one of the greatest sieges of history, both as regards its epic interest and its military importance, the reader is referred to the article *RUSSO-JAPANESE WAR*.

DEFINITIONS.—The following definitions may be useful, but have no place in the evolution of the attack, to which this section is mainly devoted.

Investment.—This most necessary, almost indispensable operation of every siege consists in surrounding the fortress about to be besieged, so as to cut off its communications with the outside world. **Preliminary investment** which is carried out by cavalry and light troops before the arrival of the besieging force, consists in closing the roads so as to shut out supplies and reinforcements. **Close investment** should be of such a character as to prevent any sort of communication, even by single messengers or spies. The term "**blockade**" is sometimes loosely used instead of investment.

Lines of Circumvallation and Contravallation.—These now obsolete terms were in great use until the 19th century. The **circumvallation** was a line of parapet which the besieger made outside the investing position of his own force, to protect it when there was a chance of attack by a relieving army. The line of **contravallation** was the line of parapet and trench sometimes made by the besieger all round the town he was attacking, to check the sorties of the garrison.

Observing Force.—When circumstances make the reduction of a particular fortress in the theatre of operations unnecessary a force is often detached to "observe" it. The duty of this force will be to watch the garrison and prevent any hostile action such as raids on the lines of communications.

Bombardment.—This operation, common to all ages, consists in a general (sometimes an indiscriminate) fire against either the whole target offered by the fortress or a particular section of that target. In ancient and medieval times the effect of a bombardment—whether of ordinary missiles, of incendiary projectiles, or of poisonous matters tending to breed pestilence—upon a population closely crowded within its walls was very powerful. In the present day little military importance is attached to bombardment, since under modern conditions it cannot do much real harm.

IV. MILITARY MINING

It has been noted already that mining is one of the most ancient resources of siege warfare. The use of gunpowder in mining operations dates from the end of the 15th century. When Shakespeare makes Fluellen say, at Henry V.'s siege of Harfleur, "th'athversary is digt himself four yards under the countermines; I think 'a will plow up all, if there is not better directions," he is anticipating the development of siegecraft by nearly 100 years. Pedro di Navarro, a Spanish officer, is credited with the first practical use of explosive mines. He employed them with great success at the siege of Naples in 1503; and afterwards, when rebuilding the Castello Nuovo after the siege, was probably the first to make permanent provision for their use in countermines. Countermining had been a measure of defence against the earlier methods of attack-mining; the object being to break into the besiegers' galleries and fight hand to hand for the possession of them. When the explosive mine was introduced, it became the object of the defenders to establish their countermines near the besiegers' galleries and destroy them by the effect of the explosion. In the 400 years or so that have passed this branch of warfare has changed less than any other. Methods of mining have not advanced much, and the increased power of high explosives as compared with gunpowder has its least advantage in moving masses of earth.

When a besieger has arrived by means of trenches within a certain distance of the enemy's works without having subdued their fire, he may find that the advance by sap becomes too slow and too dangerous. He can then advance underground by means of mine galleries, and by exploding large charges at the heads of these galleries can make a series of craters. These craters are then occupied by infantry, and are connected with each other and with the parallel in rear by trenches, thus forming a new parallel. If not interfered with by the defenders the besieger can advance in this way until he reaches the counterscarp. His mines will now be turned to a new purpose, viz. to breach the counterscarp and afterwards the escarp. This is done by placing suitable charges at intervals behind the scarps at such a height above the foundations that the pressure of the earth above the mine will more than counterbalance the resistance of the masonry.

But if the defenders are active, they will countermine. There is as a general rule this broad difference between the mines of the defence and those of the attack, that the defenders do not wish the surface of the ground broken, lest increased opportunities of getting cover should be offered to the besiegers. The object of the defence, therefore, is to destroy the besiegers' galleries without forming craters, and for this purpose they generally endeavour to get underneath the attack galleries. The defenders may, however, wish, if the opportunity is allowed them, to explode mines under the attack parallels, in which case there is of course no objection to disturbing the surface.

" At the commencement of the subterranean war the main object of the defence is to force the besieger to take to mining operations as early as possible, as it is a tedious operation and will prolong the siege. Every endeavour must be made to push forward countermines so as to meet and check the attack. On the approach of the opponents to each other careful listening for the enemy must be resorted to. To this end it is necessary at irregular intervals to suspend all work for some minutes at a time, closing doors of communication and employing experienced listeners at the heads of the countermines. This matter is a most important one, as a premature explosion of the defender's mines is a double loss to the defender, a loss of a mine and an advantage to the enemy in more than one way. As soon as the overcharged mines of the besieger have been fired, a heavy fire should be brought to bear on the craters, and if possible sorties should be made to prevent the enemy occupying them. At the same time every effort should be made underground to surround with galleries, and as it were isolate, the craters so as to prevent the besieger making a new advance from them. The efforts of the attack at this stage will probably be directed to the formation of what are called "Boule shafts" (i.e. shafts partially lined in which charges are hastily fired with little or no tamping), and to meet these in time the defender may resort to the use of boring tools, and so place charges somewhere in advance of the heads of the counter-

mines. His great object must be to prevent as long as possible the besieger from getting underground again; and these occasions, when the power of resistance is temporarily equal to, if not greater than, that of the attack, should be made the most of by the defence." (Lewis, *Text-book on Fortification, &c.*, 1893.)

The defence has the advantage, in the case of fortresses, of being able to establish beforehand a system of countermine galleries in masonry. Many systems have been worked out for this purpose. A good typical arrangement is that of General Marescot, published in 1799, shown in fig. 72

From *Textbook of Fortification*, by permission of the Controller H.M. Stationery Office.

FIG. 72.

The main galleries (those running out in a straight line from the counterscarp gallery *e* to three of the points *a*) fall gently to the front to a depth of 30 or 40 ft. below the surface—the deeper they are the less they will suffer from the enemy's mines. Branch galleries (marked *c b+d c*) run obliquely upward from them to right and to left, leading to the mines, which are placed at various depths, according to circumstances.

Two main points must be observed in any system of countermines: the branch galleries must run obliquely forward, so as not to present their sides to the action of the enemy's mines; and the distance between the ends of the branches from adjacent main galleries should be such that the enemy cannot pass between them unheard. This distance will vary with the nature of the soil, but may be taken roughly as 20 yds. A convenient size for main galleries is 6 ft. high by 3 ft. wide: branch galleries may be 5 ft. by 3 ft. When the enemy is approaching, other branch galleries, called *listeners*, will be pushed out from main

and branch galleries. The section to fig. 1 of fig. 72 shows openings left for the purpose.

Another use of mines in defence is in connexion with breaches. A permanent arrangement for this purpose, by General Dufour, is shown in fig. 72. Yet another use, on which much ingenuity was expended in the 18th century, is to extemporize retrenchments.

The charges of mines depend of course upon the effect which is desired. When the charge is strong enough to produce a crater, the radius of the circular opening on the surface of the ground is called the *radius of the crater*. The line drawn from the centre of the charge to the nearest surface, which is expressed in feet, is called the *line of least resistance* (L.L.R.). When a mine produces a crater the diameter of which is equal to the line of least resistance, it is called a one-lined crater; when the diameter is double the L.L.R., a two-lined crater and so on. *Common mines* are those which produce a two-lined crater. *Over-charged mines* produce craters greater than two-lined, and *undercharged mines* less. A *camouflet* does not produce a crater; it is used when the object is to destroy an enemy's gallery without breaking the surface. Fig. 73 shows sections of the different kinds of mines, with their

Different kinds of mines.

From *Instructions in Military Engineering*, by permission of the Controller of H.M. Stationery Office.

FIG. 73.—Mines.

craters and the effect they will produce downwards and horizontally in ordinary earth.

Consideration of this figure will show that it is possible to place a long charge at such a depth below the surface that it will destroy all galleries of the enemy within a considerable radius, without much disturbing the surface of the ground.

Bored mines, which have been alluded to above, are a comparatively recent innovation. When the enemy is heard at work in one of his galleries and his position approximately determined by the sound, it is necessary to drive a branch gallery with all speed in that direction, and when it has advanced as far as appears necessary, to load, tamp and discharge a mine before the enemy can fire his own mine. This is one of the most delicate and dangerous operations of war, and success will fall to those who are at the same time most skilful and most determined. The work can be hastened and made

less dangerous as follows: Instead of driving a branch gallery, a hole several inches in diameter is bored in the required direction. With suitable tools there is no difficulty in driving a straight bore hole 20 or 30 ft. long. A small charge of high explosives is then pushed up to the end of the borehole and fired. This forms a small camouflet chamber by compressing the earth around it. Into this chamber the charge for the mine is passed up the bore-hole. No tamping of course is required.

Mine warfare is slow, dangerous and uncertain in its results. It will certainly delay the besiegers' advance very much and may do so indefinitely. One point is distinctly in favour of the defence, namely that when ground has been much mined it becomes charged with poisonous gases. Some explosives are less noxious than others in this way, and it will be advantageous for the attack, but not necessarily for the defence, to make use of these.

Calculation of Charges.—The quantity of powder required for a charge is expressed in lbs. in terms of L.L.R.³, and the following formulae are used:

l = L.L.R. in feet, r = radius of crater in feet, c = powder charge in pounds, s = a variable dependent on the nature of the soil.

For a common mine $c = \frac{s}{10} l^3$

For an overcharged mine $c = \frac{s}{10} \{l + .9(r-l)\}^3$

For an undercharged mine $c = \frac{s}{10} \{l - .9(l-r)\}^3$

The values to be given to s are:

Nature of Soil.	Value of s .
Very light earth	0.80
Common earth	1.00
Hard sand	1.25
Earth mixed with stones	1.40
Clay mixed with loam	1.55
Inferior brickwork	1.66
Rock or good new brickwork	2.25
Very good old brickwork	2.50

Military mining is carried on by means of vertical *shafts* and horizontal or inclined *galleries*. When the soil is very stiff, very little or even no lining is required for shafts and galleries; but usually they have to be lined either with cases or frames.

Cases make a complete lining of 2 in. planking. Frames are used at intervals of 4 or 5 ft. to support a partial lining of planks. Cases are of course preferable in other respects; but in ordinary soil they take up more timber.

There are two kinds of gallery in ordinary use in the British service, namely the *common gallery* whose interior dimensions with cases are 5 ft. 6 in. x 2 ft., and the *branch gallery* which is 4 ft. x 2 ft. The *shaft* has about the same dimensions as a branch gallery. Formerly it was sometimes necessary in the systematic attack of a fortress to get guns down into the ditch. For this purpose a "great gallery" was used, 6 ft. 6 in. in height and 6 ft. 8 in. wide, internal dimensions.

Miners' Tools.—These are few and simple. The pick and shovel differ from the ordinary types in having rather shorter helms suitable for the confined space in which they are used. There is also a *push-pick*, an implement with a straight helve and a pointed shovel head 6 in. long and 3½ in. wide. The *miner's truck*, used for drawing the earth from the end of the gallery to the bottom of the shaft, is a small wooden truck holding about 2 cub. ft. of earth. Formerly the noise of the wheels of the truck passing over the uneven wooden floor of the gallery was very liable to be heard by the enemy. To obviate this they now have leather tyres and should run on battens nailed to the floor. The *miner's bucket* is a small canvas bucket with a couple of ropes attached, by which the earth can be drawn up the shaft. Nowadays, however, the truck itself has chains attached to it, by which it is drawn up, with the aid of a windlass, to the surface. By this method more earth can be taken up in one lift, and time and labour are not wasted in transferring the contents of the truck to the bucket.

Ventilation is an important point. The breath of the miners and the burning of their candles (when electric light is not available) vitiate the air in the galleries; so that even in clean ground a gallery should not be driven more than 60 ft. without providing some means of renewing the air. This is usually done by forcing fresh air, by means of a pump or bellows, through a flexible hose to the head of the gallery. Where mines have been fired close by, there is great danger from poisonous gases filtering through the soil into the gallery. This difficulty is nowadays met by the use of special apparatus, such as helmets into which fresh air is pumped, so that the wearers need not breathe the air of the gallery at all. Ventilation can also be assisted by boring holes vertically to the surface of the ground.

Where a point has been reached at which it is proposed to fire a mine, a chamber just large enough to hold the charge is cut in the

side of the gallery. The object of this is to keep the charge out of the direct line of the gallery and thus increase the force of the explosion. The charge may be placed in canvas bags, barrels or boxes, precautions being taken against damp.

The operation of loading is of the first importance, for if the mine is not exploded with success, not only is valuable time lost, which may give the enemy his opportunity, but it will probably be necessary to untamp the mine in order to renew the fuze; an operation attended by considerable danger. The loading of the mine should therefore be done by the officer in charge with his own hands. He has to work in a very cramped position and practically in the dark (unless with electric light) as of course no naked lights can be allowed near powder. Everything should therefore be prepared beforehand to facilitate the loading of the mine and placing of the fuze. At Chatham a 1000 lb mine, at the end of a gallery 136 ft. long, has been loaded in 30 minutes. The powder was passed up the gallery by hand in sandbags, and emptied into a box of the required size.

Whatever method of firing (see below) is employed, the officer who loads the mine must be careful to see that it is so arranged as to make firing certain, and that the leads passing out of the gallery are not liable to damage in the process of tamping.

Tamping.—This operation consists in filling up the head of the gallery solidly, for such a distance that there shall be no possibility of the charge wasting its force along the gallery. The distance depends on the charge and on the solidity of the tamping. For a common mine it should extend to about $\frac{1}{2}$ L.L.R. from the charge, when the tamping is of earth in sandbags; for a 3-lined crater, to about 2 L.L.R. Tamping can be improved by jamming pieces of timber across the shaft or gallery among the other filling.

Firing.—This may be done electrically, or by means of *safety* or *instantaneous fuze* or *powder hose*.

Electric firing is the safest and best, and allows of the charge being exploded at any given moment. For this purpose *electric fuzes* (for powder) or *electric detonators* (for guncotton or other high explosive) are employed. The current that fires them is passed through copper wire leads.

The safety fuze used in the British service burns at the rate of about 3 ft. a minute. Instantaneous fuze burns at the rate of a mile a minute. Both can be fired under water. They are often used in conjunction, a considerable length of instantaneous fuze, leading from the charge, being connected to a short length of safety fuze.

Powder hose, an old-time expedient, can be extemporized by making a tube of strong linen, say 1 in. in diameter, and filling it with powder. It burns at the rate of 10 to 20 ft. per second.

Explosives.—The old-fashioned gunpowder of the grained black variety is still the best for most kinds of military mines. Pebble and prism powders do not give as good results, presumably because their action is so slow that some of the gases of explosion can escape through the pores of the earth. High explosives, with their quick shattering and rending effect, are little more effective than gunpowder in actually moving large quantities of earth. Most of them give off much more poisonous fumes than gunpowder. Some recent high explosives, however, have been specially designed to be comparatively innocuous in this respect.

Some formulæ have been given above for the calculation of charges. It will, however, simplify matters for the reader to record some actual instances of charges fired both in peace and war.

In the matter of scientific experiment we find Vauban as usual leading the way, and the following results among others were obtained by him at Tournay in 1686 and 1689: A charge of 162 lb placed 13 ft. below the surface produced a crater of 13 ft. radius (a two-lined crater, or "common mine"). Galleries were destroyed at distances equal to the L.L.R. in both horizontal and vertical directions. Double the charge, placed at double the depth, *i.e.* 324 lb with an L.L.R. of 27 ft. made no crater, but like the first destroyed galleries below it and on each side at distances equal to the L.L.R. A charge of 3828 lb with L.L.R. of 37 ft. made a two-lined crater and destroyed a gallery distant 61 ft. horizontally.

Bernard Forest de Belidor, a French engineer, made many experiments at La Fère about 1732, and 20 years later, as a general officer and inspector of miners, continued them on a larger scale. His experiments were directed towards destroying an enemy's galleries at greater distances than had hitherto been supposed possible, by means of very large charges (in proportion to the L.L.R.) which he called "globes of compression." In one of them a charge of 4320 lb of powder placed only 15 ft. 9 in. below the surface damaged or "compressed" a gallery distant 65 ft. horizontally. The radius of the crater was 34 ft. 8 in.

At Frederick the Great's siege of Schweidnitz in 1762 some very large charges were exploded. One of them, of 5400 lb with an L.L.R. of 16 ft. 3 in., made a crater of 42 ft. 3 in. radius. Readers of Carlyle's *Frederick the Great* may recall his description of the contest of the rival engineers on this occasion.

At Graudenz in 1862 (experiments) a charge of 1031 lb of powder placed 10 ft. deep, untamped, in a vertical shaft, made a crater of 15 ft. 6 in. radius. A charge of 412 lb of guncotton, calculated as

being equivalent to the above charge of powder and placed under the same conditions, made a crater of 14 ft. radius. The absence of tamping in both cases of course placed the gunpowder at a disadvantage.

Perhaps the most interesting mine ever fired was that at the siege of Petersburg in the American Civil War, in June 1864. The circumstances were all abnormal, and the untechnical account of it in *Battles and Leaders of the Civil War* (vol. iv.) is well worth perusal. No mining tools or materials and no military miners were available; and no one had any confidence in the success of the attempt except its originator, Lieut.-Colonel Pleasants, a mining engineer by profession, his regiment which was recruited from a mining population, and General Burnside the corps commander. The opposing entrenchments were 130 yds. apart. The mine gallery was started behind the Federal lines and driven a distance of 510 ft. till it came under a field redoubt in the Confederate lines. There two branches were made right and left, each about 38 ft. long, and in them eight mines aggregating 8000 lb of powder were placed. The first attempt to fire them failed, and an officer and a sergeant volunteered to enter the gallery to seek the cause of the failure. A defective splice in two lengths of fuze was thus discovered and repaired. At the second attempt all the mines were fired simultaneously with success, and made a gigantic crater 170 ft. long by 60 ft. wide and 30 ft. deep. The occupants of the redoubt, at least several hundred men (they have been stated at 1000), were blown up and mostly killed. The assault which followed, however, failed completely, for want of organization. The infantry was drawn up in readiness to advance, but no outlets had been provided from the parallel, and this and other causes delayed the occupation of the crater and gave the defending artillery a moment's respite. Thus the assailants gained the crater but could not advance beyond it in face of the defenders' fire, nor could they establish themselves within it, on its steep clay sides, for want of entrenching tools. A good many troops were sent forwards in support, but being in many cases of inferior quality, they could not be induced to go forward, and huddled in disorder in the already overcrowded crater. Over 1000 of these were captured when the Confederates retook the crater by a counter-attack and the total loss of the Federals in the attack was nearly 4000.

The wars of the last generation have done little or nothing to advance the science of military mining, but a good deal has been done in peace to improve the means. Electric lighting and electric firing of mines will be a great help; modern drilling machines may be used to go through rock; ventilating arrangements are much improved; and the use of bored mines is sure to have great developments. The Russo-Japanese War taught nothing new in mine-warfare, or as to the effects of mines, but the siege of Port Arthur had this moral among others; just as in future, in the frontal attack of positions, trench must oppose trench, so in fortress warfare mines will be more necessary than ever. It appears that they will be essential to destroy both the ditch-flanking arrangements of forts and the escarp or other permanent obstacle beyond the ditch.

V. FIELD FORTIFICATION

Field Fortifications, now more often spoken of as field defences, are those which are constructed at short notice, with the means locally available, usually when the enemy is near at hand. Subject to the question of time, a very high degree of strength can be given to them, if the military situation makes it worth while to expend sufficient labour. A century or more ago, the dividing line between permanent and field fortification was very rigidly drawn, since in those days a high masonry escarp surmounted by a rampart was essential to a permanent fortress, and these could naturally not be extemporized. Works without masonry, in other ways made as strong as possible with deep ditches and heavy timbers,—such as would require about six weeks for their construction—were known as *semi-permanent*, and were used for the defence of places which acquired strategic importance in the course of a war, but were not immediately threatened. The term *field fortification* was reserved for works constructed of lighter materials, with parapets and ditches of only moderate development. Redoubts of this class required a fortnight at most for their construction.

In modern fortification if cupolas and deep revetted ditches were essential to permanent defences, the dividing line would be equally clear. But as has been shown, this is not universally admitted, and where the resources exist, the use of our present

The Petersburg Mine, 1864.

means of construction, such as steel joists, railway rails, reinforced concrete and wire, in conjunction with the defensive power of modern fire-arms, makes it possible to extemporize in a very short time works having much of the resisting power of a permanent fortress. Further, such works can be expanded from the smallest beginnings; and, if the site is not too exposed, in the presence of the enemy.

Field fortification offers, as regards the actual constructions, a very limited scope to the engineer; and a little consideration will show that its defensive possibilities were not greatly affected by the change from machine-thrown projectiles to those fired by rude smooth-bore guns. There is therefore nothing in the history of this branch of the subject that is worth tracing, from the earliest ages to about the end of the 18th century. One or two points may be noticed. The use of obstacles is probably one of the earliest measures of defence. Long before missile weapons had acquired such an importance as to make it worth while to seek shelter from them, it would obviously have been found desirable to have some means of checking the onrush of an enemy physically or numerically superior. Hence the use by savage tribes, to this day, of pits, pointed stakes hidden in the grass, entanglements and similar obstacles. In this direction the ages have made no change, and the most highly civilized nations still use the same obstacles on occasion.

Another use of field defences common to all ages is the protection of camps at night, where small forces are operating against an enemy more numerous but inferior in arms and discipline. In daylight such an enemy is not feared, but at night his numbers might be dangerous. Hence the Roman practice of making each foot-soldier carry a couple of stakes for palisades; and the simple defence of a thorn zariba used by the British for their camps in the Sudan.

Palisades and trenches, abatis and sharpened stakes have always been used. Except wire, there is practically no new material. As to methods, the laagers of the Boers are preceded by the wagon-forts of the Hussites, and those no doubt by similar arrangements of British or Assyrian war chariots; and so in almost every direction it will be found that the expedient of to-day has had its forerunners in those of the countless yester-days. The only really marked change in the arrangements of field defences has been caused not by gunpowder but by quick-firing rifled weapons. For that reason it is worth while to consider briefly what were the principles of field fortification at the end of the 18th century. That period has been chosen because it gives us the result of a couple of centuries of constant fighting between disciplined troops with fairly effective fire-arms. The field defences of the 19th century are transitional in character. Based mainly on the old methods, they show only faint attempts at adaptation to new conditions, and it was not till quite the end of the century that the methods now accepted began to take shape.

The essential elements of fieldworks up to the time of the Peninsular War were *command* and *obstacle*; now they are *protection* and *concealment*.

The command and obstacle were as necessary in the days of smooth-bore muskets and guns as in those of javelins and arrows. When the enemy could get close up to a work without serious loss, and attack in close order, the defenders needed a really good obstacle in front of them. Moreover, since they could not rely on their fire alone to repulse the attack, they needed a two-deep line, with reserves close at hand, to meet it with the "arme blanche." For this purpose a parapet 7 or 8 ft. high, with a steep slope, perhaps palisaded, up which the attackers must climb after passing the obstacle, was excellent. The defenders after firing their last volley could use their bayonets from the top of the parapet with the advantage of position. The high parapet had also the advantage that the attackers could not tell what was going on inside the redoubt, and the defenders were sheltered from their fire as well from view until the last moment.

The strength of a fortified line in the 18th century depended principally on its redoubts. Lines of shelter trenches had little

power of defence at the time, unless they held practically as many men as would have sufficed to fight in the open. Obstacles on the other hand had a greater value, against the inelastic tactics of the time, than they have now. A good position therefore was one which offered good fire-positions for redoubts and plenty of facilities for creating obstacles. Strong redoubts which could resist determined assaults; good obstacles in the intervals, guns in the redoubts to sweep the intervals, and troops in formed bodies kept in reserve for counter-strokes—these were the essentials in the days of the smooth-bore.

The redoubts were liable to a heavy cannonade by field-guns before the attack. To withstand this, the parapets had to be made of a suitable thickness—from 4 or 5 ft. upwards—according to the time available, the resisting nature of the soil, and the severity of the bombardment expected.

The whole of the earth for the parapet was as a rule obtained from the ditch, in order to make as much as possible of this obstacle. The garrison in all parts of the interior of the redoubt were to be sheltered, if possible, from the enemy's fire, and with this object great pains were bestowed on the principle of "defilade." The object of defilade, which was a great fetish in theoretical works, was so to arrange the height of the parapet with reference to the terreplein of a work that a straight line (not, be it observed, the trajectory of the projectiles) passing from the muzzle of a musket or gun on the most commanding point of the enemy's position, over the crest of the parapet, should just clear the head of a defender standing in any part of the work. This problem of defilade became quite out of date after the development of time shrapnel, but was nevertheless taught with great rigour till within the last twenty years.

The sectional area of the ditch was calculated so that with an addition of about 10% for expansion it would equal that of the parapet. If a wider and deeper ditch was considered necessary, the surplus earth could be used to form a glacis.

The interior of the redoubt had to afford sufficient space to allow the garrison to sleep in it, which was sometimes a matter of some difficulty if a small irregularly shaped work had to contain a strong garrison. Consideration of the plan and sections of these works will show that the banquette for infantry with its slopes, and the gun platforms, took off a good deal from the interior space within the crest-line. Guns were usually placed at the salients, where they could get the widest field of fire. They were sometimes placed on the ground level, firing through embrasures in the parapet, and sometimes on platforms so as to fire over the parapet (*en barbette*).

As in permanent fortification, immense pains were taken to elaborate theoretically the traces of works. A distinction was made between forts and redoubts, the former being those which were arranged to flank their own ditches, while the redoubts did not. Redoubts again were classed as "closed," those which had an equally strong defence all round; and "half-closed," those which had only a slight parapet or timber stockade for the gorge or rear faces. Open works (those which had no gorge defence) were named according to their trace, as *redans* and *lunettes*. A redan is a work with two faces making a salient angle. It was frequently used in connexion with straight lines of trench or breastwork. A lunette is a work with two faces, usually forming an obtuse angle, and two flanks.

The forts described in the text-books, as might be expected, were designed with great ingenuity, with bastioned or demi-bastioned fronts, star traces, and so forth, and in the same books intricate calculations were entered into to balance the *remblai* and *déblai*, that is, the amount of earth in the parapets with that excavated from the ditches. In practice such niceties of course disappeared, though occasionally when the ground allowed of it star forts and bastioned fronts were employed.

On irregular ground the first necessity was to fit the redoubt to the ground on which it stood, so as to sweep the whole of the foreground, and this was generally a sufficiently difficult matter without adding the complications of flanking defences. Sir John Jones, speaking of the traces of the several works in the Torres Vedras lines, says:—

"The redoubts were made of every capacity, from that of fig. 74 a, limited by want of space on the ground it occupied to 50 men and two pieces of artillery, to that of fig. 74 b, for 500 men and six pieces of artillery, the importance of the object to be attained being the only guide in forming the dimensions. Many of the redoubts first thrown up, even some of the smallest, were shaped like stars, under the idea of procuring a flank defence for the ditches; but this construction was latterly rejected, it being found to cut up the interior space, and to be almost fallacious with

FIG. 74.—Torres Vedras Works.

respect to flank defence, the breadth of the exterior slopes being in some cases equal to the whole length of the flanks so obtained. Even when, from the greater size of the work, some flanking fire was thus gained, the angle formed by the faces was generally so obtuse that it demanded more coolness in the defenders than ought reasonably to be expected to aim along the ditch of the opposite face: and further, this construction prevented the fire of the work being more powerful in front than in rear.

In order to decide on the proper trace of a work, it is necessary to consider whether its object be to prevent an enemy establishing himself on the ground on which it is to be placed, or whether it be to insure a heavy fire of artillery on some other point in its vicinity. In the first case every consideration should be sacrificed to that of adding to its powers of self-defence by flanks or other expedients. In the second, its powers of resistance are secondary to the establishment of a powerful offensive fire and its trace cannot be too simple. Latterly, the shape of the redoubts was invariably that most fitted to the ground, or such as best parried the enfilade fire or musketry plunge of neighbouring heights, care being taken to present the front of fire deemed necessary towards the pass, or other object to be guarded; and such will generally be found the best rule of proceeding.

This recommendation, however, is not intended to apply to isolated works of large dimensions, and more particularly to those considered the key of any position. No labour or expense should be spared to render such works capable of resisting the most furious assaults, either by breaking the parapet into flanks, or forming a flank defence in the ditch; for the experience gained in the Peninsula shows that an unflanked work of even more than an ordinary field profile, if skilfully and determinedly assaulted, will generally be carried. . . Nor does the serious evil of curtailing the interior space, which renders breaks in the outline so objectionable in small works, apply to works of large dimensions. . . Under this view the great work on Monte Agraça (fig. 75) must be considered as very

FIG. 75.—Monte Agraça, Torres Vedras.

defective, the flank defence being confined to an occasional break of a few feet in the trace, caused by a change of direction in the contour of the height, whilst the interior space is more than doubly sufficient for the number of its allotted garrison to encamp.

Interior and other Defences.—This work, however, had some of its salient points . . . cut off by earthen lines of parapet, steeply

revetted externally, and so traced as to serve for traverses to the interior. It had also three or four small enclosed posts formed within it; and the work at Torres Vedras (fig. 76) had each of its salient points formed into an independent post. These interior defences and retranchements were intended to guard against a general panic amongst the garrison, which would necessarily be composed in part

FIG. 76.—Torres Vedras Works.

of indifferent troops, and also to prevent the loss of the work by the entry of the assailants at any weak or ill-defended point. Such interior lines to rally on are absolutely essential to the security of a large field-work. They serve as substitutes for a blockhouse or tower, placed in the interior of all well-constructed permanent earthen works, and merit far more attention than they generally receive.

The small circular windmills of stone, which were frequently found occupying salient knolls . . . readily converted into admirable interior posts of that nature. The profile of the several works varied on every face and flank, according to its liability to be attacked or cannonaded; the only general rule enforced being that all ditches should be at least 15 ft. wide at top and 10 ft. in depth, and the crest of the parapet have at least 5 ft. command over the crest of the counterscarp. No parapet exceeded 10 ft. in thickness, unless exposed to be severely cannonaded, and few more than 6 or 8 ft.; and some, on high knolls, where artillery could not by any possibility be brought against them, were made of stone or rubble less than 2 ft. in thickness, to gain more interior space, and allow full liberty for the use of the defenders' bayonets."

Fig. 77 gives two typical sections of these works.

FIG. 77.

The works of Torres Vedras have been chosen for illustration because they offer very good historical examples, and also because of the value of the critical remarks of Sir John Jones, who as a captain was the engineer in charge of their construction. At the same time it must be remembered that they differ from ordinary field-works in having an unusual degree of strength, plenty of time and civilian labour having been available for their construction. In this respect they approximate more to semi-permanent works, the main reason why they did not receive under the circumstances a greater development of ditch and parapet being that in addition to the large number of works required, much labour was expended in abatis, inundations, scarping hill-sides and constructing roads.

Some further remarks of Sir John on the *situations of the works* are very instructive:—

"Many of the redoubts were placed on very elevated situations on the summit of steep hills, which gave them a most imposing

appearance; but it was in reality a defect . . . for the fire of their artillery on the object to be guarded became so plunging as to lose half its powers; the musketry could not be made to scour the face of the hill sufficiently; and during the night both arms became of most uncertain effect.

"The domineering situation of the redoubts, however, gave confidence to the young troops which composed their garrisons, protected them from a cannonade, and screened their interior from musketry, unless fired at a high angle, and consequently at random. These considerations perhaps justify the unusually elevated sites selected for most of the redoubts on the lines, though they cannot induce an approval of them as a general measure."

The chief principle of the period was thus that the redoubts were the most important features of lines of defence, and that they combined physical obstacle and protection with good musketry and artillery positions. The value of concealment was not ignored, but it was as a rule subordinated to other considerations.

The principles of this time remained unaltered until after the Crimean War. In the American Civil War the power of the rifle began to assert itself, and it was found that a simple breastwork defended by a double rank of men could protect itself by its fire against an ordinary assault.

This power of the rifle gave greatly enhanced importance to any defences that could be hastily extemporized behind walls, hedges or any natural cover. About the period of the Franco-German War other considerations came in. The increased velocity of artillery projectiles reduced in some ways their destructive effects against earth parapets, because the shell had an increasing tendency to deflect upwards on striking a bank of loose earth. Also the use of shrapnel made it impossible for troops to find cover on the terreplein of a work some distance behind the parapet.

These considerations, however, were not fully realized at that time. The reason was partly a want of touch between the engineers and the non-technical branches of most armies, and partly that original writers from the Napoleonic wars to the present day have been more occupied with the primary question of the value of field defences as a matter of tactics than with their details considered from the standpoint of fortification.

There was always an influential school of writers who declaimed against all defences, as being injurious to the offensive spirit so essential to success. Those writers who treated of the arrangements of defences devoted themselves to theoretical details of trace quite after the old style; discussing the size and shape of typical redoubts, their distance apart and relation to lines of trenches, &c. The profiles—the thick parapet with command of 7 ft. or more, the deep ditch, and the inadequate cover behind the parapet—remained as they had been for a century.

The American Civil War showed the power of rifles behind slight defences. Plevna in 1877 taught a further lesson. It proved the great resisting power of extemporized lines; but more than that, we begin to find new arrangements for protection against shell fire (see plans and sections in Greene's *The Russian Army and its Campaign in Turkey*). The trace of the works and the sections of parapet and ditch suggest Torres Vedras; but a multiplication of interior traverses and splinter-proof shelters show the necessity for a different class of protection. The parapet was designed according to the old type, for want of a better; the traverses and shelters were added later, to meet the necessities of the case. The Turks also used two or three tiers of musketry fire, as for instance one from the crest of the glacis, one from the parapet, and one from a traverse in rear of it. This, however, is a development which will not be necessary in future, thanks to magazine rifles.

From 1877 to 1899 the efficiency of rifles and guns rapidly increased, and certain new principles, causing the field defences of the present day to differ radically from those of the 18th century, remained to be developed. These may be considered under the following heads: the nature of protection required, the diminished need of obstacle, and the adaptation of works to ground.

The principle that *thickness* of parapet is no longer required, to resist artillery fire, was first laid down at Chatham in 1896.

The distance at which guns now engage makes direct hits on parapets comparatively rare. Further, a shell striking near the crest of a parapet may perhaps kill one man if he is in the way, and displace a bushel of earth. That is nothing. It is the contents of the shell, whether shrapnel or explosive, that is the source of danger and not the shell itself. Thus the enemy's object is to burst his common shell immediately behind the parapet, or his shrapnel a short distance in front of it, in order to get searching effect. It follows that a parapet is thick enough if it suffices to stop rifle bullets, since the same thickness will *a fortiori* keep out shrapnel bullets or splinters of shell. For this purpose 3 ft. is enough.

Real protection is gained by a trench close in rear of the parapet, deep enough to give shelter from high angle shrapnel, and narrow enough to minimize the chance of a common shell dropping into it. This protection is increased by frequent traverses across the trench.

The most essential point of all is *concealment*. In gaining this we say good-bye finally to the old type of work. Protection is now given by the trench rather than the parapet; command and the ditch-obstacle (which furnished the earth for the high parapet) are alike unnecessary. Concealment can therefore be studied by keeping the parapet down to the lowest level above the surface from which the foreground can be seen. This may be 18 in. or less.

The need of obstacle, in daylight and when the defenders are not abnormally few, has practically disappeared. For night work, or when the assailant is so strong as to be able to force home his attack in face of protected rifle fire, what is needed is not a deep ditch immediately in front of the parapet, difficult to climb, but also difficult to flank, but an obstacle that will detain him under fire at short range. It may be an entanglement, an abatis, an inundation: anything that will check the rush and make him move slowly.

In the *adaptation of works to ground*, the governing factor is the power of the rifle in frontal defence. We have seen that in Peninsular times great reliance was placed on the flanking defence of lines by guns in redoubts. Infantry extended behind a simple line of trench could not resist a strong attack without such support. Now, however, infantry behind a slight trench, with a good field of fire should be able to defend themselves against any infantry attack.

This being so, the enemy's artillery seeks to locate the trenches and to cover them with a steady hail of shells, so as to force the defenders to keep down under cover. If they can succeed in doing this, it is possible for the attacking infantry to advance, and the artillery fire is kept up until the last moment, so that the attack may have the narrowest possible space to cover after the defenders have manned their parapets and opened fire. Fig. 78 shows the action of various natures of projectiles.

From *Mil. Engineering*, by permission of the Controller of H.M. Stationery Office.
FIG. 78.—Effect of Projectiles.

We need not here discuss the rôle of the defenders' artillery in replying to that of the enemy and playing on the attack; nor for the moment consider how far the defence of the trenches while under artillery fire can be made easier by overhead cover. The main question is—what is, in view of the nature of the attack,

the best disposition of lines of trench; and do they require the addition of redoubts?

The most important point, with the object of protection, is that the trenches must not be conspicuous; this is the best defence against artillery. With the object of resistance by their own fire they must have a good view, or, as it is generally described, no *dead ground* in front of them. For this purpose 300 or 400 yds. may be enough if the ground is even and affords no cover.

This necessity for invisibility, together with the shallowness of the zone that suffices for producing a decisive fire effect, has of late years very much affected the choice of ground for a line of trenches.

For a defensive position on high ground, it was usually laid down until the South African War that a line of trenches should be on the "military crest" (Fr. *crête militaire*), i.e. the highest point on the hill from which the whole of the slopes in front can be seen. Thus in the three sections of ground shown in fig. 79 it would be at *a*, *b* and *c* respectively. The simplicity

Sking of trenches.

FIG. 79.

of this prescription made it attractive and it came to be rather abused in the text-books. There were, even before the improvements in artillery, objections to it, because on most slopes the military crest would be found at very different elevations on different parts of the line, so that by a strict adherence to the rule some of the trenches would be placed near the top of the hill, and some in dangerous isolation near the bottom. Moreover a rounded hill has no military crest.

Further, we have to consider nowadays not only the position of the fire-trenches, but those of supports, reserves and artillery, and the whole question is extremely difficult.

For instance, considering the sections alone, as if they did not vary along the line, the positions at *a* and *b*, fig. 79, are bad because they are on the sky-line and therefore a good mark for artillery. That at *b* is especially bad because the slope in front is so steep that the defenders would have to expose themselves very much to fire down it, and the artillery fire against them can be kept up until the very last moment. The position *c* has the advantage of not being on the sky-line, but the position of the supports in rear is exposed.

FIG. 80.

Another possible position for the infantry line is at *f*, fig. 81, with the guns on the high ground behind. They might easily be quite concealed from the enemy's artillery. The drawback is that no retirement up the exposed slope would be possible for them, except at night. The fire from *f* will be grazing, which will

FIG. 81.

be a great advantage as compared with the *plunging* fire that would be obtained from a position up the hill.

It is idle, however, to give more than the most cursory consideration to sections of imaginary positions. It is only by actual practice on the ground that skill can be attained in laying out positions, and only a trained soldier with a good eye can succeed in it. Briefly, the advantages of view and position given by high ground must be paid for in some degree by exposure to the enemy's artillery; and at least as much consideration—possibly as much labour—must be given to communications with the fire-trenches as to the trenches themselves. Irregular ground simplifies the question of concealment but also gives cover to the enemy's approach. The lie of the ground will itself dictate the position of the trenches, subject to the pre-dispositions of the responsible officer. On flat featureless ground the general trace of the trenches should be irregular. This makes a more difficult target for artillery, and affords a certain amount of cross and flanking fire, which is a very great advantage. Great care should, however, be taken not to expose the trenches to oblique or enfilade fire; or at least to protect them, if so exposed, by traversing.

Concealment of trenches is generally attempted by covering the freshly turned earth of the small parapet with sods, leafy branches or grass. In this connexion it should be remembered *Trenches.* that after a day or two cut leaves and grass wither and may become conspicuous against a green surface. Where the ground is so even that a good view of the foreground is possible from the surface level, the trench may be made without a parapet; but this entails great labour in removing and disposing of the excavated earth. A common device is to conceal the parapet as well as possible and to make a dummy trench some distance away to draw fire.

FIG. 82.

Besides the direct concealment of trenches, care must be taken that the site is not conspicuous. Thus a trench should not be placed along the meeting line of two different kinds of cultivation, or along the edge of a belt of heather on a hill-side, or where a difference of gradient is sharply defined; or where any conspicuous landmark would help the enemy's artillery to get the range.

Trenches are broadly distinguished as "fire trenches" and "cover trenches," according as they are for the firing line or supporting troops. The following simple types are taken from the 1908 edition of *Military Engineering* (part 1): "Field Defences."

FIG. 83.

Fig. 82 is the most common form of fire trench, in which labour is saved by equalizing trench and parapet. This would take 1½ to 2 hours in ordinary soil. Fig. 83 shows the same trench improved by 2 or 3 hours' more work. Fig. 84 shows a fire trench without parapet, with cover trench and communication.

From *Mil. Engineering: Field Defences* (1908), by permission of the Controller H. M. Stationery Office.

FIG. 84.

concealment (called *head-cover*), gives increased protection, but at the cost of greater prominence for the parapet (fig. 85). Overhead cover can only be provided in fire trenches by giving the parapet still greater height and it is not usually done. Portions of the trench not used for firing can, however, be given splinter-proof protection by putting over them branches or bundles, covered with a few inches of earth; or by boards, or sheets of corrugated iron if they can be had. A better plan when time permits is to provide cover trenches immediately behind and communicating with the fire trench.

The question of redoubts has been a vexed one for years; partly they were thought to be unnecessary in view of the resisting power of a line of trenches, but chiefly because the redoubt was always imagined as one of the older type, with a high conspicuous parapet. Of course a redoubt of such a nature would be readily identified and made untenable. But the idea of a redoubt

does not necessarily imply command. Its object is that it shall be capable of all-round defence. There can be no doubt that as there is always a possibility of lines being pierced somewhere, it is desirable, unless the whole line is to be thrown into confusion and forced back, to have some point at which the defenders can maintain themselves. This is not possible unless at such points there is provision for defence towards both flanks and rear, that is to say, when there are redoubts, which can hold on after certain portions of the line have been lost and thereby can localize the enemy's success and simplify

FIG. 85.

the action of supporting troops. In order that redoubts may exercise this function, all that is necessary is that their defenders should be able to see the ground for a furlong in front of them in every direction. Their parapets, therefore, need be in no way more conspicuous than those of the neighbouring fire trenches, and in that case there is no fear of their drawing special attention from the enemy's artillery. Whatever theories may have been put forward on the subject, in practice they are constantly used, and in the Russo-Japanese War, where the experience of South Africa was already available, we find them in the fighting lines on both sides.

FIG. 86.

The modern type of field redoubt is a fire trench, no more conspicuous than the others, in any simple form adapted to the ground that will give effective all-round fire, such as a square with blunted

FIG. 87.

angles. Enhanced strength may be given by deepening the trenches and improving the overhead cover; and special use may here be made of obstacles.

Within the redoubt cover may be provided for men in excess of those required to man the parapet, by means of cover trenches and

FIG. 88.

field casemates. Fig. 86 gives the general idea of such a redoubt, and figs. 87, 88 the plan and section of the interior shelters. Such a work can easily be made quite invisible from a distance. It gives excellent cover against shrapnel, but would not be tenable against howitzer common shell, if the enemy did manage to bring an accurate fire to bear on it.

Fig. 89 shows the section of a parapet with two shelters behind it for a work with a high command of 5 or 6 ft. This work would

From *Mil. Engineering: Field Defences* (1908), by permission of the Controller H.M. Stationery Office.

FIG. 89.

require a concealed position, which can often be found a little in rear of the firing line.

In the South African War a good deal of interest was excited by a type of trench used by the Boers. It was very narrow at the surface, giving only just room for a man to stand; but undercut or hollowed out below, so that he could sit down with very good

cover. Such a section is only possible in very firm soil. Apart from this, the type is really only suited to rifle pits, as a trench proper should have room for officers and N.C.O.'s to move along within it. The Boers showed great skill in concealing their trenches. One good point was that there was generally something making a background immediately behind the men's heads, so that they did not stand out in relief when raised above the parapet.

Boer, Russian and Japanese types.

In the Russo-Japanese War the Russian trenches at the outset were of old-fashioned type and very conspicuous. Later on better types were evolved. Figs. 90 and 91 are a couple of sections from Port Arthur; the first borrowed from the Boers but wider at the

From *Russo-Japanese War: British Officers' Reports*, vol. ii., by permission of the Controller H.M. Stationery Office.

FIGS. 90 and 91.

top. The Japanese appear to have taken their type mainly from the latest British official books, but applied them with great skill to the ground, studying especially invisibility. In their prepared positions they used large redoubts manned by several companies.

Cover for Guns.—Some degree of cover for guns, in addition to the shield, is always desirable. If the gun stands on the natural surface of the ground, the cover is called an epaulment. In that case a bank is thrown up in front of the gun, about 1 ft. high in the centre, and

From *Mil. Engineering: Field Defences*, by permission of the Controller H.M. Stationery Office.

FIG. 92.—Gun-pit.

3 ft. 6 in. high at the ends. On either side of the gun and close up to the bank is a small pit for the gunners. The rest of the earth for the epaulment is got from a trench in front. If the gun is sunk, the shelter is called a gun-pit.

In this case there is no bank immediately in front of the gun. Shelter can be got more quickly with a pit than an epaulment, but it is generally undesirable to break the surface of the ground.

The commonest forms of *obstacle* now used are *abatis* and *wire entanglements*. Fig. 93 shows a well-finished type of *abatis*. The branches are stripped and pointed, and the butts are buried and pegged firmly down. Wire entanglement may be added to this with advantage. An *abatis* should be protected from artillery fire, which is sometimes done by placing it in a shallow excavation with the earth thrown up in front of it.

From *Mil. Engineering: Field Defences*, by permission of the Controller H.M. Stationery Office.

FIG. 93.—Abatis.

Wire may be used as a *high* or *low entanglement* or as a fence or trip wire or concealed obstacle. The usual form of high wire entanglement consists of several rows of stout stakes 4 or 5 ft. long, driven firmly into the ground about 6 ft. apart, and connected horizontally and diagonally with barbed wire.

Palisades are still used, and need no description. They were formerly often made bullet-proof, but this is no longer possible. *Fraises* are seldom heard of now, though they may appear occasionally in a modified form. They were much used in connexion with deep ditches, and are palisades placed so as to project horizontally from the escarp, or sloping forward in the bottom of the ditch. *Military pits* both *deep* and *shallow* (the latter, shown in fig. 95, called *trous de loup*) are not so much used as formerly, because the obstacle is hardly worth the labour expended on it. Both,

FIG. 94.—Crows' Feet.

FIG. 95.—Plan and section of Trou-de-loup.

however, were employed in the Russo-Japanese War. *Crows' feet*, formerly much used as a defence against cavalry, are practically obsolete. They consisted of four iron spikes joined together at their bases in such a manner that however they were thrown down one point would always be pointing upwards (fig. 94). *Chevaux-de-frise* (q.v.) were formerly a much-used type of obstacle.

The best obstacle is that which can be made to fulfil a given object with the least expenditure of time and labour. From this point of view barbed wire is far the best. One of its greatest advantages is that it gives no cover whatever to the enemy.

Fougasses have always for convenience been classed as obstacles. A *fougasse* is a charge of powder buried at the bottom of a sloping pit. Over the powder is a wooden shield, 3 or 4 in. thick, and over the shield a quantity of stones are piled. The illustration, fig. 96, gives a clear idea of the arrangement. A *fougasse* of this form, charged with 80 lb of powder, will throw 5 tons of stones over a surface 160 yds. long by 120 wide. They may be fired by powder hose, fuze or electricity. Their actual effect is very often a matter of chance, but the moral effect is usually considerable.

Dams are most effective obstacles, when circumstances allow of their use. They are constructed by military engineers as small temporary dams would be in civil works.

A most important question, especially in connexion with obstacles, is that of lighting up the foreground at night. Portable electric searchlights are most valuable, especially for detecting the enemy's movements at some distance; but their use will naturally always be restricted. Star shells and parachute lights fired from guns are not of much use for the immediate foreground, and do not burn very long. They were formerly chiefly of use in siege works, to light up an enemy's working parties. Germany has introduced lightballs fired from pistols, which will probably have a considerable future.

Various civilian forms of *flare-light* would be very useful to illuminate obstacles, but cannot well be carried in the field. *Bonfires* are very useful when material is available. They require careful treatment, e.g. they must be so arranged that they can be lighted instantaneously (they may be lighted automatically, by means of a trip wire and a fuze); they must give a bright light at once (this can be ensured with shavings or straw sprinkled with petroleum); they must be firmly built so that the enemy cannot destroy them easily; and if possible there should be a screen arranged behind them so that they may not light up the defence as well as the attack.

Blockhouses are familiar to the public from the part they played in the South African War of 1899-1902. In the old-fashioned permanent fortification they were used as keeps in such positions as re-entering places of arms and built of masonry. Stone blockhouses have long been used in the Balkans for frontier outposts; they are sometimes built cruciform, so as to get some flanking defence. In the form of bullet-proof log-cabins they have played a great part in warfare between pioneer settlers and savages.

From *Mil. Engineering*, by permission of the Controller H.M. Stationery Office.

FIG. 96.—Fougasse.

In the 19th century blockhouses were usually designed to give partial protection against field artillery; the walls being built of two thicknesses of logs with earth between them, the roof flat and covered with 2 or 3 ft. of earth, and earth being piled against the walls up to the loopholes. Nowadays they are employed only in positions where it is not likely that artillery will be brought against them; but they may be made tenable for a while even under artillery fire if they are surrounded by a trench and parapet.

Blockhouses are especially useful for small posts protecting such points as railway bridges, which the enemy may attempt to destroy by cavalry raids. The essential feature is a bullet-proof loop-holed wall, arranged for all-round fire, with enough interior space for the garrison to sleep in. The roof may be simply weatherproof. Some arrangement for storing water must be provided. Circular blockhouses were very popular in South Africa. They were made of sheets of corrugated iron fastened 6 in. apart on a wooden framework, the space between the sheets being filled with small stones. The loop-holes were made of sheet-iron frames inserted in the walls. Fig. 97 shows a section of one of these blockhouses.

By permission of the Controller H.M. Stationery Office.

FIG. 97.—Blockhouse, South Africa, 1900-1902.

The defence of woods was formerly an important branch of field defences. *Abatis* and entanglements could readily be extemporized, trunks of trees made strong breastworks, and the wood concealed the numbers of the defenders. A wood was therefore generally considered a useful addition to a line of defence. It was customary to hold the front edge of the wood, the irregularities of the outline being utilized for frontal and flanking fire, while obstacles were disposed some 50 yds. in front. In a carefully prepared position, clearings would be made parallel to the front and some distance back from it, for support positions, and great attention was paid (in theory at least) to clearing communications, erections, signposts, &c., so that the defending troops might move freely in any desired direction.

Woods, however, had their inherent drawbacks. The ground is hard to dig, clearing involves great labour; and communication, at the best, is cramped. Nowadays a wood can hardly be considered a strong defensive element in a line. The front of it is an excellent ranging mark for artillery, and positions within the wood are not easily made, because of the difficulty of trenching, and the fact that no reasonable amount of timber will make a breastwork proof against the modern bullet. Once an enemy gets a footing within a wood, the position is more favourable to offensive than to defensive action. If a wood has to be occupied in a line of defence, it is probable that in most cases the rear edge or a line slightly behind it would be the best to fortify, though the front edge would no doubt be held by the fighting line at the outset.

The defence of villages is another question which has been much affected by recent improvements in artillery. Formerly villages were very important adjuncts to a line of defence, and strong points for a detached force to hold. There were indeed always drawbacks. The preparations for defence entailed

a good deal of labour, and the defending force was scattered in houses and enclosures, so that control and united action were difficult. But the value of the ready-made protection afforded by walls was so great—and sometimes even decisive—that villages were occupied as a matter of course. This is certainly now changed, but precisely to what extent it will be impossible to say, until after the next European war. A village under fire is not now an ideal defensive position. A single shrapnel penetrating the outer wall may kill all the occupants of a room; a single field-howitzer shell may practically ruin a house. At the same time, a house or line of houses may (without any preliminary labour at all) give very good protection against shell fire to troops *behind* them. Further, the value to the defence of the slightest cover, once the infantry attack has developed, is so great that the ruins of walls and houses occupied at the right moment may prove an impregnable stronghold. This class of fighting, however, does not properly come under the present heading. For the details of the defence of walls, houses, &c., see the official *Mil. Engineering* (1908).

Entrenching under Fire.—Progress in this direction has been delayed by the reluctance of military authorities to add a portable entrenching tool to the heavy burden already carried by the infantry soldier. Further delay has resulted from the attempts of enthusiastic inventors to produce a tool that shall weigh nothing, go easily in the pocket, and be available as a pick, shovel, saw, hand-axe or corkscrew. A tool that will serve more than one use is seldom satisfactory for any.

The object of entrenching under fire is to enable attacking infantry, when their advance is checked by the enemy's fire, to maintain the ground they have won by extemporizing cover where none exists. The need of this was first felt in the American Civil War, and towards the close of it a small entrenching spade 22 in. long and weighing only 1½ lb was introduced by Brigadier-General H. W. Benham into the Army of the Potomac. Since that time a great number of patterns have been tried, including shovel, trowel and adze types. The most popular of these has been the Linnemann spade, which is used by most continental armies and by the Japanese. The Austrian form of this tool is a rectangular spade with straight handle. The length over all is a little less than 20 in. The blade is 8 in. long by 6 wide. One side of it has a saw edge, and the other a cutting edge. For carriage, the blade is enclosed in a leather case, which is strapped to the pack or the waist-belt. In the British army the Wallace combined pick and shovel was used for some time, but was eventually dropped. There was always great doubt whether the utility of a portable entrenching tool was such as to justify the inconvenience caused to the soldier in carrying it. But the experience of the Russo-Japanese War seems to have finally established the necessity of it, and also the fact that it must generally be used lying down. For this purpose and for convenience in carrying it on the person, a very light short-handled tool is required.

The soldier lying down cannot attempt to dig a trench, but can make a little hole by his side as he lies, and put the earth in front of his head. A method introduced by the Japanese is that at each check in the advance the front line should do this, and, as they go forward, the supporting lines in succession should improve the cover thus commenced.

There are few things that soldiers dislike more, in the way of training, than trenchwork. For men unused to it, it is tiring and tedious work, and it is difficult for them to realize its importance. At the same time it is a commonplace of recent history that men who have been in action a few times develop a great affection for the shovel. The need of trenches grows with the growth of firearms, and the latest feature of modern tactics is the use of them in attack as well as in defence. The observation has often been made—with what truth as a general proposition we cannot here discuss—that modern battles tend more and more to resemble a siege. The weaker side, it is said, entrenches itself; the other bombards and attacks. After gaining as much ground as they can, the attacking troops wait for nightfall and entrench; perhaps making a further advance and entrenchment before dawn. In the last stage the attack might even be reduced to gaining ground by sapping. In open and featureless ground, where the rifle and gun have full play, the trench is to the modern soldier very much what the breast-plate was to the man-at-arms, an absolute essential.

The most important point in connexion with modern field fortification is the effect on both strategy and tactics of the increased resisting power of the defence. A small force well entrenched can check the frontal attack of a very much larger force, and while holding its position can make itself felt over a wider radius than ever before. This must needs have a marked effect on strategy, and it is quite possible to foresee such an ultimate triumph of field fortification as that one force should succeed in surrounding another stronger than itself, and by entrenching prevent the latter from breaking out and compel its surrender.

VI. CONCLUSION

In tracing the history of the science of fortification and in outlining the practice of our own time it has been necessary to

dwell chiefly on the material means of defence and attack. The human element has had to be almost ignored. But here comes in the paradox, that the material means are after all the least important element of defence. Certainly it is inconceivable that the designer of a fortress should not try to make it as strong as is consistent with the object in view and the means at his disposal. And yet while engineers in all ages have sought eagerly for strength and refinements of strength, the fact remains that the best defences recorded in history owed little to the builder's art. The splendid defence in 1667 of Candia, whose enceinte, of early Italian design, was already obsolete but whose capture cost the Turks 100,000 men; the three years defence of Ostend in 1601; the holding of Arcot by Clive, are instances that present themselves to the memory at once. The very weight of the odds against them sometimes calls out the best qualities of the defenders; and the *man* when at his best is worth many times more than the *rampart* behind which he fights. But it would be a poor dependence deliberately to make a place weak in order to evoke these qualities. One cannot be sure that the garrison will rise to the occasion, and the weakness of the place has very often been found an excuse for giving it up with little or no resistance.

Very much depends on the governor. Hence the French saying, "tant vaut l'homme, tant vaut la place." Among modern men we think of Todleben (not governor, but the soul of the defence) at Sevastopol, Fenwick Williams at Kars, Denfert-Rochereau at Belfort, and Osman Pasha at Plevna. The sieges of the 16th and 17th centuries offer many instances in which the event turned absolutely on the personal qualities of the governor; in some cases distinguished by courage, skill and foresight, in others by incapacity, cowardice or treachery. The reader is referred to Carnot's *Défense des places fortes* for a most interesting summary of such cases, one or two of which are quoted below.

Naarden was besieged by the prince of Orange in September 1673 and defended by Philippe de Procé, sieur Dupas. The duke of Luxemburg visited the place some hours before it was invested, and arranged with Dupas to relieve him as soon as he had collected his cavalry. But the governor lost his head when he saw the enemy encamped round the place, and surrendered it before he had even lost the covered way. He was subsequently tried by a council of war and sentenced to be degraded before the troops and imprisoned for life. The reason the court gave for not condemning him to death was that they could find no regulation which condemned a man to loss of life for being a coward. (At that period the decapitation of a governor who was considered to have failed in his duty was not uncommon.) This man, however, was not wanting in physical courage. He was in prison at Grave when it was besieged a year later, obtained leave to serve as a volunteer in the defence, fought well and was killed.

A similar case occurred in the English Civil War. In 1645 the young governor of the royal post at Bletchington House was entertaining a party of ladies from Oxford, when Cromwell appeared and summoned him to surrender. The attacking force had no firearm more powerful than a carbine, but the governor, overawed by Cromwell's personality, yielded. Charles I., who was usually merciful to his officers, caused this governor to be shot.

A defence of another kind was that of Quillebœuf in 1592. Henry IV. had occupied it and ordered it to be fortified. Before the works had been well begun, Mayenne sent 5000 men to retake it. Bellegarde undertook its defence, with 115 soldiers, 45 gentlemen and a few inhabitants. He had ammunition but not much provisions. With these forces and a line of defence a league in length, he sustained a siege, beat off an assault on the 17th day, and was relieved immediately afterwards. The relieving forces were astonished to find that he had been defending not a fortified town but a village, with a ditch which, in the places where it had been begun, measured no more than 4 ft. wide and deep.

At that period the business aspect of siege warfare already

The spirit of the defence.

General remarks.

alluded to had been recognized, but many commanders retained the old spirit of chivalry in their reluctance to say the "loth word." The gallant Marshal d'Essé, who feared nothing but the idea of dying in his bed, was lying ill at his country house when he was sent for by the king. He was ordered to take command at Théroouanne, then threatened by Charles V., and made his farewell with these words, which remind us somewhat of Grenville: "Sire, je m'y en vais donc de bon et loyal cœur; mais j'ai ouï dire que la place est mal envitaillée, non pas seulement pourvue de palles, de tranches, ni de hottes pour remparer et remuer la terre; mais lors, quand entendrez que Théroouanne est prise, dites hardiment que d'Essé est guéri de sa jaunisse et mort." And he made good his word, for he was killed at the breach by a shot from the arquebus of a Spanish soldier.

Sometimes the ardour of defence inspired the whole body of the inhabitants. Fine examples of this are the defences of Rochelle (1627) and Saint-Jean de Lône (1636), but these are too long to quote. We may, however, mention Livron, which is curious. In 1574 Henry III. sent one of his favourites, Saint Lary Bellegarde, against the Huguenots in the Dauphiné. Being entrusted with a good army, this gentleman hoped to achieve some distinction. He began by attacking the little town of Livron, which had no garrison and was defended only by the inhabitants. But he was repulsed in three assaults, and the women of the town conceived such a contempt for him that they came in crowds to empty their slops at the breach by way of insult. This annoyed him very much, and he ordered a fresh assault. The women alone sustained this one, repulsed it lightheartedly, and the siege was raised.

The history of siege warfare has more in it of human interest than any other branch of military history. It is full of the personal element, of the nobility of human endurance and of dramatic surprises. And more than any battles in the open field, it shows the great results of the courage of men fighting at bay. Think of Clive at Arcot. With 4 officers, 120 Europeans and 200 sepoys, with two 18-pounders and 8 lighter guns, he held the fort against 150 Europeans and some 10,000 native troops. "The fort" (says Orme) "seemed little capable of sustaining the impending siege. Its extent was more than a mile in circumference. The walls were in many places ruinous; the rampart too narrow to admit the firing of artillery; the parapet low and slightly built; several of the towers were decayed, and none of them capable of receiving more than one piece of cannon; the ditch was in most places fordable, in others dry and in some choked up," &c. These feeble ramparts were commanded almost everywhere by the enemy's musketry from the houses of the city outside the fort, so that the defenders were hardly able to show themselves without being hit, and much loss was suffered in this way. Yet with his tiny garrison, which numbered about one man for every 7 yds. of the enclosure, Clive sustained a siege of 50 days, ending with a really severe assault on two large open breaches, which was repulsed, and after which the enemy hastily decamped.

Such feats as this make arguments about successive lines of defence and the necessity of keeps seem very barren. History, as far as the writer knows, shows no instances where successive lines have been held with such brilliant results.

Clive's defence of his breaches, which by all the then accepted rules of war were untenable, brings us to another point which has been already mentioned, namely, that a garrison might honourably make terms when there was an open breach in their main line of defence. This is a question upon which Carnot delivers himself very strongly in endeavouring to impress upon French officers the necessity of defence to the last moment. Speaking of Cormontaingne's imaginary *Journal of the Attack of a Fortress* (which is carried up to the 35th day, and finishes by the words "It is now time to surrender"), he says with great scorn: "Crillon would have cried, 'It is time to begin fighting.' He would have said as at the siege of Quillebœuf, 'Crillon is within, the enemy is without.' Thus when Bayard was defending the shattered walls of Mézières, M. de Cormontaingne, if he had been there, would have said, 'It is time to surrender.' Thus when Guise

was repairing the breaches of Metz under the redoubled fire of the enemy, M. de Cormontaingne, if he had been there, would have said, 'It is time to surrender.'" Carnot of course allows that Cormontaingne was personally brave. His scorn is for the accepted principle, not for the man.

It is interesting to contrast with this passage some remarks by Sir John Jones, made in answer to Carnot's book. He says in the notes to the second volume of the *Journals of the Sieges in Spain*: "When the breach shall be pushed properly forward, if the governor insists upon the ceremony of his last retrenchment being stormed, as by so doing he spills the blood of many brave men without a justifiable object, his life and the lives of the garrison should be made the forfeit. A system enforced by terror must be counteracted by still greater terror. Humanity towards an enemy in such a case is cruelty to one's own troops. . . . The principle to be combated is not the obligation to resist behind the breach—for where there is a good retrenchment the bastion should be disputed equally with the counter-guard or the ravelin and can as safely be so—but the doctrine that surrender shall not take place when successful resistance becomes hopeless."

Carnot's word is "fight to the last." Sir John Jones says the commander has no right to provoke further carnage when resistance is hopeless. The question of course is, When is resistance hopeless? Sir John Jones's reputation leaves little doubt that if he had been commanding a fortress on British soil he would not have thought resistance hopeless as long as there was anything whatever left to defend. The reason why these two men of similar temper are found in opposition is quite simple. When Carnot wrote, the French army occupied most of the important fortresses of Europe, and it was to the interest of the emperor that if attacked they should be held to the last moment, in order to cause the enemy as much delay and loss as possible. Jones, on the other hand, was one of the engineers who were engaged in besieging those fortresses, and his arguments were prompted by sympathy for his own countrymen whose lives were sacrificed by the prolongation of such resistance.

A century has passed since Carnot and Jones wrote, and the ideas in which they had been educated were those of the pre-Napoleonic era. In the 18th century fortresses were many, good roads few, and campaigns for the most part leisurely. To the European nations of that time, inheritors of a perennial state of war, the idea of concentrating the national resources on a short and decisive campaign had not occurred. The "knock-out blow" had not been invented. All these conditions are now so changed that new standards must be and indeed have been set up, both for the defence of places and the general employment of fortification.

As regards the conduct of the defence, the massacre of a garrison as a penalty for holding out too long would meet with no sympathy in the present day. On the other hand, the issue of modern wars is worked out so rapidly that if a fortress is well defended, with the advantage of the present weapons, there is always a chance of holding out till the close of the war. If the place is worth holding, it should as a rule be held to the bitter end on the chance of a favourable turn in affairs; moreover, the maintenance of an important siege under modern conditions imposes a severe strain on the enemy and immobilizes a large number of his troops.

In concluding this article some elementary considerations in connexion with the use of permanent defences may be noticed, though the general question of strategic fortification is outside its scope. The objects of fortification differ, as has been shown, from age to age. In former times a peaceful people exposed to the raids of piratical Norsemen might find their refuge tower essential; later, a robber-baron might look on his castle as so much capital invested; a wealthy medieval town might prove the value of its walls more than once in a generation; a country without a standing army might gain time for preparation by means of fortresses barring the roads across the frontier. But how does the question stand to-day among European countries which can mobilize

Resisting
"to the
last."

Perman-
ent de-
fences.

their full fighting strength at a few hours' notice? It can only be answered when the circumstances of a particular country are examined.

If we assume such an impossible case as that of two nations of equal fighting strength and equal resources standing ready in arms to defend a common frontier, and that the theatre of war presents no difficulties on either side, then the use of permanent fortifications, merely as an adjunct to military strength, is wrong. Fortresses do not decide the issue of a campaign; they can only influence it. It is better, therefore, to put all the money the fortress would have cost, and all the man-power that its maintenance implies, into the increase and equipment of the active army. For the fate of the fortress must depend ultimately on the result of the operations of the active armies. Moreover, the very assumption that resources on both sides are equal means that the nation which has spent money on permanent fortifications will have the smaller active army, and therefore condemns itself beforehand to a defensive rôle.

This general negation is only useful as a corrective to the tendency to over-fortify, for such a case cannot occur. In practice there will always be occasion for some use of fortification. A mountain range may lend itself to an economical defence by a few men and some inexpensive barrier forts. A nation may have close to its frontier an important strategic centre, such as a railway junction, or a town of the first manufacturing importance, which must be protected. In such a case it may be necessary to guard against accidents by means of a fortress. Again, if one nation is admittedly slower in mobilization than the other, it may be desirable to guard one portion of the frontier by fortresses so as to force invasion into a district where concentration against it is easiest.

As for the defence of a capital, this cannot become necessary if it stands at a reasonable distance from the frontier until the active armies have arrived at some result. If the fighting strength of the country has been practically destroyed, it is not of much use to stand a siege in the capital. There can be but one end, and it is better, as business men say, to cut losses. If the fighting strength is not entirely destroyed and can be recruited within a reasonable time, say two or three months, then it appears that under modern conditions the capital might be held for that time by means of extemporized defences. The question is one that can only be decided by going into the circumstances of each particular case.

The case of a weak country with powerful and aggressive neighbours is in a different category. If she stands alone she will be eaten up in time, fortifications or no fortifications; but if she can reckon on assistance from outside, it may be worth while to expend most of the national resources on permanent defences.

These hypothetical cases have, however, no value, except as illustrations to the most elementary arguments. The actual problems that soldiers and statesmen have to consider are too complex to be dealt with in generalities, and no mere treatise can supply the place of knowledge, thought and practice.

FORTLAGE, KARL (1806-1881), German philosopher, was born at Osnabrück. After teaching in Heidelberg and Berlin, he became professor of philosophy at Jena (1846), a post which he held till his death. Originally a follower of Hegel, he turned to Fichte and Beneke (q.v.), with whose insistence on psychology as the basis of all philosophy he fully agreed. The fundamental idea of his psychology is impulse, which combines representation (which presupposes consciousness) and feeling (i.e. pleasure). Reason is the highest thing in nature, i.e. is divine in its nature, God is the absolute Ego and the empirical egos are his instruments.

Fortlage's chief works are: *Genetische Geschichte d. Philos. seit Kant* (Leipzig, 1852); *System d. Psych. als empirische Wissenschaft* (2 vols., Leipzig, 1855); *Darstellung und Kritik der Beweise für das Dasein Gottes* (Heidelberg, 1840); *Beiträge zur Psych. als Wissenschaft* (Leipzig, 1875).

FORT LEE, a borough of Bergen county, New Jersey, U.S.A., in the N.E. part of the state, on the W. bank of the Hudson river, opposite the northern part of New York City. Pop. (1905, state census) 3433. It is connected with the neighbouring towns and cities by electric railways, and by ferry with New York City, of which it is a residential suburb. The main part of the borough lies along the summit of the Palisades; north of Fort Lee is an Interstate Palisades Park. Early in the War of Independence the Americans erected here a fortification, first called Fort Constitution but later renamed Fort Lee, in honour of General Charles Lee. The name of the fort was subsequently applied to the village that grew up in its vicinity. From the 15th of September until the 20th of November 1776 Fort Lee was held by Gen. Nathanael Greene with a garrison of 3500 men, but the capture by the British of Fort Washington on the opposite bank of the river and the crossing of the Hudson by Lord Cornwallis with 5000 men made it necessary for Greene to abandon this post and join Washington in the famous "retreat across the Jerseys." An attempt to recapture Fort Lee was made by General Anthony Wayne in 1780, but was unsuccessful. On the site of the fort a monument, designed by Carl E. Tefft and consisting of heroic figures of a Continental trooper and drummer boy, was erected in 1908. The borough of Fort Lee was incorporated in 1904.

FORT MADISON, a city and the county-seat of Lee county, Iowa, U.S.A., on the Mississippi river, in the S.E. corner of the state, and about 20 m. S.W. of Burlington. Pop. (1890) 7901; (1900) 9278, of whom 1025 were foreign-born; (1905) 8767; (1910) 8900. Fort Madison is served by the Atchison, Topeka & Santa Fé (which has repair shops here) and the Chicago, Burlington & Quincy railways. The city has various manufactures, including canned goods, chairs, paper and farm implements; the value of its factory product in 1905 was \$2,378,892, an increase of 50.8% over that of 1900. Fort Madison is the seat of one of Iowa's penitentiaries. A stockade fort was erected on the site of the city in 1808, but was burned in 1813. Permanently settled in 1833, Fort Madison was laid out as a town in 1836, and was chartered as a city in 1839.

FORTROSE (Gaelic for *t'rois*, "the wood on the promontory"), a royal and police burgh, and seaport of the county of Ross and Cromarty, Scotland. Pop. (1901) 1179. It is situated on the south-eastern coast of the peninsula of the Black Isle, 8 m. due N.N.E. of Inverness, 26½ m. by rail. It is the terminus of the Black Isle branch of the Highland railway; there is communication by steamer with Inverness and also with Fort George, 2½ m. distant, by ferry from Chanonry Ness. Fortrose consists of the two towns of Rosemarkie and Chanonry, about 1 m. apart, which were united into a free burgh by James II. in 1455 and created a royal burgh in 1590. It is a place of considerable antiquity, a monastery having been established in the 6th century by St Moluag, a friend of Columba's, and St Peter's

church built in the 8th century. In 1124 David I. instituted the bishopric of Ross, with its seat here, and the town acquired some fame for its school of theology and law. The cathedral is believed to have been founded in 1330 by the countess of Ross (her canopied tomb, against the chancel wall, still exists) and finished in 1485 by Abbot Fraser, whose previous residence at Melrose is said to account for the Perpendicular features of his portion of the work. It was Early Decorated in style, cruciform in plan, and built of red sandstone, but all that is left are the south aisles of the nave and the chancel, with the chapter-house, a two-storeyed structure, standing apart near the north-eastern corner. The cathedral and bishop's palace were destroyed by order of Cromwell, who used the stones for his great fort at Inverness. Another relic of the past survives in the bell of 1460. These ruins form the chief object of interest in the town, but other buildings include the academy and the Black Isle combination poorhouse. The town is an agricultural centre of some consequence, and the harbour is kept in repair. Rosemarkie, in the churchyard of which is an ancient Celtic cross, is much resorted to for sea-bathing, and there is a golf course in Chanonry Ness. The burgh belongs to the Inverness district group of parliamentary burghs.

FORT SCOTT, a city and the county-seat of Bourbon county, Kansas, U.S.A., on the Marmaton river, about 100 m. S. of Kansas City, Missouri. Pop. (1880) 5372; (1890) 11,946; (1900) 10,322, of whom 1205 were negroes; (1906, estimate) 12,633. It is the point of intersection of the Kansas City, Fort Scott & Memphis (St Louis & San Francisco system), the Missouri, Kansas & Texas, and the Missouri Pacific railways, and has in consequence a large traffic. The city is built on a rolling plain. Among its institutions are an Epworth house (1899), Mercy hospital (1889), the Goodlander home, and a Carnegie library. Near the city there is a national cemetery. Fort Scott is in the midst of the Kansas mineral fields, and its trade in bituminous coal is especially important. Building stones, cement rock, clays, oil and gas, lead and zinc are also found in the neighbourhood. An excellent white sulphur water is procured from artesian wells about 800 ft. deep, and there is a mineral-water bath house. The city is also a trading centre for a rich farming region, and is a horse and mule market of considerable importance. Among its manufactures are mattresses, syrup, bricks, pottery, cement and foundry products. In 1905 the total value of the city's factory product was \$1,349,026, being an increase of 89% since 1900. The city owns and operates its waterworks. The fort after which the city is named was established by the Federal government in 1842, at a time when the whole of eastern Kansas was still parcelled out among Indian tribes; it was abandoned in 1855. The town was platted in 1857, and Fort Scott was chartered as a city in 1860.

FORT SMITH, a city and the county-seat of Sebastian county, on the extreme W. border of Arkansas, U.S.A., lying about 440 ft. above sea-level, on the S. bank of the Arkansas river, at its junction with the Poteau, and at the point where the Arkansas breaks through the Boston mountains. Pop. (1890) 11,311; (1900) 11,587, of whom 2407 were of negro descent and 684 were foreign-born; (1910 census) 23,975. Transportation is afforded by the river and by six railways, the St Louis & San Francisco, the St Louis, Iron Mountain & Southern, the Arkansas Central, the Fort Smith & Western, the Midland Valley and the Kansas City Southern. A belt line round the business centre of the city facilitates freight transfers. Some of the business streets are unusually broad, and the streets in the residential district are well shaded. Fort Smith is the business centre of a fine agricultural country and of the Arkansas coal and natural gas region. It has extensive wholesale jobbing interests and a large miscellaneous trade, partly in its own manufactures, among which are cotton and timber products, chairs, mattresses and other furniture, wagons, brooms and bricks. In 1905 the total value of the factory product was \$2,329,454, an increase of 66.2% since 1900. The public schools have a rich endowment: the proceeds of lands (about

200 acres) once belonging to the local military reservation, which—except the part occupied by a national cemetery—was given by Congress to the city in 1884. Near the centre of the city are a Catholic academy, convent and infirmary; and there is a Carnegie library. A United States army post was established here in 1817; the town was laid out in 1821; and the county was created in 1851. Fort Smith was incorporated as a town in 1842, and was chartered as a city in 1845. All transportation was by river and wagon until 1876, when the railway was completed from Little Rock. The military post, in earlier years the chief depôt for the western forts, was abandoned in 1871. During the Civil War Fort Smith was strongly in sympathy with the Confederacy. The fort was seized by state troops in April 1861, and was reoccupied by the Union forces in September 1863. There was considerable unrest due to border "bush-whacking" throughout the war, and several skirmishes took place here in 1864. The area of the city was more than doubled in 1905.

FORTUNA (FORTUNE), an Italian goddess of great antiquity, but apparently not native at Rome, where, according to universal Roman tradition, she was introduced by the king Servius Tullius as Fors Fortuna, and established in a temple on the Etruscan side of the Tiber outside the city, and also under other titles in other shrines. In Latium she had two famous places of worship, one at Praeneste, where there was an oracle of *Fortuna primigenia* (the first-born), frequented especially by women who, as we may suppose, desired to know the fortunes of their children or their own fortune in child-birth; the other at Antium, well known from Horace's ode (i. 35). It is highly probable that Fortuna was never a deity of the abstract idea of chance, but represented the hopes and fears of men and especially of women at different stages of their life and experience; thus we find her worshipped as time went on under numerous cult-titles, such as *muliebris*, *virilis*, *hujusce diei*, *equestris*, *redux*, &c., which connected her supposed powers with individuals, groups of individuals, or particular occasions. Gradually she became more or less closely identified with the Gr. *Τύχη*, and was represented on coins, &c., with a cornucopia as the giver of prosperity, a rudder as the controller of destinies, and with a wheel, or standing on a ball, to indicate the uncertainty of fortune. In this semi-Greek form she came to be worshipped over the whole empire, and Pliny (*N.H.* ii. 22) declares that in his day she was invoked in all places and every hour. She even became identified with Isis, and as *Panthea* was supposed to combine the attributes of all other deities.

The best account of this difficult subject is to be found in Roscher's *Mythological Lexicon* (s.v.); see also Wissowa, *Religion und Kultus der Römer*, p. 206 foll. (W. W. F.*)

FORTUNATIANUS, ATILIUS, Latin grammarian, flourished in the 4th century A.D. He was the author of a treatise on metres, dedicated to one of his pupils, a youth of senatorial rank, who desired to be instructed in the Horatian metres. The manual opens with a discussion of the fundamental ideas of metre and the chief rules of prosody, and ends with a detailed analysis of the metres of Horace. The chief authorities used are Caesius Bassus and the Latin adaptation by Juba the grammarian of the *Τέχνη* of Heliiodorus. Fortunatianus being a common name in the African provinces, it is probable that the author was a countryman of Juba, Terentianus Maurus and Victorinus.

Editions of the *Ars* in H. Keil, *Grammatici Latini*, vi., and separately by him (1885).

FORTUNATUS, the legendary hero of a popular European chap-book. He was a native, says the story, of Famagusta in Cyprus, and meeting the goddess of Fortune in a forest received from her a purse which was continually replenished as often as he drew from it. With this he wandered through many lands, and at Cairo was the guest of the sultan. Among the treasures which the sultan showed him was an old napless hat which had the power of transporting its wearer to any place he desired. Of this hat he feloniously possessed himself, and returned to Cyprus, where he led a luxurious life. On his death he left the

purse and the hat to his sons Ampedo and Andelosia; but they were jealous of each other, and by their recklessness and folly soon fell on evil days. The moral of the story is obvious: men should desire reason and wisdom before all the treasures of the world. In its full form the history of Fortunatus occupies in Karl Simrock's *Die deutschen Volksbücher*, vol. iii., upwards of 158 pages. The scene is continually shifted—from Cyprus to Flanders, from Flanders to London, from London to France; and a large number of secondary characters appear. The style and allusions indicate a comparatively modern date for the authorship; but the nucleus of the legend can be traced back to a much earlier period. The stories of Jonathas and the three jewels in the *Gesta Romanorum*, of the emperor Frederick and the three precious stones in the *Cento Novelle antiche*, of the Mazin of Khorassan in the *Thousand and one Nights*, and the flying scaffold in the *Bahar Danush*, have all a certain similarity. The earliest known edition of the German text of Fortunatus appeared at Augsburg in 1509, and the modern German investigators are disposed to regard this as the original form. Innumerable versions occur in French, Italian, Dutch and English. The story was dramatized by Hans Sachs in 1553, and by Thomas Dekker in 1600; and the latter's comedy appeared in a German translation in *Englische Komödien und Tragödien*, 1620. Ludwig Tieck has utilized the legend in his *Phantasus*, and Adelbert von Chamisso in his *Peter Schlemihl*; and Ludwig Uhland left an unfinished narrative poem entitled "Fortunatus and his Sons."

See Dr Fr. W. V. Schmidt's *Fortunatus und seine Söhne, eine Zauber-Tragödie, von Thomas Decker, mit einem Anhang, &c.* (Berlin, 1819); Joseph Johann Görres, *Die deutschen Volksbücher* (1807).

FORTUNATUS, VENANTIUS HONORIUS CLEMENTIANUS (530-609), bishop of Poitiers, and the chief Latin poet of his time, was born near Ceneda in Treviso in 530. He studied at Milan and Ravenna, with the special object of excelling as a rhetorician and poet, and in 565 he journeyed to France, where he was received with much favour at the court of Sigbert, king of Austrasia, whose marriage with Brunhild he celebrated in an *epithalamium*. After remaining a year or two at the court of Sigbert he travelled in various parts of France, visiting persons of distinction, and composing short pieces of poetry on any subject that occurred to him. At Poitiers he visited Queen Radegunda, who lived there in retirement, and she induced him to prolong his stay in the city indefinitely. Here he also enjoyed the friendship of the famous Gregory of Tours and other eminent ecclesiastics. He was elected bishop of Poitiers in 599, and died about 609. The later poems of Fortunatus were collected in 11 books, and consist of hymns (including the *Vexilla regis prodeunt*, Englished by J. M. Neale as "The royal banners forward go"), epitaphs, poetical epistles, and verses in honour of his patroness Radegunda and her sister Agnes, the abbess of a nunnery at Poitiers. He also wrote a large poem in 4 books in honour of St Martin, and several lives of the saints in prose. His prose is stiff and mechanical, but most of his poetry has an easy rhythmical flow.

An edition of the works of Fortunatus was published by C. Brower at Fulda in 1603 (2nd ed., Mainz, 1617). The edition of M. A. Luschi (Rome, 1785) was afterwards reprinted in Migne's *Patrologiæ cursus completus*, vol. lxxxviii. See the edition by Leo and Krusch (Berlin, 1881-1885). There are French lives by Nisard (1880) and Leroux (1885).

FORTUNE, ROBERT (1813-1880), Scottish botanist and traveller, was born at Kelloe in Berwickshire on the 16th of September 1813. He was employed in the botanical garden at Edinburgh, and afterwards in the Royal Horticultural Society's garden at Chiswick, and upon the termination of the Chinese War in 1842 was sent out by the Society to collect plants in China. His travels resulted in the introduction to Europe of many beautiful flowers; but another journey, undertaken in 1848 on behalf of the East India Company, had much more important consequences, occasioning the successful introduction into India of the tea-plant. In subsequent journeys he visited Formosa and Japan, described the culture of the silkworm and the manufacture of rice paper, and introduced many trees,

shrubs and flowers now generally cultivated in Europe. The incidents of his travels were related in a succession of interesting books. He died in London on the 13th of April 1880.

FORTUNY, MARIANO JOSE MARIA BERNARDO (1838-1874), Spanish painter, was born at Reus on the 11th of June 1838. His parents, who were in poor circumstances, sent him for education to the primary school of his native town, where he received some instruction in the rudiments of art. When he was twelve years old his parents died and he came under the care of his grandfather, who, though a joiner by trade, had made a collection of wax figures, with which he was travelling from town to town. In the working of this show the boy took an active part, modelling and painting many of the figures; and two years later, when he reached Barcelona, the cleverness of his handiwork made so much impression on some people in authority there that they induced the municipality to make him an allowance of forty-two francs monthly, so that he might be enabled to go through a systematic course of study. He entered the Academy of Barcelona and worked there for four years under Claudio Lorenzale, and in March 1857 he gained a scholarship that entitled him to complete his studies in Rome. Then followed a period of more than two years, during which he laboured steadily at copies of the old pictures to which he had access at Rome. To this period an end was put by the outbreak of the war between Spain and the emperor of Morocco, as Fortuny was sent by the authorities of Barcelona to paint the most striking incidents of the campaign. The expedition lasted for about six months only, but it made upon him an impression that was powerful enough to affect the whole course of his subsequent development, and to implant permanently in his mind a preference for the glitter and brilliancy of African colour. He returned to Spain in the summer of 1860, and was commissioned by the city of Barcelona to paint a large picture of the capture of the camps of Muley-el-Abbas and Muley-el-Hamed by the Spanish army. After making a large number of studies he went back to Rome, and began the composition on a canvas fifteen metres long; but though it occupied much of his time during the next few years, he never finished it. He busied himself instead with a wonderful series of pictures, mostly of no great size, in which he showed an astonishing command over vivacities of technique and modulations of colour. He visited Paris in 1868 and shortly afterwards married the daughter of Federico Madrazo, the director of the royal museum at Madrid. Another visit to Paris in 1870 was followed by a two years' stay at Granada, but then he returned to Rome, where he died somewhat suddenly on the 21st of November 1874 from an attack of malarial fever, contracted while painting in the open air at Naples and Portici in the summer of 1874.

The work which Fortuny accomplished during his short life is distinguished by a superlative facility of execution and a marvellous cleverness in the arrangement of brilliant hues, but the qualities of his art are those that are attainable by a master of technical resource rather than by a deep thinker. His insight into subtleties of illumination was extraordinary, his dexterity was remarkable in the extreme, and as a colourist he was vivacious to the point of extravagance. At the same time in such pictures as "La Vicaria" and "Choosing a Model," and in some of his Moorish subjects, like "The Snake Charmers" and "Moors playing with a Vulture," he showed himself to be endowed with a sensitive appreciation of shades of character and a thorough understanding of the peculiarities of a national type. His love of detail was instinctive, and he chose motives that gave him the fullest opportunity of displaying his readiness as a craftsman.

FORT WAYNE, a city and the county-seat of Allen county, Indiana, U.S.A., 102 m. N.E. of Indianapolis, at the point where the St Joseph and St Mary's rivers join to form the Maumee river. Pop. (1880) 26,880; (1890) 35,393; (1900) 45,115, of whom 6791 were foreign-born; (1910, census) 63,933. It is served by the Cincinnati, Hamilton & Dayton, the Fort Wayne,

Cincinnati & Louisville, the Grand Rapids & Indiana, the Lake Shore & Michigan Southern, the New York, Chicago & St Louis, the Pennsylvania and the Wabash railways, and also by inter-urban electric lines. The site of the city is high (about 770 ft. above sea-level) and level, and its land area was in 1906 a little more than 6 sq. m. The streets are laid out on a rectangular plan and bordered by a profusion of shade trees. The city has several parks, including Lawton Park (31 acres), in which there is a monument in honour of Major-General Henry Ware Lawton (1843-1899), who lived in Fort Wayne for a time, Lake Side Park (22 acres), Reservoir Park (13 acres), Piqua Park (1 acre), and Old Fort Park ($\frac{1}{4}$ acre), which is on the site of Old Fort Wayne. The educational institutions include the German Concordia Collegium (Lutheran), founded in 1839, and having 220 students in 1908, and the state school for feeble-minded youth (1879). The city has a Carnegie library. Fort Wayne is one of the most important railway centres in the Middle West, and several railways maintain here their principal car and repair shops, which add greatly to the value of its manufacturing industries; in 1905 it ranked first among the cities of the state in the value of cars constructed and repaired by steam-railway companies. The other manufactories include foundries and machine shops, iron and steel mills, knitting mills, planing mills, sash and door, car-wheel, electrical machinery, and woodenware factories and flour mills. In 1905 the total value of the factory product of the city was \$15,129,562, showing an increase of 34.3% since 1900.

The Miami Indians had several villages in the immediate neighbourhood, and the principal one, Kekionaga (Miami Town or Great Miami Village), was situated on the E. bank of the St Joseph river, within the limits of the present city. On the E. bank of the St Mary's a French trading post was built about 1680. In 1749-1750 the French fort (Fort Miami) was moved to the E. bank of the St Joseph. The English occupied the fort in 1760 and Pontiac captured it in May 1763, after a siege of more than three months. In 1790 the Miami villages were destroyed. In September 1794 General Anthony Wayne built on the S. bank of the Maumee river the stockade fort which was named in his honour, the site of which forms the present Old Fort Park. By the treaty of Greenville, concluded by General Wayne on the 3rd of August 1795, a piece of land 6 sq. m. in area, including the tract of the Miami towns, was ceded to the United States, and free passage to Fort Wayne and down the Maumee to Lake Erie was guaranteed to the people of the United States by the Indians. By the treaty of Fort Wayne, concluded by General W. H. Harrison on the 7th of June 1803, the tract about Vincennes reserved to the United States by the treaty of Greenville was described and defined; by the second treaty of Fort Wayne, concluded by Harrison on the 30th of September 1809, the Indians sold to the United States about 2,900,000 acres of land, mostly S.E. of the Wabash river. In September 1813 Fort Wayne was besieged by Indians, who withdrew on the arrival, on the 12th of September, of General Harrison with about 2700 men from Kentucky and Ohio. The fort was abandoned on the 19th of April 1819 and no trace of it remains. The first permanent settlement here was made in 1815, and the village was an important fur-trading depôt until 1830. The opening of the Wabash & Erie canal in 1843 stimulated its growth. A town was platted and was made the county-seat in 1824; and in 1840 Fort Wayne was chartered as a city.

See W. A. Brice, *History of Fort Wayne* (Ft. Wayne, 1868); John B. Dillon, *History of Indiana, from its Earliest Exploration by Europeans to the Close of the Territorial Government in 1816* (Indianapolis, Ind., 1859); and Charles E. Slocum, *History of the Maumee River Basin, from the Earliest Accounts to its Organization into Counties* (Defiance, Ohio, 1905).

FORT WILLIAM, the principal town of Thunder Bay district, Ontario, Canada, 426 m. (by rail) E.S.E. of Winnipeg, on the Kaministiquia river, about a mile from Lake Superior. It is the lake terminus of the Canadian Pacific railway, of the new Grand Trunk Pacific railway, and of several steamship lines. Port Arthur, the terminus of the Canadian Northern railway, lies 4 m. to the N.E. Fort William contains numerous grain

elevators, railway repair shops and docks, and has a large export trade in grain and other farm produce. Minerals are also exported from the mining district, of which it is the centre. Industries, such as saw, planing and flour mills, have also sprung up. The population was 4800 in 1901, but has since increased with great rapidity.

FORT WILLIAM, a police burgh of Inverness-shire, Scotland. Pop. (1901) 2087. It lies at the north-eastern end of Loch Linnhe, an arm of the sea, about 62 m. S.S.W. of Inverness by road or canal, and was, in bygone days, one of the keys of the Highlands. It is 122 $\frac{1}{2}$ m. N.E. of Glasgow by the West Highland railway. The fort, at first called Kilmallie, was built by General Monk in 1655 to hold the Cameron men in subjection, and was enlarged in 1690 by General Hugh Mackay, who renamed it after William III., the burgh then being known as Maryburgh in honour of his queen. Here the perpetrators of the massacre of Glencoe met to share their plunder. The Jacobites unsuccessfully besieged it in 1715 and 1746. The fort was dismantled in 1860, and demolished in 1890 to provide room for the railway and the station. Amongst the public buildings are the Belford hospital, public hall, court house and the low-level meteorological observatory, constructed in 1891, which was in connexion with the observatory on the top of Ben Nevis, until the latter was closed in 1904. Its great industry is distilling, and the distilleries, about 2 m. N.E., are a familiar feature in the landscape. Beyond the railway station stands the obelisk to the memory of Ewen MacLachlan (1775-1822), the Gaelic poet, who was born in the parish. Fort William is a popular tourist resort and place of call for the steamers passing through the Caledonian canal. The town is the point from which the ascent of Ben Nevis—4 $\frac{1}{2}$ m. E.S.E. as the crow flies—is commonly made. At Corpach, about 2 m. N., the Caledonian canal begins, the series of locks between here and Banavie—within little more than a mile—being known as "Neptune's Staircase." Both the Lochy and the Nevis enter Loch Linnhe immediately to the north of Fort William. A mile and a half from the town, on the Lochy, stands the grand old ruin of Inverlochy Castle, a massive quadrangular pile with a round tower at each corner, a favourite subject with landscape painters. Close by is the scene of the battle of the 2nd of February 1645, in which Montrose completely defeated the earl of Argyll. The modern castle, in the Scottish Baronial style, 1 $\frac{1}{2}$ m. to the N.E. of this stronghold and farther from the river, is the seat of Lord Abinger.

FORT WORTH, a city and the county-seat of Tarrant county, Texas, U.S.A., about 30 m. W. of Dallas, on the S. bank of the West Fork of the Trinity river. Pop. (1880) 6663; (1890) 23,076; (1900) 26,688, of whom 1793 were foreign-born and 4249 were negroes; (1910, census) 73,312. It is served by the Chicago, Rock Island & Gulf, the Fort Worth & Denver City, the Fort Worth & Rio Grande, and the St Louis, San Francisco & Texas of the "Frisco" system, the Gulf, Colorado & Santa Fé, the Houston & Texas Central, the International & Great Northern, the Missouri, Kansas & Texas, the St Louis South-Western, the Texas & Pacific, and the Trinity & Brazos Valley (Colorado & Southern) railways. Fort Worth is beautifully situated on a level space above the river. It is the seat of Fort Worth University (coeducational), a Methodist Episcopal institution, which was established as the Texas Wesleyan College in 1881, received its present name in 1889, comprises an academy, a college of liberal arts and sciences, a conservatory of music, a law school, a medical school, a school of commerce, and a department of oratory and elocution, and in 1907 had 802 students; the Polytechnic College (coeducational; Methodist Episcopal, South), which was established in 1890, has preparatory, collegiate, normal, commercial, and fine arts departments and a summer school, and in 1906 had 12 instructors and (altogether) 696 students; the Texas masonic manual training school; a kindergarten training school; St Andrews school (Protestant Episcopal), and St Ignatius Academy (Roman Catholic). There are several good business, municipal and county buildings, and a Carnegie library. On the 3rd of April 1909 a fire destroyed ten blocks in the centre of the city. Fort Worth lies in the

midst of a stock-raising and fertile agricultural region; there is an important stockyard and packing establishment just outside the city; and considerable quantities of cotton are raised in the vicinity. Among the products are packed meats, flour, beer, trunks, crackers, candy, paint, ice, paste, cigars, clothing, shoes, mattresses, woven wire beds, furniture and overalls; and there are foundries, iron rolling mills and tanneries. In 1905 the total value of the city's factory product was \$5,668,391, an increase of 62.5% since 1900; Fort Worth in 1900 ranked fifth among the cities of the state in the value of its factory product; in 1905 it ranked fourth. Fort Worth's numerous railways have given it great importance as a commercial centre. The municipality owns and operates the waterworks and the electric-lighting plant.

A military post was established here in 1849, being called first Camp Worth and then Fort Worth. It was abandoned in 1853. A settlement grew up about the fort, and the city was incorporated in 1873. The fort and the settlement were named in honour of General William Jenkins Worth (1794-1849), a native of Hudson, New York, who served in the War of 1812, commanded the United States forces against the Seminole Indians in 1841-1842, served under both General Taylor and General Scott in the Mexican War, distinguishing himself at Monterey (where he earned the brevet of major-general) and in other engagements, and later commanded the department of Texas. In 1907 Fort Worth adopted a commission form of government.

FORTY, the cardinal number equal to four tens. The word is derived from the O. Eng. *feówertig*, a combination of *feówer*, four, and *tig*, an old form of "ten," used as a suffix, cf. *icel. tíu*, Dan. *tí*, ten, and Ger. *vierzig*, forty. The name "The Forty" has been given to various bodies composed of that number of members, particularly to a judicial body in ancient Athens, who tried small cases in the rural districts, and to a court of criminal jurisdiction and two civil appeal courts in the Venetian republic. The French Academy (see **ACADEMIES**) has also been known as "The Forty" or "The Forty Immortals." The period just before the repeal of the corn laws in the United Kingdom is frequently alluded to, particularly by the free trade school, as the "hungry forties"; and the "roaring forties" is a sailor's name for the stormy region between the 40th and 50th latitudes N. and S., but more particularly applied to the portion of the north Atlantic lying between those latitudes.

FORUM (Lat. from *foris*, "out of doors"), in Roman antiquity, any open place used, like the Greek *ἀγορά*, for the transaction of mercantile, judicial or political business, sometimes merely as a promenade. It was level, rectangular in form, surrounded by porticoes, basilicas, courts of law and other public buildings. In the laws of the Twelve Tables the word is used of the vestibule of a tomb (Cicero, *De legibus*, ii. 24); in a Roman camp the forum was an open place immediately beside the praetorium; and the term was no doubt originally applied generally to the space in front of any public building or gateway. In Rome (*q.v.*) itself, however, during the period of the early history, forum was almost a proper name, denoting the flat and formerly marshy space between the Palatine and Capitoline hills (also called Forum Romanum), which probably even during the regal period afforded the accommodation necessary for such public meetings as could not be held within the area Capitolina. In early times the Forum Romanum was used for athletic games, and over the porticoes were galleries for spectators; there were also shops of various kinds. But with the growth of the city and the increase of provincial business, more than one forum became necessary, and under the empire a considerable number of *civilia* (judicial) and *venalia* (mercantile) fora came into existence. In addition to the Forum Romanum, the Fora of Caesar and Augustus belonged to the former class; the Forum *boarium* (cattle), *holitorium* (vegetable), *piscarium* (fish), *pistorium* (bread), *vinarium* (wine), to the latter. The For of Nerva (also called *transitorium* or *pervium*, because a main road led through it to the Forum Romanum), Trajan, and Vespasian, although partly intended to facilitate the course of public

business, were chiefly erected to embellish the city. The construction of separate markets was not, however, necessarily the rule in the provincial fora; thus, in Pompeii, at the north-east end of the forum, there was a *macellum* (market), and shops for provisions and possibly money changers, and on the east side a building supposed to have been the clothworkers' exchange, and at Timgad in North Africa (a military colony founded under Trajan) the whole of the south side of the forum was occupied by shops. The forum was usually paved, and although on festal occasions chariots were probably driven through, it was not a thoroughfare and was enclosed by gates at the entrances, of which traces have been found at Pompeii. When the sites for new towns were being selected, that for the forum was in the centre, and the two main streets crossed one another close to but not through it. At Timgad the main streets are some 5 or 6 ft. lower than the forum. The word *forum* frequently appears in the names of Roman market towns; as, for example, in Forum Appii, Forum Julii (*Frius*), Forum Livii (*Forli*), Forum Sempronii (*Fossombrone*). These *fora* were distinguished from mere *vici* by the possession of a municipal organization, which, however, was less complete than that of a prefecture. In legal phraseology, which distinguishes the *forum commune* from the *forum privilegium*, and the *forum generale* from the *forum speciale*, the word is practically equivalent to "court" or "jurisdiction."

For the fora at Rome, see **ROME: Archaeology**, and works quoted.

FORUM APPII, an ancient post station on the Via Appia, 43 m. S.E. of Rome, founded, no doubt, by the original constructor of the road. Horace mentions it as the usual halt at the end of the first day's journey from Rome, and describes it as full of boatmen and cheating innkeepers. The presence of the former was due to the fact that it was the starting-point of a canal which ran parallel to the road through the Pomptine Marshes, and was used instead of it at the time of Strabo and Horace (see **APPIA, VIA**). It is mentioned also as a halting place in the account of Paul's journey to Rome (Acts xxviii. 15). Under Nerva and Trajan the road was repaired; one inscription records expressly the paving with silex (replacing the former gravelling) of the section from Tripontium, 4 m. N.W., to Forum Appii; the bridge near Tripontium was similarly repaired, and that at Forum Appii, though it bears no inscription, is of the same style. Only scanty relics of antiquity have been found here; a post station was placed here by Pius VI. when the Via Appia was reconstructed. (T. As.)

FORUM CLODII, a post station on the Via Clodia, about 23 m. N.W. of Rome (not 32 m. as in the *Antonine Itinerary*), situated above the western bank of the Lacus Sabatinus (mod. Lake of Bracciano), and connected with the Via Cassia at Vacanae by a branch road which ran round the N. side of the lake (*Ann. Inst.*, 1859, 43). The site is marked by the church of SS. Marcus, Marcellinus and Liberatus, which was founded in the 8th or 9th century A.D. Inscriptions mentioning the Foro-Clodienses have come to light on the spot; and an inscription of the Augustan period, which probably stood over the door of a villa, calls the place Pausilypon—a name justified by the beauty of the site.

See *Notizie degli scavi* (1889), 5; D. Vaglieri, *ibid.* (1895), 342.

FORUM TRAIANI (mod. *Fordongianus*), an ancient town of Sardinia, on the river Thyrsus (Tirso), and a station on the Roman road through the centre of the island from Carales to Olbia and Turris Libisonis. Many of its ruins have been destroyed since 1860. The best preserved are the baths, erected over hot mineral springs. The tanks for collecting the water and the large central *piscina* are noteworthy. The bridge over the Tirso has been to some extent modernized. On the opposite bank are the scanty remains of an amphitheatre. Not far off is a group of *nuraghi*, of which that of St Barbara in the commune of Villanova Truschedda is one of the finest.

See Taramelli in *Notizie degli scavi* (1903), 469.

FOSBROKE, THOMAS DUDLEY (1770-1842), English antiquary, was born in London on the 27th of May 1770. He was educated at St Paul's school and Pembroke College, Oxford,

graduating M.A. in 1792. In that year he was ordained and became curate of Horsley, Gloucestershire, where he remained till 1810. He then removed to Walford in Herefordshire, and remained there the rest of his life, as curate till 1830, and afterwards as vicar. His first important work, *British Monachism* (2 vols., 1802), was a compilation, from manuscripts in the British Museum and Bodleian libraries, of facts relating to English monastic life. In 1799 Fosbroke had been elected fellow of the Society of Antiquaries. The work for which he is best remembered, the *Encyclopaedia of Antiquities*, appeared in 1824. A sequel to this, *Foreign Topography*, was published in 1828. Fosbroke published many other volumes. He died at Walford on the 1st of January 1842.

FOSCARI, FRANCESCO (1373-1457), doge of Venice, belonged to a noble Venetian family, and held many of the highest offices of the republic—ambassador, president of the Forty, member of the Council of Ten, inquisitor, procurator of St Mark, *avogadore di comun*, &c. His first wife was Maria Priuli and his second Maria Nani; of his many children all save one son (Jacopo) died young. But although a capable administrator he was ambitious and adventurous, and the reigning doge Tommaso Mocenigo, when speaking on his deathbed of the various candidates for the succession, warned the council against electing Foscari, who, he said, would perpetually plunge the republic into disastrous and costly wars. Nevertheless Foscari was elected (1423) and reigned for thirty-four years. In proclaiming the new doge the customary formula which recognized the people's share in the appointment and asked for their approval—the last vestige of popular government—was finally dropped.

Foscari's reign bore out Mocenigo's warning and was full of wars on the *terra ferma*, and through the doge's influence Venice joined the Florentines in their campaign against Milan, which was carried on with varying success for eight years. In 1430 an attempt was made on Foscari's life by a noble to whom he had refused an appointment; and three years later a conspiracy of young bloods to secure the various offices for themselves by illicit intrigues was discovered. These events, as well as the long and expensive wars and the unsatisfactory state of Venetian finances, induced Foscari to ask permission to abdicate, which was, however, refused. In 1444 began that long domestic tragedy by which the name of Foscari has become famous. The doge's son Jacopo, a cultivated and intelligent but frivolous and irresponsible youth, was in that year accused of the serious crime of having accepted presents from various citizens and foreign princes who either desired government appointments or wished to influence the policy of the republic. Jacopo escaped, but was tried in contumacy before the Council of Ten and condemned to be exiled to Napoli di Romania (Nauplia) and to have his property confiscated. But the execution of the sentence was delayed, as he was lying ill at Trieste, and eventually the penalty was commuted to banishment at Treviso (1446). Four years later Ermolao Donato, a distinguished official who had been a member of the Ten at the time of the trial, was assassinated and Jacopo Foscari was suspected of complicity in the deed. After a long inquiry he was brought to trial for the second time, and although all the evidence clearly pointed to his guilt the judges could not obtain a confession from the accused, and so merely banished him to Candia for the rest of his life, with a pension of two hundred ducats a year. In 1456 the council received information from the rector (governor) of Candia to the effect that Jacopo Foscari had been in reasonable correspondence with the duke of Milan and the sultan of Turkey. He was summoned to Venice, tried and condemned to a year's imprisonment, to be followed by a return to his place of exile. His aged father was allowed to see him while in prison, and to Jacopo's entreaties that he should obtain a full pardon for him, he replied advising him to bear his punishment without protest. When the year was up Jacopo returned to Candia, where he died in January 1457. The doge was overwhelmed with grief at this bereavement and became quite incapable of attending to business. Consequently the council decided to ask him to abdicate;

at first he refused, but was finally obliged to conform to their wishes and retired on a yearly pension of 1500 ducats. Within a week Pasquale Malipiero was elected in his place and two days later (1st of November 1457) Francesco Foscari was dead.

The story is a very sad and pathetic one, but legend has added many picturesque though quite apocryphal details, most of them tending to show the iniquity and harshness of Jacopo's judges and accusers, whereas, as we have shown, he was treated with exceptional leniency. The most accurate account is contained in S. Romanin's *Storia documentata di Venezia*, lib. x. cap. iv. vii. and x. (Venice, 1855); where the original authorities are quoted; see also Berlan, *I due Foscari* (Turin, 1852). Among the poetical works on the subject Byron's tragedy is the most famous (1821), and Roger's poem *Italy* (1821); Giuseppe Verdi composed an opera on the subject entitled *I due Foscari*. (L. O.)*

FOSCOLO, UGO (1778-1827), Italian writer, was born at Zante in the Ionian Isles on the 26th of January 1778. On the death of his father, a physician at Spalatro, in Dalmatia, the family removed to Venice, and in the University of Padua Foscolo prosecuted the studies begun in the Dalmatian grammar school. The fact that amongst his Paduan masters was the abbé Cesarotti, whose version of Ossian had made that work highly popular in Italy, was not without influence on Foscolo's literary tastes, and his early knowledge of modern facilitated his studies in ancient Greek. His literary ambition revealed itself by the appearance in 1797 of his tragedy *Tieste*—a production which obtained a certain degree of success. Foscolo, who, from causes not clearly explained, had changed his Christian name Niccolo to that of Ugo, now began to take an active part in the stormy political discussions which the fall of the republic of Venice had provoked. He was a prominent member of the national committees, and addressed an ode to Napoleon the liberator, expecting from the military successes of the French general, not merely the overthrow of the effete Venetian oligarchy, but the establishment of a free republican government.

The treaty of Campo Formio (17th Oct. 1797), by which Napoleon handed Venice over to the Austrians, gave a rude shock to Foscolo, but did not quite destroy his hopes. The state of mind produced by that shock is reflected in the *Letters of Jacopo Ortis* (1798), a species of political *Werther*,—for the hero of Foscolo embodies the mental sufferings and suicide of an undecieved Italian patriot just as the hero of Goethe places before us the too delicate sensitiveness embittering and at last cutting short the life of a private German scholar. The story of Foscolo, like that of Goethe, had a groundwork of melancholy fact. Jacopo Ortis had been a real personage; he was a young student of Padua, and committed suicide there under circumstances akin to those described by Foscolo. At this period Foscolo's mind appears to have been only too familiar with the thought of suicide. Cato and the many classical examples of self-destruction scattered through the pages of Plutarch appealed to the imaginations of young Italian patriots as they had done in France to those of the heroes and heroines of the Gironde. In the case of Foscolo, as in that of Goethe, the effect produced on the writer's mind by the composition of the work seems to have been beneficial. He had seen the ideal of a great national future rudely shattered; but he did not despair of his country, and sought relief in now turning to gaze on the ideal of a great national poet. At Milan, whither he repaired after the fall of Venice, he was engaged in other literary pursuits besides the composition of *Ortis*. The friendship formed there with the great poet Parini was ever afterwards remembered with pride and gratitude. The friendship formed with another celebrated Milanese poet soon gave place to a feeling of bitter enmity. Still hoping that his country would be freed by Napoleon, he served as a volunteer in the French army, took part in the battle of the Trebbia and the siege of Genoa, was wounded and made prisoner. When released he returned to Milan, and there gave the last touches to his *Ortis*, published a translation of and commentary upon *Callimachus*, commenced a version of the *Iliad*, and began his translation of Sterne's *Sentimental Journey*. The result of a memorandum prepared for Lyons, where, along with other Italian delegates, he was to have laid before Napoleon the state of Italy, only proved that the views cherished by him for his

country were too bold to be even submitted to the dictator of France. The year 1807 witnessed the appearance of his *Carme sui sepolcri*, of which the entire spirit and language may be described as a sublime effort to seek refuge in the past from the misery of the present and the darkness of the future. The mighty dead are summoned from their tombs, as ages before they had been in the masterpieces of Greek oratory, to fight again the battles of their country. The inaugural lecture on the origin and duty of literature, delivered by Foscolo in January 1809 when appointed to the chair of Italian eloquence at Pavia, was conceived in the same spirit. In this lecture Foscolo urged his young countrymen to study letters, not in obedience to academic traditions, but in their relation to individual and national life and growth. The sensation produced by this lecture had no slight share in provoking the decree of Napoleon by which the chair of national eloquence was abolished in all the Italian universities. Soon afterwards Foscolo's tragedy of *Ajax* was represented but with little success at Milan, and its supposed allusions to Napoleon rendering the author an object of suspicion, he was forced to remove from Milan to Tuscany. The chief fruits of his stay in Florence are the tragedy of *Ricciarda*, the *Ode to the Graces*, left unfinished, and the completion of his version of the *Sentimental Journey* (1813). His version of Sterne is an important feature in his personal history. When serving with the French he had been at the Boulogne camp, and had traversed much of the ground gone over by Yorick; and in his memoir of Didimo Chericco, to whom the version is ascribed, he throws much curious light on his own character. He returned to Milan in 1813, until the entry of the Austrians; thence he passed into Switzerland, where he wrote a fierce satire in Latin on his political and literary opponents; and finally he sought the shores of England at the close of 1816.

During the eleven years passed by Foscolo in London, until his death there, he enjoyed all the social distinction which the most brilliant circles of the English capital confer on foreigners of political and literary renown, and experienced all the misery which follows on a disregard of the first conditions of domestic economy. His contributions to the *Edinburgh* and *Quarterly Reviews*, his dissertations in Italian on the text of Dante and Boccaccio, and still more his English essays on Petrarch, of which the value was enhanced by Lady Dacre's admirable translations of some of Petrarch's finest sonnets, heightened his previous fame as a man of letters. But his want of care and forethought in pecuniary matters involved him in much embarrassment, and at last consigned him to a prison; and when released he felt bitterly the change in his social position, and the coldness now shown to him by many whom he had been accustomed to regard as friends. His general bearing in society—if we may accept on this point the testimony of so keen an observer and so tolerant a man as Sir Walter Scott—had unhappily not been such as to gain and retain lasting friendships. He died at Turnham Green on the 10th of October 1827. Forty-four years after his death, in 1871, his remains were brought to Florence, and with all the pride, pomp and circumstance of a great national mourning, found their final resting-place beside the monuments of Macchiavelli and Alfieri, of Michelangelo and Galileo, in Italy's Westminster Abbey, the church of Santa Croce. To that solemn national tribute Foscolo was fully entitled. For the originality of his thoughts and the splendour of his diction his country honours him as a great classic author. He had assigned to the literature of his nation higher aims than any which it previously recognized. With all his defects of character, and through all his vicissitudes of fortune, he was always a sincere and courageous patriot.

Ample materials for the study of Foscolo's character and career may be found in the complete series of his works published in Florence by Le Monnier. The series consists of *Prose letterarie*, (4 vols., 1850); *Epistolario* (3 vols., 1854); *Prose politiche* (1 vol., 1850); *Poesie* (1 vol., 1856); *Lettere di Ortis* (1 vol., 1858); *Saggi di critica storico-letteraria* (1st vol., 1859; 2nd vol., 1862). To this series must be added the very interesting work published at Leghorn in 1876, *Lettere inedite del Foscolo, del Giordani, e della Signora di Staël, a Vincenzo Monti*. The work published at Florence in the summer of 1878, *Vita di Ugo Foscolo, di Pellegrino Artusi*, throws

much doubt on the genuineness of the text in Foscolo's writings as given in the complete Florence edition, whilst it furnishes some curious and original illustrations of Foscolo's familiarity with the English language. (J. M. S.)

FOSS, EDWARD (1787–1870), English lawyer and biographer, was born in London on the 16th of October 1787. He was a solicitor by profession, and on his retirement from practice in 1840, he devoted himself to the study of legal antiquities. His *Judges of England* (9 vols., 1848–1864) is a standard work, characterized by accuracy and extensive research. *Biographia Juridica, a Biographical Dictionary of English Judges*, appeared shortly after his death. He assisted in founding the Incorporated Law Society, of which he was president in 1842 and 1843. He died of apoplexy on the 27th of July 1870.

FOSSANO, a town and episcopal see of Piedmont, Italy, in the province of Cuneo, 15 m. N.E. of it by rail, 1180 ft. above sea-level. Pop. (1901) 7696 (town), 18,175 (commune). It has an imposing castle with four towers, begun by Filippo d'Acacia in 1314. The cathedral was reconstructed at the end of the 18th century. The place began to acquire some importance in the 13th century. It appears as a commune in 1237, but in 1251 had to yield to Asti. It finally surrendered in 1314 to Filippo d'Acacia, whose successor handed it over to the house of Savoy. It lies on the main line from Turin to Cuneo, and has a branch line to Mondovì.

FOSSANUOVA, an abbey of Italy, in the province of Rome, near the railway station of Sonnino, 64 m. S.E. of Rome. It is the finest example of a Cistercian abbey, and of the Burgundian Early Gothic style, in Italy, and dates from the end of the 12th to the end of the 13th century. The church (1187–1208) is closely similar to that of Casamari. The other conventual buildings also are noteworthy. Thomas Aquinas died here in 1274.

See C. Enlart, *Origines françaises de l'architecture gothique en Italie* (Paris, 1894) (*Bibliothèque des écoles françaises d'Athènes et de Rome*, fasc. 66).

FOSSE (or Foss) **WAY**, the Early English name of a Roman road or series of roads in Britain, used later by the English, running from Lincoln by Leicester and Bath to Exeter. Almost all the Roman line is still in use as modern road or lane. It passes from Lincoln through Newark and Leicester (the Roman *Ratae*) to High Cross (*Venonae*), where it intersects Watling Street at a point often called "the centre of England." Hence it runs to Moreton-in-the-Marsh, Cirencester, Bath and Ilchester, crosses the hills near Chard, Axminster and Honiton, and enters Exeter. Antiquaries have taken it farther, usually to Totnes, but without warrant. (See further under **ERMINE STREET**.) (F. J. H.)

FOSSICK (probably an English dialectal expression, meaning fussy or troublesome), a term applied by the gold diggers of Australia to the search for gold by solitary individuals, in untried localities or in abandoned diggings. A "fossicker," or pocket miner, is one who buys up the right to search old claims, in the hope of finding gold overlooked by previous diggers.

FOSSOMBRONE (anc. *Forum Sempronii*), a town and episcopal see of the Marches, Italy, in the province of Pesaro and Urbino, 11 m. E.S.E. of the latter by road, 394 ft. above sea-level. Pop. (1901) town, 7531, commune, 10,847. The town is situated in the valley of the Metauro, in the centre of fine scenery, at the meeting-point of roads to Fano, to the Furlo pass and Fossato di Vico (the ancient Via Flaminia), to Urbino and to Sinigaglia, the last crossing the river by a fine bridge. The cathedral, rebuilt in 1772–1784, contains the chief work of the sculptor Domenico Rosselli of Rovezzano, a richly sculptured *ancona* of 1480. S. Francesco has a lunette by him over the portal. The library, founded by a nephew of Cardinal Passionei, contains some antiquities. Above the town is a medieval castle. There is a considerable trade in silk.

The ancient Forum Sempronii lay about 2 m. to the N.E. at S. Martino al Piano, where remains still exist. It was a station on the Via Flaminia and a *municipium*. The date of its foundation is not known. Excavations in 1870–1880 led to the discovery of a house and of other buildings on the ancient road (A.

Vernarecci in *Notizie degli scavi*, 1880, 458). It already had a bishop in the years 499–502. In 1295 the Malatesta obtained possession of it, and kept it until 1444, when it was sold, with Pesaro, to Federico di Montefeltro of Urbino, and with the latter it passed to the papacy under Urban VIII. in 1631.

FOSSOMBRONI, VITTORIO, COUNT (1754–1844), Tuscan statesman and mathematician, was born at Arezzo. He was educated at the university of Pisa, where he devoted himself particularly to mathematics. He obtained an official appointment in Tuscany in 1782, and twelve years later was entrusted by the grand duke with the direction of the works for the drainage of the Val di Chiana, on which subject he had published a treatise in 1789. In 1796 he was made minister for foreign affairs, but on the French occupation of Tuscany in 1799 he fled to Sicily. On the erection of the grand duchy into the ephemeral kingdom of Etruria, under the queen-regent Maria Louisa, he was appointed president of the commission of finance. In 1809 he went to Paris as one of the senators for Tuscany to pay homage to Napoleon. He was made president of the legislative commission on the restoration of the grand duke Ferdinand III. in 1814, and subsequently prime minister, which position he retained under the grand duke Leopold II. His administration, which was only terminated by his death, greatly contributed to promote the well-being of the country. He was the real master of Tuscany, and the bases of his rule were equality of all subjects before the law, honesty in the administration of justice and toleration of opinion, but he totally neglected the moral improvement of the people. At the age of seventy-eight he married, and twelve years afterwards died, in 1844.

FOSTER, SIR CLEMENT LE NEVE (1841–1904), English geologist and mineralogist, the second son of Peter Le Neve Foster (for many years secretary of the Society of Arts), was born at Camberwell on the 23rd of March 1841. After receiving his early education at Boulogne and Amiens, he studied successively at the Royal School of Mines in London and at the mining college of Freiberg in Saxony. In 1860 he joined the Geological Survey in England, working in the Wealden area and afterwards in Derbyshire. Conjointly with William Topley (1841–1894) he communicated to the Geological Society of London in 1865 the now classic paper “On the superficial deposits of the Valley of the Medway, with remarks on the Denudation of the Weald.” In this paper the sculpturing of the Wealden area by rain and rivers was ably advocated. Retiring from the Geological Survey in 1865, Foster devoted his attention to mineralogy and mining in Cornwall, Egypt and Venezuela. In 1872 he was appointed an inspector of mines under the home office for the S.W. of England, and in 1880 he was transferred to the N. Wales district. In 1890 he was appointed professor of mining at the Royal College of Science and he held this post until the close of his life. His later work is embodied largely in the reports of mines and quarries issued annually by the home office. He was distinguished for his extensive scientific and practical knowledge of metalliferous mining and stone quarrying. He was elected F.R.S. in 1892 and was knighted in 1903. While investigating the cause of a mining disaster in the Isle of Man in 1897 his constitution suffered much injury from carbonic-oxide gas, and he never fully recovered from the effects. He died in London on the 19th of April 1904. He published *Ore and Stone Mining*, 1894 (ed. 5, 1904); and *The Elements of Mining and Quarrying*, 1903.

FOSTER, GEORGE EULAS (1847–), Canadian politician and financier, was born in New Brunswick on the 3rd of September 1847, of U.E. Loyalist descent. After a brilliant university career at the university of Brunswick, at Edinburgh and Heidelberg, he returned to Canada and taught in various local schools, eventually becoming professor of classics and

history in the local university. In 1882 he became Conservative member for King's County, N.B., in the Dominion parliament, and in 1885 entered the cabinet of Sir John Macdonald as minister of marine and fisheries; in 1888 he became minister of finance, which position he held till the defeat of his party in 1896. A careful and even brilliant financier, and a keen debater, he became known as a strong believer in protection for Canadian industries and in preferential trade within the British empire.

FOSTER, JOHN (1770–1843), English author and dissenting minister, generally known as the “Essayist,” was born in a small farmhouse near Halifax, Yorkshire, on the 17th of September 1770. Partly from constitutional causes, but partly also from the want of proper companions, as well as from the grave and severe habits of his parents, his earlier years were enshrouded in a somewhat gloomy and sombre atmosphere, which was never afterwards wholly dissipated. His youthful energy, finding no proper outlet, developed within him a tendency to morbid intensity of thought and feeling; and, according to his own testimony, before he was twelve years old he was possessed of a “painful sense of an awkward but entire individuality.”

The small income accruing to Foster's parents from their farm they supplemented by weaving, and at an early age he began to assist them by spinning wool by the hand wheel, and from his fourteenth year by weaving double stuffs. Even “when a child,” however, he had the “feelings of a foreigner in the place”; and though he performed his monotonous task with conscientious diligence, he succeeded so indifferently in fixing his wandering thoughts upon it that his work never without difficulty passed the ordeal of inspection. He had acquired a great taste for reading, to gratify which he sometimes shut himself up alone in a barn, afterwards working at his loom “like a horse,” to make up for lost time. He had also at this period “a passion for making pictures with a pen.” Shortly after completing his seventeenth year he became a member of the Baptist church at Hebden Bridge, with which his parents were connected; and with the view of preparing himself for the ministerial office he began about the same time to attend a seminary at Brearley Hall conducted by his pastor Dr Fawcett.

After remaining three years at Brearley Hall he was admitted to the Baptist College, Bristol, and on finishing his course of study at this institution he obtained an engagement at Newcastle-on-Tyne, where he preached to an audience of less than a hundred persons, in a small and dingy room situated near the river at the top of a flight of steps called Tutbill Stairs. At Newcastle he remained only three months. In the beginning of 1793 he proceeded to Dublin, where, after failing as a preacher, he attempted to revive a classical and mathematical school, but with so little success that he did not prosecute the experiment for more than eight or nine months. From 1797 to 1799 he was minister of a Baptist church at Chichester, but though he applied himself with more earnestness and perseverance than formerly to the discharge of his ministerial duties, his efforts produced little apparent impression, and the gradual diminution of his hearers necessitated his resignation. After employing himself for a few months at Battersea in the instruction of twenty African youths brought to England by Zachary Macaulay, with the view of having them trained to aid as missionaries to their fellow-countrymen, he in 1800 accepted the charge of a small congregation at Downend, Bristol, where he continued about four years. In 1804, chiefly through the recommendation of Robert Hall, he became pastor of a congregation at Frome, but a swelling in the thyroid gland compelled him in 1806 to resign his charge. In the same year he published the volume of *Essays* on which his literary fame most largely if not mainly rests. They were written in the form of letters addressed to the lady whom he afterwards married, and consist of four papers,—“On a Man Writing Memoirs of himself”; “On Decision of Character”; “On the Application of the Epithet Romantic”; and “On some Causes by which Evangelical Religion has been rendered unacceptable to Men of Cultivated Taste.” The success of this work was immediate, and was so considerable that on resigning his charge he determined to adopt literature as his profession.

The *Eclectic Review* was the only periodical with which he established a connexion; but his contributions to that journal, which were begun in 1807, number no fewer than 185 articles. On his marriage in May 1808 he removed to Bourton-on-the-Water, a small village in Gloucestershire, where he remained till 1817, when he returned to Downend and resumed his duties to his old congregation. Here he published in 1820 his *Essay on Popular Ignorance*, which was the enlargement of a sermon originally preached on behalf of the British and Foreign School Society. In 1821 he removed to Stapleton near Bristol, and in 1822 he began a series of fortnightly lectures at Broadmead chapel, Bristol, which were afterwards published. On the settlement of Robert Hall at Bristol this service was discontinued, as in such circumstances it appeared to Foster to be "altogether superfluous and even bordering on impertinent." The health of Foster during the later years of his life was somewhat infirm, the result chiefly of the toil and effort of literary composition; and the death of his only son, his wife and the greater number of his most intimate friends combined with his bodily ailments to lend additional sombreness to his manner of regarding the events and arrangements of the present world—the "visage of death" being almost his "one remaining luminary." He died at Stapleton on the 15th of October 1843.

The cast of Foster's mind was meditative and reflective rather than logical or metaphysical, and though holding moderately Calvinistic views, his language even in preaching very seldom took the mould of the theological forms. Though always retaining his connexion with the Baptist denomination, the evils resulting from organized religious communities seemed to him so great that he came to be "strongly of opinion that churches are useless and mischievous institutions, and the sooner they are dissolved the better." The only Christian observances which he regarded as of any importance were public worship and the Lord's Supper, and it so happened that he never administered the ordinance of baptism. His cast of thought is largely coloured by a constant reference to the "endless future." He was a firm believer in supernatural appearances, and cherished a longing hope that a ray of light from the other world might sometimes in this way be vouchsafed to mortals. As a writer he was most painstaking and laborious in his choice of diction, and his style has its natural consequent defects, though the result is eloquent in its way.

Besides the works already alluded to, Foster was the author of a *Discourse on Missions* (1818); "Introductory Essay" to Doddridge's *Rise and Progress of Religion* (1825); "Observations on Mr Hall's Character as a Preacher," prefixed to the collected edition of Hall's *Works* (1832); an "Introduction" to a pamphlet by Mr Marshman on the Serampore Missionaries; several political letters to the *Morning Chronicle*, and contributions to the *Eclectic Review*, published posthumously in 2 vols., 1844. *His Life and Correspondence*, edited by J. E. Ryland, was published in 1846.

FOSTER, SIR MICHAEL (1836–1907), English physiologist, was born at Huntingdon on the 8th of March 1836. After graduating in medicine at London University in 1859, he began to practise in his native town, but in 1867 he returned to London as teacher of practical physiology at University College, where two years afterwards he became professor. In 1870 he was appointed by Trinity College, Cambridge, to its praelectorship in physiology, and thirteen years later he became the first occupant of the newly-created chair of physiology in the university, holding it till 1903. He excelled as a teacher and administrator, and had a very large share in the organization and development of the Cambridge biological school. From 1881 to 1903 he was one of the secretaries of the Royal Society, and in that capacity exercised a wide influence on the study of biology in Great Britain. In 1899 he was created K.C.B., and served as president of the British Association at its meeting at Dover. In the following year he was elected to represent the university of London in parliament. Though returned as a Unionist, his political action was not to be dictated by party considerations, and he gravitated towards Liberalism; but he played no prominent part in parliament and at the election of 1906 was defeated. His chief writings were a *Textbook of Physiology*

(1876), which became a standard work, and *Lectures on the History of Physiology in the 16th, 17th and 18th Centuries* (1901), which consisted of lectures delivered at the Cooper Medical College, San Francisco, in 1900. He died suddenly in London on the 29th of January 1907.

FOSTER, MYLES BIRKET (1825–1899), English painter, was born at North Shields. At the age of sixteen he entered the workshop of Ebenezer Landells, a wood engraver, with whom he worked for six years as an illustrative draughtsman, devoting himself mainly to landscape. During the succeeding fifteen years he became famous as a prolific and accomplished illustrator, but about 1861 abandoned illustration for painting, and gained wide popularity by his pictures, chiefly in water colours, of landscapes and rustic subjects, with figures, mainly of children. He was elected in 1860 associate and in 1862 full member of the Royal Society of Painters in Water Colours. His work is memorable for its delicacy and minute finish, and for its daintiness and pleasantness of sentiment.

See *Birket Foster, his Life and Work* (extra number of the *Art Journal*) by Marcus B. Huish (1890), an interesting sketch; and *Birket Foster, R.W.S.*, by H. M. Cundall (London, 1906), a very complete and fully illustrated biography.

FOSTER, STEPHEN COLLINS (1826–1864), American song and ballad writer, was born near Pittsburg, Pennsylvania, on the 4th of July 1826. He was the youngest child of a merchant of Irish descent who became a member of the state legislature and was related by marriage to President Buchanan. Stephen early showed talent for music, and played upon the flageolet, the guitar and the banjo; he also acquired a fair knowledge of French and German. He was sent to school in Towanda, Pennsylvania, and later to Athens, Pennsylvania, and when thirteen years old he wrote the song "Sadly to Mine Heart Appealing." At sixteen he wrote "Open thy Lattice, Love"; at seventeen he entered his brother's business house, Cincinnati, Ohio, where he remained about three years, composing meanwhile such popular pieces as "Old Uncle Ned," "O Susannah!" and others. He then adopted song-writing as a profession. His chief successes were songs written for the negro melodists or Christy minstrels. Besides those mentioned the following attained great popularity: "Nelly was a Lady," "Old Kentucky Home," "Old Folks at Home," "Massa's in de Cold, Cold Ground," &c. For these and other songs the composer received considerable sums, "Old Folks at Home" bringing him, it is said, 15,000 dollars. For most of his songs Foster wrote both songs and music. In 1850 he married and moved to New York, but soon returned to Pittsburg. His reputation rests chiefly on his negro melodies, many of which have been popular on both sides of the Atlantic and sung in many tongues. "Old Black Joe," the last of these negro melodies, appeared in 1861. His later songs were sentimental ballads. Among these are "Old Dog Tray," "Gentle Annie," "Willie, we have missed you," &c. His "Come where my Love lies Dreaming" is a well known vocal quartet. Although as a musician and composer Foster has little claim to high rank, his song-writing gives him a prominent place in the modern developments of popular music. He died at New York on the 13th of January 1864.

FOSTORIA, a city, partly in Seneca, partly in Hancock, and partly in Wood county, Ohio, U.S.A., 35 m. S. by E. of Toledo. Pop. (1890) 7070; (1900) 7730, of whom 584 were foreign-born. It is served by the Baltimore & Ohio, the New York, Chicago & St Louis, the Ohio Central, the Lake Erie & Western, and the Hocking Valley railways, and by two interurban electric lines. The city is situated in an agricultural region, and oil abounds in the vicinity. Among the city's manufactures are glass, flour, planing mill products, brass and iron, carriages, barrels, incandescent lamps, carbons, wire nails and fences, automobile engines and parts, railway torpedoes and muslin underwear. The waterworks are owned and operated by the municipality. In 1832, upon the coming of the first settlers, two towns, Rome and Risdon, were laid out on the site of what is now Fostoria. A bitter rivalry arose between them, but they were finally united under one government, and the city thus formed was named in

honour of Charles W. Foster, whose son Charles Foster (1828–1904), governor of the state from 1880 to 1884 and secretary of the United States treasury from 1891 to 1893, did much to promote its growth. Fostoria was chartered as a city in 1854.

FOTHERGILL, JOHN (1712–1780), English physician, was born of a Quaker family on the 8th of March 1712 at Carr End in Yorkshire. He took the degree of M.D. at Edinburgh in 1736, and after visiting the continent of Europe he in 1740 settled in London, where he gained an extensive practice. In the epidemics of influenza in 1775 and 1776 he is said to have had sixty patients daily. In his leisure he made a study of conchology and botany; and at Upton, near Stratford, he had an extensive botanical garden where he grew many rare plants obtained from various parts of the world. He was the patron of Sidney Parkinson, the South Sea voyager. A translation of the Bible (1764 sq.) by Anthony Purver, a Quaker, was made and printed at his expense. His pamphlet entitled "Account of the Sore Throat attended with Ulcers" (1748) contains one of the first descriptions of diphtheria in English, and was translated into several languages. He died in London on the 26th of December 1780.

FOTHERINGHAY, a village of Northamptonshire, England, picturesquely situated on the left bank of the river Nene, 1½ m. from Elton station on the Peterborough branch of the London & North-Western railway. The castle, of which nothing but the earthworks and foundations remain, is famous as the scene of the imprisonment of Mary queen of Scots from September 1586 to her trial and execution on the 8th of February 1587. The earthworks, commanding a ford of the river, are apparently of very early date, and probably bore a castle from Norman times. It became an important stronghold of the Plantagenets from the time of Edward III., and was the birthplace of Richard III. in 1452. The church of St Mary and All Saints, originally collegiate, is Perpendicular, and only the nave with aisles, and the tower surmounted by an octagon, remain; but the building is in the best style of its period. Edward, second duke of York, who was killed at the battle of Agincourt in 1415, Richard, the third duke, and his duchess, Cicely (d. 1495), also his son the earl of Rutland, who with Richard himself, fell at the battle of Wakefield in 1460, are buried in the church. Their monuments were erected by Queen Elizabeth, who found the choir and tombs in ruins.

FOUCAULT, JEAN BERNARD LÉON (1819–1868), French physicist, was the son of a publisher at Paris, where he was born on the 18th of September 1819. After an education received chiefly at home, he studied medicine, which, however, he speedily abandoned for physical science, the improvement of L. J. M. Daguerre's photographic processes being the object to which he first directed his attention. During three years he was experimental assistant to Alfred Donné (1801–1878) in his course of lectures on microscopic anatomy. With A. H. L. Fizeau he carried on a series of investigations on the intensity of the light of the sun, as compared with that of carbon in the electric arc, and of lime in the flame of the oxyhydrogen blowpipe; on the interference of heat rays, and of light rays differing greatly in lengths of path; and on the chromatic polarization of light. In 1849 he contributed to the *Comptes Rendus* a description of an electromagnetic regulator for the electric arc lamp, and, in conjunction with H. V. Regnault, a paper on binocular vision. By the use of a revolving mirror similar to that used by Sir Charles Wheatstone for measuring the rapidity of electric currents, he was enabled in 1850 to demonstrate the greater velocity of light in air than in water, and to establish that the velocity of light in different media is inversely as the refractive indices of the media. For his demonstration in 1851 of the diurnal motion of the earth by the rotation of the plane of oscillation of a freely suspended, long and heavy pendulum exhibited by him at the Pantheon in Paris, and again in the following year by means of his invention the gyroscope, he received the Copley medal of the Royal Society in 1855, and in the same year he was made physical assistant in the imperial observatory at Paris. In September of that year he discovered that the force required for the rotation of a copper disk becomes greater when

it is made to rotate with its rim between the poles of a magnet, the disk at the same time becoming heated by the eddy or "Foucault currents" induced in its metal. Foucault invented in 1857 the polarizer which bears his name, and in the succeeding year devised a method of giving to the speculum of reflecting telescopes the form of a spheroid or a paraboloid of revolution. With Wheatstone's revolving mirror he in 1862 determined the absolute velocity of light to be 298,000 kilometres (about 185,000 m.) a second, or 10,000 kilom. less than that obtained by previous experimenters. He was created in that year a member of the Bureau des Longitudes and an officer of the Legion of Honour, in 1864 a foreign member of the Royal Society of London, and next year a member of the mechanical section of the Institute. In 1865 appeared his papers on a modification of Watt's governor, upon which he had for some time been experimenting with a view to making its period of revolution constant, and on a new apparatus for regulating the electric light; and in the following year (*Compt. Rend.* lxxiii.) he showed how, by the deposition of a transparently thin film of silver on the outer side of the object glass of a telescope, the sun could be viewed without injuring the eye by excess of light. Foucault died of paralysis on the 11th of February 1868 at Paris. From the year 1845 he edited the scientific portion of the *Journal des Débats*. His chief scientific papers are to be found in the *Comptes Rendus*, 1847–1869.

See *Revue cours scient.* vi. (1869), pp. 484–489; *Proc. Roy. Soc.* xvii. (1869), pp. lxxxiii.–lxxxiv.; Lissajous, *Notice historique sur la vie et les travaux de Léon Foucault* (Paris, 1875).

FOUCHÉ, JOSEPH, DUKE OF OTRANTO (1763–1820), French statesman, was born in a small village near Nantes on the 21st of May 1759. His father, a seafaring man, destined him for the sea; but the weakness of his frame and the precocity of his talents soon caused this idea to be given up. He was educated at the college of the Oratorians at Nantes, and showed marked aptitude for studies both literary and scientific. Desiring to enter the teaching profession he was sent to an institution kept by brethren of the same order at Paris. There also he made rapid progress, and soon entered upon tutorial duties at the colleges of Niort, Saumur, Vendôme, Juilly and Arras. At Arras he had some dealings with Rohespierre at the time of the beginning of the French Revolution (1789).

In October 1790 he was transferred by the Oratorians to their college at Nantes, owing to irregularities due to his zeal for revolutionary principles; but at Nantes he showed even more democratic fervour. His abilities and the zeal with which he espoused the most subversive notions brought him into favour with the populace at Nantes; he became a leading member of the local Jacobin club; and on the dissolution of the college of the Oratorians at Nantes in May 1792, Fouché gave up all connexion with the church, whose major vows he had not taken. After the downfall of the monarchy on the 10th of August 1792, he was elected as deputy for the department of the Lower Loire to the National Convention which met at the autumnal equinox and proclaimed the republic. The literary and pedagogic sympathies of Fouché at first brought him into touch with Condorcet and the party, or group, of the Girondists; but their vacillation at the time of the trial and execution of Louis XVI. (December 1792–January 21, 1793) led him to espouse the cause of the Jacobins, the less scrupulous and more thoroughgoing champions of revolutionary doctrine. On the question of the execution of the king, Fouché, after some preliminary hesitations, expressed himself with the utmost vigour in favour of immediate execution, and denounced those who "wavered before the shadow of a king."

The crisis which resulted from the declaration of war by the Convention against England and Holland (Feb. 1, 1793), and a little later against Spain, brought Fouché into notoriety as one of the fiercest of the Jacobinical fanatics who then held power at Paris. While the armies of the first coalition threatened the north-east of France, a revolt of the royalist peasants of Brittany and la Vendée menaced the Convention on the west. That body deputed Fouché with a colleague, Villers, to proceed

to the west as commissioners invested with almost dictatorial powers for the crushing of the revolt of "the whites." The vigour with which he carried out these duties earned him other work, and he soon held the post of commissioner of the republic in the department of the Nièvre. Together with Chaumette, he helped to initiate the atheistical movement, the founders of which in the autumn of 1793 began to aim at the extinction of Christianity in France. In the department of the Nièvre he ransacked the churches, sent their spoils to the treasury and established the cult of the goddess of Reason. Over the cemeteries, he ordered these words to be inscribed: "Death is an eternal sleep." He also waged war against luxury and wealth, and desired to abolish the use of money. The new cult was inaugurated at Paris at Notre Dame by the strange orgy known as "The Festival of Reason" (November 10, 1793).

Fouché then proceeded to Lyons to execute the vengeance of the Convention on that city, which had revolted against the new Jacobin tyranny. Preluding his work by a festival remarkable for its obscene parody of religious rites, he then, along with his colleague, Collot d'Herbois, set the guillotine and cannon to work with a rigour which made his name odious. Modern research, however, proves that at the close of those horrors Fouché exercised a moderating influence. Outwardly his conduct was marked by the utmost rigour, and on his return to Paris early in April 1794, he thus characterised his policy: "The blood of criminals fertilises the soil of liberty and establishes power on sure foundations." By that time Robespierre had struck down the other leaders of the atheistical party; but early in June 1794, at the time of the "Festival of the Supreme Being," Fouché ventured to mock at the theistic revival which Robespierre then inaugurated. Sharp passages of arms took place between them, and Robespierre procured the ejection of Fouché from the Jacobin Club (July 14, 1794). Fouché, however, was working with his customary skill and energy, and along with Tallien and others, managed to effect the overthrow of the theistic dictator on Thermidor 10 (July 28), 1794. The ensuing reaction in favour of more merciful methods of government threatened to sweep away the group of Terrorists who had been mainly instrumental in carrying through the *coup d'état* of Thermidor; but, thanks largely to the skill of Fouché in intrigue, they managed for a time to keep at the head of affairs. Discords, however, crept in which left him for a time almost isolated, and it needed all his ability to withstand the attacks of the moderates. A vigorous attack on him by Boissy d'Anglas, on the 9th of August 1795, caused him to be arrested, but the troubles which ensued in Vendémiaire averted the doom that seemed to be pending; and he owed his release to the amnesty which was passed on the proclamation of the new constitution of the year 1795.

In the ensuing period, known as that of the Directory (1795-1799), Fouché remained at first in obscurity, but the relations which he had with the communists, once headed by Chaumette and now by François N. ("Gracchus") Babeuf (*q.v.*), helped him to rise once more. He is said to have betrayed to the director Barras the secret of the strange plot which Babeuf and a few accomplices hatched in the year 1796; but recent research has tended to throw doubt on the assertion. His rise from poverty was slow, but in 1797 he gained an appointment for the supply of military *matériel*, which offered opportunities direct and indirect. After offering his services to the royalists, whose movement was then gathering force, he again decided to support the Jacobins and the director Barras (*q.v.*). In the *coup d'état* of Fructidor 1797 he made himself serviceable to Barras, who in 1798 appointed him to be French ambassador to the Cisalpine republic. At Milan he carried matters with so high a hand against the Gallophobes of that government that his actions were disavowed and he himself was removed; but in the confused state in which matters then were, he was able for a time to hold his own and to intrigue successfully against his successor. Early in 1799 he returned to Paris, and after a brief tenure of office as ambassador at The Hague, he became minister of police at Paris (July 20, 1799). The newly elected director, Sieyès (*q.v.*),

was then in the ascendant and desired to curb the excesses of the Jacobins, who had recently reopened their club. Fouché, casting consistency to the winds, closed the Jacobins club in a manner at once daring and clever. Thereupon he hunted down the pamphleteers and editors, whether Jacobins or royalists, who were obnoxious to the government, so that at the time of the return of Bonaparte from Egypt (October 1799) the ex-Jacobin was one of the most powerful men in France.

Knowing well the unpopularity of the directors, Fouché lent himself to the schemes of Bonaparte and Sieyès for their overthrow. His activity in furthering the *coup d'état* of Brumaire 18-19 (November 9-10), 1799, procured him the favour of Bonaparte, who kept him in office (*v.* Napoleon I.). In the ensuing period of the Consulate (1799-1804) Fouché behaved with the utmost adroitness. While curbing the royalists and extreme Jacobins who at first alone opposed Bonaparte, Fouché was careful to temper as far as possible the arbitrary actions of the new master of France. In this difficult task he acquitted himself with so much skill as to earn at times the gratitude even of the royalists. Thus, while countermining a foolish intrigue of theirs in which the duchesse de Guiche was the chief agent, Fouché took care that she should escape. Equally skilful was his action in the affair of the so-called Aréna-Ceracchi plot, in which the *agents provocateurs* of the police were believed to have played a sinister part. The chief "conspirators" were easily ensnared and were executed when the affair of Nivôse (December 1800) enabled Bonaparte to act with rigour. This far more serious attempt (in which royalist conspirators exploded a bomb near the First Consul's carriage with results disastrous to the bystanders) was soon seen by Fouché to be the work of royalists; and when the First Consul, eager to entrap the still formidable Jacobins, sought to fasten the blame on them, Fouché firmly declared that he would not only assert but would prove that the outrage was the work of royalists. All his efforts, however, failed to avert the punishment which Bonaparte was resolved to inflict on the leading Jacobins. In other matters (especially in that known as the Plot of the Placards in the spring of 1802) Fouché was thought to have secured the Jacobins concerned from the vengeance of the First Consul. In any case the latter resolved to rid himself of a man who had too much power and too much skill in intrigue to be desirable as a subordinate. On the proclamation of Bonaparte as First Consul for life (August 1, 1802) Fouché was deprived of his office; but the blow was softened by the suppression of the ministry of police and by the attribution of most of its duties to an extended ministry of justice. Fouché also became a senator and received half of the reserve funds of the police which had accumulated during his tenure of office. He continued, however, to intrigue through his spies, whose information was so superior to that of the new minister of police as to render great services to Napoleon at the time of the Cadoudal-Pichegru conspiracy (February-March 1804).

As a result Napoleon, now emperor, brought back Fouché to the re-constituted ministry of police (July 1804); he also later on entrusted to him that of the interior. His work was no less important than at the time of the Consulate. His police agents were ubiquitous, and the terror which Napoleon and Fouché inspired, owing to their proven ability to benefit by plots, partly accounts for the absence of conspiracies after 1804. After Austerlitz (December 1805) Fouché uttered the *mot* of the occasion: "Sire, Austerlitz has shattered the old aristocracy; the boulevard St Germain no longer conspires."

That Napoleon retained some feeling of distrust, or even of fear, of Fouché was proved by his conduct in the early days of 1808. While engaged in the campaign of Spain, the emperor heard rumours that Fouché and Talleyrand, once bitter enemies, were having interviews at Paris in which Murat, king of Naples, was concerned. At once the sensitive autocrat hurried to Paris, but found nothing to incriminate Fouché. In that year Fouché received the title of duke of Otranto. During the absence of Napoleon in Austria in the campaign of 1809, the British Walcheren expedition threatened for a time the safety of

Antwerp. Fouché thereupon issued an order to the prefects of the northern departments of the empire for the mobilization of 60,000 National Guards. He added to the order a statement in which occurred the words: "Let us prove to Europe that although the genius of Napoleon can throw lustre on France, his presence is not necessary to enable us to repulse the enemy." The emperor's approval of the measure was no less marked than his disapproval of the words just quoted. The next months brought further causes of friction between emperor and minister. The latter, knowing the desire of his master for peace at the close of the year 1809, undertook on his own account to make secret overtures to the British ministry. A little later Napoleon opened negotiations and found that Fouché had forestalled him. His rage against his minister was extreme, and on the 3rd of June 1810 he dismissed him from his office. However, as it was not the emperor's custom completely to disgrace a man who might again be useful, Fouché received the governorship of Rome. He went thither, not as governor but as fugitive, for on receiving the emperor's order to give up certain important documents of his former ministry, he handed over only a few, declaring that the rest were destroyed. At this the emperor's anger burst forth again, and Fouché on learning, after his arrival at Florence, that the storm was still raging at Paris, prepared to sail to the United States. Compelled, however, by stress of weather and sickness to put back again, he found a mediator in Elisa Bonaparte, grand duchess of Tuscany, thanks to whom he was allowed to settle at Aix and finally to return to his domain of Point Carré. In 1812 he sought vainly to turn Napoleon from the projected invasion of Russia; and on the return of the emperor in haste from Smorgoni to Paris at the close of that year, the ex-minister of police was suspected of complicity in the conspiracy of General Malet, which came so strangely near to success. From this suspicion Fouché cleared himself and gave the emperor useful advice concerning internal affairs and the diplomatic situation. Nevertheless, the emperor, still distrustful of the arch-intriguer, ordered him to undertake the government of the Illyrian provinces. On the break-up of the Napoleonic system in Germany in October 1813 Fouché was ordered to repair to Rome and thence to Naples, in order to watch the movements of Murat. Before Fouché arrived at Naples Murat threw off the mask and invaded the Roman territory, whereupon Fouché received orders to return to France. He arrived at Paris on the 10th of April 1814 at the time when Napoleon was being constrained by his marshals to abdicate.

The conduct of Fouché at this crisis was characteristic. As senator he advised the senate to send a deputation to the comte d'Artois, brother of Louis XVIII., with a view to a reconciliation between the monarchy and the nation. A little later he addressed to Napoleon, then at Elba, a letter begging him in the interests of peace and of France to withdraw to the United States. To the new sovereign Louis XVIII. he sent an appeal in favour of liberty and recommending the adoption of measures which would conciliate all interests. It was not successful, but Fouché remained unmolested.

This was far from satisfying him, and when he found that there were no hopes of advancement, he entered into relations with conspirators who sought the overthrow of the Bourbons. Lafayette and Davout were concerned in the affair, but their refusal to take the course desired by Fouché and other bold spirits led to nothing being done. Soon Napoleon escaped from Elba and made his way in triumph to Paris. Shortly before his arrival at Paris (March 19, 1815) Louis XVIII. sent to Fouché an offer of the ministry of police, which he declined, saying, "It is too late; the only plan to adopt is to retreat." He then foiled an attempt of the royalists to arrest him, and on the arrival of Napoleon he received for the third time the portfolio of police. That, however, did not prevent him from entering into secret relations with Metternich at Vienna, his aim being then, as always, to prepare for all eventualities. Meanwhile he used all his powers to induce the emperor to popularise his rule, and he is said to have caused the insertion of the words "The sovereignty resides in the people; it is the source of

power" in the declaration of the council of state. But the autocratic tendencies of Napoleon could scarcely be held in check, and Fouché seeing the fall of the emperor to be imminent, took measures to expedite it and secure his own interests. On the 22nd of June Napoleon abdicated for the second time, and Fouché was next day elected president of the commission which provisionally governed France. Already he was in touch with Louis XVIII., then at Ghent, and now secretly received the overtures of his agent at Paris. While ostensibly working for the recognition of Napoleon II., he facilitated the success of the Bourbon cause, and thus procured for himself a place in the ministry of Louis XVIII. Even his skill, however, was unequal to the task of conciliating hot-headed royalists who remembered his vote as regicide and his fanaticism as terrorist. He resigned office, and after acting for a brief space as ambassador at Dresden, he retired to Prague. Finally he settled at Trieste, where he died on the 25th of December 1820. He had accumulated great wealth.

Marked at the outset by fanaticism, which, though cruel, was at least conscientious, Fouché's character deteriorated in and after the year 1794 into one of calculating cunning. The transition represented all that was worst in the life of France during the period of the Revolution and Empire. In Fouché the enthusiasm of the earlier period appeared as a cold, selfish and remorseless fanaticism; in him the bureaucracy of the period 1795-1799 and the autocracy of Napoleon found their ablest instrument. Yet his intellectual pride prevented him sinking to the level of a mere tool. His relations to Napoleon were marked by a certain aloofness. He multiplied the means of resistance even to that irresistible autocrat, so that though removed from office, he was never wholly disgraced. Despised by all for his tergiversations, he nevertheless was sought by all on account of his cleverness. He repaid the contempt of his superiors and the adulation of his inferiors by a mask of impenetrable reserve or scorn. He sought for power and neglected no means to make himself serviceable to the party whose success appeared to be imminent. Yet, while appearing to be the servant of the victors, present or prospective, he never gave himself to any one party. In this versatility he resembles Talleyrand, of whom he was a coarse replica. Both professed, under all their shifts and turns, to be desirous of serving France. Talleyrand certainly did so in the sphere of diplomacy; Fouché may occasionally have done so in the sphere of intrigue.

Bibliography.—Fouché wrote some political pamphlets and reports, the chief of which are *Réflexions sur le jugement de Louis Capet* (1793); *Réflexions sur l'éducation publique* (1793); *Rapport et projet de loi relatif aux collèges* (1793); *Rapport sur la situation de Commune-Affranchie [Lyons]* (1794); *Lettre aux préfets concernant les prêtres, &c.* (1801); also the letters of 1815 noted above, and a *Lettre au duc de Wellington* (1817). The best life of Fouché is that by L. Madelin, *Fouché* (2 vols., Paris, 1901). The so-called *Fouché Memoirs* are not genuine, but they were apparently compiled, at least in part, from notes written by Fouché, and are often valuable, though their account of events (e.g. of the negotiations of 1809-1810) is not seldom untrustworthy. For those negotiations see Coquelle, *Napoléon et l'Angleterre* (Paris, 1903, Eng. trans., London, 1904). For the plots with which Fouché had to deal see E. Daudet, *La Police et les Chouans sous le Consulat et l'Empire* (Paris, 1895); P. M. C. Desmarest, *Témoignages historiques, ou quinze ans de haute police* (Paris, 1833, 2nd ed., 1900); E. Picard, *Bonaparte et Moreau* (Paris, 1905); G. A. Thierry, *Conspireurs et gens de police; le complot de libelles* (Paris, 1903) (Eng. trans., London, 1903); H. Welschinger, *Le Duc d'Enghien* (Paris, 1888); E. Guillon, *Les Complots militaires sous le Consulat et l'Empire* (Paris, 1894). (J. H. L. R.)

FOUCHER, SIMON (1644-1696), French philosopher, was born at Dijon on the 1st of March 1644. He was the son of a merchant, and appears to have taken orders at a very early age. For some years he held the position of honorary canon at Dijon, but this he resigned in order to take up his residence in Paris. He graduated at the Sorbonne, and spent the remainder of his life in literary work in Paris, where he died on the 27th of April 1696. In his day Foucher enjoyed considerable repute as a keen opponent of Malebranche. His philosophical standpoint was one of scepticism in regard to external perception. He revived the old arguments of the Academy, and advanced them with much ingenuity against Malebranche's doctrine. Otherwise

his scepticism is subordinate to orthodox belief, the fundamental dogmas of the church seeming to him intuitively evident. His object was to reconcile his religious with his philosophical creed, and to remain a Christian without ceasing to be an academician. His writings against Malebranche were collected under the title *Dissertations sur la recherche de la vérité*, 1693.

See F. Rabbe, *L'Abbé Simon Foucher* (1867); C. Jourdain in *Dictionnaire des sciences philosophiques* (1875), pp. 557-559.

FOUCQUET, JEAN, or **JEHAN** (c. 1415-1485), French painter, born at Tours, is the most representative and national French painter of the 15th century. Of his life little is known, but it is certain that he was in Italy about 1437, where he executed the portrait of Pope Eugenius IV., and that upon his return to France, whilst retaining his purely French sentiment, he grafted the elements of the Tuscan style, which he had acquired during his sojourn in Italy, upon the style of the Van Eycks, which was the basis of early 15th-century French art, and thus became the founder of an important new school. He was court painter to Louis XI. Though his supreme excellence as an illuminator and miniaturist, of exquisite precision in the rendering of the finest detail, and his power of clear characterization in work on this minute scale, have long since procured him an eminent position in the art of his country, his importance as a painter was only realized when his portraits and altarpieces were for the first time brought together from various parts of Europe in 1904, at the exhibition of the French Primitives held at the Bibliothèque Nationale in Paris. One of Foucquet's most important paintings is the diptych, formerly at Notre Dame de Melun, of which one wing, depicting Agnes Sorel as the Virgin, is now at the Antwerp Museum and the other in the Berlin Gallery. The Louvre has his oil portraits of Charles VII., of Count Wilczek, and of Jouvencel des Ursins, besides a portrait drawing in crayon; whilst an authentic portrait from his brush is in the Liechtenstein collection. Far more numerous are his illuminated books and miniatures that have come down to us. The Brentano-Laroche collection at Frankfort contains forty miniatures from a Book of Hours, painted in 1461 for Etienne Chevalier who is portrayed by Foucquet on the Berlin wing of the Melun altarpiece. From Foucquet's hand again are eleven out of the fourteen miniatures illustrating a translation of Josephus at the Bibliothèque Nationale. The second volume of this MS., unfortunately with only one of the original thirteen miniatures, was discovered and bought in 1903 by Mr Henry Yates Thompson at a London sale, and restored by him to France.

See *Œuvres de Jehan Foucquet* (Curmer, Paris, 1866-1867); A. de Champeaux and P. Gauchery, *Œuvres d'art exécutées pour le duc de Berry*; "Facsimiles of two histories by Jean Foucquet" from vols. i. and ii. of the *Anciennetés des Juifs* (London, 1902); Charles Blanc, *Histoire des peintres de toutes les écoles* (introduction); and Georges Lafenestre, *Jehan Foucquet* (Paris, 1902).

FOUGÈRES, a town of north-western France, capital of an arrondissement in the department of Ille-et-Vilaine, 30 m. N.E. of Rennes by rail. Pop. (1906) 21,847. Fougères is built on the summit and slopes of a hill on the left bank of the Nançon, a tributary of the Couesnon. It was formerly one of the strongest places on the frontier towards Normandy, and it still preserves some portions of its medieval fortifications, notably a gateway of the 15th century known as the Porte St Sulpice. The castle, which is situated in the lower part of the town, directly overlooking the Nançon, is now a picturesque ruin, but gives abundant evidence in its towers and outworks of its former strength and magnificence. The finest of the towers was erected in 1242 by Hugues of Lusignan, and named after Mélusine, the mythical foundress of the family. The churches of St Léonard and St Sulpice both date, at least in part, from the 15th century. An hôtel de ville and a belfry, both of the 15th century, are of architectural interest, and the town possesses many curious old houses. There is a statue of General B. de Lari Coisière (d. 1812), born in the town. Fougères is the seat of a subprefect, and has a tribunal of first instance, a chamber of commerce and a communal college. It is the chief industrial town of its department, being a centre for the manufacture of boots and shoes; tanning and leather-dressing and the manu-

facture of sail-cloth and other fabrics are also important industries. Trade is in dairy produce and in the granite of the neighbouring quarries. Fougères frequently figures in Breton history from the 11th to the 15th century. It was taken by the English in 1166, and again in 1448; and the name of Surienne, the captor on the second occasion, is still borne by one of the towers of the castle. In 1488 it was taken by the troops of Charles VIII. under la Trémoille. In the middle ages Fougères was a lordship of some importance, which in the 13th century passed into the possession of the family of Lusignan, and in 1307 was confiscated by the crown and afterwards changed hands many times. In 1793, during the wars of the Vendée, it was occupied by the insurgents.

FOUILLÉE, ALFRED JULES EMILE (1838-), French philosopher, was born at La Pouéze on the 18th of October 1838. He held several minor philosophical lectureships, and from 1864 was professor of philosophy at the lycées of Douai, Montpellier and Bordeaux successively. In 1867 and 1868 he was crowned by the Academy of Moral Science for his work on Plato and Socrates. In 1872 he was elected master of conferences at the École Normale, and was made doctor of philosophy in recognition of his two treatises, *Platonis Hippias Minor sive Socratica contra liberum arbitrium argumenta* and *La Liberté et le déterminisme*. The strain of the next three years' continuous work undermined his health and his eyesight, and he was compelled to retire from his professorship. During these years he had published works on Plato and Socrates and a history of philosophy (1875); but after his retirement he further developed his philosophical position, a speculative eclecticism through which he endeavoured to reconcile metaphysical idealism with the naturalistic and mechanical standpoint of science. In *L'Évolutionnisme des idées-forces* (1890), *La Psychologie des idées-forces* (1893), and *La Morale des idées-forces* (1907), is elaborated his doctrine of *idées-forces*, or of mind as efficient cause through the tendency of ideas to realize themselves in appropriate movement. Ethical and sociological developments of this theory succeed its physical and psychological treatment, the consideration of the antinomy of freedom being especially important. Fouillée's wife, who by a previous marriage was the mother of the poet and philosopher Jean Marie Guyau (1854-1888), is well known, under the pseudonym of "G. Bruno," as the author of educational books for children.

His other chief works are: *L'Idée moderne du droit en Allemagne. en Angleterre et en France* (Paris, 1878); *La Science sociale contemporaine* (1880); *La Propriété sociale et la démocratie* (1884); *Critique des systèmes de morale contemporains* (1883); *La Morale, l'art et la religion d'après Guyau* (1889); *L'Avenir de la métaphysique fondée sur l'expérience* (1889); *L'Enseignement au point de vue national* (1891); *Descartes* (1893); *Tempérament et caractère* (2nd ed., 1895); *Le Mouvement positiviste et la conception sociologique du monde* (1896); *Le Mouvement idéaliste et la réaction contre la science positive* (1896); *La Psychologie du peuple français* (2nd ed., 1898); *La France au point de vue moral* (1900); *L'Esquisse psychologique des peuples européens* (1903); *Nietzsche et l'"immoralisme"* (1903); *Le Moralisme de Kant* (1905).

FOULD, ACHILLE (1800-1867), French financier and politician, was born at Paris on the 17th of November 1800. The son of a rich Jewish banker, he was associated with and afterwards succeeded his father in the management of the business. As early as 1842 he entered political life, having been elected in that year as a deputy for the department of the Hautes Pyrénées. From that time to his death he actively busied himself with the affairs of his country. He readily acquiesced in the revolution of February 1848, and is said to have exercised a decided influence in financial matters on the provisional government then formed. He shortly afterwards published two pamphlets against the use of paper money, entitled, *Pas d'Assignats!* and *Observations sur la question financière*. During the presidency of Louis Napoleon he was four times minister of finance, and took a leading part in the economical reforms then made in France. His strong conservative tendencies led him to oppose the doctrine of free trade, and disposed him to hail the *coup d'état* and the new empire. On the 25th of January 1852, in consequence of the decree confiscating the property of the Orleans family,

he resigned the office of minister of finance, but was on the same day appointed senator, and soon after rejoined the government as minister of state and of the imperial household. In this capacity he directed the Paris exhibition of 1855. The events of November 1860 led once more to his resignation, but he was recalled to the ministry of finance in November of the following year, and retained office until the publication of the imperial letter of the 19th of January 1867, when Émile Ollivier became the chief adviser of the emperor. During his last tenure of office he had reduced the floating debt, which the Mexican war had considerably increased, by the negotiation of a loan of 300 millions of francs (1863). Fould, besides uncommon financial abilities, had a taste for the fine arts, which he developed and refined during his youth by visiting Italy and the eastern coasts of the Mediterranean. In 1857 he was made a member of the Academy of the Fine Arts. He died at Tarbes on the 5th of October 1867.

FOULIS, ANDREW (1712-1775) and **ROBERT** (1707-1776), Scottish printers and publishers, were the sons of a Glasgow maltman. Robert was apprenticed to a barber; but his ability attracted the attention of Dr Francis Hutcheson, who strongly recommended him to establish a printing press. After spending 1738 and 1739 in England and France in company with his brother Andrew, who had been intended for the church and had received a better education, he started business in 1741 in Glasgow, and in 1743 was appointed printer to the university. In this same year he brought out *Demetrius Phalereus de elocutione*, in Greek and Latin, the first Greek book ever printed in Glasgow; and this was followed in 1774 by the famous 12mo edition of Horace which was long but erroneously believed to be immaculate: though the successive sheets were exposed in the university and a reward offered for the discovery of any inaccuracy, six errors at least, according to T. F. Dibdin, escaped detection. Soon afterwards the brothers entered into partnership, and they continued for about thirty years to issue carefully corrected and beautifully printed editions of classical works in Latin, Greek, English, French and Italian. They printed more than five hundred separate publications, among them the small editions of Cicero, Tacitus, Cornelius Nepos, Virgil, Tibullus and Propertius, Lucretius and Juvenal; a beautiful edition of the Greek Testament, in small 4to; Homer (4 vols. fol., 1756-1758); Herodotus, Greek and Latin (9 vols. 12mo, 1761); Xenophon, Greek and Latin (12 vols. 12mo, 1762-1767); Gray's Poems; Pope's Works; Milton's Poems. The Homer, for which Flaxman's designs were executed, is perhaps the most famous production of the Foulis press. The brothers spared no pains, and Robert went to France to procure manuscripts of the classics, and to engage a skilled engraver and a copper-plate printer. Unfortunately it became their ambition to establish an institution for the encouragement of the fine arts; and though one of their chief patrons, the earl of Northumberland, warned them to "print for posterity and prosper," they spent their money in collecting pictures, pieces of sculpture and models, in paying for the education and travelling of youthful artists, and in copying the masterpieces of foreign art. Their countrymen were not ripe for such an attempt, and the "Academy" not only proved a failure but involved the projectors in ruin. Andrew died on the 18th of September 1775, and his brother went to London, hoping to realize a large sum by the sale of his pictures. They were sold for much less than he anticipated, and Robert returned broken-hearted to Scotland, where he died at Edinburgh on the 2nd of June 1776. Robert was the author of a *Catalogue of Paintings with Critical Remarks*. The business was afterwards carried on under the same name by Robert's son Andrew.

See W. J. Duncan, *Notices and Documents illustrative of the Literary History of Glasgow*, printed for the Maitland Club (1831), which *inter alia* contains a catalogue of the works printed at the Foulis press, and another of the pictures, statues and busts in plaster of Paris produced at the "Academy" in the university of Glasgow.

FOULLON, JOSEPH FRANÇOIS (1717-1789), French administrator, was born at Saumur. During the Seven Years' War he was intendant-general of the armies, and intendant of the army and navy under Marshal de Belle-Isle. In 1771 he was appointed

intendant of finances. In 1789, when Necker was dismissed, Foulon was appointed minister of the king's household, and was thought of by the reactionary party as a substitute. But he was unpopular on all sides. The farmers-general detested him on account of his severity, the Parisians on account of his wealth accumulated in utter indifference to the sufferings of the poor; he was reported, probably quite without foundation, to have said, "If the people cannot get bread, let them eat hay." After the taking of the Bastille on the 14th of July, he withdrew to his estate at Vitry and attempted to spread the news of his death; but he was recognized, taken to Paris, carried off with a bundle of hay tied to his back to the hôtel de ville, and, in spite of the intervention of Lafayette, was dragged out by the populace and hanged to a lamp-post on the 22nd of July 1789.

See Eugène Bonnemère, *Histoire des paysans* (4th ed., 1887), tome iii.; C. L. Chassin, *Les Elections et les cahiers de Paris en 1789*. (Paris, 1889), tomes iii. and iv.

FOUNDATION (Lat. *fundatio*, from *fundare*, to found), the act of building, constituting or instituting on a permanent basis; especially the establishing of any institution by endowing or providing it with funds for its continual maintenance. The word is thus applied also to the institutions so established, such as a college, monastery or hospital; and the terms "on the foundation," or "founditioner," are used of members of such a college or society who enjoy, as fellows, scholars, &c., the benefits of the endowment. Formerly "foundation" also meant the charter or incorporation of any such institution or society, and it is still applied to the funds used for the endowment of such institutions.

The terms "old foundation" and "new foundation" used in connexion with the organizing of English cathedral chapters have no reference to the age of the cathedrals. At the time of the Reformation under Henry VIII. the old college chapters were left unchanged, and are referred to as the "old foundations," but the monastic chapters were all suppressed, consequently new chapters had to be formed for their cathedrals and these constitute the "new foundations."

"Foundation" also means the base (natural or artificial) on which any erection is built up; generally made below the level of the ground (see FOUNDATIONS below). A foundation-stone is one of the stones at the base of a building, generally a corner-stone, frequently laid with a public ceremony to celebrate the commencement of the building. The term is also applied to the ground-work of any structure, such as, in dress-making, the underskirt over which the real skirt is hung, any material used for stiffening purposes, as "foundation muslin or net." In knitting or crochet the first stitches on to which all the rest are worked are called the "foundation chain." In gem-cutting the "foundation-square" is the first of eight squares round the edges of a brilliant made in bevel planes and from which the angles are all removed to form three-corner facets.

FOUNDATIONS, in building. The object of foundations is to distribute the weight of a structure equally over the ground. In the construction of a building the weights are concentrated at given points on piers, columns, &c., and these foundations require to be spread so as to reduce the weight to an average. In the preparation of a foundation care must be taken to prevent the lateral escape of the soil or the movement of a bed upon sloping ground, and it is also necessary to provide against any damage by the action of the atmosphere. The soils met with in ordinary practice, such as rock, gravel, chalk, clay and sand, vary as to their capabilities of bearing weight. There is no provision in any English building acts as to the load that may be placed on any of these soils, but under the New York Building Code it is provided that, where no test of the sustaining power of the soil is made, different soils, excluding mud, at the bottom of the footings shall be deemed to safely sustain the following loads to the superficial foot:

Soft clay	per sq. ft.
Ordinary soft clay and sand, together in layers, wet and springy	1 ton.
Loam, clay or fine sand, firm and dry	2 tons.
Very firm coarse sand, stiff gravel or hard clay	3 tons.
	4 tons.

A comparison of the pressure exerted on an ordinary foundation by the walls of the several thicknesses and heights provided for by the London Building Act of 1894, and a comparison of a few of the principal authorities, will be found useful in helping us to arrive at a decision as to what can safely be allowed. Take as an example a wall of the warehouse class, 70 ft. high, whose section at the base for a height of 27 ft. is 2½ bricks thick (or 22½ in.), and for the same distance in height again is 2 bricks thick (or 18 in.), the remainder to the top being 1½ bricks thick (or 14 in.). The weight of brickwork per foot run of such a wall is 4.05 tons on any area of 3.75 ft. super. of brickwork. According to the act the concrete is to project 4 in. on each side; we have then an additional area of .66 ft. super. to add, thus making the total foundation area of each foot run of wall 4.41 ft. super. to take a weight of 4.05 tons or nearly a ton per foot super. (viz. .9 ton.)

Another factor must, however, be taken into consideration, viz. the weight distributed from the loaded floor and from the roof. In this case there would be at least six floors, and the entire weight could hardly be taken at less than 6 tons, which would give a total weight of 10.05 tons on an area of 4.41 ft. super. or a load of 2.28 tons per foot super. This is on the assumption that no extra weight has been thrown on the foundations by openings or piers, or by girders, &c., in which case, in addition to the work being executed in cement, the foundations should be increased in area. Piers always involve a great increase of weight on the foundations, and in very many instances this increased weight, instead of being provided for by increasing the area of the foundations and so reducing the weight per foot super., is only partly met by the improper method of merely increasing the depth of the concrete, while keeping the same projection of concrete round the footings as for the walls. As an example take an iron column to carry a safe load of 80 tons, standing on a York stone template, and in turn supported by a brick pier 22½ in. square. In this case we should have, after allowing for the projection of concrete on either side, an area of 4 ft. 5 in. square, or 19.6 ft. super., and this would give a pressure of 4.1 tons per foot on the foundations, or almost twice as much as in the previous example of a warehouse wall. Here, instead of increasing the depth of the concrete, it would be necessary to increase its width; if it were made 6 ft. square, we should have an area of 36 ft. super. to take the 80 tons, and thus the pressure would only be 2.2 tons per foot, and the cost of the foundation be much the same.

If we compare a section of wall of the dwelling-house class, as prescribed by the London Building Act, we find that, taking a wall 50 ft. high and having a thickness at base of 22½ in. as for the warehouse wall to which we have referred, we have a wall weighing 3.75 tons per foot super. on an area of 4.41 feet super., or .85 ton per foot without weight of floors and roof as against the .9 ton in the warehouse example. To this must be added the weight of, say, 5 floors and roof at a total of 3 tons per foot run of wall, and we then have an aggregate of 6.75 tons per foot run and 1.50 tons per foot super. as against 2.28 tons in the warehouse class.

If we turn from the act to text-books we find that Colonel Seddon in the *Aide Memoir* gives the load which ordinary foundations will bear as a safe load per foot super. as follows:

	tons.
Rock, moderately hard	9
Rock of strength of good concrete	3
Rock, very soft	1.8
Firm earth	1 to 1½
Hard clay	1 to 1½
Clean dry gravel and clean sharp sand prevented from spreading sideways	1 to 1½

Most of the work in London may be classed under one of the latter heads, and according to this table we have, when we erect walls in accordance with the building act, to overload our foundations.

As to the possibility of spreading weights, we have as an example the chimney at Adkin's Soap Works in Birmingham,

312 ft. high, so arranged that its pressure on the foundations is only 1½ tons per foot super.; also the great St Rollox chimney at Glasgow, which has a pressure of 1½ tons; the weight of the Eiffel Tower (7500 tons) is so spread over 4 bases, each 130 ft. square, that the pressure is only .117 ton, or 2½ cwt., per foot super. The Tower Bridge has a load of 16 tons per foot on the granite bed under the columns of towers, reduced by spreading to an actual pressure on the clay foundation of 4 tons. The piers under the Holborn Viaduct have a load of 2½ tons only, those of the Imperial Institute 2½ tons, and those of the destructor cells and chimney shaft at Great Yarmouth 4 tons 6¼ cwt. per foot super. From these various examples it would appear that on sound clay or gravel foundation a load of from 2½ to 4 tons may be employed with safety.

One of the first and most important requirements in preparing drawings for a large building is to ascertain the nature of the subsoil and strata at different levels over the proposed site, so as to be able to arrange the footings accordingly at the various depths and to decide as to the various forms and methods to be employed. For this purpose trial holes or borings are sunk until a suitable bed or bottom is found, upon which the concrete foundation may safely be put. If no such solid bottom is found, as often happens near the water side, special foundations must be employed, such as dock, gridiron, cantilever and pile foundations, &c., all of which will be described hereafter. As examples of the varying subsoils we may mention the following, in which will be noticed the great depths dug before getting through the made ground: At the Bank of England there were 22 ft. of made ground resting on 4 ft. of gravel. Some of the made ground was of ancient date, and preserved relics of Roman occupation. In some parts the subsoils have been excavated for ballast or gravel, as at Kensington, or for brick earth, as at Highbury, and the pits filled in with rubbish. Rock, which forms an excellent and unchanging foundation in one situation, may prove a dangerous foundation in another. Thus chalk forms a good limestone foundation in certain positions, but when it dips towards a slope or a cliff with an outcrop of the gault or underlying clay, it is a very unsuitable foundation for any building, as the landslips in the Isle of Wight and on the Dorsetshire coast bear witness. A boring made in Tallis Street, near the Thames embankment, showed: (1) 18 in. ballast, dirty; (2) 6 in. greensand, wet and dirty; (3) 2 ft. peat clay; (4) 6 in. greensand; (5) 5½ ft. peaty bog; (6) 9 ft. running sand; and (7) 4 ft. clean ballast, resting at a depth of 23 ft. below the ground line upon blue clay. A boring at Highbury New Park gave: (1) 2 ft. made ground, (2) 18 ft. loam, (3) 9 ft. sand, (4) 4 ft. peat, and (5) 8 ft. gravel and sand. These examples show that while trial holes should always be made before designing a foundation, to ascertain the nature of the subsoil, care must be taken not to calculate upon uniformity. Thus at the block 2 of the admiralty extension new buildings (London), one of the trial holes upon the south-west side of the old buildings showed the clay to be about 29½ ft. below the surface of the ground, while actual excavation proved the dip of the clay to be such that in the execution of the new building it became necessary to underpin the north-west corner of the old building at the deepest part 42 ft. below the ground. The foundations of block 1 of the new admiralty buildings are placed in a dock, built upon the London clay at a depth of 30 ft. in solid concrete 6 ft. thick. At the Hotel Victoria, in Northumberland Avenue (London), the various subsoils are as follows: (1) 38½ ft. made ground clay and gravel mixed, (2) 4 ft. gravel and sand, (3) 6 ft. rising sand; (4) 2 ft. fine ballast, and at a depth of 50 ft. blue clay. At the south end the clay was 43 ft. down and at the north end 37 ft. The front wall was constructed on a concrete bed 9 ft. wide. The site was surrounded by a similar wall of concrete about 6 ft. wide, forming a species of boxes, and the whole was covered with a depth of 6 ft. of concrete upon which the walls were raised. The foundation for 53 Parliament Street, where running sand was encountered, was constructed with short piles, 7 or 8 ft. long and 6 in. diam., pointed and placed as close together as possible over the whole foundation, the tops were then sawn off level, and a concrete raft, 7 or 8 ft. thick, was built over the whole area. At the Institution of Civil Engineers, Great George Street, Westminster, the foundations to the two party walls upon each side of the building were carried down about 22 ft. below the pavement level, that on the west side being 22 ft. deep and that on the east side 24 ft.

The London Building Act and the model by-laws prohibit the erection of buildings on sites that have been used as "shoots" for faecal matter or vegetable refuse, and in such cases the objectionable material must be removed prior to the commencement of building operations, and the holes from which it was taken filled up with dry brick or other rubbish well rammed. Foundations are usually executed by excavators or navvies, and the tools and implements used are boring rods, level pegs, lines, spirit level, pickaxe, various shovels, wheel-barrow, rammer or punner, &c. In digging the ordinary trenches and

Trial borings.

Construction.

excavations, should the ground be loose, planking and strutting have to be employed. This consists of rough boarding put along the sides of the trenches and wedged tight with waling pieces and struts; this work is done by navvies. Figs. 1 and 2 show the general forms of planking and strutting for the different soils.

In very large works of excavation in soft soil a steam digger is used for the bulk of the work. It consists of a large steel bucket with a cutting edge; this is lowered

FIG. 1.

by means of a crane into the excavation, and on being withdrawn cuts off a portion of soil which is hoisted and deposited in carts for removal to any desired position within the radius commanded by the crane. The work of trimming the excavation to a regular shape must always be done by manual labour. Concrete for filling into the foundations is usually mixed by navvies; for large works it is sometimes mixed by machinery. In order that the work of excavating and constructing the foundations may proceed in a water-logged site, pumps have to be employed, and where the inrush of water is great it is usual to sink a sump hole lower than the depth required for the foundations, and to use a steam pump kept going day and night.

The foundation of a wall is required to be as follows in accordance with the London Building and Amendment Acts: "The projection of the bottom of the footings of every wall on each side of the wall shall be at least equal to half of the thickness of the wall at its base, unless an adjoining wall interferes, in which case the projection may be omitted where that wall adjoins, and the diminution of the footings of every wall shall be formed in regular offsets and the height from the bottom of such footing to the base of the wall shall be at least equal to two-thirds of the thickness of the wall at its base." (See BRICKWORK.) The base of a wall is the thickness above the footing; the footing is the brickwork built directly on the top of the concrete and diminishing in width in every course. Thus: "The projection of the bottom footing to be equal to one-half the thickness of wall on both sides" means that a 13½-in. wall would require to have three courses of footings, the bottom one being 27 in. wide. "The height from the bottom of such footing to the base of the wall shall be at least equal to two-thirds the thickness of wall at its base" means that in the case of a 13½-in. wall the height of footings would have to be 9 in., or three courses of brickwork, each measuring 3 in.

FIG. 2.

The New York Building Code enters more fully into the requirements for the foundation of walls as regards depth than that in use in London. Section 25, Part 5, requires that every building, except buildings erected upon solid rock, or upon wharves and piers on the water front, shall have foundations of brick, stone, iron or concrete laid not less than 4 ft. below the surface of the earth, on the solid ground or level surface of rock, or upon piles or ranging timbers when solid earth or rock is not found. Piles intended to sustain a wall, pier or post, shall be spaced not more than 36 in. nor less than 20 in. on centres; they must be driven to a solid bearing if practicable, and their number must be sufficient to support the superstructure proposed. No pile shall be used of less dimensions than 5 in. at the small end and 10 in. at the butt for short piles, or piles 20 ft. or less in length. No pile shall be weighted with a load exceeding 40,000 lb. When a pile is not driven to refusal, its safe sustaining

power shall be determined by the following formula: twice the weight of the hammer in tons multiplied by the height of the fall in feet divided by the least penetration of pile under the last blow in inches plus one. There are also further requirements as to piles, &c., and the commissioner of buildings must be notified when the piles are to be driven.

The New York Code, Section 26, further goes on to say that foundation walls shall be constructed to include all walls and piers built below the curb level or nearest tier of beams to the curb, to serve as supports for the walls, piers, columns, girders, posts or beams. Foundation walls shall be built of stone, brick, Portland cement concrete, iron or steel. If built of rubble stone or Portland cement concrete, they shall be at least 8 in. thicker than the wall above them to a depth of 12 ft. below the curb level, and for every additional 10 ft. or part thereof deeper, they shall be increased 4 in. in thickness. If built of brick, they shall be at least 4 in. thicker than the wall next above them to a depth of 12 ft. below the curb level, and for every additional 10 ft. or part thereof deeper, they shall be increased 4 in. in thickness. The footing or base course shall be of stone or concrete, or both, or of concrete and stepped up brickwork of sufficient thickness and area to bear safely the weight to be imposed thereon. If the footing or base course be of concrete, the concrete shall not be less than 12 in. thick; if of stone, the stones shall not be less than 2×3 ft. and at least 8 in. in thickness for walls, and not less than 10 in. in thickness if under piers, columns or posts. The footing or base course, whether formed of concrete or stone, shall be at least 12 in. wider than the bottom width of walls, and at least 12 in. wider on all sides than the bottom width of said piers, columns or posts. If the superimposed load is such as to cause undue transverse strain on a footing projecting 12 in., the thickness of such footing is to be increased so as to carry the load with safety. For small structures and for small piers sustaining light loads the commissioner of buildings having jurisdiction may, in his discretion, allow a reduction in the thickness and projection specified for footing or base courses. All base stones shall be bedded and laid crosswise, edge to edge. If stepped-up footing of brick is used in place of stone above the concrete, the offsets if laid in single courses shall each not exceed 1½ in., or, if laid in double courses, then each shall not exceed 3 in. offsetting the first course of brickwork back one-half the thickness of the concrete base, so as properly to distribute the load to be imposed thereon. It will be seen by the foregoing that the American acts are far more extensive than in London. The London Building Act mentions that the footings of a wall shall rest upon the solid ground or concrete or upon other solid substructure. The building act amendment says: "The foundations of the walls of every house or building shall be formed of a bed of good concrete not less than 9 in. thick, and projecting at least 4 in. on each side of the lowest course of footings."

Various Types of Foundations.—The most natural foundations for walls are those constructed where the walls are built directly upon the ground; this is only possible where the ground is very hard or consists of rock, and in either of these cases the ground is simply levelled and the building commenced.

The next and most universally recognized method, which might safely be said to be adopted in 95% of all modern buildings, is the system of placing a bed of concrete under the walls, digging trenches where the walls are to come until a solid bottom is reached, and in these laying the concrete. The London Building Act requires this concrete bed to be at least 4 in. wider than the bottom course of footings on each side of the wall, but it is generally made 6 in. wider on each side and in general circumstances the depth of the concrete is varied according to the weight placed upon it.

Where a site is in close proximity to a river or old water-course, &c., where deep basements are excavated, or where the ground lies low, naturally water is met with, and where water is the ground is soft. It is here that special foundations are required.

In certain cases it is necessary to use concrete legs or stilts. These are placed in such positions as to take the weights of the building, and sunk to depths of 40 ft. more or less as the case may require according to the nature of the ground; and on the tops of these stilts concrete arches or lintels are turned over (fig. 3). As an example of the stilt principle, mention may be made of some premises at Stratford and a church at South Bermondsey, London, in which concrete piers were sunk at 12 ft. centres apart and 4½ ft. square, in pot holes dug out of made ground; then concrete arches were formed over the intervening untrustworthy ground with a minimum thickness of 18 in. or the piers were connected by concrete lintels 3 ft. thick in which steel joists were embedded. At Sion College, Victoria Embankment, London, the foundations were formed with cement concrete stilts or piers 8 ft. square, and going down to the London clay; from the tops of these stilts brick arches were turned, spanning the spaces between the piers, and upon these arches the walls were built.

Pile foundations, used in the case of soft ground, for small works, consist either of stout scaffold poles or of timbers varying from 6 in. to 12 in. square according to requirements (fig. 4). The bottom ends of these timbers have an iron shoe with a point, so as to be easily driven into the ground, and the tops of the timbers have an iron band round, so that when the timbers are being driven in

Concrete piers, legs, or stilts.

the band prevents them from splitting (fig. 5). The methods of driving these piles are various. The usual plan is to erect a temporary structure, upon one side of which is a guide path faced with sheet-iron so as to give a smooth face. Up and down this guide path a heavy iron weight, called a monkey, is worked; the monkey is hoisted to the top of the guide path by means of a crab worked by hand or steam, and

Pile foundations.

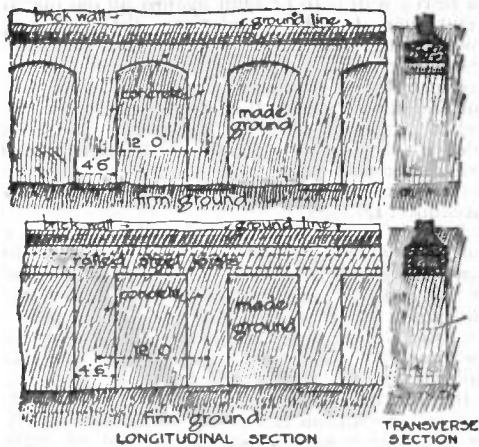

FIG. 3.

when released descends with a good force, and so drives the piles into the ground. The monkey usually weighs from 2 cwt. to 10 cwt. and is allowed a drop of 15 to 40 ft.

Piles are driven all round under the walls at varying intervals or under piers where the weights of a building are to be concentrated. In the erection of the Chicago public library four Norway pine piles, each with an average diameter of 13 in., were driven to a depth of 52½ ft. and loaded with a dead load of 50-7 tons per pile for a period of two weeks, and no settlement taking place 30 tons per pile was adopted as a safe load. The following are some examples of loads used in practice: passenger station, Harrison Street, Chicago, piles 50 ft.

FIG. 4.

in length, each carrying 25 tons; elevator, Buffalo, N.Y., piles 20 ft. in length, weight 25 tons; Trinity church, Boston, 2 tons; Schiller building, Chicago, 55 tons per pile, but in this case the building settled considerably. All timber grillage and the tops of all piles should be kept below the lowest water level, and be capped with concrete or stone. In Boston it is obligatory to cap with blocks of granite.

Another form of foundation takes the shape of Portland cement concrete blocks, and is used chiefly for bridges and in marshy land, &c. In some cases cylinders of brickwork are built, and the centres are filled with blocks of concrete and grouted in. The Yarmouth destructor cells and chimney shaft were built in this way; the cylinders were constructed of 9 in. brickwork built in Portland cement, the lower 4 ft. being encased in a wooden drum with cutting edge sunk into the gravel and sand

Concrete piles.

at least 2 ft. The cylinders were sunk by the aid of a grab, the bottom being levelled and the concrete blocks laid by a diver. Use is also made of piles consisting of Portland cement concrete having steel rods embedded in it, and provided with iron shoes and head for driving (fig. 6).

Cast iron screw piles (fig. 7) used in very loose sandy soils, consist of large hollow cast iron columns with flat screw blades cast on the lower ends. The projection of this screw from the pile may vary from 9 in. to 18 in. with a pitch of from one-quarter to one-half of the projection, the blade making a little over one turn round the shaft. For most requirements a diameter of screw from 3½ to 4½ ft. will be found sufficient, a sandy foundation requiring the largest. The lower end of the tube is generally left open, the edge being

FIG. 5.

FIG. 6.

FIG. 7.

FIG. 8.

bevelled and occasionally provided with teeth to assist in cutting into and penetrating the soil.

Another system of piling known as sheet piling (fig. 8), consists in driving piles into the ground at intervals, and between these, also driven into the ground, are timbers measuring 3 in. by 9 in., which form a wall to keep the soft earth up under the building. In this way the earth is prevented from spreading out and so causing the building to settle unevenly.

Another kind of foundation, known as plank foundation (fig. 9), consists of elm planks, about 9 in. by 3 in. laid across the trench and spiked together; on the top of these are laid similar planks but at right angles to the last, and upon the platform thus formed the wall is built. This method is used in soft ground.

Plank foundations.

Caissons are usually employed by engineers for the construction of the foundations of bridge piers, but instances of their use in foundations for buildings are to be found in the American Surety and the Manhattan Life Insurance buildings, New York City. The latter building is 242 ft. high to the parapet, and the dome and tower rise 108 ft. higher. The building is carried

Caissons.

FIG. 9.

on 16 solid masonry piers, taken down 54 ft. below the street level to solid rock, and these piers support the 34 cast iron columns upon which the building is erected. The piers to each building were constructed by the pneumatic caisson process (see CAISSON).

A good plan for foundations when the ground is loose and sandy is to build upon wells of brickwork, a method which has been successfully practised in Madras. The wells are made circular, about 3 ft. in diameter and one brick thick. The first course is laid and cemented together on the surface of the ground when it is dry, and the earth is excavated inside and round about it to allow it to sink. Then another is laid over it and again sunk. The well is thus built downwards. The brickwork is sunk bodily to a depth of 10 ft. or more, according

Well foundations.

to building to be erected upon it, and the interior is filled up with rubble work. All the public buildings at Madras were erected upon foundations of this kind. Well foundations were employed under the city hall, Kansas City, and the Stock Exchange, Chicago.

Coffer dams are wooden structures used to keep back the water whilst putting in foundations on the waterside, and are constructed with two rows of timbers, 12 in. square as piles spaced about 6 ft. apart, and filled in between with a double row of 2 in. or 3 in. boards, the space between the rows being packed with clay puddle (fig. 10). The general rule for the thickness of a coffer dam is to make it equal to the depth of water. An interesting

Coffer dams.

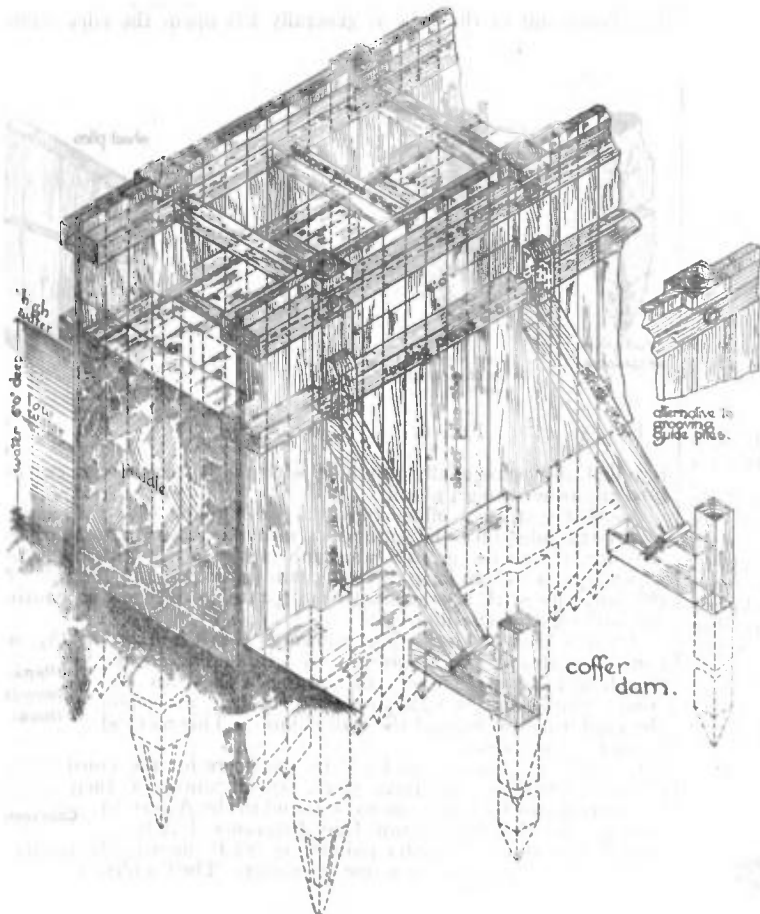

FIG. 10.

example of a coffer dam is that at the Keyham dock extension, where piles varied in length from 65 ft. to 85 ft. They were driven in a double row 5 ft. apart, and over 13,000 were used.

Dock foundations are constructed after the fashion of a large concrete tank, and are adapted to large sites where a difficulty arises as to the ingress of water. They are considered the best method of constructing a building on soft ground and of keeping a building dry (fig. 11). This type of foundation was used at the new colonial office, Whitehall, London, and the new admiralty buildings at St James's Park, London. A few buildings treated after the style of a dock, but in some instances without the enclosing walls, are the following:

Dock foundations.

FIG. 11.

At the admiralty buildings already mentioned a concrete retaining wall completely surrounds the exterior below the ground, and is joined up to the underpinning work; the whole site being covered with concrete 6 ft. thick, a huge tank is formed of an average inside clear depth of 20 ft. in which the basements are built. The new "Old Bailey" buildings in Newgate Street, London, are constructed on a concrete table 5 ft. thick, as also are the Army and Navy Auxiliary Stores, Victoria Street. At Kennet's Wharf, near Southwark Bridge, a concrete table, 8 ft. thick, was spread all over the

site, with an extra thickness under the walls. Foundations formed similarly to dock foundations, but in addition having steel joists and rods inserted in the thickness of the concrete table, to tie the whole together, are known as *gridiron* foundations.

In the Hennebique concrete system, all beams, &c., are formed with small rods and then surrounded with concrete; it is designed for floors and for spreading the weight of a building over an extended foundation on soft ground.

Where a heavy wall is to be built against an old one and there is not sufficient room for the foundations, the plan is adopted of building pier foundations at some distance from the proposed new wall. On the top of these piers rest steel cantilevers over steel pin rockers upon cast iron bedplates; the cantilevers are secured at one end to a column, while the other ends go through the full thickness of the new wall. Upon these last ends is placed a steel girder upon which the wall is built. This construction (fig. 12) has been used in America, and in the Ritz Hotel, Piccadilly, London.

Cantilever foundations.

Another form of cantilever foundations was employed in the case of some premises at Carr's Lane, Birmingham, partly built over the Great Western railway tunnel (fig. 13). In this instance large piers were built below the ground at the side of the tunnel. From the tops of these piers large steel cantilevers were erected projecting over the crown of the tunnel, and on these steel girders were fixed and the building constructed upon them.

In modern Tunis, a section of which city is built on marshy ground, the subsoil is an oozy sediment, largely deposited by the sewage water from the ancient or Arab quarter of the city, which is situated on an adjacent hill. This semi-fluid mud has a depth of about 33 ft. To prepare the soil for supporting an ordinary house, pits from 8 ft. to 10 ft. square are excavated to a depth of about 10 ft., to the level of the ground water. A mixture is made of the excavated soil and powdered fat lime, procured from clinkers and unburnt stone from the lime-kilns, which soon crumbles to fine dust when exposed to the air. The mixture is thrown into pits in layers about 12 in. thick and rammed down for a very long time by specially trained labourers. A gang of 15 or 20 men will work at least 10 or 12 days ramming for the foundations of a moderate-sized house. An extremely hard bed is thus obtained, reaching to within 18 in. of the surface of the ground, and on this artificial bed the foundations of the building are laid. Although this method of construction is crude, it is stated that the practical results are superior to those obtained by using piles, concrete or other recognized methods, and in all cases the cost is much less, for labour is cheap.

Foundations in Tunis.

A novel and interesting foundation was designed for a signal station at Cape Henlopen, Delaware. This is built on top of the highest sandhill at Cape Henlopen, so that the observer may have an unobstructed view; it rises about 80 ft. above the level of the sea and is exposed to all winds and weather, while it is absolutely required that it shall stand firmly planted in such a way that even a hurricane shall not shake it or

Building on sand.

make it tremble, since that would affect the sight of the telescope in the observatory. The usual mode of securing such a building is by means of a foundation of screw piles or of heavy timbers sunk into the sand; this method, however, has the disadvantage that if

FIG. 12.

the wind shifts the sand away from around the foundation, it becomes undermined and its effect is destroyed. To avoid such an accident, recourse was had to the following design, which was considered to be cheap and at the same time to provide an effective anchorage. The building is entirely of wood; it has a cellar, above which are two rooms one above the other, and the whole is

surmounted by the observatory proper. First, the ground sill is a square of 20 ft., made of yellow pine sticks mortised together and pinned with stout trunnels. The sill of the observatory is made likewise of heavy timbers, 12 ft. long. The two sills are joined together by four stout yellow pine corner posts, which in turn are mortised into both sills. The posts are 26 ft. in length. Five feet above the lower sill is the sill which supports the floor of the first room. Ten feet above this is the sill which supports the upper room. Both these sills again are mortised into the corner posts. The structure is sheathed outside with German siding, and inside with rough boards covered with felt, and again by tongued and grooved yellow pine boards. The observatory proper, octagonal in shape, is securely mortised into the top sill and covered with a

FIG. 13.—Cantilever Foundation over Railway Tunnel.

corrugated iron roof conical in shape. The cellar is floored with 3 in. wood, and boarded all round on the inside of the posts. A pit was first dug in the sand about 6 ft. deep and fully 20 ft. wide on the bottom. The cellar sill was laid on this bottom, and the structure built upon it; thus the whole depth of cellar is sunk below the top of the hill or the level of the sand. The cellar was then filled up with sand and packed solid all round, consequently the building is anchored in its place by the load in the cellar, about 100 tons in weight.

The subject of foundations, being naturally of the first importance, is one that calls for most careful study. It is not of so much importance that the ground be hard or even rocky as that it be compact and of similar consistency throughout. It is not always that a site answers to this description, and the problem of what will be the best form of foundation to use in placing a building, more especially if that building be of large dimensions and consequently great weight, on a site of soft yielding soil, is one that is often most difficult of solution. The foregoing article indicates in a brief manner some of the obstacles the architect or engineer is required to surmount before his work can even be started on its way to completion.

AUTHORITIES.—The principal books for reference on this subject are: *A Practical Treatise on Foundations*, by W. M. Patton, C. E.; *Building Construction and Superintendence*, part i., by F. E. Kidder; *Notes on Building Construction*, vols. i. ii. and iii.; *Aide Memoir*, vol. ii., by Colonel Seddon, R.E.; *Advanced Building Construction*, by C. F. Mitchell; *Modern House Construction*, by G. L. Sutcliffe; *Building Construction*, by Professor Henry Adams; *Practical Building Construction*, by J. P. Allen. (J. Br.)

FOUNDING (from Lat. *fundere*, to pour), the process of casting in metal, of making a reproduction of a given object by running molten metal into a mould taken in sand, loam or plaster from that object. To enable the founder to prepare a mould for the casting, he must receive a pattern similar to the casting required. Some few exceptions occur, to be noted presently, but the above statement is true of perhaps 98% of all castings produced. The construction of such patterns gives employment to a large number of highly skilled men, who can only acquire the necessary knowledge through an apprenticeship lasting from five to seven years. A knowledge of two trades at least is involved in the work of pattern construction—that of the craft itself and that of the moulder and founder. Patterns have to be constructed strongly. They are generally of wood, and they thus require skill in the use of woodworking tools and the making of timber joints, together with a knowledge of the behaviour of timber, &c. Some few patterns are made in iron, brass or white metal alloys. They have to be embedded in a matrix of sand by the founder, and being enclosed, they have to be withdrawn without inflicting any damage in the way of fracture in the sand. Since cast work involves shapes that are often very intricate, including projections and hollow spaces of all forms, it is obvious that the withdrawal of the patterns without entailing tearing up and fracture of the sand must involve many difficult problems that have to be as fully understood by the pattern-maker as by the moulder. It is from this point of view that the work of the pattern-maker should be approached in the first place. No closed mould can possibly be made without one or more joints, for if a pattern is wholly enclosed in a matrix of sand it cannot be withdrawn except by making a parting in the sand, and it is not difficult to conceive that the parting in the pattern might advantageously be made to coincide, either exactly or approximately, with that of the mould. Nor must obstacles exist to the free withdrawal of patterns. They must therefore not be wider or larger in the lower than in the upper parts; actually they are made a trifle smaller or "tapered." Nor may they have any lateral extensions into the lower sand, unless these can be made to withdraw separately from the main portion of the pattern. Finally, there are many internal spaces which cannot be formed by a pattern directly in the sand, but provision for which must be made by some means extraneous to the pattern, as by cores.

A single example must illustrate the main principles which have just been stated. The object selected is a bracket which involves questions of joints, of cores, of pattern construction and of moulding. The casting, the pattern, and its mould are illustrated. Fig. 1 illustrates in plan the casting of a double bracket, the end elevation of which is seen in fig. 2; the pattern of which presents obvious

FIG. 1.

FIG. 2.

difficulties in the way of withdrawal from a mould, supposing it were made just like its casting. But if it be made as in fig. 3, with the open spaces A, B, in fig. 2, occupied with core prints, and the pieces A, A in fig. 3 left loosely skewered on, everything will "deliver" freely. Moreover the pattern might be made solidly as shown in fig. 3, or else jointed and dowelled in the plane a-a, as in fig. 4, or along the upper faces of the prints b-b, fig. 3. The

timber shadings in figs. 3 and 4 illustrate points in the most suitable arrangement of material. The prints are "boxed up." Fig. 4 shows a certain stage of the moulding, in which one half of the pattern has been "rammed" in sand, and turned over in the "bottom box," and the upper half is ready to be rammed in the "top box," with "runner pin" or "git stick" A, set in place. The lower loose piece has had its skewer removed during the ramming. Fig. 5 illustrates the mould completed and ready for pouring. The boxes have been parted, the pattern has been withdrawn, cores inserted in the impressions left by the prints, vents taken from the central body of cinders, the pouring basin made and the boxes cotted together.

FIG. 3.

Every single detail now briefly noted in connexion with this bracket is applied and modified in an almost infinite number of ways to suit the ever varying character of foundry work. Yet this process does not touch some of the great subdivisions of moulding and casting. There is a large volume of large and heavy work for which complete patterns and core boxes are never made, because of the great expense that would be involved in the pattern construction. There are also some cases in which the methods adopted would not permit of the use of patterns, as in that group of work in which the sand or loam is "swept" to the form required for the moulds and cores by means of striking boards, loam boards, core boards or strickles. In these classes of moulding the loose green sands and core sands are not much used; instead, loam—a wet and plastic sand mixture—is employed, supported against bricks (loam moulds) or against core bars and plates, and hay ropes (loam cores). All heavy marine engine cylinders are thus made by sweeping, and all massive cores for engine cylinders and large pipes, besides much large circular and cylindrical work, as foundation cylinders, soap pans, lead pans, mortar pans, large propeller blades, &c. In these cases the edge of the striking board is a counterpart of the profile of the work swept up. Joints also have to be made in such moulds, not of course in order to provide for the removal of a pattern, but for the exposure

FIG. 4.

of the separate parts in course of construction, and for closing them up, or putting them together in their due relations. These joints also are swept by the boards, generally cut to produce suitable "checks," or "registers" to ensure that they accurately fit together. Fig. 6, showing a portion of a swept-up mould, illustrates the general arrangement. A plate, A, carries a quantity of bricks, B, which are embedded in loam, and break joint. To a striking bar, C, supported in a step, a striking board or sweeping board, D, is bolted, and is swept round against plastic loam, which is afterwards dried. The check on the board at A corresponds with a similar check on the board which strikes the interior of the pan, and by which top and bottom portions of the mould are registered together. This is indicated in dotted outline. Its mould also is swept on bricks, and

turned over into place, and the metal is poured into the space *b, b*, between the two moulds. There is also a large group of swept-up work which is not symmetrical about a centre of rotation. Then the movements of the sweeping boards are controlled by the edges of "core plates," or of "core irons" (fig. 7). Bend pipes, and the

FIG. 5.

volute casings of centrifugal pumps and pipes, afford examples of this kind. In fig. 7, A is the core iron, held down by weights, and B the "strickle," sweeping up the half bend C, two such halves pasted together completing the core.

FIG. 6.

Core-making is a special department of foundry work, often involving as much detail as the construction and moulding of patterns. Two perfectly plain boxes are shown in figs. 8 and 9, in both of which provision exists for removing the box parts from the core after the latter has been rammed. Core boxes are jointed and tapered, and often have loose pieces within them, and also prints, into the impressions of which other cores are inserted.

FIG. 7.

Machine-moulding.—There is a development of modern methods of founding which is effecting radical changes in some departments of foundry practice, namely, moulding by machines. The advantages of this method are manifold, and its limitations

are being lessened continually. There are two broad departments between which machine-moulding is divided. One, of less importance, is that of toothed wheels; the other is that of general work, except of a very massive character.

Gear-wheel moulding machines are essentially a special adaptation of the mechanism of the dividing engine, by means of which, instead of using a complete pattern of a toothed wheel, two or three pattern teeth are used, and the machine takes charge of the correct pitching or division of the teeth moulded therefrom, leaving to the moulder the

FIG. 8.

FIG. 9.

work only of turning the handle of the division plate, and ramming the sand around the pattern teeth. The result is accurate pitching, and the use of two or three teeth instead of a full pattern, together with any core boxes and striking boards that are necessary for the arms.

The other department of machine moulding includes nearly every conceivable class of work of small and medium dimensions. There are some dozens of distinct types of machines in use, for no one type is suitable for all classes of moulds, while some are designed specially for one or two kinds only.

The fundamental principles of operation are briefly these: The pattern parts constitute, by their method of attachment to a plate or table A (fig. 10), an integral portion of the machine, so that they must partake of certain movements which are imparted to it.

FIG. 10.

Often patterns mounted, as in fig. 10, are moulded by hand, without any aid from a machine, by methods of "plate-moulding." The delivery of the pattern from the sand is invariably accomplished by a perpendicular movement of a portion of the machine (fig. 11), withdrawing either the pattern from the mould or the mould from the pattern. The important point is that the perpendicular movement, being under the coercion of the vertical guides provided in the hand machines, or the hydraulic

ram in fig. 11, is free from the unsteadiness which is incidental to withdrawal by the hands of the moulder; and if the machine performed nothing more than this it would justify its existence. Little or no taper is required in the pattern, and the moulds are more nearly uniform in dimensions than hand-made moulds. But there are other advantages. In machine-moulding the joint

faces for parting moulds are produced by the faces of the plates on which the pattern is mounted (figs. 10 and 11), instead of by the hands and trowel of the moulder. When the joint face is of irregular outline, as it often is, this item alone saves a good deal of time, which again is multiplied by the number of moulds repeated, often amounting to thousands. Further, provision is generally made on machine plates for the ingates and runners (fig. 10) through which the metal enters the mould, the preparation of which in hand work occupies a considerable amount of time. Another great advantage applies especially to the case of deep moulds. These give much trouble in hand-moulding in consequence of the liability of the sand to become torn up during the withdrawal of the pattern. But in machine-moulding such patterns are encircled by a plate, termed a "stripping plate," which is pierced to allow the patterns to pass through, and which, being maintained firmly on the sand during the lifting of the pattern, prevents it from becoming torn up. This is not merely a matter of convenience, but is a necessity in numerous instances. The most familiar example is that of the teeth of gear wheels, in which even a very slight amount of taper interferes with accurate engagement, and this is representative of many other portions of mechanism. These stripping

FIG. 11.

plates are of metal, but in order to save the cost of filing them in iron or steel, many are cheaply made by casting a white metal alloy round the actual pattern in the first place, the white metal being enclosed and retained in a plain iron frame which forms the body of the plate. Lastly, many machines, but not the majority, include provision for mechanically ramming the sand around the pattern by power instead of by hand. This is really the least valuable feature of a moulding machine, because it is not applicable to any but rather shallow moulds. It is commonly used for these, but the consistency and homogeneity of a mass of sand round a pattern having deep perpendicular sides can only be ensured by careful hand ramming.

The highest economies of machine-moulding are obtained when (1) several small patterns are mounted and moulded at once on a single plate (fig. 10); (2) when top and bottom parts of a mould are produced on different machines, carrying each its moiety of the pattern; (3) when the machine and pattern details are simplified so much that the labour of trained moulders is displaced by that of unskilled attendants who are taught in a month or two the few simple operations required. That is the direction in which repetitive casting is now rapidly tending.

In fig. 11 A is the plate, which in its essentials corresponds with the plate A in fig. 10, but which in the machine is made to swivel so as to bring each half of the pattern B, B in turn uppermost for ramming in the box parts C, C. The ramming is done by hand, the final squeeze being imparted against the presser D by the action of the hydraulic ram E pushing the plate, mould and box up against D. The plate being then lowered, and turned over, the further descent of the ram withdraws the bottom box from the pattern, which is the stage seen in the illustration. Then the half mould is run away on the carriage F, provided with wheels to run on rails.

Though casting in iron, steel, the bronzes, aluminium, &c., is

carried on by different men in distinct shops, yet the foregoing principles and methods apply to all alike. Work is done in green, *i.e.* moist sand, in dry sand (the moulds being dried before being used), and in plastic loam (which is subsequently dried). Hand and machine moulding are practised in each, the last-named excepted. The differences in working are those due to the various characteristics of the different metals and alloys, which involve differences in the sand mixtures used, in the dimensions of the pouring channels, of the temperature at which the metal or alloy must be poured, of the fluxing and cleansing of the metal, and other details of a practical character. Hence the practice which is suitable for one department must be modified in others. Many castings in steel would inevitably fracture if poured into moulds prepared for iron, many iron castings would fracture if poured into moulds suitable for brass, and neither brass nor steel would fill a mould having ingates proportioned suitably for iron.

A special kind of casting is that into "chill moulds," adopted in a considerable number of iron castings, such as the railway wheels in the United States, ordinary tramway wheels, the rolls of iron and steel rolling mills, the bores of cast wheel hubs, &c. The chill ranges in depth from $\frac{1}{2}$ in. to 1 in., and is produced by pouring a special mixture of mottled, or strong, iron against a cold iron surface, the parts of the casting which are not required to be chilled being surrounded by an ordinary mould of sand. The purpose of chill-casting is to produce a surface hardness in the metal.

The shrinkage of metal is a fact which has to be taken account of by the pattern-maker and moulder. A pattern and mould are made larger than the size of the casting required by the exact amount that the metal will shrink in cooling from the molten to the cold state. This amount varies from $\frac{1}{8}$ in. in 15 in., in thin iron castings, to $\frac{1}{4}$ in. in 12 in. in heavy ones. It ranges from $\frac{1}{16}$ in. to $\frac{1}{8}$ in. per foot in steel, brass and aluminium. Its variable amount has to be borne in mind in making light and heavy castings, and castings with or without cores, for massive cores retard shrinkage. It is also a fruitful cause of fracture in badly proportioned castings, particularly of those in steel. Brass is less liable to suffer in this respect than iron, and iron much less than steel. (J. G. H.)

FOUNDLING HOSPITALS, originally institutions for the reception of "foundlings," *i.e.* children who have been abandoned or exposed, and left for the public to find and save. The early history of such institutions is connected with the practice of infanticide, and in western Europe where social disorder was rife and famine of frequent occurrence, exposure and extensive sales of children were the necessary consequences. Against these evils, which were noticed by several councils, the church provided a rough system of relief, children being deposited (*jactati*) in marble shells at the church doors, and tended first by the *matricularii* or male nurses, and then by the *nutricarii* or foster-parents.¹ But it was in the 7th and 8th centuries that definite institutions for foundlings were established in such towns as Trèves, Milan and Montpellier. In the 15th century Garcias, archbishop of Valencia, was a conspicuous figure in this charitable work; but his fame is entirely eclipsed by that of St Vincent de Paul, who in the reign of Louis XIII., with the help of the countess of Joigny, Mme le Gras and other religious ladies, rescued the foundlings of Paris from the horrors of a primitive institution named La Couche (rue St Landry), and ultimately obtained from Louis XIV. the use of the Bicêtre for their accommodation. Letters patent were granted to the Paris hospital in 1670. The Hôtel-Dieu of Lyons was the next in importance. No provision, however, was made outside the great towns; the houses in the cities were overcrowded and administered with laxity; and in 1784 Necker prophesied that the state would yet be seriously embarrassed by this increasing evil.² From 1452 to 1789 the law had imposed on the *seigneurs de haute justice* the duty of succouring children found deserted on their territories. The first constitutions of the Revolution undertook as a state debt the support of every foundling. For a time premiums were given to the mothers of illegitimate children, the "enfants de la patrie." By the law of 12 Brumaire, An II. "Toute recherche de la paternité est interdite," while by art. 341 of the Code Napoléon, "la recherche de la maternité est admise."

France.—The laws of France relating to this part of what is called L'Assistance Publique are the decree of January 1811, the instruction of February 1823, the decree of the 5th of March 1852, the law of

the 5th of May 1869, the law of the 24th of July 1889 and the law of the 27th of June 1904. These laws carry out the general principles of the law of 7 Frimaire An V., which completely decentralized the system of national poor relief established by the Revolution. The *enfants assistés* include, besides (1) orphans and (2) foundlings proper, (3) children abandoned by their parents, (4) ill-treated, neglected or morally abandoned children whose parents have been deprived of their parental rights by the decision of a court of justice, (5) children, under sixteen years of age, of parents condemned for certain crimes, whose parental rights have been delegated by a tribunal to the state. Children classified under 1-5 are termed *pupilles de l'assistance*, "wards of public charity," and are distinguished by the law of 1904 from children under the protection of the state, classified as: (1) *enfants secourus*, *i.e.* children whose parents or relatives are unable, through poverty, to support them; (2) *enfants en dépôt*, *i.e.* children of persons undergoing a judicial sentence and children temporarily taken in while their parents are in hospital, and (3) *enfants en garde*, *i.e.* children who have either committed or been the victim of some felony or crime and are placed under state care by judicial authority. The asylum which receives all these children is a departmental (*établissement dépositaire*), and not a communal institution. The *établissement dépositaire* is usually the ward of an hospice, in which—with the exception of children *en dépôt*—the stay is of the shortest, for by the law of 1904, continuing the principle laid down in 1811, all children under thirteen years of age under the guardianship of the state, except the mentally or physically infirm, must be boarded out in country districts. They are generally apprenticed to some one engaged in the agricultural industry, and until majority they remain under the guardianship of the administrative commissioners of the department. The state pays the whole of the cost of inspection and supervision. The expenses of administration, the "home" expenses, for the nurse (*nourrice sédentaire*) or the wet nurse (*nourrice au sein*), the *prime de survie* (premium on survival), washing, clothes, and the "out-door" expenses, which include (1) temporary assistance to unmarried mothers in order to prevent desertion; (2) allowances to the foster-parents (*nourriciers*) in the country for board, school-money, &c.; (3) clothing; (4) travelling-money for nurses and children; (5) printing, &c.; (6) expenses in time of sickness and for burials and apprentice fees—are borne in the proportion of two-fifths by the state, two-fifths by the department, and the remaining fifth by the communes. The following figures show the number of children (exclusive of *enfants secourus*) relieved at various periods:

Year.	Number relieved.
1890	95,701
1895	121,201
1900	138,308
1905	149,803

The *droit de recherche* is conceded to the parent on payment of a small fee. The decree of 1811 contemplated the repayment of all expenses by a parent reclaiming a child. The same decree directed a *tour* or revolving box (*Drehcyliner* in Germany) to be kept at each hospital. These have been discontinued. The "Assistance Publique" of Paris is managed by a "directeur" appointed by the minister of the interior, and associated with a representative *conseil de surveillance*. The Paris Hospice des Enfants-Assistés contains about 700 beds. There are also in Paris numerous private charities for the adoption of poor children and orphans. It is impossible here to give even a sketch of the long and able controversies which have occurred in France on the principles of management of foundling hospitals, the advantages of *tours* and the system of admission *à bureau ouvert*, the transfer of orphans from one department to another, the hygiene and service of hospitals and the inspection of nurses, the education and reclamation of the children and the rights of the state in their future. Reference may be made to the works noticed at the end of this article.

Belgium.—In this country the arrangements for the relief of foundlings and the appropriation of public funds for that purpose very much resemble those in France, and can hardly be usefully described apart from the general questions of local government and poor law administration. The Commissions des Hospices Civiles, however, are purely communal bodies, although they receive pecuniary assistance from both the departments and the state. A decree of 1811 directed that there should be an asylum and a wheel for receiving foundlings in every *arrondissement*. The last "wheel," that of Antwerp, was closed in 1860. (See *Des Institutions de bienfaisance et de prévoyance en Belgique*, 1850 à 1860, par M. P. Lentz.)

Italy is very rich in foundling hospitals, pure and simple, orphans and other destitute children being separately provided for. (See *Della carità preventiva in Italia*, by Signor Fano.) In Rome one branch of the Santo Spirito in Sassia (so called from the Schola Saxonum built in 728 by King Ina in the Borgo) has, since the time of Pope Sixtus IV., been devoted to foundlings. The average annual number of foundlings supported is about 3000. (See *The Charitable Institutions of Rome*, by Cardinal Morichini.) In Venice the Casa degli Esposti or foundling hospital, founded in 1346, and receiving 450 children annually, is under provincial administration. The splendid legacy of the last doge, Ludovico Manin, is applied to the

¹ See *Capitularia regum Francorum*, ii. 474.

² *De l'administration des finances*, iii. 136; see also the article "Enfant exposé" in Diderot's *Encyclopédie*, 1755, and Chamousset's *Mémoire politique sur les enfants*, 1757.

support of about 160 children by the "Congregazione di Carita" acting through 30 parish boards (*deputazione fraterne*).

Austria.—In Austria foundling hospitals occupied a very prominent place in the general instructions which, by rescript dated 16th of April 1781, the emperor Joseph II. issued to the charitable endowment commission. In 1818 foundling asylums and lying-in houses were declared to be state institutions. They were accordingly supported by the state treasury until the fundamental law of 20th October 1860 handed them over to the provincial committees. They are now local institutions, depending on provincial funds, and are quite separate from the ordinary parochial poor institute. Admission is gratuitous when the child is actually found on the street, or is sent by a criminal court, or where the mother undertakes to serve for four months as nurse or midwife in an asylum, or produces a certificate from the parish priest and "poor-father" (the parish inspector of the poor-law administration) that she has no money. In other cases payments of 30 to 100 florins are made. When two months old the child is sent for six or ten years to the houses in the neighbourhood of respectable married persons, who have certificates from the police or the poor-law authorities, and who are inspected by the latter and by a special medical officer. These persons receive a constantly diminishing allowance, and the arrangement may be determined by 14 days' notice on either side. The foster-parents may retain the child in their service or employment till the age of twenty-two, but the true parents may at any time reclaim the foundling on reimbursing the asylum and compensating the foster-parents.

Russia.—Under the old Russian system of Peter I. foundlings were received at the church windows by a staff of women paid by the state. But since the reign of Catherine II. the foundling hospitals have been in the hands of the provincial officer of public charity (*prykaz obshestvennago pryzyrenya*). The great central institutions (*Vospitatelnoi Dom*), at Moscow and St Petersburg (with a branch at Gatchina), were founded by Catherine. When a child is brought the baptismal name is asked, and a receipt is given, by which the child may be reclaimed up to the age of ten. The mother may nurse her child. After the usual period of six years in the country very great care is taken with the education, especially of the more promising children. The hospital is a valuable source of recruits for the public service. Malthus (*The Principles of Population*, vol. i. p. 434) has made a violent attack on these Russian charities. He argues that they discourage marriage and therefore population, and that the best management is unable to prevent a high mortality. He adds: "An occasional child murder from false shame is saved at a very high price if it can be done only by the sacrifice of some of the best and most useful feelings of the human heart in a great part of the nation." It does not appear, however, that the rate of illegitimacy in Russia is comparatively high; it is so in the two great cities. The rights of parents over the children were very much restricted, and those of the government much extended by a ukase issued by the emperor Nicholas in 1837. The most eminent Russian writer on this subject is M. Gourou. See his *Recherches sur les enfants trouvés*, and *Essai sur l'histoire des enfants trouvés* (Paris, 1829).

In *America*, foundling hospitals, which are chiefly private charities, exist in most of the large cities.

Great Britain.—The Foundling Hospital of London was incorporated by royal charter in 1739 "for the maintenance and education of exposed and deserted young children." The petition of Captain Thomas Coram, who is entitled to the whole credit of the foundation,¹ states as its objects "to prevent the frequent murders of poor miserable children at their birth, and to suppress the inhuman custom of exposing new-born infants to perish in the streets." At first no questions were asked about child or parent, but a distinguishing mark was put on each child by the parent. These were often marked coins, trinkets, pieces of cotton or ribbon, verses written on scraps of paper. The clothes, if any, were carefully recorded. One entry is, "Paper on the breast, clout on the head." The applications became too numerous, and a system of balloting with red, white and black balls was adopted. In 1756 the House of Commons came to a resolution that all children offered should be received, that local receiving places should be appointed all over the country, and that the funds should be publicly guaranteed. A basket was accordingly hung outside the hospital; the maximum age for admission was raised from two to twelve months, and a flood of children poured in from the country workhouses. In less than four years 14,934 children were presented, and a vile trade grew up among vagrants of undertaking to carry children from the country to the hospital,—an undertaking which, like the French *meneurs*, they often did not perform or performed with great cruelty. Of these 15,000 only 4400 lived to be apprenticed out. The total expense was about £500,000. This alarmed the House of Commons. After throwing out a bill which proposed to raise the necessary funds by fees from a general system of parochial registration, they came to the conclusion that the indiscriminate admission should be discontinued. The hospital, being thus thrown on its own resources, adopted a pernicious system of receiving children with considerable

sums (e.g. £100), which sometimes led to the children being reclaimed by the parent. This was finally stopped in 1801; and it is now a fundamental rule that no money is received. The committee of inquiry must now be satisfied of the previous good character and present necessity of the mother, and that the father of the child has deserted it and the mother, and that the reception of the child will probably replace the mother in the course of virtue and in the way of an honest livelihood. All the children at the Foundling hospital are those of unmarried women, and they are all first children of their mothers. The principle is in fact that laid down by Fielding in *Tom Jones*—"Too true I am afraid it is that many women have become abandoned and have sunk to the last degree of vice by being unable to retrieve the first slip." At present the hospital supports about 500 children up to the age of fifteen. The average annual number of applications is over 200, and of admissions between 40 and 50. The children used to be named after the patrons and governors, but the treasurer now prepares a list. Children are seldom taken after they are twelve months old. On reception they are sent down to the country, where they stay until they are about four or five years old. At sixteen the girls are generally apprenticed as servants for four years, and the boys at the age of fourteen as mechanics for seven years. There is a small benevolent fund for adults. The musical service, which was originally sung by the blind children only, was made fashionable by the generosity of Handel, who frequently had the "Messiah" performed there, and who bequeathed to the hospital a MS. copy (full score) of his greatest oratorio. The altar-piece is West's picture of Christ presenting a little Child. In 1774 Dr Burney and Signor Giardini made an unsuccessful attempt to form in connexion with the hospital a public music school, in imitation of the Conservatorium of the Continent. In 1847, however, a successful "Juvenile Band" was started. The educational effects of music have been found excellent, and the hospital supplies many musicians to the best army and navy bands. The early connexion between the hospital and the eminent painters of the reign of George II. is one of extreme interest. The exhibitions of pictures at the Foundling, which were organized by the Dilettanti Club, undoubtedly led to the formation of the Royal Academy in 1768. Hogarth painted a portrait of Captain Coram for the hospital, which also contains his March to Finchley, and Roubillac's bust of Handel. (See *History and Objects of the Foundling Hospital, with Memoir of its Founder*, by J. Brownlow.)

In 1704 the Foundling hospital of Dublin was opened. No inquiry was made about the parents, and no money received. From 1500 to 2000 children were received annually. A large income was derived from a duty on coal and the produce of car licences. In 1822 an admission fee of £5 was charged on the parish from which the child came. This reduced the annual arrivals to about 500. In 1829 the select committee on the Irish miscellaneous estimates recommended that no further assistance should be given. The hospital had not preserved life or educated the foundlings. The mortality was nearly 4 in 5, and the total cost £10,000 a year. Accordingly in 1835 Lord Glenelg (then Irish Secretary) closed the institution.

Scotland never seems to have possessed a foundling hospital. In 1759 John Watson left funds which were to be applied to the pious and charitable purpose "of preventing child murder" by the establishment of a hospital for receiving pregnant women and taking care of their children as foundlings. But by an act of parliament in 1822, which sets forth "doubts as to the propriety" of the original purpose, the money was given to trustees to erect a hospital for the maintenance and education of destitute children.

FOUNTAIN (Late Lat. *fontana*, from *fons*, a spring), a term applied in a restricted sense to such outlets of water as, whether fed by natural or artificial means, have contrivances of human art at a point where the water emerges. A very early existing example is preserved in the carved Babylonian basin (about 3000 B.C.) found at Tello, the ancient Lagash, and Layard mentions an Assyrian fountain, found by him in a gorge of the river Gomel,

¹ Addison had suggested such a charity (*Guardian*, No. 3).

which consists of a series of basins cut in the solid rock and descending in steps to the stream. The water had been originally led from one to the other by small conduits, the lowest of which was ornamented by two rampant lions in relief. The term is applied equally to the simpler arrangements for letting water gush into an ornamental basin or to the more elaborate ones by which water is mechanically forced into high jets; and a "fountain" may be either the ornamental receptacle or the jet of water itself. In modern times the examples of ornamental or useful fountains are legion, and it will suffice here to mention some of the more important facts of historical interest.

Among the Greeks fountains were very common in the cities. Springs being very plentiful in Greece, little engineering skill was required to convey the water from place to place. Receptacles of sufficient size were made for it at the springs; and to maintain its purity, structures were raised enclosing and covering the receptacle. In Greece they were dedicated to gods and goddesses, nymphs and heroes, and were frequently placed in or near temples. That of Pirene at Corinth (mentioned also by Herodotus) was formed of white stone, and contained a number of cells from which the pleasant water flowed into an open basin. Legend connects it with the nymph Pirene, who shed such copious tears, when bewailing her son who had been slain by Diana, that she was changed into a fountain. The city of Corinth possessed many fountains. In one near the statues of Diana and Bellerophon the water flowed through the hoofs of the horse Pegasus. The fountain of Glauce, enclosed in the Odeum, was dedicated to Glauce, because she was said to have thrown herself into it believing that its waters could counteract the poisons of Medea. Another Corinthian fountain had a bronze statue of Poseidon standing on a dolphin from which the water flowed. The fountain constructed by Theagenes at Megara was remarkable for its size and decorations, and for the number of its columns. One at Lerna was surrounded with pillars, and the structure contained a number of seats affording a cool summer retreat. Near Pharae was a grove dedicated to Apollo, and in it a fountain of water. Pausanias gives a definite architectural detail when he says that a fountain at Patrae was reached from without by descending steps. Mystical, medicinal, surgical and other qualities, as well as supernatural origin, were ascribed to fountains. One at Cyane in Lycia was said to possess the quality of endowing all persons descending into it with power to see whatever they desired to see; while the legends of fountains and other waters with strange powers to heal are numerous in many lands. The fountain Enneacrunus at Athens was called Callirrhoe before the time the water was drawn from it by the nine pipes from which it took its later name. Two temples were above it, according to Pausanias, one dedicated to Demeter and Persephone, and the other to Triptolemus. The fountain in the temple of Erechtheus at Athens was supplied by a spring of salt water, and a similar spring supplied that in the temple of Poseidon Hippios at Mantinea.

The water-supply of Rome and the works auxiliary to it were on a scale to be expected from a people of such great practical power. The remains of the aqueducts which stretched from the city across the Campagna are amongst the most striking monuments of Italy. Vitruvius (book viii.) gives minute particulars concerning the methods to be employed for the discovery, testing and distribution of water, and describes the properties of different waters with great care, proving the importance which was attached to these matters by the Romans. The aqueducts supplied the baths and the public fountains, from which last all the populace, except such as could afford to pay for a separate pipe to their houses, obtained their water. These fountains were therefore of large size and numerous. They were formed at many of the *castella* of the aqueducts. According to Vitruvius, each *castellum* should have three pipes,—one for public fountains, one for baths and the third for private houses. Considerable revenue was drawn from the possessors of private water-pipes. The Roman fountains were generally decorated with figures and heads. Fountains were often also the ornament of Roman villas and country houses; in those so situated the water gener-

ally fell from above into a large marble basin, with at times a second fall into a still lower receptacle. Two adjacent houses in Pompeii had very remarkable fountains. One, says Gell, "is covered with a sort of mosaic consisting of vitrified tesserae of different colours, but in which blue predominates. These are sometimes arranged in not inelegant patterns, and the grand divisions as well as the borders are entirely formed and ornamented with real sea-shells, neither calcined by the heat of the eruption nor changed by the lapse of so many centuries" (*Pompeiana*, i. 196). Another of large size was similarly decorated with marine shells, and is supposed to have borne two sculptured figures, one of which, a bronze, is in the museum at Naples. This fountain projects 5 ft. 7 in. from the wall against which it is placed, and is 7 ft. wide in front, while the height of the structure up to the eaves of the pediment is 7 ft. 7 in. On a central column in the piscina was a statue of Cupid, with a dove, from the mouth of which water issued. Cicero had, at his villa at Formiae, a fountain which was decorated with marine shells.

Fountains were very common in the open spaces and at the crossways in Pompeii. They were supplied by leaden pipes from the reservoirs, and had little ornament except a human or animal head, from the mouth of which it was arranged that the water should issue. Not only did simple running fountains exist, but the remains of *jets d'eau* have been found; and a drawing exists representing a vase with a double jet of water, standing on a pedestal placed in what is supposed to have been the impluvium of a house. There was also a *jet d'eau* at the eastern end of the peristyle of the Fullonica at Pompeii.

As among the Greeks, so with the early Celts, traces of superstitious beliefs and usages with relation to fountains can be traced in monumental and legendary remains. Near the village of Primaleon in Brittany was a very remarkable monument,—one possibly unique, as giving distinct proof of the existence of an ancient cult of fountains. Here is a dolmen composed of a horizontal table supported by two stones only, one at each end. All the space beneath this altar is occupied by a long square basin formed of large flat stones, which receives a fountain of water. At Lochrist is another vestige of the Celtic cult of fountains. Beneath the church, and at the foot of the hill upon which it is built, is a sacred fountain, near which is erected an ancient chapel, which with its ivy-covered walls has a most romantic appearance. A Gothic vault protects this fountain. Miraculous virtues are still attributed to its water, and on certain days the country people still come with offerings to draw it (see La Poix de Fremenville, *Antiquités de la Bretagne*, i. p. 101). In the enchanted forest of Brochelande, so famous from its connexion with Merlin, was the fountain of Baranton, which was said to possess strange characteristics. Whoever drew water from it, and sprinkled the steps therewith, produced a tremendous storm of thunder and hail, accompanied with thick darkness.

Christianity transferred to its own uses the ancient religious feeling concerning fountains. Statues of the Virgin or of saints were erected upon the rude structures that collected the water and preserved its purity. There is some uniformity in the architectural characteristics of these structures during the middle ages. A very common form in rural districts was that in which the fountain was reached by descending steps (*fontaine grotte*). A large basin received the water, sometimes from a spout, but often from the spring itself. This basin was covered by a sort of porch or vault, with at times moulded arches and sculptured figures and escutcheons. On the bank of the Clain at Poitiers is a fountain of this kind, the Fontaine Joubert, which though restored in 1597 was originally a structure of the 14th century. This kind of fountain is frequently decorated with figures of the Virgin or of saints, or with the family arms of its founder; often, too, the water is the only ornament of the structure, which bears a simple inscription. A large number of these fountains are to be found in Brittany and indeed throughout France, and the great antiquity of some of them is proved by the superstitions regarding them which still exist amongst the peasantry. A form more common in populous districts was that of a large open basin, round, square, polygonal, or lobed in

form, with a columnar structure at the centre, from the lower part of which it was arranged that spouts should issue, playing into an open basin, and supplying vessels brought for the purpose in the cleanest and quickest manner. The columns take very various forms, from that of a simple regular geometrical solid, with only grotesque masks at the spouts, to that of an elaborate and ornate Gothic structure, with figures of virgins, saints and warriors, with mouldings, arches, crockets and finials. At Provins there is a fountain said to be of the 12th century, which is in form an hexagonal vase with a large column in the centre, the capital of which is pierced by three mouths, which are furnished with heads of bronze projecting far enough to cast the water into the basin. In the public market-place at Brunswick is a fountain of the 15th century, of which the central structure is made of bronze. Many fountains are still existing in France and Germany which, though their actual present structure may date no earlier than the 15th or 16th century, have been found on the place of, and perhaps may almost be considered as restorations of, pre-existing fountains. Except in Italy few fountains are of earlier date than the 14th century. Two of that date are at the abbey of Fontaine Daniel, near Mayenne, and another, of granite, is at Limoges. Some of these middle-age fountains are simple, open reservoirs enclosed in structures which, however plain, still carry the charm that belongs to the stone-work of those times. There is one of this kind at Cully, Calvados, walled on three sides, and fed from the spring by two circular openings. Its only ornamentation is a small empty niche with mouldings. At Lincoln is a fountain of the time of Henry VIII., in front of the church of St Mary Wickford. At Durham is one of octangular plan, which bears a statue of Neptune.

The decay of architectural taste in the later centuries is shown by the fountain of Limoges. It is in form a rock representing Mount Parnassus, upon which are carved in relief Apollo, the horse Pegasus, Philosophy and the Nine Muses. At the top Apollo, in the 16th-century costume, plays a harp. Rocks, grass and sheep fill up the scene.

Purely ornamental fountains and *jets d'eau* are found in or near many large cities, royal palaces and private seats. The celebrated Fontana di Trevi, at Rome, was erected early in the 18th century under Pope Clement XII., and has all the characteristics of decadence. La Fontana Paolina and those in the piazza of St Peter's are perhaps next in celebrity to that of Trevi, and are certainly in better taste. At Paris the Fontaine des Innocens (the earliest) and those of the Place Royal, of the Champs Elysées and of the Place de la Concorde are the most noticeable. The fountain of the lions and other fountains in the Alhambra palace are, with their surroundings, a very magnificent sight. The largest *jets d'eau* are those at Versailles, at the Sydenham Crystal Palace and at San Ildefonso.

About the earliest drawing of any drinking fountain in England occurs in Moxon's *Tutor to Astronomie and Geographie* (1659); it is "surmounted by a diall, which was made by Mr John Leak, and set upon a composite column at Leadenhall corner, in the majoralty of Sir John Dethick, Knight." The water springs from the top and base of the column, which stands upon a square pedestal and bears four female figures, one at least of which represents the costume of the period.

In the East the public drinking fountains are a very important institution. In Cairo alone there are three hundred. These "sebeels" are not only to be seen in the cities, but are plentiful in the fields and villages.

The Metropolitan Drinking Fountain Association (1859) has done much to provide facilities in London for both man and beast to get water to drink in the streets. And in the United States liberal provision has also been made by private and public enterprise.

FOUNTAINS ABBEY, one of the most celebrated ecclesiastical ruins in England. It lies in the sequestered valley of the river Skell, 3 m. S.W. of the city of Ripon in Yorkshire. The situation is most beautiful. The little Skell descends from the uplands of Pateley Moor to the west a clear swift stream, traversing a valley clothed with woods, conspicuous among which are some

ancient yew trees which may have sheltered the monks who first sought retreat here. Steep rocky hills enclose the vale. Mainly on the north side of the stream, in an open glade, rise the picturesque and extensive ruins, the church with its stately tower, and the numerous remnants of domestic buildings which enable the great abbey to be almost completely reconstructed in the mind. The arrangements are typical of a Cistercian house (see ABBEY). Building began in earnest about 1135, and was continued steadily until the middle of the 13th century, after which the only important erection was Abbot Huby's tower (c. 1500). The demesne of Studley Royal (marquess of Ripon) contains the ruins. It is in part laid out in the formal Dutch style, the work of John Aislable, lord of the manor in the early part of the 18th century. Near the abbey is the picturesque Jacobean mansion of Fountains Hall.

In 1132 the prior and twelve monks of St Mary's abbey, York, being dissatisfied with the easy life they were living, left the monastery and with the assistance of Thurstan, archbishop of York, founded a house in the valley of the Skell, where they adopted the Cistercian rule. While building their monastery the monks are said to have lived at first under an elm and then under seven yew trees called the Seven Sisters. Two years later they were joined by Hugh, dean of St Peter's, York, who brought with him a large sum of money and a valuable collection of books. His example was followed by Serlo, a monk of St Mary's abbey, York, and by Tosti, a canon of York, and others. Henry I. and succeeding sovereigns granted them many privileges. During the reign of Edward I. the monks appear to have again suffered from poverty, partly no doubt owing to the invasion of the Scots, but partly also through their own "misconduct and extravagance." On account of this Edward I. in 1291 appointed John de Berwick custodian of the abbey so that he might pay their debts from the issues of their estates, allowing them enough for their maintenance, and Edward II. in 1319 granted them exemption from taxes. After the Dissolution Henry VIII. sold the manor and site of the monastery to Sir Richard Gresham, and from him after passing through several families it came to the marquess of Ripon.

See *Victoria County History, Yorkshire; Dugdale, Monasticon; Surtees Society, Memorials of the Abbey of St Mary of Fountains*, collected and edited by J. R. Walbran (1863-78).

FOUQUÉ, FERDINAND ANDRÉ (1828-1904), French geologist and petrologist, was born at Mortain, dept. of La Manche, on the 21st of June 1828. At the age of twenty-one he entered the *École Normale* in Paris, and from 1853 to 1858 he held the appointment of keeper of the scientific collections. In 1877 he became professor of natural history at the *Collège de France*, in Paris, and in 1881 he was elected a member of the Academy of Sciences. As a stratigraphical geologist he rendered much assistance on the Geological Survey of France, but in the course of time he gave his special attention to the study of volcanic phenomena and earthquakes, to minerals and rocks; and he was the first to introduce modern petrographical methods into France. His studies of the eruptive rocks of Corsica, Santorin and elsewhere; his researches on the artificial reproduction of eruptive rocks, and his treatise on the optical characters of felspars deserve special mention; but he was perhaps best known for the joint work which he carried on with his friend Michel Lévy. He died on the 7th of March 1904. His chief publications were: *Santorin et ses éruptions*, 1879; (with A. Michel Lévy) *Minéralogie micrographique, Roches éruptives françaises* (2 vols., 1879); and *Synthèse des minéraux et des roches* (1882).

FOUQUÉ, FRIEDRICH HEINRICH KARL DE LA MOTTE, BARON (1777-1843), German writer of the romantic movement, was born on the 12th of February 1777 at Brandenburg. His grandfather had been one of Frederick the Great's generals and his father was a Prussian officer. Although not originally intended for a military career, Friedrich de la Motte Fouqué ultimately gave up his university studies at Halle to join the army, and he took part in the Rhine campaign of 1794. The rest of his life was devoted mainly to literary pursuits. Like so many of the younger romanticists, Fouqué owed his introduction to

literature to A. W. Schlegel, who published his first book, *Dramatische Spiele von Pellegrin* in 1804. His next work, *Romanzen vom Tal Ronceval* (1805), showed more plainly his allegiance to the romantic leaders, and in the *Historie vom edlen Ritter Galmy* (1806) he versified a 16th-century romance of medieval chivalry. *Sigurd der Schlangentöter, ein Heldenpiel* (1808), the first modern German dramatization of the *Nibelungen* saga, attracted attention to him, and influenced considerably subsequent versions of the story, such as Hebbel's *Nibelungen* and Wagner's *Ring des Nibelungen*. These early writings indicate the lines which Fouqué's subsequent literary activity followed; his interests were divided between medieval chivalry on the one hand and northern mythology on the other. In 1813, the year of the rising against Napoleon, he again fought with the Prussian army, and the new patriotism awakened in the German people left its mark upon his writings.

Between 1810 and 1815 Fouqué's popularity was at its height; the many romances and novels, plays and epics, which he turned out with extraordinary rapidity, appealed exactly to the mood of the hour. The earliest of these are the best—*Undine*, which appeared in 1811, being, indeed, one of the most charming of all German *Märchen* and the only work by which Fouqué's memory still lives to-day. A more comprehensive idea of his powers may, however, be obtained from the two romances *Der Zauberring* (1813) and *Die Fahrten Thiodulfs des Isländers* (1815). From 1820 onwards the quality of Fouqué's work rapidly degenerated, partly owing to the fatal ease with which he wrote, partly to his inability to keep pace with the changes in German taste. He remained the belated romanticist, who, as the reading world turned to new interests, clung the more tenaciously to the paraphernalia of romanticism; but in the cold, sober light of the post-romantic age, these appeared merely flimsy and theatrical. The vitalizing imaginative power of his early years deserted him, and the sobriquet of a "Don Quixote of Romanticism" which his enemies applied to him was not unjustified.

Fouqué's first marriage had been unhappy and soon ended in divorce. His second wife, Karoline von Briest (1773-1831) enjoyed some reputation as a novelist in her day. After her death Fouqué married a third time. Some consolation for the ebbing tide of popular favour was afforded him by the munificence of Frederick William IV. of Prussia, who granted him a pension which allowed him to spend his later years in comfort. He died in Berlin on the 23rd of January 1843.

Fouqué's *Ausgewählte Werke*, edited by himself, appeared in 12 vols. (Berlin, 1841); a selection, edited by M. Koch, will be found in Kürschner's *Deutsche Nationalliteratur*, vol. 146, part ii. (Stuttgart, 1893); *Undine, Sintram, &c.*, in innumerable reprints. Bibliography in Goedeke's *Grundriss zur Geschichte der deutschen Dichtung* (2nd ed., vi. pp. 115 ff., Dresden, 1898). Most of Fouqué's works have been translated, and the English versions of *Aslauga's Knight* (by Carlyle), *Sintram and his Companions* and *Undine*, have been frequently republished. For Fouqué's life cp. *Lebensgeschichte des Baron Friedrich de la Motte Fouqué. Aufgezeichnet durch ihn selbst* (Halle, 1840), (only to the year 1813), and also the introduction to Koch's selections in the *Deutsche Nationalliteratur*. (J. G. R.)

FOUQUET (or FOUQUET), **NICOLAS** (1615-1680), viscount of Melun and of Vaux, marquis of Belle-Isle, superintendent of finance in France under Louis XIV., was born at Paris in 1615. He belonged to an influential family of the *noblesse de la robe*, and after some preliminary schooling with the Jesuits, at the age of thirteen was admitted as *avocat* at the parlement of Paris. While still in his teens he held several responsible posts, and in 1636, when just twenty, he was able to buy the post of *maître des requêtes*. From 1642 to 1650 he held various intendancies at first in the provinces and then with the army of Mazarin, and, coming thus in touch with the court, was permitted in 1650 to buy the important position of *procureur général* to the parlement of Paris. During Mazarin's exile Fouquet shrewdly remained loyal to him, protecting his property and keeping him informed of the situation at court.

Upon the cardinal's return, Fouquet demanded and received as reward the office of superintendent of the finances (1653), a position which, in the unsettled condition of the government, threw into his hands not merely the decision as to which funds

should be applied to meet the demands of the state's creditors, but also the negotiations with the great financiers who lent money to the king. The appointment was a popular one with the moneyed class, for Fouquet's great wealth had been largely augmented by his marriage in 1651 with Marie de Castille, who also belonged to a wealthy family of the legal nobility. His own credit, and above all his unfailing confidence in himself, strengthened the credit of the government, while his high position at the parlement (he still remained *procureur général*) secured financial transactions from investigation. As minister of finance, he soon had Mazarin almost in the position of a suppliant. The long wars, and the greed of the courtiers, who followed the example of Mazarin, made it necessary at times for Fouquet to meet the demands upon him by borrowing upon his own credit, but he soon turned this confusion of the public purse with his own to good account. The disorder in the accounts became hopeless; fraudulent operations were entered into with impunity, and the financiers were kept in the position of clients by official favours and by generous aid whenever they needed it. Fouquet's fortune now surpassed even Mazarin's, but the latter was too deeply implicated in similar operations to interfere, and was obliged to leave the day of reckoning to his agent and successor Colbert. Upon Mazarin's death Fouquet expected to be made head of the government; but Louis XIV. was suspicious of his poorly dissembled ambition, and it was with Fouquet in mind that he made the well-known statement, upon assuming the government, that he would be his own chief minister. Colbert fed the king's displeasure with adverse reports upon the deficit, and made the worst of the case against Fouquet. The extravagant expenditure and personal display of the superintendent served to intensify the ill-will of the king. Fouquet had bought the port of Belle Isle and strengthened the fortifications, with a view to taking refuge there in case of disgrace. He had spent enormous sums in building a palace on his estate of Vaux, which in extent, magnificence, and splendour of decoration was a forecast of Versailles. Here he gathered the rarest manuscripts, the finest paintings, jewels and antiques in profusion, and above all surrounded himself with artists and authors. The table was open to all people of quality, and the kitchen was presided over by Vatel. Lafontaine, Corneille, Scarron, were among the multitude of his clients. In August 1661 Louis XIV., already set upon his destruction, was entertained at Vaux with a *fête* rivalled in magnificence by only one or two in French history, at which Molière's *Les Fâcheux* was produced for the first time. The splendour of the entertainment sealed Fouquet's fate. The king, however, was afraid to act openly against so powerful a minister. By crafty devices Fouquet was induced to sell his office of *procureur général*, thus losing the protection of its privileges, and he paid the price of it into the treasury.

Three weeks after his visit to Vaux the king withdrew to Nantes, taking Fouquet with him, and had him arrested when he was leaving the presence chamber, flattered with the assurance of his esteem. The trial lasted almost three years, and its violation of the forms of justice is still the subject of frequent monographs by members of the French bar. Public sympathy was strongly with Fouquet, and Lafontaine, Madame de Sévigné and many others wrote on his behalf; but when Fouquet was sentenced to banishment, the king, disappointed, "commuted" the sentence to imprisonment for life. He was sent at the beginning of 1665 to the fortress of Pignerol, where he undoubtedly died on the 23rd of March 1680.¹ Louis acted throughout "as though he were conducting a campaign," evidently fearing that Fouquet would play the part of a Richelieu. Fouquet bore himself with manly fortitude, and composed several mediocre translations in prison. The devotional works bearing his name are apocryphal. A report of his trial was published in Holland, in 15 volumes, in 1665-1667, in spite of the remonstrances which Colbert addressed to the States-General. A second edition under the title of *Œuvres de M. Fouquet* appeared in 1696.

¹ Fouquet has been identified with the "Man with the Iron Mask" (see IRON MASK), but this theory is quite impossible.

See Chéruef, *Mémoires sur la vie publique et privée de Fouquet* . . . d'après ses lettres et des pièces inédites (2 vols., Paris, 1864); J. Lair, *Nicolas Fouquet, procureur général, surintendant des finances, ministre d'Etat de Louis XIV* (2 vols., Paris, 1890); U. V. Châtelain, *Le Surintendant Nicolas Fouquet, protecteur des lettres, des arts et des sciences* (Paris, 1905); R. Pfnor et A. France, *Le Château de Vaux-le-Vicomte dessiné et gravé* (Paris, 1888).

FOUQUIER-TINVILLE, ANTOINE QUENTIN (1746–1795), French revolutionist, was born at Hérouel, a village in the department of the Aisne. Originally a *procureur* attached to the Châtelet at Paris, he sold his office in 1783, and became a clerk under the lieutenant-general of police. He seems to have early adopted revolutionary ideas, but little is known of the part he played at the outbreak of the Revolution. When the Revolutionary Tribunal of Paris was established on the 10th of March 1793, he was appointed public prosecutor to it, an office which he filled until the 28th of July 1794. His activity during this time earned him the reputation of one of the most terrible and sinister figures of the Revolution. His function as public prosecutor was not so much to convict the guilty as to see that the proscriptions ordered by the faction for the time being in power were carried out with a due regard to a show of legality. He was as ruthless and as incorrupt as Robespierre himself; he could be moved from his purpose neither by pity nor by bribes; nor was there in his cruelty any of that quality which made the ordinary Jacobin *enragé* by turns ferocious and sentimental. It was this very quality of passionless detachment that made him so effective an instrument of the Terror. He had no forensic eloquence; but the cold obstinacy with which he pressed his charges was more convincing than any rhetoric, and he seldom failed to secure a conviction.

His horrible career ended with the fall of Robespierre and the terrorists on the 9th Thermidor. On the 1st of August 1794 he was imprisoned by order of the Convention and brought to trial. His defence was that he had only obeyed the orders of the Committee of Public Safety; but, after a trial which lasted forty-one days, he was condemned to death, and guillotined on the 7th of May 1795.

See *Mémoire pour A. Q. Fouquier ex-accusateur public près le tribunal révolutionnaire*, &c. (Paris, 1794); Domenget, *Fouquier-Tinville et le tribunal révolutionnaire* (Paris, 1878); H. Wallon, *Histoire du tribunal révolutionnaire de Paris* (1880–1882) (a work of general interest, but not always exact); George Lecoq, *Notes et documents sur Fouquier-Tinville* (Paris, 1885). See also the documents relating to his trial enumerated by M. Tourneux in *Bibliographie de l'histoire de Paris pendant la Révolution Française*, vol. i. Nos. 4445–4454 (1890).

FOURCHAMBAULT, a town of central France in the department of Nièvre, on the right bank of the Loire, $4\frac{1}{2}$ m. N.W. of Nevers, on the Paris-Lyon railway. Pop. (1906) 4591. It owes its importance to its extensive iron-works, established in 1821, which give employment to 2000 workmen and produce engineering material for railway, military and other purposes. Among the more remarkable *chefs-d'œuvre* which have been produced at Fourchambault are the metal portions of the Pont du Carrousel, the iron beams of the roof of the cathedral at Chartres, and the vast spans of the bridge over the Dordogne at Cubzac. A small canal unites the works to the Lateral canal of the Loire.

FOURCROY, ANTOINE FRANÇOIS, COMTE DE (1755–1809), French chemist, the son of an apothecary in the household of the duke of Orleans, was born at Paris on the 15th of June 1755. He took up medical studies by the advice of the anatomist Félix Vicq d'Azyr (1748–1794), and after many difficulties caused by lack of means finally in 1780 obtained his doctor's diploma. His attention was specially turned to chemistry by J. B. M. Bucquet (1746–1780), the professor of chemistry at the Medical School of Paris, and in 1784 he was chosen to succeed P. J. Macquer (1718–1784) as lecturer in chemistry at the college of the Jardin du Roi, where his lectures attained great popularity. He was one of the earliest converts to the views of Lavoisier, which he helped to promulgate by his voluminous writings, but though his name appears on a large number of chemical and also physiological and pathological memoirs, either alone or with others, he was rather a teacher and an organizer than an

original investigator. A member of the committees for public instruction and public safety, and later, under Napoleon, director general of instruction, he took a leading part in the establishment of schools for both primary and secondary education, scientific studies being especially provided for. Fourcroy died at Paris on the 16th of December 1809, the very day on which he had been created a count of the French empire. By his conduct as a member of the Convention he has been accused of contributing to the death of Lavoisier. Baron Cuvier in his *Éloge historique* of Fourcroy repels the charge, but he can scarcely be acquitted of time-serving indifference, if indeed active, though secret, participation be not proved against him.

The Royal Society's *Catalogue of Scientific Papers* enumerates 59 memoirs by Fourcroy himself, and 58 written jointly by him and others, mostly L. N. Vauquelin.

FOURIER, FRANÇOIS CHARLES MARIE (1772–1837), French socialist writer, was born at Besançon in Franche-Comté on the 7th of April 1772. His father was a draper in good circumstances, and Fourier received an excellent education at the college in his native town. After completing his studies there he travelled for some time in France, Germany and Holland. On the death of his father he inherited a considerable amount of property, which, however, was lost when Lyons was besieged by the troops of the Convention. Being thus deprived of his means of livelihood Fourier entered the army, but after two years' service as a *chasseur* was discharged on account of ill-health. In 1803 he published a remarkable article on European politics which attracted the notice of Napoleon, some of whose ideas were foreshadowed in it. Inquiries were made after the author, but nothing seems to have come of them. After leaving the army Fourier entered a merchant's office in Lyons, and some years later undertook on his own account a small business as broker. He obtained in this way just sufficient to supply his wants, and devoted all his leisure time to the elaboration of his first work on the organization of society.

During the early part of his life, and while engaged in commerce, he had become deeply impressed with the conviction that social arrangements resulting from the principles of individualism and competition were essentially imperfect and immoral. He proposed to substitute for these principles co-operation or united effort, by means of which full and harmonious development might be given to human nature. The scheme, worked out in detail in his first work, *Théorie des quatre mouvements* (2 vols., Lyons, 1808, published anonymously), has for foundation a particular psychological proposition and a special economical doctrine. Psychologically Fourier held what may with some laxity of language be called natural optimism,—the view that the full, free development of human nature or the unrestrained indulgence of human passion is the only possible way to happiness and virtue, and that misery and vice spring from the unnatural restraints imposed by society on the gratification of desire. This principle of harmony among the passions he regarded as his grandest discovery—a discovery which did more than set him on a level with Newton, the discoverer of the principle of attraction or harmony among material bodies. Throughout his works, in uncouth, obscure and often unintelligible language, he endeavours to show that the same fundamental fact of harmony is to be found in the four great departments,—society, animal life, organic life and the material universe. In order to give effect to this principle and obtain the resulting social harmony, it was needful that society should be reconstructed; for, as the social organism is at present constituted, innumerable restrictions are imposed upon the free development of human desire. As practical principle for such a reconstruction Fourier advocated co-operative or united industry. In many respects what he says of co-operation, in particular as to the enormous waste of economic force which the actual arrangements of society entail, still deserves attention, and some of the most recent efforts towards extension of the co-operative method, e.g. to house-keeping, were in essentials anticipated by him. But the full realization of his scheme demanded much more than the mere admission that co-operation is economically more

efficacious than individualism. Society as a whole must be organized on the lines requisite to give full scope to co-operation and to the harmonious evolution of human nature. The details of this reorganization of the social structure cannot be given briefly, but the broad outlines may be thus sketched. Society, on his scheme, is to be divided into departments or *phalanges*, each *phalange* numbering about 1600 persons. Each *phalange* inhabits a *phalanstère* or common building, and has a certain portion of soil allotted to it for cultivation. The *phalanstères* are built after a uniform plan, and the domestic arrangements are laid down very elaborately. The staple industry of the *phalanges* is, of course, agriculture, but the various *series* and *groupes* into which the members are divided may devote themselves to such occupations as are most to their taste; nor need any occupation become irksome from constant devotion to it. Any member of a group may vary his employment at pleasure, may pass from one task to another. The tasks regarded as menial or degrading in ordinary society can be rendered attractive if advantage is taken of the proper principles of human nature: thus children, who have a natural affinity for dirt, and a fondness for "cleaning up," may easily be induced to accept with eagerness the functions of public scavengers. It is not, on Fourier's scheme, necessary that private property should be abolished, nor is the privacy of family life impossible within the *phalanstère*. Each family may have separate apartments, and there may be richer and poorer members. But the rich and poor are to be locally intermingled, in order that the broad distinction between them, which is so painful a feature in actual society, may become almost imperceptible. Out of the common gain of the *phalange* a certain portion is deducted to furnish to each member the minimum of subsistence; the remainder is distributed in shares to labour, capital and talent,—five-twelfths going to the first, four-twelfths to the second and three-twelfths to the third. Upon the changes requisite in the private life of the members Fourier was in his first work more explicit than in his later writings. The institution of marriage, which imposes unnatural bonds on human passion, is of necessity abolished; a new and ingeniously constructed system of licence is substituted for it. Considerable offence seems to have been given by Fourier's utterances with regard to marriage, and generally the later advocates of his views are content to pass the matter over in silence or to veil their teaching under obscure and metaphorical language.

The scheme thus sketched attracted no attention when the *Théorie* first appeared, and for some years Fourier remained in his obscure position at Lyons. In 1812 the death of his mother put him in possession of a small sum of money, with which he retired to Bellay in order to perfect his second work. The *Traité de l'association agricole domestique* was published in 2 vols. at Paris in 1822, and a summary appeared in the following year. After its publication the author proceeded to Paris in the hope that some wealthy capitalist might be induced to attempt the realization of the projected scheme. Disappointed in this expectation he returned to Lyons. In 1826 he again visited Paris, and as a considerable portion of his means had been expended in the publication of his book, he accepted a clerkship in an American firm. In 1829 and 1830 appeared what is probably the most finished exposition of his views, *Le Nouveau Monde industriel*. In 1831 he attacked the rival socialist doctrines of Saint-Simon and Owen in the small work *Pièges et charlatanisme de deux sectes, St Simon et Owen*. His writings now began to attract some attention. A small body of adherents gathered round him, and the most ardent of them was Victor Considérant (*q.v.*). In 1832 a newspaper, *Le Phalanstère ou la réforme industrielle* was started to propagate the views of the school, but its success was not great. In 1833 it declined from a weekly to a monthly, and in 1834 it died of inanition. It was revived in 1836 as *Le Phalange*, and in 1843 became a daily paper, *La Démocratie pacifique*. In 1850 it was suppressed.

Fourier did not live to see the success of his newspaper, and the only practical attempt during his lifetime to establish a *phalanstère* was a complete failure. In 1832 M. Baudet Dulary,

deputy for Seine-et-Oise, who had become a convert, purchased an estate at Condé-sur-Vesgre, near the forest of Rambouillet, and proceeded to establish a socialist community. The capital supplied was, however, inadequate, and the community broke up in disgust. Fourier was in no way discouraged by this failure, and till his death, on the 10th of October 1837, he lived in daily expectation that wealthy capitalists would see the merits of his scheme and be induced to devote their fortunes to its realization. It may be added that subsequent attempts to establish the *phalanstère* have been uniformly unsuccessful.¹

Fourier seems to have been of an extremely retiring and sensitive disposition. He mixed little in society, and appeared, indeed, as if he were the denizen of some other planet. Of the true nature of social arrangements, and of the manner in which they naturally grow and become organized, he must be pronounced extremely ignorant. The faults of existing institutions presented themselves to him in an altogether distorted manner, and he never appears to have recognized that the evils of actual society are immeasurably less serious than the consequences of his arbitrary scheme. Out of the chaos of human passion he supposed harmony was to be evolved by the adoption of a few theoretically disputable principles, which themselves impose restraints even more irksome than those due to actual social facts. With regard to the economic aspects of his proposed new method, it is of course to be granted that co-operation is more effective than individual effort, but he has nowhere faced the question as to the probable consequences of organizing society on the abolition of those great institutions which have grown with its growth. His temperament was too ardent, his imagination too strong, and his acquaintance with the realities of life too slight to enable him justly to estimate the merits of his fantastic views. That this description of him is not expressed in over-strong language must be clear to any one who not only considers what is true in his works,—and the portion of truth is by no means a peculiar discovery of Fourier's,—but who takes into account the whole body of his speculations, the cosmological and historical as well as the economical and social. No words can adequately describe the fantastic nonsense which he pours forth, partly in the form of general speculation on the universe, partly in the form of prophetic utterances with regard to the future changes in humanity and its material environment. From these extraordinary writings it is no extreme conclusion that there was much of insanity in Fourier's mental constitution.

FOURIER, JEAN BAPTISTE JOSEPH (1768–1830), French mathematician, was born at Auxerre on the 21st of March 1768. He was the son of a tailor, and was left an orphan in his eighth year; but, through the kindness of a friend, admission was gained for him into the military school of his native town, which was then under the direction of the Benedictines of Saint-Maur. He soon distinguished himself as a student and made rapid progress, especially in mathematics. Debarred from entering the army on account of his lowness of birth and poverty, he was appointed

¹ Several experiments were made to this end in the United States (see COMMUNISM) by American followers of Fourier, whose doctrines were introduced there by Albert Brisbane (1809–1890). Indeed, in the years between 1840 and 1850, during which the movement waxed and waned, no fewer than forty-one *phalanges* were founded, of which some definite record can be found. The most interesting of all the experiments, not alone from its own history, but also from the fact that it attracted the support of many of the most intellectual and cultured Americans was that of Brook Farm (*q.v.*).

professor of mathematics in the school in which he had been a pupil. In 1787 he became a novice at the abbey of St Benoit-sur-Loire; but he left the abbey in 1789 and returned to his college, where, in addition to his mathematical duties, he was frequently called to lecture on other subjects,—rhetoric, philosophy and history. On the institution of the École Normale at Paris in 1795 he was sent to teach in it, and was afterwards attached to the École Polytechnique, where he occupied the chair of analysis. Fourier was one of the savants who accompanied Bonaparte to Egypt in 1798; and during this expedition he was called to discharge important political duties in addition to his scientific ones. He was for a time virtually governor of half Egypt, and for three years was secretary of the Institut du Caire; he also delivered the funeral orations for Kléber and Desaix. He returned to France in 1801, and in the following year he was nominated prefect of Isère, and was created baron and chevalier of the Legion of Honour. He took an important part in the preparation of the famous *Description de l'Égypte* and wrote the historical introduction. He held his prefecture for fourteen years; and it was during this period that he carried on his elaborate and fruitful investigations on the conduction of heat. On the return of Napoleon from Elba, in 1815, Fourier published a royalist proclamation, and left Grenoble as Napoleon entered it. He was then deprived of his prefecture, and, although immediately named prefect of the Rhône, was soon after again deprived. He now settled at Paris, was elected to the Académie des Sciences in 1816, but in consequence of the opposition of Louis XVIII. was not admitted till the following year, when he succeeded the Abbé Alexis de Rochon. In 1822 he was made perpetual secretary in conjunction with Cuvier, in succession to Delambre. In 1826 Fourier became a member of the French Academy, and in 1827 succeeded Laplace as president of the council of the École Polytechnique. In 1828 he became a member of the government commission established for the encouragement of literature. He died at Paris on the 16th of May 1830.

As a politician Fourier achieved uncommon success, but his fame chiefly rests on his strikingly original contributions to science and mathematics. The theory of heat engaged his attention quite early, and in 1812 he obtained a prize offered by the Académie des Sciences with a memoir in two parts, *Théorie des mouvements de la chaleur dans les corps solides*. The first part was republished in 1822 as *La Théorie analytique de la chaleur*, which by its new methods and great results made an epoch in the history of mathematical and physical science (see below: FOURIER'S SERIES). An English translation has been published by A. Freeman (Cambridge, 1872), and a German by Weinstein (Berlin, 1884). His mathematical researches were also concerned with the theory of equations, but the question as to his priority on several points has been keenly discussed. After his death Navier completed and published Fourier's unfinished work, *Analyse des équations indéterminées* (1831), which contains much original matter. In addition to the works above mentioned, Fourier wrote many memoirs on scientific subjects, and *éloges* of distinguished men of science. His works have been collected and edited by Gaston Darboux with the title *Œuvres de Fourier* (Paris, 1889-1890).

For a list of Fourier's publications see the *Catalogue of Scientific Papers of the Royal Society of London*. Reference may also be made to Arago, "Joseph Fourier," in the *Smithsonian Report* (1871).

FOURIER'S SERIES, in mathematics, those series which proceed according to sines and cosines of multiples of a variable, the various multiples being in the ratio of the natural numbers; they are used for the representation of a function of the variable for values of the variable which lie between prescribed finite limits. Although the importance of such series, especially in the theory of vibrations, had been recognized by D. Bernoulli, Lagrange and other mathematicians, and had led to some discussion of their properties, J. B. J. Fourier (see above) was the first clearly to recognize the arbitrary character of the functions which the series can represent, and to make any serious attempt to prove the validity of such representation; the series are

consequently usually associated with the name of Fourier. More general cases of trigonometrical series, in which the multiples are given as the roots of certain transcendental equations, were also considered by Fourier.

Before proceeding to the consideration of the special class of series to be discussed, it is necessary to define with some precision what is to be understood by the representation of an arbitrary function by an infinite series. Suppose a function of a variable x to be arbitrarily given for values of x between two fixed values a and b ; this means that, corresponding to every value of x such that $a \leq x \leq b$, a definite arithmetical value of the function is assigned by means of some prescribed set of rules. A function so defined may be denoted by $f(x)$; the rules by which the values of the function are determined may be embodied in a single explicit analytical formula, or in several such formulae applicable to different portions of the interval, but it would be an undue restriction of the nature of an arbitrarily given function to assume *a priori* that it is necessarily given in this manner, the possibility of the representation of such a function by means of a single analytical expression being the very point which we have to discuss. The variable x may be represented by a point at the extremity of an interval measured along a straight line from a fixed origin; thus we may speak of the point c as synonymous with the value $x=c$ of the variable, and of $f(c)$ as the value of the function assigned to the point c . For any number of points between a and b the function may be discontinuous, *i.e.* it may at such points undergo abrupt changes of value; it will here be assumed that the number of such points is finite. The only discontinuities here considered will be those known as ordinary discontinuities. Such a discontinuity exists at the point c if $f(c+\epsilon)$, $f(c-\epsilon)$ have distinct but definite limiting values as ϵ is indefinitely diminished; these limiting values are known as the limits on the right and on the left respectively of the function at c , and may be denoted by $f(c+0)$, $f(c-0)$. The discontinuity consists therefore of a sudden change of value of the function from $f(c-0)$ to $f(c+0)$, as x increases through the value c . If there is such a discontinuity at the point $x=0$, we may denote the limits on the right and on the left respectively by $f(+0)$, $f(-0)$.

Suppose we have an infinite series $u_1(x) + u_2(x) + \dots + u_n(x) + \dots$ in which each term is a function of x , of known analytical form; let any value $x=c$ ($a \leq c \leq b$) be substituted in the terms of the series, and suppose the sum of n terms of the arithmetical series so obtained approaches a definite limit as n is indefinitely increased; this limit is known as the sum of the series. If for every value of c such that $a \leq c \leq b$ the sum exists and agrees with the value of $f(c)$, the series $\sum_{n=1}^{\infty} u_n(x)$ is said to represent the function ($f(x)$) between

the values a , b of the variable. If this is the case for all points within the given interval with the exception of a finite number, at any one of which either the series has no sum, or has a sum which does not agree with the value of the function, the series is said to represent "in general" the function for the given interval. If the sum of n terms of the series be denoted by $S_n(c)$, the condition that $S_n(c)$ converges to the value $f(c)$ is that, corresponding to any finite positive number δ as small as we please, a value n_1 of n can be found such that if $n \geq n_1$, $|f(c) - S_n(c)| < \delta$.

Functions have also been considered which for an infinite number of points within the given interval have no definite value, and series have also been discussed which at an infinite number of points in the interval cease either to have a sum, or to have one which agrees with the value of the function; the narrower conception above will however be retained in the treatment of the subject in this article, reference to the wider class of cases being made only in connexion with the history of the theory of Fourier's Series.

Uniform Convergence of Series.—If the series $u_1(x) + u_2(x) + \dots + u_n(x) + \dots$ converge for every value of x in a given interval a to b , and its sum be denoted by $S(x)$, then if, corresponding to a finite positive number δ , as small as we please, a finite number n_1 can be found such that the arithmetical value of $S(x) - S_n(x)$, where $n \geq n_1$ is less than δ , for every value of x in the given interval, the series is said to converge uniformly in that interval. It may however happen that as x approaches a particular value the number of terms of the series which must be taken so that $|S(x) - S_n(x)|$ may be $< \delta$, increases indefinitely; the convergence of the series is then infinitely slow in the neighbourhood of such a point, and the series is not uniformly convergent throughout the given interval, although it converges at each point of the interval. If the number of such points in the neighbourhood of which the series ceases to converge uniformly be finite, they may be excluded by taking intervals of finite magnitude as small as we please containing such points, and considering the convergence of the series in the given interval with such sub-intervals excluded; the convergence of the series is now uniform throughout the remainder of the interval. The series is said to be *in general* uniformly convergent within the given interval a to b if it can be made uniformly convergent by the exclusion of a finite number of portions of the interval, each such portion being arbitrarily small. It is known that the sum of an infinite series of continuous terms can be discontinuous only at points in the neighbourhood of which the convergence of the series is not

uniform, but non-uniformity of convergence of the series does not necessarily imply discontinuity in the sum.

Form of Fourier's Series.—If it be assumed that a function $f(x)$ arbitrarily given for values of x such that $0 \leq x \leq l$ is capable of being represented in general by an infinite series of the form

$$A_1 \sin \frac{\pi x}{l} + A_2 \sin \frac{2\pi x}{l} + \dots + A_n \sin \frac{n\pi x}{l} + \dots,$$

and if it be further assumed that the series is in general uniformly convergent throughout the interval 0 to l , the form of the coefficients A can be determined. Multiply each term of the series by $\sin \frac{n\pi x}{l}$, and integrate the product between the limits 0 and l ,

then in virtue of the property $\int_0^l \sin \frac{n\pi x}{l} \sin \frac{n'\pi x}{l} dx = 0$, or $\frac{1}{2}l$, according as n' is not, or is, equal to n , we have $\frac{1}{2}lA_n = \int_0^l f(x) \sin \frac{n\pi x}{l} dx$, and

thus the series is of the form $\frac{2}{l} \sum_1^\infty \sin \frac{n\pi x}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx \dots (1)$

This method of determining the coefficients in the series would not be valid without the assumption that the series is in general uniformly convergent, for in accordance with a known theorem the sum of the integrals of the separate terms of the series is otherwise not necessarily equal to the integral of the sum. This assumption being made, it is further assumed that $f(x)$ is such that $\int_0^l f(x) \sin \frac{n\pi x}{l} dx$ has a definite meaning for every value of n .

Before we proceed to examine the justification for the assumptions made, it is desirable to examine the result obtained, and to deduce other series from it. In order to obtain a series of the form

$$B_0 + B_1 \cos \frac{\pi x}{l} + B_2 \cos \frac{2\pi x}{l} + \dots + B_n \cos \frac{n\pi x}{l} + \dots$$

for the representation of $f(x)$ in the interval 0 to l , let us apply the series (1) to represent the function $f(x) \sin \frac{\pi x}{l}$; we thus find

$$\frac{2}{l} \sum_1^\infty \sin \frac{n\pi x}{l} \int_0^l f(x) \sin \frac{\pi x}{l} \sin \frac{n\pi x}{l} dx,$$

or

$$\frac{1}{l} \sum_1^\infty \sin \frac{n\pi x}{l} \int_0^l f(x) \left\{ \cos \frac{(n-1)\pi x}{l} - \cos \frac{(n+1)\pi x}{l} \right\} dx.$$

On rearrangement of the terms this becomes

$$\frac{1}{l} \sin \frac{\pi x}{l} \int_0^l f(x) dx + \frac{2}{l} \sum_1^\infty \sin \frac{\pi x}{l} \cos \frac{n\pi x}{l} \int_0^l f(x) \cos \frac{n\pi x}{l} dx.$$

hence $f(x)$ is represented for the interval 0 to l by the series of cosines

$$\frac{1}{l} \int_0^l f(x) dx + \frac{2}{l} \sum_1^\infty \cos \frac{n\pi x}{l} \int_0^l f(x) \cos \frac{n\pi x}{l} dx \dots (2)$$

We have thus seen, that with the assumptions made, the arbitrary function $f(x)$ may be represented, for the given interval, either by a series of sines, as in (1), or by a series of cosines, as in (2). Some important differences between the two series must, however, be noticed. In the first place, the series of sines has a vanishing sum when $x=0$ or $x=l$; it therefore does not represent the function at the point $x=0$, unless $f(0)=0$, or at the point $x=l$, unless $f(l)=0$, whereas the series (2) of cosines may represent the function at both these points. Again, let us consider what is represented by (1) and (2) for values of x which do not lie between 0 and l . As $f(x)$ is given only for values of x between 0 and l , the series at points beyond these limits have no necessary connexion with $f(x)$ unless we suppose that $f(x)$ is also given for such general values of x in such a way that the series continue to represent that function. If in (1) we change x into $-x$, leaving the coefficients unaltered, the series changes sign, and if x be changed into $x+2l$, the series is unaltered; we infer that the series (1) represents an odd function of x and is periodic of period $2l$; thus (1) will represent $f(x)$ in general for values of x between $-\infty$, only if $f(x)$ is odd and has a period $2l$. If in (2) we change x into $-x$, the series is unaltered, and it is also unaltered by changing x into $x+2l$; from this we see that the series (2) represents $f(x)$ for values of x between $-\infty$, only if $f(x)$ is an even function, and is periodic of period $2l$. In general a function $f(x)$ arbitrarily given for all values of x between $-\infty$ is neither periodic nor odd, nor even, and is therefore not represented by either (1) or (2) except for the interval 0 to l .

From (1) and (2) we can deduce a series containing both sines and cosines, which will represent a function $f(x)$ arbitrarily given in the interval $-l$ to l , for that interval. We can express by (1) the function $\frac{1}{2}\{f(x)-f(-x)\}$ which is an odd function, and thus this function is represented for the interval $-l$ to $+l$ by

$$\frac{2}{l} \sum_1^\infty \sin \frac{n\pi x}{l} \int_0^l \frac{1}{2}\{f(x)-f(-x)\} \sin \frac{n\pi x}{l} dx;$$

we can also express $\frac{1}{2}\{f(x)+f(-x)\}$, which is an even function, by means of (2), thus for the interval $-l$ to $+l$ this function is represented by

$$\frac{1}{l} \int_0^l \frac{1}{2}\{f(x)+f(-x)\} dx + \frac{2}{l} \sum_1^\infty \cos \frac{n\pi x}{l} \int_0^l \frac{1}{2}\{f(x)+f(-x)\} \cos \frac{n\pi x}{l} dx.$$

It must be observed that $f(-x)$ is absolutely independent of $f(x)$,

the former being not necessarily deducible from the latter by putting $-x$ for x in a formula; both $f(x)$ and $f(-x)$ are functions given arbitrarily and independently for the interval 0 to l . On adding the expressions together we obtain a series of sines and cosines which represents $f(x)$ for the interval $-l$ to l . The integrals

$$\int_0^l f(-x) \cos \frac{n\pi x}{l} dx, \int_0^l f(-x) \sin \frac{n\pi x}{l} dx$$

are equivalent to

$$-\int_0^l f(x) \cos \frac{n\pi x}{l} dx, + \int_0^l f(x) \sin \frac{n\pi x}{l} dx,$$

thus the series is

$$\frac{1}{2l} \int_{-l}^l f(x) dx + \frac{1}{l} \sum_1^\infty \cos \frac{n\pi x}{l} \int_{-l}^l f(x) \cos \frac{n\pi x}{l} dx + \frac{1}{l} \sum_1^\infty \sin \frac{n\pi x}{l} \int_{-l}^l f(x) \sin \frac{n\pi x}{l} dx,$$

which may be written

$$\frac{1}{2l} \int_{-l}^l f(x') dx' + \frac{1}{l} \sum_1^\infty \int_{-l}^l f(x') \cos \frac{n\pi(x-x')}{l} dx' \dots (3)$$

The series (3), which represents a function $f(x)$ arbitrarily given for the interval $-l$ to l , is what is known as Fourier's Series; the expressions (1) and (2) being regarded as the particular forms which (3) takes in the two cases, in which $f(-x) = -f(x)$, or $f(-x) = f(x)$ respectively. The expression (3) does not represent $f(x)$ at points beyond the interval $-l$ to l , unless $f(x)$ has a period $2l$. For a value of x within the interval, at which $f(x)$ is discontinuous, the sum of the series may cease to represent $f(x)$, but, as will be seen hereafter, has the value $\frac{1}{2}\{f(x+0)+f(x-0)\}$, the mean of the limits at the points on the right and the left. The series represents the function at $x=0$, unless the function is there discontinuous, in which case the series is $\frac{1}{2}\{f(+0)+f(-0)\}$; the series does not necessarily represent the function at the points l and $-l$, unless $f(l)=f(-l)$. Its sum at either of these points is $\frac{1}{2}\{f(l)+f(-l)\}$.

Examples of Fourier's Series.—(a) Let $f(x)$ be given from 0 to l , by $f(x)=c$, when $0 \leq x < \frac{1}{2}l$, and by $f(x)=-c$ from $\frac{1}{2}l$ to l ; it is required to find a sine series, and also a cosine series, which shall represent the function in the interval.

We have

$$\begin{aligned} \int_0^l f(x) \sin \frac{n\pi x}{l} dx &= c \int_0^{\frac{1}{2}l} \sin \frac{n\pi x}{l} dx - c \int_{\frac{1}{2}l}^l \sin \frac{n\pi x}{l} dx \\ &= \frac{cl}{n\pi} (\cos n\pi - 2 \cos \frac{1}{2}n\pi + 1). \end{aligned}$$

This vanishes if n is odd, and if $n=4m$, but if $n=4m+2$ it is equal to $4cl/n\pi$; the series is therefore

$$\frac{4c}{\pi} \left(\frac{1}{2} \sin \frac{2\pi x}{l} + \frac{1}{3} \sin \frac{6\pi x}{l} + \frac{1}{5} \sin \frac{10\pi x}{l} + \dots \right).$$

For unrestricted values of x , this series represents the ordinates of the series of straight lines in fig. 1, except that it vanishes at the points 0, $\frac{1}{2}l$, l , $\frac{3}{2}l$, ...

FIG. 1.

We find similarly that the same function is represented by the series

$$\frac{4c}{\pi} \left(\cos \frac{\pi x}{l} - \frac{1}{3} \cos \frac{3\pi x}{l} + \frac{1}{5} \cos \frac{5\pi x}{l} - \dots \right)$$

during the interval 0 to l ; for general values of x the series represents the ordinate of the broken line in fig. 2, except that it vanishes at the points $\frac{1}{2}l$, l , ...

FIG. 2.

b) Let $f(x)=x$ from 0 to $\frac{1}{2}l$, and $f(x)=l-x$, from $\frac{1}{2}l$ to l ; then

$$\begin{aligned} \int_0^l f(x) \sin \frac{n\pi x}{l} dx &= \int_0^{\frac{1}{2}l} x \sin \frac{n\pi x}{l} dx + \int_{\frac{1}{2}l}^l (l-x) \sin \frac{n\pi x}{l} dx \\ &= -\frac{l}{2n\pi} \cos \frac{n\pi}{2} + \frac{l}{n^2\pi^2} \sin \frac{n\pi}{2} + \frac{l}{n\pi} \left(\cos \frac{n\pi}{2} - \cos n\pi \right) \\ &\quad + \frac{l}{n\pi} \cos n\pi - \frac{l}{2n\pi} \cos \frac{n\pi}{2} + \frac{l}{n^2\pi^2} \sin \frac{n\pi}{2} = \frac{2l}{n^2\pi^2} \sin \frac{n\pi}{2} \end{aligned}$$

hence the sine series is

$$\frac{1}{\pi^2} \left(\sin \frac{\pi x}{l} - \frac{1}{3^2} \sin \frac{3\pi x}{l} + \frac{1}{5^2} \sin \frac{5\pi x}{l} - \dots \right)$$

For general values of x , the series represents the ordinates of the row of broken lines in fig. 3.

FIG. 3.

The cosine series, which represents the same function for the interval 0 to l , may be found to be

$$\frac{1}{4} - \frac{2l}{\pi^2} \left(\cos \frac{2\pi x}{l} + \frac{1}{3^2} \cos \frac{6\pi x}{l} + \frac{1}{5^2} \cos \frac{10\pi x}{l} + \dots \right)$$

This series represents for general values of x the ordinate of the set of broken lines in fig. 4.

FIG. 4.

Dirichlet's Integral.—The method indicated by Fourier, but first carried out rigorously by Dirichlet, of proving that, with certain restrictions as to the nature of the function $f(x)$, that function is in general represented by the series (3), consists in finding the sum of $n+1$ terms of that series, and then investigating the limiting value of the sum, when n is increased indefinitely. It thus appears that the series is convergent, and that the value towards which its sum converges is $\frac{1}{2}[f(x+0)+f(x-0)]$, which is in general equal to $f(x)$. It will be convenient throughout to take $-\pi$ to π as the given interval; any interval $-l$ to l may be reduced to this by changing x into lx/π , and thus there is no loss of generality.

We find by an elementary process that

$$\begin{aligned} & \frac{1}{2} + \cos(x-x') + \cos 2(x-x') + \dots + \cos n(x-x') \\ &= \frac{\sin \frac{2n+1}{2}(x'-x)}{2 \sin \frac{1}{2}(x'-x)}. \end{aligned}$$

Hence, with the new notation, the sum of the first $n+1$ terms of (3) is

$$\frac{1}{\pi} \int_{-\pi}^{\pi} f(x') \frac{\sin \frac{2n+1}{2}(x'-x)}{2 \sin \frac{1}{2}(x'-x)} dx'.$$

If we suppose $f(x)$ to be continued beyond the interval $-\pi$ to π , in such a way that $f(x) = f(x+2\pi)$, we may replace the limits in this integral by $x+\pi$, $x-\pi$ respectively; if we then put $x'-x = 2z$, and

let $f(x') = F(z)$, the expression becomes $\frac{1}{\pi} \int_{-\pi}^{\pi} F(z) \frac{\sin mz}{\sin z} dz$, where $m = 2n+1$; this expression may be written in the form

$$\frac{1}{\pi} \int_0^{\pi} F(z) \frac{\sin mz}{\sin z} dz + \frac{1}{\pi} \int_0^{\pi} F(-z) \frac{\sin mz}{\sin z} dz \dots \dots \dots (4)$$

We require therefore to find the limiting value, when m is indefinitely increased, of $\int_0^{\pi} F(z) \frac{\sin mz}{\sin z} dz$; the form of the second integral being essentially the same. This integral, or rather the slightly more general one $\int_0^h F(z) \frac{\sin mz}{\sin z} dz$, when $0 < h \leq \frac{1}{2}\pi$, is known as Dirichlet's integral. If we write $X(z) = F(z) \frac{z}{\sin z}$, the integral becomes $\int_0^h X(z) \frac{\sin mz}{z} dz$, which is the form in which the integral is frequently considered.

The Second Mean-Value Theorem.—The limiting value of Dirichlet's integral may be conveniently investigated by means of a theorem in the integral calculus known as the second mean-value theorem. Let a, b be two fixed finite numbers such that $a < b$, and suppose $f(x), \phi(x)$ are two functions which have finite and determinate values everywhere in the interval except for a finite number of points; suppose further that the functions $f(x), \phi(x)$ are integrable throughout the interval, and that as x increases from a to b the function $f(x)$ is monotone, i.e. either never diminishes or never increases; the theorem is that

$$\int_a^b f(x)\phi(x)dx = f(a+0) \int_a^{\xi} \phi(x)dx + f(b-0) \int_{\xi}^b \phi(x)dx$$

when ξ is some point between a and b , and $f(a), f(b)$ may be written for $f(a+0), f(b-0)$ unless a or b is a point of discontinuity of the function $f(x)$.

To prove this theorem, we observe that, since the product of two integrable functions is an integrable function, $\int_a^b f(x)\phi(x)dx$ exists, and may be regarded as the limit of the sum of a series $f(x_0)\phi(x_0)(x_1-x_0) + f(x_1)\phi(x_1)(x_2-x_1) + \dots + f(x_{n-1})\phi(x_{n-1})(x_n-x_{n-1})$ where $x_0 = a, x_n = b$ and x_1, x_2, \dots, x_{n-1} are $n-1$ intermediate points. We can express $\phi(x_r)(x_{r+1}-x_r)$ in the form $Y_{r+1}-Y_r$, by putting $Y_r = \sum_{k=1}^r \phi(x_{k-1})(x_k-x_{k-1}), Y_0 = 0$.

Writing X_r for $f(x_r)$, the series becomes $X_0(Y_1-Y_0) + X_1(Y_2-Y_1) + \dots + X_{n-1}(Y_n-Y_{n-1})$ or $Y_1(X_0-X_1) + Y_2(X_1-X_2) + \dots + Y_n(X_{n-1}-X_n) + Y_n X_n$. Now, by supposition, all the numbers Y_1, Y_2, \dots, Y_n are finite, and all the numbers $X_{r-1}-X_r$ are of the same sign, hence by a known algebraical theorem the series is equal to $M(X_0-X_n) + Y_n X_n$, where M is a number intermediate between the greatest and the least of the numbers Y_1, Y_2, \dots, Y_n . This remains true however many partial intervals are taken, and therefore, when their number is increased indefinitely, and their breadths are diminished indefinitely according to any law, we have

$$\int_a^b f(x)\phi(x)dx = \{f(a)-f(b)\}M + f(b) \int_a^b \phi(x)dx$$

when M is intermediate between the greatest and least values which $\int_a^x \phi(x)dx$ can have, when x is in the given integral. Now this integral is a continuous function of its upper limit x , and therefore there is a value of x in the interval, for which it takes any particular value between the greatest and least values that it has.

There is therefore a value ξ between a and b , such that $M = \int_a^{\xi} \phi(x)dx$, hence

$$\begin{aligned} \int_a^b f(x)\phi(x)dx &= \{f(a)-f(b)\} \int_a^{\xi} \phi(x)dx + f(b) \int_a^b \phi(x)dx \\ &= f(a) \int_a^{\xi} \phi(x)dx + f(b) \int_{\xi}^b \phi(x)dx. \end{aligned}$$

If the interval contains any finite numbers of points of discontinuity of $f(x)$ or $\phi(x)$, the method of proof still holds good, provided these points are avoided in making the subdivisions; in particular if either of the ends be a point of discontinuity of $f(x)$, we write $f(a+0)$ or $f(b-0)$, for $f(a)$ or $f(b)$, it being assumed that these limits exist.

Functions, with Limited Variation.—The condition that $f(x)$, in the mean-value theorem, either never increases or never diminishes as x increases from a to b , places a restriction upon the applications of the theorem. We can, however, show that a function $f(x)$ which is finite and continuous between a and b , except for a finite number of ordinary discontinuities, and which only changes from increasing to diminishing or vice versa, a finite number of times, as x increases from a to b , may be expressed as the difference of two functions $f_1(x), f_2(x)$, neither of which ever diminishes as x passes from a to b , and that these functions are finite and continuous, except that one or both of them are discontinuous at the points where the given function is discontinuous. Let a, β be two consecutive points at which $f(x)$ is discontinuous, consider any point x_1 , such that $a \leq x_1 \leq \beta$, and suppose that at the points M_1, M_2, \dots, M_r between a and x_1 , $f(x)$ is a maximum, and at m_1, m_2, \dots, m_r it is a minimum; we will suppose, for example, that the ascending order of values is $a, M_1, m_1, M_2, m_2, \dots, M_r, m_r, x_1$; it will make no essential difference in the argument if m_1 comes before M_1 , or if M_r immediately precedes x_1, M_{r-1} being then the last minimum.

Let $\psi(x_1) = [f(M_1)-f(a+0)] + [f(M_2)-f(m_1)] + \dots + [f(M_r)-f(m_{r-1})] + [f(x_1)-f(m_r)]$;

now let x_1 increase until it reaches the value M_{r+1} at which $f(x)$ is again a maximum, then let

$$\psi(x_1) = [f(M_1)-f(a+0)] + [f(M_2)-f(m_1)] + \dots + [f(M_r)-f(m_{r-1})] + [f(M_{r+1})-f(m_r)]$$

and suppose as x increases beyond the value M_{r+1} , $\psi(x_1)$ remains constant until the next minimum m_{r+1} is reached, when it again becomes variable; we see that $\psi(x_1)$ is essentially positive and never diminishes as x increases.

Let $\chi(x_1) = [f(M_1)-f(m_1)] + [f(M_2)-f(m_1)] + \dots + [f(M_r)-f(m_r)]$, then let x_1 increase until it is beyond the next maximum M_{r+1} , and then let $\chi(x_1) = [f(M_1)-f(m_1)] + [f(M_2)-f(m_1)] + \dots + [f(M_r)-f(m_r)] + [f(M_{r+1})-f(x_1)]$

thus $\chi(x_1)$ never diminishes, and is alternately constant and variable. We see that $\psi(x_1) - \chi(x_1)$ is continuous as x_1 increases from a to β , and that $\psi(x_1) - \chi(x_1) = f(x_1) - f(a+0)$, and when x_1 reaches β , we have $\psi(\beta) - \chi(\beta) = f(\beta-0) - f(a+0)$. Hence it is seen that between a and β , $f(x) = [\psi(x) + f(a+0)] - \chi(x)$, where $\psi(x) + f(a+0), \chi(x)$ are continuous and never diminish as x increases; the same reasoning

applies to every continuous portion of $f(x)$, for which the functions $\psi(x)$, $\chi(x)$ are formed in the same manner; we now take $f_1(x) = \psi(x) + f(a+0) + C$, $f_2(x) = \chi(x) + C$, where C is constant between consecutive discontinuities, but may have different values in the next interval between discontinuities; the C can be so chosen that neither $f_1(x)$ nor $f_2(x)$ diminishes as x increases through a value for which $f(x)$ is discontinuous. We thus see that $f(x) = f_1(x) - f_2(x)$, where $f_1(x)$, $f_2(x)$ never diminish as x increases from a to b , and are discontinuous only where $f(x)$ is so. The function $f(x)$ is a particular case of a class of functions defined and discussed by Jordan, under the name "functions with limited variation" (*fonctions à variation bornée*); in general such functions have not necessarily only a finite number of maxima and minima.

Proof of the Convergence of Fourier's Series.—It will now be assumed that a function $f(x)$ arbitrarily given between the values $-\pi$ and $+\pi$, has the following properties:—

(a) The function is everywhere numerically less than some fixed positive number, and continuous except for a finite number of values of the variable, for which it may be ordinarily discontinuous.

(b) The function only changes from increasing to diminishing or vice versa, a finite number of times within the interval; this is usually expressed by saying that the number of maxima and minima is finite.

These limitations on the nature of the function are known as Dirichlet's conditions; it follows from them that the function is integrable throughout the interval.

On these assumptions, we can investigate the limiting value of Dirichlet's integral; it will be necessary to consider only the case of a function $F(z)$ which does not diminish as z increases from 0 to $\frac{1}{2}\pi$, since it has been shown that in the general case the difference of two such functions may be taken. The following lemmas will be required:

1. Since

$$\int_0^{\frac{\pi}{2}} \frac{\sin mz}{\sin z} dz = \int_0^{\frac{\pi}{2}} \{1 + 2 \cos 2z + 2 \cos 4z + \dots + 2 \cos 2nz\} dz = \frac{\pi}{2};$$

this result holds however large the odd integer m may be.

2. If $0 < \alpha < \beta \leq \frac{\pi}{2}$,

$$\int_{\alpha}^{\beta} \frac{\sin mz}{\sin z} dz = \frac{1}{\sin \alpha} \int_{\alpha}^{\gamma} \sin mz dz + \frac{1}{\sin \beta} \int_{\gamma}^{\beta} \sin mz dz$$

where $\alpha < \gamma < \beta$, hence

$$\left| \int_{\alpha}^{\beta} \frac{\sin mz}{\sin z} dz \right| < \frac{2}{m} \left(\frac{1}{\sin \alpha} + \frac{1}{\sin \beta} \right) < \frac{4}{m \sin \alpha};$$

a precisely similar proof shows that $\left| \int_{\alpha}^{\beta} \frac{\sin mz}{z} dz \right| < \frac{4}{m\alpha}$,

hence the integrals $\int_{\alpha}^{\beta} \frac{\sin mz}{\sin z} dz$, $\int_{\alpha}^{\beta} \frac{\sin mz}{z} dz$, converge to the limit zero, as m is indefinitely increased.

3. If $\alpha > 0$, $\left| \int_{\alpha}^{\infty} \frac{\sin \theta}{\theta} d\theta \right|$ cannot exceed $\frac{1}{2}\pi$. For by the mean-

value theorem $\left| \int_{\alpha}^h \frac{\sin \theta}{\theta} d\theta \right| < \frac{2}{\alpha} + \frac{2}{h}$,

hence $\left| Lh = \int_{\alpha}^h \frac{\sin \theta}{\theta} d\theta \right| \leq \frac{2}{\alpha}$;

in particular if $\alpha \geq \pi$, $\left| \int_{\alpha}^{\infty} \frac{\sin \theta}{\theta} d\theta \right| \leq \frac{2}{\pi} < \frac{\pi}{2}$.

Again $\frac{d}{d\alpha} \int_{\alpha}^{\infty} \frac{\sin \theta}{\theta} d\theta = -\frac{\sin \alpha}{\alpha}$, $\alpha > 0$,

therefore $\int_{\alpha}^{\infty} \frac{\sin \theta}{\theta} d\theta$ increases as α diminishes, when $\theta < \alpha < \pi$;

but $\lim_{\alpha \rightarrow 0} \int_{\alpha}^{\infty} \frac{\sin \theta}{\theta} d\theta = \frac{\pi}{2}$, hence $\left| \int_{\alpha}^{\infty} \frac{\sin \theta}{\theta} d\theta \right| < \frac{\pi}{2}$,

where $\alpha < \pi$, and $< \frac{2}{\pi}$ where $\alpha \geq \pi$. It follows that

$$\left| \int_{\alpha}^{\beta} \frac{\sin \theta}{\theta} d\theta \right| \leq \pi, \text{ provided } 0 \leq \alpha < \beta.$$

To find the limit of $\int_0^{\frac{\pi}{2}} F(z) \frac{\sin mz}{\sin z} dz$, we observe that it may be written in the form

$$F(0) \int_0^{\frac{\pi}{2}} \frac{\sin mz}{\sin z} dz + \int_0^{\mu} \{F(z) - F(0)\} \frac{\sin mz}{\sin z} dz + \int_{\mu}^{\frac{\pi}{2}} \{F(z) - F(0)\} \frac{\sin mz}{\sin z} dz$$

where μ is a fixed number as small as we please; hence if we use lemma (1), and apply the second mean-value theorem,

$$\int_0^{\frac{\pi}{2}} F(z) \frac{\sin mz}{\sin z} dz - \frac{\pi}{2} F(0) = \int_0^{\mu} \{F(z) - F(0)\} \frac{z}{\sin z} \frac{\sin mz}{z} dz$$

$$+ \{F(\mu+0) - F(0)\} \int_{\mu}^{\xi} \frac{\sin mz}{\sin z} dz + \{F(\frac{1}{2}\pi - 0) - F(0)\} \int_{\xi}^{\frac{\pi}{2}} \frac{\sin mz}{\sin z} dz$$

when ξ lies between μ and $\frac{1}{2}\pi$. When m is indefinitely increased, the two last integrals have the limit zero in virtue of lemma (2). To evaluate the first integral on the right-hand side, let $G(z) =$

$\{F(z) - F(0)\} \frac{z}{\sin z}$, and observe that $G(z)$ increases as z increases from 0 to μ , hence if we apply the mean-value theorem

$$\left| \int_0^{\mu} G(z) \frac{\sin mz}{z} dz \right| = \left| G(\mu) \int_{\xi}^{\mu} \frac{\sin mz}{z} dz \right| = \left| G(\mu) \int_{\frac{\theta}{m}}^{\frac{\mu}{m}} \frac{\sin \theta}{\theta} d\theta \right| < \pi G(\mu),$$

where $0 < \xi < \mu$, since $G(z)$ has the limit zero when $z=0$. If ϵ be an arbitrarily chosen positive number, a fixed value of μ may be so

chosen that $\pi G(\mu) < \frac{1}{2}\epsilon$, and thus that $\left| \int_0^{\mu} G(z) \frac{\sin mz}{z} dz \right| < \frac{1}{2}\epsilon$. When

μ has been so fixed, m may now be so chosen that

$$\left| \int_0^{\frac{1}{2}\pi} F(z) \frac{\sin mz}{\sin z} dz - \frac{\pi}{2} F(0) \right| < \epsilon.$$

It has now been shown that when m is indefinitely increased $\int_0^{\frac{\pi}{2}} F(z) \frac{\sin mz}{\sin z} dz - \frac{\pi}{2} F(0)$ has the limit zero.

Returning to the form (4), we now see that the limiting value of

$$\frac{1}{\pi} \int_0^{\frac{\pi}{2}} F(z) \frac{\sin mz}{\sin z} dz + \frac{1}{\pi} \int_0^{\pi} F(-z) \frac{\sin mz}{\sin z} dz \text{ is } \frac{1}{2} \{F(+0) + F(-0)\};$$

hence the sum of $n+1$ terms of the series

$$\frac{1}{2l} \int_{-l}^l f(x) dx + \frac{1}{2} \sum \int_{-l}^l f(x^i) \cos \frac{n\pi(x-x^i)}{l} dx$$

converges to the value $\frac{1}{2} \{f(x+0) + f(x-0)\}$, or to $f(x)$ at a point where $f(x)$ is continuous, provided $f(x)$ satisfies Dirichlet's conditions for the interval from $-l$ to l .

Proof that Fourier's Series is in General Uniformly Convergent.—

To prove that Fourier's Series converges uniformly to its sum for all values of x , provided that the immediate neighbourhoods of the points of discontinuity of $f(x)$ are excluded, we have

$$\left| \int_{\frac{\pi}{2}}^{\pi} F(z) \frac{\sin mz}{\sin z} dz - \frac{\pi}{2} F(0) \right| < \pi G(\mu) + \frac{4}{m \sin \mu} \{F(\mu+0) - F(0)\} + \frac{4}{m \sin \xi} \{F(\frac{1}{2}\pi - 0) - F(0)\} < \frac{\pi \mu}{\sin \mu} \{f(x+2\mu) - f(x)\} + \frac{4}{m \sin \mu} \{f(x+2\mu) - f(x)\} + \frac{4}{m \sin \xi} \{f(x+\pi) - f(x)\}.$$

Using this inequality and the corresponding one for $F(-z)$, we have

$$|S_{2n+1}(x) - f(x)| < \mu \operatorname{cosec} \mu \{ |f(x+2\mu) - f(x)| + |f(x-2\mu) - f(x)| \} + A |m \operatorname{cosec} \mu|,$$

where A is some fixed number independent of m . In any interval (a, b) in which $f(x)$ is continuous, a value μ_1 of μ can be chosen such that, for every value of x in (a, b) , $|f(x+2\mu) - f(x)|$, $|f(x-2\mu) - f(x)|$ are less than an arbitrarily prescribed positive number ϵ , provided $\mu = \mu_1$. Also a value μ_2 of μ can be so chosen that $\epsilon \mu_2 \operatorname{cosec} \mu_2 < \frac{1}{2}\eta$, where η is an arbitrarily assigned positive number. Take for μ the lesser of the numbers μ_1, μ_2 , then $|S_{2n+1} - f(x)| < \eta + A |m \operatorname{cosec} \mu|$ for every value of x in (a, b) . It follows that, since η and m are independent of x , $|S_{2n+1} - f(x)| < 2\epsilon$, provided n is greater than some fixed value n_1 , dependent only on ϵ . Therefore S_{2n+1} converges to $f(x)$ uniformly in the interval (a, b) .

Case of a Function with Infinities.—The limitation that $f(x)$ must be numerically less than a fixed positive number throughout the interval may, under a certain restriction, be removed. Suppose $F(z)$ is indefinitely great in the neighbourhood of the point $z=c$, and is

such that the limits of the two integrals $\int_c^{c+\epsilon} F(z) dz$ are both zero, as ϵ is indefinitely diminished, then

$$\int_0^{\frac{\pi}{2}} F(z) \frac{\sin mz}{\sin z} dz \text{ denotes the limit when } \epsilon=0, \epsilon^l=0 \text{ of}$$

$$\int_0^{c-\epsilon} F(z) \frac{\sin mz}{\sin z} dz + \int_{c+\epsilon}^{\frac{\pi}{2}} F(z) \frac{\sin mz}{\sin z} dz, \text{ both these limits existing; the}$$

first of these integrals has $\frac{1}{2}\pi F(+0)$ for its limiting value when m is indefinitely increased, and the second has zero for its limit. The theorem therefore holds if $F(z)$ has an infinity up to which it is absolutely integrable; this will, for example, be the case if $F(z)$ near the point C is of the form $\chi(z) (z-c)^{-\mu} + \psi(z)$, where $\chi(c), \psi(c)$ are finite, and $0 < \mu < 1$. It is thus seen that $f(x)$ may have a finite number of infinities within the given interval, provided the function is integrable through any one of these points; the function is in that case still representable by Fourier's Series.

The Ultimate Values of the Coefficients in Fourier's Series.—If $f(x)$ is everywhere finite within the given interval $-\pi$ to $+\pi$, it can be shown that a_n, b_n , the coefficients of $\cos nx, \sin nx$ in the series which represent the function, are such that na_n, nb_n , however

great n is, are each less than a fixed finite quantity. For writing $f(x) = f_1(x) - f_2(x)$, we have

$$\int_{-\pi}^{\pi} f_1(x) \cos nx dx = f_1(-\pi+0) \int_{-\pi}^{\xi} \cos nx dx + f_1(\pi-0) \int_{\xi}^{\pi} \cos nx dx$$

hence
$$\int_{-\pi}^{\pi} f_1(x) \cos nx dx = f_1(-\pi+0) \frac{\sin n\xi}{n} + f_1(\pi-0) \frac{\sin n\xi}{n}$$
 with a similar expression, with $f_2(x)$ for $f_1(x)$, ξ being between π and $-\pi$; the result then follows at once, and is obtained similarly for the other coefficient.

If $f(x)$ is infinite at $x=c$, and is of the form $\frac{\phi(x)}{(x-c)^K}$ near the point c , where $0 < K < 1$, the integral

$$\int_{-\pi}^{\pi} f(x) \cos nx dx$$
 contains portions of the form $\int_c^{c+\epsilon} \frac{\phi(x)}{(x-c)^K} \cos nx dx$; consider the first of these, and put $x=c+u$, it thus becomes $\int_0^{\epsilon} \frac{\phi(c+u)}{u^K} \cos n(c+u) du$, which is of the form

$$\phi(c+\theta\epsilon) \int_0^{\epsilon} \frac{\cos n(c+u)}{u^K} du$$
; now let $nu=v$, the integral becomes

$$\phi(c+\theta\epsilon) \left\{ \frac{\cos nc}{n^{1-K}} \int_0^{n\epsilon} \frac{\cos v}{v^K} dv - \frac{\sin nc}{n^{1-K}} \int_0^{n\epsilon} \frac{\sin v}{v^K} dv \right\};$$

hence $n^{1-K} \int_{-\pi}^{\pi} f(x) \cos nx dx$ becomes, as n is definitely increased,

$$\phi(c) \left\{ \cos nc \int_0^{\infty} \frac{\cos v}{v^K} dv - \sin nc \int_0^{\infty} \frac{\sin v}{v^K} dv \right\}$$

which is finite, both the integrals being convergent and of known value. The other integral has a similar property, and we infer that $n^{1-K}a_n, n^{1-K}b_n$ are less than fixed finite numbers.

The Differentiation of Fourier's Series.—If we assume that the differential coefficient of a function $f(x)$ represented by a Fourier's Series exists, that function $f'(x)$ is not necessarily representable by the series obtained by differentiating the terms of the Fourier's Series, such derived series being in fact not necessarily convergent. Stokes has obtained general formulae for finding the series which represent $f'(x), f''(x)$ —the successive differential coefficients of a limited function $f(x)$. As an example of such formulae, consider the sine series (1); $f(x)$ is represented by

$$\frac{2}{\pi} \sin \frac{n\pi x}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx;$$

on integration by parts we have $\int_0^l f(x) \sin \frac{n\pi x}{l} dx$

$$= \frac{l}{\pi} \left[f(+0) \mp f(l-0) + \sum \cos \frac{n\pi a}{l} \{ f(a+0) - f(a-0) \} \right] + \frac{l}{\pi} \int_0^l f'(x) \cos \frac{n\pi x}{l} dx$$

where a represent the points where $f(x)$ is discontinuous. Hence if $f(x)$ is represented by the series $\sum a_n \sin \frac{n\pi x}{l}$, and $f'(x)$ by the series $\sum b_n \cos \frac{n\pi x}{l}$, we have the relation

$$b_n = \frac{n\pi}{l} a_n - \frac{2}{l} \left[f(+0) \mp f(l-0) + \sum \cos \frac{n\pi a}{l} \{ f(a+0) - f(a-0) \} \right]$$

hence only when the function is everywhere continuous, and $f(+0), f(l-0)$ are both zero, is the series which represents $f'(x)$ obtained at once by differentiating that which represents $f(x)$. The form of the coefficient a_n discloses the discontinuities of the function and of its differential coefficients, for on continuing the integration by parts we find

$$a_n = \frac{2}{n\pi} \left[f(+0) \mp f(l-0) + \sum \cos \frac{n\pi a}{l} \{ f(a+0) - f(a-0) \} \right] + \frac{2l}{n^2\pi^2} \left[f'(+0) \mp f'(l-0) + \sum \sin \frac{n\pi \beta}{l} \{ f'(\beta+0) - f'(\beta-0) \} \right] + \&c.$$

where β are the points at which $f'(x)$ is discontinuous.

HISTORY AND LITERATURE OF THE THEORY

The history of the theory of the representation of functions by series of sines and cosines is of great interest in connexion with the progressive development of the notion of an arbitrary function of a real variable, and of the peculiarities which such a function may possess; the modern views on the foundations of the infinitesimal calculus have been to a very considerable extent formed in this connexion (see FUNCTION). The representation of functions by these series was first considered in the 18th century, in connexion with the problem of a vibrating cord, and led to a controversy as to the possibility of such expansions. In a memoir published in 1747 (*Memoirs of the Academy of Berlin*, vol. iii.) D'Alembert showed that the ordinate y at any time t of a vibrating cord satisfies a differential equation of the form $\frac{\delta^2 y}{\delta t^2} = a^2 \frac{\delta^2 y}{\delta x^2}$, where x is measured along the undisturbed length of the cord, and that with the ends of the cord of length l fixed, the appropriate solution is $y = f(at+x) - f(at-x)$, where

f is a function such that $f(x) = f(x+2l)$; in another memoir in the same volume he seeks for functions which satisfy this condition. In the year 1748 (*Berlin Memoirs*, vol. iv.) Euler, in discussing the problem, gave $f(x) = a \sin \frac{\pi x}{l} + \beta \sin \frac{2\pi x}{l} + \dots$ as a particular

solution, and maintained that every curve, whether regular or irregular, must be representable in this form. This was objected to by D'Alembert (1750) and also by Lagrange on the ground that irregular curves are inadmissible. D. Bernoulli (*Berlin Memoirs*, vol. ix., 1753) based a similar result to that of Euler on physical intuition; his method was criticized by Euler (1753). The question was then considered from a new point of view by Lagrange, in a memoir on the nature and propagation of sound (*Miscellanea Taurensia*, 1759; *Ceuvres*, vol. i.), who, while criticizing Euler's method, considers a finite number of vibrating particles, and then makes the number of them infinite; he did not, however, quite fully carry out the determination of the coefficients in Bernoulli's Series. These mathematicians were hampered by the narrow conception of a function, in which it is regarded as necessarily continuous; a discontinuous function was considered only as a succession of several different functions. Thus the possibility of the expansion of a broken function was not generally admitted. The first cases in which rational functions are expressed in sines and cosines were given by Euler (*Subsidium calculi sinuum*, Novi Comm. Petrop., vol. v., 1754-1755), who obtained the formulae

$$\frac{1}{2}\phi = \sin \phi - \frac{1}{3} \sin 3\phi + \frac{1}{5} \sin 5\phi - \dots$$

In a memoir presented to the Academy of St Petersburg in 1777, but not published until 1798, Euler gave the method afterwards used by Fourier, of determining the coefficients in the expansions; he remarked that if ϕ is expansible in the form

$$A + B \cos \phi + C \cos 2\phi + \dots, \text{ then } A = \frac{1}{\pi} \int_0^{\pi} \phi d\phi, B = \frac{2}{\pi} \int_0^{\pi} \phi \cos \phi d\phi, \&c.$$

The second period in the development of the theory commenced in 1807, when Fourier communicated his first memoir on the Theory of Heat to the French Academy. His exposition of the present theory is contained in a memoir sent to the Academy in 1811, of which his great treatise *Théorie analytique de la chaleur*, published in 1822, is, in the main, a reproduction. Fourier set himself to consider the representation of a function given graphically, and was the first fully to grasp the idea that a single function may consist of detached portions given arbitrarily by a graph. He had an accurate conception of the convergence of a series, and although he did not give a formally complete proof that a function with discontinuities is representable by the series, he indicated in particular cases the method of procedure afterwards carried out by Dirichlet. As an exposition of principles, Fourier's work is still worthy of careful perusal by all students of the subject. Poisson's treatment of the subject, which has been adopted in English works (see the *Journal de l'école polytechnique*, vol. xi., 1820, and vol. xii., 1823, and also his treatise, *Théorie de la chaleur*, 1835),

depends upon the equality $\int_{-\pi}^{\pi} f(a) \frac{1-h^2}{1-2h \cos(x-a)+h^2} da$

$$= \frac{1}{2\pi} \int_{-\pi}^{\pi} f(a) da + \frac{1}{\pi} \sum h^n \int_{-\pi}^{\pi} f(a) \cos n(x-a) da$$

where $0 < h < 1$; the limit of the integral on the left-hand side is evaluated when $h=1$, and found to be $\frac{1}{2} \{ f(x+0) + f(x-0) \}$, the series on the right-hand side becoming Fourier's Series. The equality of the two limits is then inferred. If the series is assumed to be convergent when $h=1$, by a theorem of Abel's its sum is continuous with the sum for values of h less than unity, but a proof of the convergency for $h=1$ is requisite for the validity of Poisson's proof; as Poisson gave no such proof of convergency, his proof of the general theorem cannot be accepted. The deficiency cannot be removed except by a process of the same nature as that afterwards applied by Dirichlet. The definite integral has been carefully studied by Schwarz (see two memoirs in his collected

works on the integration of the equation $\frac{\delta^2 u}{\delta x^2} + \frac{\delta^2 u}{\delta y^2} = 0$), who showed that the limiting value of the integral depends upon the manner in which the limit is approached. Investigations of Fourier's Series were also given by Cauchy (see his "Mémoire sur les développements des fonctions en séries périodiques," *Mém. de l'Inst.*, vol. vi., also *Ceuvres complètes*, vol. vii.); his method, which depends upon a use of complex variables, was accepted, with some modification, as valid by Riemann, but one at least of his proofs is no longer regarded as satisfactory. The first completely satisfactory investigation is due to Dirichlet; his first memoir appeared in *Crelle's Journal* for 1829, and the second, which is a model of clearness, in *Dove's Repertorium der Physik*. Dirichlet laid down certain definite sufficient conditions in regard to the nature of a function which is expansible, and found under these conditions the limiting value of the sum of n terms of the series. Dirichlet's determination of the sum of the series at a point of discontinuity has been criticized by Schläfli (see *Crelle's Journal*, vol. lxxii.) and by Du Bois-Reymond (*Mathem. Annalen*, vol. vii.), who maintained that the sum is really

indeterminate. Their objection appears, however, to rest upon a misapprehension as to the meaning of the sum of the series; if x_1 be the point of discontinuity, it is possible to make x approach x_1 , and n become indefinitely great, so that the sum of the series takes any assigned value in a certain interval, whereas we ought to make $x = x_1$, first and afterwards $n = \infty$, and no other way of going to the double limit is really admissible. Other papers by Dircksen (*Crelle*, vol. iv.) and Bessel (*Astronomische Nachrichten*, vol. xvi.), on similar lines to those by Dirichlet, are of inferior importance. Many of the investigations subsequent to Dirichlet's have the object of freeing a function from some of the restrictions which were imposed upon it in Dirichlet's proof, but no complete set of necessary and sufficient conditions as to the nature of the function has been obtained. Lipschitz ("De explicatione per series trigonometricas," *Crelle's Journal*, vol. lxxiii., 1864) showed that, under a certain condition, a function which has an infinite number of maxima and minima in the neighbourhood of a point is still expansible; his condition is that at the point of discontinuity β , $|f(\beta + \delta) - f(\beta)| < B\delta^a$ as δ converges to zero, B being a constant, and a a positive exponent. A somewhat wider condition is

$$f(\beta + \delta) - f(\beta) \log \delta = o, \\ \delta = 0$$

for which Lipschitz's results would hold. This last condition is adopted by Dini in his treatise (*Sopra la serie di Fourier*, &c., Pisa, 1880).

The modern period in the theory was inaugurated by the publication by Riemann in 1867 of his very important memoir, written in 1854, *Über die Darstellbarkeit einer Function durch eine trigonometrische Reihe*. The first part of his memoir contains a historical account of the work of previous investigators; in the second part there is a discussion of the foundations of the Integral Calculus, and the third part is mainly devoted to a discussion of what can be inferred as to the nature of a function respecting the changes in its value for a continuous change in the variable, if the function is capable of representation by a trigonometrical series. Dirichlet and probably Riemann thought that all continuous functions were everywhere representable by the series; this view was refuted by Du Bois-Reymond (*Abh. der Bayer. Akad.* vol. xii. 2). It was shown by Riemann that the convergence or non-convergence of the series at a particular point x depends only upon the nature of the function in an arbitrarily small neighbourhood of the point x . The first to call attention to the importance of the theory of uniform convergence of series in connexion with Fourier's Series was Stokes, in his memoir "On the Critical Values of the Sums of Periodic Series" (*Camb. Phil. Trans.*, 1847; *Collected Papers*, vol. i.). As the method of determining the coefficients in a trigonometrical series is invalid unless the series converges in general uniformly, the question arose whether series with coefficients other than those of Fourier exist which represent arbitrary functions. Heine showed (*Crelle's Journal*, vol. lxxi., 1870, and in his treatise *Kugelfunctionen*, vol. i.) that Fourier's Series is in general uniformly convergent, and that if there is a uniformly convergent series which represents a function, it is the only one of the kind. G. Cantor then showed (*Crelle's Journal*, vols. lxxii. lxxiii.) that even if uniform convergence be not demanded, there can be but one convergent expansion for a function, and that it is that of Fourier. In the *Math. Ann.* vol. v., Cantor extended his investigation to functions having an infinite number of discontinuities. Important contributions to the theory of the series have been published by Du Bois-Reymond (*Abh. der Bayer. Akademie*, vol. xii., 1875, two memoirs, also in *Crelle's Journal*, vols. lxxiv. lxxvi. lxxix.), by Kronecker (*Berliner Berichte*, 1885), by O. Hölder (*Berliner Berichte*, 1885), by Jordan (*Comptes rendus*, 1881, vol. xcii.), by Ascoli (*Math. Ann.*, 1873, and *Annali di matematica*, vol. vi.), and by Genocchi (*Atti della R. Acc. di Torino*, vol. x., 1875). Hamilton's memoir on "Fluctuating Functions" (*Trans. R.I.A.*, vol. xix., 1842) may also be studied with profit in this connexion. A memoir by Brodén (*Math. Annalen*, vol. liii.) contains a good investigation of some of the most recent results on the subject. The scope of Fourier's Series has been extended by Lebesgue, who introduced a conception of integration wider than that due to Riemann. Lebesgue's work on Fourier's Series will be found in his treatise, *Leçons sur les séries trigonométriques* (1906); also in a memoir, "Sur les séries trigonométriques," *Annales sc. de l'école normale supérieure*, series ii. vol. xx. (1903), and in a paper "Sur la convergence des séries de Fourier," *Math. Annalen*, vol. lxiv. (1905).

AUTHORITIES.—The foregoing historical account has been mainly drawn from A. Sachse's work, "Versuch einer Geschichte der Darstellung willkürlicher Functionen einer Variablen durch trigonometrische Reihen," published in *Schlömilch's Zeitschrift für Mathematik*, Supp., vol. xxv. 1880, and from a paper by G. A. Gibson "On the History of the Fourier Series" (*Proc. Ed. Math. Soc.* vol. xi.). Reiff's *Geschichte der unendlichen Reihen* may also be consulted, and also the first part of Riemann's memoir referred to above. Besides Dini's treatise already referred to, there is a lucid treatment of the subject from an elementary point of view in C. Neumann's treatise, *Über die nach Kreis-, Kugel- und Cylinder-Functionen fortschreitenden Entwicklungen*. Jordan's discussion of the subject in his *Cours d'analyse* is worthy of attention; an account of functions with limited variation is given in vol. i.; see also a paper by Study

in the *Math. Annalen*, vol. xlvii. On the second mean-value theorem papers by Bonnet (*Brux. Mémoires*, vol. xxiii., 1849, *Lionville's Journal*, vol. xiv., 1849), by Du Bois-Reymond (*Crelle's Journal*, vol. lxxix., 1875), by Hankel (*Zeitschrift für Math. und Physik*, vol. xiv., 1869), by Meyer (*Math. Ann.*, vol. vi., 1872) and by Hölder (*Göttinger Anzeigen*, 1894) may be consulted; the most general form of the theorem has been given by Hobson (*Proc. London Math. Soc.*, Series II. vol. vii., 1909). On the theory of uniform convergence of series, a memoir by W. F. Osgood (*Amer. Journal of Math.* xix.) may be with advantage consulted. On the theory of series in general, in relation to the functions which they can represent, a memoir by Baire (*Annali di matematica*, Series III. vol. iii.) is of great importance. Bromwich's *Theory of Infinite Series* (1908) contains much information on the general theory of series. Bôcher's "Introduction to the Theory of Fourier's Series," *Annals of Math.*, Series II. vol. vii., 1906, will be found useful. See also Carslaw's *Introduction to the Theory of Fourier's Series and Integrals*, and the *Mathematical Theory of the Conduction of Heat* (1906). A full account of the theory will be found in Hobson's treatise *On the Theory of Functions of a Real Variable and on the Theory of Fourier's Series* (1907). (E. W. H.)

FOURMIES, a town of northern France, in the department of Nord, on an affluent of the Sambre, 39 m. S.E. of Valenciennes by rail. Pop. (1906) 13,308. It is one of the chief centres in France for wool combing and spinning, and produces a great variety of cloths. The glass-works of Fourmies date from 1599, and were the first established in the north of France. Iron is worked in the vicinity, and there are important forges and foundries. Enamel-ware is also manufactured. In 1891 labour troubles brought about military intervention and consequent bloodshed. A board of trade arbitration and a school of commerce and industry are among the public institutions.

FOURMONT, ÉTIENNE (1683–1745), French orientalist, was born at Herbelai, near Saint Denis, on the 23rd of June 1683. He studied at the Collège Mazarin, Paris, and afterwards in the Collège Montaigu, where his attention was attracted to Oriental languages. Shortly after leaving the college he published a *Traduction du commentaire du Rabbin Abraham Aben Esra sur l'ecclésiaste*. In 1711 Louis XIV. appointed Fourmont to assist a young Chinese, Hoan-ji, in compiling a Chinese grammar. Hoan-ji died in 1716, and it was not until 1737 that Fourmont published *Méditationes Sinicae* and in 1742 *Grammatica Sinica*. He also wrote *Reflexions critiques sur les histoires des anciens peuples* (1735), and several dissertations printed in the *Mémoires* of the Academy of Inscriptions. He became professor of Arabic in the Collège de France in 1715. In 1713 he was elected a member of the Academy of Inscriptions, in 1738 a member of the Royal Society of London, and in 1742 a member of that of Berlin. He died at Paris on the 10th of December 1745.

His brother, Michel Fourmont (1690–1746), was also a member of the Academy of Inscriptions, and professor of the Syriac language in the Royal College, and was sent by the government to copy inscriptions in Greece.

An account of Étienne Fourmont's life and a catalogue of his works will be found in the second edition (1747) of his *Reflexions critiques*.

FOURNET, JOSEPH JEAN BAPTISTE XAVIER (1801–1869), French geologist and metallurgist, was born at Strassburg on the 15th of May 1801. He was educated at the École des Mines at Paris, and after considerable experience as a mining engineer he was in 1834 appointed professor of geology at Lyons. He was a man of wide knowledge and extensive research, and wrote memoirs on chemical and mineralogical subjects, on eruptive rocks, on the structure of the Jura, the metamorphism of the Western Alps, on the formation of oolitic limestones, on kaolinization and on metalliferous veins. On metallurgical subjects also he was an acknowledged authority; and he published observations on the order of sulphurability of metals (*loi de Fournet*). He died at Lyons on the 8th of January 1869. His chief publications were: *Études sur les dépôts métallifères* (Paris, 1834); *Histoire de la dolomie* (Lyons, 1847); *De l'extension des terrains houillers* (1855); *Géologie lyonnaise* (Lyons, 1861).

FOURNIER, PIERRE SIMON (1712–1768), French engraver and typefounder, was born at Paris on the 15th of September 1712. He was the son of a printer, and was brought up to his father's business. After studying drawing under the painter

Colson, he practised for some time the art of wood-engraving, and ultimately turned his attention to the engraving and casting of types. He designed many new characters, and his foundry became celebrated not only in France, but in foreign countries. Not content with his practical achievements, he sought to stimulate public interest in his art by the production of various works on the subject. In 1737 he published his *Table des proportions qu'il faut observer entre les caractères*, which was followed by several other technical treatises. In 1758 he assailed the title of Gutenberg to the honour awarded him as inventor of printing, claiming it for Schöffer, in his *Dissertation sur l'origine et les progrès de l'art de graver en bois*. This gave rise to a controversy in which Schöppin and Baer were his opponents. Fournier's contributions to this debate were collected and re-printed under the title of *Traité historiques et critiques sur l'origine de l'imprimerie*. His principal work, however, was the *Manuel typographique*, which appeared in 2 vols. 8vo in 1764, the first volume treating of engraving and type-founding, the second of printing, with examples of different alphabets. It was the author's design to complete the work in four volumes, but he did not live to execute it. He died at Paris on the 8th of October 1768.

FOURNIER L'HÉRITIER, CLAUDE (1745-1825), French revolutionist, called "l'Américain," was born at Auzon (Haute-Loire) on the 21st of December 1745, the son of a poor weaver. He went to America to seek his fortune, and started at San Domingo an establishment for making *tafia* (an inferior quality of rum), but lost his money in a fire. Returning to France he threw himself into the Revolution with enthusiasm, and specially distinguished himself by the active part he took in the organization of the popular armed force by means of which the most famous of the revolutionary *coups* were effected. His influence was principally manifested in the insurrections of the 5th and 6th of October 1789, the 17th of July 1791, and the 20th of June and the 10th of August 1792. He was on bad terms with the majority of the politicians, and particularly with Marat, and spent a great part of his time in prison, all the governments regarding him as an agitator and accusing him of inciting to insurrection. Arrested for the first time for trying to force an entrance into the club of the Cordeliers, from which he had been expelled, he was released, but was in prison from the 12th of December 1793 to the 21st of September 1794, and again from the 9th of March 1795 to the 26th of October 1795. After the attempt on the First Consul in the rue Sainte-Nicaise he was deported to Guiana, but was allowed to return to France in 1809. In 1811, while under surveillance at Auxerre, he was accused of having provoked an *émeute* against taxes known as the *droits réunis* (afterwards called *contributions indirectes*), and was imprisoned in the Château d'If, where he remained till 1814. On the second restoration of the Bourbons Fournier was confined for about nine months in the prison of La Force. After 1816 he was left unmolested, turned royalist, and passed his last years in importuning the Restoration government for compensation for his lost property in San Domingo. He died in obscurity.

For further details see preface to F. A. Aulard's edition of Fournier's *Mémoires secrets* (Paris, 1890), published by the Société de l'histoire de la Révolution.

FOURTOU, MARIE FRANÇOIS OSCAR BARDY DE (1836-1897), French politician, was born at Ribérac (Dordogne) on the 3rd of January 1836, and represented his native department in the National Assembly after the Franco-German War. There he proved a useful adherent to Thiers, who made him minister of public works in December 1872. He was minister of religion in the cabinet of May 18-24, 1873, being the only member of the Right included by Thiers in that short-lived ministry. As minister of education, religion and the fine arts in the reconstructed cabinet of the duc de Broglie he had used his administrative powers to further clerical ends, and as minister of the interior in Broglie's cabinet in 1877 he resumed the administrative methods of the Second Empire. With a well-known Bonapartist, Baron R. C. F. Reille, as his secretary, he replaced

republican functionaries by Bonapartist partisans, reserving a few places for the Legitimists. In the general elections of that year he used the whole weight of officialdom to secure a majority for the Right, to support a clerical and reactionary programme. He accompanied Marshal MacMahon in his tour through southern France, and the presidential manifesto of September, stating that the president would rely solely on the Senate should the elections prove unfavourable, was generally attributed to Fourtou. In spite of these efforts the cabinet fell, and a commission was appointed to inquire into their unconstitutional abuse of power. Fourtou was unseated in consequence of the revelations made in the report of the commission. In the Chamber of Deputies Gambetta gave the lie direct to Fourtou's allegation that the republican party opposed every republican principle that was not antiquated. A duel was fought in consequence, but neither party was injured. He was re-elected to the chamber in 1879 and entered the Senate the next year. Failing to secure re-election to the Senate in 1885 he again entered the popular chamber as Legitimist candidate in 1889, but he took no further active part in politics. He died in Paris in 1897.

His works include *Histoire de Louis XVI* (1840); *Histoire de Saint Pie V* (1845); *Mme Swetchine, sa vie et ses œuvres* (2 vols., 1859); *La Question italienne* (1860); *De la contre-révolution* (1876); and *Mémoires d'un royaliste* (2 vols., 1888).

FOUSSA, or FOSSA, the native name of *Cryptoprocta ferox*, a somewhat cat-like or civet-like mammal peculiar to Madagascar, where it is the largest carnivorous animal. It is about twice the size of a cat (5 ft. from nose to end of tail), with short close fur of nearly uniform pale brown. Little is known of its habits, except that it is nocturnal, frequently attacks and carries off goats, and especially kids, and shows great ferocity when wounded, on which account it is much dreaded by the natives. An example lived in the London zoological gardens for nearly fourteen years. See CARNIVORA.

FOWEY (usually pronounced *Foy*), a seaport and market-town in the Bodmin parliamentary division of Cornwall, England, on the Great Western railway, 25 m. by sea W. of Plymouth. Pop. (1901) 2258. It lies on the west shore of the picturesque estuary of the river Fowey, close to the water's edge, and sheltered by a screen of hills. Its church of St Nicholas is said to have been built in the 14th century, on the site of a still older edifice dedicated to St Finbar of Cork. It has a fine tower and late Norman doorway. Within are a priest's chamber over the porch, a handsome oak ceiling, a 15th-century pulpit, and some curious monuments and brasses. Place House, adjacent to the church, is a highly ornate Tudor building. A few ancient houses remain in the town. Deep-sea fishing is carried on; but the staple trade consists in the export of china clay and minerals, coal being imported. Fowey harbour, which is easy of access in clear weather, will admit large vessels at any state of the tide. St Catherine's Fort, dating from the days of Henry VIII. and now ruined, stands at the harbour's mouth, and once formed the main defence of the town. Opposite the town, and connected with it by Bodeneck Ferry, is the village of Polruan. Its main features are St Saviour's Chapel, with an ancient rood-stone, and the remains of Hall House, which was garrisoned during the civil wars of the 17th century.

Fowey (Fawy, Vawy, Fowyk) held a leading position amongst Cornish ports from the reign of Edward I. to the days of the Tudors. The numerous references to the privateering exploits of its ships in the Patent and Close Rolls and the extraordinary number of them at the siege of Calais in 1346 alike testify to its importance. During this period the king's mandates were addressed to the bailiffs or to the mayor and bailiffs, and no charter of incorporation appears to have been granted until the reign of James II. Under the second charter of 1690 the common council consisted of a mayor and eight aldermen and these with a recorder elected the free burgesses. A member for Fowey and Looe was summoned to a council at Westminster in 1340, but from that date until 1571, when it was entrusted with the privilege of returning two members, it had no parliamentary representation. By the Reform Act of 1832 it lost both its

members. It had ceased to exercise its municipal functions a few years previously. In 1316 the prior of Tywardreath, as lord of the manor, obtained the right to hold a Monday market and two fairs on the feasts of St Finbar and St Lucy, but by the charter of 1690 provision was made for a Saturday market and three fairs, on the 1st of May, 10th of September and Shrove Tuesday, and only these three continue to be held.

FOWL (Dan. *Fugl*, Ger. *Vogel*), a term originally used in the sense that bird¹ now is, but, except in composition,—as sea-fowl, wild-fowl and the like,—practically almost confined² at present to designate the otherwise nameless species which struts on our dunghills, gathers round our barn-doors, or stocks our poultry yards—the type of the genus *Gallus* of ornithologists, of which four well-marked species are known. The first of these is the red jungle-fowl of the greater part of India, *G. ferrugineus*,—called by many writers *G. bankiva*,—which is undoubtedly the parent stock of all the domestic races (cf. Darwin, *Animals and Plants under Domestication*, i. pp. 233-246). It inhabits northern India from Sind to Burma and Cochin China, as well as the Malay Peninsula and many of the islands as far as Timor, besides the Philippines. It occurs on the Himalayas up to the height of 4000 ft., and its southern limits in the west of India proper are, according to Jerdon, found on the Raj-peepla hills to the south of the Nerbudda, and in the east near the left bank of the Godavery, or perhaps even farther, as he had heard of its being killed at Cummum. This species resembles in plumage what is commonly known among poultry-fanciers as the "Black-breasted game" breed, and this is said to be especially the case with examples from the Malay countries, between which and examples from India some differences are observable—the latter having the plumage less red, the ear-lappets almost invariably white, and slate-coloured legs, while in the former the ear-lappets are crimson, like the comb and wattles, and the legs yellowish. If the Malayan birds be considered distinct, it is to them that the name *G. bankiva* properly applies. This species is said to be found in lofty forests and in dense thickets, as well as in ordinary bamboo-jungles, and when cultivated land is near its haunts, it may be seen in the fields after the crops are cut in straggling parties of from 10 to 20. The crow to which the cock gives utterance morning and evening is just like that of a bantam, never prolonged as in most domestic birds. The hen breeds from January to July, according to the locality; and lays from 8 to 12 creamy-white eggs, occasionally scraping together a few leaves or a little dry grass by way of a nest. The so-called *G. giganteus*, formerly taken by some ornithologists for a distinct species, is now regarded as a tame breed of *G. ferrugineus* or *bankiva*. The second good species is the grey jungle-fowl, *G. sonnerati*, whose range begins a little to the northward of the limits of the preceding, and it occupies the southern part of the Indian peninsula, without being found elsewhere. The cock has the end of the shaft of the neck-hackles dilated, forming a horny plate, like a drop of yellow sealing-wax. His call is very peculiar, being a broken and imperfect kind of crow, quite unlike that of *G. ferrugineus* and more like a cackle. The two species where their respective ranges overlap, occasionally interbreed in a wild state, and the present readily crosses in confinement with domestic poultry, but the hybrids are nearly always sterile. The third species is the Sinhalese jungle-fowl, *G. stanleyi* (the *G. lafayettii* of some authors), peculiar to Ceylon. This also greatly resembles in plumage some domestic birds, but the cock is red beneath, and has a yellow comb with a red edge and purplish-red cheeks and wattles. He has also a singularly different voice, his crow being dissyllabic. This bird crosses readily with tame hens, but the hybrids are believed to be infertile. The fourth species, *G. varius* (the *G. furcatus* of some authors), inhabits Java and the islands eastwards as far as Flores. This differs remarkably from the others in not possessing hackles, and

in having a large unserrated comb of red and blue and only a single chin wattle. The predominance of green in its plumage is another easy mark of distinction. Hybrids between this species and domestic birds are often produced, but they are most commonly sterile. Some of them have been mistaken for distinct species, as those which have received the names of *G. aeneus* and *G. temmincki*.

Several circumstances seem to render it likely that fowls were first domesticated in Burma or the countries adjacent thereto, and it is the tradition of the Chinese that they received their poultry from the West about the year 1400 B.C. By the Institutes of Manu, the tame fowl is forbidden, though the wild is allowed to be eaten—showing that its domestication was accomplished when they were written. The bird is not mentioned in the Old Testament nor by Homer, though he has Ἀλέκτωρ (cock) as the name of a man, nor is it figured on ancient Egyptian monuments. Pindar mentions it, and Aristophanes calls it the Persian bird, thus indicating it to have been introduced to Greece through Persia, and it is figured on Babylonian cylinders between the 6th and 7th centuries B.C. It is sculptured on the Lycian marbles in the British Museum (c. 600 B.C.), and E. Blyth remarks (*Ibis*, 1867, p. 157) that it is there represented with the appearance of a true jungle-fowl, for none of the wild *Galli* have the upright bearing of the tame breed, but carry their tail in a drooping position. For further particulars of these breeds see POULTRY. (A. N.)

FOWLER, CHARLES (1792-1867), English architect, was born at Cullompton, Devon, on the 17th of May 1792. After serving an apprenticeship of five years at Exeter, he went to London in 1814, and entered the office of David Laing, where he remained till he commenced practice for himself. His first work of importance was the court of bankruptcy in Basinghall Street, finished in 1821. In the following year he gained the first premium for a design for the new London bridge, which, however, was ultimately built according to the design of another architect. Fowler's other designs for bridges include one constructed across the Dart at Totnes. He was also the architect for the markets of Covent Garden and Hungerford, the new market at Gravesend, and Exeter lower market, and besides several churches he designed Devon lunatic asylum (1845), the London fever hospital (1849), and the hall of the Wax Chandlers' Company, Gresham Street (1853). For some years he was honorary secretary of the institute of British architects, and he was afterwards created vice-president. He retired from his profession in 1853, and died at Great Marlow, Bucks, on the 26th of September 1867.

FOWLER, EDWARD (1632-1714), English divine, was born in 1632 at Westerleigh, Gloucestershire, and was educated at Corpus Christi College, Oxford, afterwards migrating to Trinity College, Cambridge. He was successively rector of Norhill, Bedfordshire (1656) and of All Hallows, Bread Street, London (1673), and in 1676 was elected a canon of Gloucester, his friend Henry More, the Cambridge Platonist, resigning in his favour. In 1681 he became vicar of St Giles, Cripplegate, but after four years was suspended for Whiggism. When the Declaration of Indulgence was published in 1687 he successfully influenced the London clergy against reading it. In 1691 he was consecrated bishop of Gloucester and held the see until his death on the 26th of August 1714. Fowler was suspected of Pelagian tendencies, and his earliest book was a *Free Discourse* in defence of *The Practices of Certain Moderate Divines called Latitudinarians* (1670). *The Design of Christianity*, published by him in the following year, in which he laid stress on the moral design of revelation, was criticized by Baxter in his *How far Holiness is the Design of Christianity* (1671) and by Bunyan in his *Defence of the Doctrine of Justification by Faith* (1672), the latter describing the *Design* as "a mixture of Popery, Socinianism and Quakerism," a horrid accusation to which Fowler replied in a scurrilous pamphlet entitled *Dirty Wip'd Off*. He also published, in 1693, *Twenty-Eight Propositions, by which the Doctrine of the Trinity is endeavoured to be explained*, challenging with some success the Socinian position.

¹ Bird (cognate with *breed* and *brood*) was originally the young of any animal, and an early Act of the Scottish parliament speaks of "Wolf-birdis," i.e. Wolf-cubs.

² Like *Deer* (Dan. *Dyr*. Ger. *Tier*). *Beast*, too, with some men has almost attained as much specialization.

FOWLER, JOHN (1826–1864), English inventor, was born at Melksham, Wilts, on the 11th of July 1826. He learned practical engineering at Middlesborough-on-Tees, and about 1850 invented a mechanical system for the drainage of land. In 1852 he began experiments in steam cultivation, and in 1858 the Royal Agricultural Society awarded him the prize of £500 which it had offered for a steam-cultivator that should be an economic substitute for the plough or the spade. In 1860 he founded at Hunslet, Leeds, the firm of Fowler & Co., manufacturers of agricultural machinery, traction engines, &c. He died at Ackworth, Yorkshire, on the 4th of December 1864.

FOWLER, SIR JOHN (1817–1898), English civil engineer, was born on the 15th of July 1817 at Wadsley Hall, near Sheffield, where his father was a land-surveyor. At the age of sixteen he became a pupil of John Towlerton Leather, the engineer of the Sheffield water-works. The latter's uncle, George Leather, was engineer of the Great Aire and Calder Navigation Company, of the Goole Docks, and other similar works, and Fowler passed occasionally into his employment, in which he acquired a thorough knowledge of hydraulic engineering. The era of railway construction soon swept both Fowler and his employers into its service, and one of his first employments was to oppose the route of the Midland railway, chosen by the Stephensons, which left Sheffield on a branch line, and was therefore strongly resented by the inhabitants. The prestige of the Stephensons carried all before it, but in later life Sir John Fowler had the satisfaction of seeing the opposition of his clients justified, and Sheffield placed on the main line. In 1838 he went into the office of John Urpeth Rastrick, one of the leading railway engineers of the day, where he was employed in designing bridges for the line from London to Brighton, and also in surveying for railways in Lancashire. In 1839 he went as representative of Mr Leather to take charge of the construction of the Stockton & Hartlepool railway and remained as manager of the line after it was finished. In 1844 he began his independent career as an engineer, and from the first was largely employed, more particularly in laying out the small railway systems which eventually were amalgamated under the title of the Manchester, Sheffield & Lincolnshire. In the course of this work he designed a bridge known as Torksey Bridge, which was disallowed by the Board of Trade inspector, Captain (afterwards Field-Marshal Sir) Lintorn Simmons. The engineering profession espoused Fowler's side in the controversy which followed, and as a result the verdict of the Board of Trade was modified. The episode was the beginning of a warm friendship between these distinguished representatives of civil and military engineering. Fowler was engineer of the London Metropolitan railway, the pioneer of underground railways, and noteworthy in that it was mostly made not by tunnelling, but by excavating from the surface and then covering in the permanent way; and he lived to be one of the engineers officially connected with the deep tunnelling "tube" system extensively adopted for electric railways in London. He was also engaged in the making of railways in Ireland, and in 1867 he was selected by Disraeli to serve on a commission to advise the government in respect of a proposal for a state-purchase of the Irish railway system. He also carried out considerable works in relation to the Nene Valley drainage and the reclamation of land at the Norfolk estuary.

In 1865 he was elected president of the Institution of Civil Engineers, the youngest president who had ever sat in the chair. He was strongly opposed to the project of a Channel tunnel to France, and in 1872 he endeavoured to obtain the consent of parliament to a Channel ferry scheme, whereby trains were to be transported across the strait in large ferry steamers. The proposal involved the making of enlarged harbours at Dover and Audresselles on the French coast, and the bill, after passing the Commons, was thrown out by the casting vote of the chairman of a committee of the House of Lords. In 1875 he was enabled to render, in his private capacity, a signal service to the Italian government, which was much embarrassed by impracticable proposals pressed on it by Garibaldi for a rectification of the course of the Tiber and other engineering works. He had

several interviews with the Italian patriot, and persuaded him of the impracticable nature of his plan, thereby obtaining for the government leisure to devise a more reasonable scheme. For eight years from 1871 he acted as general engineering adviser in Egypt to the Khedive Ismail. He projected a railway to the Sudan, and also the reparation of the barrage. These and many other plans came to an end owing to financial reasons. But the maps and surveys for the railway were given to the war office, and proved most useful to Lord Wolseley in his Nile expedition. For his service Fowler was made K.C.M.G. (1885). He was created a baronet in 1890 on the completion of the Forth bridge, of which with his partner Sir Benjamin Baker he was joint engineer. He died at Bournemouth on the 20th of November 1898.

FOWLER, WILLIAM (c. 1560–1614), Scottish poet, was born about the year 1560. He attended St Leonard's college, St Andrews, between 1574 and 1578, and in 1581 he was in Paris studying civil law. In 1581 he issued a pamphlet against John Hamilton and other Catholics, who had, he said, driven him from his country. He subsequently (about 1590) became private secretary and Master of Requests to Anne of Denmark, wife of James VI., and was renominated to these offices when the queen went to England. In 1609 his services were rewarded by a grant of 2000 acres in Ulster. His sister Susannah Fowler married Sir John Drummond, and was mother of the poet William Drummond of Hawthornden. On the title-page of *The Triumphs of Petrarke*, Fowler styles himself "P. of Hawick," which has been held to mean that he was parson of Hawick, but this is doubtful. A MS. collection of seventy-two sonnets, entitled *The Tarantula of Love*, and a translation (1587) from the Italian of the *Triumphs of Petrarke* are preserved in the library of the university of Edinburgh, in the collection bequeathed by his nephew, William Drummond. Two other volumes of his manuscript notes, scrolls of poems, &c., are preserved among the Drummond MSS., now in the library of the Society of Antiquaries of Scotland. Specimens of Fowler's verses were published in 1803 by John Leyden in his *Scottish Descriptive Poems*. Fowler contributed a prefatory sonnet to James VI.'s *Furies*; and James, in return, commended, in verse, Fowler's *Triumphs*.

FOX, CHARLES JAMES (1749–1806), British statesman and orator, was the third son of Henry Fox, 1st Lord Holland, and his wife, Lady Caroline Lennox, eldest daughter of Charles Lennox, 2nd duke of Richmond. He was born at 9 Conduit Street, Westminster, on the 24th of January 1749. The father, who treated his children with extreme indulgence, allowed him to choose his school, and he elected to go to one kept at Wandsworth by a French refugee, named Pampelonne. In a very short time he asked to be sent to Eton, where he went in 1757. At Eton he did no more work than was acceptable to him, but he had an inborn love of literature, and he laid the foundation of that knowledge of the classic languages which in after years was the delight of his life. The vehemence of his temper was controlled by an affectionate disposition. When quite a boy he checked his own tendency to fits of passion on learning that his father trusted him to cure his defects.

That he learnt anything, and that he grew up an amiable and magnanimous man, were solely due to his natural worth, for no one ever owed less to education or to family example. The relations of Lord Holland to his sons would be difficult to parallel. He not only treated them, and in particular Charles, as friends and companions in pleasure from the first, but he did his best to encourage them in dissipation. In 1763 he took Charles for a tour on the continent, introduced him to the most immoral society of the time and gave him money with which to gamble. The boy came back to Eton a precocious rake. It was his good fortune that he did go back, for he was subjected to a wholesome course of ridicule by the other boys, and was flogged by Dr Barnard, the headmaster. In 1764 Charles proceeded to Hertford College, Oxford. At Oxford, as at Eton, he read literature from natural liking, and he paid some attention to mathematics. His often quoted saying that he found mathematics entertaining was probably meant as a jest at the expense

of Sir G. Macartney, to whom he was writing, and who was known to maintain that it was useless. His own account of his school and college training, given in a letter to the same correspondent (6th August 1767), is: "I employed almost my whole time at Oxford in the mathematical and classical knowledge, but more particularly in the latter, so that I understand Latin and Greek tolerably well. I am totally ignorant in every part of useful knowledge. I am more convinced every day how little advantage there is in being what at school and the university is called a good scholar: one receives a good deal of amusement from it, but that is all. At present I read nothing but Italian, which I am immoderately fond of, particularly of the poetry. . . . As for French, I am far from being so thorough a master of it as I could wish, but I know so much of it that I could perfect myself in it at any time with very little trouble, especially if I pass three or four months in France." The passage is characteristic. It shows at once his love of good literature and his thoroughness. Fox's youth was disorderly, but it was never indolent. He was incapable of half doing anything which he did at all. He did perfect himself in French, and he showed no less determination to master mere sports. At a later period when he had grown fat he accounted for his skill in taking "cut halls" at tennis by saying that he was a very "painstaking man." He was all his life a great and steady walker.

The disorders of his early years were notorious, and were a common subject of gossip. In the spring of 1767 he left Oxford and joined his father on the continent during a tour in France and Italy. In 1768 Lord Holland bought the pocket borough of Midhurst for him, and he entered on his parliamentary career, and on London society, in 1769. Within the next few years Lord Holland reaped to the full the reward for all that was good, and whatever was evil, in the training he had given his son. The affection of Charles Fox for his father was unbounded, but the passion for gambling which had been instilled in him as a boy proved the ruin of the family fortune. He kept racehorses, and bet on them largely. On the racecourse he was successful, and it is another proof of his native thoroughness that he gained a reputation as a handicapper. It is said that he won more than he lost on the course. At the gambling table he was unfortunate, and there can be little question that he was fleeced both in London and in Paris by unscrupulous players of his own social rank, who took advantage of his generosity and whose worthlessness he knew. In the ardour of his passion Fox took his losses and their consequences with an attractive gaiety. He called the room in which he did business with the Jew money-lenders his "Jerusalem chamber." When his elder brother had a son, and his prospects were injured, he said that the boy was a second Messiah, who had appeared for the destruction of the Jews. "He had his jest, and they had his estate." In 1774 Lord Holland had to find £140,000 to pay the gambling debts of his sons. For years Charles lived in pecuniary embarrassment, and during his later years, when he had given up gambling, he was supported by the contributions of wealthy friends, who in 1793 formed a fund of £70,000 for his benefit.

His public career did not supply him with a check on habits of dissipation in the shape of the responsibilities of office. He began, as was to be expected in his father's son, by supporting the court; and in 1770, when only twenty-one, he was appointed a junior lord of the admiralty with Lord North. During the violent conflict over the Middlesex election (see WILKES, JOHN) he took the unpopular side, and vehemently asserted the right of the House of Commons to exclude Wilkes. In 1772 during the proceedings against Croshy and Oliver—a part of the "Wilkes and liberty" agitation—he and Lord North were attacked by a mob and rolled in the mud. But Fox's character was incompatible with ministerial service under King George III. The king, himself a man of orderly life, detested him as a gambler and a rake. And Fox was too independent to please a master who expected obedience. In February 1772 he threw up his place to be free to oppose the Royal Marriage Act, on which the king's heart was set. He returned to office as junior lord of the treasury in December. But he was insubordinate; his

sympathy with the American colonies, which were now beginning to resist the claims of the mother country to tax them, made him intolerable to the king and he was dismissed in February 1774. The death of his father on the 1st of July of that year removed an influence which tended to keep him subordinate to the court, and his friendship for Burke drew him into close alliance with the Rockingham Whigs. From the first his ability had won him admiration in the House of Commons. He had prepared to distinguish himself as an orator by the elaborate cultivation of his voice, which was naturally harsh and shrill. His argumentative force was recognized at once, but the full scope of his powers was first shown on the 2nd of February 1775, when he spoke on the disputes with the colonies. The speech is unfortunately lost, but Gibbon, who heard it, told his friend Holroyd (afterwards Earl of Sheffield) that Fox, "taking the vast compass of the question before us, discovered powers for regular debate which neither his friends hoped nor his enemies dreaded."

His great political career dates from that day. It is unique among the careers of British statesmen of the first rank, for it was passed almost wholly in opposition. Except for a few months in 1782 and 1783, and again for a few months before his death in 1806, he was out of office. If he was absolutely sincere in the statement he made to his friend Fitzpatrick, in a letter of the 3rd of February 1778, his life was all he could have wished. "I am," he wrote, "certainly ambitious by nature, but I really have, or think I have, totally subdued that passion. I have still as much vanity as ever, which is a happier passion by far, because great reputation I think I may acquire and keep, great situation I never can acquire, nor if acquired keep, without making sacrifices that I never will make." His words show that he judged himself and read the future accurately. Yet it was certainly a cause of bitter disappointment to him that he had to stand by while the country was in his opinion not only misgoverned, but led to ruin. His reputation as an orator and a political critic, which was great from the first and grew as he lived, most assuredly did not console him for his impotence as a statesman. Of the causes which rendered his brilliant capacity useless for the purpose of obtaining practical success the most important, perhaps the only one of real importance, was his personal character. Lord John Russell (afterwards Earl Russell), his friendly biographer, has to confess that Fox might have joined in the confession of Mirabeau: "The public cause suffers for the immoralities of my youth." His reputation as a rake and gambler was so well established at the very beginning of his career that when he was dismissed from office in 1774 there was a general belief among the vulgar that he had been detected in actual theft. His perfect openness, the notoriety of his bankruptcies and of the seizure of his books and furniture in execution, kept him before the world as a model of dissipation. In 1776, when he was leading the resistance to Lord North's colonial policy, he "neither abandoned gaming nor his rakish life. He was seldom in bed before five in the morning nor out of it before two at noon." At the most important crisis of his life in 1783, he almost made an ostentation of disorder and of indifference not only to appearances, but even to decency. Horace Walpole has drawn a picture of him at that time which Lord Holland, Fox's beloved and admiring nephew, speaking from his early recollections of his uncle, confesses has "some justification." Coming from such an authority the certificate may be held to confirm the substantial accuracy of Walpole. "Fox lodged in St James's Street, and as soon as he rose, which was very late, had a levée of his followers and of the gaming club at Brooks's—all his disciples. His hristly black person, and shagged breast quite open and rarely purified by any ablutions, was wrapped in a foul linen nightgown and his hushy hair dishevelled. In these cynic weeds and with Epicurean good humour did he dictate his politics, and in this school did the heir of the empire attend his lessons and imbibe them." That this cynic manner, and Epicurean speech, were only the outside of a manly and generous nature was well known to the personal friends of Fox, and is now universally allowed. But by the hulk of his contemporaries.

who could not fail to see the weaknesses he ostentatiously displayed, Fox was, not unnaturally, suspected as being immoral and untrustworthy. Therefore when he came into collision with the will of the king he failed to secure the confidence of the nation which was his only support. Nor ought any critical admirer of Fox to deny that George III. was not wholly wrong when he said that the great orator "was totally destitute of discretion and sound judgment." Fox made many mistakes, due in some cases to vehemence of temperament, and in others only to be ascribed to want of sagacity. That he fought unpopular causes is a very insufficient explanation of his failure as a practical statesman. He could have profited by the reaction which followed popular excitement but for his bad reputation and his want of discretion.

During the eight years between his expulsion from office in 1774 and the fall of Lord North's ministry in March 1782 he may indeed be said to have done one very great thing in politics. He planted the seed of the modern Liberal party as opposed to the pure Whigs. In political allegiance he became a member of the Rockingham party and worked in alliance with the marquis and with Burke, whose influence on him was great. In opposing the attempt to coerce the American colonists, and in assailing the waste and corruption of Lord North's administration, as well as the undue influence of the crown, he was at one with the Rockingham Whigs. During the agitation against corruption, and in favour of honest management of the public money, which was very strong between 1779 and 1782, he and they worked heartily together. It had a considerable effect, and prepared the way for the reforms begun by Burke and continued by Pitt. But if Fox learnt much from Burke he learnt with originality. He declined to accept the revolution settlement as final, or to think with Burke that the constitution of the House of Commons could not be bettered. Fox acquired the conviction that, if the House was to be made an efficient instrument for restraining the interference of the king and for securing good government, it must cease to be filled to a very large extent by the nominees of boroughmongers and the treasury. He became a strong advocate for parliamentary reform. In all ways he was the ardent advocate of what have in later times been known as "Liberal causes," the removal of all religious disabilities and tests, the suppression of private interests which hampered the public good, the abolition of the slave trade, and the emancipation of all classes and races of men from the strict control of authority.

A detailed account of his activity from 1774 to 1782 would entail the mention of every crisis of the American War of Independence and of every serious debate in parliament. Throughout the struggle Fox was uniformly opposed to the coercion of the colonies and was the untiring critic of Lord North. While the result must be held to prove that he was right, he prepared future difficulties for himself by the fury of his language. He was the last man in the world to act on the worldly-wise maxim that an enemy should always be treated as if he may one day be a friend, and a friend as if he might become an enemy. On the 29th of November 1779 Fox was wounded in a duel with Mr William Adam, a supporter of Lord North's whom he had savagely denounced. He assailed Lord North with unmeasured invective, directed not only at his policy but at his personal character, though he well knew that the prime minister was an amiable though pliable man, who remained in office against his own wish, in deference to the king who appealed to his loyalty. When the disasters of the American war had at last made a change of ministry necessary, and the king applied to the Whigs, through the intermediary of Lord Shelburne, Fox made a very serious mistake in persuading the marquess of Rockingham not to insist on dealing directly with the sovereign. The result was the formation of a cabinet belonging, in Fox's own words, partly to the king and partly to the country—that is to say, partly of Whigs who wished to restrain the king, and partly of the king's friends, represented by Lord Shelburne, whose real function was to baffle the Whigs. Dissensions began from the first, and were peculiarly acute between Shelburne

and Fox, the two secretaries of state. The old division of duties by which the southern secretary had the correspondence with the colonies and the western powers of Europe, and the northern secretary with the others, had been abolished on the formation of the Rockingham cabinet. All foreign affairs were entrusted to Fox. Lord Shelburne meddled in the negotiations for the peace at Paris. He also persuaded his colleagues to grant some rather scandalous pensions, and Fox's acquiescence in this abuse after his recent agitation against Lord North's waste did him injury. When the marquess of Rockingham died on the 1st of July 1782, and the king offered the premiership to Shelburne, Fox resigned, and was followed by a part of the Rockingham Whigs.

In refusing to serve under Shelburne he was undoubtedly consistent, but his next step was ruinous to himself and his party. On the 14th of February 1783 he formed a coalition with Lord North, based as they declared on "mutual goodwill and confidence." Plausible excuses were made for the alliance, but to the country at large this union, formed with a man whom he had denounced for years, had the appearance of an unscrupulous conspiracy to obtain office on any terms. In the House of Commons the coalition was strong enough to drive Shelburne from office on the 24th of February. The king made a prolonged resistance to the pressure put on him to accept Fox and North as his ministers (see PITT, WILLIAM). On the 2nd of April he was constrained to submit to the formation of a new ministry, in which the duke of Portland was prime minister and Fox and North were secretaries of state. The new administration was ill liked by some of the followers of both. Fox increased its unpopularity both in the House and in the country by consenting against the wish of most of his colleagues to ask for the grant of a sum of £100,000 a year to the prince of Wales. The act had the appearance of a deliberate offence to the king, who was on bad terms with his son. The magnitude of the sum, and his acquiescence in the grant of pensions by the Shelburne ministry, convinced the country that his zeal for economy was hypocritical. The introduction of the India Bill in November 1783 alarmed many vested interests, and offended the king by the provision which gave the patronage of India to a commission to be named by the ministry and removable only by parliament. The coalition, and Fox in particular, were assailed in a torrent of most telling invective and caricature. Encouraged by the growing unpopularity of his ministers, George III. gave it to be understood that he would not look upon any member of the House of Lords who voted for the India Bill as his friend. The bill was thrown out in the upper House on the 17th of December, and next day the king dismissed his ministers.

Fox now went into opposition again. The remainder of his life may be divided into four portions—his opposition to Pitt during the session of 1784; his parliamentary activity till his secession in 1797; his retirement till 1800; his return to activity and his short tenure of office before his death in 1806. During the first of these periods he deepened his unpopularity by assailing the undoubted prerogatives of the crown, by claiming for the House of Commons the right to override not only the king and the Lords but the opinion of the country, and by resisting a dissolution. This last pretension came very ill from a statesman who in 1780 had advocated yearly elections. He lost ground daily before the steady good judgment and unblemished character of Pitt. When parliament was dissolved at the end of the session of 1784, the country showed its sentiments by unseating 180 of the followers of Fox and North. Immense harm was done to both by the publication of a book called *The Beauties of Fox, North and Burke*, a compilation of their abuse of one another in recent years.

Fox himself was elected for Westminster with fewer votes than Admiral Lord Hood, but with a majority over the ministerial candidate, Sir Cecil Wray. The election was marked by an amazing outflow of caricatures and squibs, by weeks of rioting in which Lord Hood's sailors fought pitched battles in St James's Street with Fox's hackney coachmen, and by the intrepid canvassing of Whig ladies. The beautiful duchess of Devonshire

(Georgiana Spencer) is said to have won at least one vote for Fox by kissing a shoemaker who had a romantic idea of what constituted a desirable bribe. The high bailiff refused to make a return, and the confirmation of Fox's election was delayed by the somewhat mean action of the ministry. He had, however, been chosen for Kirkwall, and could fight his cause in the House. In the end he recovered damages from the high bailiff. In his place in parliament he sometimes supported Pitt and sometimes opposed him with effect. His criticism on the ministers' bill for the government of India was sound in principle, though the evils he foresaw did not arise. Little excuse can be made for his opposition to Pitt's commercial policy towards Ireland. But as Fox on this occasion aided the vested interests of some English manufacturers he secured a certain revival of popularity. His support of Pitt's Reform Bill was qualified by a just dislike of the ministers' proposal to treat the possession of the franchise by a constituency as a property and not as a trust. His unsuccessful opposition to the commercial treaty with France in 1787 was unwise and most injurious to himself. He committed himself to the proposition that France was the natural enemy of Great Britain, a saying often quoted against him in coming years. It has been excused on the ground that when he said France he meant the aggressive house of Bourbon. A statesman whose words have to be interpreted by an esoteric meaning cannot fairly complain if he is often misunderstood. In 1788 he travelled in Italy, but returned in haste on hearing of the illness of the king. Fox supported the claim of the prince of Wales to the regency as a right, a doctrine which provoked Pitt into declaring that he would "unwhig the gentleman for the rest of his life." The friendship between him and the prince of Wales (see GEORGE IV.) was always injurious to Fox. In 1787 he was misled by the prince's ambiguous assurances into denying the marriage with Mrs Fitzherbert. On discovering that he had been deceived he broke off all relations with the prince for a year, but their alliance was renewed. During these years he was always in favour of whatever measures could be described as favourable to emancipation and to humanity. He actively promoted the impeachment of Warren Hastings, which had the support of Pitt. He was always in favour of the abolition of the slave trade (which he actually effected during his short tenure of office in 1806), of the repeal of the Test Acts, and of concessions to the Roman Catholics, both in Great Britain and in Ireland.

The French Revolution affected Fox profoundly. Together with almost all his countrymen he welcomed the meeting of the states-general in 1789 as the downfall of a despotism hostile to Great Britain. But when the development of the Revolution caused a general reaction, he adhered stoutly to his opinion that the Revolution was essentially just and ought not to be condemned for its errors or even for its crimes. As a natural consequence he was the steady opponent of Pitt's foreign policy, which he condemned as a species of crusade against freedom in the interest of despotism. Between 1790 and 1800 his unpopularity reached its height. He was left almost alone in parliament, and was denounced as the enemy of his country. On the 6th of May 1791 occurred the painful scene in the House of Commons, in which Burke renounced his friendship. In 1792 there was some vague talk of a coalition between him and Pitt, which came to nothing. It should be noted that the scene with Burke took place in the course of the debate on the Quebec Bill, in which Fox displayed real statesmanship by criticizing the division of Upper from Lower Canada, and other provisions of the bill, which in the end proved so injurious as to be unworkable. In this year he carried the Libel Bill. In 1792 his ally, the duke of Portland, and most of his party left him. In 1797 he withdrew from parliament, and only came forward in 1798 to reaffirm the doctrine of the sovereignty of the people at a great Whig dinner. On the 9th of May he was dismissed from the privy council.

The interval of secession was perhaps the happiest in his life. In 1783 he formed a connexion with Elizabeth Bridget Cane, commonly known as Mrs Armstead or Armistead, an amiable

and well-mannered woman to whom he was passionately attached. In company with her he established himself at St Anne's Hill near Chertsey in Surrey. In 1795 he married her privately, but did not avow his marriage till 1802. In his letters he spoke of her always as Mrs Armistead, and some of his friends—Mr Coke of Holkham, afterwards Lord Leicester, with whom he stayed every year, being one of them—would not invite her to their houses. It is hard to explain this solitary instance of shabby conduct in a thoroughly generous man towards a person to whom he was unalterably attached and who fully deserved his affection. Fox's time at St Anne's was largely spent in gardening, in the enjoyment of the country, and in correspondence on literary subjects with his nephew, the 3rd Lord Holland, and with Gilbert Wakefield, the editor of Euripides. His letters show that he had a very sincere love for, and an enlightened appreciation of, good literature. Greek and Italian were his first favourites, but he was well read in English literature and in French, and acquired some knowledge of Spanish. His favourite authors were Euripides, Virgil and Racine, whom he defends against the stock criticisms of the admirers of Corneille with equal zeal and insight.

Fox reappeared in parliament to take part in the vote of censure on ministers for declining Napoleon's overtures for a peace. The fall of Pitt's first ministry and the formation of the Addington cabinet, the peace of Amiens, and the establishment of Napoleon as first consul with all the powers of a military despot, seemed to offer Fox a chance of resuming power in public life. The struggle with Jacobinism was over, and he could have no hesitation in supporting resistance to a successful general who ruled by the sword, and who pursued a policy of perpetual aggression. During 1802 he visited Paris in company with his wife. An account of his journey was published in 1811 by his secretary, Mr Trotter, in an otherwise poor book of reminiscence. It gives an attractive picture of Fox's good-humour, and of his enjoyment of the "species of minor comedy which is constantly exhibited in common life." His main purpose in visiting Paris was to superintend the transcription of the correspondence of Barillon, which he needed for his proposed life of James II. The book was never finished, but the fragment he completed was published in 1808, and was translated into French by Armand Carrel in 1846. Fox was not favourably impressed by Napoleon. He saw a good deal of French society, and was himself much admired for his hearty defence of his rival Pitt against a foolish charge of encouraging plots for Napoleon's assassination. On his return he resumed his regular attendance in the House of Commons. The history of the renewal of the war, of the fall of Addington's ministry, and of the formation of Pitt's second administration is so fully dealt with in the article on Pitt (*q.v.*) that it need not be repeated here.

The death of Pitt left Fox so manifestly the foremost man in public life that the king could no longer hope to exclude him from office. The formation of a ministry was entrusted by the king to Lord Grenville, but when he named Fox as his proposed secretary of state for foreign affairs George III. accepted him without demur. Indeed his hostility seems to a large extent to have died out. A long period of office might now have appeared to lie before Fox, but his health was undermined. Had he lived it may be considered as certain that the war with Napoleon would have been conducted with a vigour which was much wanting during the next few years. In domestic politics Fox had no time to do more than insist on the abolition of the slave trade. He, like Pitt, was compelled to bow to the king's invincible determination not to allow the emancipation of the Roman Catholics. When a French adventurer calling himself Guillet de la Gevrière, whom Fox at first "did the honour to take for a spy," came to him with a scheme for the murder of Napoleon, he sent a warning on the 20th of February to Talleyrand. The incident gave him an opportunity for reopening negotiations for peace. A correspondence ensued, and British envoys were sent to Paris. But Fox was soon convinced that the French ministers were playing a false game. He was resolved not to treat apart from Russia, then the ally of Great Britain,

nor to consent to the surrender of Sicily, which Napoleon insisted upon, unless full compensation could be obtained for King Ferdinand. The later stages of the negotiation were not directed by Fox, but by colleagues who took over his work at the foreign office when his health began to fail in the summer of 1806. He showed symptoms of dropsy, and operations only procured him temporary relief. After carrying his motion for the abolition of the slave trade on the 10th of June, he was forced to give up attendance in parliament, and he died in the house of the duke of Devonshire, at Chiswick, on the 13th of September 1806. His wife survived him till the 8th of July 1842. No children were born of the marriage. Fox is buried in Westminster Abbey by the side of Pitt.

The striking personal appearance of Fox has been rendered very familiar by portraits and by innumerable caricatures. The latter were no doubt deliberately exaggerated, and yet a comparison between the head of Fox in Sayer's plate "Carlo Khan's triumphal entry into Leadenhall," and in Abbot's portrait, shows that the caricaturist did not depart from the original. Fox was twice painted by Sir Joshua Reynolds, once when young in a group with Lady Sarah Bunbury and Lady Susan Strangeways, and once at full length. A half-length portrait by the German painter, Karl Anton Hickel, is in the National Portrait Gallery, where there is also a terra-cotta bust by Nollekens.

AUTHORITIES.—The materials for a life of Fox were first collected by his nephew, Lord Holland, and were then revised and rearranged by Mr Allen and Lord John Russell. These materials appear as *Memoirs and Correspondence of C. J. Fox* (London, 1853-1857). On them Lord John Russell based his *Life and Times of C. J. Fox* (London, 1859-1866); Sir G. O. Trevelyan's *Early History of C. J. Fox* (London, 1880) brings new evidence; *Charles James Fox, a Political Study*, by J. L. Le B. Hammond (London, 1903), is a series of studies written by an extreme admirer. His *Speeches* were collected and published in 1815. The newspaper articles (e.g. in *The Times*) published on the occasion of the centenary of his death contain interesting appreciations. See also Lloyd Sanders, *The Holland House Circle* (1908). (D. H.)

FOX, EDWARD (c. 1496-1538), bishop of Hereford, was born about 1496 at Dursley in Gloucestershire; he is said on very doubtful authority to have been related to Richard Fox (*q.v.*). From Eton he proceeded to King's College, Cambridge, and after graduating was made secretary to Wolsey. In 1528 he was sent with Gardiner to Rome to obtain from Clement VII. a decretal commission for the trial and decision of the case between Henry VIII. and Catherine of Aragon. On his return he was elected provost of King's College, and in August 1529 was the means of conveying to the king Cranmer's historic advice that he should apply to the universities of Europe rather than to the pope. This introduction led eventually to Cranmer's promotion over Fox's head to the archbishopric of Canterbury. After a brief mission to Paris in October 1529, Fox in January 1530 befriended Latimer at Cambridge and took an active part in persuading that university and Oxford to decide in the king's favour. He was sent to employ similar methods of persuasion at the French universities in 1530-1531, and was also engaged in negotiating a closer league between England and France. In April 1533 he was prolocutor of convocation when it decided against the validity of Henry's marriage with Catherine, and in 1534 published his treatise *De vera differentia regiae potestatis et ecclesiae* (second ed. 1538, English transl. 1548). Various ecclesiastical preferments were now granted him, including the archdeaconry of Leicester (1531) and the bishopric of Hereford (1535). In 1535-1536 he was sent to Germany to discuss the basis of a political and theological understanding with the Lutheran princes and divines, and had several interviews with Luther, who could not be persuaded of the justice of Henry VIII.'s divorce. The principal result of the mission was the Wittenberg articles of 1536, which had no slight influence on the English Ten Articles of the same year. Bucer dedicated to him in 1536 his *Commentaries on the Gospels*, and Fox's Protestantism was also illustrated by his patronage of Alexander Ales, whom he defended before Convocation. Fox is credited with the authorship of several proverbial sayings, such as "the surest way to peace is a constant preparedness for war" and "time and I will challenge

any two in the world." The former at any rate is only a variation of the Latin *si vis pacem, para bellum*, and probably the latter is not more original in Fox than in Philip II., to whom it is usually ascribed. Fox died on the 8th of May 1538 and was buried in the church of St Mary Mounthaw, London. His chief distinction is perhaps that he was the most Lutheran of Henry VIII.'s bishops, and was largely responsible for the Ten Articles of 1536.

FOX, GEORGE (1624-1691), the founder of the "Society of Friends" or "Quakers," was born at Drayton, Leicestershire, in July 1624. His father, Christopher Fox, called by the neighbours "Righteous Christer," was a weaver by occupation; and his mother, Mary Lago, "an upright woman and accomplished above most of her degree," was "of the stock of the martyrs." George from his childhood "appeared of another frame than the rest of his brethren, being more religious, inward, still, solid and observing beyond his years"; and he himself declares: "When I came to eleven years of age I knew pureness and righteousness; for while a child I was taught how to walk to be kept pure." Some of his relations wished that he should be educated for the ministry; but his father apprenticed him to a shoemaker, who also dealt in wool and cattle. In this service he remained till his nineteenth year. According to Penn, "he took most delight in sheep," but he himself simply says: "A good deal went through my hands. . . . People had generally a love to me for my innocence and honesty." In 1643, being upon business at a fair, and having accompanied some friends to the village public-house, he was troubled by a proposal to "drink healths," and withdrew in grief of spirit. "When I had done what business I had to do I returned home, but did not go to bed that night, nor could I sleep, but sometimes walked up and down, and sometimes prayed and cried to the Lord, who said unto me, 'Thou seest how young people go together into vanity and old people into the earth; thou must forsake all, both young and old, and keep out of all, and be a stranger unto all.' Then, at the command of God, on the ninth day of the seventh month, 1643, I left my relations and broke off all familiarity or fellowship with old or young."

Thus briefly he describes what appears to have been the greatest moral crisis in his life. The four years which followed were a time of great perplexity and distress, though sometimes "I had intermissions, and was sometimes brought into such a heavenly joy that I thought I had been in Abraham's bosom." He would go from town to town, "travelling up and down as a stranger in the earth, which way the Lord inclined my heart; taking a chamber to myself in the town where I came, and tarrying sometimes a month, more or less, in a place"; and the reason he gives for this migratory habit is that he was "afraid both of professor and profane, lest, being a tender young man, he should be hurt by conversing much with either." The same fear often led him to shun all society for days at a time; but frequently he would apply to "professors" for spiritual direction and consolation. These applications, however, never proved successful; he invariably found that his advisers "possessed not what they professed." Some recommended marriage, others enlistment as a soldier in the civil wars; one "ancient priest" bade him take tobacco and sing psalms; another of the same fraternity, "in high account," advised physic and blood-letting.

About the beginning of 1646 his thoughts began to take more definite shape. One day, approaching Coventry, "the Lord opened to him" that none were true believers but such as were born of God and had passed from death unto life; and this was soon followed by other "openings" to the effect that "being bred at Oxford or Cambridge was not enough to fit and qualify men to be ministers of Christ," and that "God who made the world did not dwell in temples made with hands." He also experienced deeper manifestations of Christ within his own soul. "When I myself was in the deep, shut up under all [the burden of corruptions], I could not believe that I should ever

overcome; my troubles, my sorrows and my temptations were so great that I thought many times I should have despaired, I was so tempted. But when Christ opened to me how He was tempted by the same devil, and overcame him and bruised his head, and that through Him, and His power, light, grace and spirit, I should overcome also, I had confidence in Him; so He it was that opened to me, when I was shut up and had no hope nor faith. Christ, who had enlightened me, gave me His light to believe in; He gave me hope which He himself revealed in me; and He gave me His spirit and grace, which I found sufficient in the deeps and in weakness." In 1647 he records that at a time when all outward help had failed "I heard a voice which said, 'There is one, even Christ Jesus, that can speak to thy condition.' And when I heard it my heart did leap for joy." In the same year he first openly declared his message in the neighbourhood of Dukinfield and Manchester (see FRIENDS, SOCIETY OF).

In 1649, as he was walking towards Nottingham, he heard the bell of the "steeple house" of the city, and was admonished by an inward voice to go forward and cry against the great idol and the worshippers in it. Entering the church he found the preacher engaged in expounding the words, "We have also a more sure word of prophecy," from which the ordinary Protestant doctrine of the supreme authority of Scripture was being enforced in a manner which appeared to Fox so defective or erroneous as to call for his immediate and most energetic protest. Lifting up his voice against the preacher's doctrine, he declared that it is not by the Scripture alone, but by the divine light by which the Scriptures were given, that doctrines ought to be judged. He was carried off to prison, where he was detained for some time, and from which he was released only by the favour of the sheriff, whose sympathies he had succeeded in enlisting. In 1650 he was imprisoned for about a year at Derby on a charge of blasphemy. On his release, overwrought and weakened by six months spent "in the common gaol and dungeon," he performed what was almost the only and certainly the most pronounced act of his life which had the appearance of wild fanaticism. Through the streets of Lichfield, on market day, he walked barefoot, crying, "Woe to the bloody city of Lichfield." His own explanation of the act, connecting it with the martyrdom of a thousand Christians in the time of Diocletian, is not convincing. His proceeding was probably due to a horror of the city arising from a subconscious memory of what he must have heard in childhood from his mother ("of the stock of the martyrs") concerning a martyr, a woman, burnt in the reign of Mary at Lichfield, who had been taken thither from Mancetter, a village two miles from his home in which he had worked as a journeyman shoemaker (see *The Martyrs Glover and Lewis of Mancetter*, by the Rev. B. Richings). He must also have heard of the burning of Edward Wightman in the same city in 1612, the last person burned for heresy in England.

It would be here out of place to follow with any minuteness the details of his subsequent imprisonments, such as that at Carlisle in 1653; London 1654; Launceston 1656; Lancaster 1660, and again in 1663, whence he was taken to Scarborough in 1665; and Worcester 1673. During these terms of imprisonment his pen was not idle, as is amply shown by the very numerous letters, pastorals and exhortations which have been preserved; while during his intervals of liberty he was unwearied in the work of "declaring truth" in all parts of the country. In 1669 he married Margaret, widow of Judge Fell, of Swarthmoor, near Ulverston, who, with her family, had been among his earliest converts. In 1671 he visited Barbados, Jamaica, and the American continent, and shortly after his return in 1673 he was, as has been already noted, apprehended in Worcestershire for attending meetings that were forbidden by the law. At Worcester he suffered a captivity of nearly fourteen months. In 1677 he visited Holland along with Barclay, Penn and seven others; and this visit he repeated (with five others) in 1684. The later years of his life were spent mostly in London, where he continued to speak in public, comparatively unmolested,

until within a few days of his death, which took place on the 13th of January 1691 (1690 O.S.).

William Penn has left on record an account of Fox from personal knowledge—a *Brief Account of the Rise and Progress of the People called Quakers*, written as a preface to Fox's *Journal*. Although a man of large size and great bodily strength, he was "very temperate, eating little and sleeping less." He was a man of strong personality, of measured utterance, "civil" (says Penn) "beyond all forms of breeding." From his *Journal* we gather that he had piercing eyes and a very loud voice, and wore good clothes. Unlike the Roundheads, he wore his hair long. Even before his marriage with Margaret Fell he seems to have been fairly well off; he does not appear to have worked for a living after he was nineteen, and yet he had a horse, and speaks of having money to give to those who were in need. He had much practical common-sense, and keen sympathy for all who were in distress and for animals. The mere fact that he was able to attract to himself so considerable a body of respectable followers, including such men as Ellwood, Barclay, Penington and Penn, is sufficient to prove that he possessed in a very eminent degree the power of conviction, persuasion, and moral ascendancy; while of his personal uprightness, single-mindedness and sincerity there can be no question.

The writings of Fox are enumerated in Joseph Smith's *Catalogue of Friends' Books*. The *Journal* is especially interesting; of it Sir James Mackintosh has said that "it is one of the most extraordinary and instructive narratives in the world, which no reader of competent judgment can peruse without revering the virtue of the writer." The *Journal* was originally published in London in 1694; the edition known as the Bicentenary Edition, with notes biographical and historical (reprint of 1901 or later), will be found the most useful in practice. An exact transcript of the *Journal* has been issued by the Cambridge University Press. A *Life of George Fox*, by Dr Thomas Hodgkin; *The Fells of Swarthmoor Hall*, by Maria Webb; and *The Life and Character of George Fox*, by John Stephenson Rowntree, are valuable. For a mention of other works, and for details of the principles and history of the Society of Friends, together with some further information about Fox, see the article FRIENDS, SOCIETY OF. (A. N. B.)

FOX, RICHARD (c. 1448–1528), successively bishop of Exeter, Bath and Wells, Durham, and Winchester, lord privy seal, and founder of Corpus Christi College, Oxford, was born about 1448 at Ropesley near Grantham, Lincolnshire. His parents belonged to the yeoman class, and there is some obscurity about Fox's early career. It is not known at what school he was educated, nor at what college, though the presumption is in favour of Magdalen, Oxford, whence he drew so many members of his subsequent foundation, Corpus Christi. He also appears to have studied at Cambridge, but nothing definite is known of the first thirty-five years of his career. In 1484 he was in Paris, whether merely for the sake of learning or because he had rendered himself obnoxious to Richard III. is a matter of speculation. At any rate he was brought into contact with the earl of Richmond, who was then beginning his quest for the English throne, and was taken into his service. In January 1485 Richard intervened to prevent Fox's appointment to the vicarage of Stepney on the ground that he was keeping company with the "great rebel, Henry ap Tudor."

The important offices conferred on Fox immediately after the battle of Bosworth imply that he had already seen more extensive political service than can be traced in records. Doubtless Henry VII. had every reason to reward his companions in exile, and to rule like Ferdinand of Aragon by means of lawyers and churchmen rather than trust nobles like those who had made the Wars of the Roses. But without an intimate knowledge of Fox's political experience and capacity he would hardly have made him his principal secretary, and soon afterwards lord privy seal and bishop of Exeter (1487). The ecclesiastical preferment was merely intended to provide a salary not at Henry's expense; for Fox never saw either Exeter or the diocese of Bath and Wells to which he was translated in 1492. His activity was confined to political and especially diplomatic channels; so long as Morton lived, Fox was his subordinate, but after the archbishop's death he was second to none in Henry's confidence, and he had an important share in all the diplomatic

work of the reign. In 1487 he negotiated a treaty with James III. of Scotland, in 1491 he baptized the future Henry VIII., in 1492 he helped to conclude the treaty of Etaples, and in 1497 he was chief commissioner in the negotiations for the famous commercial agreement with the Netherlands which Bacon seems to have been the first to call the *Magnus Intercursus*.

Meanwhile in 1494 Fox had been translated to Durham, not merely because it was a richer see than Bath and Wells but because of its political importance as a palatine earldom and its position with regard to the Borders and relations with Scotland. For these reasons rather than from any ecclesiastical scruples Fox visited and resided in his new diocese; and he occupied Norham Castle, which he fortified and defended against a Scottish raid in Perkin Warbeck's interests (1497). But his energies were principally devoted to pacific purposes. In that same year he negotiated Perkin's retirement from the court of James IV., and in 1498-1499 he completed the negotiations for that treaty of marriage between the Scottish king and Henry's daughter Margaret which led ultimately to the union of the two crowns in 1603 and of the two kingdoms in 1707. The marriage itself did not take place until 1503, just a century before the accession of James I.

This consummated Fox's work in the north, and in 1501 he was once more translated to Winchester, then reputed the richest bishopric in England. In that year he brought to a conclusion marriage negotiations not less momentous in their ultimate results, when Prince Arthur was betrothed to Catherine of Aragon. His last diplomatic achievement in the reign of Henry VII. was the betrothal of the king's younger daughter Mary to the future emperor Charles V. In 1500 he was elected chancellor of Cambridge University, an office not confined to noble lords until a much more democratic age, and in 1507 master of Pembroke Hall in the same university. The Lady Margaret Beaufort made him one of her executors, and in this capacity as well as in that of chancellor, he had the chief share with Fisher in regulating the foundation of St John's College and the Lady Margaret professorships and readerships. His financial work brought him a less enviable notoriety, though a curious freak of history has deprived him of the credit which is his due for "Morton's fork." The invention of that ingenious dilemma for extorting contributions from poor and rich alike is ascribed as a tradition to Morton by Bacon; but the story is told in greater detail of Fox by Erasmus, who says he had it from Sir Thomas More, a well-informed contemporary authority. It is in keeping with the somewhat malicious saying about Fox reported by Tyndale that he would sacrifice his father to save his king, which after all is not so damning as Wolsey's dying words.

The accession of Henry VIII. made no immediate difference to Fox's position. If anything, the substitution of the careless pleasure-loving youth for Henry VII. increased the power of his ministry, the personnel of which remained unaltered. The Venetian ambassador calls Fox "alter rex" and the Spanish ambassador Carroz says that Henry VIII. trusted him more than any other adviser, although he also reports Henry's warning that the bishop of Winchester was, as his name implied, "a fox indeed." He was the chief of the ecclesiastical statesmen who belonged to the school of Morton, believed in frequent parliaments, and opposed the spirited foreign policy which laymen like Surrey are supposed to have advocated. His colleagues were Warham and Ruthal, but Warham and Fox differed on the question of Henry's marriage, Fox advising the completion of the match with Catherine while Warham expressed doubts as to its canonical validity. They also differed over the prerogatives of Canterbury with regard to probate and other questions of ecclesiastical jurisdiction.

Wolsey's rapid rise in 1511 put an end to Fox's influence. The pacific policy of the first two years of Henry VIII.'s reign was succeeded by an adventurous foreign policy directed mainly against France; and Fox complained that no one durst do anything in opposition to Wolsey's wishes. Gradually Warham and Fox retired from the government; the occasion of Fox's

resignation of the privy seal was Wolsey's ill-advised attempt to drive Francis I. out of Milan by financing an expedition led by the emperor Maximilian in 1516. Tunstall protested, Wolsey took Warham's place as chancellor, and Fox was succeeded by Ruthal, who, said the Venetian ambassador, "sang treble to Wolsey's bass." He bore Wolsey no ill-will, and warmly congratulated him two years later when warlike adventures were abandoned at the peace of London. But in 1522 when war was again declared he emphatically refused to bear any part of the responsibility, and in 1523 he opposed in convocation the financial demands which met with a more strenuous resistance in the House of Commons.

He now devoted himself assiduously to his long-neglected episcopal duties. He expressed himself as being as anxious for the reformation of the clergy as Simeon for the coming of the Messiah; but while he welcomed Wolsey's never-realized promises, he was too old to accomplish much himself in the way of remedying the clerical and especially the monastic depravity, licence and corruption he deplored. His sight failed during the last ten years of his life, and there is no reason to doubt Matthew Parker's story that Wolsey suggested his retirement from his bishopric on a pension. Fox replied with some warmth, and Wolsey had to wait until Fox's death before he could add Winchester to his archbishopric of York and his abbey of St Albans, and thus leave Durham vacant as he hoped for the illegitimate son on whom (aged 18) he had already conferred a deanery, four archdeaconries, five prebends and a chancellorship.

The crown of Fox's career was his foundation of Corpus Christi College, which he established in 1515-1516. Originally he intended it as an Oxford house for the monks of St Swithin's, Winchester; but he is said to have been dissuaded by Bishop Oldham, who denounced the monks and foretold their fall. The scheme adopted breathed the spirit of the Renaissance; provision was made for the teaching of Greek, Erasmus lauded the institution and Pole was one of its earliest fellows. The humanist Vives was brought from Italy to teach Latin, and the reader in theology was instructed to follow the Greek and Latin Fathers rather than the scholastic commentaries. Fox also built and endowed schools at Taunton and Grantham, and was a benefactor to numerous other institutions. He died at Wolsey on the 5th of October 1528; Corpus possesses several portraits and other relics of its founder.

Fowler (formerly president of Corpus) in the *Dict. Nat. Biog.* (A. F. P.)

FOX, ROBERT WERE (1789-1877), English geologist and natural philosopher, was born at Falmouth on the 26th of April 1789. He was a member of the Society of Friends, and was descended from members who had long settled in Cornwall, although he was not related to George Fox who had introduced the community into the county. He was distinguished for his researches on the internal temperature of the earth, being the first to prove that the heat increased definitely with the depth; his observations being conducted in Cornish mines from 1815 for a period of forty years. In 1829 he commenced a series of experiments on the artificial production of miniature metalliferous veins by means of the long-continued influence of electric currents, and his main results were published in *Observations on Mineral Veins (Rep. Royal Cornwall Polytech. Soc., 1836)*. He was one of the founders in 1833 of the Royal Cornwall Polytechnic Society. He constructed in 1834 an improved form of deflector dipping needle. In 1848 he was elected F.R.S. His garden at Penjerrick near Falmouth became noted for the number of exotic plants which he had naturalized. He died on the 25th of July 1877. (See *A Catalogue of the Works of Robert Were Fox, F.R.S., with a Sketch of his Life*, by J. H. Collins, 1878.)

His daughter, CAROLINE FOX (1819-1871), born at Falmouth on the 24th of May 1819, is well known as the authoress of a

diary, recording memories of many distinguished people, such as John Stuart Mill, John Sterling and Carlyle. Selections from her diary and correspondence (1835-1871) were published under the title of *Memories of Old Friends* (ed. by H. N. Pym, 1881; 2nd ed., 1882). She died on the 12th of January 1871.

FOX, SIR STEPHEN (1627-1716), English statesman, born on the 27th of March 1627, was the son of William Fox, of Farley, in Wiltshire, a yeoman farmer. At the age of fifteen he first obtained a situation in the household of the earl of Northumberland; then he entered the service of Lord Percy, the earl's brother, and was present with the royalist army at the battle of Worcester as Lord Percy's deputy at the ordnance board. Accompanying Charles II. in his flight to the continent, he was appointed manager of the royal household, on Clarendon's recommendation as "a young man bred under the severe discipline of Lord Percy . . . very well qualified with languages, and all other parts of clerkship, honesty and discretion." The skill with which he managed the exiguous finances of the exiled court earned him further confidence and promotion. He was employed on several important missions, and acted eventually as intermediary between the king and General Monk. Honours and emolument were his reward after the Restoration; he was appointed to the lucrative offices of first clerk of the board of green cloth and paymaster-general of the forces. In November 1661 he became member of parliament for Salisbury. In 1665 he was knighted, was returned as M.P. for Westminster on the 27th of February 1679, and succeeded the earl of Rochester as a commissioner of the treasury, filling that office for twenty-three years and during three reigns. In 1680 he resigned the paymastership and was made first commissioner of horse. In 1684 he became sole commissioner of horse. He was offered a peerage by James II., on condition of turning Roman Catholic, but refused, in spite of which he was allowed to retain his commissionerships. In 1685 he was again M. P. for Salisbury, and opposed the bill for a standing army supported by the king. During the Revolution he maintained an attitude of decent reserve, but on James's flight, submitted to William III., who confirmed him in his offices. He was again elected for Westminster in 1691 and 1695, for Cricklade in 1698, and finally in 1713 once more for Salisbury. He died on the 28th of October 1716. It is his distinction to have founded Chelsea hospital, and to have contributed £13,000 in aid of this laudable public work. Though his place as a statesman is in the second or even the third rank, yet he was a useful man in his generation, and a public servant who creditably discharged all the duties with which he was entrusted. Unlike other statesmen of his day, he grew rich in the service of the nation without being suspected of corruption, and without forfeiting the esteem of his contemporaries.

He was twice married (1651 and 1703); by his first wife, Elizabeth Whittle, he had seven sons, who predeceased him, and three daughters; by his second, Christian Hopes, he had two sons and two daughters. The elder son by the second marriage, Stephen (1704-1776), was created Lord Ilchester and Stavordale in 1747 and earl of Ilchester in 1756; in 1758 he took the additional name of Strangways, and his descendants, the family of Fox-Strangways, still hold the earldom of Ilchester. The younger son, Henry, became the 1st Lord Holland (q.v.).

FOX, SIR WILLIAM (1812-1893), New Zealand statesman, third son of George Townshend Fox, deputy-lieutenant for Durham county, was born in England on the 9th of June 1812, and educated at Wadham College, Oxford, where he took his degree in 1832. Called to the bar in 1842, he emigrated immediately thereafter to New Zealand, where, on the death of Captain Arthur Wakefield, killed in 1843 in the Wairau massacre, he became the New Zealand Company's agent for the South Island. While holding this position he made a memorable exploring march on foot from Nelson to Canterbury, through Cannibal Gorge, in the course of which he discovered the fertile pastoral country of Amuri. In 1848 Governor Grey made Fox attorney-general, but he gave up the post almost at once in order to join the agitation, then at its height, for a free constitu-

tion. As the political agent of the Wellington settlers he sailed to London in 1850 to urge their demands in Downing Street. The colonial office, however, refused to recognize him, and, after publishing a sketch of the New Zealand settlements, *The Six Colonies of New Zealand*, and travelling in the United States, he returned to New Zealand and again threw himself with energy into public affairs. When government by responsible ministers was at last initiated, in 1856, Fox ousted the first ministry and formed a cabinet, only to be himself beaten in turn after holding office but thirteen days. In 1861 he regained office, and was somewhat more fortunate, for he remained premier for nearly thirteen months. Again, in the latter part of 1863 he took office: this time with Sir Frederick Whitaker as premier, an arrangement which endured for another thirteen months. Fox's third premiership began in 1869 and lasted until 1872. His fourth, which was a matter of temporary convenience to his party, lasted only five weeks in March and April 1873. Soon afterwards he left politics, and, though he reappeared after some years and led the attack which overthrew Sir George Grey's ministry in 1879, he lost his seat in the dissolution which followed in that year and did not again enter parliament. He was made K.C.M.G. in 1880.

For the thirty years between 1850 and 1880 Sir William Fox was one of the half-dozen most notable public men in the colony. Impulsive and controversial, a fluent and rousing speaker, and a ready writer, his warm and sympathetic nature made him a good friend and a troublesome foe. He was considered for many years to be the most dangerous leader of the Opposition in the colony's parliament, though as premier he was at a disadvantage when measured against more patient and more astute party managers. His activities were first devoted to secure self-government for the New Zealand colonists. Afterwards his sympathies made him prominent among the champions of the Maori race, and he laboured indefatigably for their rights and to secure permanent peace with the tribes and a just settlement of their claims. It was during his third premiership that this peace, so long deferred, was at last gained, mainly through the influence and skill of Sir Donald M'Lean, native minister in the Fox cabinet. Finally, after Fox had left parliament he devoted himself, as joint-commissioner with Sir Francis Dillon Bell, to the adjustment of the native land-claims on the west coast of the North Island. The able reports of the commissioners were his last public service, and the carrying out of their recommendations gradually removed the last serious native trouble in New Zealand. When, however, in the course of the native wars from 1860 to 1870 the colonists of New Zealand were exposed to cruel and unjust imputations in England, Fox zealously defended them in a book, *The War in New Zealand* (1866), which was not only a spirited vindication of his fellow-settlers, but a scathing criticism of the generalship of the officers commanding the imperial troops in New Zealand. Throughout his life Fox was a consistent advocate of total abstinence. It was he who founded the New Zealand Alliance, and he undoubtedly aided the growth of the prohibition movement afterwards so strong in the colony. He died on the 23rd of June 1893, exactly twelve months after his wife, Sarah, daughter of William Halcombe. (W. P. R.)

FOX, a name (female, "vixen"¹) properly applicable to the single wild British representative of the family *Canidae* (see *CARNIVORA*), but in a wider sense used to denote fox-like species from all parts of the world, inclusive of many from South America which do not really belong to the same group. The fox was included by Linnaeus in the same genus with the dog and the wolf, under the name of *Canis vulpes*, but at the present day is regarded by most naturalists as the type of a separate genus, and should then be known as *Vulpes alopec* or *Vulpes vulpes*. From

¹ The word is common to the Teutonic languages, cf. Dutch *vos*, Ger. *Fuchs*; the ultimate origin is unknown, but a connexion has been suggested with Sanskrit *puccha*, tail. The feminine "vixen" represents the O. Eng. *fyxen*, due to the change from *o* to *y*, and addition of the feminine termination *-en*, cf. O. Eng. *gyden*, goddess, and Ger. *Füchsin*, vixen. The *v*, for *f*, is common in southern English pronunciation; *vox*, for fox, is found in the *Ancrum Riwle*, c. 1230.

dogs, wolves, jackals, &c., which constitute the genus *Canis* in its more restricted sense, foxes are best distinguished by the circumstance that in the skull the (postorbital) projection immediately behind the socket for the eye has its upper surface concave, with a raised ridge in front, in place of regularly convex. Another character is the absence of a hollow chamber, or sinus, within the frontal bone of the forehead. Foxes are likewise distinguished by their slighter build, longer and bushy tail, which always exceeds half the length of the head and body, sharper muzzle, and relatively longer body and shorter limbs. Then again, the ears are large in proportion to the head, the pupil of the eye is elliptical and vertical when in a strong light, and the female has six pairs of teats, in place of the three to five pairs found in dogs, wolves and jackals. From the North American grey foxes, constituting the genus or subgenus *Urocyon*, the true foxes are distinguished by the absence of a crest of erectile long hairs along the middle line of the upper surface of the tail, and also of a projection (subangular process) to the postero-inferior angle of the lower jaw. With the exception of certain South African species, foxes differ from wolves and jackals in that they do not associate in packs, but go about in pairs or are solitary.

From the Scandinavian peninsula and the British Islands the range of the fox extends eastwards across Europe and central and northern Asia to Japan, while to the south it embraces northern Africa and Arabia, Persia, Baluchistan, and the north-western districts of India and the Himalaya. On the North American side of the Atlantic the fox reappears. With such an enormous geographical range the species must of necessity present itself under a considerable number of local phases, differing from one another to a greater or less degree in the matters of size and colouring. By some naturalists many of these local forms are regarded as specifically distinct, but it seems better and simpler to class them all as local phases or races of a single species primarily characterized by the white tip to the tail and the black or dark-brown hind surface of the ear. The "foxy red" colouring of the typical race of north-western Europe is too well known to require description. From this there is a more or less nearly complete gradation on the one hand to pale-coloured forms like the white-footed fox (*V. alopec leucopus*) of Persia, N.W. India and Arabia, and on the other to the silver or black fox (*V. a. argentatus*) of North America which yields the valuable silver-tipped black fur. Silver foxes apparently also occur in northern Asia.

To mention all the other local races would be superfluous, and it will suffice to note that the North African fox is known as *V. a. niloticus*, the Himalayan as *V. a. montanus*, the Tibetan as *V. a. wadelli*, the North American red or cross fox as *V. a. pennsylvanicus*, and the Alaskan as *V. a. harrimani*; the last named, like several other animals from Alaska, being the largest of its kind.

The cunning and stratagem of the fox have been proverbial for many ages, and he has figured as a central character in fables from the earliest times, as in Aesop, down to "Uncle Remus," most notably as Reynard (*Raginohardus*, strong in counsel) in the great medieval beast-epic "Reynard the Fox" (*q.v.*). It is not unlikely that, owing to the conditions under which it now lives, these traits are even more developed in England than elsewhere. In habits the fox is to a great extent solitary, and its home is usually a burrow, which may be excavated by its own labour, but is more often the usurped or deserted tenement of a badger or a rabbit. Foxes will, however, often take up their residence in woods, or even in water-meadows with large tussocks of grass, remaining concealed during the day and issuing forth on marauding expeditions at night. Rabbits, hares, domesticated poultry, game-birds, and, when these run short, rats, mice and even insects, form the chief diet of the fox. When living near the coast foxes will, however, visit the shore at low water in search of crabs and whelks; and the old story of the fox and the grapes seems to be founded upon a partiality on the part of the creature for that fruit. Flesh that has become tainted appears to be specially acceptable; but it is a curious fact that on no account will a fox eat any kind of bird of prey.

After a gestation of from 60 to 65 days, the vixen during the month of April gives birth to cubs, of which from five to eight usually go to form a litter. When first born these are clothed with a uniform slaty-grey fur, which in due course gives place to a coat of more tawny hue than the adult livery. In a year and a half the cubs attain their full development; and from observations on captive specimens it appears that the duration of life ought to extend to some thirteen or fourteen years. In the care and defence of her young the vixen displays extraordinary solicitude and boldness, altogether losing on such occasions her accustomed timidity and caution. Like most other young animals, fox-cubs are exceedingly playful, and may be seen chasing one another in front of the mouth of the burrow, or even running after their own tails.

Young foxes can be tamed to a certain extent, and do not then emit the well-known odour to any great degree unless excited. The species cannot, however, be completely domesticated, and never displays the affectionate traits of the dog. It was long believed that foxes and dogs would never interbreed; but several instances of such unions have been recorded, although they are undoubtedly rare. When suddenly confronted in a situation where immediate escape is impossible, the fox, like the wolf, will not hesitate to resort to the death-feigning instinct. Smartness in avoiding traps is one of the most distinctive traits in the character of the species; but when a trap has once claimed its victim, and is consequently no longer dangerous, the fox is always ready to take advantage of the gratuitous meal.

Red fox-skins are largely imported into Europe for various purposes, the American imports alone formerly reaching as many as 60,000 skins annually. Silver fox is one of the most valuable of all furs, as much as £480 having been given for an unusually fine pair of skins in 1902.

Of foxes certainly distinct specifically from the typical representative of the group, one of the best known is the Indian *Vulpes bengalensis*, a species much inferior in point of size to its European relative, and lacking the strong odour of the latter, from which it is also distinguished by the black tip to the tail and the pale-coloured backs of the ears. The corsac fox (*V. corsac*), ranging from southern Russia and the Caspian provinces across Asia to Amurland, may be regarded as a northern representative of the Indian species; while the pale fox (*V. pallidus*), of the Suakin and Dongola deserts, may be regarded as the African representative of the group. Possibly the kit-fox (*V. velox*), which has likewise a black tail-tip and pale ears, may be the North American form of the same group. The northern fennec (*V. famelicus*), whose range extends apparently from Egypt and Somaliland through Palestine and Persia into Afghanistan, seems to form a connecting link between the more typical foxes and the small African species properly known as fennecs. The long and bushy tail in the northern species has a white tip and a dark gland-patch near the root, but the backs of the ears are fawn-coloured. The enormous length of the ears and the small bodily size (inferior to that of any other member of the family) suffice to distinguish the true fennec (*V. zerda*) of Algeria and Egypt, in which the general colour is pale and the tip of the relatively short tail black. South of the Zambezi the group reappears in the shape of the asse-fox or fennec (*V. cama*), a dark-coloured species, with a black tip to the long, bushy tail and reddish-brown ears.

Passing from South Africa to the north polar regions of both the Old and the New World, inclusive of Iceland, we enter the domain of the Arctic fox (*V. lagopus*), a very distinct species characterized by the hairy soles of its feet, the short, blunt ears, the long, bushy tail, and the great length of the fur in winter. The upper parts in summer are usually brownish and the under parts white; but in winter the whole coat, in this phase of the species, turns white. In a second phase of the species, the colour, which often displays a slaty hue (whence the name of blue fox), remains more or less the same throughout the year, the winter coat being, however, recognizable by the great length of the fur. Many at least of the "blue fox" skins of the fur-trade are white skins dyed. About 2000 blue fox-skins were

annually imported into London from Alaska some five-and-twenty years ago. Arctic foxes feed largely on sea-birds and lemmings, laying up hidden stores of the last-named rodents for winter use.

The American grey fox, or Virginian fox, is now generally ranged as a distinct genus (or a subgenus of *Canis*) under the name of *Urocyon cinereo-argentatus*, on account of being distinguished, as already mentioned, by the presence of a ridge of long erectile hairs along the upper surface of the tail and of a projection to the postero-inferior angle of the lower jaw. The prevailing colour of the fur of the upper parts is iron-grey.

The so-called foxes of South America, such as the crab-eating fox (*C. thous*), Azara's fox (*C. azarae*), and the colpeo (*C. magellanicus*), are aberrant members of the typical genus *Canis*. On the other hand, the long-eared fox or Delalande's fox (*Otocyon megalotis*) of south and east Africa represents a totally distinct genus.

See St George Mivart, *Dogs, Jackals, Wolves and Foxes* (London, 1890); R. I. Pocock, "Ancestors and Relatives of the Dog," in *The Kennel Encyclopaedia* (London, 1907). For fox-hunting, see HUNTING. (R. L. *)

FOXE, JOHN (1516–1587), the author of the famous *Book of Martyrs*, was born at Boston, in Lincolnshire, in 1516. At the age of sixteen he is said to have entered Brasenose College, Oxford, where he was the pupil of John Harding or Hawarden, and had for room-mate Alexander Nowell, afterwards dean of St. Paul's. His authenticated connexion at the university is, however, with Magdalen College. He took his B.A. degree in 1537 and his M.A. in 1543. He was lecturer on logic in 1540–1541. He wrote several Latin plays on Scriptural subjects, of which the best, *De Christo triumphante*, was repeatedly printed, (London, 1551; Basel, 1556, &c.), and was translated into English by Richard Day, son of the printer. He became a fellow of Magdalen College in 1539, resigning in 1545. It is said that he refused to conform to the rules for regular attendance at chapel, and that he protested both against the enforced celibacy of fellows and the obligation to take holy orders within seven years of their election. The customary statement that he was expelled from his fellowship is based on the untrustworthy biography attributed to his son Samuel Foxe, but the college records state that he resigned of his own accord and *ex honesta causa*. The letter in which he protests to President Oglethorpe against the charges of irreverence, &c., brought against him is printed in Pratt's edition (vol. i. Appendix, pp. 58–61).

On leaving Oxford he acted as tutor for a short time in the house of the Lucys of Charlecote, near Stratford-on-Avon, where he married Agnes Randall. Late in 1547 or early in the next year he went to London. He found a patron in Mary Fitzroy, duchess of Richmond, and having been ordained deacon by Ridley in 1550, he settled at Reigate Castle, where he acted as tutor to the duchess's nephews, the orphan children of Henry Howard, earl of Surrey. On the accession of Queen Mary, Foxe was deprived of his tutorship by the boys' grandfather, the duke of Norfolk, who was now released from prison. He retired to Strassburg, and occupied himself with a Latin history of the Christian persecutions which he had begun at the suggestion of Lady Jane Grey. He had assistance from two clerics of widely differing opinions—from Edmund Grindal, who was later, as archbishop of Canterbury, to maintain his Puritan convictions in opposition to Elizabeth; and from John Aylmer, afterwards one of the bitterest opponents of the Puritan party. This book, dealing chiefly with Wycliffe and Huss, and coming down to 1500, formed the first outline of the *Actes and Monuments*. It was printed by Wendelin Richelius with the title of *Commentarii rerum in ecclesia gestarum* (Strasburg, 1554). In the year of its publication Foxe removed to Frankfort, where he found the English colony of Protestant refugees divided into two camps. He made a vain attempt to frame a compromise which should be accepted by the extreme Calvinists and by the partisans of the Anglican doctrine. He removed (1555) to Basel, where he worked as printer's reader to Johann Herbst or Oporinus. He made steady progress with his great book as he received

reports from England of the religious persecutions there, and he issued from the press of Oporinus his pamphlet *Ad inclytos ac praepotentes Angliae proceres . . . supplicatio* (1557), a plea for toleration addressed to the English nobility. In 1559 he completed the Latin edition¹ of his martyrology and returned to England. He lived for some time at Aldgate, London, in the house of his former pupil, Thomas Howard, now duke of Norfolk, who retained a sincere regard for his tutor and left him a small pension in his will. He became associated with John Day the printer, himself once a Protestant exile. Foxe was ordained priest by Edmund Grindal, bishop of London, in 1560, and besides much literary work he occasionally preached at Paul's Cross and other places. His work had rendered great service to the government, and he might have had high preferment in the Church but for the Puritan views which he consistently maintained. He held, however, the prebend of Shipton in Salisbury cathedral, and is said to have been for a short time rector of Cripplegate.

In 1563 was issued from the press of John Day the first English edition of the *Actes and Monuments of these latter and perillous Dayes, touching matters of the Church, wherein are comprehended and described the great Persecution and horrible Troubles that have been wrought and practised by the Romishe Prelates, specialllye in this Realme of England and Scolland, from the yeare of our Lorde a thousande to the time now present. Gathered and collected according to the true Copies and Wrytinges certificatorie as well of the Parties themselves that Suffered, as also out of the Bishop's Registers, which were the Doers thereof, by John Foxe*, commonly known as the *Book of Martyrs*. Several gross errors which had appeared in the Latin version, and had been since exposed, were corrected in this edition. Its popularity was immense and signal. The Marian persecution was still fresh in men's minds, and the graphic narrative intensified in its numerous readers the fierce hatred of Spain and of the Inquisition which was one of the master passions of the reign. Nor was its influence transient. For generations the popular conception of Roman Catholicism was derived from its bitter pages. Its accuracy was immediately attacked by Catholic writers, notably in the *Dialogi sex* (1566), nominally from the pen of Alan Cope, but in reality by Nicholas Harpsfield and by Robert Parsons in *Three Conversions of England* (1570). These criticisms induced Foxe to produce a second corrected edition, *Ecclesiastical History, containing the Actes and Monuments of things passed in every kynges tyme . . . in 1570*, a copy of which was ordered by Convocation to be placed in every collegiate church. Foxe based his accounts of the martyrs partly on authentic documents and reports of the trials, and on statements received direct from the friends of the sufferers, but he was too hasty a worker and too violent a partisan to produce anything like a correct or impartial account of the mass of facts with which he had to deal. Anthony à Wood says that Foxe "believed and reported all that was told him, and there is every reason to suppose that he was purposely misled, and continually deceived by those whose interest it was to bring discredit on his work," but he admits that the book is a monument of his industry, his laborious research and his sincere piety. The gross blunders due to carelessness have often been exposed, and there is no doubt that Foxe was only too ready to believe evil of the Catholics, and he cannot always be exonerated from the charge of wilful falsification of evidence. It should, however, be remembered in his honour that his advocacy of religious toleration was far in advance of his day. He pleaded for the despised Dutch Anabaptists, and remonstrated with John Knox on the rancour of his *First Blast of the Trumpet*. Foxe was one of the earliest students of Anglo-Saxon, and he and Day published an edition of the Saxon gospels under the patronage of Archbishop Parker. He died on the 18th of April 1587 and was buried at St Giles's, Cripplegate.

¹ Printed by Oporinus and Nicolaus Brylinger. The title is *Rerum in ecclesia gestarum . . . pars prima, in qua primum de rebus per Angliam et Scotiam gestis atque in primis de horrenda sub Maria nuper regina persecutione narratio continetur*.

A list of his Latin tracts and sermons is given by Wood, and others, some of which were never printed, appear in Bale. Four editions of the *Actes and Monuments* appeared in Foxe's lifetime. The eighth edition (1641) contains a memoir of Foxe purporting to be by his son Samuel, the MS. of which is in the British Museum (Lansdowne MS. 388). Samuel Foxe's authorship is disputed, with much show of reason, by Dr S. R. Maitland in *On the Memoirs of Foxe ascribed to his Son* (1841). The best-known modern edition of the Martyrology is that (1837-1841) by the Rev. Stephen R. Cattley, with an introductory life by Canon George Townsend. The numerous inaccuracies of this life and the frequent errors of Foxe's narrative were exposed by Dr Maitland in a series of tracts (1837-1842), collected (1841-1842) as *Notes on the Contributions of the Rev. George Townsend, M.A. . . . to the New Edition of Fox's Martyrology*. The criticism lavished on Cattley and Townsend's edition led to a new one (1846-1849) under the same editorship. A new text prepared by the Rev. Josiah Pratt was issued (1870) in the "Reformation Series" of the *Church Historians of England*, with a revised version of Townsend's *Life* and appendices giving copies of original documents. Later edition by W. Grinton Berry (1907).

Foxe's papers are preserved in the Harleian and Lansdowne collections in the British Museum. Extracts from these were edited by J. G. Nichols for the Camden Society (1859). See also W. Winters, *Biographical Notes on John Foxe* (1876); James Gairdner, *History of the English Church in the Sixteenth Century*.

FOXGLOVE, a genus of biennial and perennial plants of the natural order Scrophulariaceae. The common or purple foxglove,

It flourishes best in siliceous soils, and is not found in the Jura and Swiss Alps. The characters of the plant are as follows: stem erect, roundish, downy, leafy below, and from 18 in. to 5 ft. or more in height; leaves alternate, crenate, rugose, ovate or elliptic oblong, and of a dull green, with the under surface downy and paler than the upper; radical leaves together with their stalks often a foot in length; root of numerous, slender, whitish fibres; flowers 1½-2½ in. long, pendulous, on one side of the stem, purplish crimson, and hairy and marked with eye-like spots within; segments of calyx ovate, acute, cleft to the base; corolla bell-shaped with a broadly two-lipped obtuse mouth, the upper lip entire or obscurely divided; stamens four, two longer than the other two (*didynamous*); anthers yellow and bilobed; capsule bivalved, ovate and pointed; and seeds numerous, small, oblong, pitted and of a pale brown. As Parkinson remarks of the plant, "It flowreth seldome before July, and the seed is ripe in August"; but it may occasionally be found in blossom as late as September. Many varieties of the common foxglove have been raised by cultivation, with flowers varying in colour from white to deep rose and purple; in the variety *gloxinioides* the flowers are almost regular, suggesting those of the cultivated gloxinia. Other species of foxglove with variously coloured flowers have been introduced into Britain from the continent of Europe. The plants may be propagated by unflowered off-sets from the roots, but being biennials are best raised from seed.

The foxglove, probably from folks'-glove, that is fairies' glove, is known by a great variety of popular names in Britain. In the south of Scotland it is called bloody fingers; farther north, dead-men's-bells; and on the eastern borders, ladies' thimbles, wild mercury and Scotch mercury. In Ireland it is generally known under the name of fairy thimble. Among its Welsh synonyms are *menyg-ellyllon* (elves' gloves), *menyg y llwynog* (fox's gloves), *bysedd cochion* (redfingers) and *bysedd y cwn* (dog's fingers). In France its designations are *gants de notre dame* and *doigts de la Vierge*. The German name *Fingerhut* (thimble) suggested to Fuchs, in 1542, the employment of the Latin adjective *digitalis* as a designation for the plant. Other species of foxglove or *Digitalis* although found in botanical collections are not generally grown. For medicinal uses see **DIGITALIS**.

FOX INDIANS, the name, from one of their clans, of an Algonquian tribe, whose former range was central Wisconsin. They call themselves Muskwakiuk, "red earth people." Owing to heavy losses in their wars with the Ojibways and the French, they allied themselves with the Sauk tribe about 1780, the two tribes being now practically one.

FOX MORCILLO, SEBASTIAN (1526?-1559?), Spanish scholar and philosopher, was born at Seville between 1526 and 1528. About 1548 he studied at Louvain, and, following the example of the Spanish Jew, Judas Abarbanel, published commentaries on Plato and Aristotle in which he endeavoured to reconcile their teaching. In 1559 he was appointed tutor to Don Carlos, son of Philip II., but did not live to take up the duties of the post, as he was lost at sea on his way to Spain. His most original work is the *De imitatione, seu de informandi styli ratione libri II.* (1554), a dialogue in which the author and his brother take part under the pseudonyms of Gaspar and Francisco Enuesia. Among Fox Morcillo's other publications are: (1) *In Topica Ciceronis paraphrasis et scholia* (1550); (2) *In Platonis Timaeum commentarii* (1554); (3) *Compendium ethices philosophiae ex Platone, Aristotele, aliisque philosophis collectum*; (4) *De historiae institutione dialogus* (1557), and (5) *De naturae philosophia*.

He is the subject of an excellent monograph by Urbano Gonzalez de Calle, *Sebastián Fox Morcillo: estudio histórico-crítico de sus doctrinas* (Madrid, 1903).

FOY, MAXIMILIEN SÉBASTIEN (1775-1825), French general and statesman, was born at Ham in Picardy on the 3rd of February 1775. He was the son of an old soldier who had fought at Fontenoy and had become post-master of the town in which he lived. His father died in 1780, and his early instruction was given by his mother, a woman of English origin and of

Foxglove (*Digitalis purpurea*), one-third nat. size.

1. Corolla cut open showing the four stamens; rather more than half nat. size.
2. Unripe fruit cut lengthwise.
3. Ripe capsule split open, showing the thick axial placenta bearing numerous small seeds.

D. purpurea, is common in dry hilly pastures and rocky places and by road-sides in various parts of Europe; it ranges in Great Britain from Cornwall and Kent to Orkney, but it does not occur in Shetland or in some of the eastern counties of England.

superior ability. He continued his education at the college of Soissons, and thence passed at the age of fifteen to the artillery school of La Fère. After eighteen months' successful study he entered the army, served his first campaign in Flanders (1791-92), and was present at the battle of Jemmapes. He soon attained the rank of captain, and served successively under Dampierre, Jourdan, Pichegru and Houchard. In 1794, in consequence of having spoken freely against the violence of the extreme party at Paris, he was imprisoned by order of the commissioner of the Convention, Joseph Lebon, at Cambrai, but regained his liberty soon after the fall of Robespierre. He served under Moreau in the campaigns of 1796 and 1797, distinguishing himself in many engagements. The leisure which the treaty of Campo Formio gave him he devoted to the study of public law and modern history, attending the lectures of Christoph Wilhelm von Koch (1737-1813), the famous professor of public law at Strassburg. He was recommended by Desaix to the notice of General Bonaparte, but declined to serve on the staff of the Egyptian expedition. In the campaign of Switzerland (1798) he distinguished himself afresh, though he served only with the greatest reluctance against a people which possessed republican institutions. In Masséna's brilliant campaign of 1799 Foy won the rank of *chef de brigade*. In the following year he served under Moncey in the Marengo campaign and afterwards in Tirol.

Foy's republican principles caused him to oppose the gradual rise of Napoleon to the supreme power and at the time of Moreau's trial he escaped arrest only by joining the army in Holland. Foy voted against the establishment of the empire, but the only penalty for his independence was a long delay before attaining the rank of general. In 1806 he married a daughter of General Baraguay d'Hilliers. In the following year he was sent to Constantinople, and there took part in the defence of the Dardanelles against the English fleet. He was next sent to Portugal, and thenceforward he served in the Peninsular War from first to last. Under Junot he won at last his rank of general of brigade, under Soult he held a command in the pursuit of Sir John Moore's army, and under Masséna he fought in the third invasion of Portugal (1810). Masséna reposed the greatest confidence in Foy, and employed him after Busaco in a mission to the emperor. Napoleon now made Foy's acquaintance for the first time, and was so far impressed with his merits as to make him a general of division at once. The part played by General Foy at the battle of Salamanca won him new laurels, but above all he distinguished himself when the disaster of Vittoria had broken the spirit of the army. Foy rose to the occasion; his resistance in the Pyrenees was steady and successful, and only a wound (at first thought mortal) which he received at Orthez prevented him from keeping the field to the last. At the first restoration of the Bourbons he received the grand cross of the Legion of Honour and a command, and on the return of Napoleon from Elba he declined to join him until the king had fled from the country. He held a divisional command in the Waterloo campaign, and at Waterloo was again severely wounded at the head of his division (see WATERLOO CAMPAIGN). After the second restoration he returned to civil life, devoting his energies for a time to his projected history of the Peninsular War, and in 1819 was elected to the chamber of deputies. For this position his experience and his studies had especially fitted him, and by his first speech he gained a commanding place in the chamber, which he never lost, his clear, manly eloquence being always employed on the side of the liberal principles of 1789. In 1823 he made a powerful protest against French intervention in Spain, and after the dissolution of 1824 he was re-elected for three constituencies. He died at Paris on the 28th of November 1825, and his funeral was attended, it is said, by 100,000 persons. His early death was regarded by all as a national calamity. His family was provided for by a general subscription.

The *Histoire de la guerre de la Péninsule sous Napoléon* was published from his notes in 1827, and a collection of his speeches (with memoir by Tissot) appeared in 1826 soon after his death. See Cousin, *Vie militaire, politique, &c., du général Foy*; Vidal, *Vie militaire et politique du général Foy*.

FRAAS, KARL NIKOLAS (1810-1875), German botanist and agriculturist, was born at Rattelsdorf, near Bamberg, on the 8th of September 1810. After receiving his preliminary education at the gymnasium of Bamberg, he in 1830 entered the university of Munich, where he took his doctor's degree in 1834. Having devoted great attention to the study of botany, he went to Athens in 1835 as inspector of the court garden; and in April 1836 he became professor of botany at the university. In 1842 he returned to Germany and became teacher at the central agricultural school at Schleissheim. In 1847 he was appointed professor of agriculture at Munich, and in 1851 director of the central veterinary college. For many years he was secretary of the Agricultural Society of Bavaria, but resigned in 1861. He died at his estate of Neufreimann, near Munich, on the 9th of November 1875.

His principal works are: *Εραχμία τῆς Βορρακῆς* (Athens, 1835); *Synopsis florae classicae* (Munich, 1845); *Klima und Pflanzenwelt in der Zeit* (Landsh., 1847); *Histor.-encyklopäd. Grundriss der Landwirtschaftslehre* (Stuttgart, 1848); *Geschichte der Landwirtschaft* (Prague, 1851); *Die Schule des Landbaues* (Munich, 1852); *Baierns Rinderrassen* (Munich, 1853); *Die künstliche Fischerzeugung* (Munich, 1854); *Die Natur der Landwirtschaft* (Munich, 1857); *Buch der Natur für Landwirthe* (Munich, 1860); *Die Ackerbaukrisen und ihre Heilmittel* (Munich, 1866); *Das Wurzelleben der Kulturpflanzen* (Berlin, 1872); and *Geschichte der Landbau und Forstwissenschaft seit dem 16ten Jahrh.* (Munich, 1865). He also founded and edited a weekly agricultural paper, the *Schranne*.

FRACASTORO [FRACASTORIUS], **GIROLAMO** [HIERONYMUS] (1483-1553), Italian physician and poet, was born at Verona in 1483. It is related of him that at his birth his lips adhered so closely that a surgeon was obliged to divide them with his incision knife, and that during his infancy his mother was killed by lightning, while he, though in her arms at the moment, escaped unhurt. Fracastoro became eminently skilled, not only in medicine and belles-lettres, but in most arts and sciences. He studied at Padua, and became professor of philosophy there in 1502, afterwards practising as a physician in Verona. It was by his advice that Pope Paul III., on account of the prevalence of a contagious distemper, removed the council of Trent to Bologna. He was the author of many works, both poetical and medical, and was intimately acquainted with Cardinal Bembo, Julius Scaliger, Gianbattista Ramusio (*q.v.*), and most of the great men of his time. In 1517, when the builders of the citadel of San Felice (Verona) found fossil mussels in the rocks, Fracastoro was consulted about the marvel, and he took the same view—following Leonardo da Vinci, but very advanced for those days—that they were the remains of animals once capable of living in the locality. He died of apoplexy at Casi, near Verona, on the 8th of August 1553; and in 1559 the town of Verona erected a statue in his honour.

The principal work of Fracastoro is a kind of medical poem entitled *Syphilitidis, sive Morbi Gallici, libri tres* (Verona, 1530), which has been often reprinted and also translated into French and Italian. Among his other works (all published at Venice) are *De vini temperatura* (1534); *Homocentricorum* (1535); *De sympathia et antipathia rerum* (1546); and *De contagionibus* (1546). His complete works were published at Venice in 1555, and his poetical productions were collected and printed at Padua in 1728.

FRAGONARD, JEAN-HONORÉ (1732-1806), French painter, was born at Grasse, the son of a glover. He was articled to a Paris notary when his father's circumstances became straitened through unsuccessful speculations, but he showed such talent and inclination for art that he was taken at the age of eighteen to Boucher, who, recognizing the youth's rare gifts but disinclined to waste his time with one so inexperienced, sent him to Chardin's atelier. Fragonard studied for six months under the great luminist, and then returned more fully equipped to Boucher, whose style he soon acquired so completely that the master entrusted him with the execution of replicas of his paintings. Though not a pupil of the Academy, Fragonard gained the Prix de Rome in 1752 with a painting of "Jeroboam sacrificing to the Idols," but before proceeding to Rome he continued to study for three years under Van Loo. In the year preceding his departure he painted the "Christ washing the Feet of the Apostles" now at Grasse cathedral. In 1755 he took up his abode at the French Academy in Rome, then presided over by Natoire. There he

benefited from the study of the old masters whom he was set to copy—always remembering Boucher's parting advice not to take Raphael and Michelangelo too seriously. He successively passed through the studios of masters as widely different in their aims and technique as Chardin, Boucher, Van Loo and Natoire, and a summer sojourn at the Villa d'Este in the company of the abbé de Saint-Non, who engraved many of Fragonard's studies of these entrancing gardens, did more towards forming his personal style than all the training at the various schools. It was in these romantic gardens, with their fountains, grottos, temples and terraces, that he conceived the dreams which he was subsequently to embody in his art. Added to this influence was the deep impression made upon his mind by the florid sumptuousness of Tiepolo, whose works he had an opportunity of studying in Venice before he returned to Paris in 1761. In 1765 his "Corésus et Callirhoé" secured his admission to the Academy. It was made the subject of a pompous eulogy by Diderot, and was bought by the king, who had it reproduced at the Gobelins factory. Hitherto Fragonard had hesitated between religious, classic and other subjects; but now the demand of the wealthy art patrons of Louis XV.'s pleasure-loving and licentious court turned him definitely towards those scenes of love and voluptuousness with which his name will ever be associated, and which are only made acceptable by the tender beauty of his colour and the virtuosity of his facile brushwork—such works as the "Serment d'amour" (Love Vow), "Le Verrou" (The Bolt), "La Culbute" (The Tumble), "La Chemise calvée" (The Shift Withdrawn), and "The Swing" (Wallace collection), and his decorations for the apartments of Mme du Barry and the dancer Marie Guimard.

The Revolution made an end to the *ancien régime*, and Fragonard, who was so closely allied to its representatives, left Paris in 1793 and found shelter in the house of his friend Maubert at Grasse, which he decorated with the series of decorative panels known as the "Roman d'amour de la jeunesse," originally painted for Mme du Barry's pavilion at Louvreciennes. The panels in recent years came into the possession of Mr Pierpont Morgan. Fragonard returned to Paris early in the 19th century, where he died in 1806, neglected and almost forgotten. For half a century or more he was so completely ignored that Lübke, in his history of art (1873), omits the very mention of his name. But within the last thirty years he has regained the position among the masters of painting to which he is entitled by his genius. If the appreciation of his art by the modern collector can be expressed in figures, it is significant that the small and sketchy "Billet Doux," which appeared at the Cronier sale in Paris in 1905 and was subsequently exhibited by Messrs Duveen in London (1906), realized close on £19,000 at the Hôtel Drouot.

Besides the works already mentioned, there are four important pictures by Fragonard in the Wallace collection: "The Fountain of Love," "The Schoolmistress," "A Lady carving her Name on a Tree" (usually known as "Le Chiffre d'amour") and "The Fair-haired Child." The Louvre contains thirteen examples of his art, among them the "Corésus," "The Sleeping Bacchante," "The Shift Withdrawn," "The Bathers," "The Shepherd's Hour" ("L'Heure du berger"), and "Inspiration." Other works are in the museums of Lille, Besançon, Rouen, Tours, Nantes, Avignon, Amiens, Grenoble, Nancy, Orleans, Marseilles, &c., as well as at Chantilly. Some of Fragonard's finest work is in the private collections of the Rothschild family in London and Paris.

See R. Portalis, *Fragonard* (Paris, 1899), fully illustrated; Felix Naquet, *Fragonard* (Paris, 1890); Virgile Jozz, *Fragonard—mœurs du XVIII^e siècle* (Paris, 1901); E. and J. de Goncourt, *L'Art du dix-huitième siècle—Fragonard* (Paris, 1883). (P. G. K.)

FRAHN, CHRISTIAN MARTIN (1782-1851), German numismatist and historian, was born at Rostock. He began his Oriental studies under Tychem at the university of Rostock, and afterwards prosecuted them at Göttingen and Tübingen. He became a Latin master in Pestalozzi's famous institute in 1804, returned home in 1806, and in the following year was chosen to fill the chair of Oriental languages in the Russian university of Kazan. Though in 1815 he was invited to succeed Tychem at

Rostock, he preferred to go to St Petersburg, where he became director of the Asiatic museum and councillor of state. He died at St Petersburg.

Frahn wrote over 150 works. Among the more important are: *Numophylacium orientale Pototianum* (1813); *De numorum Bulgharicorum fonte antiquissimo* (1816); *Das muhammedanische Münzkabinet des asiatischen Museum der kaiserl. Akademie der Wissenschaften zu St Petersburg* (1821); *Numi cufici ex variis museis selecti* (1823); *Notice d'une centaine d'ouvrages arabes, &c., qui manquent en grande partie aux bibliothèques de l'Europe* (1834); and *Nova supplementa ad recensionem Num. Muham. Acad. Imp. Sci. Petropolitanae* (1855). His description of some medals struck by the Samanid and Bouid princes (1804) was composed in Arabic because he had no Latin types.

FRAME, a word employed in many different senses, signifying something joined together or shaped. It is derived ultimately from O.E. *fram*, from, in its primary meaning "forward." In constructional work it connotes the union of pieces of wood, metal or other material for purposes of enclosure as in the case of a picture or mirror frame. Frames intended for these uses are of great artistic interest but comparatively modern origin. There is no record of their existence earlier than the 16th century, but the decorative opportunities which they afforded caused speedy popularity in an artistic age, and the Renaissance found in the picture frame a rich and attractive means of expression. The impulses which made frames beautiful have long been extinct or dormant, but fine work was produced in such profusion that great numbers of examples are still extant. Frames for pictures or mirrors are usually square, oblong, round or oval, and, although they have usually been made of wood or composition overlaid upon wood, the richest and most costly materials have often been used. Ebony, ivory and tortoiseshell; crystal, amber and mother-of-pearl; lacquer, gold and silver, and almost every other metal have been employed for this purpose. The domestic frame has in fact varied from the simplest and cheapest form of a plain wooden moulding to the most richly carved examples. The introduction in the 17th century of larger sheets of glass gave the art of frame-making a great *essor*, and in the 18th century the increased demand for frames, caused chiefly by the introduction of cheaper forms of mirrors, led to the invention of a composition which could be readily moulded into stereotyped patterns and gilded. This was eventually the deathblow of the artistic frame, and since the use of composition moulding became normal, no important school of wood-carving has turned its attention to frames. The carvers of the Renaissance, and down to the middle of the 18th century, produced work which was often of the greatest beauty and elegance. In England nothing comparable to that of Grinling Gibbons and his school has since been produced. Chippendale was a great frame maker, but he not only had recourse to composition, but his designs were often extravagantly rococo. Even in France there has been no return of the great days when Oeben enclosed the looking-glasses which mirrored the Pompadour in frames that were among the choicest work of a gorgeous and artificial age. In the decoration of frames as in so many other respects France largely followed the fashions of Italy, which throughout the 16th and 17th centuries produced the most elaborate and grandiose, the richest and most palatial, of the mirror frames that have come down to us. English art in this respect was less exotic and more restrained, and many of the mirrors of the 18th century received frames the grace and simplicity of which have ensured their constant reproduction even to our own day.

FRAMINGHAM, a township of Middlesex county, Massachusetts, U.S.A., having an area of 27 sq. m. of hilly surface, dotted with lakes and ponds. Pop. (1890) 9239; (1900) 11,302, of whom 2391 were foreign-born; (1910 census) 12,948. It is served by the Boston & Albany, and the New York, New Haven & Hartford railways. Included within the township are three villages, Framingham Center, Saxonville and South Framingham, the last being much the most important. Framingham Academy was established in 1792, and in 1851 became a part of the public school system. A state normal school (the first normal school in the United States, established at Lexington

in 1839, removed to Newton in 1844 and to Framingham in 1853) is situated here; and near South Framingham, in the township of Sherborn, is the state reformatory prison for women. South Framingham has large manufactories of paper tags, shoes, boilers, carriage wheels and leather board; formerly straw braid and bonnets were the principal manufactures. Saxonville manufactures worsted cloth. The value of the township's factory products increased from \$3,007,301 in 1900 to \$4,173,579 in 1905, or 38.8%. Framingham was first settled about 1640, and was named in honour of the English home (Framlingham) of Governor Thomas Danforth (1622-1699), to whom the land once belonged. In 1700 it was incorporated as a township. The "old Connecticut path," the Boston-to-Worcester turnpike, was important to the early fortunes of Framingham Center, while the Boston & Worcester railway (1834) made the greater fortune of South Framingham.

See J. H. Temple, *History of Framingham . . . 1640-1880* (Framingham, 1887).

FRAMLINGHAM, a market town in the Eye parliamentary division of Suffolk, 91 m. N.E. from London by a branch of the Great Eastern railway. Pop. (1901) 2526. The church of St Michael is a fine Perpendicular and Decorated building of black flint, surmounted by a tower 96 ft. high. In the interior there are a number of interesting monuments, among which the most noticeable are those of Thomas Howard, 3rd duke of Norfolk, and of Henry Howard, the famous earl of Surrey, who was beheaded by Henry VIII. The castle forms a picturesque ruin, consisting of the outer walls 44 ft. high and 8 ft. thick, 13 towers about 58 ft. high, a gateway and some outworks. About half a mile from the town is the Albert Memorial Middle Class College, opened in 1865, and capable of accommodating 300 boys. A bronze statue of the Prince Consort by Joseph Durham adorns the front terrace.

Framlingham (Frendlingham, Framalingaham) in early Saxon times was probably the site of a fortified earthwork to which St Edmund the Martyr is said to have fled from the Danes in 870. The Danes captured the stronghold after the escape of the king, but it was won back in 921, and remained in the hands of the crown, passing to William I. at the Conquest. Henry I. in 1100 granted it to Roger Bigod, who in all probability raised the first masonry castle. Hugh, son of Roger, created earl of Norfolk in 1141, succeeded his father, and the manor and castle remained in the Bigod family until 1306, when in default of heirs it reverted to the crown, and was granted by Edward II. to his half-brother Thomas de Brotherton, created earl of Norfolk in 1312. On an account roll of Framlingham Castle of 1324 there is an entry of "rent received from the borough," also of "rent from those living outside the borough," and in all probability burghal rights had existed at a much earlier date, when the town had grown into some importance under the shelter of the castle. Town and castle followed the vicissitudes of the dukedom of Norfolk, passing to the crown in 1405, and being alternately restored and forfeited by Henry V., Richard III., Henry VII., Edward VI., Mary, Elizabeth and James I., and finally sold in 1635 to Sir Robert Hitcham, who left it in 1636 to the master and fellows of Pembroke Hall, Cambridge.

In the account roll above mentioned reference is made to a fair and a market, but no early grant of either is to be found. In 1792 two annual fairs were held, one on Whit Monday, the other on the 10th of October; and a market was held every Saturday. The market day is still Saturday, but the fairs are discontinued.

See Robert Hawes, *History of Framlingham in the County of Suffolk*, edited by R. Loder (Woodbridge, 1798).

FRANC, a French coin current at different periods and of varying values. The first coin so called was one struck in gold by John II. of France in 1360. On it was the legend *Johannes Dei gracia Francorum rex*; hence, it is said, the name. It also bore an effigy of King John on horseback, from which it was called a *franc à cheval*, to distinguish it from another coin of the same value, issued by Charles V., on which the king was represented standing upright under a Gothic dais; this

coin was termed a *franc à pied*. As a coin it disappeared after the reign of Charles VI., but the name continued to be used as an equivalent for the *livre tournois*, which was worth twenty sols. French writers would speak without distinction of so many livres or so many francs, so long as the sum mentioned was an even sum; otherwise livre was the correct term, thus "*trois livres*" or "*trois francs*," but "*trois livres cinq sols*." In 1795 the livre was legally converted into the franc, at the rate of 81 livres to 80 francs, the silver franc being made to weigh exactly five grammes. The franc is now the unit of the monetary system and also the money of account in France, as well as in Belgium and Switzerland. In Italy the equivalent is the lira, and in Greece the drachma. The franc is divided into 100 centimes, the lira into 100 centesimi and the drachma into 100 lepta. Gold is now the standard, the coins in common use being ten and twenty franc pieces. The twenty franc gold piece weighs 6.4516 grammes, .900 fine. The silver coins are five, two, one, and half franc pieces. The five franc silver piece weighs 25 grammes, .900 fine, while the franc piece weighs 5 grammes, .835 fine. See also MONEY.

FRANÇAIS, ANTOINE, COUNT (1756-1836), better known as FRANÇAIS OF NANTES, French politician and author, was born at Beaurepaire, in the department of Isère. In 1791 he was elected to the legislative assembly by the department of Loire Inférieure, and was noted for his violent attacks upon the farmers general, the pope and the priests; but he was not re-elected to the Convention. During the Terror, as he had belonged to the Girondin party, he was obliged to seek safety in the mountains. In 1798 he was elected to the council of Five Hundred by the department of Isère, and became one of its secretaries; and in the following year he voted against the Directory. He took office under the consulate as prefect of Charente Inférieure, rose to be a member of the council of state, and in 1804 obtained the important post of director-general of the indirect taxes (*droits réunis*). The value of his services was recognized by the titles of count of the empire and grand officer of the Legion of Honour. On the second restoration he retired into private life; but from 1819 to 1822 he was representative of the department of Isère, and after the July revolution he was made a peer of France. He died at Paris on the 7th of March 1836.

Français wrote a number of works, but his name is more likely to be preserved by the eulogies of the literary men to whom he afforded protection and assistance. It is sufficient to mention *Le Manuscrit de feu M. Jérôme* (1825); *Recueil de fadaises composé sur la montagne à l'usage des habitants de la plaine* (1826); *Voyage dans la vallée des originaux* (1828); *Tableau de la vie rurale, ou l'agriculture enseignée d'une manière dramatique* (1829).

FRANÇAIS, FRANÇOIS LOUIS (1814-1897), French painter, was born at Plombières (Vosges), and, on attaining the age of fifteen, was placed as office-boy with a bookseller. After a few years of hard struggle, during which he made a precarious living by drawing on stone and designing woodcut vignettes for book illustration, he studied painting under Gigoux, and subsequently under Corot, whose influence remained decisive upon Français's style of landscape painting. He generally found his subjects in the neighbourhood of Paris, and though he never rivalled his master in lightness of touch and in the lyric poetry which is the principal charm of Corot's work, he is still counted among the leading landscape painters of his country and period. He exhibited first at the Salon in 1837 and was elected to the Académie des Beaux-Arts in 1890. Comparatively few of his pictures are to be found in public galleries, but his painting of "An Italian Sunset" is at the Luxembourg Museum in Paris. Other works of importance are "Daphnis et Chloé" (1872), "Bas Meudon" (1861), "Orpheus" (1863), "Le Bois sacré" (1864), "Le Lac de Nemi" (1868).

FRANCATELLI, CHARLES ELMÉ (1805-1876), Anglo-Italian cook, was born in London, of Italian extraction, in 1805, and was educated in France, where he studied the art of cookery. Coming to England, he was employed successively by various noblemen, subsequently becoming manager of Crockford's club. He left Crockford's to become chief cook to Queen Victoria, and afterwards he was chef at the Reform Club. He was the

author of *The Modern Cook* (1845), which has since been frequently republished; of a *Plain Cookery Book for the Working Classes* (1861), and of *The Royal English and Foreign Confectionery Book* (1862). Francatelli died at Eastbourne on the 10th of August 1876.

FRANCAVILLA FONTANA, a town and episcopal see of Apulia, Italy, in the province of Lecce, 22 m. by rail E. by N. of Taranto, 460 ft. above sea-level. Pop. (1901) 17,759 (town); 20,510 (commune). It is in a fine situation, and has a massive square castle of the Umperiali family, to whom, with Oria, it was sold by S. Carlo Borromeo in the 16th century for 40,000 ounces of gold, which he distributed in one day to the poor.

FRANCE, ANATOLE (1844–), French critic, essayist and novelist (whose real name was Jacques Anatole Thibault), was born in Paris on the 16th of April 1844. His father was a bookseller, one of the last of the booksellers, if we are to believe the Goncourts, into whose establishment men came, not merely to order and buy, but to dip, and turn over pages and discuss. As a child he used to listen to the nightly talks on literary subjects which took place in his father's shop. Nurtured in an atmosphere so essentially bookish, he turned naturally to literature. In 1868 his first work appeared, a study of Alfred de Vigny, followed in 1873 by a volume of verse, *Les Poèmes dorés*, dedicated to Leconte de Lisle, and, as such a dedication suggests, an outcome of the "Parnassian" movement; and yet another volume of verse appeared in 1876, *Les Noces corinthiennes*. But the poems in these volumes, though unmistakably the work of a man of great literary skill and cultured taste, are scarcely the poems of a man with whom verse is the highest form of expression.

He was to find his richest vein in prose. He himself, avowing his preference for a simple, or seemingly simple, style as compared with the artistic style, vaunted by the Goncourts—a style compounded of neologisms and "rare" epithets, and startling forms of expression—observes: "A simple style is like white light. It is complex, but not to outward seeming. In language, a beautiful and desirable simplicity is but an appearance, and results only from the good order and sovereign economy of the various parts of speech." And thus one may say of his own style that its beautiful translucency is the result of many qualities—felicity, grace, the harmonious grouping of words, a perfect measure. Anatole France is a sceptic. The essence of his philosophy, if a spirit so light, evanescent, elusive, can be said to have a philosophy, is doubt. He is a doubter in religion, metaphysics, morals, politics, aesthetics, science—a most genial and kindly doubter, and not at all without doubts even as to his own negative conclusions. Sometimes his doubts are expressed in his own person—as in the *Jardin d'épicure* (1894) from which the above extracts are taken, or *Le Livre de mon ami* (1885), which may be accepted, perhaps, as partly autobiographical; sometimes, as in *La Rôtisserie de la reine Pédauque* (1893) and *Les Opinions de M. Jérôme Coignard* (1893), or *L'Orme du mail* (1897), *Le Mannequin d'osier* (1897), *L'Anneau d'améthyste* (1899), and *M. Bergeret à Paris* (1901), he entrusts the expression of his opinions, dramatically, to some fictitious character—the abbé Coignard, for instance, projecting, as it were, from the 18th century some very effective criticisms on the popular political theories of contemporary France—or the M. Bergeret of the four last-named novels, which were published with the collective title of *Histoire contemporaine*. This series deals with some modern problems, and particularly, in *L'Anneau d'améthyste* and *M. Bergeret à Paris*, with the humours and follies of the anti-Dreyfusards. All this makes a piquant combination. Neither should reference be omitted to his *Crime de Sylvestre Bonnard* (1881), crowned by the Institute, nor to works more distinctly of fancy, such as *Balthazar* (1889), the story of one of the Magi or *Thaïs* (1890), the story of an actress and courtesan of Alexandria, whom a hermit converts, but with the loss of his own soul. His ironic comedy, *Crainquebille* (Renaissance theatre, 1903), was founded on his novel (1902) of the same year. His more recent work includes his anti-clerical *Vie de Jeanne d'Arc* (1908); his pungent satire the *Ile des péguins* (1908); and a volume of stories, *Les Sept Femmes de la Barbe-Bleue* (1909).

Lightly as he bears his erudition, it is very real and extensive, and is notably shown in his utilization of modern archaeological and historical research in his fiction (as in the stories in *Sur une pierre blanche*). As a critic—see the *Vie littéraire* (1888–1892), reprinted mainly from *Le Temps*—he is graceful and appreciative. Academic in the best sense, he found a place in the French Academy, taking the seat vacated by Lesseps, and was received into that body on the 24th of December 1896. In the *affaire Dreyfus* he sided with M. Zola.

For studies of M. Anatole France's talent see Maurice Barrès, *Anatole France* (1885); Jules Lemaitre, *Les Contemporains* (2nd series, 1886); and G. Brandes, *Anatole France* (1908). In 1908 Frederic Chapman began an edition of *The works of Anatole France in an English translation* (John Lane).

FRANCE, a country of western Europe, situated between 51° 5' and 42° 20' N., and 4° 42' W. and 7° 39' E. It is hexagonal in form, being bounded N.W. by the North Sea, the Strait of Dover (*Pas de Calais*) and the English Channel (*La Manche*), W. by the Atlantic Ocean, S.W. by Spain, S.E. by the Mediterranean Sea, E. by Italy, Switzerland and Germany, N.E. by Germany, Luxemburg and Belgium. From north to south its length is about 600 m., measured from Dunkirk to the Col de Falguères; its breadth from east to west is 528 m., from the Vosges to Cape Saint Mathieu at the extremity of Brittany. The total area is estimated¹ at 207,170 sq. m., including the island of Corsica, which comprises 3367 sq. m. The coast-line of France extends for 384 m. on the Mediterranean, 700 on the North Sea, the Strait of Dover and the Channel, and 865 on the Atlantic. The country has the advantage of being separated from its neighbours over the greater part of its frontier by natural barriers of great strength, the Pyrenees forming a powerful bulwark on the south-west, the Alps on the south-east, and the Jura and the greater portion of the Vosges Mountains on the east. The frontier generally follows the crest line of these ranges. Germany possesses both slopes of the Vosges north of Mont Donon, from which point the north-east boundary is conventional and unprotected by nature.

France is geographically remarkable for its possession of great natural and historical highways between the Mediterranean and the Atlantic Ocean. The one, following the depression between the central plateau and the eastern mountains by way of the valleys of the Rhône and Saône, traverses the Côte d'Or hills and so gains the valley of the Seine; the other, skirting the southern base of the Cévennes, reaches the ocean by way of the Garonne valley. Another natural highway, traversing the lowlands to the west of the central plateau, unites the Seine basin with that of the Garonne.

Physiography.—A line drawn from Bayonne through Agen, Poitiers, Troyes, Reims and Valenciennes divides the country roughly into two dissimilar physical regions—to the west and north-west a country of plains and low plateaus; in the centre, east and south-east a country of mountains and high plateaus with a minimum elevation of 650 ft. To the west of this line the only highlands of importance are the granitic plateaus of Brittany and the hills of Normandy and Perche, which, uniting with the plateau of Beauce, separate the basins of the Seine and Loire. The highest elevations of these ranges do not exceed 1400 ft. The configuration of the region east of the dividing line is widely different. Its most striking feature is the mountainous and eruptive area known as the Massif Central, which covers south-central France. The central point of this huge tract is formed by the mountains of Auvergne comprising the group of Cantal, where the Plomb du Cantal attains 6096 ft., and that of Mont Dore, containing the Puy de Sancy (6188 ft.), the culminating point of the Massif, and to the north the lesser elevations of the Monts Dôme. On the west the downward slope is gradual by way of lofty plateaus to the heights of Limousin and Marche and the table-land of Quercy, thence to the plains of Poitou, Angoumois and Guienne. On the east only river valleys divide the Auvergne mountains from those of Forez and Margeride, western spurs of the Cévennes. On the south the Aubrac mountains and the barren plateaus known as the Causses intervene between them and the Cévennes. The main range of the Cévennes (highest point Mont Lozère, 5584 ft.) sweeps in a wide curve from the granitic table-land of Morvan in the north along the right banks of the Saône and Rhône to the Montagne Noire in the south, where it is separated from the Pyrenean system by the river Aude. On the south-western border of France the Pyrenees include

¹ By the *Service géographique de l'armée*.

several peaks over 10,000 ft. within French territory; the highest elevation therein, the Vignemale, in the centre of the range, reaches 10,820 ft. On the north their most noteworthy offshoots are, in the centre, the plateau of Lannemezan from which rivers radiate fanwise to join the Adour and Garonne; and in the east the Corbière. On the south-eastern frontier the French Alps, which include Mont Blanc (15,800 ft.), and, more to the south, other summits over 11,000 ft. in height, cover Savoy and most of Dauphiné and Provence, that is to say, nearly the whole of France to the south and east of the Rhône. North of that river the parallel chains of the Jura form an arc of a circle with its convexity towards the north-west. In the southern and most elevated portion of the range there are several summits exceeding 5500 ft. Separated from the Jura by the defile of Belfort (Trouée de Belfort) the Vosges extend northward parallel to the course of the Rhine. Their culminating points in French territory, the Ballon d'Alsace and the Hôhneck in the southern portion of the chain, reach 4100 ft. and 4480 ft. The Vosges are buttressed on the west by the Faucilles, which curve southwards to meet the plateau of Langres, and by the plateaus of Haute-

Marne, united to the Ardennes on the north-eastern frontier by the wooded highlands of Argonne.

Seaboard.—The shore of the Mediterranean encircling the Gulf of the Lion (Golfe du Lion)¹ from Cape Cerbera to Martigues is low-lying and unbroken, and characterized chiefly by lagoons separated from the sea by sand-dunes. The coast, constantly encroaching on the sea by reason of the alluvium washed down by the rivers of the Pyrenees and Cévennes, is without important harbours saving that of Cette, itself continually invaded by the sand. East of Martigues the coast is rocky and of greater altitude, and is broken by projecting capes (Couronne, Croisette, Sicié, the peninsula of Giens and Cape Antibes), and by deep gulfs forming secure roadsteads such as those of Marseilles, which has the chief port in France, Toulon, with its great naval harbour, and Hyères, to which may be added the Gulf of St Tropez.

Along the Atlantic coast from the mouth of the Adour to the

¹ The etymology of this name (sometimes wrongly written Golfe de Lyon) is unknown.

estuary of the Gironde there stretches a monotonous line of sand-dunes bordered by lagoons on the land side, but towards the sea harbourless and unbroken save for the Bay of Arcachon. To the north as far as the rocky point of St Gildas, sheltering the mouth of the Loire, the shore, often occupied by salt marshes (marshes of Poitou and Brittany), is low-lying and hollowed by deep bays sheltered by large islands, those of Oléron and Ré lying opposite the ports of Rochefort and La Rochelle, while Noirmoutier closes the Bay of Bourgneuf.

Beyond the Loire estuary, on the north shore of which is the port of St Nazaire, the peninsula of Brittany projects into the ocean and here begins the most rugged, wild and broken portion of the French seaboard; the chief of innumerable indentations are, on the south the Gulf of Morbihan, which opens into a bay protected to the west by the narrow peninsula of Quiberon, the Bay of Lorient with the port of Lorient, and the Bay of Concarneau; on the west the dangerous Bay of Audierne and the Bay of Douarnenez separated from the spacious roadstead of Brest, with its important naval port, by the peninsula of Crozon, and forming with it a great indentation sheltered by Cape St Mathieu on the north and by Cape Raz on the south; on the north, opening into the English Channel, the Morlaix roads, the Bay of St Brieuc, the estuary of the Rance, with the port of St Malo and the Bay of St Michel. Numerous small archipelagos and islands, of which the chief are Belle Ile, Groix and Ushant, fringe the Breton coast. North of the Bay of St Michel the peninsula of Cotentin, terminating in the promontories of Hague and Barfleur, juts north into the English Channel and closes the bay of the Seine on the west. Cherbourg, its chief harbour, lies on the northern shore between the two promontories. The great port of Le Havre stands at the mouth of the Seine estuary, which opens into the bay of the Seine on the east. North of that point a line of high cliffs, in which occur the ports of Fécamp and Dieppe, stretches nearly to the sandy estuary of the Somme. North of that river the coast is low-lying and bordered by sand-dunes, to which succeed on the Strait of Dover the cliffs in the neighbourhood of the port of Boulogne and the marshes and sand-dunes of Flanders, with the ports of Calais and Dunkirk, the latter the principal French port on the North Sea.

To the maritime ports mentioned above must be added the river ports of Bayonne (on the Adour), Bordeaux (on the Garonne), Nantes (on the Loire), Rouen (on the Seine). On the whole, however, France is inadequately provided with natural harbours; her long tract of coast washed by the Atlantic and the Bay of Biscay has scarcely three or four good seaports, and those on the southern shore of the Channel form a striking contrast to the spacious maritime inlets on the English side.

Rivers.—The greater part of the surface of France is divided between four principal and several secondary basins.

The basin of the Rhône, with an area (in France) of about 35,000 sq. m., covers eastern France from the Mediterranean to the Vosges, from the Cévennes and the Plateau de Langres to the crests of the Jura and the Alps. Alone among French rivers, the Rhône, itself Alpine in character in its upper course, is partly fed by Alpine rivers (the Arve, the Isère and the Durance) which have their floods in spring at the melting of the snow, and are maintained by glacier-water in summer. The Rhône, the source of which is in Mont St Gothard, in Switzerland, enters France by the narrow defile of L'Écluse, and has a somewhat meandering course, first flowing south, then north-west, and then west as far as Lyons, whence it runs straight south till it reaches the Mediterranean, into which it discharges itself by two principal branches, which form the delta or island of the Camargue. The Ain, the Saône (which rises in the Faucilles and in the lower part of its course skirting the regions of Bresse and Dombes, receives the Doubs and joins the Rhone at Lyons), the Ardèche and the Gard are the affluents on the right; on the left it is joined by the Arve, the Isère, the Drôme and the Durance. The small independent river, the Var, drains that portion of the Alps which fringes the Mediterranean.

The basin of the Garonne occupies south-western France with the exception of the tracts covered by the secondary basins of the Adour, the Aude, the Hérault, the Orb and other smaller rivers, and the low-lying plain of the Landes, which is watered by numerous coast rivers, notably by the Leyre. Its area is nearly 33,000 sq. m., and extends from the Pyrenees to the uplands of Saintonge, Périgord and Limousin. The Garonne rises in the valley of Aran (Spanish Pyrenees), enters France near Bagnères-de-Luchon, has first a north-west course, then bends to the north-east, and soon resumes its first direction. Joining the Atlantic between Royan and the Pointe de Grave, opposite the tower of Cordouan. In the lower part of its course, from the Bec-d'Ambez, where it receives the Dordogne, it becomes considerably wider, and takes the name of Gironde. The principal affluents are the Ariège, the Tarn with the Aveyron and the Agout, the Lot and the Dordogne, which descends from Mont Dore-les-Bains, and joins the Garonne at Bec-d'Ambez, to form the Gironde. All these affluents are on the right, and with the exception of the Ariège, which descends from the eastern Pyrenees, rise in the mountains of Auvergne and the southern Cévennes, their sources often lying close to those of the rivers of the Loire and Rhone basins. The Neste, a Pyrenean torrent, and the Save, the Gers and the Baise, rising on the plateau of Lannemezan, are the principal left-hand

tributaries of the Garonne. North of the basin of the Garonne an area of over 3800 sq. m. is watered by the secondary system of the Charente, which descends from Chéronnac (Haute-Vienne), traverses Angoulême and falls into the Atlantic near Rochefort. Farther to the north a number of small rivers, the chief of which is the Sèvre Niortaise, drain the coast region to the south of the plateau of Gâtine.

The basin of the Loire, with an area of about 47,000 sq. m., includes a great part of central and western France or nearly a quarter of the whole country. The Loire rises in Mont Gerbier de Jonc, in the range of the Vivarais mountains, flows due north to Nevers, then turns to the north-west as far as Orléans, in the neighbourhood of which it separates the marshy region of the Sologne (*q.v.*) on the south from the wheat-growing region of Beauce and the Gâtinais on the north. Below Orléans it takes its course towards the south-west, and lastly from Saumur runs west, till it reaches the Atlantic between Paimbœuf and St Nazaire. On the right the Loire receives the waters of the Furens, the Arroux, the Nièvre, the Maine (formed by the Mayenne and the Sarthe with its affluent the Loir), and the Erdre, which joins the Loire at Nantes; on the left, the Allier (which receives the Dore and the Sioule), the Loiret, the Cher, the Indre, the Vienne with its affluent the Creuse, the Thouet, and the Sèvre-Nantaise. The peninsula of Brittany and the coasts of Normandy on both sides of the Seine estuary are watered by numerous independent streams. Amongst these the Vilaine, which passes Rennes and Redon, waters, with its tributaries, an area of 4200 sq. m. The Orne, which rises in the hills of Normandy and falls into the Channel below Caen, is of considerably less importance.

The basin of the Seine, though its area of a little over 30,000 sq. m. is smaller than that of any of the other main systems, comprises the finest network of navigable rivers in the country. It is by far the most important basin of northern France, those of the Somme and Scheldt in the north-west together covering less than 5000 sq. m., those of the Meuse and the Rhine in the north-east less than 7000 sq. m. The Seine descends from the Langres plateau, flows north-west down to Méry, turns to the west, resumes its north-westerly direction at Montereau, passes through Paris and Rouen and discharges itself into the Channel between Le Havre and Honfleur. Its affluents are, on the right, the Aube; the Marne, which joins the Seine at Charenton near Paris; the Oise, which has its source in Belgium and is enlarged by the Aisne; and the Epte; on the left the Yonne, the Loing, the Essonne, the Eure and the Rille.

Lakes.—France has very few lakes. The Lake of Geneva, which forms 32 m. of the frontier, belongs to Switzerland. The most important French lake is that of Grand-Lieu, between Nantes and Paimbœuf (Loire-Inférieure), which presents a surface of 17,300 acres. There may also be mentioned the lakes of Bourget and Annecy (both in Savoy), St Point (Jura), Paladru (Isère) and Nantua (Ain). The marshy districts of Sologne, Brenne, Landes and Dombes still contain large undrained tracts. The coasts present a number of maritime inlets, forming inland bays, which communicate with the sea by channels of greater or less width. Some of these are on the south-west coast, in the Landes, as Carcaus, Lacanau, Biscarosse, Cazau, Sanguinet; but more are to be found in the south and south-east, in Languedoc and Provence, as Leucate, Sigean, Thau, Vaccarès, Berre, &c. Their want of depth prevents them from serving as roadsteads for shipping, and they are useful chiefly for fishing or for the manufacture of bay-salt.

Climate.—The north and north-west of France bear a great resemblance, both in temperature and produce, to the south of England, rain occurring frequently, and the country being consequently suited for pasture. In the interior the rains are less frequent, but when they occur are far more heavy, so that there is much less difference in the annual rainfall there as compared with the rest of the country than in the number of rainy days. The annual rainfall for the whole of France averages about 32 in. The precipitation is greatest on the Atlantic seaboard and in the elevated regions of the interior. It attains over 60 in. in the basin of the Adour (71 in. at the western extremity of the Pyrenees), and nearly as much in the Vosges, Morvan, Cévennes and parts of the central plateau. The zone of level country extending from Reims and Troyes to Angers and Poitiers, with the exception of the Loire valley and the Brie, receives less than 24 in. of rain annually (Paris about 23 in.), as also does the Mediterranean coast west of Marseilles. The prevailing winds, mild and humid, are west winds from the Atlantic; continental climatic influence makes itself felt in the east wind, which is frequent in winter and in the east of France, while the *mistral*, a violent wind from the north-west, is characteristic of the Mediterranean region. The local climates of France may be grouped under the following seven designations: (1) Sequan climate, characterizing the Seine basin and northern France, with a mean temperature of 50° F., the winters being cold, the summers mild; (2) Breton climate, with a mean temperature of 51.8° F., the winters being mild, the summers temperate, it is characterized by west and south-west winds and frequent fine rains; (3) Girondin climate (characterizing Bordeaux, Agen, Pau, &c.), having a mean of 53.6° F., with mild winters and hot summers, the prevailing wind is from the north-west, the average rainfall about 28 in.; (4) Auvergne climate, comprising the Cévennes, central plateau, Clermont, Limoges and Rodez, mean temperature 51.8° F., with cold

winters and hot summers; (5) Vosges climate (comprehending Epinal, Mézières and Nancy), having a mean of 48.2° F., with long and severe winters and hot and rainy summers; (6) Rhône climate (experienced by Lyons, Chalon, Mâcon, Grenoble) mean temperature 51.8° F., with cold and wet winters and hot summers, the prevailing winds are north and south; (7) Mediterranean climate, ruling at Valence, Nîmes, Nice and Marseilles, mean temperature, 57.5° F., with mild winters and hot and almost rainless summers.

Flora and Fauna.—The flora of southern France and the Mediterranean is distinct from that of the rest of the country, which does not differ in vegetation from western Europe generally. Evergreens predominate in the south, where grow subtropical plants such as the myrtle, arbutus, laurel, holm-oak, olive and fig; varieties of the same kind are also found on the Atlantic coast (as far north as the Cotentin), where the humidity and mildness of the climate favour their growth. The orange, date-palm and eucalyptus have been acclimatized on the coast of Provence and the Riviera. Other trees of southern France are the cork-oak and the Aleppo and maritime pines. In north and central France the chief trees are the oak, the beech, rare south of the Loire, and the hornbeam; less important varieties are the birch, poplar, ash, elm and walnut. The chestnut covers considerable areas in Périgord, Limousin and Béarn; resinous trees (firs, pines, larches, &c.) form fine forests in the Vosges and Jura.

The indigenous fauna include the bear, now very rare but still found in the Alps and Pyrenees, the wolf, harbouring chiefly in the Cévennes and Vosges, but in continually decreasing areas; the fox, marten, badger, weasel, otter, the beaver in the extreme south of the Rhône valley, and in the Alps the marmot; the red deer and roe deer are preserved in many of the forests, and the wild boar is found in several districts; the chamois and wild goat survive in the Pyrenees and Alps. Hares, rabbits and squirrels are common. Among birds of prey may be mentioned the eagle and various species of hawk, and among game-birds the partridge and pheasant. The reptiles include the ringed-snake, slow-worm, viper and lizard. (R. Tr.)

Geology.—Many years ago it was pointed out by Elie de Beaumont and Dufrenoy that the Jurassic rocks of France form upon the map an incomplete figure of 8. Within the northern circle of the 8 lie the Mesozoic and Tertiary beds of the Paris basin, dipping inwards; within the southern circle lie the ancient rocks of the Central Plateau, from which the later beds dip outwards. Outside the northern circle lie on the west the folded Palaeozoic rocks of Brittany, and on the north the Palaeozoic *massif* of the Ardennes. Outside the southern circle lie on the west the Mesozoic and Tertiary beds of the basin of the Garonne, with the Pyrenees beyond, and on the east the Mesozoic and Tertiary beds of the valley of the Rhône, with the Alps beyond.

In the geological history of France there have been two great periods of folding since Archean times. The first of these occurred towards the close of the Palaeozoic era, when a great mountain system was raised in the north running approximately from E. to W., and another chain arose in the south, running from S.W. to N.E. Of the former the remnants are now seen in Brittany and the Ardennes; of the latter the Cévennes and the Montagne Noire are the last traces visible on the surface. The second great folding took place in Tertiary times, and to it was due the final elevation of the Jura and the Western Alps and of the Pyrenees. No great mountain chain was ever raised by a single effort, and folding went on to some extent in other periods besides those mentioned. There were, moreover, other and broader oscillations which raised or lowered extensive areas without much crumpling of the strata, and to these are due some of the most important breaks in the geological series.

The oldest rocks, the gneisses and schists of the Archean period, form nearly the whole of the Central Plateau, and are also exposed in the axes of the folds in Brittany. The Central Plateau has probably been a land mass ever since this period, but the rest of the country was flooded by the Palaeozoic sea. The earlier deposits of that sea now rise to the surface in Brittany, the Ardennes, the Montagne Noire and the Cévennes, and in all these regions they are intensely folded. Towards the close of the Palaeozoic era France had become a part of a great continent; in the north the Coal Measures of the Boulonnais and the Nord were laid down in direct connexion with those of Belgium and England, while in the Central Plateau the Coal Measures were deposited in isolated and scattered basins. The Permian and Triassic deposits were also, for the most part, of continental origin; but with the formation of the Rhaetic beds the sea again began to spread, and throughout the greater part of the Jurassic period it covered nearly the whole of the country except the Central Plateau, Brittany and the Ardennes. Towards the end of the period, however, during the deposition of the Portlandian beds, the sea again retreated, and in the early part of the Cretaceous period was limited (in France) to the catchment basins of the Saône and Rhône—in the Paris basin the contemporaneous deposits were chiefly estuarine and were confined to the northern and eastern rim. Beginning with the Aptian and Albian the sea again gradually spread over the country and attained its maximum in the early part of the Senonian epoch, when once more the ancient massifs of the Central Plateau, Brittany and the Ardennes, alone rose above the waves. There was still, however, a well-marked difference between the deposits of the northern and the southern parts of France, the

former consisting of chalk, as in England, and the latter of sandstones and limestones with Hippurites. During the later part of the Cretaceous period the sea gradually retreated and left the whole country dry.

During the Tertiary period arms of the sea spread into France—in the Paris basin from the north, in the basins of the Loire and the Garonne from the west, and in the Rhône area from the south. The changes, however, were too numerous and complex to be dealt with here.

In France, as in Great Britain, volcanic eruptions occurred during several of the Palaeozoic periods, but during the Mesozoic era the

country was free from outbursts, except in the regions of the Alps and Pyrenees. In Tertiary times the Central Plateau was the theatre of great volcanic activity from the Miocene to the Pleistocene periods, and many of the volcanoes remain as nearly perfect cones to the present day. The rocks are mainly basalts and andesites, together with trachytes and phonolites, and some of the basaltic flows are of enormous extent.

On the geology of France see the classic *Explication de la carte géologique de la France* (Paris, vol. i. 1841, vol. ii. 1848), by Dufrenoy and Elie de Beaumont; a more modern account, with full references, is given by A. de Lapparent, *Traité de géologie* (Paris, 1906).

(J. A. H.)

Population.

The French nation is formed of many different elements. Iberian influence in the south-west, Ligurian on the shores of the Mediterranean, Germanic immigrations from east of the Rhine and Scandinavian immigrations in the north-west have tended to produce ethnographical diversities which ease of intercommunication and other modern conditions have failed to obliterate. The so-called Celtic type, exemplified by individuals of rather less than average height, brown-haired and brachycephalic, is the fundamental element in the nation and peoples the region between the Seine and the Garonne; in southern France a different type, dolichocephalic, short and with black hair and eyes, predominates. The tall, fair and blue-eyed individuals who are found to the north-east of the Seine and in Normandy appear to be nearer in race to the Scandinavian and Germanic invaders; a tall and darker type with long faces and aquiline noses occurs in some parts of Franche-Comté and Champagne, the Vosges and the Perche. From the Celts has been derived the gay, brilliant and adventurous temperament easily moved to extremes of enthusiasm and depression, which

combined with logical and organizing faculties of a high order, the heritage from the Latin domination, and with the industry, frugality and love of the soil natural in an agricultural people go to make up the national character. The Bretons, who most nearly represent the Celts, and the Basques, who inhabit parts of the western versant of the Pyrenees, have preserved their distinctive languages and customs, and are ethnically the most interesting sections of the nation; the Flemings of French Flanders where Flemish is still spoken are also racially distinct. The immigration of Belgians into the northern departments and of Italians into those of the south-east exercise a constant modifying influence on the local populations.

During the 19th century the population of France increased to a less extent than that of any other country (except Ireland) for which definite data exist, and during the last twenty years of that period it was little more than stationary. The following table exhibits the rate of increase as indicated by the censuses from 1876 to 1906.

	Population.
1876	36,905,788
1881	37,673,048
1886	38,218,903
1891	38,342,948
1896	38,517,975
1901	38,961,945
1906	39,252,245

Thus the rate of increase during the decade 1891-1901 was 1.6%, whereas during the same period the population of England increased 1.08%. The birth-rate markedly decreased during the 19th century; despite an increase of population between 1801 and 1901 amounting to 40%, the number of births in the former was 904,000, as against 857,000 in the latter year, the diminution being accompanied by a decrease in the annual number of deaths.¹ In the following table the decrease in births and deaths for the decennial periods during the thirty years ending 1900 are compared.

Births.	
1871-1880	935,000 or 25.4 per 1000
1881-1890	909,000 " 23.9 "
1891-1900	853,000 " 22.2 "
Deaths.	
1871-1880	870,900 or 23.7 per 1000
1881-1890	841,700 " 22.1 "
1891-1900	829,000 " 21.5 "

About two-thirds of the French departments, comprising a large proportion of those situated in mountainous districts and in the basin of the Garonne, where the birth-rate is especially feeble, show a decrease in population. Those which show an increase usually possess large centres of industry and are already thickly populated, e.g. Seine and Pas-de-Calais. In most departments the principal cause of decrease of population is the attraction of great centres. The average density of population in France is about 190 to the square mile, the tendency being for the large towns to increase at the expense of the small towns as well as the rural communities. In 1901 37% of the population lived in centres containing more than 2000 inhabitants, whereas in 1861 the proportion was 28%. Besides the industrial districts the most thickly populated regions include the coast of the department of Seine-Inférieure and Brittany, the wine-growing region of the Bordelais and the Riviera.²

¹ In 1907 deaths were superior in number to births by nearly 20,000.

² The following list comprises the three most densely-populated and the three most sparsely populated departments in France:

Inhabitants to the Square Mile.		
Seine	20,803	Basses-Alpes 42
Nord	850	Hautes-Alpes 49
Rhône	778	Lozère 64

In the quinquennial period 1901-1905, out of the total number of births the number of illegitimate births to every 1000 inhabitants was 2.0, as compared with 2.1 in the four preceding periods of like duration.

In 1906 the number of foreigners in France was 1,009,415 as compared with 1,027,491 in 1896 and 1,115,214 in 1886. The departments with the largest population of foreigners were Nord (101,678), in which there is a large proportion of Belgians; Bouches-du-Rhône (123,497), Alpes-Maritimes (93,554), Var (47,475), Italians being numerous in these three departments; Seine (153,647), Meurthe-et-Moselle (44,595), Pas-de-Calais (21,436) and Ardennes (21,401).

The following table gives the area in square miles of each of the eighty-seven departments with its population according to the census returns of 1886, 1896 and 1906:

Departments.	Area, sq. m.	Population.		
		1886.	1896.	1906.
Ain	2,249	364,408	351,569	345,856
Aisne	2,867	555,925	541,613	534,495
Allier	2,849	424,582	424,378	417,961
Alpes-Maritimes	1,442	238,057	265,155	334,007
Ardèche	2,145	375,472	363,501	347,140

Of the population in 1901, 18,916,889 were males and 19,533,899 females, an excess of females over males of 617,010, i.e. 1.6% or about 508 females to every 492 males. In 1881 the proportion was 501 females to every 499 males, since when the disparity has been slightly more marked at every census. Below is a list of the departments in which the number of women to every thousand men was (1) greatest and (2) least.

Departments from which the adult males emigrate regularly either to sea or to seek employment in towns tend to fall under the first head, those in which large bodies of troops are stationed under the second.

The annual number of emigrants from France is small. The Basques of Basses-Pyrénées go in considerable numbers to the Argentine Republic, the inhabitants of Basses Alpes to Mexico and the United States, and there are important French colonies in Algeria and Tunisia.

The following table shows the distribution of the active population of France according to their occupations in 1901.

Occupation.	Males.	Females.	Total.

Religion.

Great alterations were made with regard to religious matters in France by a law of December 1905, supplemented by a law of January 1907 (see below, *Law and Institutions*). Before that time three religions (*cultes*) were recognized and supported by the state—the Roman Catholic, the Protestant (subdivided into the Reformed and Lutheran) and the Hebrew. In Algeria the Mahomedan religion received similar recognition. By the law of 1905 all the churches ceased to be recognized or supported by the state and became entirely separated therefrom, while the adherents of all creeds were permitted to form associations for public worship (*associations cultuelles*), upon which the expenses of maintenance were from that time to devolve. The state, the departments, and the communes were thus relieved from the payment of salaries and grants to religious bodies, an item of expenditure which amounted in the last year of the old system to £1,101,000 paid by the state and £302,200 contributed by the departments and communes. Before these alterations the relations between the state and the Roman Catholic communion, by far the largest and most important in France, were chiefly regulated by the provisions of the Concordat of 1801, concluded between the first consul, Bonaparte, and Pope Pius VII. and by other measures passed in 1802.

France is divided into provinces and dioceses as follows:

Archbishoprics.	Bishoprics.
PARIS	Chartres, Meaux, Orléans, Blois, Versailles.
AIX	Marseilles, Fréjus, Digne, Gap, Nice, Ajaccio.
ALBI	Rodez, Cahors, Mende, Perpignan.
AUCH	Aire, Tarbes, Bayonne.
AVIGNON	Nîmes, Valence, Viviers, Montpellier.
BESANÇON	Verdun, Bellay, St Dié, Nancy.
BORDEAUX	Agen, Angoulême, Poitiers, Périgueux, La Rochelle, Luçon.
BOURGES	Clermont, Limoges, Le Puy, Tulle, St Flour.
CAMBRAI	Arras.
CHAMBERY	Annecy, Tarentaise, St Jean-de-Maurienne.
LYONS	Autun, Langres, Dijon, St Claude, Grenoble.

The French census uses the commune as the basis of its returns, and employs the following classifications in respect to communal population: (1) Total communal population. (2) *Population comptée à part*, which includes soldiers and sailors, inmates of prisons, asylums, schools, members of religious communities, and workmen temporarily engaged in public works. (3) Total municipal population, i.e. communal population minus the *population comptée à part*. (4) *Population municipale agglomérée au chef-lieu de la commune*, which embraces the urban population as opposed to the rural population. The following tables, showing the growth of the largest towns in France, are drawn up on the basis of the fourth classification, which is used throughout this work in the articles on French towns, except where otherwise stated.

In 1906 there were in France twelve towns with a population of over 100,000 inhabitants. Their growth or decrease from 1886 to 1906 is shown in the following table:

	1886.	1896.	1906.
Paris	2,294,108	2,481,223	2,711,931
Lyons	344,124	398,867	430,186
Marseilles	249,938	332,515	421,116
Bordeaux	225,281	239,806	237,707
Lille	143,135	160,723	196,624
St Etienne	103,229	120,300	130,940
Le Havre	109,199	117,009	129,403
Toulouse	123,040	124,187	125,856
Roubaix	89,781	113,899	119,955
Nantes	110,638	107,137	118,244
Rouen	100,043	106,825	111,402
Reims	91,130	99,001	102,800

In the same years the following eighteen towns, now numbering from 50,000 to 100,000 inhabitants, each had:

	1886.	1896.	1906.
Nice	61,464	69,140	99,556
Nancy	69,463	83,668	98,302
Toulon	53,941	70,843	87,997
Amiens	68,177	74,808	78,407
Limoges	56,699	64,718	75,906
Angers	65,152	69,484	73,585
Brest	59,352	64,144	71,163
Nîmes	62,108	66,905	70,708
Montpellier	45,930	62,717	65,983
Dijon	50,684	58,355	65,516
Tourcoing	41,183	55,705	62,694
Rennes	52,614	57,249	62,024
Tours	51,467	56,706	61,507
Calais	52,830	50,818	59,623
Grenoble	43,260	50,084	58,641
Orléans	51,208	56,915	57,544
Le Mans	46,991	49,665	54,907
Troyes	44,864	50,676	51,228

Archbishoprics.	Bishoprics.
REIMS	Soissons, Châlons-sur-Marne, Beauvais, Amiens.
RENNES	Quimper, Vannes, St Briec.
ROUEN	Bayeux, Evreux, Sées, Coutances.
SENS	Troyes, Nevers, Moulins.
TOULOUSE	Montauban, Pamiers, Carcassonne.
TOURS	Le Mans, Angers, Nantes, Laval.

The dioceses are divided into parishes each under a parish priest known as a *curé* or *desservant* (incumbent). The bishops and archbishops, formerly nominated by the government and canonically confirmed by the pope, are now chosen by the latter. The appointment of *curés* rested with the bishops and had to be confirmed by the government, but this confirmation is now dispensed with. The archbishops used to receive an annual salary of £600 each and the bishops £400.

The archbishops and bishops are assisted by vicars-general (at salaries previously ranging from £100 to £180), and to each cathedral is attached a chapter of canons. A *curé*, in addition to his regular salary, received fees for baptisms, marriages, funerals and special masses, and had the benefit of a free house called a *presbytère*. The total personnel of state-paid Roman Catholic clergy amounted in 1903 to 36,169. The Roman priests are drawn from the seminaries, established by the church for the education of young men intending to join its ranks, and divided into lower and higher seminaries (*grands et petits séminaires*), the latter giving the same class of instruction as the *lycées*.

The number of Protestants may be estimated at about 600,000 and the Jews at about 70,000. The greatest number of Jews is to be found at Paris, Lyons and Bordeaux, while the departments of the centre and of the south along the range of the Cévennes, where Calvinism flourishes, are the principal Protestant localities, Nîmes being the most important centre. Considerable sprinklings of Protestants are also to be found in the two Charentes, in Dauphiné, in Paris and in Franche-Comté. The two Protestant bodies used to cost the state about £60,000 a year and the Jewish Church about £6000.

Both Protestant churches have a parochial organization and a presbyterian form of church government. In the Reformed Church (far the more numerous of the two bodies) each parish has a council of presbyters, consisting of the pastor and lay-members elected by the congregation. Several

parishes form a consistorial circumscription, which has a consistorial council consisting of the council of presbyters of the chief town of the circumscription, the pastor and one delegate of the council of presbyters from each parish and other elected members. There are 103 circumscriptions (including Algeria), which are grouped into 21 provincial synods composed of a pastor and lay delegate from each consistory. All the more important questions of church discipline and all decisions regulating the doctrine and practice of the church are dealt with by the synods. At the head of the whole organization is a General Synod, sitting at Paris. The organization of the Lutheran Church (*Eglise de la confession d'Augsburg*) is broadly similar. Its consistories are grouped into two special synods, one at Paris and one at Montbéliard (for the department of Doubs and Haute-Saône and the territory of Belfort, where the churches of this denomination are principally situated). It also has a general synod—composed of 2 inspectors,¹ 5 pastors elected by the synod of Paris, and 6 by that of Montbéliard, 22 laymen and a delegate of the theological faculty at Paris—which holds periodical meetings and is represented in its relations with the government by a permanent executive commission.

The Jewish parishes, called *synagogues*, are grouped into departmental consistories (Paris, Bordeaux, Nancy, Marseilles, Bayonne, Lille, Vesoul, Besançon and three in Algeria). Each synagogue is served by a rabbi assisted by an officiating minister, and in each consistory is a grand rabbi. At Paris is the central consistory, controlled by the government and presided over by the supreme grand rabbi.

Agriculture.

Of the population of France some 17,000,000 depend upon agriculture for their livelihood, though only about 6,500,000 are engaged in work on the land. The cultivable land of the country occupies some 195,000 sq. m. or about 94 % of the total area; of this 171,000 sq. m. are cultivated. There are besides 12,300 sq. m. of uncultivable area covered by lakes, rivers, towns, &c. Only the roughest estimate is possible as to the

¹ Inspectors are placed at the head of the synodal circumscriptions; their functions are to consecrate candidates for the ministry, install the pastors, &c.

sizes of holdings, but in general terms it may be said that about 3 million persons are proprietors of holdings under 25 acres in extent amounting to between 15 and 20% of the cultivated area, the rest being owned by some 750,000 proprietors, of whom 150,000 possess half the area in holdings averaging 400 acres in extent. About 80% of holdings (amounting to about 60% of the cultivated area) are cultivated by the proprietor; of the rest approximately 13% are let on lease and 7% are worked on the system known as *métayage* (*q.v.*).

The capital value of land, which greatly decreased during the last twenty years of the 19th century, is estimated at £3,120,000,000, and that of stock, buildings, implements, &c., at £340,000,000. The value per acre of land, which exceeds £48 in the departments of Seine, Rhône and those fringing the north-west coast from Nord to Manche inclusive, is on the average about £29, though it drops to £16 and less in Morbihan, Landes, Basses-Pyrénées, and parts of the Alps and the central plateau.

While wheat and wine constitute the staples of French agriculture, its distinguishing characteristic is the variety of its products. *Cereals* occupy about one-third of the cultivated area. For the production of *wheat*, in respect of which France is self-supporting, French Flanders, the Seine basin, notably the Beauce and the Brie, and the regions bordering on the lower course of the Loire and the upper course of the Garonne, are the chief areas. Rye, on the other hand, one of the least valuable of the cereals, is grown chiefly in the poor agricultural territories of the central plateau and western Brittany. Buckwheat is cultivated mainly in Brittany. Oats and barley are generally cultivated, the former more especially in the Parisian region, the latter in Mayenne and one or two of the neighbouring departments. Meslin, a mixture of wheat and rye, is produced in the great majority of French departments, but to a marked extent in the basin of the Sarthe. Maize covers considerable areas in Landes, Basses-Pyrénées and other south-western departments.

	Average Acreage (Thousands of Acres).		Average Production (Thousands of Bushels).		Average Yield per Acre (Bushels).	
	1886-1895.	1896-1905.	1886-1895.	1896-1905.	1886-1895.	1896-1905.
Wheat	17,004	16,580	294,564	317,707	17.3	19.1
Meslin	720	491	12,193	8,826	16.9	17.0
Rye	3,888	3,439	64,651	56,612	16.6	16.4

Buckwheat	1,484	1,392	26,345	23,136	17.7	16.6
Maize	1,391	1,330	25,723	24,459	18.4	18.4

Forage Crops.—The mangold-wurzel, occupying four times the acreage of swedes and turnips, is by far the chief root-crop in France. It is grown largely in the departments of Nord and Pas-de-Calais and in those of the Seine basin, the southern limit of its cultivation being roughly a line drawn from Bordeaux to Lyons. The average area occupied by it in the years from 1896 to 1905 was 1,043,000 acres, the total average production being 262,364,000 cwt. and the average production per acre 10½ tons. Clover, lucerne and sainfoin make up the bulk of artificial pasturage, while vetches, crimson clover and cabbage are the other chief forage crops.

Vegetables.—*Potatoes* are not a special product of any region, though grown in great quantities in the Bresse and the Vosges. Early potatoes and other vegetables (*primeurs*) are largely cultivated in the districts bordering the English Channel. Market-gardening is an important industry in the regions round Paris, Amiens and Angers, as it is round Toulouse, Montauban, Avignon and in southern France generally. The market-gardeners of Paris and its vicinity have a high reputation for skill in the forcing of early vegetables under glass.

Potatoes: Decennial Averages.

	Acreage.	Total Yield (Tons).	Average Yield per Acre (Tons).
1886-1895	3,690,000	11,150,000	3.02
1896-1905	3,735,000	11,594,000	3.1

*Industrial Plants.*²—The manufacture of sugar from beetroot, owing to the increased use of sugar, became highly important during

² *Cultures industrielles*—Under this head the French group beetroot, hemp, flax and other plants, the products of which pass through some process of manufacture before they reach the consumer.

the latter half of the 19th century, the industry both of cultivation and manufacture being concentrated in the northern departments of Aisne, Nord, Pas-de-Calais, Somme and Oise, the first named supplying nearly a quarter of the whole amount produced in France.

Flax and hemp showed a decreasing acreage from 1881 onwards. Flax is cultivated chiefly in the northern departments of Nord, Seine-Inférieure, Pas-de-Calais, Côtes-du-Nord, hemp in Sarthe, Morbihan and Maine-et-Loire.

Colza, grown chiefly in the lower basin of the Seine (Seine-Inférieure and Eure), is the most important of the oil-producing plants, all of which show a diminishing acreage. The three principal regions for the production of tobacco are the basin of the Garonne (Lot-et-Garonne, Dordogne, Lot and Gironde), the basin of the Isère (Isère and Savoie) and the department of Pas-de-Calais. The state controls its cultivation, which is allowed only in a limited number of departments. Hops cover only about 7000 acres, being almost confined to the departments of Nord, Côte d'Or and Meurthe-et-Moselle.

Decennial Averages 1896-1905.

	Acreage.	Production (Tons).	Average Yield per Acre (Tons).
Sugar beet . . .	672,000	6,868,000	10.2
Hemp	64,856	18,451 ¹	.28 ¹
Flax	57,893	17,857 ¹	.30 ¹
Colza	102,454	47,697	.46
Tobacco	41,564	22,453	.54

Vineyards (see WINE).—The vine grows generally in France, except in the extreme north and in Normandy and Brittany. The great wine-producing regions are:

1. The country fringing the Mediterranean coast and including Hérault (240,822,000 gals. in 1905), and Aude (117,483,000 gals. in 1905), the most productive departments in France in this respect.

2. The department of Gironde (95,559,000 gals. in 1905), whence come Médoc and the other wines for which Bordeaux is the market.

3. The lower valley of the Loire, including Touraine and Anjou, and the district of Saumur.

4. The valley of the Rhône.

5. The Burgundian region, including Côte d'Or and the valley of the Saône (Beaujolais, Mâconnais).

6. The Champagne.

7. The Charente region, the grapes of which furnish brandy, as do those of Armagnac (department of Gers).

The decennial averages for the years 1896-1905 were as follows:

Acreage of productive vines	4,056,725
Total production in gallons	1,072,622,000
Average production in gallons per acre	260

Fruit.—Fruit-growing is general all over France, which, apart from bananas and pine-apples, produces in the open air all the ordinary species of fruit which its inhabitants consume. Some of these may be specially mentioned. The cider apple, which ranks first in importance, is produced in those districts where cider is the habitual drink, that is to say, chiefly in the region north-west of a line drawn from Paris to the mouth of the Loire. The average annual production of cider during the years 1896 to 1905 was 304,884,000 gallons. Dessert apples and pears are grown there and in the country on both banks of the lower Loire, the valley of which abounds in orchards wherein many varieties of fruit flourish and in nursery-gardens. The hilly regions of Limousin, Périgord and the Cévennes are the home of the chestnut, which in some places is still a staple food; walnuts grow on the lower levels of the central plateau and in lower Dauphiné and Provence, figs and almonds in Provence, oranges and citrons on the Mediterranean coast, apricots in central France, the olive in Provence and the lower valleys of the Rhône and Durance. Truffles are found under

Silk Cocoons.	1891-1895.	1896-1900.	1901-1905.
Annual average production over quinquennial periods in lb.	19,587,000	17,696,000	16,566,000

the oaks of Périgord, Comtat-Venaissin and lower Dauphiné. The mulberry grows in the valleys of the Rhône and its tributaries, the Isère, the Drôme, the Ardèche, the Gard and the Durance, and also

¹ Fibre only. In the years 1896-1905, 8130 tons of hemp-seed and 12,137 tons of flax-seed was the average annual production in addition to fibre.

along the coast of the Mediterranean. Silk-worm rearing, which is encouraged by state grants, is carried on in the valleys mentioned and on the Mediterranean coast east of Marseilles. The numbers of growers decreased from 139,000 in 1891 to 124,000 in 1905. The decrease in the annual average production of cocoons is shown in the preceding table.

Snails are reared in some parts of the country as an article of food, those of Burgundy being specially esteemed.

Stock-raising.—From this point of view the soil of France may be divided into four categories:

1. The rich pastoral regions where dairy-farming and the fattening of cattle are carried on with most success, viz. (a) Normandy, Perche, Cotentin and maritime Flanders, where horses are bred in great numbers; (b) the strip of coast between the Gironde and the mouth of the Loire; (c) the Morvan including the Nivernais and the Charolais, from which the famous Charolais breed of oxen takes its name; (d) the central region of the central plateau including the districts of Cantal and Aubrac, the home of the famous beef-breeds of Salers and Aubrac.² The famous *pré-salé* sheep are also reared in the Vendée and Cotentin.

2. The poorer grazing lands on the upper levels of the Alps, Pyrenees, Jura and Vosges, the Landes, the more outlying regions of the central plateau, southern Brittany, Sologne, Berry, Champagne-Pouilleuse, the Crau and the Camargue, these districts being given over for the most part to sheep-raising.

3. The plain of Toulouse, which with the rest of south-western France produces good draught oxen, the Parisian basin, the plains of the north to the east of the maritime region, the lower valley of the Rhône and the Bresse, where there is little or no natural pasturage, and forage is grown from seed.

4. West, west-central and eastern France outside these areas, where meadows are predominant and both dairying and fattening are general. Included therein are the dairying and horse-raising district of northern Brittany and the dairying regions of Jura and Savoy.

In the industrial regions of northern France cattle are stall-fed with the waste products of the beet-sugar factories, oil-works and distilleries. *Swine*, bred all over France, are more numerous in Brittany, Anjou (whence comes the well-known breed of Craon), Poitou, Burgundy, the west and north of the central plateau and Béarn. Upper Poitou and the zone of south-western France to the north of the Pyrenees are the chief regions for the breeding of mules. Asses are reared in Béarn, Corsica, Upper Poitou, the Limousin, Berry and other central regions. Goats are kept in the mountainous regions (Auvergne, Provence, Corsica). The best poultry come from the Bresse, the district of Houdan (Seine-et-Oise), the district of Le Mans and Crèvecœur (Calvados).

The *prés naturels* (meadows) and *herbages* (unmown pastures) of France, i.e. the grass-land of superior quality as distinguished from *paturages et pacages*, which signifies pasture of poorer quality, increased in area between 1895 and 1905 as is shown below:

	1895 (Acres).	1905 (Acres).
Prés naturels	10,852,000	11,715,000
Herbages	2,822,000	3,022,000

The following table shows the number of live stock in the country at intervals of ten years since 1885.

	Cattle.			Sheep and Lambs.	Pigs.	Horses.	Mules.	Asses.
	Cows.	Other Kinds.	Total.					
1885	6,414,487	6,690,483	13,104,970	22,616,547	5,881,088	2,011,392	238,620	387,227
1895	6,359,795	6,874,033	13,233,828	21,163,767	6,306,019	2,812,447	211,479	357,778
1905	7,515,564	6,799,988	14,315,552	17,783,209	7,558,779	3,169,224	198,865	365,181

Agricultural Organization.—In France the interests of agriculture are entrusted to a special ministry, comprising the following divisions: (1) forests, (2) breeding-studs (*haras*); (3) agriculture, a department which supervises agricultural instruction and the distribution of grants and premiums; (4) agricultural improvements, draining, irrigation, &c.; (5) an intelligence department which prepares statistics, issues information as to prices and markets, &c. The minister is assisted by a superior council of agriculture, the members of which, numbering a hundred, include senators, deputies and prominent agriculturists. The ministry employs inspectors, whose duty it is to visit the different parts of the country and to report on their respective position and wants. The reports which they furnish help to determine the distribution of the moneys dispensed by the state in the form of subventions to agricultural

² The chief breeds of horses are the *Boulonnais* (heavy draught), the *Percheron* (light and heavy draught), the *Anglo-Norman* (light draught and heavy cavalry) and the *Tarbaïs* of the western Pyrenees (saddle horses and light cavalry). Of cattle besides the breeds named the *Norman* (beef and milk), the *Limousin* (beef), the *Montbéliard*, the *Bazadais*, the *Flamand*, the *Breton* and the *Parthenais* breeds may be mentioned.

societies and in many other ways. The chief type of agricultural society is the *comice agricole*, an association for the discussion of agricultural problems and the organization of provincial shows. There are besides several thousands of local syndicates, engaged in the purchase of materials and sale of produce on the most advantageous terms for their members, credit banks and mutual insurance societies (see CO-OPERATION). Three societies demand special mention: the *Union centrale des agriculteurs de France*, to which the above syndicates are affiliated; the *Société nationale d'agriculture*, whose mission is to further agricultural progress and to supply the government with information on everything appertaining thereto and the *Société des agriculteurs de France*.

Among a variety of premiums awarded by the state are those for the best cultivated estates and for irrigation works, and to the owners of the best stallions and brood-mares. *Haras* or stallion stables containing in all over 3000 horses are established in twenty-two central towns, and annually send stallions, which are at the disposal of private individuals in return for a small fee, to various stations throughout the country. Other institutions belonging to the state are the national sheep-fold of Rambouillet (Seine-et-Oise) and the cow-house of Vieux-Pin (Orne) for the breeding of Durham cows. Four different grades of institution for agricultural instruction are under state direction: (1) farm-schools and schools of apprenticeship in dairying, &c., to which the age of admission is from 14 to 16 years; (2) practical schools, to which boys of from 13 to 18 years of age are admitted. These number forty-eight, and are intended for sons of farmers of good position; (3) national schools, which are established at Grignon (Seine-et-Oise), Rennes and Montpellier, candidates for which must be 17 years of age; (4) the National Agronomic Institute at Paris, which is intended for the training of estate agents, professors, &c. There are also departmental chairs of agriculture, the holders of which give instruction in training-colleges and elsewhere and advise farmers.

Forests.—In relation to its total extent, France presents but a very limited area of forest land, amounting to only 36,700 sq. m. or about 18% of the entire surface of the country. Included under the denomination of "forest" are lands—*surfaces boisées*—which are *bush* rather than *forest*. The most wooded parts of France are the mountains and plateaus of the east and of the north-east, comprising the pine-forests of the Vosges and Jura (including the beautiful Forest of Chaux), the Forest of Haye, the Forest of Ardennes, the Forest of Argonne, &c.; the Landes, where replanting with maritime pines has transformed large areas of marsh into forest; and the departments of Var and Ariège. The Central Mountains and the Morvan also have considerable belts of wood. In the Parisian region there are the Forests of Fontainebleau (66 sq. m.), of Compiègne (56 sq. m.), of Rambouillet, of Villers-Cotterets, &c. The Forest of Orléans, the largest in France, covers about 145 sq. m. The Alps and Pyrenees are in large part deforested, but reforestation with a view to minimizing the effects of avalanches and sudden floods is continually in progress.

Of the forests of the country approximately one-third belongs to the state, communes and public institutions. The rest belongs to private owners who are, however, subject to certain restrictions. The Department of Waters¹ and Forests (Administration des Eaux et Forêts) forms a branch of the ministry of agriculture. It is administered by a director-general, who has his headquarters at Paris, assisted by three administrators who are charged with the working of the forests, questions of rights and law, finance and plantation works. The establishment consists of 32 conservators, each at the head of a district comprising one or more departments, 200 inspectors, 215 sub-inspectors and about 300 *gardes généraux*. These officials form the higher grade of the service (*agents*). There are besides several thousand forest-rangers and other employes (*préposés*). The department is supplied with officials of the higher class from the National School of Waters and Forests at Nancy, founded in 1824.

Industries.

In France, as in other countries, the development of machinery,

¹ The department is also entrusted with surveillance over river-fishing, pisciculture and the amelioration of pasture.

whether run by steam, water-power or other motive forces, has played a great part in the promotion of industry; the increase in the amount of steam horse-power employed in industrial establishments is, to a certain degree, an index to the activity of the country as regards manufactures.

The appended table shows the progress made since 1850 with regard to steam power. Railway and marine locomotives are not included.

Years.	No. of Establishments.	No. of Steam-Engines.	Total Horse-Power.
1852	6,543	6,080	76,000
1861	14,153	15,805	191,000
1871	22,192	26,146	316,000
1881	35,712	44,010	576,000
1891	46,828	58,967	916,000
1901	58,151	75,866	1,907,730
1905	61,112	79,203	2,232,263

With the exception of Loire, Bouches-du-Rhône and Rhône, the chief industrial departments of France are to be found in the north and north-east of the country. In 1901 and 1896 those in which the working inhabitants of both sexes were engaged in industry as opposed to agriculture to the extent of 50% (approximately) or over, numbered eleven, viz.:—

Departments.	Total Working Population (1901).	Industrial Population (1901).	Percentage engaged in Industry.	
			1901.	1896.
Nord	848,306	544,177	64.15	63.45
Territoire de Belfort	40,703	24,470	60.10	58.77
Loire	202,808	167,693	57.27	54.73
Seine	2,071,344	1,143,809	55.22	53.54
Bouches-du-Rhône	341,823	187,801	54.94	51.00
Rhône	449,121	243,571	54.23	54.78
Meurthe-et-Moselle	215,501	115,214	53.46	50.19
Ardennes	139,270	73,250	52.60	52.42
Vosges	208,142	107,547	51.67	51.05
Pas-de-Calais	404,153	200,402	49.58	46.55
Seine-Inférieure	428,591	206,612	48.21	49.85

The department of Seine, comprising Paris and its suburbs, which has the largest manufacturing population, is largely occupied with the manufacture of dress, millinery and articles of luxury (perfumery, &c.), but it plays the leading part in almost every great branch of industry with the exception of

Groups.	Basins.	Departments.	Average Production (Thousands of Metric Tons) 1901-1905.
Nord and Pas-de-Calais	Valenciennes Le Boulonnais	Nord, Pas-de-Calais Pas-de-Calais	20,965

Tarn and Aveyron	Aubin Carmaux and Albi Rodez St Perdox	Aveyron Tarn Aveyron Lot	1,770
Bourbonnais	Commentry and Doyet St Eloi L'Aumance La Queune	Allier Puy-de-Dôme Allier Allier	994

spinning and weaving. The typically industrial region of France is the department of Nord, the seat of the woollen industry, but also prominently concerned in other textile industries, in metal working, and in a variety of other manufactures, fuel for which is supplied by its coal-fields. The following sketch of the manufacturing industry of France takes account chiefly of those of its branches which are capable in some degree of localization. Many of the great industries of the country, e.g. tanning, brick-making, the manufacture of garments, &c., are evenly distributed throughout it, and are to be found in or near all larger centres of population.

Coal.—The principal mines of France are coal and iron mines. The production of coal and lignite averaging 33,465,000 metric tons¹ in the years 1901–1905 represents about 73% of the total consumption of the country; the surplus is supplied from Great Britain, Belgium and Germany. The preceding table shows the average output of the chief coal-groups for the years 1901–1905 inclusive. The Flemish coal-basin, employing over 100,000 hands, produces 60% of the coal mined in France.

French lignite comes for the most part from the department of Bouches-du-Rhône (near Fuveau).

The development of French coal and lignite mining in the 19th century, together with records of prices, which rose considerably at the end of the period, is set forth in the table below:

Years.	Average Yearly Production (Thousands of Metric Tons).	Average Price per Ton at Pit Mouth (Francs).
1821–1830	1,495	10.23
1831–1840	2,571	9.83
1841–1850	4,078.5	9.69
1851–1860	6,857	11.45
1861–1870	11,831	11.61
1871–1880	16,774	14.34
1881–1890	21,542	11.55
1891–1900	29,190	11.96
1901–1905	33,465	14.18

Iron.—The iron-mines of France are more numerous than its coal-mines, but they do not yield a sufficient quantity of ore for the needs of the metallurgical industries of the country; as will be seen in the table below the production of iron in France gradually increased during the 19th century; on the other hand, a decline in prices operated against a correspondingly marked increase in its annual value.

Years.	Average Annual Production (Thousands of Metric Tons).	Price per Metric Ton (Francs).
1841–1850	1247	6.76
1851–1860	2414.5	5.51
1861–1870	3035	4.87
1871–1880	2514	5.39
1881–1890	2934	3.99
1891–1900	4206	3.37
1901–1905	6072	3.74

The department of Meurthe-et-Moselle (basins of Nancy and Longwy-Briey) furnished 84% of the total output during the quinquennial period 1901–1905, may be reckoned as one of the principal iron-producing regions of the world. The other chief producers were Pyrénées-Orientales, Calvados, Haute-Marne (Vassy) and Saône-et-Loire (Mazenay and Change).

Other Ores.—The mining of zinc, the chief deposits of which are at Malines (Gard), Les Bormettes (Var) and Planioles (Lot), and of lead, produced especially at Chaliac (Ardèche), ranks next in importance to that of iron. Iron-pyrites come almost entirely from

Sain-Bel (Rhône), manganese chiefly from Ariège and Saône-et-Loire, antimony from the departments of Mayenne, Haute-Loire and Cantal. Copper and mispickel are mined only in small quantities. The table below gives the average production of zinc, argentiferous lead, iron-pyrites and other ores during the quinquennial period 1901–1905.

	Production (Thousands of Metric Tons).	Value £
Zinc	60.3	206,912
Lead	18.5	100,424
Iron-pyrites	297.2	170,312
Other ores	36.0	68,376

Salt, &c.—Rock-salt is worked chiefly in the department of Meurthe-et-Moselle, which produces more than half the average annual product of salt. For the years 1896–1905 this was 1,010,000 tons, including both rock- and sea-salt. The salt-marshes of the Mediterranean coast, especially the Étang de Berre and those of Loire-Inférieure, are the principal sources of sea-salt. Sulphur is obtained near Apt (Vaucluse) and in a few other localities of south-eastern France; bituminous schist near Autun (Saône-et-Loire) and Buxières (Allier). The most extensive peat-workings are in the valleys of the Somme; asphalt comes from Seyssel (Ain) and Puy-de-Dôme.

The mineral springs of France are numerous, of varied character and much frequented. Leading resorts are: in the Pyrenean region, Amélie-les-Bains, Bagnères-de-Luchon, Bagnères-de-Bigorre, Barèges, Cauterets, Eaux-Bonnes, Eaux-Chaudes and Dax; in the Central Plateau, Mont-Dore, La Bourboule, Bourbon l'Archambault, Vichy, Royat, Chaudes-Aigues, Vals, Lamalou; in the Alps, Aix-les-Bains and Evian; in the Vosges and Faucilles, Plombières, Luxeuil, Contrexéville, Vittel, Martigny and Bourbonne-les-Bains. Outside these main groups St Amand-les-Eaux and Foyes-les-Eaux may be mentioned.

Quarry-Products.—Quarries of various descriptions are numerous all over France. Slate is obtained in large quantities from the departments of Maine-et-Loire (Angers), Ardennes (Fumay) and Mayenne (Renazé). Stone-quarrying is specially active in the departments round Paris, Seine-et-Oise employing more persons in this occupation than any other department. The environs of Creil (Oise) and Château-Landon (Seine-et-Marne) are noted for their freestone (*Pierre de taille*), which is also abundant at Euville and Lérerville in Meuse; the production of plaster is particularly important in the environs of Paris, of kaolin of fine quality at Yrieix (Haute-Vienne), of hydraulic lime in Ardèche (Le Teil), of lime phosphates in the department of Somme, of marble in the departments of Haute-Garonne (St Bât), Hautes-Pyrénées (Campan, Sarrancolin), Isère and Pas-de-Calais, and of cement in Pas-de-Calais (vicinity of Boulogne) and Isère (Grenoble). Paving-stone is supplied in large quantities by Seine-et-Oise, and brick-clay is worked chiefly in Nord, Seine and Pas-de-Calais. The products of the quarries of France for the five years 1901–1905 averaged £9,311,000 per annum in value, of which building material brought in over two-thirds.

Metallurgy.—The average production and value of iron and steel manufactured in France in the last four decades of the 19th century is shown below:

Years.	Cast Iron.		Wrought Iron and Steel.	
	Product (Thousands of Metric Tons).	Value (Thousands of £).	Product (Thousands of Metric Tons).	Value (Thousands of £).
1861–1870	1191.5	5012	844	8,654
1871–1880	1391	5783	1058.5	11,776
1881–1890	1796	5119	1376	11,488
1891–1900	2267	5762	1686	14,540
1903	2841	7334	1896	15,389

Taking the number of hands engaged in the industry as a basis of comparison, the most important departments as regards iron and steel working in 1901 were:

Department.	Chief Centres.	Hands engaged in Production of Pig-Iron and Steel.	Hands engaged in Production of Engineering Material and Manufactured Goods.
Seine		600	102,500
Nord	Lille, Anzin, Denain, Douai, Hautmont, Maubeuge	14,000	45,000
Loire	Rive-de-Gier, Firminy, St Étienne, St Chamond	9,500	17,500
Meurthe-et-Moselle	Pont-à-Mousson, Frouard, Longwy, Nancy	16,500	6,500
Ardennes	Charleville, Nouzon	800	23,000

¹ The metric ton = 1000 kilogrammes or 2204 lb.

Rhône (Lyons), Saône-et-Loire (Le Creusot, Chalon-sur-Saône) and Loire-Inférieure (Basse-Indre, Indret, Couëron, Trignac) also play a considerable part in this industry.

The chief centres for the manufacture of cutlery are Châtelleraut (Vienne), Langres (Haute-Marne) and Thiers (Puy-de-Dôme); for that of arms St Étienne, Tulle and Châtelleraut; for that of watches and clocks, Besançon (Doubs) and Montbéliard (Doubs); for that of optical and mathematical instruments Paris, Morez (Jura) and St Claude (Jura); for that of locksmiths' ware the region of Vimeu (Pas-de-Calais).

There are important zinc works at Auby and St Amand (Nord) and Viviez (Aveyron) and Noyelles-Godault (Pas-de-Calais); there are lead works at the latter place, and others of greater importance at Couëron (Loire-Inférieure). Copper is smelted in Ardennes and Pas-de-Calais. The production of these metals, which are by far the most important after iron and steel, increased steadily during the period 1890-1905, and reached its highest point in 1905, details for which year are given below:

	Zinc.	Lead.	Copper.
Production (in metric tons)	43,200	24,100	7,600
Value	£1,083,000	£386,000	£526,000

Wool.—In 1901, 161,000 persons were engaged in the spinning and other preparatory processes and in the weaving of wool. The woollen industry is carried on most extensively in the department of Nord (Roubaix, Tourcoing, Fourmies). Of second rank are Reims and Sedan in the Champagne group; Elbeuf, Louviers and Rouen in Normandy; and Mazamet (Tarn).

Cotton.—In 1901, 166,000 persons were employed in the spinning and weaving of cotton, French cotton goods being distinguished chiefly for the originality of their design. The cotton industry is distributed in three principal groups. The longest established is that of Normandy, having its centres at Rouen, Havre, Evreux, Falaise and Flers. Another group in the north of France has its centres at Lille, Tourcoing, Roubaix, St Quentin and Amiens. That of the Vosges, which has experienced a great extension since the loss of Alsace-Lorraine, comprises Epinal, St Dié, Remiremont and Belfort. Other groups of less importance are situated in the Lyonnais (Roanne and Tarare) and Mayenne (Laval and Mayenne).

Silk.—The silk industry occupied 134,000 hands in 1901. The silk fabrics of France hold the first place, particularly the more expensive kinds. The industry is concentrated in the departments bordering the river Rhône, the chief centres being Lyons (Rhône), Voiron (Isère), St Étienne and St Chamond (Loire) (the two latter being especially noted for their ribbons and trimmings) and Annonay (Ardèche) and other places in the departments of Ain, Gard and Drôme.

Flax, Hemp, Jute, &c.—The preparation and spinning of these materials and the manufacture of nets and rope, together with the weaving of linen and other fabrics, give occupation to 112,000 persons chiefly in the departments of Nord (Lille, Armentières, Dunkirk), Somme (Amiens) and Maine-et-Loire (Angers, Cholet).

Hosiery, the manufacture of which employs 55,000 hands, has its chief centre in Aube (Troyes). The production of lace and guipure, occupying 112,000 persons, is carried on mainly in the towns and villages of Haute-Loire and in Vosges (Mirecourt), Rhône (Lyons), Pas-de-Calais (Calais) and Paris.

Leather.—Tanning and leather-dressing are widely spread industries, and the same may be said of the manufacture of boots and shoes, though these trades employ more hands in the department of Seine than elsewhere; in the manufacture of gloves Isère (Grenoble) and Aveyron (Millau) hold the first place amongst French departments.

Sugar.—The manufacture of sugar is carried on in the departments of the north, in which the cultivation of beetroot is general—Aisne, Nord, Somme, Pas-de-Calais, Oise and Seine-et-Marne, the three first being by far the largest producers. The increase in production in the last twenty years of the 19th century is indicated in the following table:—

Years.	Annual Average of Men employed.	Average Annual Production in Metric Tons.
1881-1891	43,108	415,786
1891-1901	42,841	696,938
1901-1906	43,061	820,553

Alcohol.—The distillation of alcohol is in the hands of three classes of persons. (1) Professional distillers (*bouilleurs et distillateurs de profession*); (2) private distillers (*bouilleurs de cru*) under state control; (3) small private distillers, not under state control, but giving notice to the state that they distil. The two last classes number over 400,000 (1903), but the quantity of alcohol distilled by them is small. Beetroot, molasses and grain are the chief sources of spirit. The department of Nord produces by far the greatest quantity, its average annual output in the decade 1895-1904

being 13,117,000 gallons, or about 26% of the average annual production of France during the same period (49,945,000 gallons). Aisne, Pas-de-Calais and Somme rank next to Nord.

Glass is manufactured in the departments of Nord (Aniche, &c.), Seine, Loire (Rive-de-Gier) and Meurthe-et-Moselle, Baccarat in the latter department being famous for its table-glass. Limoges is the chief centre for the manufacture of porcelain, and the artistic products of the national porcelain factory of Sèvres have a world-wide reputation.

The manufacture of paper and cardboard is largely carried on in Isère (Voiron), Seine-et-Oise (Essonnes), Vosges (Epinal) and of the finer sorts of paper in Charente (Angoulême). That of oil, candles and soap has its chief centre at Marseilles. Brewing and malting are localized chiefly in Nord. There are well-known chemical works at Dombasle (close to Nancy) and Chauny (Aisne) and in Rhône.

Occupations.—The following table, which shows the approximate numbers of persons engaged in the various manufacturing industries of France, who number in all about 5,820,000, indicates their relative importance from the point of view of employment:

Occupation.	1901.	1866.
Baking	163,500	..
Milling	99,400	..
Charcuterie	39,600	..
Other alimentary industries	161,500	..
Alimentary industries: total	464,000	308,000
Gas-works	26,000	..
Tobacco factories	16,000	..
Oil-works	10,000	..
Other "chemical" industries	58,000	..
Chemical industries: total	110,000	49,000
Rubber factories	9,000	25,000
Paper factories	61,000	
Typographic and lithographic printing	76,000	..
Other branches of book production	23,000	..
Book production: total	99,000	38,000
Spinning and weaving	892,000	1,072,000
Clothing, millinery and making up of fabrics generally	1,484,000	761,000
Basket work, straw goods, feathers	39,000	
Leather and skin	338,000	286,000
Joinery	153,000	..
Builder's carpentering	94,900	..
Wheelwright's work	82,700	..
Cooperage	46,600	..
Wooden shoes	52,400	..
Other wood industries	280,400	..
Wood industries: total	710,000	671,000
Metallurgy and metal working	783,000	345,000
Goldsmiths' and jewellers' work	35,000	55,000
Stone-working	56,000	12,000
Construction, building, decorating	572,000	443,000
Glass manufacture	43,000	..
Tiles	29,000	..
Porcelain and faïence	27,000	..
Bricks	17,000	..
Other kiln industries	45,000	..
Kiln industries: total	161,000	110,000
Some 9000 individuals were engaged in unclassified industries.		

Fisheries.—The fishing population of France is most numerous in the Breton departments of Finistère, Côtes-du-Nord and Morbihan and in Pas-de-Calais. Dunkirk, Gravelines, Boulogne and Paimpol send considerable fleets to the Icelandic cod-fisheries, and St Malo, Fécamp, Granville and Cancale to those of Newfoundland. The Dogger Bank is frequented by numbers of French fishing-boats.

¹ Includes manufactories of glue, tallow, soap, perfumery, fertilizers, soda, &c.

Besides the above, Boulogne, the most important fishing port in the country, Calais, Dieppe, Concarneau, Douarnenez, Les Sables d'Olonne, La Rochelle, Marennes and Arcachon are leading ports for the herring, sardine, mackerel and other coast-fisheries of the ocean, while Cette, Agde and other Mediterranean ports are engaged in the tunny and anchovy fisheries. Sardine preserving is an important industry at Nantes and other places on the west coast. Oysters are reared chiefly at Marennes, which is the chief French market for them, and at Arcachon, Vannes, Oléron, Auray, Cancale and Courseulles. The total value of the produce of fisheries increased from £4,537,000 in 1892 to £5,259,000 in 1902. In 1902 the number of men employed in the home fisheries was 144,000 and the number of vessels 25,481 (tonnage 127,000); in the deep-sea fisheries 10,500 men and 450 vessels (tonnage 51,000) were employed.

Communications.

Roads.—Admirable highways known as *routes nationales* and kept up at the expense of the state radiate from Paris to the great towns of France. Averaging 52½ ft. in breadth, they covered in 1905 a distance of nearly 24,000 m. The *École des Ponts et Chaussées* at Paris is maintained by the government for the training of the engineers for the construction and upkeep of roads and bridges. Each department controls and maintains the *routes départementales*, usually good macadamized roads connecting the chief places within its limits and extending in 1903 over 9700 m. The *routes nationales* and the *routes départementales* come under the category of *la grande voirie* and are under the supervision of the Ministry of Public Works. The urban and rural district roads, covering a much greater mileage and classed as *la petite voirie*, are maintained chiefly by the communes under the supervision of the Minister of the Interior.

Waterways.¹—The waterways of France, 7543 m. in length, of which canals cover 3031 m., are also classed under *la grande voirie*; they are the property of the state, and for the most part are free of tolls. They are divided into two classes. Those of the first class, which comprise rather less than half the entire system, have a minimum depth of 6½ ft., with locks 126 ft. long and 17 ft. wide; those of the second class are of smaller dimensions. Water traffic, which is chiefly in heavy merchandise, as coal, building materials, and agriculture and food produce, more than doubled in volume between 1881 and 1905. The canal and river system attains its greatest utility in the north, north-east and north-centre of the country; traffic is thickest along the Seine below Paris; along the rivers and small canals of the rich departments of Nord and Pas-de-Calais and along the Oise and the canal of St Quentin whereby they communicate with Paris; along the canal from the Marne to the Rhine and the succession of waterways which unite it with the Oise; along the Canal de l'Est (departments of Meuse and Ardennes); and along the waterways uniting Paris with the Saône at Chalon (Seine, Canal du Loing, Canal de Briare, Lateral canal of the Loire and Canal du Centre) and along the Saône between Chalon and Lyons.

In point of length the following are the principal canals:

	Miles.
Est (uniting Meuse with Moselle and Saône)	270
From Nantes to Brest	225
Berry (uniting Montluçon with the canalized Cher and the Loire canal)	163
Midi (Toulouse to Mediterranean via Béziers); see CANAL	175
Burgundy (uniting the Yonne and Saône)	151
Lateral canal of Loire	137
From Marne to Rhine (on French territory)	131
Lateral canal of Garonne	133
Rhône to Rhine (on French territory)	119
Nivernais (uniting Loire and Yonne)	111
Canal de la Somme	97
Centre (uniting Saône and Loire)	81
Canal de l'Ourcq	67
Ardennes (uniting Aisne and Canal de l'Est)	62
From Rhône to Cette	77
Canal de la Haute Marne	60
St Quentin (uniting Scheldt with Somme and Oise)	58

Railways.—The first important line in France, from Paris to Rouen, was constructed through the instrumentality of Sir Edward Blount (1809–1905), an English banker in Paris, who was afterwards for thirty years chairman of the Ouest railway. After the rejection in 1838 of the government's proposals for the construction of seven trunk lines to be worked by the state, he obtained a concession for that piece of line on the terms that the French treasury would advance one-third of the capital at 3% if he would raise the remaining two-thirds, half in France and half in England. The contract for building the railway was put in the hands of Thomas Brassey; English navvies were largely employed on the work, and a number of English engine-drivers were employed when traffic was begun in 1843. A law passed in 1842 laid the foundation of the plan under which the railways have since been developed, and mapped out nine main lines, running from Paris to the frontiers and from the Mediterranean to the Rhine and to the Atlantic coast. Under it the cost of the necessary land was to be found as to one-third by the state and as to the residue locally, but this arrangement proved unworkable and was abandoned in 1845, when it was settled that the state should provide the land and construct the earthworks and stations, the various companies which obtained concessions being left to make the permanent way, provide rolling stock and work the lines for certain periods. Construction proceeded under this law, but not with very satisfactory results, and new arrangements had to be made between 1852 and 1857, when the railways were concentrated in the hands of six great companies, the Nord, the Est, the Ouest, the Paris-Lyon-Méditerranée, the Orléans and the Midi. Each of these companies was allotted a definite sphere of influence, and was granted a concession for ninety-nine years from its date of formation, the concessions thus terminating at various dates between 1950 and 1960. In return for the privileges granted them the companies undertook the construction out of their own unaided resources of 1500 m. of subsidiary lines, but the railway expenditure of the country at this period was so large that in a few years they found it impossible to raise the capital they required. In these circumstances the state agreed to guarantee the interest on the capital, the sums it paid in this way being regarded as advances to be reimbursed in the future with interest at 4%. This measure proved successful and the projected lines were completed. But demands for more lines were constantly arising, and the existing companies, in view of their financial position, were disinclined to undertake their construction. The government therefore found itself obliged to inaugurate a system of direct subventions, not only to the old large companies, but also to new small ones, to encourage the development of branch and local lines, and local authorities were also empowered to contribute a portion of the required capital. The result came to be that many small lines were begun by companies that had not the means to complete them, and again the state had to come to the rescue. In 1878 it agreed to spend £20,000,000 in purchasing and completing a number of

these lines, some of which were handed over to the great companies, while others were retained in the hands of the government, forming the system known as the Chemins de Fer de l'État. Next year a large programme of railway expansion was adopted, at an estimated cost to the state of £140,000,000, and from 1880 to 1882 nearly £40,000,000 was expended and some 1800 m. of line constructed. Then there was a change in the financial situation, and it became difficult to find the money required. In these circumstances the conventions of 1883 were concluded, and the great companies partially relieved the government of its obligations by agreeing to contribute a certain proportion of the cost of the new lines and to provide the rolling stock for working them. In former cases when the railways had had recourse to state aid, it was the state whose contributions were fixed, while the railways were left to find the residue; but on this occasion the position was reversed. The state further guaranteed a minimum rate of interest on the capital invested, and this guarantee, which by the convention of 1859 had applied to "new" lines only, was now extended to cover both "old" and "new" lines, the receipts and expenditure from both kinds being lumped together. As before, the sums paid out in respect of guaranteed dividend were to be regarded as advances which were to be paid back to the state out of the profits made, when these permitted, and when the advances were wiped out, the profits, after payment of a certain dividend, were to be divided between the state and the railway, two-thirds going to the former and one-third to the latter. All the companies, except the Nord, have at one time or another had to take advantage of the guarantee, and the fact that the Ouest had been one of the most persistent and heavy borrowers in this respect was one of the reasons that induced the government to take it over as from the 1st of January 1909. By the 1859 conventions the state railway system obtained an entry into Paris by means of running powers over the Ouest from Chartres, and its position was further improved by the exchange of certain lines with the Orléans company.

The great railway systems of France are as follows:

1. The Nord, which serves the rich mining, industrial and farming districts of Nord, Pas-de-Calais, Aisne and Somme, connecting with the Belgian railways at several points. Its main lines run from Paris to Calais, via Creil, Amiens and Boulogne, from Paris to Lille, via Creil and Arras, and from Paris to Maubeuge via Creil, Tergnier and St. Quentin.
 2. The Ouest-État, a combination of the West and state systems. The former traversed Normandy in every direction and connected Paris with the towns of Brittany. Its chief lines ran from Paris to Le Havre via Mantes and Rouen, to Dieppe via Rouen, to Cherbourg, to Granville and to Brest. The state railways served a large portion of western France, their chief lines being from Nantes via La Rochelle to Bordeaux, and from Bordeaux via Saintes, Niort and Saumur to Chartres.
 3. The Est, running from Paris via Châlons and Nancy to Avricourt (for Strassburg), via Troyes and Langres to Belfort and on via Basel to the Saint Gotthard, and via Reims and Mezières to Longwy.
 4. The Orléans, running from Paris to Orléans, and thence serving Bordeaux via Tours, Poitiers and Angoulême, Nantes via Tours and Angers, and Montauban and Toulouse via Vierzon and Limoges.
 5. The Paris-Lyon-Méditerranée, connecting Paris with Marseilles via Moret, Laroche, Dijon, Mâcon and Lyons, and with Nîmes via Moret, Nevers and Clermont-Ferrand. It establishes communication between France and Switzerland and Italy via Mâcon and Culoz (for the Mt. Cenis Tunnel) and via Dijon and Pontarlier (for the Simplon), and also has a direct line along the Mediterranean coast from Marseilles to Genoa via Toulon and Nice.
 6. The Midi (Southern) has lines radiating from Toulouse to Bordeaux via Agen, to Bayonne via Tarbes and Pau, and to Cette via Carcassonne, Narbonne and Béziers. From Bordeaux there is also a direct line to Bayonne and Irun (for Madrid), and at the other end of the Pyrenees a line leads from Narbonne to Perpignan and Barcelona.
- The following table, referring to lines "of general interest," indicates the development of railways after 1885:

Year.	Mileage.	Receipts in Thousands of £.	Expenses in Thousands of £.	Passengers carried (1000's).	Goods carried (1000 Metric Tons).
1885	18,650	42,324	23,508	214,451	75,192
1890	20,800	46,145	24,239	241,119	92,506
1895	22,650	50,542	27,363	348,852	100,834
1900	23,818	60,674	32,966	453,193	126,830
1904	24,755	60,589	31,477	433,913	130,144

Narrow gauge and normal gauge railways "of local interest" covered 3905 m. in 1904.

Commerce.

After entering on a régime of free trade in 1860 France gradually reverted towards protection; this system triumphed in the Customs Law of 1892, which imposed more or less considerable duties on imports—a law associated with the name of M. Méline. While raising the taxes both on agricultural products and manufactured goods, this law introduced, between France and all the powers trading with her, relations different from those in the past. It left the government free either to apply to foreign countries the general tariff or to enter into negotiations with them for the application, under certain conditions, of a minimum tariff. The policy of protection was further accentuated by raising the impost on corn from 5 to 7 francs per hectolitre (2½ bushels). This system, however, which is opposed by a powerful party, has at various times undergone modifications. On the one hand it became necessary, in face of an inadequate harvest, to suspend in 1898 the application of the law on the import of corn. On the other hand, in order to check the decline of exports and neutralize the harmful effects of a prolonged customs war, a commercial treaty was in 1896 concluded with Switzerland, carrying with it a reduction, in respect of certain articles, of the imposts which had been fixed by the law of 1892. An accord was likewise in 1898 effected with Italy, which since 1886 had been in a state of economic rupture with France, and in July 1899 an accord was concluded with the United States of America. Almost all other countries, moreover, share in the benefit of the minimum tariff, and profit by the modifications it may successively undergo.

Being in the main a self-supporting country France carries on most of her trade within her own borders, and ranks below

Commerce, in Millions of Pounds Sterling.

	General			Special		
	Imports.	Exports.	Total.	Imports.	Exports.	Total.
1876-1880	210.1	175.3	385.4	171.7	135.1	306.8
1881-1885	224.1	177.8	401.9	183.4	135.3	318.7
1886-1890	208.2	179.4	387.6	168.8	137.6	306.4
1891-1895	205.9	178.6	384.5	163.0	133.8	296.8
1896-1900	237.8	201.0	438.8	171.9	150.8	322.7
1901-1905	233.3	227.5	460.8	182.8	174.7	357.5

Great Britain, Germany and the United States in volume of exterior trade. The latter is subdivided into *general* commerce, which includes all goods entering or leaving the country, and *special* commerce which includes imports for home use and exports of home produce. The above table shows the developments of French trade during the years from 1876 to 1905 by means of quinquennial averages. A permanent body (the *commission permanente des valeurs*) fixes the average prices of the

	Imports.		Exports.

1901-1905	32,554	17.8	98,582	56.4

¹ Includes horses, mules and asses.

² Except certain manufactures which come under the category of articles of food.

articles in the customs list; this value is estimated at the end of the year in accordance with the variations that have taken place and is applied provisionally to the following year.

Amongst imports raw materials (wool, cotton and silk, coal, oil-seeds, timber, &c.) hold the first place, articles of food (cereals, wine, coffee, &c.) and manufactured goods (especially machinery) ranking next. Amongst exports manufactured goods (silk, cotton and woollen goods, fancy wares, apparel, &c.) come before raw materials and articles of food (wine and dairy products bought chiefly by England).

Divided into these classes the imports and exports (special trade) for quinquennial periods from 1886 to 1905 averaged as shown in the preceding table.

The decline both in imports and in exports of articles of food, which is the most noteworthy fact exhibited in the preceding table, was due to the almost prohibitive tax in the Customs Law of 1892, upon agricultural products.

The average value of the principal articles of import and export (special trade) over quinquennial periods following 1890 is shown in the two tables below.

Principal Imports (Thousands of £).

	1891-1895.	1896-1900.	1901-1905.
Coal, coke, &c.	7,018	9,883	10,539

Wool, manufactures of	11,998	10,190	8,459

The following were the countries sending the largest quantities of goods (special trade) to France (during the same periods as in previous table).

Trade with Principal Countries. Imports (Thousands of £).

	1891-1895.	1896-1900.	1901-1905.
Germany	13,178	13,904	17,363
Belgium	15,438	13,113	13,057
United Kingdom	20,697	22,132	22,725
Spain	10,294	10,560	6,525 ²
United States	15,577	18,491	19,334
Argentine Republic	7,119	10,009	10,094

Other countries importing largely into France are Russia, Algeria and British India, whose imports in each case averaged over £9,000,000 in value in the period 1901-1905; China (average value £7,000,000); and Italy (average value £6,000,000).

The following are the principal countries receiving the exports of France (special trade), with values for the same periods.

¹ Includes small fancy wares, toys, also wooden wares and furniture, brushes, &c.

² Decrease largely due to Spanish-American War (1898).

Trade with Principal Countries. Exports (Thousands of £).

	1891-1895.	1896-1900.	1901-1905.
Germany	13,712	16,285	21,021
Belgium	19,857	22,135	24,542
United Kingdom	39,310	45,203	49,156
United States	9,337	9,497	10,411
Algeria	7,872	9,434	11,652

The other chief customers of France were Switzerland and Italy, whose imports from France averaged in 1901-1905 nearly £10,000,000 and over £7,200,000 respectively in value. In the same period Spain received exports from France averaging £4,700,000.

The trade of France was divided between foreign countries and her colonies in the following proportions (imports and exports combined).

	General Trade.		Special Trade.	
	Foreign Countries.	Colonies.	Foreign Countries.	Colonies.
1891-1895	92.00	8.00	90.89	9.11
1896-1900	91.18	8.82	89.86	10.14
1901-1905	90.41	9.59	88.78	11.22

The respective shares of the leading customs in the trade of the country is approximately shown in the following table, which gives the value of their exports and imports (general trade) in 1905 in millions sterling.

	£	£	
Marseilles	88.8	Boulogne	17.5
Le Havre	79.5	Calais	14.1
Paris	42.8	Dieppe	13.5
Dunkirk	34.8	Rouen	11.3
Bordeaux	27.4	Belfort-Petit-Croix	10.7

In the same year the other chief customs in order of importance were Tourcoing, Jeumont, Cette, St Nazaire and Avricourt.

The chief local bodies concerned with commerce and industry are the *chambres de commerce* and the *chambres consultatives d'arts et manufactures*, the members of which are elected from their own number by the traders and industrialists of a certain standing. They are established in the chief towns, and their principal function is to advise the government on measures for improving and facilitating commerce and industry within their circumscription. See also BANKS AND BANKING; SAVINGS BANKS; POST AND POSTAL SERVICE.

Shipping.—The following table shows the increase in tonnage of sailing and steam shipping engaged in foreign trade entered and cleared at the ports of France over quinquennial periods from 1890.

	Entered.		Cleared.	
	French.	Foreign.	French.	Foreign.
1891-1895	4,277,967	9,947,893	4,521,928	10,091,000
1896-1900	4,665,268	12,037,571	5,005,563	12,103,358
1901-1905	4,782,101	14,744,626	5,503,463	14,823,217

The increase of the French mercantile marine (which is fifth in importance in the world) over the same period is traced in the following table. Vessels of 2 net tons and upwards are enumerated.

	Sailing.		Steam.		Total.	
	Number of Vessels.	Tonnage.	Number of Vessels.	Tonnage.	Number of Vessels.	Tonnage.
1891-1895	14,183	402,982	1182	502,363	15,365	905,345
1896-1900	14,327	437,468	1231	504,674	15,558	942,142
1901-1905	14,867	642,562	1388	617,536	16,255	1,260,098

At the beginning of 1908 the total was 17,193 (tonnage, 1,402,647); of these 13,601 (tonnage, 81,833) were vessels of less than 20 tons, while 502 (tonnage, 1,014,506) were over 800 tons.

The increase in the tonnage of sailing vessels, which in other countries tends to decline, was due to the bounties voted by parliament to its merchant sailing fleet with the view of increasing the number of skilled seamen. The prosperity of the French shipping trade is hampered by the costliness of shipbuilding and by the scarcity of outward-bound cargo. Shipping has been fostered by paying bounties for vessels constructed in France and sailing under the French flag, and by reserving the coasting trade, traffic between France and Algeria, &c., to French vessels. Despite these monopolies, three-fourths of the shipping in French ports is foreign, and France is without shipping companies comparable in importance to those of other great maritime nations. The three chief companies are the *Messageries Maritimes* (Marseilles and Bordeaux), the *Compagnie Générale Transatlantique* (Le Havre, St Nazaire and Marseilles) and the *Chargeurs Réunis* (Le Havre).

Government and Administration.

Central Government.—The principles upon which the French constitution is based are representative government (by two chambers), manhood suffrage, responsibility of ministers and irresponsibility of the head of the state. Alterations or modifications of the constitution can only be effected by the National Assembly, consisting of both chambers sitting together *ad hoc*. The legislative power resides in these two chambers—the Senate and the Chamber of Deputies; the executive is vested in the president of the republic and the ministers. The members of both chambers owe their election to universal suffrage; but the Senate is not elected directly by the people and the Chamber of Deputies is.

The Chamber of Deputies, consisting of 584 members, is elected by the *scrutin d'arrondissement* (each elector voting for one deputy) for a term of four years, the conditions of election being as follows: Each *arrondissement* sends one deputy if its population does not exceed 100,000, and an additional deputy for every additional 100,000 inhabitants or fraction of that number. Every citizen of twenty-one years of age, unless subject to some legal disability, such as actual engagement in military service, bankruptcy or condemnation to certain punishments, has a vote, provided that he can prove a residence of six months' duration in any one town or commune. A deputy must be a French citizen, not under twenty-five years old. Each candidate must make, at least five days before the elections, a declaration setting forth in what constituency he intends to stand. He may only stand for one, and all votes given for him in any other than that specified in the declaration are void. To secure election a candidate must at the first voting poll an absolute majority and a number of votes equal to one-fourth of the number of electors. If a second poll is necessary a relative majority is sufficient.

The Senate (see below, *Law and Institutions*) is composed of 300 members who must be French citizens at least forty years of age. They are elected by the "*scrutin de liste*" for a period of nine years, and one-third of the body retires every three years. The department which is to elect a senator when a vacancy occurs is settled by lot.

Both senators and deputies receive a salary of £600 per annum. No member of a family that has reigned in France is eligible for either chamber.

Bills may be proposed either by ministers (in the name of the president of the republic), or by private members, and may be initiated in either chamber, but money-bills must be submitted in the first place to the Chamber of Deputies. Every bill is first examined by a committee, a member of which is chosen to "report" on it to the chamber, after which it must go through two readings (*délibérations*), before it is presented to the other chamber. Either house may pass a vote of no confidence in the government, and in practice the government resigns in face of the passing of such a vote by the deputies, but not if it is passed by the Senate only. The chambers usually assemble in January each year, and the ordinary session lasts not less than five months; usually it continues till July. There is an extraordinary session from October till Christmas.

The president (see below, *Law and Institutions*) is elected for

seven years, by a majority of votes, by the Senate and Chamber of Deputies sitting together as the National Assembly. Any French citizen may be chosen president, no fixed age being required. The only exception to this rule is that no member of a royal family which has once reigned in France can be elected. The president receives 1,200,000 francs (£48,000) a year, half as salary, half for travelling expenses and the charges incumbent upon the official representative of the country. Both the chambers are summoned by the president, who has the power of dissolving the Chamber of Deputies with the assent of the Senate. When a change of Government occurs the president chooses a prominent parliamentarian as premier and president of the council. This personage, who himself holds a portfolio, nominates the other ministers, his choice being subject to the ratification of the chief of the state. The ministerial council (*conseil des ministres*) is presided over by the president of the republic; less formal meetings (*conseils de cabinet*) under the presidency of the premier, or even of some other minister, are also held.

The ministers, whether members of parliament or not, have the right to sit in both chambers and can address the house whenever they choose, though a minister may only vote in the chamber of which he happens to be a member. There are twelve ministries¹ comprising those of justice; finance; war; the interior; marine; colonies; public instruction and fine arts; foreign affairs; commerce and industry; agriculture; public works; and labour and public thrift. Individual ministers are responsible for all acts done in connexion with their own departments, and the body of ministers collectively is responsible for the general policy of the government.

The council of state (*conseil d'état*) is the principal council of the head of the state and his ministers, who consult it on various legislative problems, more particularly on questions of administration. It is divided for despatch of business into four sections, each of which corresponds to a group of two or three ministerial departments, and is composed of (1) 32 councillors "*en service ordinaire*" (comprising a vice-president and sectional presidents), and 19 councillors "*en service extraordinaire*," i.e. government officials who are deputed to watch the interests of the ministerial departments to which they belong, and in matters not concerned with those departments have a merely consultative position; (2) 32 *maîtres des requêtes*; (3) 40 auditors.

The presidency of the council of state belongs *ex officio* to the minister of justice.

The theory of "*droit administratif*" lays down the principle that an agent of the government cannot be prosecuted or sued for acts relating to his administrative functions before the ordinary tribunals. Consequently there is a special system of administrative jurisdiction for the trial of "*le contentieux administratif*" or disputes in which the administration is concerned. The council of state is the highest administrative tribunal, and includes a special "*Section du contentieux*" to deal with judicial work of this nature.

Local Government.—France is divided into 86 administrative departments (including Corsica) or 87 if the Territory of Belfort, a remnant of the Haut Rhin department, be included. These departments are subdivided into 362 *arrondissements*, 2911 cantons and 36,222 communes.

CORSE (CORSIKA)	Ajaccio	Corse.

Before 1790 France was divided into thirty-three great and seven small military governments, often called provinces, which are, however, to be distinguished from the provinces formed under the feudal system. The great governments were: Alsace, Saintonge and Angoumois, Anjou, Artois, Aunis, Auvergne, Béarn and Navarre, Berry, Bourbonnais, Bourgogne, Burgundy, Bretagne, Brittany, Champagne, Dauphiné, Flandre, Foss, Franche-Comté, Guienne and Gascogne (Astarac), Ile-de-France, Languedoc, Limousin, Lorraine, Maine, Mayenne, Marche, Nivernais, Normandie, Orléanais, Picardie,

Poitou, Provence, Roussillon, Touraine and Corse. The eight small governments were: Paris, Boulogne and Boulonnais, Le Havre, Sedan, Toulous, Pays Messin and Verdunois and Saumurois.

At the head of each department is a prefect, a political official nominated by the minister of the interior and appointed by the president, who acts as general agent of the government and representative of the central authority. To aid him the prefect

has a general secretary and an advisory body (*conseil de préfecture*), the members of which are appointed by the president, which has jurisdiction in certain classes of disputes arising out of administration and must, in certain cases, be consulted, though the prefect is not compelled to follow its advice. The prefect supervises the execution of the laws; has wide authority in regard to policing, public hygiene and relief of pauper children; has the nomination of various subordinate officials; and is in correspondence with the subordinate functionaries in his department, to whom he transmits the orders and instructions of the government. Although the management of local affairs is in the hands of the prefect his power with regard to these is checked by a deliberative body known as the general council (*conseil général*). This council, which consists for the most part of business and professional men, is elected by universal suffrage, each canton in the department contributing one member. The general council controls the departmental administration of the prefect, and its decisions on points of local government are usually final. It assigns its quota of taxes (*contingent*) to each arrondissement, authorizes the sale, purchase or exchange of departmental property, superintends the management thereof, authorizes the construction of new roads, railways or canals, and advises on matters of local interest. Political questions are rigorously excluded from its deliberations. The general council, when not sitting, is represented by a permanent delegation (*commission départementale*).

As the prefect in the department, so the sub-prefect in the arrondissement, though with a more limited power, is the representative of the central authority. He is assisted, and in some degree controlled, in his work by the district council (*conseil d'arrondissement*), to which each canton sends a member, chosen by universal suffrage. As the arrondissement has neither property nor budget, the principal business of the council is to allot to each commune its share of the direct taxes imposed on the arrondissement by the general council.

The canton is purely an administrative division, containing, on an average, about twelve communes, though some exceptional communes are big enough to contain more than one canton. It is the seat of a justice of the peace, and is the electoral unit for the general council and the district council.

The communes, varying greatly in area and population, are the administrative units in France. The chief magistrate of the commune is the mayor (*maire*), who is (1) the agent of the central government and charged as such with the local promulgation and execution of the general laws and decrees of the country; (2) the executive head of the municipality, in which capacity he supervises the police, the revenue and public works of the commune, and acts as the representative of the corporation in general. He also acts as registrar of births, deaths and marriages, and officiates at civil marriages. Mayors are usually assisted by deputies (*adjoints*). In a commune of 2500 inhabitants or less there is one deputy; in more populous communes there may be more, but in no case must the number exceed twelve, except at Lyons, where as many as seventeen are allowed. Both mayors and deputy mayors are elected by and from among members of the municipal council for four years. This body consists, according to the population of the commune, of from 10 to 36 members, elected for four years on the principle of the *scrutin de liste* by Frenchmen who have reached the age of twenty-one years and have a six months' residence qualification.

The local affairs of the commune are decided by the municipal council, and its decisions become operative after the expiration of a month, save in matters which involve interests transcending those of the commune. In such cases the prefect must approve them, and in some cases the sanction of the general council or even ratification by the president is necessary. The council also chooses communal delegates to elect senators; and draws up the list of *répartiteurs*, whose function is to settle how the commune's share of direct taxes shall be allotted among the taxpayers. The sub-prefect then selects from this list ten of whom he approves for the post. The meetings of the council are open to the public.

Justice.

The ordinary judicial system of France comprises two classes of courts: (1) civil and criminal, (2) special, including courts dealing only with purely commercial cases; in addition there are the administrative courts, including bodies, the Conseil d'État and the Conseils de Préfecture, which deal, in their judicial capacity, with cases coming under the *droit administratif*. Mention may also be made of the Tribunal des Conflits, a special court whose function it is to decide which is the competent tribunal when an administration and a judicial court both claim or refuse to deal with a given case.

Taking the first class of courts, which have both civil and criminal jurisdiction, the lowest tribunal in the system is that of the *juge de paix*.

In each canton is a *juge de paix*, who in his capacity as a civil judge takes cognizance, without appeal, of disputes where the amount sought to be recovered does not exceed £12 in value. Where the amount exceeds £12 but not £24 an appeal lies from his decision to the court of first instance. In some particular cases where special promptitude or local knowledge is necessary, as disputes between hotelkeepers and travellers, and the like, he has jurisdiction (subject to appeal to the court of first instance) up to £60. He has also a criminal jurisdiction in *contraventions*, i.e. breaches of law punishable by a fine not exceeding 12s. or by imprisonment not exceeding five days. If the sentence be one of imprisonment or the fine exceeds 4s., appeal lies to the court of first instance. It is an important function of the *juge de paix* to endeavour to reconcile disputants who come before him, and no suit can be brought before the court of first instance until he has endeavoured without success to bring the parties to an agreement.

Tribunaux de première instance, also called *tribunaux d'arrondissement*, of which there is one in every arrondissement (with few exceptions), besides serving as courts of appeal from the *juges de paix* have an original jurisdiction in matters civil and criminal. The court consists of a president, one or more vice-presidents and a variable number of judges. A *procureur*, or public prosecutor, is also attached to each court. In civil matters the tribunal takes cognizance of actions relating to personal property to the value of £60, and actions relating to land to the value of 60 fr. (£2: 8s.) per annum. When it deals with matters involving larger sums an appeal lies to the courts of appeal. In penal cases its jurisdiction extends to all offences of the class known as *délits*—offences punishable by a more serious penalty than the "contraventions" dealt with by the *juge de paix*, but not entailing such heavy penalties as the code applies to *crimes*, with which the assize courts (see below) deal. When sitting in its capacity as a criminal court it is known as the *tribunal correctionnel*. Its judgments are invariably subject in these matters to appeal before the court of appeal.

There are twenty-six courts of appeal (*cours d'appel*), to each of which are attached from one to five departments.

Cours d'Appel.	Departments depending on them.
PARIS . . .	Seine, Aube, Eure-et-Loir, Marne, Seine-et-Marne, Seine-et-Oise, Yonne.
AGEN . . .	Gers, Lot, Lot-et-Garonne.
AIX . . .	Basses-Alpes, Alpes-Maritimes, Bouches-du-Rhône, Var.
AMIENS . . .	Aisne, Oise, Somme.
ANGERS . . .	Maine-et-Loire, Mayenne, Sarthe.
BASTIA . . .	Corse.

Cours d'Appel.	Departments depending on them.
ORLÉANS . . .	Indre-et-Loire, Loir-et-Cher, Loiret.
PAU . . .	Landes, Basses-Pyrénées, Hautes-Pyrénées.
POITIERS . . .	Charente-Inférieure, Deux-Sèvres, Vendée, Vienne.
RENNES . . .	Côtes-du-Nord, Finistère, Ile-et-Vilaine, Loire-Inférieure, Morbihan.
RIOM . . .	Allier, Cantal, Haute-Loire, Puy-de-Dôme.
ROUEN . . .	Eure, Seine-Inférieure.
TOULOUSE . . .	Ariège, Haute-Garonne, Tarn, Tarn-et-Garonne.

At the head of each court, which is divided into sections (*chambres*), is a *premier président*. Each section (*chambre*) consists of a *président de chambre* and four judges (*conseillers*). *Procureurs-généraux* and *avocats-généraux* are also attached to the *parquet*, or permanent official staff, of the courts of appeal. The principal function of these courts is the hearing of appeals both civil and criminal from the courts of first instance; only in some few cases (e.g. discharge of bankrupts) do they exercise an original jurisdiction. One of the sections is termed the *chambre des mises en accusation*. Its function is to examine criminal cases and to decide whether they shall be referred for trial to the lower courts or the *cours d'assises*. It may also dismiss a case on grounds of insufficient evidence.

The *cours d'assises* are not separate and permanent tribunals. Every three months an *assize* is held in each department, usually at the chief town, by a *conseiller*, appointed *ad hoc*, of the court of appeal upon which the department depends. The *cour d'assises* occupies itself entirely with offences of the most serious type, classified under the penal code as *crimes*, in accordance with the severity of the penalties attached. The president is assisted in his duties by two other magistrates, who may be chosen either from among the *conseillers* of the court of appeal or the presidents or judges of the local court of first instance. In this court and in this court alone there is always a jury of twelve. They decide, as in England, on facts only, leaving the application of the law to the judges. The verdict is given by a simple majority.

In all criminal prosecutions, other than those coming before the *juge de paix*, a secret preliminary investigation is made by an official called a *juge d'instruction*. He may either dismiss the case at once by an order of "non-lieu," or order it to be tried, when the prosecution is undertaken by the *procureur* or *procureur-général*. This process in some degree corresponds to the manner in which English magistrates dismiss a case or commit the prisoner to quarter sessions or *assizes*, but the powers of the *juge d'instruction* are more arbitrary and absolute.

The highest tribunal in France is the *cour de cassation*, sitting at Paris, and consisting of a first president, three sectional presidents and forty-five *conseillers*, with a ministerial staff (*parquet*) consisting of a *procureur-général* and six advocates-general. It is divided into three sections: the *Chambre des Requêtes*, or court of petitions, the civil court and the criminal court. The *cour de cassation* can review the decision of any other tribunal, except administrative courts. Criminal appeals usually go straight to the criminal section, while civil appeals are generally taken before the *Chambre des Requêtes*, where they undergo a preliminary examination. If the demand for rehearing is refused such refusal is final; but if it is granted the case is then heard by the civil chamber, and after argument *cassation* (annulment) is granted or refused. The Court of Cassation does not give the ultimate decision on a case; it pronounces, not on the question of fact, but on the legal principle at issue, or the competence of the court giving the original decision. Any decision, even one of a *cour d'assises*, may be brought before it in the last resort, and may be *cassé*—annulled. If it pronounces *cassation* it remits the case to the hearing of a court of the same order.

Commercial courts (*tribunaux de commerce*) are established in all the more important commercial towns to decide as expeditiously as possible disputed points arising out of business transactions. They consist of judges, chosen, from among the leading merchants; and elected by *commerçants patentés depuis cinq ans*, i.e. persons who have held the licence to trade (see FINANCE) for

five years and upwards. In the absence of a *tribunal de commerce* commercial cases come before the ordinary *tribunal d'arrondissement*.

In important industrial towns tribunals called *conseils de prud'hommes* are instituted to deal with disputes between employers and employees, actions arising out of contracts of apprenticeship and the like. They are composed of employers and workmen in equal numbers and are established by decree of the council of state, advised by the minister of justice. The minister of justice is notified of the necessity for a *conseil de prud'hommes* by the prefect, acting on the advice of the municipal council and the Chamber of Commerce or the Chamber of Arts and Manufactures. The judges are elected by employers and workmen of a certain standing. When the amount claimed exceeds £12 appeal lies to the *tribunaux d'arrondissement*.

Police.—Broadly, the police of France may be divided into two great branches—administrative police (*la police administrative*) and judicial police (*la police judiciaire*), the former having for its object the maintenance of order, and the latter charged with tracing out offenders, collecting the proofs, and delivering the presumed offenders to the tribunals charged by law with their trial and punishment. Subdivisions may be, and often are, named according to the particular duties to which they are assigned, as *la police politique*, *police des mœurs*, *police sanitaire*, &c. The officers of the judicial police comprise the *juge de paix* (equivalent to the English police magistrate), the *maire*, the *commissaire de police*, the *gendarmerie* and, in rural districts, the *gardes champêtres* and the *gardes forestiers*. *Gardiens de la paix* (sometimes called *sergents de ville*, *gardes de ville* or *agents de police*) are not to be confounded with the *gendarmerie*, being a branch of the administrative police and corresponding more or less nearly with the English equivalent "police constables," which the *gendarmerie* do not, although both perform police duty. The *gendarmerie*, however, differ from the agents or *gardes* both in uniform and in the fact that they are for the most part country patrols. The organization of the Paris police, which is typical of that in other large towns, may be outlined briefly. The central administration (*administration centrale*) comprises three classes of functions which together constitute *la police*. First there is the office or *cabinet* of the prefect for the general police (*la police générale*), with bureaux for various objects, such as the safety of the president of the republic, the regulation and order of public ceremonies, theatres, amusements and entertainments, &c.; secondly, the judicial police (*la police judiciaire*), with numerous bureaux also, in constant communication with the courts of judicature; thirdly, the administrative police (*la police administrative*) including bureaux, which superintend navigation, public carriages, animals, public health, &c. Concurrently with these divisions there is the municipal police, which comprises all the agents in enforcing police regulations in the streets or public thoroughfares, acting under the orders of a chief (*chef de la police municipale*) with a central bureau. The municipal police is divided into two principal branches—the service in uniform of the *agents de police* and the service out of uniform of *inspecteurs de police*. In Paris the municipal police are divided among the twenty *arrondissements*, which the uniform police patrol (see further PARIS and POLICE).

Prisons.—The prisons of France, some of them attached to the ministry of the interior, are complex in their classification. It is only from the middle of the 19th century that close attention has been given to the principle of individual separation. Cellular imprisonment was, however, partially adopted for persons awaiting trial. Central prisons, in which prisoners lived and worked in association, had been in existence from the commencement of the 19th century. These prisons received all sentenced to short terms of imprisonment, the long-term convicts going to the *bagnes* (the great convict prisons at the arsenals of Rochefort, Brest and Toulon), while in 1851 transportation to penal colonies was adopted. In 1869 and 1871 commissions were appointed to inquire into prison discipline, and as a consequence of the report of the last commission, issued in 1874, the principle of cellular

confinement was put in operation the following year. There were, however, but few prisons in France adapted for the cellular system, and the process of reconstruction has been slow. In 1898 the old Paris prisons of Grande-Roquette, Saint-Pélagie and Mazas were demolished, and to replace them a large prison with 1500 cells was erected at Fresnes-lès-Rungis. There are (1) the *maison d'arrêt*, temporary places of duration in every arrondissement for persons charged with offences, and those sentenced to more than a year's imprisonment who are awaiting transfer to a *maison centrale*; (2) the *maison de justice*, often part and parcel of the former, but only existing in the assize court towns for the safe custody of those tried or condemned at the assizes; (3) departmental prisons, or *maisons de correction*, for summary convictions, or those sentenced to less than a year, or, if provided with sufficient cells, those amenable to separate confinement; (4) *maisons centrales* and *pénitenciers agricoles*, for all sentenced to imprisonment for more than a year, or to hard labour, or to those condemned to *travaux forcés* for offences committed in prison. There are eleven *maisons centrales*, nine for men (Loos, Clairvaux, Beaulieu, Poissy, Melun, Fontevrault, Thouars, Riom and Nîmes); two for women (Rennes and Montpellier). The *pénitenciers agricoles* only differ from the *maisons centrales* in the matter of régime; there are two—at Castelluccio and at Chiavari (Corsica). There are also reformatory establishments for juvenile offenders, and *dépôts de sûreté* for prisoners who are travelling, at places where there are no other prisons. For the penal settlements at a distance from France see DEPORTATION.

Finance.

At the head of the financial organization of France, and exercising a general jurisdiction, is the minister of finance, who co-ordinates in one general budget the separate budgets prepared by his colleagues and assigns to each ministerial department the sums necessary for its expenses.

The financial year in France begins on the 1st of January, and the budget of each financial year must be laid on the table of the Chamber of Deputies in the course of the ordinary session of the preceding year in time for the discussion upon it to begin in October and be concluded before the 31st of December. It is then submitted to a special commission of the Chamber of Deputies, elected for one year, who appoint a general reporter and one or more special reporters for each of the ministries. When the Chamber of Deputies has voted the budget it is submitted to a similar course of procedure in the Senate. When the budget has passed both chambers it is promulgated by the president under the title of *Loi des finances*. In the event of its not being voted before the 31st of December, recourse is had to the system of "provisional twelfths" (*douzièmes provisoires*), whereby the government is authorized by parliament to incur expenses for one, two or three months on the scale of the previous year. The expenditure of the government has several times been regulated for as long as six months upon this system.

In each department an official collector (*Trésorier payeur général*) receives the taxes and public revenue collected therein and accounts for them to the central authority in Paris. In view of his responsibilities he has, before appointment, to pay a large deposit to the treasury. Besides receiving taxes, they pay the creditors of the state in their departments, conduct all operations affecting departmental loans, buy and sell government stock (*rentes*) on behalf of individuals, and conduct certain banking operations. The *trésorier* nearly always lives at the chief town of the department, and is assisted by a *receveur particulier des finances* in each arrondissement (except that in which the *trésorier* himself resides). From the *receveur* is demanded a security equal to five times his total income. The direct taxes are actually collected by *percepteurs*. In the commune an official known as the *receveur municipal* receives all moneys due to it, and, subject to the authorization of the mayor, makes all payments due from it. In communes with a revenue of less than £2400 the *percepteur* fulfils the functions of *receveur municipal*, but a special official may be appointed in communes with large incomes.

The direct taxes fall into two classes. (1) *Impôts de répartition* (apportionment), the amount to be raised being fixed in advance annually and then apportioned among the departments. They

include the land tax,¹ the personal and habitation tax (*contribution personnelle-mobilière*), and door and window tax. (2) *Impôts de quotité*, which are levied directly on the individual, who pays his quota according to a fixed tariff. These comprise the tax on buildings¹ and the trade-licence tax (*impôt des patentes*). Besides these, certain other taxes (*taxes assimilées aux contributions directes*) are included under the heading of direct taxation, e.g. the tax on property in mortmain, dues for the verification of weights and measures, the tax on royalties from mines, on horses, mules and carriages, on cycles, &c.

The land tax falls upon land not built upon in proportion to its net yearly revenue. It is collected in accordance with a register of property (*cadastre*) drawn up for the most part in the first half of the 19th century, dealing with every piece of property in France, and giving its extent and value and the name of the owner. The responsibility of keeping this register accurate and up to date is divided between the state, the departments and the communes, and involves a special service and staff of experts. The building tax consists of a levy of 3.20% of the rental value of the property, and is charged upon the owner.

The personal and habitation tax consists in fact of two different taxes, one imposing a fixed capitation charge on all citizens alike of every department, the charge, however, varying according to the department from 1 fr. 50 c. (1s. 3d.) to 4 frs. 50 c. (3s. 9d.), the other levied on every occupier of a furnished house or of apartments in proportion to its rental value.

The tax on doors and windows is levied in each case according to the number of apertures, and is fixed with reference to population, the inhabitants of the more populous paying more than those of the less populous communes.

The trade-licence tax (*impôt des patentes*) is imposed on every person carrying on any business whatever; it affects professional men, bankers and manufacturers, as well as wholesale and retail traders, and consists of (1) a fixed duty levied not on actual profits but with reference to the extent of a business or calling as indicated by number of employés, population of the locality and other considerations. (2) An assessment on the letting value of the premises in which a business or profession is carried on.

The administrative staff includes, for the purpose of computing the individual quotas of the direct taxes, a director assisted by *contrôleurs* in each department and subordinate to a central authority in Paris, the *direction générale des contributions directes*.

The indirect taxes comprise the charges on registration; stamps; customs; and a group of taxes specially described as "indirect taxes."

Registration (*enregistrement*) duties are charged on the transfer of property in the way of business (*à titre onéreux*); on changes in ownership effected in the way of donation or succession (*à titre gratuit*), and on a variety of other transactions which must be registered according to law. The revenue from stamps includes as its chief items the returns from stamped paper, stamps on goods traffic, securities and share certificates and receipts and cheques.

The *Direction générale de l'enregistrement, des domaines et du timbre*, comprising a central department and a director and staff of agents in each department, combines the administration of state property (not including forests) with the exaction of registration and stamp duties.

The Customs (*douane*), at one time only a branch of the administration of the *contributions indirectes*, were organized in 1869 as a special service. The central office at Paris consists of a *directeur général* and two *administrateurs*, nominated by the president of the republic. These officials form a council of administration presided over by the minister of finance. The service in the departments comprises *brigades*, which are actually engaged in guarding the frontiers, and a clerical staff (*service de bureau*) entrusted with the collection of the duties. There are twenty-four districts, each under the control of a *directeur*, assisted by inspectors, sub-inspectors and other officials. The chief towns of these districts are Algiers, Bayonne, Besançon, Bordeaux, Boulogne, Brest, Chambéry, Charleville, Dunkirk, Épinal, La Rochelle, Le Havre, Lille, Lyons, Marseilles, Montpellier, Nancy, Nantes, Nice, Paris, Perpignan, Rouen, St-Malo, Valenciennes. There is also an official performing the functions of a director at Bastia, in Corsica.

The group specially described as indirect taxes includes those on alcohol, wine, beer, cider and other alcoholic drinks, on passenger and goods traffic by railway, on licences to distillers, spirit-sellers, &c., on salt and on sugar of home manufacture. The collection of these excise duties as well as the sale of matches, tobacco and gunpowder to retailers, is assigned to a special service in each department subordinated to a central administration. To the above taxes must be added the tax on Stock Exchange transactions and the tax of 4% on dividends from stocks and shares (other than state loans).

Other main sources of revenue are: the domains and forests managed by the state; government monopolies, comprising tobacco, matches, gunpowder; posts, telegraphs, telephones; and state

¹ The tax on land (*propriétés non bâties*) and that on buildings (*propriétés bâties*) are included under the head of *contribution foncière*.

railways. An administrative tribunal called the *cour des comptes* subjects the accounts of the state's financial agents (*trésoriers-payeurs, receveurs* of registration fees, of customs, of indirect taxes, &c.) and of the communes¹ to a close investigation, and a vote of definitive settlement is finally passed by parliament. The *Cour des Comptes*, an ancient tribunal, was abolished in 1791, and reorganized by Napoleon I. in 1807. It consists of a president and 110 other officials, assisted by 25 auditors. All these are nominated for life by the president of the republic. Besides the accounts of the state and of the communes, those of charitable institutions¹ and training colleges¹ and a great variety of other public establishments are scrutinized by the *Cour des Comptes*.

The following table shows the rapid growth of the state revenue of France during the period 1875-1905, the figures for the specified years representing millions of pounds.

1875.	1880.	1885.	1890.	1895.	Average 1896-1900.	Average 1901-1905.
108	118	122	129	137	144	147

Of the revenue in 1905 (150½ million pounds) the four direct taxes produced approximately 20 millions. Other principal items of revenue were: Registration 25 millions, stamps 7½ millions, customs 18 millions, inland revenue on liquors 16½ millions, receipts from the tobacco monopoly 18 millions, receipts from post office 10½ millions.

Since 1875 the expenditure of the state has passed through considerable fluctuations. It reached its maximum in 1883, descended in 1888 and 1889, and since then has continuously increased. It was formerly the custom to divide the credits voted for the discharge of the public services into two heads—the ordinary and extraordinary budget. The ordinary budget of expenditure was that met entirely by the produce of the taxes, while the extraordinary budget of expenditure was that which had to be incurred either in the way of an immediate loan or in aid of the funds of the floating debt. The policy adopted after 1890 of incorporating in the ordinary budget the expenditure on war, marine and public works, each under its own head, rendered the "extraordinary budget" obsolete, but there are still, besides the ordinary budget, *budgets annexes*, comprising the credits voted to certain establishments under state supervision, e.g. the National Savings Bank, state railways, &c. The growth of the expenditure of France is shown in the following summary figures, which represent millions of pounds.

1875.	1880.	1885.	1890.	1895.	Average 1896-1900.	Average 1901-1905.
117	135	139	132	137	143	147

The chief item of expenditure (which totalled 148 million pounds in 1905) is the service of the public debt, which in 1905 cost 48½ million pounds sterling. Of the rest of the sum assigned to the ministry of finance (59½ millions in all) 8½ millions went in the expense of collection of revenue. The other ministries with the largest outgoings were the ministry of war (the expenditure of which rose from 25½ millions in 1895 to over 30 millions in 1905), the ministry of marine (10½ millions in 1895, over 12½ millions in 1905), the ministry of public works (with an expenditure in 1905 of over 20 millions, 10 millions of which was assigned to posts, telegraphs and telephones) and the ministry of public instruction, fine arts and public worship, the expenditure on education having risen from 7½ millions in 1895 to 9½ millions in 1905.

Public Debt.—The national debt of France is the heaviest of any country in the world. Its foundation was laid early in the 15th century, and the continuous wars of succeeding centuries, combined with the extravagance of the monarchs, as well as deliberate disregard of financial and economic conditions, increased it at an alarming rate. The duke of Sully carried out a revision in 1604, and other attempts were made by Mazarin and Colbert, but the extravagances of Louis XV. swelled it again heavily. In 1764 the national debt amounted to 2,360,000,000 livres, and the annual charge to 93,000,000 livres. A consolidation was effected in 1793, but the lavish issue of assignats (*q.v.*) destroyed whatever advantage might have accrued, and the debt was again dealt with by a law of the 9th of Vendémiaire year VI. (27th of September 1797), the annual interest paid yearly to creditors then amounting to 40,216,000 francs (£1,600,000). During the Directory a sum of £250,000 was added to the interest charge, and by 1814 this annual charge had risen to £2,530,000. This large increase is to be accounted for by the fact that during the Napoleonic régime the government steadily refused to issue inconvertible paper currency or to meet war expenditure by borrowing. The following table shows the increase of the funded debt since 1814.²

Date.	Nominal Capital (Millions of £).	Interest (Millions of £).
April 1, 1814	50½	2½
April 1, 1830	177	8
March 1, 1848	238½	9½
January 1, 1852	220½	9½
" 1871	498½	15½
" 1876	796½	30
" 1887	986½	34½
" 1895	1038½	32½
" 1905	1037½	31

The French debt as constituted in 1905 was made up of funded debt and floating debt as follows:

<i>Funded Debt.</i>	
Perpetual 3% <i>rentes</i>	£888,870,400
Terminable 3% <i>rentes</i>	148,490,400
Total of funded debt	<u>£1,037,360,800</u>
Guarantees to railway companies, &c. (in capital)	£89,724,080
Other debt in capital	46,800,840
<i>Floating Debt.</i>	
Exchequer bills	£9,923,480
Liabilities on behalf of communes and public establishments, including departmental services	17,366,520
Deposit and current accounts of Caisse des dépôts, &c., including savings banks	15,328,840
Caution money of Trésoriers payeurs-généraux	1,431,680
Other liabilities	6,456,200
Total of floating debt	<u>£50,506,720</u>

Departmental Finances.—Every department has a budget of its own, which is prepared and presented by the prefect, voted by the departmental council and approved by decree of the president of the republic. The ordinary receipts include the revenues from the property of the department, the produce of *additional centimes*, which are levied in conjunction with the direct taxes for the maintenance of both departmental and communal finances, state subventions and contributions of the communes towards certain branches of poor relief and to maintenance of roads. The chief expenses of the departments are the care of pauper children and lunatics, the maintenance of high-roads and the service of the departmental debt.

Communal Finances.—The budget of the commune is prepared by the mayor, voted by the municipal council and approved by the prefect. But in communes the revenues of which exceed £120,000, the budget is always submitted to the president of the republic. The ordinary revenues include the produce of "additional centimes" allocated to communal purposes, the rents and profits of communal property, sums produced by municipal taxes and dues, concessions to gas, water and other companies, and by the *octroi (q.v.)* or duty on a variety of articles imported into the commune for local consumption. The repairing of highways, the upkeep of public buildings, the support of public education, the remuneration of numerous officials connected with the collection of state taxes, the keeping of the *cadastre*, &c., constitute the principal objects of communal expenditure.

Both the departments and the communes have considerable public debts. The departmental debt in 1904 stood at 24 million pounds, and the communal debt at 153 million pounds. (R. Tr.)

Army.

Recruiting and Strength.—Universal compulsory service was adopted after the disasters of 1870-1871, though in principle it had been established by Marshal Niel's reforms a few years before that date. The most important of the recruiting laws passed since 1870 are those of 1872, 1889 and 1905, the last the "loi de deux ans" which embodies the last efforts of the French war department to keep pace with the ever-growing numbers of the German empire. Compulsory service with the colours is in Germany no longer universal, as there are twice as many able-bodied men presented by the recruiting commissions as the active army can absorb. France, with a greatly inferior population, now trains every man who is physically capable. This law naturally made a deep impression on military Europe, not merely because the period of colour service was reduced—Germany had taken this step years before—but because of the almost entire absence of the usual exemptions.

² In 1894 the *rentes* then standing at 4½% were reduced to 3½%, and in 1902 to 3%.

¹ With revenues of over £1200.

² For a history of the French debt, see C. F. Bastable, *Public Finance* (1903).

Even bread-winners are required to serve, the state pensioning their dependants (75 centimes per diem, up to 10% of the strength) during their period of service. Dispensations, and also the one-year voluntariat, which had become a short cut for the so-called "intellectual class" to employment in the civil service rather than a means of training reserve officers, were abolished. Every Frenchman therefore is a member of the army practically or potentially from the age of twenty to the age of forty-five. Each year there is drawn up in every commune a list of the young men who attained the age of twenty during the previous year. These young men are then examined by a revising body (*Conseil de révision cantonal*) composed of civil and military officials. Men physically unfit are wholly exempted, and men who have not, at the time of the examination, attained the required physical standard are put back for re-examination after an interval. Men who, otherwise suitable, have some slight infirmity are drafted into the non-combatant branches. The minimum height for the infantry soldier is 1.54 m., or 5 ft. $\frac{1}{2}$ in., but men of special physique are taken below this height. In 1904, under the old system of three-years' service with numerous total and partial exemptions, 324,253 men became liable to incorporation, of whom 25,432 were rejected as unfit, 55,265 were admitted as one-year volunteers, 62,160 were put back, 27,825 had already enlisted with a view to making the army a career, 5257 were taken for the navy, and thus, with a few extra details and casualties, the contingent for full service dwindled to 147,549 recruits. In 1906, 326,793 men had to present themselves, 25,348 had already enlisted, 4923 went to the navy, 68,526 were put back, 33,777 found unfit, which, deducting 3128 details, gives an actual incorporated contingent of 191,091 young men of twenty-one to serve for two full years (in each case, for the sake of comparison, men put back from former years who were enrolled are omitted). In theory a two-years' contingent of course should be half as large again as a three-years' one, but in practice, France has not men enough for so great an increase. Still the law of 1905 provides a system whereby there is room with the colours for every available man, and moreover ensures his services. The net gain in the 1906 class is not far short of 50,000, and the proportion of the new contingent to the old is practically 5:4. The *loi des cadres* of 1907 introduced many important changes of detail supplementary to the *loi de deux ans*. Important changes were also made in the provisions and administration of military law. The active army, then, at a given moment, say November 1, 1908, is composed of all the young men, not legally exempted, who have reached the age of twenty in the years 1906 and 1907. It is at the disposal of the minister of war, who can decree the recall of all men discharged to the reserve the previous year and all those whose time of service has for any reason been shortened. The reserves of the active army are composed of those who have served the legal period in the active army. These are recalled twice, in the eleven years during which they are members of the reserve, for refresher courses. The active army and its reserve are not localized, but drawn from and distributed over the whole of France. The advantages of a purely territorial system have tempted various War Ministers to apply it, but the results were not good, owing to the want of uniformity in the military qualities and the political subordination of the different districts. One result of this is that mobilization and concentration are much slower processes than they are in Germany.

The Territorial Army and its reserve (members of which undergo two short periods of training) are, however, allocated to local service. The soldier spends six years in the Territorial Army, and six in the reserve of the Territorial Army. The reserves of the active army and the Territorial Army and its reserve can only be recalled to active service in case of emergency and by decree of the head of the state.

The total service rendered by the individual soldier is thus twenty-five years. He is registered at the age of twenty, is called to the colours on the 1st of October of the next year, discharged to the active army reserve on the 30th of September of the second year thereafter, to the Territorial Army at the

same date thirteen complete years after his incorporation, and finally discharged from the reserve of the Territorial Army on the twenty-fifth anniversary of his entry into the active army. On November 1, 1908, then the active army was composed of the classes registered 1906 and 1907, the reserve of the classes 1895-1905, the Territorial Army of those of 1889-1894 and the Territorial Army reserve of those of 1883-1888.

In 1906 the peace strength of the army in France was estimated at 532,593 officers and men; in Algeria 54,580; in Tunis 20,320; total 607,493. Deducting vacancies, sick and absent, the effective strength of the active army in 1906 was 540,563; of the gendarmerie and Garde Républicaine 24,512; of colonial troops in the colonies 58,568. The full number of persons liable to be called upon for military service and engaged in such service is calculated (1908) as 4,800,000, of whom 1,350,000 of the active army and the younger classes of army reserve would constitute the field armies set on foot at the outbreak of war. 150,000 horses and mules are maintained on a peace footing and 600,000 on a war footing.

Organization.—The general organization of the French army at home is based on the system of permanent army corps, the headquarters of which are as follows: I. Lille, II. Amiens, III. Rouen, IV. Le Mans, V. Orléans, VI. Châlons-sur-Marne, VII. Besançon, VIII. Bourges, IX. Tours, X. Rennes, XI. Nantes, XII. Limoges, XIII. Clermont-Ferrand, XIV. Lyons, XV. Marseilles, XVI. Montpellier, XVII. Toulouse, XVIII. Bordeaux, XIX. Algiers and XX. Nancy. Each army corps consists in principle of two infantry divisions, one cavalry brigade, one brigade of horse and field artillery, one engineer battalion and one squadron of train. But certain army corps have a special organization. The VI. corps (Châlons) and the VII. (Besançon) consist of three divisions each, and the XIX. (Algiers) has three divisions of its own as well as the division occupying Tunis. In addition to these corps there are eight permanent cavalry divisions with headquarters at Paris, Lunéville, Meaux, Sedan, Reims, Lyons, Melun and Dôle. The military government of Paris is independent of the army corps system and comprises, besides a division of the colonial army corps (see below), 3½ others detached from the II., III., IV. and V. corps, as well as the 1st and 3rd cavalry divisions and many smaller bodies of troops. The military government of Lyons is another independent and special command; it comprises practically the XIV. army corps and the 6th cavalry division. The infantry division consists of 2 brigades, each of 2 regiments of 3 or 4 battalions (the 4 battalion regiments have recently been reduced for the most part to 3), with 1 squadron cavalry and 12 batteries, attached from the corps troops, in war a proportion of the artillery would, however, be taken back to form the corps artillery (see ARTILLERY and TACTICS). The cavalry division consists of 2 or 3 brigades, each of 2 regiments or 8 squadrons, with 2 horse artillery batteries attached. The army corps consists of headquarters, 2 (or 3) infantry divisions, 1 cavalry brigade, 1 artillery brigade (2 regiments, comprising 21 field and 2 horse batteries), 1 engineer battalion, &c. In war a group of "Rimailho" heavy howitzers (see ORDNANCE: *Heavy Field and Light Siege Units*) would be attached. It is proposed, and accepted in principle, to increase the number of guns in the army corps by converting the horse batteries in 18 army corps to field batteries, which, with other measures, enables the number of the latter to be increased to 36 (144 guns).

The organization of the "metropolitan troops" by regiments is (a) 163 regiments of line infantry, some of which are affected to "regional" duties and do not enter into the composition of their army corps for war, 31 battalions of *chasseurs à pied*, mostly stationed in the Alps and the Vosges, 4 regiments of Zouaves, 4 regiments of Algerian tirailleurs (natives, often called Turcos¹), 2 foreign legion regiments, 5 battalions of African light infantry (disciplinary regiments), &c.; (b) 12

¹ Algerian native troops are recruited by voluntary enlistment. But in 1908, owing to the prevailing want of trained soldiers in France, it was proposed to set free the white troops in Algeria by applying the principles of universal service to the natives, as in Tunis.

regiments of cuirassiers, 32 of dragoons, 21 of *chasseurs à cheval*, 14 of hussars, 6 of *chasseurs d'Afrique* and 4 of Spahis (Algerian natives); (c) 40 regiments of artillery, comprising 445 field batteries, 14 mountain batteries and 52 horse batteries (see, however, above), 18 battalions of garrison artillery, with in addition 13 companies of artificers, &c.; (d) 6 regiments of engineers forming 22 battalions, and 1 railway regiment; (e) 20 squadrons of train, 27 legions of gendarmerie and the Paris Garde Républicaine, administrative and medical units.

Colonial Troops.—These form an expeditionary army corps in France to which are attached the actual corps of occupation to the various colonies, part white, part natives. The colonial army corps, headquarters at Paris, has three divisions, at Paris, Toulon and Brest.

The French colonial (formerly marine) infantry, recruited by voluntary enlistment, comprises 18 regiments and 5 independent battalions (of which 12 regiments are at home), 74 batteries of field, fortress and mountain artillery (of which 32 are at home), with a few cavalry and engineers, &c., and other services in proportion. The native troops include 13 regiments and 8 independent battalions. The strength of this army corps is 28,700 in France and 61,300 in the colonies.

Command.—The commander-in-chief of all the armed forces is the president of the Republic, but the practical direction of affairs lies in the hand of the minister of war, who is assisted by the *Conseil supérieur de la guerre*, a body of senior generals who have been selected to be appointed to the higher commands in war. The vice-president is the destined commander-in-chief of the field armies and is styled the generalissimo. The chief of staff of the army is also a member of the council. In war the latter would probably remain at the ministry of war in Paris, and the generalissimo would have his own chief of staff. The ministry of war is divided into branches for infantry, cavalry, &c.—and services for special subjects such as military law, explosives, health, &c. The general staff (*état major de l'armée*) has its functions classed as follows: personnel; material and finance; 1st bureau (organization and mobilization), 2nd (intelligence), 3rd (military operations and training) and 4th (communications and transport); and the famous historical section. The president of the Republic has a military household, and the minister a cabinet, both of which are occupied chiefly with questions of promotion, patronage and decorations.

The general staff and also the staff of the corps and divisions are composed of certificated (*brevetés*) officers who have passed all through the *École de Guerre*. In time of peace an officer is attached to the staff for not more than four years. He must then return to regimental duty for at least two years.

The officers of the army are obtained partly from the old-established military schools, partly from the ranks of the non-commissioned officers, the proportion of the latter being about one-third of the total number of officers. Artillery and engineer officers come from the *École Polytechnique*, infantry and cavalry from the *École spéciale militaire de St-Cyr*. Other important training institutions are the staff college (*École supérieure de Guerre*) which trains annually 70 to 90 selected captains and lieutenants; the musketry school of Châlons, the gymnastic school at Joinville-le-Pont and the schools of St Maixent, Saumur and Versailles for the preparation of non-commissioned officers for commissions in the infantry, cavalry, artillery and engineers respectively. The non-commissioned officers are, as usual in universal service armies, drawn partly from men who voluntarily enlist at a relatively early age, and partly from men who at the end of their compulsory period of service are re-engaged. Voluntary enlistments in the French army are permissible, within certain limits, at the age of eighteen, and the *engagés* serve for at least three years. The law further provides for the re-engagement of men of all ranks, under conditions varying according to their rank. Such re-engagements are for one to three years' effective service but may be extended to fifteen. They date from the time of the legal expiry of each man's compulsory active service. *Rengagés* receive a bounty, a higher rate of pay and a pension at the conclusion of their service.

The total number of men who had re-enlisted stood in 1903 at 8594.

Armament.—The field artillery is armed with the 75 mm. gun, a shielded quick-firer (see *ORDNANCE: Field Equipments*, for illustration and details); this weapon was the forerunner of all modern models of field gun, and is handled on tactical principles specially adapted for it, which gives the French field artillery a unique position amongst the military nations. The infantry, which was the first in Europe to be armed with the magazine rifle, still carries this, the Lebel, rifle which dates from 1886. It is believed, however, that a satisfactory type of automatic rifle (see *RIFLE*) has been evolved and is now (1908) in process of manufacture. Details are kept strictly secret. The cavalry weapons are a straight sword (that of the heavy cavalry is illustrated in the article *SWORD*), a bamboo lance and the Lebel carbine.

It is convenient to mention in this place certain institutions attached to the war department and completing the French military organization. The *Hôtel des Invalides* founded by Louis XIV. and Louvois is a house of refuge for old and infirm soldiers of all grades. The number of the inmates is decreasing; but the institution is an expensive one. In 1875 the "Invalides" numbered 642, and the hôtel cost the state 1,123,053 francs. The order of the *Legion of Honour* is treated under *KNIGHTHOOD AND CHIVALRY*. The *médaille militaire* is awarded to private soldiers and non-commissioned officers who have distinguished themselves or rendered long and meritorious services. This was introduced in 1852, carries a yearly pension of 100 frs. and has been granted occasionally to officers.

Fortifications.—After 1870 France embarked upon a policy of elaborate frontier and inner defences, with the object of ensuring, as against an unexpected German invasion, the time necessary for the effective development of her military forces, which were then in process of reorganization. Some information as to the types of fortification adopted in 1870-1875 will be found in *FORTIFICATION AND SIEGECRAFT*. The general lines of the scheme adopted were as follows: On the Meuse, which forms the principal natural barrier on the side of Lorraine, Verdun (*q.v.*) was fortified as a large entrenched camp, and along the river above this were constructed a series of *forts d'arrêt* (see *MEUSE LINE*) ending in another entrenched camp at Toul (*q.v.*). From this point a gap (the *trouée d'Épinal*) was left, so as "in some sort to canalize the flow of invasion" (General Bonnal), until the upper Moselle was reached at Épinal (*q.v.*). Here another entrenched camp was made and from it the "Moselle line" (*q.v.*) of *forts d'arrêt* continues the barrier to Belfort (*q.v.*), another large entrenched camp, beyond which a series of fortifications at Montbéliard and the Lomont range carries the line of defence to the Swiss border, which in turn is protected by works at Pontarlier and elsewhere. In rear of these lines Verdun-Toul and Épinal-Belfort, respectively, lie two large defended areas in which under certain circumstances the main armies would assemble preparatory to offensive movements. One of these areas is defined by the three fortresses, La Fère, Laon and Reims, the other by the triangle, Langres—Dijon—Besançon. On the side of Belgium the danger of irruption through neutral territory, which has for many years been foreseen, is provided against by the fortresses of Lille, Valenciennes and Maubeuge, but (with a view to tempting the Germans to attack through Luxemburg, as is stated by German authorities) the frontier between Maubeuge and Verdun is left practically undefended. The real defence of this region lies in the field army which would, if the case arose, assemble in the area La Fère-Reims-Laon. On the Italian frontier the numerous *forts d'arrêt* in the mountains are strongly supported by the entrenched camps of Besançon, Grenoble and Nice. Behind all this huge development of fixed defences lie the central fortresses of Paris and Lyons. The defences of the Spanish frontier consist of the entrenched camps of Bayonne and Perpignan and the various small *forts d'arrêt* of the Pyrenees. Of the coast defences the principal are Toulon, Antibes, Rochefort, Lorient, Brest, Oléron, La Rochelle, Belle-Isle, Cherbourg, St-Malo, Havre, Calais, Gravelines and Dunkirk.

A number of the older fortresses, dating for the most part from Louis XIV.'s time, are still in existence, but are no longer of military importance. Such are Arras, Longwy, Mézières and Montmédy.

Navy.

Central Administration.—The head of the French navy is the Minister of Marine, who like the other ministers is appointed by decree of the head of the state, and is usually a civilian. He selects for himself a staff of civilians (the *cabinet du ministre*), which is divided into bureaux for the despatch of business. The head of the cabinet prepares for the consideration of the minister all the business of the navy, especially questions of general importance. His chief professional assistant is the *chef d'état-major général* (chief of the general staff), a vice-admiral, who is responsible for the organization of the naval forces, the mobilization and movements of the fleet, &c.

The central organization also comprises a number of departments (*services*) entrusted with the various branches of naval administration, such as administration of the active fleet, construction of ships, arsenals, recruiting, finance, &c. The minister has the assistance of the *Conseil supérieur de la Marine*, over which he presides, consisting of three vice-admirals, the chief of staff and some other members. The *Conseil supérieur* devotes its attention to all questions touching the fighting efficiency of the fleet, naval bases and arsenals and coast defence. Besides the *Conseil supérieur* the minister is advised on a very wide range of naval topics (including pay, quarters and recruiting) by the *Comité consultatif de la Marine*. Advisory committees are also appointed to deal with special subjects, e.g. the *commissions de classement* which attend to questions of promotion in the various branches of the navy, the naval works council and others.

The French coast is divided into five naval arrondissements, which have their headquarters at the five naval ports, of which Cherbourg, Brest, and Toulon are the most important, Lorient and Rochefort being of lesser degree. All are building and fitting-out yards. Each arrondissement is divided into sous-arrondissements, having their centres in the great commercial ports, but this arrangement is purely for the embodiment of the men of the Inscription Maritime, and has nothing to do with the dockyards as naval arsenals. In each arrondissement the vice-admiral, who is naval prefect, is the immediate representative of the minister of marine, and has full direction and command of the arsenal, which is his headquarters. He is thus commander-in-chief, as also governor-designate for time of war, but his authority does not extend to ships belonging to organized squadrons or divisions. The naval prefect is assisted by a rear-admiral as chief of the staff (except at Lorient and Rochefort, where the office is filled by a captain), and a certain number of other officers; the special functions of the chief of the staff having relation principally to the efficiency and *personnel* of the fleet, while the "major-general," who is usually a rear-admiral, is concerned chiefly with the *matériel*. There are also directors of stores, of naval construction, of the medical service, and of the submarine defences (which are concerned with torpedoes, mines and torpedo-boats), as well as of naval ordnance and works. The prefect directs the operations of the arsenal, and is responsible for its efficiency and for that of the ships which are there in reserve. In regard to the constitution and maintenance of the naval forces, the administration of the arsenals is divided into three principal departments, the first concerned with naval construction, the second with ordnance, including gun-mountings and small-arms, and the third with the so-called submarine defences, dealing with all torpedo *matériel*.

The French navy is manned partly by voluntary enlistment, partly by the transference to the navy of a certain proportion of each year's recruits for the army, but mainly by a system known as *inscription maritime*. This system, devised and introduced by Colbert in 1681, has continued, with various modifications, ever since. All French sailors between the ages of eighteen and fifty must be enrolled as members of the *armée de mer*. The term sailor is used in a very wide sense and includes

all persons earning their living by navigation on the sea, or in the harbours or roadsteads, or on salt lakes or canals within the maritime domain of the state, or on rivers and canals as far as the tide goes up or sea-going ships can pass. The inscript usually begins his service at the age of twenty and passes through a period of obligatory service lasting seven years, and generally comprising five years of active service and two years furlough.

Besides the important harbours already referred to, the French fleet has naval bases at Oran in Algeria, Bizerta in Tunisia, Saigon in Cochin China and Hongaj in Tongking, Diégo-Suarez in Madagascar, Dakar in Senegal, Fort de France in Martinique, Nouméa in New Caledonia.

The ordnance department of the navy is carried on by a large detachment of artillery officers and artificers provided by the war office for this special duty.

The fleet is divided into the Mediterranean squadron, the Northern squadron, the Atlantic division, the Far Eastern division, the Pacific division, the Indian Ocean division, the Cochin China division.

The chief naval school is the *École navale* at Brest, which is devoted to the training of officers; the age of admission is from fifteen to eighteen years, and pupils after completing their course pass a year on a frigate school. At Paris there is a more advanced school (*École supérieure de la Marine*) for the supplementary training of officers. Other schools are the school of naval medicine at Bordeaux with annexes at Toulon, Brest and Rochefort; schools of torpedoes and mines and of gunnery at Toulon, &c., &c. The *écoles d'hydrographie* established at various ports are for theoretical training for the higher grades of the merchant service. (See also NAVY.)

The total personnel of the *armée de mer* in 1909 is given as 56,800 officers and men. As to the number of vessels, which fluctuates from month to month, little can be said that is wholly accurate at any given moment, but, very roughly, the French navy in 1909 included 25 battleships, 7 coast defence ironclads, 19 armoured cruisers, 36 protected cruisers, 22 sloops, gunboats, &c., 45 destroyers, 319 torpedo boats, 71 submersibles and submarines and 8 auxiliary cruisers. It was stated that, according to proposed arrangements, the principal fighting elements of the fleet would be, in 1919, 34 battleships, 36 armoured cruisers, 6 smaller cruisers of modern type, 100 destroyers, 170 torpedo boats and 171 submersibles and submarines. The budgetary cost of the navy in 1908 was stated as 312,000,000 fr. (£12,480,000). (C. F. A.)

Education.

The burden of public instruction in France is shared by the communes, departments and state, while side by side with the public schools of all grades are private schools subjected to a state supervision and certain restrictions. At the head of the whole organization is the minister of public instruction. He is assisted and advised by the superior council of public instruction, over which he presides.

France is divided into sixteen *académies* or educational districts, having their centres at the seats of the universities. The capitals of these *académies*, together with the departments included in them, are tabulated below:

Académies.	Departments included in them.
PARIS	Seine, Cher, Eure-et-Loir, Loir-et-Cher, Loiret, Marne, Oise, Seine-et-Marne, Seine-et-Oise.
AIX	Bouches-du-Rhône, Basses-Alpes, Alpes-Maritimes, Corse, Var, Vaucluse.
BESANÇON	Doubs, Jura, Haute-Saône, Territoire de Belfort.
BORDEAUX	Gironde, Dordogne, Landes, Lot-et-Garonne, Basses-Pyrénées.
CAEN	Calvados, Eure, Manche, Orne, Sarthe, Seine-Inférieure.
CHAMBERY	Savoie, Haute-Savoie.
CLERMONT-FERRAND	Puy-de-Dôme, Allier, Cantal, Corrèze, Creuse, Haute-Loire.
DIJON	Côte-d'Or, Aube, Haute-Marne, Nièvre, Yonne.
GRENOBLE	Isère, Hautes-Alpes, Ardèche, Drôme.
LILLE	Nord, Aisne, Ardennes, Pas-de-Calais, Somme.
LYONS	Rhône, Ain, Loire, Saône-et-Loire.

Académies.	Departments included in them.
MONTPELLIER	Hérault, Aude, Gard, Lozère, Pyrénées-Orientales.
NANCY	Meurthe-et-Moselle, Meuse, Vosges.
POITIERS	Vienne, Charente, Charente-Inférieure, Indre, Indre-et-Loire, Deux-Sèvres, Vendée, Haute-Vienne.
RENNES	Ille-et-Vilaine, Côtes-du-Nord, Finistère, Loire-Inférieure, Maine-et-Loire, Mayenne, Morbihan.
TOULOUSE	Haute-Garonne, Ariège, Aveyron, Gers, Lot, Hautes-Pyrénées, Tarn, Tarn-et-Garonne.

There is also an *académie* comprising Algeria.

For the administrative organization of education in France see EDUCATION.

Any person fulfilling certain legal requirements with regard to capacity, age and character may set up privately an educational establishment of any grade, but by the law of 1904 all religious congregations are prohibited from keeping schools of any kind whatever.

Primary Instruction.—All primary public instruction is free and compulsory for children of both sexes between the ages of six and thirteen, but if a child can gain a certificate of primary studies at the age of eleven or after, he may be excused the rest of the period demanded by law. A child may receive instruction in a public or private school or at home. But if the parents wish him to be taught in a private school they must give notice to the mayor of the commune of their intention and the school chosen. If educated at home, the child (after two years of the compulsory period has expired) must undergo a yearly examination, and if it is unsatisfactory the parents will be compelled to send him to a public or private school.

Each commune is in theory obliged to maintain at least one public primary school, but with the approval of the minister, the departmental council may authorize a commune to combine with other communes in the upkeep of a school. If the number of inhabitants exceed 500, the commune must also provide a special school for girls, unless the Departmental Council authorizes it to substitute a mixed school. Each department is bound to maintain two primary training colleges, one for masters, the other for mistresses of primary schools. There are two higher training colleges of primary instruction at Fontenay-aux-Roses and St Cloud for the training of mistresses and masters of training colleges and higher primary schools.

The Laws of 1882 and 1886 "laicized" the schools of this class, the former suppressing religious instruction, the latter providing that only laymen should be eligible for masterships. There were also a great many schools in the control of various religious congregations, but a law of 1904 required that they should all be suppressed within ten years from the date of its enactment.

Public primary schools include (1) *écoles maternelles*—infant schools for children from two to six years old; (2) elementary primary schools—these are the ordinary schools for children from six to thirteen; (3) higher primary schools (*écoles primaires supérieures*) and "supplementary courses"; these admit pupils who have gained the certificate of primary elementary studies (*certificat d'études primaires*), offer a more advanced course and prepare for technical instruction; (4) primary technical schools (*écoles manuelles d'apprentissage, écoles primaires supérieures professionnelles*) kept by the communes or departments. Primary courses for adults are instituted by the prefect on the recommendation of the municipal council and academy inspector.

Persons keeping private primary schools are free with regard to their methods, programmes and books employed, except that they may not use books expressly prohibited by the superior council of public instruction. Before opening a private school the person proposing to do so must give notice to the mayor, prefect and academy inspector, and forward his diplomas and other particulars to the latter official.

Secondary Education.—Secondary education is given by the state in *lycées*, by the communes in *collèges* and by private individuals and associations in private secondary schools. It is not compulsory, nor is it entirely gratuitous, but the fees are small and the state offers a great many scholarships, by means of which a clever child can pay for its own instruction. Cost of tuition (simply) ranges from £2 to £16 a year. The *lycées* also take boarders—the cost of boarding ranging from £22 to £52 a year. A *lycée* is founded in a town by decree of the president of the republic, with the advice of the superior council of public instruction. The municipality has to pay the cost of building, furnishing and upkeep. At the head of the *lycée* is the principal (*proviseur*), an official nominated by the minister, and assisted by a teaching staff of professors and *chargés de cours* or teachers of somewhat lower standing. To become professor in a *lycée* it is necessary to pass an examination known as the "agrégation," candidates for which must be licentiates of a faculty (or have passed through the *École normale supérieure*).

The system of studies—reorganized in 1902—embraces a full

curriculum of seven years, which is divided into two periods. The first lasts four years, and at the end of this the pupil may obtain (after examination) the "certificate of secondary studies." During the second period the pupil has a choice of four courses: (1) Latin and Greek; (2) Latin and sciences; (3) Latin and modern languages; (4) sciences and modern languages. At the end of this period he presents himself for a degree called the *Baccalauréat de l'enseignement secondaire*. This is granted (after two examinations) by the faculties of letters and sciences jointly (see below), and in most cases it is necessary for a student to hold this general degree before he may be enrolled in a particular faculty of a university and proceed to a *Baccalauréat* in a particular subject, such as law, theology or medicine.

The *collèges*, though of a lower grade, are in most respects similar to the *lycées*, but they are financed by the communes; the professors may have certain less important qualifications in lieu of the "agrégation." Private secondary schools are subjected to state inspection. The teachers must not belong to any congregation, and must have a diploma of aptitude for teaching and the degree of "licencié." The establishment of *lycées* for girls was first attempted in 1880. They give an education similar to that offered in the *lycées* for boys—with certain modifications—in a curriculum of five or six years. There is a training-college for teachers in secondary schools for girls at Sèvres.

Higher education is given by the state in the universities, and in special higher schools; and, since the law of 1875 established the freedom of higher education, by private individuals and bodies in private schools and "faculties" (*facultés libres*). The law of 1880 reserved to the state "faculties" the right to confer degrees, and the law of 1896 established various universities each containing one or more faculties. There are five kinds of faculties: medicine, letters, science, law and Protestant theology. The faculties of letters and sciences, besides granting the *Baccalauréat de l'enseignement secondaire*, confer the degrees of licentiate and doctor (*la Licence, le Doctorat*). The faculties of medicine confer the degree of doctor of medicine. The faculties of theology confer the degrees of bachelor, licentiate and doctor of theology. The faculties of law confer the same degrees in law and also grant "certificates of capacity," which enable the holder to practise as an *avoué*; a *licence* is necessary for the profession of barrister. Students of the private faculties have to be examined by and take their degrees from the state faculties. There are 2 faculties of Protestant theology (Paris and Montauban); 12 faculties of law (Paris, Aix, Bordeaux, Caen, Grenoble, Lille, Lyons, Montpellier, Nancy, Poitiers, Rennes, Toulouse); 3 faculties of medicine (Paris, Montpellier and Nancy), and 4 joint faculties of medicine and pharmacy (Bordeaux, Lille, Lyons, Toulouse); 15 faculties of sciences (Paris, Besançon, Bordeaux, Caen, Clermont, Dijon, Grenoble, Lille, Lyons, Marseilles, Montpellier, Nancy, Poitiers, Rennes, Toulouse); 15 faculties of letters (at the same towns, substituting Aix for Marseilles). The private faculties are at Paris (the Catholic Institute with a faculty of law); Angers (law, science and letters); Lille (law, medicine and pharmacy, science, letters); Lyons (law, science, letters); Marseilles (law); Toulouse (Catholic Institute with faculties of theology and letters). The work of the faculties of medicine and pharmacy is in some measure shared by the *écoles supérieures de pharmacie* (Paris, Montpellier, Nancy), which grant the highest degrees in pharmacy, and by the *écoles de plein exercice de médecine et de pharmacie* (Marseilles, Rennes and Nantes) and the more numerous *écoles préparatoires de médecine et de pharmacie*; there are also *écoles préparatoires à l'enseignement supérieur des sciences et des lettres* at Chambéry, Rouen and Nantes.

Besides the faculties there are a number of institutions, both state-supported and private, giving higher instruction of various special kinds. In the first class must be mentioned the Collège de France, founded 1530, giving courses of highest study of all sorts, the Museum of Natural History, the École des Chartes (palaeography and archives), the School of Modern Oriental Languages, the École Pratique des Hautes Études (scientific research), &c. All these institutions are in Paris. The most important free institution in this class is the École des Sciences Politiques, which prepares pupils for the civil services and teaches a great number of political subjects, connected with France and foreign countries, not included in the state programmes.

Commercial and technical instruction is given in various institutions comprising national establishments such as the *écoles nationales professionnelles* of Armentières, Vierzon, Voiron and Nantes for the education of working men; the more advanced *écoles d'arts et métiers* of Châlons, Angers, Aix, Lille and Cluny; and the Central School of Arts and Manufactures at Paris; schools depending on the communes and state in combination, e.g. the *écoles pratiques de commerce et d'industrie* for the training of clerks and workmen; private schools controlled by the state, such as the *écoles supérieures de commerce*; certain municipal schools, such as the Industrial Institute of Lille; and private establishments, e.g. the school of watch-making at Paris. At Paris the École Supérieure des Mines and the École des Ponts et Chaussées are controlled by the minister of public works, the École des Beaux-Arts, the École des Arts Décoratifs and the Conservatoire National de Musique et de Déclamation by the under-secretary for fine arts, and other schools

mentioned elsewhere are attached to several of the ministries. In the provinces there are national schools of fine art and of music and other establishments and free subventioned schools.

In addition to the educational work done by the state, communes and private individuals, there exist in France a good many societies which disseminate instruction by giving courses of lectures and holding classes both for children and adults. Examples of such bodies are the Society for Elementary Instruction, the Polytechnic Association, the Philotechnic Association and the French Union of the Young at Paris; the Philomathic Society of Bordeaux; the Popular Education Society at Havre; the Rhone Society of Professional Instruction at Lyons; the Industrial Society of Amiens and others.

The highest institution of learning is the *Institut de France*, founded and kept up by the French government on behalf of science and literature, and composed of five academies: the *Académie française*, the *Académie des Inscriptions et Belles-Lettres*, the *Académie des Sciences*, the *Académie des Beaux-Arts* and the *Académie des Sciences Morales et Politiques* (see ACADEMIES). The *Académie de Médecine* is a separate body.

Poor Relief (Assistance publique).—In France the pauper, as such, has no legal claim to help from the community, which however, is bound to provide for destitute children (see FOUNDLING HOSPITALS) and pauper lunatics (both these being under the care of the department), aged and infirm people without resources and victims of incurable illness, and to furnish medical assistance gratuitously to those without resources who are afflicted with curable illness. The funds for these purposes are provided by the department, the commune and the central authority.

There are four main types of public benevolent institutions, all of which are communal in character: (1) The *hôpital*, for maternity cases and cases of curable illness; (2) the *hospice*, where the aged poor, cases of incurable malady, orphans, foundlings and other children without means of support, and in some cases lunatics, are received; (3) the *bureau de bien-faisance*, charged with the provision of out-door relief (*secours à domicile*) in money or in kind, to the aged poor or those who, though capable of working, are prevented from doing so by illness or strikes; (4) the *bureau d'assistance*, which dispenses free medical treatment to the destitute.

These institutions are under the supervision of a branch of the ministry of the interior. The hospices and *hôpitaux* and the *bureaux de bien-faisance*, the foundation of which is optional for the commune, are managed by committees consisting of the mayor of the municipality and six members, two elected by the municipal council and four nominated by the prefect. The members of these committees are unpaid, and have no concern with ways and means which are in the hands of a paid treasurer (*receveur*). The *bureaux de bien-faisance* in the larger centres are aided by unpaid workers (*commissaires* or *dames de charité*), and in the big towns by paid inquiry officers. *Bureaux d'assistance* exist in every commune, and are managed by the combined committees of the hospices and the *bureaux de bien-faisance* or by one of these in municipalities, where only one of those institutions exists.

No poor-rate is levied in France. Funds for *hôpitaux*, hospices and *bureaux de bien-faisance* comprise:

1. A 10% surtax on the fees of admission to places of public amusement.
2. A proportion of the sums payable in return for concessions of land in municipal cemeteries.
3. Profits of the communal *Monts de Piété* (pawn-shops).
4. Donations, bequests and the product of collections in churches.
5. The product of certain fines.
6. Subventions from the departments and communes.
7. Income from endowments.

(R. TR.)

Colonies.

In the extent and importance of her colonial dominion France is second only to Great Britain. The following table gives the name, area and population of each colony and protectorate as well as the date of acquisition or establishment of a protectorate. It should be noted that the figures for area and population are, as a rule, only estimates, but in most instances they probably approximate closely to accuracy. Detailed notices of the separate countries will be found under their several heads:

Colony.	Date of Acquisition.	Area in sq. m.	Population.
In Asia—			
Establishments in India.	1683-1750	200	273,000
In Indo-China—			
Annam	1883	60,000	6,000,000
Cambodia	1863	65,000	1,500,000
Cochin-China	1862	22,000	3,000,000
Tongking	1883	46,000	6,000,000
Laos	1893	100,000	600,000
Kwang-Chow-Wan	1898	325	189,000
Total in Asia		293,525	17,562,000
In Africa and the Indian Ocean—			
Algeria	1830-1847	185,000	5,231,850
Algerian Sahara	1872-1890	760,000
Tunisia	1881	51,000	2,000,000
West Africa—			
Senegal	1626	74,000	1,800,000
Upper Senegal and Niger (including part of Sahara)	1880	1,580,000	4,000,000
Guinea	1848	107,000	2,500,000
Ivory Coast	1842	129,000	2,000,000
Dahomey	1863-1894	40,000	1,000,000
Congo (French Equatorial Africa)—			
Gabun	1839	700,000	376,000
Mid. Congo	1882		259,000

It will be seen that nearly all the colonies and protectorates lie within the tropics. The only countries in which there is a considerable white population are Algeria, Tunisia and New Caledonia. The "year of acquisition" in the table, when one date only is given, indicates the period when the country or some part of it first fell under French influence, and does not imply continuous possession since.

Government.—The principle underlying the administration of the French possessions overseas, from the earliest days until the close of the 19th century, was that of "domination" and "assimilation," notwithstanding that after the loss of Canada and the sale of Louisiana France ceased to hold any considerable colony in which Europeans could settle in large numbers. With

¹ Kerguelen lies in the Great Southern Ocean, but is included here for the sake of convenience.

the vast extension of the colonial empire in tropical countries in the last quarter of the 19th century the evils of the system of assimilation, involving also intense centralization, became obvious. This, coupled with the realization of the fact that the value to France of her colonies was mainly commercial, led at length to the abandonment of the attempt to impose on a great number of diverse peoples, some possessing (as in Indo-China and parts of West Africa) ancient and highly complex civilizations, French laws, habits of mind, tastes and manners. For the policy of assimilation there was substituted the policy of "association," which had for aim the development of the colonies and protectorates upon natural, *i.e.* national, lines. Existing civilizations were respected, a considerable degree of autonomy was granted, and every effort made to raise the moral and economic status of the natives. The first step taken in this direction was in 1900 when a law was passed which laid down that the colonies were to provide for their own civil expenditure. This law was followed by further measures tending to decentralization and the protection of the native races.

The system of administration bears nevertheless many marks of the "assimilation" era. None of the French possessions is self-governing in the manner of the chief British colonies. Several colonies, however, elect members of the French legislature, in which body is the power of fixing the form of government and the laws of each colony or protectorate. In default of legislation the necessary measures are taken by decree of the head of the state; these decrees having the force of law. A partial exception to this rule is found in Algeria, where all laws in force in France before the conquest of the country are also (in theory, not in practice) in force in Algeria. In all colonies Europeans preserve the political rights they held in France, and these rights have been extended, in whole or in part, to various classes of natives. Where these rights have not been conferred, native races are *subjects* and not *citizens*. To this rule Tunisia presents an exception, Tunisians retaining their nationality and laws.

In addition to Algeria, which sends three senators and six deputies to Paris and is treated in many respects not as a colony but as part of France, the colonies represented in the legislature are: Martinique, Guadeloupe and Réunion (each electing one senator and two deputies), French India (one senator and one deputy), Guiana, Senegal and Cochin-China (one deputy each). The franchise in the three first-named colonies is enjoyed by all classes of inhabitants, white, negro and mulatto, who are all French citizens. In India the franchise is exercised without distinction of colour or nationality; in Senegal the electors are the inhabitants (black and white) of the communes which have been given full powers. In Guiana and Cochin-China the franchise is restricted to citizens, in which category the natives (in those colonies) are not included.¹ The inhabitants of Tahiti though accorded French citizenship have not been allotted a representative in parliament. The colonial representatives enjoy equal rights with those elected for constituencies in France.

The oversight of all the colonies and protectorates save Algeria and Tunisia is confided to a minister of the colonies (law of March 20, 1894)² whose powers correspond to those exercised in France by the minister of the interior. The colonial army is nevertheless attached (law of 1900) to the ministry of war. The colonial minister is assisted by a number of organizations of which the most important is the superior council of the colonies (created by decree in 1883), an advisory body which includes the senators and deputies elected by the colonies, and delegates elected by the universal suffrage of all citizens in the colonies and protectorates which do not return members to parliament. To the ministry appertains the duty of fixing the duties on foreign produce in those colonies which have not been, by law, subjected to the same tariff as in France. (Nearly all the colonies save those

¹ In 1906 the number of registered electors in these colonies was 199,055, of whom 106,695 exercised their suffrage.

² In the case of Madagascar by decree of the 11th of December 1895.

of West Africa and the Congo have been, with certain modifications, placed under the French tariff.) The budget of all colonies not possessing a council general (see below) must also be approved by the minister. Each colony and protectorate, including Algeria, has a separate budget. As provided by the law of 1900 all local charges are borne by the colonies—supplemented at need by grants in aid—but the military expenses are borne by the state. In all the colonies the judicature has been rendered independent of the executive.

The colonies are divisible into two classes, (1) those possessing considerable powers of local self-government, (2) those in which the local government is autocratic. To this second class may be added the protectorates (and some colonies) where the native form of government is maintained under the supervision of French officials.

Class (1) includes the American colonies, Réunion, French India, Senegal, Cochin-China and New Caledonia. In these colonies the system of assimilation was carried to great lengths. At the head of the administration is a governor under whom is a secretary-general, who replaces him at need. The governor is aided by a privy council, an advisory body to which the governor nominates a minority of unofficial members, and a council general, to which is confided the control of local affairs, including the voting of the budget. The councils general are elected by universal suffrage of all citizens and those who, though not citizens, have been granted the political franchise. In Cochin-China, in place of a council general, there is a colonial council which fulfils the functions of a council general.

In the second class of colonies the governor, sometimes assisted by a privy council, on which non-official members find seats, sometimes simply by a council of administration, is responsible only to the minister of the colonies. In Indo-China, West Africa, French Congo and Madagascar, the colonies and protectorates are grouped under governors-general, and to these high officials extensive powers have been granted by presidential decree. The colonies under the governor-general of West Africa are ruled by lieutenant-governors with restricted powers, the budget of each colony being fixed by the governor-general, who is assisted by an advisory government council comprising representatives of all the colonies under his control. In Indo-China the governor-general has under his authority the lieutenant-governor of the colony of Cochin-China, and the residents superior at the courts of the kings of Cambodia and Annam and in Tongking (nominally a viceroyalty of Annam). There is a superior council for the whole of Indo-China on which the natives and the European commercial community are represented, while in Cochin-China a privy council, and in the protectorates a council of the protectorate, assists in the work of administration. In each of the governments general there is a financial controller with extensive powers who corresponds directly with the metropolitan authorities (decree of March 22, 1907). Details and local differences in form of government will be found under the headings of the various colonies and protectorates.

Colonial Finance.—The cost of the extra-European possessions, other than Algeria and Tunisia, to the state is shown in the expenses of the colonial ministry. In the budget of 1885 these expenses were put at £1,380,000; in 1895 they had increased to £3,200,000 and in 1900 to £5,100,000. In 1905 they were placed at £4,431,000. Fully three-fourths of the state contributions is expenditure on military necessities; in addition there are subventions to various colonies and to colonial railways and cables, and the expenditure on the penitentiary establishments; an item not properly chargeable to the colonies. In return the state receives the produce of convict labour in Guiana and New Caledonia. Save for the small item of military expenditure Tunisia is no charge to the French exchequer. The similar expenses of Algeria borne by the state are not separately shown, but are estimated at £2,000,000.

The colonial budgets totalled in 1907 some £16,760,000, being divisible into six categories: Algeria £4,120,000; Tunisia £3,640,000; Indo-China³ about £5,000,000; West Africa £1,600,000; Madagascar £960,000; all other colonies combined £1,440,000.

³ The Indo-China budget is reckoned in piastres, a silver coin of fluctuating value (1s. 10d. to 2s.). The budget of 1907 balanced at 50,000,000 piastres.

The authorized colonial loans, omitting Algeria and Tunisia, during the period 1884-1904 amounted to £19,200,000, the sums paid for interest and sinking funds on loans varying from £600,000 to £800,000 a year. The amount of French capital invested in French colonies and protectorates, including Algeria and Tunisia, was estimated in 1905 at £120,000,000, French capital invested in foreign countries at the same date being estimated at ten times that amount (see *Qués. Dip. et Col.*, February 16, 1905).

Commerce.—The value of the external trade of the French possessions, exclusive of Algeria and Tunisia, increased in the ten years 1896-1905 from £18,784,060 to £34,957,479. In the last-named year the commerce of Algeria amounted to £24,506,020 and that of Tunisia to £5,969,248, making a grand total for French colonial trade in 1905 of £65,432,746. The figures were made up as follows:

	Imports.	Exports.	Total.
Algeria	£15,355,500	£9,150,520	£24,506,020
Tunisia	3,638,185	2,331,063	5,969,248
Indo-China	10,182,411	6,750,306	16,932,717
West Africa	3,874,698	2,248,317	6,123,015
Madagascar	1,247,936	914,024	2,161,960
All other colonies	4,258,134	5,481,652	9,739,786
Total	£38,556,864	£26,875,882	£65,432,746

Over three-fourths of the trade of Algeria and Tunisia is with France and other French possessions. In the other colonies and protectorates more than half the trade is with foreign countries. The foreign countries trading most largely with the French colonies are, in the order named, British colonies and Great Britain, China and Japan, the United States and Germany. The value of the trade with British colonies and Great Britain in 1905 was over £7,200,000. (F. R. C.)

HISTORY

The identity of the earliest inhabitants of Gaul is veiled in obscurity, though philologists, anthropologists and archaeologists are using the glimmer of traditions collected by ancient historians to shed a faint twilight upon that remote past. The subjugation of those primitive tribes did not mean their annihilation: their blood still flows in the veins of Frenchmen; and they survive also on those megalithic monuments (see **STONE MONUMENTS**) with which the soil of France is dotted, in the drawings and sculptures of caves hollowed out along the sides of the valleys, and in the arms and ornaments yielded by sepulchral tumuli, while the names of the rivers and mountains of France probably perpetuate the first utterances of those nameless generations.

The first peoples of whom we have actual knowledge are the Iberians and Ligurians. The Basques who now inhabit both sides of the Pyrenean range are probably the last representatives of the Iberians, who came from Spain to settle between the Mediterranean and the Bay of Biscay. The Ligurians, who exhibited the hard cunning characteristic of the Genoese Rívierá,

Pre-historic Gaul.

must have been descendants of that Indo-European vanguard who occupied all northern Italy and the centre and south-east of France, who in the 7th century B.C. received the Phocæan immigrants at Marseilles, and who at a much later period were encountered by Hannibal during his march to Rome, on the banks of the Rhône, the frontier of the Iberian and Ligurian territories. Upon these peoples it was that the conquering minority of Celts or Gauls imposed themselves, to be succeeded at a later date by the Roman aristocracy.

Iberians and Ligurians.

When Gaul first enters the field of history, Rome has already laid the foundation of her freedom, Athens dazzles the eastern Mediterranean with her literature and her art, while in the west Carthage and Marseilles are lining opposite shores with their great houses of commerce. Coming from the valley of the Danube in the 6th century, the Celts or Gauls had little by little occupied central and southern Europe long before they penetrated into the plains of the Saône, the Seine, and the Loire as far as the Spanish border, driving out the former inhabitants of the country. A century later their political hegemony, extending from the Black Sea to the Strait of Gibraltar, began to disintegrate, and the Gauls then embarked on more distant migrations, from the Columns of Hercules to the plateaux of Asia Minor, taking Rome on their way. Their empire in Gaul, encroached upon in the north by the Belgæ, a kindred race, and in the south by the Iberians, gradually contracted in area and eventually crumbled to pieces. This process served the turn of the Romans, who little by little had subjugated first the Cisalpine Gauls and afterwards those inhabiting the south-east of France, which was turned into a Roman province in the 2nd century. Up to this time Hellenism and the mercantile spirit of the Jews had almost exclusively dominated the Mediterranean littoral, and at first the Latin spirit only won foothold for itself in various spots on the western coast—as at Aix in Provence (123 B.C.) and at Narbonne (118 B.C.). A refuge of Italian pauperism in the time of the Gracchi, after the triumph of the oligarchy the Narbonnaise became a field for shameless exploitation, besides providing, under the proconsulate of Caesar, an excellent point of observation whence to watch the intestine quarrels between the different nations of Gaul.

Empire of the Celts.

The Roman Conquest.

These are divided by Caesar in his *Commentaries* into three groups: the Aquitanians to the south of the Garonne; the Celts, properly so called, from the Garonne to the Seine and the Marne; and the Belgæ, from the Seine to the Rhine. But these ethnological names cover a very great variety of half-savage tribes, differing in speech and in institutions, each surrounded by frontiers of dense forests abounding in game. On the edges of these forests stood isolated dwellings like sentinel outposts; while the inhabitants of the scattered hamlets, caves hollowed in the ground, rude circular huts or lake-dwellings, were less occupied with domestic life than with war and the chase. On the heights, as at Bibracte, or on islands in the rivers, as at Lutetia, or protected by marshes, as at Avaricum, *oppida*—at once fortresses and places of refuge, like the Greek Acropolis—kept watch and ward over the beaten tracks and the rivers of Gaul.

Political divisions of Gaul.

These primitive societies of tall, fair-skinned warriors, blue-eyed and red-haired, were gradually organized into political bodies of various kinds—kingdoms, republics and federations—and divided into districts or *pagi* (*pays*) to which divisions of the minds of the country folk have remained faithfully attached ever since. The victorious aristocracy of the kingdom dominated the other classes, strengthened by the prestige of birth, the ownership of the soil and the practice of arms. Side by side with this martial nobility the Druids constituted a priesthood unique in ancient times; neither hereditary as in India, nor composed of isolated priests as in Greece, nor of independent colleges as at Rome, it was a true corporation, which at first possessed great moral authority, though by Caesar's time it had lost both strength and prestige. Beneath these were the common people attached to the soil,

Political institutions of Gaul.

who did not count for much, but who reacted against the insufficient protection of the regular institutions by a voluntary subordination to certain powerful chiefs.

This impotence of the state was a permanent cause of those discords and revolts, which in the 1st century B.C. were so singularly favourable to Caesar's ambition. Thus after eight years of incoherent struggles, of scattered revolts, and then of more and more energetic efforts, Gaul, at last aroused by Vercingetorix, for once concentrated her strength, only to perish at Alesia, vanquished by Roman discipline and struck at from the rear by the conquest of Britain (58-50 B.C.).

This defeat completely altered the destiny of Gaul, and she became one of the principal centres of Roman civilization.

Of the vast Celtic empire which had dominated Europe nothing now remained but scattered remnants in the farthest corners of the land, refuges for all the vanquished Gaels, Picts or Gauls; and of its civilization there lingered only idioms and dialects—Gaelic, Pict and Gallic—which gradually dropped out of use. During five centuries Gaul was unfalteringly loyal to her conquerors; for to conquer is nothing if the conquered be not assimilated by the conqueror, and Rome was a past-mistress of this art. The personal charm of Caesar and the prestige of Rome are not of themselves sufficient to explain this double conquest. The generous and enlightened policy of the imperial administration asked nothing of the people of Gaul but military service and the payment of the tax; in return it freed individuals from patronal domination, the people from oligarchic greed or Druidic excommunication, and every one in general from material anxiety. Petty tyrannies gave place to the great *Pax Romana*. The Julio-Claudian dynasty did much to attach the Gauls to the empire; they always occupied the first place in the mind of Augustus, and the revolt of the Aeduan Julius Sacrovir, provoked by the census of A.D. 21, was easily repressed by Tiberius. Caligula visited Gaul and founded literary competitions at Lyons, which had become the political and intellectual capital of the country. Claudius, who was a native of Lyons, extended the right of Roman citizenship to many of his fellow-townsmen, gave them access to the magistracy and to the senate, and supplemented the annexation of Gaul by that of Britain. The speech which he pronounced on this occasion was engraved on tables of bronze at Lyons, and is the first authentic record of Gaul's admission to the citizenship of Rome. Though the crimes of Nero and the catastrophes which resulted from his downfall, provoked the troubles of the year A.D. 70, the revolt of Sabinus was in the main an attempt by the Germans to pillage Gaul and the prelude to military insurrections. The government of the Flavians and the Antonines completed a definite reconciliation. After the extinction of the family of Augustus in the 1st century Gaul had made many emperors—Galba, Otho, Vitellius, Vespasian and Domitian; and in the 2nd century she provided Gauls to rule the empire—Antoninus (138-161) came from Nîmes and Claudius from Lyons, as did also Caracalla later on (211-217).

The romanization of the Gauls, like that of the other subject nations, was effected by slow stages and by very diverse means, furnishing an example of the constant adaptability of Roman policy. It was begun by establishing a network of roads with Lyons as the central point, and by the development of a prosperous urban life in the increasingly wealthy Roman colonies; and it was continued by the disintegration into independent cities of nearly all the Gaulish states of the Narbonnaise, together with the substitution of the Roman collegial magistracy for the isolated magistracy of the Gauls. This alteration came about more quickly in the north-east in the Rhine-land than in the west and the centre, owing to the near neighbourhood of the legions on the frontiers. Rome was too tolerant to impose her own institutions by force; it was the conquered peoples who collectively and individually solicited as a favour the right of adopting the municipal system, the magistracy, the sacerdotal

and aristocratic social system of their conquerors. The edict of Caracalla, at the beginning of the 3rd century, by conferring the right of citizenship on all the inhabitants of the empire, completed an assimilation for which commercial relations, schools, a taste for officialism, and the adaptability and quick intelligence of the race had already made preparation. The Gauls now called themselves Romans and their language Romance. There was neither oppression on the one hand nor servility on the other to explain this abandonment of their traditions. Thanks to the political and religious unity which a common worship of the emperor and of Rome gave them, thanks to administrative centralization tempered by a certain amount of municipal autonomy, Gaul prospered throughout three centuries.

But this stability of the Roman peace had barely been realized when events began to threaten it both from within and without. The *Pax Romana* having rendered any armed force unnecessary amid a formerly very bellicose people, only eight legions mounted guard over the Rhine to protect it from the barbarians who surrounded the empire. The raids made by the Germans on the eastern frontiers, the incessant competitions for the imperial power, and the repeated revolts of the Pretorian guard, gradually undermined the internal cohesion of Gaul; while the insurrections of the Bagaudae aggravated the destruction wrought by a grasping treasury and by barbarian incursions; so that the anarchy of the 3rd century soon aroused separatist ideas. Under Postumus Gaul had already attempted to restore an independent though short-lived empire (258-267); and twenty-eight years later the tetrarchy of Diocletian proved that the blood now circulated with difficulty from the heart to the extremities of an empire on the eve of disintegration. Rome was to see her universal dominion gradually menaced from all sides. It was in Gaul that the decisive revolutions of the time were first prepared; Constantine's crusades to overthrow the altars of paganism, and Julian's campaigns to set them up again. After Constantine the emperors of the East in the 4th century merely put in an occasional appearance at Rome; they resided at Milan or in the prefectorial capitals of Gaul—at Arles, at Treves (Trier), at Reims or in Paris. The ancient territorial divisions—Belgium, Gallia Lugdunensis (Lyonnaise), Gallia Narbonensis (Narbonnaise)—were split up into seventeen little provinces, which in their turn were divided into two dioceses. Thus the great historic division was made between southern and northern France. Roman nationality persisted, but the administrative system was tottering.

Upon ground that had been so well levelled by Roman legislation aristocratic institutions naturally flourished. From the 4th century onward the balance of classes was disturbed by the development of a landed aristocracy that grew more powerful day by day, and by the corresponding ruin of the small proprietors and industrial and commercial corporations. The members of the *curia* who assisted the magistrates in the cities, crushed by the burden of taxes, now evaded as far as possible public office or senatorial honours. The vacancies left in this middle class by this continual desertion were not compensated for by the progressive advance of a lower class destitute of personal property and constantly unsettled in their work. The peasants, no less than the industrial labourers, suffered from the absence of any capital laid by, which alone could have enabled them to improve their land or to face a time of bad harvests. Having no credit they found themselves at the mercy of their neighbours, the great landholders, and by degrees fell into the position of tenants, or into servitude. The *curia* was thus emptied both from above and from below. It was in vain that the emperors tried to rivet the chains of the *curia* in this hereditary bondage, by attaching the small proprietor to his glebe, like the artisan to his gild and the soldier to his legion. To such a miserable pretence of freedom they all preferred servitude, which at least ensured them a livelihood; and the middle class of freemen thus became gradually extinct.

English Miles 50 100 150

The aristocracy, on the contrary, went on increasing in power, and eventually became masters of the situation. It was through them that the emperor, theoretically absolute, practically carried on his administration; but he was no longer either strong or a divinity, and possessed nothing but the semblance of omnipotence. His official despotism was opposed by the passive but invincible competition of an aristocracy, more powerful than himself because it derived its support from the revived relation of patron and dependants. But though the aristocracy administered, yet they did not govern. They suffered, as did the Empire, from a general state of lassitude. Like their private life, their public life, no longer stimulated by struggles and difficulties, had become sluggish; their power of initiative was enfeebled. Feeling their incapacity they no longer embarked on great political schemes; and the army, the instrument by which such schemes were carried on, was only held together by the force of habit. In this society, where there was no traffic in anything but wealth and ideas, the soldier was nothing more than an agitator or a parasite. The egoism of the upper classes held military duty in contempt, while their avarice depopulated the countryside, whence the legions had drawn their recruits. And now come the barbarians! A prey to perpetual alarm, the people entrenched themselves behind those high walls of the *oppida* which Roman security had razed to the ground, but imperial impotence had restored, and where life in the middle ages was destined to vegetate in unrestful isolation.

Amidst this general apathy, intellectual activity alone persisted. In the 4th century there was a veritable renaissance in Gaul, the last outburst of a dying flame, which yet bore witness also to the general decadence. The agreeable versification of an amateur like Ausonius, the refined panegyrics of a Eumenius, disguising nullity of thought beneath elegance of form, already foretold the perilous sterility of scholasticism. Art, so widespread in the wealthy villas of Gaul, contented itself with imitation, produced nothing original and remained mediocre. Human curiosity, no longer concerned with philosophy and science, seemed as though stifled, religious polemics alone continuing to hold public attention. Disinclination for the self-sacrifice of active life and weariness of the things of the earth lead naturally to absorption in the things of heaven. After bringing about the success of the Asiatic cults of Mithra and Cybele, these same factors now assured the triumph over exhausted paganism of yet another oriental religion—Christianity—after a duel which had lasted two centuries.

This new faith had appeared to Constantine likely to infuse young and healthy blood into the Empire. In reality Christianity, which had contributed not a little to stimulate the political unity of continental Gaul, now tended to dissolve it by destroying that religious unity which had heretofore been its complement. Before this there had been complete harmony between Church and State; but afterwards came indifference and then disagreement between political and religious institutions, between the City of God and that of Caesar. Christianity, introduced into Gaul during the 1st century of the Christian era by those foreign merchants who traded along the coasts of the Mediterranean, had by the middle of the 2nd century founded communities at Vienne, at Autun and at Lyons. Their propagandizing zeal soon exposed them to the wrath of an ignorant populace and the contempt of the educated; and thus it was that in A.D. 177, under Marcus Aurelius, the Church of Lyons, founded by St Pothinus, suffered those persecutions which were the effective cause of her ultimate victory. These Christian communities, disguised under the legally authorized name of burial societies, gradually formed a vast secret cosmopolitan association, superimposed upon Roman society but incompatible with the Empire. Christianity had to be either destroyed or absorbed. The persecutions under Aurelian and Diocletian almost succeeded in accomplishing the former; the Christian churches were saved by the instability of the existing authorities, by military anarchy and by the incursions of the barbarians. Despite tortures and martyrdoms, and thanks

Absorption of land and power by the aristocracy of Gaul.

Intellectual decadence of Gaul.

Christianity in Gaul.

to the seven apostles sent from Rome in 250, during the 3rd century their branches extended all over Gaul.

The emperors had now to make terms with these churches, which served to group together all sorts of malcontents, and this was the object of the edict of Milan (313), by which the Church, at the outset simply a Jewish institution, was naturalized as Roman; while in 325 the Council of Nicaea endowed her with unity. But for the security and the power thus attained she had to pay with her independence. On the other hand, pagan and Christian elements in society existed side by side without intermingling, and even openly antagonistic to each other—one aristocratic and the other democratic. In order to induce the masses of the people once more to become loyal to the imperial form of government the emperor Julian tried by founding a new religion to give its functionaries a religious prestige which should impress the popular mind. His plan failed; and the emperor Theodosius, aided by Ambrose, bishop of Milan, preferred to make the Christian clergy into a body of imperial and conservative officials; while in return for their adhesion he abolished the Arian heresy and paganism itself, which could not survive without his support. Thenceforward it was in the name of Christ that persecutions took place in an Empire now entirely won over to Christianity.

In Gaul the most famous leader of this first merciless, if still perilous crusade, was a soldier-monk, Saint Martin of Tours. Thanks to him and his disciples in the middle of the 4th century and the beginning of the 5th many of the towns possessed well-established churches; but the militant ardour of monks and centuries of labour were needed to conquer the country districts, and in the meantime both dogma and internal organization were subjected to important modifications. As regards the former the Church adopted a course midway between metaphysical explanations and historical traditions, and reconciled the more extreme theories; while with the admission of pagans a great deal of paganism itself was introduced. On the other hand, the need for political and social order involved the necessity for a disciplined and homogeneous religious body; the exercise of power, moreover, soon transformed the democratic Christianity of the earlier churches into a federation of little conservative monarchies. The increasing number of her adherents, and her inexperience of government on such a vast and complicated scale, obliged her to comply with political necessity and to adopt the system of the state and its social customs. The Church was no longer a fraternity, on a footing of equality, with freedom of belief and tentative as to dogma, but an authoritative aristocratic hierarchy. The episcopate was now recruited from the great families in the same way as the imperial and the municipal public services. The Church called on the emperor to convoke and preside over her councils and to combat heresy; and in order more effectually to crush the latter she replaced primitive independence and local diversity by uniformity of doctrine and worship, and by the hierarchy of dioceses and ecclesiastical provinces. The heads of the Church, her bishops, her metropolitans, took the titles of their pagan predecessors as well as their places, and their jurisdiction was enforced by the laws of the state. Rich and powerful chiefs, they were administrators as much as priests: Germanus (Germain), bishop of Auxerre (d. 448), St Eucherius of Lyons (d. 450), Apollinaris Sidonius of Clermont (d. c. 490) assumed the leadership of society, fed the poor, levied tithes, administered justice, and in the towns where they resided, surrounded by priests and deacons, ruled both in temporal and spiritual matters.

But the humiliation of Theodosius before St Ambrose proved that the emperor could never claim to be a pontiff, and that the dogma of the Church remained independent of the sovereign as well as of the people; if she sacrificed her liberty it was but to claim it again and maintain it more effectively amid the general languor. The Church thus escaped the unpopularity of this decadent empire, and during the 5th century she provided a refuge for all those who, wishing to preserve the Roman unity, were terrified

Triumph of Christianity in Gaul.

Organization of the Church.

The Church's independence of the Empire.

by the blackness of the horizon. In fact, whilst in the Eastern Church the metaphysical ardour of the Greeks was spending itself in terrible combats in the oecumenical councils over the interpretation of the Nicene Creed, the clergy of Gaul, more simple and strict in their faith, abjured these theological logomachies; from the first they had preferred action to criticism and had taken no part in the great controversy on free-will raised by Pelagius. Another kind of warfare was about to absorb their whole attention; the barbarians were attacking the frontiers of the Empire on every side, and their advent once again modified Gallo-Roman civilization.

For centuries they had been silently massing themselves around ancient Europe, whether Iberian, Celtic or Roman.

Many times already during that evening of a decadent civilization, their threatening presence had seemed like a dark cloud veiling the radiant sky of the peoples established on the Mediterranean seaboard. The cruel lightning of the sword of Brennus had illumined the night, setting Rome or Delphi on fire. Sometimes the storm had burst over Gaul, and there had been need of a Marius to stem the torrent of Cimbri and Teutons, or of a Caesar to drive back the Helvetians into their mountains. On the morrow the western horizon would clear again, until some such disaster as that which befell Varus would come to mortify cruelly the pride of an Augustus. The Romans had soon abandoned hope of conquering Germany, with its fluctuating frontiers and nomadic inhabitants. For more than two centuries they had remained prudently entrenched behind the earthworks that extended from Cologne to Ratisbon (Regensburg); but the intestine feuds which prevailed among the barbarians and were fostered by Rome, the organization under bold and turbulent chiefs of the bands greedy for booty, the pressing forward on populations already settled of tribes in their rear; all this caused the Germanic invasion to filter by degrees across the frontier. It was the work of several generations and took various forms, by turns and simultaneously colonization and aggression; but from this time forward the *pax romana* was at an end. The emperors Probus, Constantine, Julian and Valentinian, themselves foreigners, were worn out with repulsing these repeated assaults, and the general enervation of society did the rest. The barbarians gradually became part of the Roman population; they permeated the army, until after Theodosius they recruited it exclusively; they permeated civilian society as colonists and agriculturists, till the command of the army and of important public duties was given over to a Stilicho or a Crocus. Thus Rome allowed the wolves to mingle with the dogs in watching over the flock, just at a time when the civil wars of the 4th century had denuded the Rhenish frontier of troops, whose numbers had already been diminished by Constantine. Then at the beginning of the 5th century, during a furious irruption of Germans fleeing before Huns, the *limes* was carried away (406-407); and for more than a hundred years the torrent of fugitives swept through the Empire, which retreated behind the Alps, there to breathe its last.

Whilst for ten years Alaric's Goths and Stilicho's Vandals were drenching Italy with blood, the Vandals and the Alani from

the steppes of the Black Sea, dragging in their wake the reluctant German tribes who had been allies of Rome and who had already settled down to the cultivation of their lands, invaded the now abandoned Gaul, and

having come as far as the Pyrenees, crossed over them. After the passing of this torrent the Visigoths, under their kings Ataulphus, Wallia and Theodoric, still dazzled by the splendours of this immense empire, established themselves like submissive vassals in Aquitaine, with Toulouse as their capital. About the same time the Burgundians settled even more peaceably in Rhenish Gaul, and, after 456, to the west of the Jura in the valleys of the Saône and the Rhone. The original Franks of

Germany, already established in the Empire, and pressed upon by the same Huns who had already forced the Goths across the Danube, passed beyond the Rhine and occupied north-eastern Gaul; Ripuarians of the Rhine establishing themselves on the Sambre and the Meuse, and

Salians in Belgium, as far as the great fortified highroad from Bavai to Cologne. Accepted as allies, and supported by Roman prestige and by the active authority of the general Aetius, all these barbarians rallied round him and the Romans of Gaul, and in 451 defeated the hordes of Attila, who had advanced as far as Orleans, at the great battle of the Catalaunian plains.

Thus at the end of the 5th century the Roman empire was nothing but a heap of ruins, and fidelity to the empire was now only maintained by the Catholic Church; she alone survived, as rich, as much honoured as ever, and more powerful, owing to the disappearance of the imperial officials for whom she had found substitutes, and the decadence of the municipal bodies into whose inheritance she had entered. Owing to her the City of God gradually replaced the Roman imperial polity and preserved its civilization; while the Church allied herself more closely with the new kingdoms than she had ever done with the Empire. In the Gothic or Burgundian states of the period the bishops, after having for a time opposed the barbarian invaders, sought and obtained from their chief the support formerly received from the emperor. Apollinaris Sidonius paid court to Euric, since 476 the independent king of the Visigoths, against whom he had defended Auvergne; and Avitus, bishop of Vienne, was graciously received by Gundibald, king of the Burgundians. But these princes were Arians, *i.e.* foreigners among the Catholic population; the alliance sought for by the Church could not reach her from that source, and it was from the rude and pagan Franks that she gained the material support which she still lacked. The conversion of Clovis was a master-stroke; it was fortunate both for himself and for the Franks. Unity in faith brought about unity in law.

Clovis was king of the Sicambrians, one of the tribes of the Salian Franks. Having established themselves in the plains of Northern Gaul, but driven by the necessity of finding

new land to cultivate, in the days of their king Childeric they had descended into the fertile valleys of the Somme and the Oise. Clovis's victory at Soissons

over the last troops left in the service of Rome (486) extended their settlements as far as the Loire. By his conversion, which was due to his wife Clotilda and to Remigius, bishop of Reims, more than to the victory of Tolbiac over the Alamanni, Clovis made definitely sure of the Roman inhabitants and gave the Church an army (496). Thenceforward he devoted himself to the foundation of the Frankish monarchy by driving the exhausted and demoralized heretics out of Gaul, and by putting himself in the place of the now enfeebled emperor. In 500 he conquered Gundibald, king of the Burgundians, reduced him to a kind of vassalage, and forced him into reiterated promises of conversion to orthodoxy. In 507 he conquered and killed Alaric II., king of the Arian Visigoths, and drove the latter into Spain. Legend adorned his campaign in Aquitaine with miracles; the bishops were the declared allies of both him and his son Theuderich (Thierry) after his conquest of Auvergne. At Tours he received from the distant emperor at Constantinople the diploma and insignia of *patricius* and Roman consul, which legalized his military conquests by putting him in possession of civil powers. From this time forward a great historic transformation was effected in the eyes of the bishops and of the Gallo-Romans; the Frankish chief took the

place of the ancient emperors. Instead of blaming him for the murder of the lesser kings of the Franks, his relatives, by which he had accomplished the union of the Frankish tribes, they saw in this the hand of God rewarding a faithful soldier and a converted pagan. He became their king, their new David, as the Christian emperors had formerly been; he built churches, endowed monasteries, protected St Vaast (Vedastus, d. 540), first bishop of Arras and Cambrai, who restored Christianity in northern Gaul. Like the emperors before him Clovis, too, reigned over the Church. Of his own authority he called together a council at Orleans in 511, the year of his death. He was already the grand distributor of ecclesiastical benefices, pending the time when his successors were to confirm the episcopal elections, and his power began to take

on a more and more absolute character. But though he felt the ascendant influence of Christian teaching, he was not really penetrated by its spirit; a professing Christian, and a friend to the episcopate, Clovis remained a barbarian, crafty and ruthless. The bloody tragedies which disfigured the end of his reign bear sad witness to this; they were a fit prelude to that period during the course of which, as Gregory of Tours said, "barbarism was let loose."

The conquest of Gaul, begun by Clovis, was finished by his sons: Theuderich, Chlodomer, Childebert and Clotaire. In three successive campaigns, from 523 to 532, they annihilated the Burgundian kingdom, which had maintained its independence, and had endured for nearly a century. Favoured by the war between Justinian, the East Roman emperor, and Theodoric's Ostrogoths, the Frankish kings divided Provence among them as they had done in the case of Burgundy. Thus the whole of Gaul was subjected to the sons of Clovis, except Septimania in the south-east, where the Visigoths still maintained their power. The Frankish armies then overflowed into the neighbouring countries and began to pillage them. Their disorderly cohorts made an attack upon Italy, which was repulsed by the Lombards, and another on Spain with the same want of success; but beyond the Rhine they embarked upon the conquest of Germany, where Clovis had already reduced to submission the country on the banks of the Maine, later known as Franconia. In 531 the Thuringians in the centre of Germany were brought into subjection by his eldest son, King Theuderich, and about the same time the Bavarians were united to the Franks, though preserving a certain autonomy. The Merovingian monarchy thus attained the utmost limits of its territorial expansion, bounded as it was by the Pyrenees, the Alps and the Rhine; it exercised influence over the whole of Germany, which it threw open to the Christian missionaries, and its conquests formed the first beginnings of German history.

But to these wars of aggrandizement and pillage succeeded those fratricidal struggles which disgraced the whole of the sixth century and arrested the expansion of the Merovingian power. When Clotaire, the last surviving son of Clovis, died in 561, the kingdom was divided between his four sons like some piece of private property, as in 511, and according to the German method. The capitals of these four kings—Charibert, who died in 567, Guntram, Sigebert and Chilperic—were Paris, Orleans, Reims and Soissons—all near one another and north of the Loire, where the Germanic inhabitants predominated; but their respective boundaries were so confused that disputes were inevitable. There was no trace of a political idea in these disputes; the mutual hatred of two women aggravated jealousy to the point of causing terrible civil wars from 561 to 613, and these finally created a national conflict which resulted in the dismemberment of the Frankish empire. Recognized, in fact, already as separate provinces were Austrasia, or the eastern kingdom, Neustria, or north-west Gaul and Burgundy; Aquitaine alone was as yet undifferentiated.

Sigebert had married Brunhilda, the daughter of a Visigoth king; she was beautiful and well educated, having been brought up in Spain, where Roman civilization still flourished. Chilperic had married Galswintha, one of Brunhilda's sisters, for the sake of her wealth; but despite this marriage he had continued his amours with a waiting-woman named Fredegond, who pushed ambition to the point of crime, and she induced him to get rid of Galswintha. In order to avenge her sister, Brunhilda incited Sigebert to begin a war which terminated in 575 with the assassination of Sigebert by Fredegond at the very moment when, thanks to the help of the Germans, he had gained the victory, and with the imprisonment of Brunhilda at Rouen. Fredegond subsequently caused the death of Merovech (Mérovée), the son of Chilperic, who had been secretly married to Brunhilda, and that of Bishop Praetextatus, who had solemnized their union. After this, Fredegond endeavoured to restore imperial finance to a state of solvency, and to set up a more regular form of government in her Neustria, which was less romanized and less wealthy than Burgundy,

where Guntram was reigning, and less turbulent than the eastern kingdom, where most of the great warlike chiefs with their large landed estates were somewhat impatient of royal authority. But the accidental death of two of her children, the assassination of her husband in 584, and the advice of the Church, induced her to make overtures to her brother-in-law Guntram. A lover of peace through sheer cowardice, and as depraved in his morals as Chilperic, Guntram had played a vacillating and purely self-interested part in the family tragedy. He declared himself the protector of Fredegond, but his death in 593 delivered up Burgundy and Neustria to Brunhilda's son Childebert, king of Austrasia, in consequence of the treaty of Andelot, made in 587. An ephemeral triumph, however; for Childebert died in 596, followed a year later by Fredegond.

The whole of Gaul was now handed over to three children: Childebert's two sons, Theudebert and Theuderich (Thierry), and the son of Fredegond, Clotaire II. The latter, having vanquished the two former at Latofao in 596, was in turn beaten by them at Dormelles in 600, and a year later a fresh fratricidal struggle broke out between the two grandsons of the aged Brunhilda. Theuderich joined with Clotaire against Theodobert, and invaded his brother's kingdom, conquering first an army of Austrasians and then one composed of Saxons and Thuringians. Strife began again in 613 in consequence of Theuderich's desire to join Austrasia to Neustria, but his death delivered the kingdoms into the hands of Clotaire II. This weak king leaned for support upon the nobles of Burgundy and Austrasia, impatient as they were of obedience to a woman and the representative of Rome. The ecclesiastical party also abandoned Brunhilda because of her persecution of their saints, after which Clotaire, having now got the upper hand, thanks to the defection of the Austrasian nobles, of Arnulf, bishop of Metz, with his brother Pippin, and of Warnachaire, mayor of the palace, made a terrible end of Brunhilda in 613. Her long reign had not lacked intelligence and even greatness; she alone, amid all these princes, warped by self-indulgence or weakened by discord, had behaved like a statesman, and she alone understood the obligations of the government she had inherited. She wished to abolish the fatal tradition of dividing up the kingdom, which so constantly prevented any possible unity; in opposition to the nobles she used her royal authority to maintain the Roman principles of order and regular administration. Towards the Church she held a courteous but firm policy, renewing relations between the Frankish kingdom and the pope; and she so far maintained the greatness of the Empire that tradition associated her name with the Roman roads in the north of France, entitling them "les chaussées de Brunehaut."

Like his grandfather, Clotaire II. reigned over a once more united Gaul of Franks and Gallo-Romans, and like Clovis he was not too well obeyed by the nobles; moreover, his had been a victory more for the aristocracy than for the crown, since it limited the power of the latter. Not that the permanent constitution of the 18th of October 614 was of the nature of an anti-monarchic revolution, for the royal power still remained very great, decking itself with the pompous titles of the Empire, and continuing to be the dominant institution; but the reservations which Clotaire II. had to make in conceding the demands of the bishops and great laymen show the extent and importance of the concessions these latter were already aiming at. The bishops, the real inheritors of the imperial idea of government, had become great landowners through enormous donations made to the Church, and allied as they were to the aristocracy, whence their ranks were continually recruited, they had gradually identified themselves with the interests of their class and had adopted its customs; while thanks to long minorities and civil wars the aristocracy of the high officials had taken an equally important social position. The treaty of Andelot in 587 had already decided that the benefices or lands granted to them by the kings should be held for life. In the 7th century the Merovingian kings adopted the custom of summoning them all, and not merely the officials of their *Palatium*, to discuss political affairs; they began, moreover,

to choose their counts or administrators from among the great landholders. This necessity for approval and support points to yet another alteration in the nature of the royal power, absolute as it was in theory.

The Mayoralty of the Palace aimed a third and more serious blow at the royal authority. By degrees, the high officials of the *Palatium*, whether secular or ecclesiastical, and also the provincial counts, had rallied round the mayors of the palace as their real leaders. As under the Empire, the *Palatium* was both royal court and centre of government, with the same bureaucratic hierarchy and the same forms of administration; and the mayor of the palace was premier official of this itinerant court and ambulatory government. Moreover, since the palace controlled the whole of each kingdom, the mayors gradually extended their official authority so as to include functionaries and agents of every kind, instead of merely those attached immediately to the king's person. They suggested candidates for office for the royal selection, often appointed office-holders, and, by royal warrant, supported or condemned them. Mere subordinates while the royal power was strong, they had become, owing to the frequent minorities, and to civil wars which broke the tradition of obedience, the all-powerful ministers of kings nominally absolute but without any real authority. Before long they ceased to claim an even greater degree of independence than that of Warnachaire, who forced Clotaire II. to swear that he should never be deprived of his mayoralty of Burgundy; they wished to take the first place in the kingdoms they governed, and to be able to attack neighbouring kingdoms on their own account. A struggle, motivated by self-interest, no doubt; but a struggle, too, of opposing principles. Since the Frankish monarchy was now in their power some of them tried to re-establish the unity of that monarchy in all its integrity, together with the superiority of the State over the Church; others, faithless to the idea of unity, saw in the disintegration of the state and the supremacy of the nobles a warrant for their own independence. These two tendencies were destined to strive against one another during an entire century (613-714), and to occasion two periods of violent conflict, which, divided by a kind of renaissance of royalty, were to end at last in the triumphant substitution of the Austrasian mayors for royalty and aristocracy alike.

The first struggle began on the accession of Clotaire II., when Austrasia, having had a king of her own ever since 561, demanded one now. In 623 Clotaire was obliged to send her his son Dagobert and even to extend his territory. But in Dagobert's name two men ruled, representing the union of the official aristocracy and the Church. One, Pippin of Landen, derived his power from his position as mayor of the palace, from great estates in Aquitaine and between the Meuse and the Rhine, and from the immense number of his supporters; the other, Arnulf, bishop of Metz, sprang from a great family, probably of Roman descent, and was besides immensely wealthy in worldly possessions. By the union of their forces Pippin and Arnulf were destined to shape the future. They had already, in 613, treated with Clotaire and betrayed the hopes of Brunhilda, being consequently rewarded with the guardianship of young Dagobert. Burgundy followed the example of Austrasia, demanded the abolition of the mayoralty, and in 627 succeeded in obtaining her independence of Neustria and Austrasia and direct relations with the king.

The death of Clotaire (629) was the signal for a revival of the royal power. Dagobert deprived Pippin of Landen of his authority and forced him to fly to Aquitaine; but still he had to give the Austrasians his son Sigebert III. for their king (634). He made administrative progresses through Neustria and Burgundy to recall the nobles to their allegiance, but again he was forced to designate his second son Clovis as king of Neustria. He did subdue Aquitaine completely, thanks to his brother Charibert, with whom he had avoided dividing the kingdom, and he tried to restore his own demesne, which had been despoiled

by the granting of benefices or by the pious frauds of the Church. In short, this reign was one of great conquests, impossible except under a strong government. Dagobert's victories over Samo, king of the Slavs along the Elbe, and his subjugation of the Bretons and the Basques, maintained the prestige of the Frankish empire; while the luxury of his court, his taste for the fine arts (ministered to by his treasurer Eloi¹), his numerous achievements in architecture—especially the abbey of St Denis, burial-place of the kings of France—the brilliance and the power of the churchmen who surrounded him and his revision of the Salic law, ensured for his reign, in spite of the failure of his plans for unity, a fame celebrated in folksong and ballad.

But for barbarous nations old-age comes early, and after Dagobert's death (639), the monarchy went swiftly to its doom. The mayors of the palace again became supreme. The "Rois fainéants" might not even remove them from office. Such mayors were Aega and Erchinoald, in Neustria, Pippin and Otto in Austrasia, and Flaochat in Burgundy. One of them, Grimoald, son of Pippin, actually dared to take the title of king in Austrasia (640). This was a premature attempt and barren of result, yet it was significant; and not less so is the fact that the palace in which these mayors bore rule was a huge association of great personages, laymen and ecclesiastics who seem to have had much more independence than in the 6th century. We find the dukes actually raising troops without the royal sanction, and even against the king. In 641 the mayor Flaochat was forced to swear that they should hold their offices for life; and though these offices were not yet hereditary, official dynasties, as it were, began to be established permanently within the palace. The crown lands, the governorships, the different offices, were looked upon as common property to be shared between themselves. Organized into a compact body they surrounded the king and were far more powerful than he. In the general assembly of its members this body of officials decided the selection of the mayor; it presented Flaochat to the choice of Queen Nanthilda, Dagobert's widow; after long discussion it appointed Ebroïn as mayor; it submitted requests that were in reality commands to the Assembly of Bonneuil in 616 and later to Childeric in 670. Moreover, the countries formerly subdued by the Franks availed themselves of this opportunity to loosen the yoke; Thuringia was lost by Sigebert in 641, and the revolt of Alamannia in 643 set back the frontier of the kingdom from the Elbe to Austrasia. Aquitaine, hitherto the common prey of all the Frankish kings, having in vain tried to profit by the struggles between Fredegond and Brunhilda, and set up an independent king, Gondibald, now finally burst her bonds in 670. Then came a time when the kings were mere children, honoured with but the semblance of respect, under the tutelage of a single mayor, Ebroïn of Neustria.

This representative of royalty, chief minister for four-and-twenty years (656-681), attempted the impossible, endeavouring to re-establish unity in the midst of general dissolution and to maintain intact a royal authority usurped everywhere by the hereditary power of the great palatine families. He soon stirred up against himself all the dissatisfied nobles, led by Léger (Leodegarius), bishop of Autun and his brother Gerinus. Clotaire III.'s death gave the signal for war. Ebroïn's enemies set up Childeric II. in opposition to Theuderich, the king whom he had chosen without summoning the great provincial officials. Despite a temporary triumph, when Childeric was forced to recognize the principle of hereditary succession in public offices, and when the mayoralties of Neustria and Burgundy were alternated to the profit of both, Léger soon fell into disgrace and was exiled to that very monastery of Luxeuil to which Ebroïn had been relegated. Childeric having regained the mastery restored the mayor's office, which was immediately disputed by the two rivals; Ebroïn was successful and established himself as mayor of the palace in the room of Leudesius, a partisan of Léger (675),

Renaissance of monarchy under Dagobert, 629-639.

The "Rois fainéants" might not even remove them from office. Such mayors were Aega and Erchinoald, in Neustria, Pippin and Otto in Austrasia, and Flaochat in Burgundy. One of them, Grimoald, son of Pippin, actually dared to take the title of king in Austrasia (640). This was a premature attempt and barren of result, yet it was significant; and not less so is the fact that the palace in which these mayors bore rule was a huge association of great personages, laymen and ecclesiastics who seem to have had much more independence than in the 6th century. We find the dukes actually raising troops without the royal sanction, and even against the king. In 641 the mayor Flaochat was forced to swear that they should hold their offices for life; and though these offices were not yet hereditary, official dynasties, as it were, began to be established permanently within the palace. The crown lands, the governorships, the different offices, were looked upon as common property to be shared between themselves. Organized into a compact body they surrounded the king and were far more powerful than he. In the general assembly of its members this body of officials decided the selection of the mayor; it presented Flaochat to the choice of Queen Nanthilda, Dagobert's widow; after long discussion it appointed Ebroïn as mayor; it submitted requests that were in reality commands to the Assembly of Bonneuil in 616 and later to Childeric in 670. Moreover, the countries formerly subdued by the Franks availed themselves of this opportunity to loosen the yoke; Thuringia was lost by Sigebert in 641, and the revolt of Alamannia in 643 set back the frontier of the kingdom from the Elbe to Austrasia. Aquitaine, hitherto the common prey of all the Frankish kings, having in vain tried to profit by the struggles between Fredegond and Brunhilda, and set up an independent king, Gondibald, now finally burst her bonds in 670. Then came a time when the kings were mere children, honoured with but the semblance of respect, under the tutelage of a single mayor, Ebroïn of Neustria.

Struggle between Ebroïn and Léger.

following this up by a distribution of offices and dignities right and left among his adherents. Léger was put to death in 678, and the Austrasians, commanded by the Carolingian Pippin II., with whom many of the chief Neustrians had taken refuge, were dispersed near Laon (680). But Ebroïn was assassinated next year in the midst of his triumph, having like Fredegonde been unable to do more than postpone for a quarter of a century the victory of the nobles and of Austrasia; for his successor, Berthar, was unfitted to carry on his work, having neither his gifts and energy nor the powerful personality of Pippin. Berthar met his death at the battle of Tertry (687), which gave the king into the hands of Pippin, as also the royal treasure and the mayoralty, and by thus enabling him to reward his followers made him supreme over the Merovingian dynasty. Thenceforward the degenerate descendants of Clovis offered no further resistance to his claims, though it was not until 752 that their line became extinct.

In that year the Merovingian dynasty gave place to the rule of Pippin II. of Heristal, who founded a Carolingian empire fated to be as ephemeral as that of the Merovingians. This political victory of the aristocracy was merely the consummation of a slow subterranean revolution which by innumerable reiterated blows had sapped the structure of the body politic, and was about to transfer the people of Gaul from the Roman monarchical and administrative government to the sway of the feudal system.

The Merovingian kings, mere war-chiefs before the advent of Clovis, had after the conquest of Gaul become absolute hereditary monarchs, thanks to the disappearance of the popular assemblies and to the perpetual state of warfare. They concentrated in their own hands all the powers of the empire, judicial, fiscal and military; and even the so-called "rois fainéants" enjoyed this unlimited power, in spite of the general disorder and the civil wars. To make their authority felt in the provinces they had an army of officials at their disposal—a legacy, this, from imperial Rome—who represented them in the eyes of their various peoples. They had therefore only to keep up this established government, but they could not manage even this much; they allowed the idea of the common interests of kings and their subjects gradually to die out, and forgetting that national taxes are a necessary impost, a charge for service rendered by the state, they had treated these as though they were illicit and unjustifiable spoils. The taxpayers, with the clergy at their head, adopted the same idea, and every day contrived fresh methods of evasion. Merovingian justice was on the same footing as Merovingian finance: it was arbitrary, violent and self-seeking. The Church, too, never failed to oppose it—at first not so much on account of her own ambitions as in a more Christian spirit—and proceeded to weaken the royal jurisdiction by repeated interventions on behalf of those under sentence, afterwards depriving it of authority over the clergy, and then setting up ecclesiastical tribunals in opposition to those held by the dukes and counts. At last, just as the kingdom had become the personal property of the king, so the officials—dukes, counts, royal vicars, tribunes, *centenarii*—who had for the most part bought their unpaid offices by means of presents to the monarch, came to look upon the public service rather as a mine of official wealth than as an administrative organization for furthering the interests, material or moral, of the whole nation. They became petty local tyrants, all the more despotic because they had nothing to fear save the distant authority of the king's *missi*, and the more rapacious because they had no salary save the fines they inflicted and the fees that they contrived to multiply. Gregory of Tours tells us that they were robbers, not protectors of the people, and that justice and the whole administrative apparatus were merely engines of insatiable greed. It was the abuses thus committed by the kings and their agents, who did not understand the art of gloving the iron hand, aided by the absolutely unfettered licence of conduct and the absence of any popular liberty, that occasioned the gradual increase of charters of immunity.

Immunity was the direct and personal privilege which forbade any royal official or his agents to decide cases, to levy taxes, or to exercise any administrative control on the domains of a bishop, an abbot, or one of the great secular nobles. On thousands of estates the royal government gradually allowed the law of the land to be superseded by local law, and public taxation to change into special contributions; so that the duties of the lower classes towards the state were transferred to the great landlords, who thus became loyal adherents of the king but absolute masters on their own territory. The Merovingians had no idea that they were abdicating the least part of their authority, nevertheless the deprivations acquiesced in by the feebler kings led of necessity to the diminution of their authority and their judicial powers, and to the abandonment of public taxation. They thought that by granting immunity they would strengthen their direct control; in reality they established the local independence of the great landowners, by allowing royal rights to pass into their hands. Then came confusion between the rights of the sovereign and the rights of property. The administrative machinery of the state still existed, but it worked in empty air: its taxpayers disappeared, those who were amenable to its legal jurisdiction slipped from its grasp, and the number of those whose affairs it should have directed dwindled away. Thus the Merovingians had shown themselves incapable of rising above the barbarous notion that royalty is a personal asset to the idea that royalty is of the state, a power belonging to the nation and instituted for the benefit of all. They represented in society nothing more than a force which grew feebler and feebler as other forces grew strong; they never stood for a national magistracy.

Society no less than the state was falling asunder by a gradual process of decay. Under the Merovingians it was a hierarchy wherein grades were marked by the varied scale of the *wergild*, a man being worth anything from thirty to six hundred gold pieces. The different degrees were those of slave, freedman, tenant-farmer and great landowner. As in every social scheme where the government is without real power, the weakest sought protection of the strongest; and the system of patron, client and journeyman, which had existed among the Romans, the Gauls and the Germans, spread rapidly in the 6th and 7th centuries, owing to public disorder and the inadequate protection afforded by the government. The Church's patronage provided some with a refuge from violence; others ingratiated themselves with the rich for the sake of shelter and security; others again sought place and honour from men of power; while women, churchmen and warriors alike claimed the king's direct and personal protection.

This hierarchy of persons, these private relations of man to man, were recognized by custom in default of the law, and were soon strengthened by another and territorial hierarchy. The large estate, especially if it belonged to the Church, very soon absorbed the few fields of the freeman. In order to farm these, the Church and the rich landowners granted back the holdings on the temporary and conditional terms of tenancy-at-will or of the *beneficium*, thus multiplying endlessly the land subject to their overlordship and the men who were dependent upon them as tenants. The kings, like private individuals and ecclesiastical establishments, made use of the *beneficium* to reward their servants; till finally their demesne was so reduced by these perpetual grants that they took to distributing among their champions land owning the overlordship of the Church, or granted their own lands for single lives only. These various "benefactions" were, as a rule, merely the indirect methods which the great landowners employed in order to absorb the small proprietor. And so well did they succeed, that in the 6th and 7th centuries the provincial hierarchy consisted of the cultivator, the holder of the *beneficium* and the owner; while this dependence of one man upon another affected the personal liberty of a large section of the community, as well as the condition of the land. The great landowner tended to become not only lord over his tenants, but also himself a vassal of the king.

Thus by means of immunities, of the *beneficium* and of patronage, society gradually organized itself independently of the state, since it required further security. Such extra security was first provided by the conqueror of Tertry; for Pippin II. represented the two great families of Pippin and of Arnulf, and consequently the two interests then paramount, *i.e.* land and religion, while he had at his back a great company of followers and vast landed estates. For forty years (615-655) the office of mayor of Austrasia had gone down in his family almost continuously in direct descent from father to son. The death of Grimoald had caused the loss of this post, yet Ansegisus (Ansegisel), Arnulf's son and Pippin's son-in-law, had continued to hold high office in the Austrasian palace; and about 680 his son, Pippin II., became master of Austrasia, although he had held no previous office in the palace. His dynasty was destined to supplant that of the Merovingian house.

Pippin of Heristal was a pioneer; he it was who began all that his descendants were afterwards to carry through. Thus he gathered the nobles about him not by virtue of his position, but because of his own personal prowess, and because he could assure them of justice and protection; instead of being merely the head of the royal palace he was the absolute lord of his own followers. Moreover, he no longer bore the title of mayor, but that of duke or prince of the Franks; and the mayoralty, like the royal power now reduced to a shadow, became an hereditary possession which Pippin could bestow upon his sons. The reigns of Theuderich III., Clovis III. or Childebert III. are of no significance except as serving to date charters and diplomas. Pippin it was who administered justice in Austrasia, appointed officials and distributed dukedoms; and it was Pippin, the military leader, who defended the frontiers threatened by Frisians, Alamanni and Bavarians. Descended as he was from Arnulf, bishop of Metz, he was before all things a churchman, and behind his armies marched the missionaries to whom the Carolingian dynasty, of which he was the founder, were to subject all Christendom. Pippin it was, in short, who governed, who set in order the social confusions of Neustria, who, after long wars, put a stop to the malpractices of the dukes and counts, and summoned councils of bishops to make good regulations. But at his death in 714 the child-king Dagobert III. found himself subordinated to Pippin's two grandsons, who, being minors, were under the wardship of their grandmother Plectrude.

Pippin's work was almost undone—a party among the Neustrians under Raginfrid, mayor of the palace, revolted against Pippin II.'s adherents, and Radbod, duke of the Frisians, joined them. But the Austrasians appealed to an illegitimate son of Pippin, Charles Martel, who had escaped from the prison to which Plectrude, alarmed at his prowess, had consigned him, and took him for their leader. With Charles Martel begins the great period of Austrasian history. Faithful to the traditions of the Austrasian mayors, he chose kings for himself—Clotaire IV., then Chilperic II. and lastly Theuderich IV. After Theuderich's death (737) he left the throne vacant until 742, but he himself was king in all but name; he presided over the royal tribunals, appointed the royal officers, issued edicts, disposed of the funds of the treasury and the churches, conferred immunities upon adherents, who were no longer the king's nobles but his own, and even appointed the bishops, though there was nothing of the ecclesiastic about himself. He decided questions of war and peace, and re-established unity in Gaul by defeating the Neustrians and the Aquitanian followers of Duke Odo (Eudes) at Vincy in 717. When Odo, brought to bay, appealed for help to the Arab troops of Abd-rahman, who after conquering Spain had crossed the Pyrenees, Charles, like a second Clovis, saved Catholic Christendom in its peril by crushing the Arabs at Tours (732). The retreat of the Arabs, who were further weakened by religious disputes, enabled him to restore Frankish rule in Aquitaine in spite of Hunald, son of Odo. But Charles's longest expeditions were made into Germany, and in these he sought the support of the Church, then

the greatest of all powers since it was the depository of the Roman imperial tradition.

No less unconscious of his mission than Clovis had been, Charles Martel also was a soldier of Christ. He protected the missionaries who paved the way for his militant invasions. Without him the apostle of Germany, the English monk Boniface, would never have succeeded in preserving the purity of the faith and keeping the bishops submissive to the Holy See. The help given by Charles had two very far-reaching results. Boniface was the instrument of the union of Rome and Germany, of which union the Holy Roman Empire in Germany was in the 10th century to become the most perfect expression, continuing up to the time of Luther. And Boniface also helped on the alliance between the papacy and the Carolingian dynasty, which, more momentous even than that between Clovis and the bishops of Gaul, was to sanctify might by right.

This union was imperative for the bishops of Rome if they wished to establish their supremacy, and their care for orthodoxy by no means excluded all desire of domination. Mere religious authority did not secure to them the obedience of either the faithful or the clergy; moreover, they had to consider the great secular powers, and in this respect their temporal position in Italy was growing unbearable. Their relations with the East Roman emperor (sole lord of the world after the Roman Senate had sent the imperial insignia to Constantinople in 476) were confined to receiving insults from him or suspecting him of heresy. Even in northern Italy there was no longer any opposition to the progress of the Lombards, the last great nation to be established towards the end of the 6th century within the ancient Roman empire—their king Liudprand clearly intended to seize Italy and even Rome itself. Meanwhile from the south attacks were being made by the rebel dukes of Spoleto and Beneventum. Pope Gregory III. cherished dreams of an alliance with the powerful duke of the Franks, as St Remigius before him had thought of uniting with Clovis against the Goths. Charles Martel had protected Boniface on his German missions: he would perhaps lend Gregory the support of his armies. But the warrior, like Clovis aforesaid, hesitated to put himself at the disposal of the priest. When it was a question of winning followers or keeping them, he had not scrupled to lay hands on ecclesiastical property, nor to fill the Church with his friends and kinsfolk, and this alliance might embarrass him. So if he loaded the Roman ambassadors with gifts in 739, he none the less remembered that the Lombards had just helped him to drive the Saracens from Provence. However, he died soon after this, on the 22nd of October 741, and Gregory III. followed him almost immediately.

Feeling his end near, Charles, before an assembly of nobles, had divided his power between his two sons, Carloman and Pippin III. The royal line seemed to have been forgotten for six years, but in 742 Pippin brought a son of Chilperic II. out of a monastery and made him king. This Childeric III. was but a shadow—and knew it. He made a phantom appearance once every spring at the opening of the great annual national convention known as the Campus Martius (Champ de Mars): a dumb idol, his chariot drawn in leisurely fashion by oxen, he disappeared again into his palace or monastery. An unexpected event re-established unity in the Carolingian family. Pippin's brother, the pious Carloman, became a monk in 747, and Pippin, now sole ruler of the kingdom, ordered Childeric also to cut off his royal locks; after which, being king in all but name, he adopted that title in 752. Thus ended the revolution which had been going on for two centuries. The disappearance of Grippo, Pippin's illegitimate brother, who, with the help of all the enemies of the Franks—Alamanni, Aquitanians and Bavarians—had disputed his power, now completed the work of centralization, and Pippin had only to maintain it. For this the support of the Church was indispensable, and Pippin understood the advantages of such an alliance better than Charles Martel. A son of the Church, a protector of bishops, a president of councils, a collector of relics, devoted to Boniface

(whom he invited, as papal legate, to reform the clergy of Austrasia), he astutely accepted the new claims of the vicar of St Peter to the headship of the Church, perceiving the value of an alliance with this rising power.

Prudent enough to fear resistance if he usurped the Merovingian crown, Pippin the Short made careful preparations for his accession, and discussed the question of the dynasty with Pope Zacharias. Receiving a favourable opinion, he had himself anointed and crowned by Boniface in the name of the bishops, and was then proclaimed king in an assembly of nobles, counts and bishops at Soissons in November 751. Still, certain disturbances made him see that aristocratic approval of his kingship might be strengthened if it could claim a divine sanction which no Merovingian had ever received. Two years later, therefore, he demanded a consecration of his usurpation from the pope, and in St Denis on the 28th of July 754 Stephen II. crowned and anointed not only Pippin, but his wife and his two sons as well.

The political results of this custom of coronation were all-important for the Carolingians, and later for the first of the Capets. Pippin was hereby invested with new dignity, and when Boniface's anointing had been confirmed by that of the pope, he became the head of the Frankish Church, the equal of the pope. Moreover, he astutely contrived to extend his priestly prestige to his whole family; his royalty was no longer merely a military command or a civil office, but became a Christian priesthood. This sacred character was not, however, conferred gratuitously. On the very day of his coronation Pippin allowed himself to be proclaimed patrician of the Romans by the pope, just as Clovis had been made consul. This title of the imperial court was purely honorary, but it attached him still more closely to Rome, though without lessening his independence. He had besides given a written promise to defend the Church of Rome, and that not against the Lombards only. Qualified by letters of the papal chancery as "liberator and defender of the Church," his armies twice (754-756) crossed the Alps, despite the opposition of the Frankish aristocracy, and forced Aistulf, king of the Lombards, to cede to him the exarchate of Ravenna and the Pentapolis. Pippin gave them back to Pope Stephen II., and by this famous donation founded that temporal power of the popes which was to endure until 1870. He also dragged the Western clergy into the pope's quarrel with the emperor at Constantinople, by summoning the council of Gentilly, at which the iconoclastic heresy was condemned (767). Matters being thus settled with Rome, Pippin again took up his wars against the Saxons, against the Arabs (whom he drove from Narbonne in 758), and above all against Waifer, duke of Aquitaine, and his ally, duke Tassilo of Bavaria. This last war was carried on systematically from 760 to 768, and ended in the death of Waifer and the definite establishment of the Frankish hold on Aquitaine. When Pippin died, aged fifty-four, on the 24th of September 768, the whole of Gaul had submitted to his authority.

Pippin left two sons, and before he died he had, with the consent of the dignitaries of the realm, divided his kingdom between them, making the elder, Charles (Charlemagne), king of Austrasia, and giving the younger, Carloman, Burgundy, Provence, Septimania, Alsace and Alamannia, and half of Aquitaine to each. On the 9th of October 768 Charles was enthroned at Noyon in solemn assembly, and Carloman at Soissons. The Carolingian sovereignty was thus neither hereditary nor elective, but was handed down by the will of the reigning king, and by a solemn acceptance of the future king on the part of the nobles. In 771 Carloman, with whom Charles had had disputes, died, leaving sons; but bishops, abbots and counts all declared for Charles, save a few who took refuge in Italy with Desiderius, king of the Lombards. Desiderius, whose daughter Bertha or Desiderata Charles, despite the pope, had married at the instance of his mother Bertrade, supported the rights of Carloman's sons, and threatened Pope Adrian in Rome itself after he had despoiled him of Pippin's territorial gift. At the pope's appeal Charles crossed the Alps, took

Verona and Pavia after a long siege, assumed the iron crown of the Lombard kings (June 774), and made a triumphal entry into Rome, which had not formed part of the pope's desires. Pippin's donation was restored, but the protectorate was no longer so distant, respectful and intermittent as the pope liked. After the departure of the imperious conqueror, a fresh revolt of the Lombards of Beneventum under Arichis, Desiderius's son-in-law, supported by a Greek fleet, obliged Pope Adrian to write fresh entreaties to Charlemagne; and in two campaigns (776-777) the latter conquered the whole Lombard kingdom. But another of Desiderius's daughters, married to the powerful duke Tassilo of Bavaria, urged her husband to avenge her father, now imprisoned in the monastery of Corbie. After endless intrigues, however, the duke, hemmed in by three different armies, had in his turn to submit (788), and all Italy was now subject to Charlemagne. These wars in Italy, even the fall of the Lombard kingdom and the recapture of the duchy of Bavaria, were merely episodes: Charlemagne's great war was against the Saxons and lasted thirty years (772-804).

The work of organizing the three great Carolingian conquests—Aquitaine, Italy and Saxony—had yet to be done. Charlemagne approached it with a moderation equal to the vigour which he had shown in the war. But by multiplying its advance-posts, the Frankish kingdom came into contact with new peoples, and each new neighbour meant a new enemy. Aquitaine bordered upon Mussulman Spain; the Avars of Hungary threatened Bavaria with their tireless horsemen; beyond the Elbe and the Saal the Slavs were perpetually at war with the Saxons, and to the north of the Eider were the Danes. All were pagans; all enemies of Charlemagne, defender of Christ's Church, and hence the appointed conqueror of the world.

Various causes—the weakening of the Arabs by the struggle between the Omayyads and the Abbasids just after the battle of Tours; the alliance of the petty Christian kings of the Spanish peninsula; an appeal from the northern amirs who had revolted against the new caliphate of Cordova (755)—made Charlemagne resolve to cross the Pyrenees. He penetrated as far as the Ebro, but was defeated before Saragossa; and in their retreat the Franks were attacked by Vascons, losing many men as they came through the passes. This defeat of the rear-guard, famous for the death of the great Roland and the treachery of Ganelo, induced the Arabs to take the offensive once more and to conquer Septimania. Charlemagne had created the kingdom of Aquitaine especially to defend Septimania, and William, duke of Toulouse, from 790 to 806, succeeded in restoring Frankish authority down to the Ebro, thus founding the Spanish March with Barcelona as its capital. For two centuries and a half the Avars, a remnant of the Huns entrenched in the Hungarian Mesopotamia, had made descents alternately upon the Germans and upon the Greeks of the Eastern empire. They had overrun Bavaria in the very year of its subjugation by Charlemagne (788), and it took an eight-years' struggle to destroy the robber stronghold. The empire thus pushed its frontier-line on from the Elbe to the Oder, ever as it grew menaced by increasing dangers. The sea came to the help of the depopulated land, and Danish pirates, Widukind's old allies, came in their leathern boats to harry the coasts of the North Sea and the Channel. Permanent armies and walls across isthmuses were alike useless; Charlemagne had to build fleets to repulse his elusive foes (808-810), and even after forty years of war the danger was only postponed.

Meanwhile Pippin's Frankish kingdom, vast and powerful as it had been, was doubled. All nations from the Oder to the Elbe and from the Danube to the Atlantic were subject or tributary, and Charlemagne's power even crossed these frontiers. At his summons Christian princes and Mussulman amirs flocked to his palaces. The kings of Northumbria and Sussex, the kings of the Basques and of Galicia, Arab amirs of Spain and Fez, and even the caliph of Bagdad came to visit him in person or sent gifts by the hands of ambassadors. A great warrior and an upright ruler, his

Charlemagne's empire.

conquests recalled those of the great Christian emperors, and the Church completed the parallel by training him in her lore. This still barely civilized German literally went to school to the English Alcuin and to Peter of Pisa, who, between two campaigns, taught him history, writing, grammar and astronomy, satisfying also his interest in sacred music, literature (religious literature especially), and the traditions of Rome and Constantinople. Why should he not be the heir of their Caesars? And so, little by little, this man of insatiable energy was possessed by the ambition of restoring the Empire of the West in his own favour.

There were, however, two serious obstacles in the way: first, the supremacy of the emperor of the East, which though nominal rather than real was upheld by peoples, princes, and even by popes; secondly, the rivalry of the bishops of Rome, who since the early years of Adrian's pontificate had claimed the famous "Donation of Constantine" (q.v.). According to that apocryphal document, the emperor after his baptism had ceded to the sovereign pontiff his imperial power and honours, the purple chlamys, the golden crown, "the town of Rome, the districts and cities of Italy and of all the West." But in 797 the empress of Constantinople had just deposed her son Constantine VI. after putting out his eyes, and the throne might be considered vacant; while on the other hand, Pope Leo III., who had been driven from Rome by a revolt in 799, and had only been restored by a Frankish army, counted for little beside the Frankish monarch, and could not but submit to the wishes of the Carolingian court. So when next year the king of the Franks went to Rome in person, on Christmas Eve of the year 800 and in the basilica of St Peter the pope placed on his head the imperial crown and did him reverence "after the established custom of the time of the ancient emperors." The Roman ideal, handed down in tradition through the centuries, was here first revived.

This event, of capital importance for the middle ages, was fertile in results both beneficial and the reverse. It brought about the rupture between the West and Constantinople. Then Charlemagne raised the papacy on the ruins of Lombardy to the position of first political power in Italy; and the universal Church, headed by the pope, made common cause with the Empire, which all the thinkers of that day regarded as the ideal state. Confusion between these powers was inevitable, but at this time neither Charles, the pope, nor the people had a suspicion of the troubles latent in the ceremony that seemed so simple. Thirdly, Charlemagne's title of emperor strengthened his other title of king of the Franks, as is proved by the fact that at the great assembly of Aix-la-Chapelle in 802 he demanded from all, whether lay or spiritual, a new oath of allegiance to himself as Caesar. His increased power came rather from moral value, from the prestige attaching to one who had given proof of it, than from actual authority over men or centralization; this is shown by the division between the Empire and feudalism. Universal sovereignty claimed as a heritage from Rome had a profound influence upon popular imagination, but in no way modified that tendency to separation of the various nations which was already manifest. Charles himself in his government preferred to restore the ancient Empire by vigorous personal action, rather than to follow old imperial traditions; he introduced cohesion into his "palace," and perfect centralization into his official administration, inspiring his followers and servants, clerical and lay, with a common and determined zeal. The system was kept in full vigour by the *missi dominici*, who regularly reported or reformed any abuses of administration, and by the courts, military, judicial or political, which brought to Charlemagne the strength of the wealth of his subjects, carrying his commands and his ideas to the farthest limits of the Empire. Under him there was in fact a kind of early renaissance after centuries of barbarism and ignorance.

This emperor, who assumed so high a tone with his subjects, his bishops and his counts, who undertook to uphold public order in civil life, held himself no less responsible for the eternal salvation of men's souls in the other world. Thanks to Charlemagne, and through the

restoration of order and of the schools, a common civilization was prepared for the varied elements of the Empire. By his means the Church was able to concentrate in the palatine academy all the intellectual culture of the middle ages, having preserved some of the ancient traditions of organization and administration and guarded the imperial ideal. Charlemagne apparently wished, like Theodoric, to use German blood and Christian unity to bring back life to the great body of the Empire. Not the equal of Caesar or Augustus in genius or in the lastingness of his work, he yet recalls them in his capitularies, his periodic courts, his official hierarchy, his royal emissaries, his ministers, his sole right of coinage, his great public works, his campaigns against barbarism and heathenry, his zeal for learning and literature, and his divinity as emperor. Once more there existed a great public entity such as had not been seen for many years; but its duration was not to be a long one.

Charlemagne had for the moment succeeded in uniting western Europe under his sway, but he had not been able to arrest its evolution towards feudal dismemberment. He had, doubtless conscientiously, laboured for the reconstitution of the Empire; but it often happens that individual wills produce results other than those at which they aimed, sometimes results even contrary to their wishes, and this was what happened in Charlemagne's case. He had restored the superstructure of the imperial monarchy, but he had likewise strengthened and legalized methods and institutions till then private and insecure, and these, passing from custom into law, undermined the foundations of the structure he had thought himself to be repairing. A quarter of a century after his death his Empire was in ruins.

The practice of giving land as a *beneficium* to a grantee who swore personal allegiance to the grantor had persisted, and by his capitularies Charlemagne had made these personal engagements, these contracts of immunity—hitherto not transferable, nor even for life, but quite conditional—regular, legal, even obligatory and almost indissoluble. The *beneficium* was to be as practically irrevocable as the oath of fidelity. He submitted to the yoke of the social system and feudal institutions at the very moment when he was attempting to revive royal authority; he was ruler of the state, but ruler of vassals also. The monarchical principle no longer sufficed to ensure social discipline; the fear of forfeiting the grant became the only powerful guarantee of obedience, and as this only applied to his personal vassals, Charlemagne gave up his claim to direct obedience from the rest of the people, accepting the mediation of the counts, lords and bishops, who levied taxes, adjudicated and administered in virtue of the privileges of patronage, not of the right of the state. The very multiplication of offices, so noticeable at this time, furthered this triumph of feudalism by multiplying the links of personal dependence, and neutralizing more and more the direct action of the central authority. The frequent convocations of military assemblies, far from testifying to political liberty, was simply a means of communicating the emperor's commands to the various feudal groups.

Thus Charlemagne, far from opposing, systematized feudalism, in order that obedience and discipline might pass from one man to another down to the lowest grades of society, and he succeeded for his own lifetime. No authority was more weighty or more respected than that of this feudal lord of Gaul, Italy and Germany; none was more transient, because it was so purely personal.

When the great emperor was buried at Aix-la-Chapelle in 814, his work was entombed with him. The fact was that his successors were incapable of maintaining it. Twenty-nine years after his death the Carolingian Empire had been divided into three kingdoms; forty years later one alone of these kingdoms had split into seven; while when a century had passed France was a litter of tiny states each practically independent. This disintegration was caused neither by racial hate nor by linguistic patriotism. It was the weakness of princes, the discouragement of freemen and landholders confronted by an inexorable system of financial

Causes for the dissolution of the Empire.

The Carolingian Renaissance.

and military tyranny, and the incompatibility of a vast empire with a too primitive governmental system, that wrecked the work of Charlemagne.

The Empire fell to Louis the Pious, sole survivor of his three sons. At the Aix assembly in 813 his father had crowned him with his own hand, thus avoiding the papal sanction that had been almost forced upon himself in 800. Louis was a gentle and well-trained prince, but weak and prone to excessive devotion to the Church. He had only reigned a few years when dissensions broke out on all sides, as under the Merovingians. Charlemagne had assigned their portions to his three sons in 781 and again in 806; like Charles Martel and Pippin the Short before him, however, what he had divided was not the imperial authority, nor yet countries, but the whole system of fiefs, offices and adherents which had been his own patrimony. The division that Louis the Pious made at Aix in 817 among his three sons, Lothair, Pippin and Louis, was of like character, since he reserved the supreme authority for himself, only associating Lothair, the eldest, with him in the government of the empire. Following the advice of his ministers Walla and Agobard, supporters of the policy of unity, Louis the Pious put Bernard of Italy, Charlemagne's grandson, to death for refusing to acknowledge Lothair as co-emperor; crushed a revolt in Brittany; and carried on among the Danes the work of evangelization begun among the Slavs. A fourth son, Charles, was born to him by his second wife, Judith of Bavaria. Jealousy arose between the children of the two marriages. Louis tried in vain to satisfy his sons and their followers by repeated divisions—at Worms (829) and at Aix (831)—in which there was no longer question of either unity or subordination. Yet his elder sons revolted against him in 831 and 832, and were supported by Walla and Agobard and by their followers, weary of all the contradictory oaths demanded of them. Louis was deposed at the assembly of Compiègne (833), the bishops forcing him to assume the garb of a penitent; but he was re-established on his throne in St Etienne at Metz, the 28th of February 835, from which time until his death in 840 he fell more and more under the influence of his ambitious wife, and thought only of securing an inheritance for Charles, his favourite son.

Hardly was Louis buried in the basilica of Metz before his sons flew to arms. The first dynastic war broke out between Lothair, who by the settlement of 817 claimed the whole monarchy with the imperial title, and his brothers Louis and Charles. Lothair wanted, with the Empire, the sole right of patronage over the adherents of his house, but each of these latter chose his own lord according to individual interests, obeying his fears or his preferences. The three brothers finished their discussion by fighting for a whole day (June 25th, 841) on the plain of Fontanet by Auxerre; but the battle decided nothing, so Charles and Louis, in order to get the better of Lothair, allied themselves and their vassals by an oath taken in the plain of Strassburg (Feb. 14th, 842). This, the first document in the vulgar tongue in the history of France and Germany, was merely a mutual contract of protection for the two armies, which nevertheless did not risk another battle. An amicable division of the imperial succession was arranged, and after an assessment of the empire which took almost a year, an agreement was signed at Verdun in August 843.

This was one of the important events in history. Each brother received an equal share of the dismembered empire. Louis had the territory on the right bank of the Rhine, with Spire, Worms and Mainz "because of the abundance of wine." Lothair took Italy, the valleys of the Rhone, the Saône and the Meuse, with the two capitals of the empire, Aix-la-Chapelle and Rome, and the title of emperor. Charles had all the country watered by the Scheldt, the Seine, the Loire and the Garonne, as far as the Atlantic and the Ebro. The partition of Verdun separated once more, and definitively, the lands of the eastern and western Franks. The former became modern Germany, the latter

France, and each from this time forward had its own national existence. However, as the boundary between the possessions of Charles the Bald and those of Louis was not strictly defined, and as Lothair's kingdom, having no national basis, soon disintegrated into the kingdoms of Italy, Burgundy and Arles, in Lotharingia, this great undefined territory was to serve as a tilting-ground for France and Germany on the very morrow of the treaty of Verdun and for ten centuries after.

Charles the Bald was the first king of western France. Anxious as he was to preserve Charlemagne's traditions of government, he was not always strong enough to do so, and warfare within his own dominions was often forced on him. The Norse pirates who had troubled Charlemagne showed a preference for western France, justified by the easy access afforded by river estuaries with rich monasteries on their shores. They began in 841 with the sack of Rouen; and from then until 912, when they made a settlement in one part of the country, though few in numbers they never ceased attacking Charles's kingdom, coming in their ships up the Loire as far as Auvergne, up the Garonne to Toulouse, and up the Seine and the Scheldt to Paris, where they made four descents in forty years, burning towns, pillaging treasure, destroying harvests and slaughtering the peasants or carrying them off into slavery. Charles the Bald thus spent his life sword in hand, fighting unsuccessfully against the Bretons, whose two kings, Nomenoé and Erispoé, he had to recognize in turn; and against the people of Aquitaine, who, in full revolt, appealed for help to his brother, Louis the German. He was beaten everywhere and always: by the Bretons at Ballon (845) and Juvardail (851); by the people of Aquitaine near Angoulême (845); and by the Northmen, who several times extorted heavy ransoms from him. Before long, too, Louis the German actually allied himself with the people of Brittany and Aquitaine, and invaded France at the summons of Charles the Bald's own vassals. Though the treaty of Coblenz (860) seemed to reconcile the two kings for the moment, no peace was ever possible in Charles the Bald's kingdom. His own son Charles, king of Aquitaine, revolted, and Salomon proclaimed himself king of Brittany in succession to Erispoé, who had been assassinated. To check the Bretons and the Normans, who were attacking from the Atlantic and the Mediterranean, Charles the Bald found himself obliged to entrust the defence of the country to Robert the Strong, ancestor of the house of Capet and duke of the lands between Loire and Seine. Robert the Strong, however, though many times victorious over the incorrigible pirates, was killed by them in a fight at Brissarthe (866).

Despite all this, Charles spoke authoritatively in his capitularies, and though incapable of defending western France, coveted other crowns and looked obstinately eastwards. He managed to become king of Lorraine on the death of his nephew Lothair II., and emperor and king of Germany on that of his other nephew Louis II. (875); though only by breaking the compact of the year 800. In 876, the year before his death, he took a third crown, that of Italy, though not without a fresh defeat at Andernach by Louis the German's troops. His titles increased, indeed, but not his power; for while his kingdom was thus growing in area it was falling to pieces. The duchy with which he rewarded Robert the Strong was only a military command, but became a powerful fief. Baldwin I. (d. 879), count of Flanders, turned the country between the Scheldt, the Somme and the sea into another feudal principality. Aquitaine and Brittany were almost independent, Burgundy was in full revolt, and within thirty years Rollo, a Norman leader, was to be master of the whole of the lower Seine from the Cotentin to the Somme. The fact was that between the king's inability to defend the kingdom, and the powerlessness of nobles and peasants to protect themselves from pillage, every man made it his business to seek new protectors, and the country, in spite of Charles the Bald's efforts, began to be covered with strongholds, the peasant learning to live beneath the shelter of the donjon keeps. Such vassals gave themselves utterly to the lord who guarded them, working for him sword

or pickaxe in hand. The king was far away, the lord close at hand. Hence the sixty years of terror and confusion which came between Charlemagne and the death of Charles the Bald suppressed the direct authority of the king in favour of the nobles, and prepared the way for a second destruction of the monarchy at the hands of a stronger power (see FEUDALISM).

Before long Charles the Bald's followers were dictating to him; and in the disaffection caused by his feebleness and cowardice prelates and nobles allied themselves against him. If they acknowledged the king's authority at the assemblies of Yütz (near Thionville) in 844, they forced from him a promise that they should keep their fiefs and their dignities; and while establishing a right of control over all his actions they deprived him of his right of jurisdiction over them. Despite Charles's resistance his royal power dwindled steadily: an appeal to Hincmar, archbishop of Reims, entailed concessions to the Church. In 856 some of his vassals deserted him and went over to Louis the German. To win them back Charles had to sign a new charter, by the terms of which loyalty was no longer a one-sided engagement but a reciprocal contract between king and vassal. He gave up his personal right of distributing the fiefs and honours which were the price of adherence, and thus lost for the Carolingians the free disposal of the immense territories they had gradually usurped; they retained the over-lordship, it is true, but this over-lordship, without usufruct and without choice of tenant, was but a barren possession.

Like their territories public authority little by little slipped from the grasp of the Carolingians, largely because of their abuse of their too great power. They had concentrated the entire administration in their own hands. Like Charlemagne, Louis the Pious and Charles the Bald were omnipotent. There were no provincial assemblies, no municipal bodies, no merchant-gilds, no autonomous churches; the people had no means of making themselves heard; they had no place in an administration which was completely in the hands of a central hierarchy of officials of all ranks, from dukes to *scabini*, with counts, viscounts and *centenarii* in between. However, these dukes and counts were not merely officials: they too had become lords of *fideles*, of their own *advocati*, *centenarii* and *scabini*, whom they nominated, and of all the free men of the county, who since Charlemagne's time had been first allowed and then commanded to "commend" themselves to a lord, receiving feudal benefices in return. Any deprivation or supercession of the count might impoverish, dispossess or ruin the vassals of the entire county; so that all, vassals or officials, small and great, feeling their danger, united their efforts, and lent each other mutual assistance against the permanent menace of an overweening monarchy. Hence, at the end of the 9th century, the heredity of offices as well as of fiefs. In the disordered state of society official stability was a valuable warrant of peace, and the administrative hierarchy, lay or spiritual, thus formed a mould for the hierarchy of feudalism. There was no struggle with the king, simply a cessation of obedience; for without strength or support in the kingdom he was powerless to resist. In vain Charles the Bald affirmed his royal authority in the capitularies of Quierzy-sur-Oise (857), Reims (860), Pistes (864), Gondreville (872) and Quierzy-sur-Oise (877); each time in exchange for assent to the royal will and renewal of oaths he had to acquiesce in new safeguards against himself and by so much to diminish that power of protection against violence and injustice for which the weak had always looked to the throne. Far from forbidding the relation of lord and vassal, Charles the Bald imposed it upon every man in his kingdom, himself proclaiming the real incapacity and failure of that theoretic royal power to which he laid claim. Henceforward royalty had no servants, since it performed no service. There was no longer the least hesitation over the choice between liberty with danger and subjection with safety; men sought and found in vassalage the right to live, and willingly bartered away their liberty for it.

The degeneration of the monarchy was clearly apparent on the death of Charles the Bald, when his son, Louis the Stammerer, was only assured of the throne, which had passed by the right of birth under the Merovingians and been hereditary under the earlier Carolingians, through his election by nobles and bishops under the direction of Hugh the Abbot, successor of Robert the Strong, each voter having been won over by gift of abbey, counties or manors. When Louis died two years later (879), the same nobles met, some at Creil, the rest at Meaux, and the first party chose Louis of Germany, who preferred Lorraine to the crown; while the rest anointed Louis III. and Carloman, sons of the late king, themselves deciding how the kingdom was to be divided between the two princes. Thus the king no longer chose his own vassals; but vassals and fief-holders actually elected their king according to the material advantages they expected from him. Louis III. and Carloman justified their election by their brilliant victories over the Normans at Saucourt (881) and near Epernay (883); but at their deaths (882-884), the nobles, instead of taking Louis's boy-son, Charles the Simple, as king, chose Charles the Fat, king of Germany, because he was emperor and seemed powerful. He united once more the dominions of Charlemagne; but he disgraced the imperial throne by his feebleness, and was incapable of using his immense army to defend Paris when it was besieged by the Normans. Expelled from Italy, he only came to France to buy a shameful peace. When he died in January 888 he had not a single faithful vassal, and the feudal lords resolved never again to place the sceptre in a hand that could not wield the sword.

The death-struggle of the Carolingians lasted for a century of uncertainty and anarchy, during which time the bishops, counts and lords might well have suppressed the monarchy had they been hostile to it. Such, however, was not their policy; on the contrary, they needed a king to act as agent for their private interests, since he alone could invest their rank and dignities with an official and legitimate character. They did not at once agree on Charles's successor; for some of them chose Eudes (Odo), son of Robert the Strong, for his brilliant defence of Paris against the Normans in 885; others Guy, duke of Spoleto in Italy, who had himself crowned at Langres; while many wished for Arnulf, illegitimate son of Carloman, king of Germany and emperor. Eudes was victor in the struggle, and was crowned and anointed at Compiègne on the 29th of February 888; but five years later, meeting with defeat after defeat at the hands of the Normans, his followers deserted from him to Charles the Simple, grandson of Charles the Bald, who was also supported by Fulc, archbishop of Reims.

This first Carolingian restoration took place on the 28th of January 893, and thenceforward throughout this warlike period from 888 to 936 the crown passed from one dynasty to the other according to the interests of the nobles. After desperate strife, an agreement between the two rivals, Arnulf's support, and the death of Odo, secured it for Charles III., surnamed the Simple. His subjects remained faithful to him for a good while, as he put an end to the Norman invasions which had desolated the kingdom for two centuries, and cowed those barbarians, much to the benefit of France. By the treaty of St Clair-sur-Epte (911) their leader Rolf (Rollo) obtained one of Charles's daughters in marriage and the district of the Lower Seine which the Normans had long occupied, on condition that he and his men ceased their attacks and accepted Christianity. Having thus tranquillized the west, Charles took advantage of Louis the Child's death, and conquered Lorraine, in spite of opposition from Conrad, king of Germany (921). But his preference for his new conquest, and for a Lorrainer of low birth named Hagano, aroused the jealousy and discontent of his nobles. They first elected Robert, count of Paris (923), and then after his death in a successful battle near Soissons against Charles the

Simple, Rudolph of Burgundy, his son-in-law. But Herbert of Vermandois, one of the successful combatants at Soissons, coveted the countship of Laon, which Rudolph refused him; and he thereupon proclaimed Charles the Simple, who had confided his cause to him, as king once more. Seeing his danger Rudolph ceded the countship to Herbert, and Charles was relegated to his prison until his death in 920. After unsuccessful wars against the nobles of the South, against the Normans, who asserted that they were bound to no one except Charles the Simple, and against the Hungarians (who, now the Normans were pacified, were acting their part in the East), Rudolph had a return of good fortune in the years between 930 and 936, despite the intrigues of Herbert of Vermandois. Upon his death the nobles assembled to elect a king; and Hugh the Great, Rudolph's brother-in-law, moved by irresolution as much as by prudence, instead of taking the crown, preferred to restore the Carolingians once more in the person of Charles the Simple's son, Louis d'Outremer, himself claiming numerous privileges and enjoying the exercise of power unencumbered by a title which carried with it the jealousy of the nobles.

This restoration was no more peaceful than its predecessor. The Carolingians had as it were a fresh access of energy, and the struggle against the Robertinians went on relentlessly.

Louis IV. the Foreigner (936-954.) Both sides employed similar methods: one was supported by Normandy, the other by Germany; the archbishop of Reims was for the Carolingians, the Robertinians had to be content with the less influential bishop of Sens. Louis soon proved to Hugh the Great, who was trying to play the part of a mayor of the palace, that he was by no means a *roi fainéant*; and the powerful duke of the Franks, growing uneasy, allied himself with Herbert of Vermandois, William of Normandy and his brother-in-law Otto I. king of Germany, who resented the loss of Lorraine. Louis defended himself with energy, aided chiefly by the nobles of the South, by his relative Edmund, king of the English, and then by Otto himself, whose brother-in-law he also had become. A peace advantageous to him was made in 942, and on the deaths of his two opponents, Herbert of Vermandois and William of Normandy, all seemed to be going well for him; but his guardianship of Richard, son of the duke of Normandy, aroused fresh strife, and on the 13th of July 945 he fell into an ambush and suffered a captivity similar to his father's of twenty-two years before. No one had befriended Charles the Simple, but Louis had his wife Gerberga, who won over to his cause the kings of England and Germany and even Hugh. Hugh set him free, insisting, as payment for his aid, on the cession of Laon, the capital of the kingdom and the last fortified town remaining to the Carolingians (946). Louis was hardly free before he took vengeance, harried the lands of his rival, restored to the archiepiscopal throne of Reims Artald, his faithful adviser, in place of the son of Herbert of Vermandois, and managed to get Hugh excommunicated by the council of Ingelheim (948) and by the pope. A two years' struggle wearied the rivals, and they made peace in 950. Louis once more held Laon, and in the following year further strengthened his position by a successful expedition into Burgundy. Still his last years were not peaceful; for besides civil wars there were two Hungarian invasions of France (951 and 954).

Louis's sudden death in 954 once more placed the Carolingian line in peril, since he had not had time to have his son Lothair crowned. For a third time Hugh had the disposal of the crown, and he was no more tempted to take it himself in 954 than in 923 or 936: it was too profitless a possession. Thanks to Hugh's support and to the good offices of Otto and his brother Bruno, archbishop of Cologne and duke of Lorraine, Lothair was chosen king and crowned at Reims. Hugh exacted, as payment for his disinterestedness and fidelity, a renewal of his sovereignty over Burgundy with that of Aquitaine as well; he was in fact the viceroy of the kingdom, and others imitated him by demanding indemnities, privileges and confirmation of rights, as was customary at the beginning of a reign.

Hugh strengthened his position in Burgundy, Lorraine and Normandy by means of marriages; but just as his power was at its height he died (956). His death and the minority of his sons, Hugh Capet and Eudes, gave the Carolingian dynasty thirty years more of life.

For nine years (956-965) Bruno, archbishop of Cologne, was regent of France, and thanks to him there was a kind of *entente cordiale* between the Carolingians and the Robertinians and Otto. Bruno made Lothair recognize Hugh as duke of France and Eudes as duke of Burgundy; but the sons preserved the father's enmity towards king Louis, despite the archbishop's repeated efforts. His death deprived Lothair of a wise and devoted guardian, even if it did set him free from German influence; and the death of Odalric, archbishop of Reims, in 969, was another fatal loss for the Carolingians, succeeded as he was by Adalbero, who, though learned, pious and highly intelligent, was none the less ambitious. On the death of Otto I. (973) Lothair wished to regain Lorraine; but his success was small, owing to his limited resources and the uncertain support of his vassals. In 980, regretting his fruitless quarrel with Otto II., who had ravaged the whole country as far as Paris, and fearing that even with the support of the house of Vermandois he would be crushed like his father Louis IV. between the duke of France and the emperor, who could count on the archbishop of Reims, Lothair made peace with Otto—a great mistake, which cost him the prestige he had gained among his nobles by his fairly successful struggle with the emperor, drawing down upon him, moreover, the swift wrath of Hugh, who thought himself tricked. Otto, meanwhile, whom he was unwise enough to trust, made peace secretly with Hugh, as it was his interest to play off his two old enemies one against the other. However, Otto died first (983), leaving a three-year-old son, Otto III., and Lothair, hoping for Lorraine, upheld the claims of Henry of Bavaria, who wished to oust Otto. This was a war-signal for Archbishop Adalbero and his adviser Gerbert, devoted to the idea of the Roman empire, and determined that it should still be vested in the race of Otto, which had always been beneficent to the Church.

They decided to set the Robertinians against the Carolingians, and on their advice Hugh Capet dispersed the assembly of Compiègne which Lothair had commissioned to examine Adalbero's behaviour. On Lothair's death in 986, Hugh surrounded his son and successor, Louis V., with intrigues. Louis was a weak-minded and violent young man with neither authority nor prestige, and Hugh tried to have him placed under tutelage. After Louis V.'s sudden death, aged twenty, in 987, Adalbero and Gerbert, with the support of the reformed Cluniac clergy, at the Assembly of Senlis eliminated from the succession the rightful heir, Charles of Lorraine, who, without influence or wealth, had become a stranger in his own country, and elected Hugh Capet, who, though rich and powerful, was superior neither in intellect nor character. Thus the triple alliance of Adalbero's bold and adroit imperialism with the cautious and vacillating ambition of the duke of the Franks, and the impolitic hostility towards Germany of the ruined Carolingians, resulted in the unlooked-for advent of the new Capetian dynasty.

This event completed the evolution of the forces that had produced feudalism, the basis of the medieval social system. The idea of public authority had been replaced by one that was simpler and therefore better fitted for a half-civilized society—that of dependence of the weak on the strong, voluntarily entered on by means of mutual contract. Feudalism had gained ground in the 8th century; feudalism it was which had raised the first Carolingian to the throne as being the richest and most powerful person in Austrasia; and Charlemagne with all his power had been as utterly unable as the Merovingians to revive the idea of an abstract and impersonal state. Charlemagne's vassals, however, had needed him; while from Charles the Bald onward it was the king who needed the vassals—a change more marked with each successive prince. The feudal system had in fact turned against the throne, the vassals using it to secure a permanent hold upon offices and

fiefs, and to get possession of estates and of power. After Charles the Bald's death royalty had only, so to speak, a shell—administrative officialdom. No longer firmly rooted in the soil, the monarchy was helpless before local powers which confronted it, seized upon the land, and cut off connexion between throne and people. The king, the supreme lord, was the only lord without lands, a nomad in his own realms, merely lingering there until starved out. Feudalism claimed its new rights in the capitulary of Quierzy-sur-Oise in 857; the rights of the monarchy began to dwindle in 877.

But vassalage could only be a cause of disintegration, not of unity, and that this disintegration did not at once spread indefinitely was due to the dozen or so great military commands—Flanders, Burgundy, Aquitaine, &c.—which Charles the Bald had been obliged to establish on a strong territorial basis. One of these great vassals, the duke of France, was amply provided with estates and offices, in contrast to the landless Carolingian, and his power, like that of the future kings of Prussia and Austria, was based on military authority, for he had a frontier—that of Anjou. Then the inevitable crisis had come. For a hundred years the great feudal lords had disposed of the crown as they pleased, handing it back and forward from one dynasty to another. At the same time the contrast between the vast proportions of the Carolingian empire and its feeble administrative control over a still uncivilized community became more and more accentuated. The Empire crumbled away by degrees. Each country began to lead its own separate existence, stammering its own tongue; the different nations no longer understood one another, and no longer had any general ideas in common. The kingdoms of France and Germany, still too large, owed their existence to a series of dispossessions imposed on sovereigns too feeble to hold their own, and consisted of a great number of small states united by a very slight bond. At the end of the 10th century the duchy of France was the only central part of the kingdom which was still free and without organization. The end was bound to come, and the final struggle was between Laon, the royal capital, and Reims, the ecclesiastical capital, the former carrying with it the soil of France, and the latter the crown. The Capets captured the first in 985 and the other in 987. Thenceforth all was over for the Carolingians, who were left with no heritage save their great name.

Was the day won for the House of Capet? In the 11th century the kings of that line possessed meagre domains scattered about in the Ile de France among the seigniorial possessions of Brie, Beauce, Beauvaisis and Valois. They were hemmed in by the powerful duchy of Normandy, the counties of Blois, Flanders and Champagne, and the duchy of Burgundy. Beyond these again stretched provinces practically impenetrable to royal influence: Brittany, Gascony, Toulouse, Septimania and the Spanish March. The monarchy lay stifling in the midst of a luxuriant feudal forest which surrounded its only two towns of any importance: Paris, the city of the future, and Orleans, the city of learning. Its power, exercised with an energy tempered by prudence, ran to waste like its wealth in a suzerainty over turbulent vassals devoid of common government or administration, and was undermined by the same lack of social discipline among its vassals which had sapped the power of the Carolingians. The new dynasty was thus the poorest and weakest of the great civil and ecclesiastical lordships which occupied the country from the estuary of the Scheldt to that of the Llobregat, and bounded approximately by the Meuse, the Saône and the ridge of the Cévennes; yet it cherished a great ambition which it revealed at times during its first century (987–1108)—a determination not to repeat the Carolingian failure. It had to wait two centuries after the revolution of 987 before it was strong enough to take up the dormant tradition of an authority like that of Rome; and until then it cunningly avoided unequal strife in which, victory being impossible, reverses might have weakened those titles, higher than any due to feudal rights, conferred by the heritage of the Caesars and the coronation at Reims, and held in reserve for the future.

The new dynasty thus at first gave the impression rather of decrepitude than of youth, seeming more a continuation of the Carolingian monarchy than a new departure. Hugh Capet's reign was one of disturbance and danger; behind his dim personality may be perceived the struggle of greater forces—royalty and feudalism, the French clergy and the papacy, the kingdom of France and the Empire. Hugh Capet needed more than three years and the betrayal of his enemy into his hands before he could parry the attack of a quite second-rate adversary, Charles of Lorraine (990), the last descendant of Charlemagne. The insubordination of several great vassals—the count of Vermandois, the duke of Burgundy, the count of Flanders—who treated him as he had treated the Carolingian king; the treachery of Arnulf, archbishop of Reims, who let himself be won over by the empress Theophano; the papal hostility inflamed by the emperor against the claim of feudal France to independence,—all made it seem for a time as though the unity of the Roman empire of the West would be secured at Hugh's expense and in Otto's favour; but as a matter of fact this papal and imperial hostility ended by making the Capet dynasty a national one. When Hugh died in 996, he had succeeded in maintaining his liberty mainly, it is true, by diplomacy, not force, despite opposing powers and his own weakness. Above all, he had secured the future by associating his son Robert with him on the throne; and although the nobles and the archbishop of Reims were disturbed by this suspension of the feudal right of election, and tried to oppose it, they were unsuccessful.

Robert the Pious, a crowned monk, resembled his father in eschewing great schemes, whether from timidity or prudence; yet from 996 to 1031 he preserved intact the authority he had inherited from Hugh, despite many domestic disturbances. He maintained a defiant attitude towards Germany; increased his heritage; strengthened his royal title by the addition of that of duke of Burgundy after fourteen years of pillage; and augmented the royal domain by adding several countships on the south-east and north-west. Limited in capacity, he yet understood the art of acquisition.

Henry I., his son, had to struggle with a powerful vassal, Eudes, count of Chartres and Troyes, and was obliged for a time to abandon his father's anti-German policy. Eudes, who was rash and adventurous, in alliance with the queen-mother, supported the second son, Robert, and captured the royal town of Sens. In order to retake it Henry ceded the beautiful valley of the Saône and the Rhône to the German emperor Conrad, and henceforth the kingdom of Burgundy was, like Lorraine, to follow the fortunes of Germany. Henry had besides to invest his brother with the duchy of Burgundy—a grave error which hampered French politics during three centuries. Like his father, he subsequently managed to retrieve some of the crown lands from William the Bastard, the too-powerful duke of Normandy; and he made a praiseworthy though fruitless attempt to regain possession of Lorraine for the French crown. Finally, by the coronation of his son Philip (1059) he confirmed the hereditary right of the Capets, soon to be superior to the elective rights of the bishops and great barons of the kingdom. The chief merit of these early Capets, indeed, was that they had sons, so that their dynasty lasted on without disastrous minorities or quarrels over the division of inheritance.

Philip I. achieved nothing during his long reign of forty-eight years except the necessary son, Louis the Fat. Unsuccessful even in small undertakings he was utterly incapable of great ones; and the two important events of his reign took place, the one against his will, the other without his help. The first, which lessened Norman aggression in his kingdom, was William the Bastard's conquest of England (1066); the second was the First Crusade preached by the French pope Urban II. (1095). A few half-hearted campaigns against recalcitrant vassals and a long and obstinate quarrel with the papacy over his adulterous union with Bertrade de Montfort, countess of Anjou, represented the total activity

of Philip's reign; he was greedy and venal, by no means disdain- ing the petty profits of brigandage, and he never left his own domains.

After a century's lethargy the house of Capet awoke once more with Louis VI. and began the destruction of the feudal polity.

Louis VI. For thirty-four years of increasing warfare this active **the Fat** and energetic king, this brave and persevering soldier, (1108-1137). never spared himself, energetically policing the royal demesne against such pillagers as Hugh of Le Puiset or Thomas of Marle. There was, however, but little difference yet between a count of Flanders or of Chartres and Louis VI., the possessor of a but small and perpetually disturbed realm, who was praised by his minister, the monk Suger, for making his power felt as far as distant Berril. This was clearly shown when he attempted to force the great feudal lords to recognize his authority. His bold endeavour to establish William Cito in Flanders ended in failure; and his want of strength was particularly humiliating in his unfortunate struggle with Henry I., king of the English and duke of Normandy, who was powerful and well served, the real master of a comparatively weak baron- age. Louis only escaped being crushed because he remembered, as did his successors for long after him, that his house owed its power to the Church.

The Church has never loved weakness; she has always had a secret sympathy for power, whatever its source, when she could hope to capture it and make it serve her ends. Louis VI. de- fended her against feudal robbers; and she supported him in his struggles against the nobles, making him, moreover, by his son's marriage with the heiress of Aquitaine, the greatest and richest landholder of the kingdom. But Louis was not the obedient tool she wished for. With equal firmness and success he vindicated his rights, whether against the indirect attacks of the papacy on his independence, or the claims of the ecclesiastical courts which, in principle, he made subordinate to the jurisdic- tion of the crown; whether in episcopal elections, or in ecclesi- astical reforms which might possibly imperil his power or his revenues. The prestige of this energetic king, protector of the Church, of the infant communes in the towns, and of the peasants as against the constant oppressions of feudalism, became still greater at the end of his reign, when an invasion of the German emperor Henry V. in alliance with Henry Beauclerk of Normandy (Henry I. of England), rallied his subjects round the oriflamme of St Denis, awakening throughout northern France the unanimous and novel sentiment of national danger.

Unfortunately his successor, Louis VII., almost destroyed his work by a colossal blunder, although circumstances seemed much in his favour. Germany and England, the two

Louis VII. powers especially to be dreaded, were busy with **the Young** internal troubles and quarrels of succession. On the (1137-1180). other hand, thanks to his marriage with Eleanor

of Aquitaine, Louis's own domains had been increased by the greater part of the country between the Loire and the Pyrenees; while his father's minister, the monk Suger, continued to assist him with his moderation and prudence. His first successes against Theobald of Champagne, who for thirty years had been the most dangerous of the great French barons and had refused a vassal's services to Louis VI., as well as the adroit diplomacy with which he wrested from Geoffrey the Fair, count of Anjou, a part of the Norman Vexin long claimed by the French kings, in exchange for permitting him to conquer Normandy, augured well for his boldness and activity, had he but confined them to serving his own interests. The second crusade, under- taken to expiate his burning of the church of Vitry, inaugurated a series of magnificent but fruitless exploits; while his wife was the cause of domestic quarrels still more disastrous. Piety and a thirst for glory impelled Louis to take the lead in this

fresh expedition to the Holy Land, despite the **The** opposition of Suger, and the hesitation of the pope, **second** Bernard of Clairvaux and the barons. The alliance **crusade.**

with the German king Conrad III. only enhanced the difficulties of an enterprise already made hazardous by the misunderstandings between Greeks and Latins. The Crusade

ended in the double disaster of military defeat and martial dishonour (1147-1149); and Suger's death in 1151 deprived Louis of a counsellor who had exercised the regency skilfully and with success, just at the very moment when his divorce from Eleanor was to jeopardize the fortunes of the Capets.

For the proud and passionate Eleanor married, two months later (May 1152), the young Henry, count of Anjou and duke of Normandy, who held, besides these great fiefs, the whole of the south-west of France, and in two years' time the crown of England as well. Henry and Louis at once engaged in the first Capet-Angevin duel, destined to last a hundred years (1152-1242). When France and England thus entered European history, their conditions were far from being equal. In England royal power was strong; the size of the Angevin empire was vast, and the succession assured. It was only abuse of their too-great powers that ruined the early Angevin kings. France in the 12th century was merely a federation of separate states, jealously independent, which the king had to negotiate with rather than rule; while his own possessions, shorn of the rich heritage of Aquitaine, were, so to speak, swamped by those of the English king. For some time it was feared that the French kingdom would be entirely absorbed in consequence of the marriage between Louis's daughter and Henry II.'s eldest son. The two rivals were typical of their states, Henry II. being markedly superior to Louis in political resource, military talent and energy. He failed, however, to realize his ambition of shutting in the Capet king and isolating him from the rest of Europe by crafty alliances, notably that with the emperor Frederick Barbarossa—while watching an opportunity to supplant him upon the French throne. It is extraordinary that Louis should have escaped final destruction, considering that Henry had subdued Scotland, retaken Anjou from his brother Geoffrey, won a hold over Brittany, and schemed successfully for Languedoc. But the Church once more came to the rescue of her devoted son. The retreat to France of Pope Alexander III., after he had been driven from Rome by the emperor Frederick in favour of the anti-pope Victor, revived Louis's moral prestige. Henry II.'s quarrel with Thomas Becket, archbishop of Canterbury, which ran its course in France (1164-1171) as a struggle for the independence and reform of the Church, both threatened by the Constitutions of Clarendon, and ended with the murder of Becket in 1172, gave Louis yet another advantage over his rival. Finally the birth of Philip Augustus (1165), after thirty years of childless wedlock, saved the kingdom from a war of succession just at the time when the powerful Angevin sway, based entirely upon force, was jeopardized by the rebellion of Henry II.'s sons against their father. Louis naturally joined the coalition of 1173, but showed no more vigour in this than in his other wars; and his fate would have been sealed had not the pope checked Henry by the threat of an interdict, and reconciled the combatants (1177). Louis had still time left to effect the coronation of his son Philip Augustus (1179), and to associate him with himself in the exercise of the royal power for which he had grown too old and infirm.

Philip Augustus, who was to be the bitterest enemy of Henry II. and the Angevins, was barely twenty before he revealed the full measure of his cold energy and unscrupulous **Philip** ambition. In five years (1180-1186) he rid himself **Augustus** of the overshadowing power of Philip of Alsace, count (1180-1223). of Flanders, and his own uncles, the counts of Champagne; while the treaty of May 20th, 1186, was his first rough lesson to the feudal leagues, which he had reduced to powerlessness, and to the subjugated duke of Burgundy and count of Flanders. Northern and eastern France recognized the suzerainty of the Capet, and Philip Augustus was now bold enough to attack Henry II., the master of the west, whose friendly neutrality (assured by the treaty of Gisors) had made possible the successive defeats of the great French barons. Like his father, Philip understood how to make capital out of the quarrels of the aged and ailing Henry II. with his sons, especially with Richard, who claimed his French heritage in his father's lifetime, and raised up enemies for the disunited Angevins even

in Germany. After two years of constant defeat, Henry's capitulation at Azai proved once more that fortune is never with the old. The English king had to submit himself to "the advice and desire of the king of France," doing him homage for all continental fiefs (1187-1189).

The defection of his favourite son John gave Henry his death-blow, and Philip Augustus found himself confronted by a new king of England, Richard Cœur de Lion, as powerful, besides being younger and more energetic. Philip's ambition could not rest satisfied with the petty principalities of Amiens, Vermandois and Valois, which he had added to the royal demesne. The third crusade, undertaken, sorely against Philip's will, in alliance with Richard, only increased the latent hostility between the two kings; and in 1191 Philip abandoned the enterprise in order to return to France and try to plunder his absent rival. Despite his solemn oath no scruples troubled him: witness the large sums of money he offered to the emperor Henry VI. if he would detain Richard, who had been made prisoner by the duke of Austria on his return from the crusade; and his negotiations with his brother John Lackland, whom he acknowledged king of England in exchange for the cession of Normandy. But Henry VI. suddenly liberated Richard, and in five years that "devil set free" took from Philip all the profit of his trickery, and shut him off from Normandy by the strong fortress of Château-Gaillard (1194-1199).

Happily an accident which caused Richard's death at the siege of Chalus, and the evil imbecility of his brother and successor, John Lackland, brilliantly restored the fortunes of the Capets. The quarrel between John and his nephew Arthur of Brittany gave Philip Augustus one of those opportunities of profiting by family discord which, coinciding with discontent among the various peoples subject to the house of Anjou, had stood him in such good stead against Henry II. and Richard. He demanded renunciation on John's part, not of Anjou only, but of Poitou and Normandy—of all his French-speaking possessions, in fact—in favour of Arthur, who was supported by William des Roches, the most powerful lord of the region of the Loire. Philip's divorce from Ingeborg of Denmark, who appealed successfully to Pope Innocent III., merely delayed the inevitable conflict. John of England, moreover, was a past-master in the art of making enemies of his friends, and his conduct towards his vassals of Aquitaine furnished a judicial pretext for conquest. The royal judges at Paris condemned John, as a felon, to death and the forfeiture of his fiefs (1203), and the murder of Arthur completed his ruin. Philip Augustus made a vigorous onslaught on Normandy in right of justice and of superior force, took the formidable fortress of Château-Gaillard on the Seine after several months' siege, and invested Rouen, which John abandoned, fleeing to England. In Anjou, Touraine, Maine and Poitou, lords, towns and abbeys made their submission, won over by Philip's bribes despite Pope Innocent III.'s attempts at intervention. In 1208 John was obliged to own the Plantagenet continental power as lost. There were no longer two rival monarchies in France; the feudal equilibrium was destroyed, to the advantage of the duchy of France.

But Philip in his turn nearly allowed himself to be led into an attempt at annexing England, and so reversing for his own benefit the work of the Angevins (1213); but, happily for the future of the dynasty, Pope Innocent III. prevented this. Thanks to the ecclesiastical sanction of his royalty, Philip had successfully braved the pope for twenty years, in the matter of Ingeborg and again in that of the German schism, when he had supported Philip of Swabia against Otto of Brunswick, the pope's candidate. In 1213, John Lackland, having been in conflict with Innocent regarding the archiepiscopal see of Canterbury, had made submission and done homage for his kingdom, and Philip wished to take vengeance for this at the expense of the rebellious vassals of the north-west, and of Renaud and Ferrand, counts of Boulogne and Flanders, thus combating English influence in those quarters.

This was a return to the old Capet policy; but it was also menacing to many interests, and sure to arouse energetic resistance. John seized the opportunity to consolidate against Philip a European coalition, which included most of the feudal lords in Flanders, Belgium and Lorraine, and the emperor Otto IV. So dangerous did the French monarchy already seem! John began operations with an attack from Anjou, supported by the notably capricious nobles of Aquitaine, and was routed by Philip's son at La Roche aux Moines, near Angers, on the 2nd of July 1214. Twenty-five days later the northern allies, intending to surprise the smaller French army on its passage over the bridge at Bouvines, themselves sustained a complete defeat. This first national victory had not only a profound effect on the whole kingdom, but produced consequences of far-reaching importance: in Germany it brought about Otto's fall before Frederick II.; in England it introduced the great drama of 1215, the first act of which closed with Magna Carta—John Lackland being forced to acknowledge the control of his barons, and to share with them the power he had abused and disgraced. In France, on the contrary, the throne was exalted beyond rivalry, raised far above a feudalism which never again ventured on acts of independence or rebellion. Bouvines gave France the supremacy of the West. The feudalism of Languedoc was all that now remained to conquer.

The whole world, in fact, was unconsciously working for Philip Augustus. Anxious not to risk his gains, but to consolidate them by organization, Philip henceforth until his death in 1223 operated through diplomacy alone, leaving to others the toil and trouble of conquests, the advantages of which were not for them. When his son Louis wished to wrest the English crown from John, now crushed by his barons, Philip intervened without seeming to do so, first with the barons, then with Innocent III., supporting and disowning his son by turns; until the latter, held in check by Rome, was forced to sign the treaty of Lambeth (1217). When the Church and the needy and fanatical nobles of northern and central France destroyed the feudal dynasty of Toulouse and the rich civilization of the south in the Albigensian crusade, it was for Philip Augustus that their leader, Simon de Montfort, all unknowing, conquered Languedoc. At last, instead of the two Frances of the *langue d'oc* and the *langue d'oïl*, there was but one royal France comprising the whole kingdom.

Philip Augustus was not satisfied with the destruction of a turbulent feudalism; he wished to substitute for it such unity and peace as had obtained in the Roman Empire; and just as he had established his supremacy over the feudal lords, so now he managed to extend it over the clergy, and to bend them to his will. He took advantage of their weakness in the midst of an age of violence. By contracts of "pariage" the clergy claimed and obtained the king's protection even in places beyond the king's jurisdiction, to their common advantage. Philip thus set the feudal lords one against the other; and against them all, first the Church, then the communes. He exploited also the townspeople's need for security and the instinct of independence which made them claim a definite place in the feudal hierarchy. He was the actual creator of the communes, although an interested creator, since they made a breach in the fortress of feudalism and extended the royal authority far beyond the king's demesne. He did even more: he gave monarchy the instruments of which it still stood in need, gathering round him in Paris a council of men humble in origin, but wise and loyal; while in 1190 he instituted *baillis* and *seneschals* throughout his enlarged dominions, all-powerful over the nobles and subservient to himself. He filled his treasury with spoils harshly wrung from all classes; thus inaugurating the monarchy's long and patient labours at enlarging the crown lands bit by bit through taxes on private property. Finally he created an army, no longer the temporary feudal *ost*, but a more or less permanent royal force. By virtue of all these organs of government the throne guaranteed peace, justice and a secure future, having routed

Philip Augustus and John Lackland.

Administration of Philip Augustus.

feudalism with sword and diplomacy. Philip's son was the first of the Capets who was not crowned during his father's lifetime; a fact clearly showing that the principle of heredity had now been established beyond discussion.

Louis VIII.'s short reign was but a prolongation of Philip's in its realization of his two great designs: the recovery from Henry III. of England of Poitou as far as the Garonne; and the crusade against the Albigenses, which with small pains procured him the succession of Amaury de Montfort, and the Languedoc of the counts of Toulouse, if not the whole of Gascony. Louis VIII. died on his return from this short campaign without having proved his full worth.

But the history of France during the 11th and 12th centuries does not entirely consist of these painful struggles of the Capet dynasty to shake off the fetters of feudalism. France, no longer split up into separate fragments, now began to exercise both intellectual and military influence over Europe. Everywhere her sons gave proof of rejuvenated activity. The Christian missions which others were reviving in Prussia and beginning in Hungary were undertaken on a vaster scale by the Capets. These "elder sons of the Church" made themselves responsible for carrying out the "work of God," and French pilgrims in the Holy Land prepared the great movement of the Crusades against the infidels. Religious faith, love of adventure, the hope of making advantageous conquests, anticipations of a promised paradise—all combined to force this advance upon the Orient, which though failing to rescue the sepulchre of Christ, the ephemeral kingdoms of Jerusalem and Cyprus, the dukedom of Athens, or the Latin empire of Constantinople, yet gained for France that prestige for military glory and religious piety which for centuries constituted her strength in the Levant (see CRUSADES). At the call of the pope other members of the French chivalry also made victorious expeditions against the Mussulmans, and founded the Christian kingdom of Portugal. Obeying that enterprising spirit which was to take them to England half a century later, Normans descended upon southern Italy and wrested rich lands from Greeks and Saracens.

In the domain of intellect the advance of the French showed a no less dazzling and a no less universal activity; they sang as well as they fought, and their epics were worthy of their swordsmanship, while their cathedrals were hymns in stone as ardent as their soaring flights of devotion. In this period of intense religious life France was always in the vanguard. It was the ideas of Cluniac monks that freed the Church from feudal supremacy, and in the 11th century produced a Pope Gregory VII.; the spirit of free investigation shown by the heretics of Orleans inspired the rude Breton, Abelard, in the 12th century; and with Gerbert and Fulbert of Chartres the schools first kindled that brilliant light which the university of Paris, organized by Philip Augustus, was to shed over the world from the heights of Sainte-Geneviève. In the quarrels of the priesthood under the Empire it was St Bernard, the great abbot of Clairvaux, who tried to arrest the papacy on the slippery downward path of theocracy; finally, it was in Suger's church of St Denis that French art began that struggle between light against darkness which, culminating in Notre-Dame and the Sainte-Chapelle, was to teach the architects of the world the delight of building with airiness of effect. The old basilica which contains the history of the monarchy sums up the whole of Gothic art to this day, and it was Suger who in the domain of art and politics brought forward once more the conception of unity. The courteous ideal of French chivalry, with its "delectable" language, was adopted by all seigniorial Europe, which thus became animated, as it were, by the life-blood of France. Similarly, in the universal movement of those forces which made for freedom, France began the age-long struggle to maintain the rights of civil society and continually to enlarge the social categories. The townsman enriched by commerce and the emancipated peasant tried more or less valiantly to shake off

the yoke of the feudal system, which had been greatly weakened, if not entirely broken down, by the crusades. Grouped around their belfry-towers and organized within their guilds, they made merry in their free jocular language over their own hardships, and still more over the vices of their lords. They insinuated themselves into the counsels of their ignorant masters, and though still sitting humbly at the feet of the barons, these upright and well-educated servitors were already dreaming of the great deeds they would do when their tyrants should have vacated their high position, and when royalty should have summoned them to power.

By the beginning of the 13th century the Capet monarchy was so strong that the crisis occasioned by the sudden death of Louis VIII. was easily surmounted by the foreign woman and the child whom he left behind him. It is true that that woman was Blanche of Castile, and that child the future Louis IX. A virtuous and very devout Spanish princess, Blanche assumed the regency of the kingdom and the tutelage of her child, and carried them on for nine years with so much force of character and capacity for rule that she soon impressed the clamorous and disorderly leaders of the opposition (1226-1235). By the treaty of Meaux (1229), her diplomacy combined with the influence of the Church to prepare effectually for the annexation of Languedoc to the kingdom, supplementing this again by a portion of Champagne; and the marriage of her son to Margaret of Provence definitely broke the ties which held the country within the orbit of the German empire. She managed also to keep out of the great quarrel between Frederick II. and the papacy which was convulsing Germany. But her finest achievement was the education of her son; she taught him that lofty religious morality which in his case was not merely a rule for private conduct, but also a political programme to which he remained faithful even to the detriment of his apparent interests. With Louis IX. morality for the first time permeated and dominated politics; he had but one end: to do justice to every one and to reconcile all Christendom in view of a general crusade.

The oak of Vincennes, under which the king would sit to mete out justice, cast its shade over the whole political action of Louis IX. He was the arbiter of townspeople, of feudal lords and of kings. The interdiction of the judicial duel, the "quarantaine le roi," i.e. "the king's truce of forty days" during which no vengeance might be taken for private wrongs, and the *assurancement*,¹ went far to diminish the abuses of warfare by allowing his mediation to make for a spirit of reconciliation throughout his kingdom. When Thibaud (Theobald), count of Champagne, attempted to marry the daughter of Pierre Mauclerc, duke of Brittany, without the king's consent, Louis IX., who held the county of Champagne at his mercy, contented himself with exacting guarantees of peace. Beyond the borders of France, at the time of the emperor Frederick II.'s conflict with a papacy threatened in its temporal powers, though he made no response to Frederick's appeal to the civil authorities urging them to present a solid front against the pretensions of the Church, and though he energetically supported the latter, yet he would not admit her right to place kingdoms under interdict, and refused the imperial crown which Gregory IX. offered him for one of his brothers. He always hoped to bring about an honourable agreement between the two adversaries, and in his estimation

¹ The *assurancement* (*assecuratio*, *assecuramentum*) differed from the truce, which was a suspension of hostilities by mutual consent, in so far as it was a peace forced by judicial authority on one of the parties at the request of the other. The party desiring protection applied for the *assurancement*, either before or during hostilities, to any royal, seigniorial or communal judge, who thereupon cited the other party to appear and take an oath that he would assure the person, property and dependents of his adversary (*qu'il l'assurera, elle et les siens*). This custom, which became common in the 13th century, of course depended for its effectiveness on the degree of respect inspired in the feudal nobles by the courts. It was difficult, for instance, to refuse or to violate an *assurancement* imposed by a royal *bailli* or by the parlement itself. See A. Luchaire, *Manuel des institutions françaises* (Paris, 1892), p. 233.—(W. A. P.)

the advantages of peace outweighed personal interest. In matters concerning the succession in Flanders, Hainaut and Navarre; in the quarrels of the princes regarding the Empire, and in those of Henry III. of England with his barons; it was because of his justice and his disinterestedness that he was appealed to as a trusted mediator. His conduct towards Henry III. was certainly a most characteristic example of his behaviour.

The king of England had entered into the coalition formed by the nobility of Poitou and the count of Toulouse to prevent the execution of the treaty of 1229 and the enfeoffment of Poitou to the king's brother Alphonse. Louis IX. defeated Henry III. twice within two days, at Taillebourg and at Saintes, and obliged him to demand a truce (1242). It was forbidden that any lord should be a vassal both of the king of France and of the king of England. After this Louis IX. had set off upon his first crusade in Egypt (1248-54), and on his return he wanted to make this truce into a definite treaty and to "set love" between his children and those of the English king. By a treaty signed at Paris (1259), Henry III. renounced all the conquests of Philip Augustus, and Louis IX. those of his father Louis VIII.—an example unique in history of a victorious king spontaneously giving up his spoil solely for the sake of peace and justice, yet proving by his act that honesty is the best policy; for monarchy gained much by that moral authority which made Louis IX. the universal arbitrator.

But his love of peace and concord was not always "sans grands despens" to the kingdom. In 1258, by renouncing his rights over Roussillon and the countship of Barcelona, conquered by Charlemagne, he made an advantageous bargain because he kept Montpellier; but he committed a grave fault in consenting to accept the offers regarding Sicily made by Pope Urban IV. to his brother the count of Anjou and Provence. That was the origin of the expeditions into Italy on which the house of Valois was two centuries later to squander the resources of France unavailingly, compromising beyond the Alps its interests in the Low Countries and upon the Rhine. But Louis IX.'s worst error was his obsession with regard to the crusades, to which he sacrificed everything. Despite the signal failure of the first crusade, when he had been taken prisoner; despite the protests of his mother, of his counsellors, and of the pope himself, he flung himself into the mad adventure of Tunis. Nowhere was his blind faith more plainly shown, combined as it was with total ignorance of the formidable migrations that were convulsing Asia, and of the complicated game of politics just then proceeding between the Christian nations and the Moslems of the Mediterranean. At Tunis he found his death, on the 25th of August 1270.

The death of Louis IX. and that of his brother Alphonse of Poitiers, heir of the count of Toulouse, made Philip III., the Bold, legitimate master of northern France and undisputed sovereign of southern France. From the latter he detached the *comtat* Venaissin in 1274 and gave it to the papacy, which held it until 1791. But he had not his father's great soul nor disinterested spirit. Urged by Pope Martin IV. he began the fatal era of great international wars by his unlucky crusade against the king of Aragon, who, thanks to the massacre of the Sicilian Vespers, substituted his own predominance in Sicily for that of Charles of Anjou. Philip returned from Spain only to die at Perpignan, ending his insignificant reign as he had begun it, amid the sorrows of a disastrous retreat (1270-1285). His reign was but a halting-place of history between those of Louis IX. and Philip the Fair, just when the transition was taking place from the last days of the middle ages to the modern epoch.

The middle ages had been dominated by four great problems. The first of these had been to determine whether there should be a universal empire exercising tutelage over the nations; and if so, to whom this empire should belong, to pope or emperor. The second had been the extension to the East of that Catholic unity which reigned in the West. Again, for more than a century, the question had also been debated whether the English kings were

to preserve and increase their power over the soil of France. And, finally, two principles had been confronting one another in the internal life of all the European states: the feudal and the monarchical principles. France had not escaped any of these conflicts; but Philip the Fair was the initiator or the instrument (it is difficult to say which) who was to put an end to both imperial and theocratic dreams, and to the international crusades; who was to remove the political axis from the centre of Europe, much to the benefit of the western monarchies, now definitely emancipated from the feudal yoke and firmly organized against both the Church and the barons. The hour had come for Dante, the great Florentine poet, to curse the man who was to dismember the empire, precipitate the fall of the papacy and discipline feudalism.

Modern in his practical schemes and in his calculated purpose, Philip the Fair was still more so in his method, that of legal procedure, and in his agents, the lawyers. With him the French monarchy defined its ambitions, and little by little forsook its feudal and ecclesiastical character in order to clothe itself in juridical forms. His aggressive and litigious policy and his ruthless financial method were due to those lawyers of the south and of Normandy who had been nurtured on Roman law in the universities of Bologna or Montpellier, had practised chicanery in the provincial courts, had gradually thrust themselves into the great arena of politics, and were now leading the king and filling his parlement. It was no longer upon religion or morality, it was upon imperial and Roman rights that these *chevaliers ès lois* based the prince's omnipotence; and nothing more clearly marks the new tradition which was being elaborated than the fact that all the great events of Philip the Fair's reign were lawsuits.

The first of these was with the papacy. The famous quarrel between the priesthood and the Empire, which had culminated at Canossa under Gregory VII., in the apotheosis of the Lateran council under Innocent III., and again in the fall of the house of Hohenstaufen under Innocent IV., was reopened with the king of France by Boniface VIII. The quarrel began in 1294 about a question of money. In his bull *Clericis laicos* the pope protested against the taxes levied upon the French clergy by the king, whose expenses were increasing with his conquests. But he had not insisted; because Philip, between feudal vassals ruined by the crusades and lower classes fleeced by everybody, had threatened to forbid the exportation from France of any ecclesiastical gold and silver. In 1301 and 1302 the arrest of Bernard Saisset, bishop of Pamiers, by the officers of the king, and the citation of this cleric before the king's tribunal for the crime of *lèse-majesté*, revived the conflict and led Boniface to send an order to free Saisset, and to put forward a claim to reform the kingdom under the threat of excommunication. In view of the gravity of the occasion Philip made an unusually extended appeal to public opinion by convoking the states-general at Notre-Dame in Paris (1302). Whatever were their views as to the relations between ecclesiastical and secular jurisdiction, the French clergy, ruined by the dues levied by the papal court, ranged themselves on the national side with the nobility and the *bourgeoisie*; whereupon the king, with a bold stroke far ahead of his time, gave tit for tat. His chancellor, Nogaret, went to Anagni to seize the pope and drag him before a council; but Boniface died without confessing himself vanquished. As a matter of fact the king and his lawyers triumphed, where the house of Swabia had failed. After the death of Boniface the splendid fabric of the medieval theocracy gave place to the rights of civil society, the humiliation of Avignon, the disruption of the great schism, the vain efforts of the councils for reform, and the radical and heretical solutions of Wycliffe and Huss.

The affair of the Templars was another legal process carried out by the same Nogaret. Of course this military religious order had lost utility and justification when the Holy Land had been evacuated and the crusades were over. Their great mistake had lain in becoming rich, and rich to excess, through serving as bankers to princes, kings and popes; for great financial powers soon became

unpopular. Philip took advantage of this hatred of the lower classes and the cowardice of his creature, Pope Clement V., to satisfy his desire for money. The trial of the order (1307-1313) was a remarkable example of the use of the religious tribunal of the Inquisition as a political instrument. There was a dramatic completeness about this unexpected result of the crusades. A general arbitrary arrest of the Templars, the sequestration of their property, examination under torture, the falsifying of procedure, extortion of money from the pope, the *auto-da-fé* of innocent victims, the dishonest pillaging of their goods by the joint action of the king and the pope: such was the outcome of this vast process of secularization, which foreshadowed the events of the 16th and 18th centuries.

External policy had the same litigious character. Philip the Fair instituted suits against his natural enemies, the king of England and the count of Flanders, foreign princes holding possessions within his kingdom; and against the emperor, whose ancient province of Lorraine and kingdom of Arles constantly changed hands between Germany and France. Philip began by interfering in the affairs of Sicily and Aragon, his father's inheritance; after which, on the pretext of a quarrel between French and English sailors, he set up his customary procedure: a citation of the king of England before the parlement of Paris, and in case of default a decree of forfeiture; the whole followed by execution—that is to say by the unimportant war of 1295. A truce arranged by Boniface VIII. restored Guienne to Edward I., gave him the hand of Philip's sister for himself and that of the king's daughter for his son (1298).

A still more lengthy and unfortunate suit was the attempt of Philip the Fair and his successors to incorporate the Flemish fief like the English one (1300-1326), thus coming into conflict with proud and turbulent republics composed of wool and cloth merchants, weavers, fullers and powerful counts. Guy de Dampierre, count of Namur, who had become count of Flanders on the death of his mother Margaret II. in 1279—an ambitious, greedy and avaricious man—was arrested at the Louvre on account of his attempt to marry his daughter to Edward I.'s eldest son without the consent of his suzerain Philip. Released after two years, he sided definitely with the king of England when the latter was in arms against Philip; and being only weakly supported by Edward, he was betrayed by the nobles who favoured France, and forced to yield up not only his personal liberty but the whole of Flanders (1300). The Flemings, however, soon wearying of the oppressive administration of the French governor, Jacques de Châtillon, and the recrudescence of patrician domination, rose and overwhelmed the French chivalry at Courtrai (1302)—a prelude to the coming disasters of the Hundred Years' War. Philip's double revenge, on sea at Zierikzee and on land at Mons-en-Pévèle (1304), led to the signing of a treaty at Athis-sur-Orge (1305).

The efforts of Philip the Fair to expand the limits of his kingdom on the eastern border were more fortunate. His marriage had gained him Champagne; and he afterwards extended his influence over Franche Comté, Bar and the bishoprics of Lorraine, acquiring also Viviers and the important town of Lyons—all this less by force of arms than by the expenditure of money. Disdaining the illusory dream of the imperial crown, still cherished by his legal advisers, he pushed forward towards that fluctuating eastern frontier, the line of least resistance, which would have yielded to him had it not been for the unfortunate interruption of the Hundred Years' War.

His three sons, Louis X., Philip V. the Tall, and Charles IV., continued his work. They increased the power of the monarchy politically by destroying the feudal reaction excited in 1314 by the tyrannical conduct of the jurists, like Enguerrand de Marigny, and by the increasing financial extortions of their father; and they also—notably Philip V., one of the most hard-working of the Capets—increased it on the administrative side by specializing the services

of justice and of finance, which were separated from the king's council. Under these mute self-effacing kings the progress of royal power was only the more striking. With them the senior male line of the house of Capet became extinct.

During three centuries and a half they had effected great things: they had founded a kingdom, a royal family and civil institutions. The land subject to Hugh Capet in 987, barely representing two of the modern departments of France, in 1328 covered a space equal to fifty-nine of them. The political unity of the kingdom was only fettered by the existence of four large isolated fiefs: Flanders on the north, Brittany on the west, Burgundy on the east and Guienne on the south. The capital, which for long had been movable, was now established in the Louvre at Paris, fortified by Philip Augustus. Like the fiefs, feudal institutions at large had been shattered. The Roman tradition which made the will of the sovereign law, gradually propagated by the teaching of Roman law—the law of servitude, not of liberty—and already proclaimed by the jurist Philippe de Beaumanoir as superior to the customs, had been of immense support to the interest of the state and the views of the monarchs; and finally the Capets, so humble of origin, had created organs of general administration common to all in order to effect an administrative centralization. In their grand council and their domains they would have none but silent, servile and well-disciplined agents. The royal exchequer, which was being painfully elaborated in the *chambre des comptes*, and the treasury of the crown lands at the Louvre, together barely sufficed to meet the expenses of this more complicated and costly machinery. The uniform justice exercised by the parlement spread gradually over the whole kingdom by means of *cas royaux* (royal suits), and at the same time the royal coinage became obligatory. Against this exaltation of their power two adversaries might have been formidable; but one, the Church, was a captive in Babylon, and the second, the people, was deprived of the communal liberties which it had abused, or humbly effaced itself in the states-general behind the declared will of the king. This well-established authority was also supported by the revered memory of "Monseigneur Saint Louis"; and it is this prestige, the strength of this ideal superior to all other, that explains how the royal prerogative came to survive the mistakes and misfortunes of the Hundred Years' War.

On the extinction of the direct line of the Capets the crown passed to a younger branch, that of the Valois. Its seven representatives (1328-1498) were on the whole very inferior to the Capets, and, with the exception of Charles V. and Louis XI., possessed neither their political sense nor even their good common sense; they cost France the loss of her great advantage over all other countries. During this century and a half France passed through two very severe crises; under the first five Valois the Hundred Years' War imperilled the kingdom's independence; and under Louis XI. the struggle against the house of Burgundy endangered the territorial unity of the monarchy that had been established with such pains upon the ruins of feudalism.

Charles the Fair having died and left only a daughter, the nation's rights, so long in abeyance, were once more regained. An assembly of peers and barons, relying on two precedents under Philip V. and Charles IV., declared that "no woman, nor therefore her son, could in accordance with custom succeed to the monarchy of France." This definite decision, to which the name of the Salic law was given much later, set aside Edward III., king of England, grandson of Philip the Fair, nephew of the late kings and son of their sister Isabel. Instead it gave the crown to the feudal chief, the hard and coarse Philip VI. of Valois, nephew of Philip the Fair. This at once provoked war between the two monarchies, English and French, which, including periods of truce, lasted for a hundred and sixteen years. Of active warfare there were two periods, both disastrous to begin with, but ending favourably: one lasted from 1337 to 1378 and the other from 1413 to 1453, thirty-three years of distress and folly coming in between.

Advent of the Valois.

Philip VI. (1328-1350).

However, the Hundred Years' War was not mainly caused by the pretensions of Edward III. to the throne of the Capets; since after having long hesitated to do homage to Philip VI. for his possessions in Guienne, Edward at last brought himself to it—though certainly only after lengthy negotiations, and even threats of war in 1331. It is true that six years later he renounced his homage and again claimed the French inheritance; but this was on the ground of personal grievances, and for economic and political reasons. There was a natural rivalry between Edward III. and Philip VI., both of them young, fond of the life of chivalry, festal magnificence, and the "belles apertises d'armes." This rivalry was aggravated by the enmity between Philip VI. and Robert of Artois, his brother-in-law, who, after having warmly supported the disinheriting of Edward III., had been convicted of deceit in a question of succession, had revenged himself on Philip by burning his waxen effigy, and had been welcomed with open arms at Edward's court. Philip VI. had taken reprisals against him in 1336 by making his parlement declare the forfeiture of Edward's lands and castles in Guienne; but the Hundred Years' War, at first simply a feudal quarrel between vassal and suzerain, soon became a great national conflict, in consequence of what was occurring in Flanders.

The communes of Flanders, rich, hard-working, jealous of their liberties, had always been restive under the authority of their counts and the influence of their suzerain, the king of France. The affair at Cassel, where Philip VI. had avenged the injuries done by the people of Bruges in 1325 to their count, Louis of Nevers, had also compromised English interests. To attack the English through their colonies, Guienne and Flanders, was to injure them in their most vital interests—cloth and claret; for England sold her wool to Bruges in order to pay Bordeaux for her wine. Edward III. had replied by forbidding the exportation of English wool, and by threatening the great industrial cities of Flanders with the transference to England of the cloth manufacture—an excellent means of stirring them up against the French, as without wool they could do nothing. Workless, and in desperation, they threw themselves on Edward's mercy, by the advice of a rich citizen of Ghent, Jacob van Artevelde (*q.v.*); and their last scruples of loyalty gave way when Edward decided to follow the counsels of Robert of Artois and of Artevelde, and to claim the crown of France.

The war began, like every feudal war of that day, with a solemn defiance, and it was soon characterized by terrible disasters. The destruction of the finest French fleet that had yet been seen, surprised in the port of Sluys, closed the sea to the king of France; the struggle was continued on land, but with little result. Flanders tired of it, but fortunately for Edward III. Brittany now took fire, through a quarrel of succession, analogous to that in France, between Charles of Blois (who had married the daughter of the late duke and was a nephew of Philip VI., by whom he was supported) and John of Montfort, brother of the old duke, who naturally asked assistance from the king of England. But here, too, nothing important was accomplished; the capture of John of Montfort at Nantes deprived Edward of Brittany at the very moment when he finally lost Flanders by the death of Artevelde, who was killed by the people of Ghent in 1345. Under the influence of Godefroi d'Harcourt, whom Philip VI. had wished to destroy on account of his ambitions with regard to the duchy of Normandy, Edward III. now invaded central France, ravaged Normandy, getting as near to Paris as Saint-Germain; and profiting by Philip VI.'s hesitation and delay, he reached the north with his spoils by dint of forced marches. Having been pursued and encountered at

Crécy, Edward gained a complete victory there on the 26th of April 1346. The seizure of Calais in 1347, despite heroic resistance, gave the English a port where they could always find entry into France, just when the queen of England had beaten David of Scotland, the ally of France, at Neville's Cross, and when Charles of Blois, made prisoner in his turn, was held captive

in London. The Black Death put the finishing touch to the military disasters and financial upheavals of this unlucky reign; though before his death in 1350 Philip VI. was fortunate enough to augment his territorial acquisitions by the purchase of the rich port of Montpellier, as well as by that of Dauphiné, which extended to the Alpine frontier, and was to become the appanage of the eldest son of the king of France (see DAUPHINÉ and DAUPHIN).

Philip VI.'s successor was his son John the Good—or rather, the stupid and the spendthrift. This noble monarch was unspeakably brutal (as witness the murders, simply on suspicion, of the constable Raoul de Brienne, count of Eu, and of the count of Harcourt) and incredibly extravagant. His need of money led him to debase the currency eighty-one times between 1350 and 1355. And this money, so necessary for the prosecution of the war with England, which had been interrupted for a year, thanks to the pope's intervention, was lavished by him upon his favourite, Charles of La Cerda. The latter was murdered in 1354 by order of Charles of Navarre, the king's son-in-law, who also prevented the levying of the taxes voted by the states in 1355 with the object of replenishing the treasury. The Black Prince took this opportunity to ravage the southern provinces, and then marched to join the duke of Lancaster and Charles of Navarre in Normandy. John the Good managed to bring the English army to bay at Maupertuis, not far from Poitiers; but the battle was conducted with such a want of intelligence on his part that the French army was overwhelmed, though very superior in numbers, and King John was made prisoner, after a determined resistance, on the 19th of September 1356.

The disaster at Poitiers almost led to the establishment in France of institutions analogous to those which England owed to Bouvines. The king a prisoner, the dauphin discredited and deserted, and the nobility decimated, the people—that is to say, the states-general—could raise their voice. Philip the Fair had never regarded the states-general as a financial institution, but merely as a moral support. Now, however, in order to obtain substantial help from taxes instead of mere dribbles, the Valois needed a stronger lever than cunning or force. War against the English assured them the support of the nation. Exactions, debasement of the currency and extortionate taxation were ruinous palliatives, and insufficient to supply a treasury which the revenue from crown lands and various rights taken from the nobles could not fill even in times of peace. By the 14th century the motto "*N'impose qui ne veut*" (*i.e.* no taxation without consent) was as firmly established in France as in England. After Crécy Philip VI. called the states together regularly, that he might obtain subsidies from them, as an assistance, an "aid" which subjects could not refuse their suzerain. In return for this favour, which the king could not claim as a right, the states, feeling their power, began to bargain, and at the session of November 1355 demanded the participation of all classes in the tax voted, and obtained guarantees both for its levy and the use to be made of it. A similar situation in England had given birth to political liberty; but in France the great crisis of the early 15th century stifled it. It was with this money that John the Good got himself beaten and taken prisoner at Poitiers. Once more the states-general had to be convoked. Confronted by a pale weakly boy like the dauphin Charles and the remnants of the discredited council, the situation of the states was stronger than ever. Predominant in influence were the deputies from the towns, and above all the citizens of the capital, led by Robert le Coq, bishop of Laon, and Étienne Marcel, provost of the merchants of Paris. Having no cause for confidence in the royal administration, the states refused to treat with the dauphin's councillors, and proposed to take him under their own tutelage. He himself hesitated whether to sacrifice the royal authority, or else, without resources or support, to resist an assembly backed by public opinion. He decided for resistance. Under pretext of

John the Good (1350).

grave news received from his father, and of an interview at Metz with his uncle, the emperor Charles IV., he begged the states to adjourn till the 3rd of November 1356. This was a political *coup d'état*, and when the time had expired he attempted a financial *coup d'état* by debasing the currency. An uprising obliged him to call the states-general together again in February 1357, when they transformed themselves into a deliberative, independent and permanent assembly by means of the *Grande Ordonnance*.

In order to make this great French charter really effective resistance to the royal authority should have been collective, national and even popular, as in the case of the charters of 1215 and 1258 in England. But the lay and ecclesiastical feudal lords continued to show themselves in France, as everywhere else except across the Straits of Dover, a cause of division and oppression. Moreover, the states were never really general; those of the Langue d'oc and the Langue d'oïl sometimes acted together; but there was never a common understanding between them and always two Frances within the kingdom. Besides, they only represented the three classes who alone had any social standing at that period: the nobles, the clergy, and the burgesses of important towns. Étienne Marcel himself protested against councillors "*de petit état*." Again, the states, intermittently convoked according to the king's good pleasure, exercised neither periodical rights nor effective control, but fulfilled a duty which was soon felt as onerous. Indifference and satiety spread speedily; the bourgeoisie forsook the reformers directly they had recourse to violence (February 1358), and the Parisians became hostile when Étienne Marcel complicated his revolutionary work by intrigues with Navarre, releasing from prison the grandson of Louis X., the Headstrong, an ambitious, fine-spoken courter of popularity, covetous of the royal crown. The dauphin's flight from Paris excited a wild outburst of monarchist loyalty and anger against the capital among the nobility and in the states-general of Compiègne. Marcel, like the dauphin, was not a man to turn back. But neither the support of the peasant insurgents—the "*Jacques*"—who were annihilated in the market of Meaux, nor a last but unheeded appeal to the large towns, nor yet the uncertain support of Charles the Bad, to whom Marcel in despair proposed to deliver up Paris, saved him from being put to death by the royalist party of Paris on the 31st of July 1358.

Isolated as he was, Étienne Marcel had been unable either to seize the government or to create a fresh one. In the reaction which followed his downfall royalty inherited the financial administration which the states had set up to check extravagance. The "*Élus*" and the superintendents, instead of being delegates of the states, became royal functionaries like the *baillis* and the provosts; imposts, hearth-money (*fouage*), salt-tax (*gabelle*), sale-dues (*droits de vente*), voted for the war, were levied during the whole of Charles V.'s reign and added to his personal revenue. The opportunity of founding political liberty upon the vote and the control of taxation, and of organizing the administration of the kingdom so as to ensure that the entire military and financial resources should be always available, was gone beyond recall.

Re-establishing the royal authority in Paris was not enough; an end had to be put to the war with England and Navarre, and this was effected by the treaty of Brétigny (1360). King John ceded Poitou, Saintonge, Agenais, Périgord and Limousin to Edward III., and was offered his liberty for a ransom of three million gold crowns; but, unable to pay that enormous sum, he returned to his agreeable captivity in London, where he died in 1364.

Yet through the obstinacy and selfishness of John the Good, France, in stress of suffering, was gradually realizing herself. More strongly than her king she felt the shame of defeat. Local or municipal patriotism waxed among peasants and townfolk, and combined with hatred of the English to develop national sentiment. Many of the conquered repeated that proud, sad answer of the men

of Rochelle to the English: "We will acknowledge you with our lips; but with our hearts, never!"

The peace of Brétigny brought no repose to the kingdom. War having become a congenial and very lucrative industry, its cessation caused want of work, with all the evils that entails. For ten years the remnants of the armies of England, Navarre and Brittany—the "*Grandes Compagnies*," as they were called—ravaged the country; although Charles V., "*durement subtil et sage*," succeeded in getting rid of them, thanks to du Guesclin, one of their chiefs, who led them to any place where fighting was going on—to Brittany, Alsace, Spain. Charles also had all towns and large villages fortified; and being a man of affairs he set about undoing the effect of the treaty of Brétigny by alliances with Flanders, whose heiress he married to his brother Philip, duke of Burgundy; with Henry, king of Castile, and Ferdinand of Portugal, who possessed fine navies; and, finally, with the emperor Charles IV. Financial and military preparations were made no less seriously when the harsh administration of the Black Prince, to whom Edward III. had given Guienne in fief, provoked the nobles of Gascony to complain to Charles V. Cited before the court of Paris, the Black Prince refused to attend, and war broke out in Gascony, Poitou and Normandy, but with fresh tactics (1369). Whilst the English adhered to the system of wide circuits, under Chandos or Robert Knolles, Charles V. limited himself to defending the towns and exhausting the enemy without taking dangerous risks. Thanks to the prudent constable du Guesclin, sitting quietly at home he reconquered bit by bit what his predecessors had lost upon the battlefield, helm on head and sword in hand; and when he died in 1380, after the decease of both Edward III. and the Black Prince, the only possessions of England in a liberated but ruined France were Bayonne, Bordeaux, Brest, Cherbourg and Calais.

The death of Charles V. and dynastic revolutions in England stopped the war for thirty-five years. Then began an era of internal disorder and misery. The men of that period, coarse, violent and simple-minded, with few political ideas, loved brutal and noisy pleasures—witness the incredible festivities at the marriage of Charles VI., and the assassinations of the constable de Clisson, the duke of Orleans and John the Fearless. It would have needed an energetic hand to hold these passions in check; and Charles VI. was a gentle-natured child, twelve years of age, who attained his majority only to fall into a second childhood. Thence arose a question which remained without reply during the whole of his reign. Who should have possession of the royal person, and, consequently, of the royal power? Should it be the uncles of the king, or his followers Clisson and Bureau de la Rivière, whom the nobles called in mockery the *Marmousets*? His uncles first seized the government, each with a view to his own particular interests, which were by no means those of the kingdom at large. The duke of Anjou emptied the treasury in conquering the kingdom of Naples, at the call of Queen Joanna of Sicily. The duke of Berry seized upon Languedoc and the wine-tax. The duke of Burgundy, heir through his wife to the countship of Flanders, wanted to crush the democratic risings among the Flemings. Each of them needed money, but Charles V., pricked by conscience on his death-bed, forbade the levying of the hearth-tax (1380). His brother's attempt to re-establish it set Paris in revolt. The *Maillotins* of Paris found imitators in other great towns; and in Auvergne and Vivarais the *Tuchins* renewed the Jacquerie. Revolutionary attempts between 1380 and 1385 to abolish all taxes were echoed in England, Florence and Flanders. These isolated rebellions, however, were crushed by the ever-ready coalition of royal and feudal forces at Roosebeke (1382). Taxes and subsidies were maintained and the hearth-money re-established.

The death of the duke of Anjou at Bari (1384) gave preponderant influence to Philip the Bold, duke of Burgundy, who increased the large and fruitless expenses of his Burgundian

policy to such a point that on the return of a last unfortunate expedition into Gelderland Charles VI., who had been made by him to marry Isabel of Bavaria, took the government from his uncles on the 3rd of May 1389, and recalled the *Marmousets*. But this young king, aged only twenty, very much in love with his young wife and excessively fond of pleasure, soon wrecked the delicate poise of his mental faculties in the festivities of the Hôtel Saint-Paul; and a violent attack of Pierre de Craon on the constable de Clisson having led to an expedition against his accomplice, the duke of Brittany, Charles was seized by insanity on the road. The *Marmousets* were deposed, the king's brother, the duke of Orleans, set aside, and the old condition of affairs began again (1392).

The struggle was now between the two branches of the royal family, the Orleanist and the Burgundian, between the aristocratic south and the democratic north; while the deposition of Richard II. of England in favour of Henry of Lancaster permitted them to vary civil war by war against the foreigner. Philip the Bold, duke of Burgundy, the king's uncle, had certain advantages over his rival Louis of Orleans, Charles VI.'s brother: superiority in age, relations with the Lancastrians and with Germany, and territorial wealth and power. The two adversaries had each the same scheme of government: each wanted to take charge of Charles VI., who was intermittently insane, and to exclude his rival from the pillage of the royal exchequer; but this rivalry of desires brought them into opposition on all the great questions of the day—the war with England, the Great Schism and the imperial election. The struggle became acute when John the Fearless of Burgundy succeeded his father in 1404. Up to this time the queen, Isabel of Bavaria, had been held in a kind of dependency upon Philip of Burgundy, who had brought about her marriage; but less eager for influence than for money, since political questions were unintelligible to her and her situation was a precarious one, she suddenly became favourable to the duke of Orleans. Whether due to passion or caprice this cost the duke his life, for John the Fearless had him assassinated in 1407, and thus let loose against one another the Burgundians and the Armagnacs, so-called because the son of the murdered duke was the son-in-law of the count of Armagnac (see ARMAGNAC). Despite all attempts at reconciliation the country was divided into two parties. Paris, with her tradesmen—the butchers in particular—and her university, played an important part in this quarrel; for to be master of Paris was to be master of the king. In 1413 the duke of Burgundy gained the upper hand there, partly owing to the rising of the *Cabochiens*, i.e. the butchers led by the skinner Simon Caboche, partly to the hostility of the university to the Avignon pope and partly to the Parisian bourgeoisie.

Amid this reign of terror and of revolt the university, the only moral and intellectual force, taking the place of the impotent states-general and of a parlement carefully restricted to the judiciary sphere, vainly tried to re-establish a firm monarchical system by means of the *Ordonnance Cabochienne*; but this had no effect, the government being now at the mercy of the mob, themselves at the mercy of incapable hot-headed leaders. The struggle ended in becoming one between factions of the townsmen, led respectively by the *Wächter* Cirasse and by Jean Caboche. The former overwhelmed John the Fearless, who fled from Paris; and the Armagnacs, re-entering on his exit, substituted white terror for red terror, from the 12th of December 1413 to the 28th of July 1414. The butchers' organization was suppressed and all hope of reform lost. Such disorders allowed Henry V. of England to take the offensive again.

The Armagnacs were in possession of Paris and the king when Henry V. crushed them at Agincourt on the 25th of October 1415. It was as at Crécy and Poitiers; the French chivalry, accustomed to mere playing at battle in the tourneys, no longer knew how to fight. Charles of Orleans being a captive and his father-in-law, the count of

Armagnac, highly unpopular, John the Fearless, hitherto prudently neutral, re-entered Paris, amid scenes of carnage, on the invitation of the citizen Perrinet le Clerc.

Secure from interference, Henry V. had occupied the whole of Normandy and destroyed in two years the work of Philip Augustus. The duke of Burgundy, feeling as incapable of coming to an understanding with the masterful Englishman as of resisting him unaided, tried to effect a reconciliation with the Armagnacs, who had with them the heir to the throne, the dauphin Charles; but his assassination at Montreuil in 1419 nearly caused the destruction of the kingdom, the whole Burgundian party going over to the side of the English. By the treaty of Troyes (1420) the son of John the Fearless, Philip the Good, in order to avenge his father recognized Henry V. (now married to Catherine, Charles VI.'s daughter) as heir to the crown of France, to the detriment of the dauphin Charles, who was disavowed by his mother and called in derision "the soi-disant dauphin of Viennois." When Henry V. and Charles VI. died in 1422, Henry VI.—son of Henry V. and Catherine—was proclaimed at Paris king of France and of England, with the concurrence of Philip the Good, duke of Burgundy. Thus in 1428 the English occupied all eastern and northern France, as far as the Loire; while the two most important civil powers of the time, the parlement and the university of Paris, had acknowledged the English king.

But the cause of greatest weakness to the French party was still Charles VII. himself, the king of Bourges. This youth of nineteen, the ill-omened son of a madman and of a Bavarian of loose morals, was a symbol of France, timorous and mistrustful. The châteaux of the Loire, where he led a restless and enervating existence, held an atmosphere little favourable to enthusiasm and energy. After his victories at Cravant (1423) and Verneuil (1424), the duke of Bedford, appointed regent of the kingdom, had given Charles VII. four years' respite, and these had been occupied in violent intrigues between the constable de Richemont¹ and the sire de la Trémoille, the young king's favourites, and solely desirous of enriching themselves at his expense. The king, melancholy spectacle as he was, seemed indeed to suit that tragic hour when Orleans, the last bulwark of the south, was besieged by the earl of Salisbury, now roused from inactivity (1428). He had neither taste nor capacity like Philip VI. or John the Good for undertaking "belles apertises d'armes"; but then a lack of chivalry combined with a temporizing policy had not been particularly unsuccessful in the case of his grandfather Charles V.

Powerful aid now came from an unexpected quarter. The war had been long and cruel, and each successive year naturally increased feeling against the English. The damage done to Burgundian interests by the harsh yet impotent government of Bedford, disgust at the iniquitous treaty of Troyes, the monarchist loyalty of many of the warriors, the still deeper sentiment felt by men like Alain Chartier towards "Dame France," and the "great misery that there was in the kingdom of France"; all these suddenly became incarnate in the person of Joan of Arc, a young peasant of Domrémy in Lorraine. Determined in her faith and proud in her meekness, in opposition to the timid counsels of the military leaders, to the interested delays of the courtiers, to the scruples of the experts and the quarrelling of the doctors, she quoted her "voices," who had, she said, commissioned her to raise the siege of Orleans and to conduct the gentle dauphin to Reims, there to be crowned. Her sublime folly turned out to be wiser than their wisdom; in two months, from May to July 1429, she had freed Orleans, destroyed the prestige of the English army at Patay, and dragged the doubting and passive king against his will to be crowned at Reims. All this produced a marvellous revulsion of political feeling throughout France, Charles VII. now becoming incontestably "him to whom the kingdom of France ought to belong." After Reims Joan's first thought was for Paris, and to achieve the final overthrow

of the English; while Charles VII. was already sighing for the easy life of Touraine, and recurring to that policy of truce which was so strongly urged by his counsellors, and so keenly irritating to the clear-sighted Joan of Arc. A check before Paris allowed the jealousy of La Trémoille to waste the heroine for eight months on operations of secondary importance, until the day when she was captured by the Burgundians under the walls of Compiègne, and sold by them to the English. The latter incontinently prosecuted her as a heretic; they had, indeed, a great interest in seeing her condemned by the Church, which would render her conquests sacrilegious. After a scandalous four months' duel between this simple innocent girl and a tribunal of crafty malevolent ecclesiastics and doctors of the university of Paris, Joan was burned alive in the old market-place of Rouen, on the 30th of May 1431 (see JOAN OF ARC).

On Charles VII.'s part this meant oblivion and silence until the day when in 1450, more for his own sake than for hers, he caused her memory to be rehabilitated; but Joan had given the country new life and heart. From 1431 to 1454 the struggle against the English went on energetically; and the king, relieved in 1433 of his evil genius, La Trémoille, then became a man once more, playing a kingly part under the guidance of Dunois, Richemont, La Hire and Saintrailles, leaders of worth on the field of battle. Moreover, the English territory, a great triangle, with the Channel for base and Paris for apex, was not a really solid position. Yet the war seemed interminable; until at last Philip of Burgundy, for long embarrassed by his English alliance, decided in 1435 to become reconciled with Charles VII. This was in consequence of the death of his sister, who had been married to Bedford, and the return of his brother-in-law Richemont into the French king's favour. The treaty of Arras, which made him a sovereign prince for life, though harsh, at all events gave a united France the opportunity of expelling the English from the east, and allowed the king to re-enter Paris in 1436. From 1436 to 1439 there was a terrible repetition of what happened after the Peace of Brétigny; famine, pestilence, extortions and, later, the aristocratic revolt of the Praguerie, completed the ruin of the country. But thanks to the permanent tax of the *taille* during this time of truce Charles VII. was able to effect the great military reform of the Compagnies d'Ordonnance, of the Francs-Archers, and of the artillery of the brothers Bureau. From this time forward the English, ruined, demoralized and weakened both by the death of the duke of Bedford and the beginnings of the Wars of the Roses, continued to lose territory on every recurrence of conflict. Normandy was lost to them at Formigny (1450), and Guienne, English since the 12th century, at Castillon (1453). They kept only Calais; and now it was their turn to have a madman, Henry VI., for king.

France issued from the Hundred Years' War victorious, but terribly ruined and depopulated. It is true she had definitely freed her territory from the stranger, and through the sorrows of defeat and the menace of disruption had fortified her national solidarity, and defined her patriotism, still involved in and not yet dissociated from loyalty to the monarchy. A happy awakening, although it went too far in establishing royal absolutism; and a victory too complete, in that it enervated all the forces of resistance. The nation, worn out by the long disorders consequent on the captivity of King John and the insanity of Charles VI., abandoned itself to the joys of peace. Preferring the solid advantage of orderly life to an unstable liberty, it acquiesced in the abdication of 1439, when the States consented to taxation for the support of a permanent army without any periodical renewal of their authorization. No doubt by the prohibition to levy the smallest *taille* the feudal lords escaped direct taxation; but from the day when the privileged classes selfishly allowed the taxing of the third estate, provided that they themselves were exempt, they opened the door to monarchic absolutism. The principle of autocracy triumphed everywhere over the remnants of local or provincial authority, in the sphere of industry as in that of administration;

while the gild system became much more rigid. A loyal bureaucracy, far more powerful than the phantom administration of Bourges or of Poitiers, gradually took the place of the court nobility; and thanks to this the institutions of control which the war had called into power—the provincial states-general—were nipped in the bud, withered by the people's poverty of political idea and by the blind worship of royalty. Without the nation's concurrence the king's creatures were now to endow royalty with all the organs necessary for the exertion of authority; by which imprudent compliance, and above all thanks to Jacques Cœur (*q.v.*), the financial independence of the provinces disappeared little by little, and all the public revenues were left at the discretion of the king alone (1436-1440). By this means, too, and chiefly owing to the constable de Richemont and the brothers Bureau, the first permanent royal army was established (1445).

Henceforward royalty, strengthened by victory and organized for the struggle, was able to reduce the centrifugal social forces to impotence. The parlement of Paris saw its monopoly encroached upon by the court of Toulouse in 1443, and by the parlement of Grenoble in 1453. The university of Paris, compromised with the English, like the parlement, witnessed the institution and growth of privileged provincial universities. The Church of France was isolated from the papacy by the Pragmatic Sanction of Bourges (1438) only to be exploited and enslaved by royalty. Monarchic centralization, interrupted for the moment by the war, took up with fresh vigour its attacks upon urban liberties, especially in the always more independent south. It caused a slackening of that spirit of communal initiative which had awakened in the midst of unprecedented disasters. The decimated and impoverished nobility proved their impotence in the coalitions they attempted between 1437 and 1442, of which the most important, the Praguerie, fell to pieces almost directly, despite the support of the dauphin himself.

The life of society, now alarmingly unstable and ruthlessly cruel, was symbolized by the *danse macabre* painted on the walls of the cemeteries; the sombre and tragic art of the 15th century, having lost the fine balance shown by that of the 13th, gave expression in its mournful realism to the general state of exhaustion. The favourite subject of the mysteries and of other artistic manifestations was no longer the triumphant Christ of the middle ages, nor the smiling and teaching Christ of the 13th century, but the Man of sorrows and of death, the naked bleeding Jesus, lying on the knees of his mother or crowned with thorns. France, like the Christ, had known all the bitterness and weakness of a Passion.

The war of independence over, after a century of fatigue, regrets and doubts, royalty and the nation, now more united and more certain of each other, resumed the methodic and utilitarian war of widening boundaries. Leaving dreams about crusades to the poets, and to a papacy delivered from schism, Charles VII. turned his attention to the ancient appanage of Lothair, Alsace and Lorraine, those lands of the north and the east whose frontiers were constantly changing, and which seemed to invite aggression. But the chance of annexing them without great trouble was lost; by the fatal custom of appanages the Valois had set up again those feudal institutions which the Capets had found such difficulty in destroying, and Louis XI. was to make sad experience of this.

To the north and east of the kingdom extended a wide territory of uncertain limits; countries without a chief like Alsace; principalities like Lorraine, ecclesiastical lordships like the bishopric of Liège; and, most important of all, a royal appanage, that of the duchy of Burgundy, which dated back to the time of John the Good. Through marriages, conquests and inheritance, the dukes of Burgundy had enormously increased their influence; while during the Hundred Years' War they had benefited alternately by their criminal alliance with the English and by their self-interested reconciliation with their sovereign. They soon

appeared the most formidable among the new feudal chiefs so imprudently called into being by Louis XI.'s predecessors. Fleeing from the paternal wrath which he had drawn down upon himself by his ambition and by his unauthorized marriage with Charlotte of Savoy, the future Louis XI. had passed five years of voluntary exile at the court of the chief of the House of Burgundy, Philip the Good; and he was able to appreciate the territorial power of a duchy which extended from the Zuyder Zee to the Somme, with all the country between the Saône and the Loire in addition, and its geographical position as a commercial intermediary between Germany, England and France. He had traversed the fertile country of Flanders; he had visited the rich commercial and industrial republics of Bruges and Ghent, which had escaped the disasters of the Hundred Years' War; and, finally, he had enjoyed a hospitality as princely as it was self-interested at Brussels and at Dijon, the two capitals, where he had seen the brilliancy of a court unique in Europe for the ideal of chivalric life it offered.

But the dauphin Louis, although a bad son and impatient for the crown, was not dazzled by all this. With very simple tastes, an inquiring mind, and an imagination always at work, he combined a certain easy good-nature which inspired confidence, and though stingy in spending money on himself, he could be lavish in buying men either dangerous or likely to be useful. More inclined to the subtleties of diplomacy than to the risks of battle, he had recognized and speedily grasped the disadvantages of warfare. The duke of Burgundy, however rich and powerful, was still the king's vassal; his wide but insecure authority, of too rapid growth and unpopular, lacked sovereign rights. Hardly, therefore, had Louis XI. heard of his father's death than he made his host aware of his perfectly independent spirit, and his very definite intention to be master in his own house.

But by a kind of poetic justice, Louis XI. had for seven years, from 1465 to 1472, to struggle against fresh Pragueries, called *The Leagues of the Public Weal* (presumably from their disregard of it), composed of the most powerful French nobles, to whom he had set the example of revolt. His first proceedings had indeed given no promise of the moderation and prudence afterwards to characterize him; he had succeeded in exasperating all parties; the officials of his father, "the well-served," whom he dismissed in favour of inferiors like Jean Balue, Oliver le Daim and Tristan Lermite; the clergy, by abrogating the Pragmatic Sanction; the university of Paris, by his ill-treatment of it; and the nobles, whom he deprived of their hunting rights, among them being those whom Charles VII. had been most careful to conciliate in view of the inevitable conflict with the duke of Burgundy—in particular, Francis II., duke of Brittany. The repurchase in 1463 of the towns of the Somme (to which Philip the Good, now grown old and engaged in a quarrel with his son, the count of Charolais, had felt obliged to consent on consideration of receiving four hundred thousand gold crowns), and the intrigues of Louis XI. during the periodical revolts of the Liégeois against their prince-bishop, set the powder alight. On three different occasions (in 1465, 1467 and 1472), Louis XI.'s own brother, the duke of Berry, urged by the duke of Brittany, the count of Charolais, the duke of Bourbon, and the other feudal lords, attempted to set up six kingdoms in France instead of one, and to impose upon Louis XI. a regency which should give them enormous pensions. This was their idea of Public Weal.

Louis XI. won by his favourite method, diplomacy rather than arms. At the time of the first league, the battle of Monthéry (16th of July 1465) having remained undecided between the two equally badly organized armies, Louis XI. conceded everything in the treaties of Conflans and Saint-Maur—promises costing him little, since he had no intention of keeping them. But during the course of the second league, provoked by the recapture of Normandy, which he had promised to his brother in exchange for Berry, he was nearly caught in his own trap. On the 15th of June 1467 Philip the Good died, and the accession of the count of

Charolais was received with popular risings. In order to embarrass him Louis XI. had secretly encouraged the people of Liège to revolt; but preoccupied with the marriage of Charles the Bold with Margaret of York, sister of Edward IV. of England, he wished to negotiate personally with him at Péronne, and hardly had he reached that place when news arrived there of the revolt of Liège amid cries of "Vive France." Charles the Bold, proud, violent, pugnacious, as treacherous as his rival, a hardier soldier, though without his political sagacity, imprisoned Louis in the tower where Charles the Simple had died as a prisoner of the count of Vermandois. He only let him depart when he had sworn in the treaty of Péronne to fulfil the engagements made at Conflans and Saint-Maur to assist in person at the subjugation of rebellious Liège, and to give Champagne as an appanage to his ally the duke of Berry.

Louis XI., supported by the assembly of notables at Tours (1470), had no intention of keeping this last promise, since the duchy of Champagne would have made a bridge between Burgundy and Flanders—the two isolated branches of the house of Burgundy. He gave the duke of Berry distant Guienne. But death eventually rid him of the duke in 1472, just when a third league was being organized, the object of which was to make the duke of Berry king with the help of Edward IV., king of England. The duke of Brittany, Francis II., was defeated; Charles the Bold, having failed at Beauvais in his attempt to recapture the towns of the Somme which had been promised him by the treaty of Conflans, was obliged to sign the peace of Senlis (1472). This was the end of the great feudal coalitions, for royal vengeance soon settled the account of the lesser vassals; the duke of Alençon was condemned to prison for life; the count of Armagnac was killed; and "the Germans" were soon to disembarrass Louis of Charles the Bold.

Charles had indeed only signed the peace so promptly because he was looking eastward towards that royal crown and territorial cohesion of which his father had also dreamed. The king, he said of Louis XI., is always ready. He wanted to provide his future sovereignty with organs analogous to those of France; a permanent army, and a judiciary and financial administration modelled on the French parlement and exchequer. Since he could not dismember the kingdom of France, his only course was to reconstitute the ancient kingdom of Lotharingia; while the conquest of the principality of Liège and of the duchy of Gelderland, and the temporary occupation of Alsace, pledged to him by Sigismund of Austria, made him greedy for Germany. To get himself elected king of the Romans he offered his daughter Mary, his eternal candidate for marriage, to the emperor Frederick III. for his son. Thus either he or his son-in-law Maximilian would have been emperor.

But the Tarpeian rock was a near neighbour of the Capitol. Frederick—distrustful, and in the pay of Louis XI.—evaded a meeting arranged at Trier, and Burgundian influence in Alsace was suddenly brought to a violent end by the putting to death of its tyrannical agent, Peter von Hagenbach. Charles thought to repair the rebuff of Trier at Cologne, and wasted his resources in an attempt to win over its elector by besieging the insignificant town of Neuss. But the "universal spider"—as he called Louis XI.—was weaving his web in the darkness, and was eventually to entangle him in it. First came the reconciliation, in his despite, of those irreconcilables, the Swiss and Sigismund of Austria; and then the union of both with the duke of Lorraine, who was also disturbed at the duke of Burgundy's ambition. In vain Charles tried to kindle anew the embers of former feudal intrigues; the execution of the duke of Nemours and the count of Saint Pol cooled all enthusiasm. In vain did he get his dilatory friends, the English Yorkists, to cross the Channel; on the 29th of August 1475, at Picquigny, Louis XI. bribed them with a sum of seventy-five thousand crowns to forsake him. Edward further undertaking to guarantee the loyalty of the duke of Brittany. Exasperated, Charles attacked and took Nancy,

wishing, as he said, "to skin the Bernese bear and wear its fur." To the hanging of the brave garrison of Granson the Swiss responded by terrible reprisals at Granson and at Morat (March to June 1476); while the people of Lorraine finally routed Charles at Nancy on the 5th of January 1477, the duke himself falling in the battle.

The central administration of Burgundy soon disappeared, swamped by the resurgence of ancient local liberties; the army fell to pieces; and all hope of joining the two limbs of the great eastern duchy was definitely lost. As for the remnants that were left, French provinces and imperial territory, Louis XI. claimed the whole. He seized everything, alleging different rights in each place; but he displayed such violent haste and such trickery that he threw the heiress of Burgundy, in despair, into the arms of Maximilian of Austria. At the treaty of Arras (December 1482) Louis XI. received only Picardy; the Boulonnais and Burgundy; by the marriage of Charles the Bold's daughter the rest was annexed to the Empire, and later to Spain. Thus by Louis XI.'s short-sighted error the house of Austria established itself in the Low Countries. An age-long rivalry between the houses of France and Austria was the result of this disastrous marriage; and as the son who was its issue espoused the heiress of a now unified Spain, France, hemmed in by the Spaniards and by the Empire, was thenceforward to encounter them everywhere in her course. The historical progress of France was once more endangered.

The reasons of state which governed all Louis XI.'s external policy also inspired his internal administration. If they justified him in employing lies and deception in international affairs, in his relations with his subjects they led him to regard as lawful everything which favoured his authority; no question of right could weigh against it. The army and taxation, as the two chief means of domination within and without the kingdom, constituted the main bulwarks of his policy. As for the nobility, his only thought was to diminish their power by multiplying their number, as his predecessors had done; while he reduced the rebels to submission by his iron cages or the axe of his gossip Tristan Lermite. The Church was treated with the same unconcerned cynicism; he held her in strict tutelage, accentuating her moral decadence still further by the manner in which he set aside or re-established the Pragmatic Sanction, according to the fluctuations of his financial necessities or his Italian ambitions. It has been said that on the other hand he was a king of the common people, and certainly he was one of them in his simple habits, in his taste for rough pleasantries, and above all in his religion, which was limited to superstitious practices and small devoutnesses. But in the states of Tours in 1468 he evinced the same mistrust for fiscal control by the people as for the privileges of the nobility. He inaugurated that autocratic rule which was to continue gaining strength until Louis XV.'s time. Louis XI. was the king of the bourgeoisie; he exacted much from them, but paid them back with interest by allowing them to reduce the power of all who were above them and to lord it over all who were below. As a matter of fact Louis XI.'s most faithful ally was death. Saint-Pol, Nemours, Charles the Bold, his brother the duke of Berry, old René of Anjou and his nephew the count of Maine, heir to the riches of Provence and to rights over Naples—the skeleton hand mowed down all his adversaries as though it too were in his pay; until the day when at Plessisles-Tours it struck a final blow, claimed its just dues from Louis XI., and carried him off despite all his relics on the 30th of August 1483.

There was nothing noble about Louis XI. but his aims, and nothing great but the results he attained; yet however different he might have been he could not have done better, for what he achieved was the making of France. This was soon seen after his death in the reaction which menaced his work and those who had served him; but thanks to himself and to his true successor, his eldest daughter Anne, married to the sire de Beaujeu, a

younger member of the house of Bourbon, the set-back was only partial. Strife began immediately between the numerous malcontents and the Beaujeu party, who had charge of the little Charles VIII. These latter prudently made concessions: reducing the *taille*, sacrificing some of Louis XI.'s creatures to the rancour of the parlement, and restoring a certain number of offices or lands to the hostile princes (chief of whom was the duke of Orleans), and even consenting to a convocation of the states-general at Tours (1484). But the elections having been favourable to royalty, the Beaujeu family made the states reject the regency desired by the duke of Orleans, and organize the king's council after their own views. When they subsequently eluded the conditions imposed by the states, the deputies—nobles, clergy and burgesses—showed their incapacity to oppose the progress of despotism. In vain did the malcontent princes attempt to set up a new League of Public Weal, the *Guerre folle* (Mad War), in which the duke of Brittany, Francis II., played the part of Charles the Bold, dragging in the people of Lorraine and the king of Navarre. In vain did Charles VIII., his majority attained, at once abandon in the treaty of Sablé the benefits gained by the victory of Saint-Aubin du Cormier (1488). In vain did Henry VII. of England, Ferdinand the Catholic, and Maximilian of Austria try to prevent the annexation of Brittany by France; its heiress Anne, deserted by every one, made peace and married Charles VIII. in 1491. There was no longer a single great fief in France to which the malcontents could fly for refuge.

It now remained to consolidate the later successes attained by the policy of the Valois—the acquisition of the duchies of Burgundy and Brittany; but instead there was a sudden change and that policy seemed about to be lost in dreams of recapturing the rights of the Angevins over Naples, and conquering Constantinople. Charles VIII., a prince with neither intelligence nor resolution, his head stuffed with chivalric romance, was scarcely freed from his sister's control when he sought in Italy a fatal distraction from the struggle with the house of Austria. By this "war of magnificence" he caused an interruption of half a century in the growth of national sentiment, which was only revived by Henry II.; and he was not alone in thus leaving the bone for the shadow: his contemporaries, Ferdinand the Catholic when delivered from the Moors, and Henry VII. from the power of the English nobles, followed the same superficial policy, not taking the trouble to work for that real strength which comes from the adhesion of willing subjects to their sovereign. They only cared to aggrandize themselves, without thought of national feeling or geographical conditions. The great theorist of these "conquistadores" was Machiavelli. The regent, Anne of Beaujeu, worked in her daughter's interest to the detriment of the kingdom, by means of a special treaty destined to prevent the property of the Bourbons from reverting to the crown; while Anne of Brittany did the like for her daughter Claude. Louis XII., the next king of France, thought only of the Milanese; Ferdinand the Catholic all but destroyed the Spanish unity at the end of his life by his marriage with Germaine de Foix; while the house of Austria was for centuries to remain involved in this petty course of policy. Ministers followed the example of their self-seeking masters, thinking it no shame to accept pensions from foreign sovereigns. The preponderating consideration everywhere was direct material advantage; there was disproportion everywhere between the means employed and the poverty of the results, a contradiction between the interests of the sovereigns and those of their subjects, which were associated by force and not naturally blended. For the sake of a morsel of Italian territory every one forgot the permanent necessity of opposing the advance of the Turkish crescent, the two horns of which were impinging upon Europe on the Danube and on the Mediterranean.

Italy and Germany were two great tracts of land at the mercy of the highest bidder, rich and easy to dominate, where these coarse and alien kings, still reared on medieval traditions, were for fifty years to gratify their love of conquest. Italy was their

A policy of "magnificence."

Charles VIII. and Brittany (1483-1498).

first battlefield; Charles VIII. was summoned thither by Lodovico II Moro, tyrant of Milan, involved in a quarrel with his rival, Ferdinand II. of Aragon. The Aragonese had snatched the kingdom of Naples from the French house of Anjou, whose claims Louis XI. had inherited in 1480. To safeguard himself in the rear Charles VIII. handed over Roussillon and Cerdagne (Cerdeña) to Ferdinand the Catholic (that is to say, all the profits of Louis XI.'s policy); gave enormous sums of money to Henry VII. of England; and finally, by the treaty of Senlis ceded Artois and Franche-Comté to Maximilian of Austria. After these fool's bargains the paladin set out for Naples in 1494. His journey was long and triumphant, and his return precipitate; indeed it very nearly ended in a disaster at Fornovo, owing to the first of those Italian holy leagues which at the least sign of friction were ready to turn against France. At the age of twenty-eight, however, Charles VIII. died without issue (1498).

The accession of his cousin, Louis of Orleans, under the title of Louis XII., only involved the kingdom still further in this Italian imbroglio. Louis did indeed add the fief of Orleans to the royal domain and hastened to divorce Jeanne of France in order to marry Anne, the widow of his predecessor, so that he might keep Brittany. But he complicated the Naples affair by claiming Milan in consideration of the marriage of his grandfather, Louis of Orleans, to Valentina, daughter of Gian Galeazzo Visconti, duke of Milan. In 1499, appealed to by Venice, and encouraged by his favourite, Cardinal d'Amboise (who was hoping to succeed Pope Alexander VI.), and also by Cesare Borgia, who had lofty ambitions in Italy, Louis XII. conquered Milan in seven months and held it for fourteen years; while Lodovico Sforza, betrayed by his Swiss mercenaries, died a prisoner in France. The kingdom of Naples was still left to recapture; and fearing to be thwarted by Ferdinand of Aragon, Louis XII. proposed to this master of roguery that they should divide the kingdom according to the treaty of Granada (1500). But no sooner had Louis XII. assumed the title of king of Naples than Ferdinand set about despoiling him of it, and despite the bravery of a Bayard and a Louis d'Ars, Louis XII., being also betrayed by the pope, lost Naples for good in 1504. The treaties of Blois occasioned a vast amount of diplomacy, and projects of marriage between Claude of France and Charles of Austria, which came to nothing but served as a prelude to the later quarrels between Bourbons and Habsburgs.

It was Pope Julius II. who opened the gates of Italy to the horrors of war. Profiting by Louis XII.'s weakness and the emperor Maximilian's strange capricious character, this martial pope sacrificed Italian and religious interests alike in order to re-establish the temporal power of the papacy. Jealous of Venice, at that time the Italian state best provided with powers of expansion, and unable to subjugate it single-handed, Julius succeeded in obtaining help from France, Spain and the Empire. The league of Cambrai (1508) was his finest diplomatic achievement. But he wanted to be sole master of Italy; so in order to expel the French "barbarians" whom he had brought in, he appealed to other barbarians who were far more dangerous—Spaniards, Germans and Swiss—to help him against Louis XII., and stabbed him from behind with the Holy League of 1511.

Weakened by the death of Cardinal d'Amboise, his best counsellor, Louis XII. tried vainly in the assembly of Tours and in the unsuccessful council of Pisa to alienate the French clergy from a papacy which was now so little worthy of respect. But even the splendid victories of Gaston de Foix could not shake that formidable coalition; and despite the efforts of Bayard, La Palice and La Trémouille, it was the Church that triumphed. Julius II. died in the hour of victory; but Louis XII. was obliged to evacuate Milan, to which he had sacrificed everything, even France itself, with that political stupidity characteristic of the first Valois. He died almost immediately after this, on the 1st of January 1515, and his subjects, recognizing his thrift, his justice and the secure prosperity of the kingdom, forgot the

seventeen years of war in which they had not been consulted, and rewarded him with the fine title of Father of his People.

As Louis XII. left no son, the crown devolved upon his cousin and son-in-law the count of Angoulême, Francis I. No sooner king, Francis, in alliance with Venice, renewed the chimerical attempts to conquer Milan and Naples; also cherishing dreams of his own election as emperor and of a partition of Europe. The heroic episode of Marignano, when he defeated Cardinal Schinner's Swiss troops (13-15 of September 1515), made him master of the duchy of Milan and obliged his adversaries to make peace. Leo X., Julius II.'s successor, by an astute volte-face exchanged Parma and the Concordat for a guarantee of all the Church's possessions, which meant the defeat of French plans (1515). The Swiss signed the permanent peace which they were to maintain until the Revolution of 1789; while the emperor and the king of Spain recognized Francis I.'s very precarious hold upon Milan. Once more the French monarchy was pulled up short by the indignation of all Italy (1518).

The question now was how to occupy the military activity of a young, handsome, chivalric and gallant prince, "ondoyant et divers," intoxicated by his first victory and his tardy accession to fortune. This had been hailed with joy by all who had been his comrades in his days of difficulty; by his mother, Louise of Savoy, and his sister Marguerite; by all the rough young soldiery; by the nobles, tired of the bourgeois ways of Louis XI. and the patriarchal simplicity of Louis XII.; and finally by all the aristocracy who expected now to have the government in their own hands. So instead of heading the crusade against the Turks, Francis threw himself into the electoral contest at Frankfurt, which resulted in the election of Charles V., heir of Ferdinand the Catholic, Spain and Germany thus becoming united. Pope Leo X., moreover, handed over three-quarters of Italy to the new emperor in exchange for Luther's condemnation, thereby kindling that rivalry between Charles V. and the king of France which was to embroil the whole of Europe throughout half a century (1519-1559), from Pavia to St Quentin.

The territorial power of Charles V., heir to the houses of Burgundy, Austria, Castile and Aragon, which not only arrested the traditional policy of France but hemmed her in on every side; his pretensions to be the head of Christendom; his ambition to restore the house of Burgundy and the Holy Roman Empire; his grave and forceful intellect all rendered rivalry both inevitable and formidable. But the scattered heterogeneity of his possessions, the frequent crippling of his authority by national privileges or by political discords and religious quarrels, his perpetual straits for money, and his cautious calculating character, almost outweighed the advantages which he possessed in the terrible Spanish infantry, the wealthy commerce of the Netherlands, and the inexhaustible mines of the New World. Moreover, Francis I. stirred up enmity everywhere against Charles V., and after each defeat he found fresh support in the patriotism of his subjects. Immediately after the treaty of Madrid (1526), which Francis I. was obliged to sign after the disaster at Pavia and a period of captivity, he did not hesitate to his honour as a gentleman and the interests of his kingdom. Having been unable to win over Henry VIII. of England at their interview on the Field of the Cloth of Gold, he joined hands with Suleiman the Magnificent, the conqueror of Mohács; and the Turkish cavalry, crossing the Hungarian *Puszta*, made their way as far as Vienna, while the mercenaries of Charles V., under the constable de Bourbon, were reviving the saturnalia of Alaric in the sack of Rome (1527). In Germany, Francis I. assisted the Catholic princes to maintain their political independence, though he did not make the capital he might have made of the reform movement. Italy remained faithful to the vanquished in spite of all, while even Henry VIII. of England, who only needed bribing, and Wolsey, accessible to flattery, took part in the temporary coalition. Thus did France, menaced with disruption, embark upon a course of action imposed

Defeat at Pavia and treaty of Madrid.

upon her by the harsh conditions of the treaty of Madrid—otherwise little respected—and later by those of Cambrai (1529); but it was not till later, too late indeed, that it was defined and became a national policy.

After having, despite so many reverses and mistakes, saved Burgundy, though not Artois nor Flanders, and joined to the crown lands the domains of the constable de Bourbon who had gone over to Charles V., Francis I. should have had enough of defending other people's independence as well as his own, and should have thought more of his interests in the north and east than of Milan.

Yet between 1531 and 1547 he manifested the same regrets and the same invincible ambition for that land of Italy which Charles V., on his side, regarded as the basis of his strength. Their antagonism, therefore, remained unabated, as also the contradiction of an official agreement with Charles V., combined with secret intrigues with his enemies. Anne de Montmorency, now head of the government in place of the headstrong chancellor Duprat, for four years upheld a policy of reconciliation and of almost friendly agreement between the two monarchs (1531-1535). The death of Francis I.'s mother, Louise of Savoy (who had been partly instrumental in arranging the peace of Cambrai), the replacement of Montmorency by the bellicose Chabot, and the advent to power of a Burgundian, Granvella, as Charles V.'s prime minister, put an end to this double-faced policy, which attacked the Calvinists of France while supporting the Lutherans of Germany; made advances to Clement VII. while pretending to maintain the alliance with Henry VIII. (just then consummating the Anglican schism); and sought an alliance with Charles V. without renouncing the possession of Italy. The death of the duke of Milan provoked a third general war (1536-1538);

The truce at Nice.

but after the conquest of Savoy and Piedmont and a fruitless invasion of Provence by Charles V., it resulted in another truce, concluded at Nice, in the interview at Aigues-mortes, and in the old contradictory policy of the treaty of Cambrai. This was confirmed by Charles V.'s triumphal journey through France (1539).

Rivalry between Madame d'Etampes, the imperious mistress of the aged Francis I., and Diane de Poitiers, whose ascendancy over the dauphin was complete, now brought court intrigues and constant changes in those who held office, to complicate still further this wearisome policy of ephemeral "combinazioni" with English, Germans, Italians and Turks, which urgent need of money always brought to naught. The disillusionment of Francis I., who had hitherto hoped that Charles V. would be generous enough to give Milan back to him, and then the assassination of Rincon, his ambassador at Constantinople, led to a fourth war (1544-1546), in the course of which the king of England went over to the side of Charles V.

Unable in the days of his youth to make Italy French, when age began to come upon him, Francis tried to make France Italian. In his château at Blois he drank greedily of the cup of Renaissance art; but he found the exciting draughts of diplomacy which he imbibed from Machiavelli's *Prince* even more intoxicating, and he headed the ship of state straight for the rock of absolutism. He had been the first king "*du bon plaisir*" ("of his own good pleasure")—a "Caesar," as his mother Louise of Savoy proudly hailed him in 1515—and to a man of his gallant and hot-headed temperament love and war were schools little calculated to teach moderation in government. Italy not only gave him a taste for art and letters, but furnished him with an arsenal of despotic maxims. Yet his true masters were the jurists of the southern universities, passionately addicted to centralization and autocracy, men like Duprat and Poyet, who revived the persistent tradition of Philip the Fair's legists. Grouped together on the council of affairs, they managed to control the policy of the common council, with its too mixed and too independent membership. They successfully strove to separate "the grandeur and superexcellence of the king" from the rest of the nation; to isolate the nobility amid the seductions of a court lavish in

promises of favour and high office; and to win over the bourgeoisie by the buying and selling and afterwards by the hereditary transmission of offices. Thanks to their action, feudalism was attacked in its landed interest in the person of the constable de Bourbon; feudalism in its financial aspect by the execution of superintendent Semblançay and the special privileges of towns and provinces by administrative centralization. The bureaucracy became a refuge for the nobles, and above all for the bourgeois, whose fixed incomes were lowered by the influx of precious metals from the New World, while the wages of artisans rose. All those time-worn medieval institutions which no longer allowed free scope to private or public life were demolished by the legists in favour of the monarchy.

Their masterstroke was the Concordat of 1516, which meant an immense stride in the path towards absolutism. While Germany and England, where ultramontane doctrines had been allowed to creep in, were seeking a remedy against the economic exactions of the papacy in a reform of dogma or in schism, France had supposed herself to have found this in the Pragmatic Sanction of Bourges. But to the royal jurists the right of the churches and abbeys to make appointments to all vacant benefices was a guarantee of liberties valuable to the clergy, but detestable to themselves because the clergy thus retained the great part of public wealth and authority. By giving the king the ecclesiastical patronage they not only made a docile instrument of him, but endowed him with a mine of wealth, even more productive than the sale of offices, and a power of favouring and rewarding that transformed a needy and ill-obeyed king into an absolute monarch. To the pope they offered a mess of pottage in the shape of *annates* and the right of canonical institution, in order to induce him to sell the Church of France to the king. By this royal reform they completely isolated the monarchy, in the presumptuous pride of omnipotence, upon the ruins of the Church and the aristocracy, despite both the university and the parlement of Paris.

The concordat of 1516.

This is explained Francis I.'s preoccupation with Italian adventures in the latter part of his reign, and also the inordinate squandering of money, the autos-da-fé in the provinces and in Paris, the harsh repression of reform and free thought, and the sale of justice; while the nation became impoverished and the state was at the mercy of the caprices of royal mistresses—all of which was to become more and more pronounced during the twelve years of Henry II.'s government.

Henry II. shone but with a reflected light—in his private life reflected from his old mistress, Diane de Poitiers, and in his political action reflected from the views of Montmorency or the Guises. He only showed his own personality in an egoism more narrow-minded, in hatred yet bitterer than his father's; or in a haughty and jealous insistence upon an absolute authority which he never had the wit to maintain.

Henry II. (1547-1559.)

The struggle with Charles V. was at first delayed by differences with England. The treaty of Ardres had left two bones of contention: the cession of Boulogne to England and the exclusion of the Scotch from the terms of peace. At last the regent, the duke of Somerset, endeavoured to arrange a marriage between Edward VI., then a minor, and Mary Stuart, who had been offered in marriage to the dauphin Francis by her mother, Marie of Lorraine, a Guise who had married the king of Scotland. The transference of Mary Stuart to France, and the treaty of 1550 which restored Boulogne to France for a sum of 400,000 crowns, suspended the state of war; and then Henry II.'s opposition to the imperial policy of Charles V. showed itself everywhere: in Savoy and Piedmont, occupied by the French and claimed by Philibert Emmanuel, Charles V.'s ally; in Navarre, unlawfully conquered by Ferdinand the Catholic and claimed by the family of Albret; in Italy, where, aided and abetted by Pope Paul III., Henry II. was trying to regain support; and, finally, in Germany, where after the victory of Charles V. at Mühlberg (1547) the Protestant princes called Henry II. to their aid, offering to

Henry II. and Charles V.

subsidize him and cede to him the towns of Metz, Toul and Verdun. The Protestant alliance was substituted for the Turkish alliance, and Henry II. hastened to accept the offers made to him (1552); but this was rather late in the day, for the reform movement had produced civil war and evoked fresh forces. The Germans, in whom national feeling got the better of imperialistic ardour, as soon as they saw the French at Strassburg, made terms with the emperor at Passau and permitted Charles to use all his forces against Henry II. The

defence of Metz by Francis of Guise was admirable and successful; but in Picardy operations continued their course without much result, owing to the incapacity of the constable de Montmorency. Fortunately, despite the marriage of Charles V.'s son Philip to Mary Tudor, which gave him the support of England (1554), and despite the religious pacification of Germany through the peace of

Augsburg (1555), Charles V., exhausted by illness and by thirty years of intense activity, in the truce of Vaucelles abandoned Henry II.'s conquests—Piedmont and the Three Bishoprics. He then abdicated the government of his kingdoms, which he divided between his son Philip II. and his brother Ferdinand (1556). A double victory, this, for France.

Henry II.'s resumption of war, without provocation and without allies, was a grave error; but more characterless than ever, the king was urged to it by the Guises, whose influence since the defence of Metz had been supreme at court and who were perhaps hoping to obtain

Naples for themselves. On the other hand, Pope Paul IV. and his nephew Carlo Caraffa embarked upon the struggle, because as Neapolitans they detested the Spaniards, whom they considered as "barbarous" as the Germans or the French. The constable de Montmorency's disaster at Saint Quentin (August 1557), by which Philip II. had not the wit to profit, was successfully avenged

by Guise, who was appointed lieutenant-general of the kingdom. He took Calais by assault in January 1558, after the English had held it for two centuries, and occupied Luxemburg. The treaty of Cateau-Cambrésis (August 1559) finally put an end to the Italian follies, Naples, Milan and Piedmont; but it also lost Savoy, making a gap in the frontier for a century. The question of Burgundy was definitely settled, too; but the Netherlands had still to be conquered. By the possession of the three bishoprics and the recapture of Calais an effort towards a natural line of frontier and towards a national policy seemed indicated; but while the old soldiers could not forget Marignano, Ceresole, nor Italy perishing with the name of France on her lips, the secret alliance between the cardinal of Lorraine and Granvella against the Protestant heresy foretold the approaching subordination of national questions to religious differences, and a decisive attempt to purge the kingdom of the new doctrines.

The origin and general history of the religious reformation in the 16th century are dealt with elsewhere (see CHURCH

HISTORY and REFORMATION). In France it had originally no revolutionary character whatever; it proceeded from traditional Gallican theories and from the innovating principle of humanism, and it began as a protest against Roman decadence and medieval scholasticism. It found its first adherents and its first defenders among the clerics and learned men grouped around Faber (Lefèvre) of Étamples at Meaux; while Marguerite of Navarre, "des Roynes la non pareille," was the indefatigable Maecenas of these innovators, and the incarnation of the Protestant spirit at its purest. The reformers shook off the yoke of systems in order boldly to renovate both knowledge and faith; and, instead of resting on the abstract *a priori* principles within which man and nature had been imprisoned, they returned to the ancient methods of observation and analysis. In so doing, they separated intellectual from popular life; and acting in this spirit, through the need of a moral renaissance, they reverted to primitive Christianity, substituting the inner and individual authority of conscience for the general and external authority of the Church. Their

efforts would not, however, have sufficed if they had not been seconded by events; pure doctrine would not have given birth to a church, nor that church to a party; in France, as in Germany, the religious revolution was conditioned by an economic and social revolution.

The economic renaissance due to the great maritime discoveries had the consequence of concentrating wealth in the hands of the bourgeoisie. Owing to their mental qualities, their tendencies and their resources, the bourgeoisie had been, if not alone, at least most apt in profiting by the development of industry, by the extension of commerce, and by the formation of a new and mobile means of enriching themselves. But though the bourgeois had acquired through capitalism certain sources of influence, and gradually monopolized municipal and public functions, the king and the peasants had also benefited by this revolution. After a hundred and fifty years of foreign war and civil discord, at a period when order and unity were ardently desired, an absolute monarchy had appeared the only power capable of realizing such aspirations. The peasants, moreover, had profited by the reduction of the idle landed aristocracy; serfdom had decreased or had been modified; and the free peasants were more prosperous, had reconquered the soil, and were selling their produce at a higher rate while they everywhere paid less exorbitant rents. The victims of this process were the urban proletariat, whose treatment by their employers in trade became less and less protective and beneficent, and the nobility, straitened in their financial resources, uprooted from their ancient strongholds, and gradually despoiled of their power by a monarchy based on popular support. The unlimited sovereignty of the prince was established upon the ruins of the feudal system; and the capitalism of the merchants and bankers upon the closing of the trade-gilds to workmen, upon severe economic pressure and upon the exploitation of the artisans' labour.

Though reform originated among the educated classes it speedily found an echo among the industrial classes of the 16th century, further assisted by the influence of German and Flemish journeymen. The popular reform-movement was essentially an urban movement; although under Francis I. and Henry II. it had already begun to spread into the country. The artisans, labourers and small shop-keepers who formed the first nucleus of the reformed church were numerous enough to provide an army of martyrs, though too few to form a party. Revering the monarchy and established institutions, they endured forty years of persecution before they took up arms. It was only during the second half of Henry II.'s reign that Protestantism, having achieved its religious evolution, became a political party. Weary of being trodden under foot, it now demanded much more radical reform, quitting the ranks of peaceable citizens to pass into the only militant class of the time and adopt its customs. Men like Coligny, d'Andelot and Condé took the place of the timid Lefèvre of Étamples and the harsh and bitter Calvin; and the reform party, in contradiction to its doctrines and its doctors, became a political and religious party of opposition, with all the compromises that presupposes. The struggle against it was no longer maintained by the university and the parlement alone, but also by the king, whose authority it menaced.

With his intrepid spirit, his disdain for ecclesiastical authority and his strongly personal religious feeling, Francis I. had for a moment seemed ready to be a reformer himself; but deprived by the Concordat of all interest in the confiscation of church property, aspiring to political alliance with the pope, and as mistrustful of popular forces as desirous of absolute power and devoted to Italy, he paused and then drew back. Hence came the revocation in 1540 of the edict of tolerance of Coucy (1535), and the massacre of the Vaudois (1545). Henry II., a fanatic, went still further in his edict of Châteaubriant (1551), a code of veritable persecution, and in the *coup d'état* carried out in the parlement against Antoine du Bourg and his colleagues (1559). At the same time the pastors of the reformed religion,

The Reformation.

Transformation of religious reform into party politics.

Royal persecution under Francis I. and Henry II.

met in synod at Paris, were setting down their confession of faith founded upon the Scriptures, and their ecclesiastical discipline founded upon the independence of the churches. Thenceforward Protestantism adopted a new attitude, and refused obedience to the orders of a persecuting monarchy when contrary to its faith and its interests. After the saints came men. Hence those wars of religion which were to hold the monarchy in check for forty years and even force it to come to terms.

In slaying Henry II. Montgomery's lance saved the Protestants for the time being. His son and successor, Francis II., was but a nervous sickly boy, banded between two women: his mother, Catherine de' Medici, hitherto kept in the background, and his wife, Mary Stuart, queen of Scotland, who being a niece of the Guises brought her uncles, the constable Francis and the cardinal of Lorraine, into power. These ambitious and violent men took the government out of the hands of the constable de Montmorency and the princes of the blood: Antoine de Bourbon, king of Navarre, weak, credulous, always playing a double game on account of his preoccupation with Navarre; Condé, light-hearted and brave, but not fitted to direct a party; and the cardinal de Bourbon, a mere nonentity. The only plan which these princes could adopt in the struggle, once they had lost the king, was to make a following for themselves among the Calvinist malcontents and the gentlemen disbanded after the Italian wars. The Guises, strengthened by the failure of the conspiracy of Amboise, which had been aimed at them, abused the advantage due to their victory. Despite the edict of Romorantin, which by giving the bishops the right of cognizance of heresy prevented the introduction of the Inquisition on the Spanish model into France; despite the assembly of Fontainebleau, where an attempt was made at a compromise acceptable to both Catholics and moderate Calvinists; the reform party and its Bourbon leaders, arrested at the states-general of Orleans, were in danger of their lives. The death of Francis II. in December 1560 compromised the influence of the Guises and again saved Protestantism.

Charles IX. also was a minor, and the regent should legally have been the first prince of the blood, Antoine de Bourbon; but cleverly flattered by the queen-mother, Catherine de' Medici, he let her take the reins of government. Hitherto Catherine had been merely the resigned and neglected wife of Henry II., and though eloquent, insinuating and ambitious, she had been inactive. She had attained the age of forty-one when she at last came into power amidst the hopes and anxieties aroused by the fall of the Guises and the return of the Bourbons to fortune. Indifferent in religious matters, she had a passion for authority, a characteristically Italian adroitness in intrigue, a fine political sense, and the feeling that the royal authority might be endangered both by Calvinistic passions and Catholic violence. She decided for a system of tolerance; and Michel de l'Hôpital, the new chancellor, was her spokesman at the states of Orleans (1560). He was a good and honest man, moderate, conciliatory and temporizing, anxious to lift the monarchy above the strife of parties and to reconcile them; but he was so little practical that he could believe in a reformation of the laws in the midst of all the violent passions which were now to be let loose. These two, Catherine and her chancellor, attempted, like Charles V. at Augsburg, to bring about religious pacification as a necessary condition for the maintenance of order; but they were soon overwhelmed by the different factions.

On one side was the Catholic triumvirate of the constable de Montmorency, the duke of Guise, and the marshal de St André; and on the other the Huguenot party of Condé and Coligny, who, having obtained liberty of conscience in January 1561, now demanded liberty of worship. The colloquy at Poissy between the cardinal of Lorraine and Theodore Beza (September 1561), did not end in the agreement hoped for, and the duke of Guise so far abused its spirit as to embroil the French Calvinists with the German

Lutherans. The rupture seemed irremediable when the assembly of Poissy recognized the order of the Jesuits, which the French church had held in suspicion since its foundation. However, yielding to the current which was carrying the greater part of the nation towards reform, and despite the threats of Philip II. who dreaded Calvinistic propaganda in his Netherlands, Michel de l'Hôpital promulgated the edict of January 17, 1562—a true charter of enfranchisement for the Protestants. But the pressure of events and of parties was too strong; the policy of toleration which had miscarried at the council of Trent had no chance of success in France.

The triumvirate's relations with Spain and Rome were very close; they had complete ascendancy over the king and over Catherine; and now the massacre of two hundred Protestants at Vassy on the 1st of March 1562 made the cup overflow. The duke of Guise had either ordered this, or allowed it to take place, on his return from an interview with the duke of Württemberg at Zabern, where he had once more demanded the help of his Lutheran neighbours against the Calvinists; and the Catholics having celebrated this as a victory the signal was given for the commencement of religious wars. When these eight fratricidal wars first began, Protestants and Catholics rivalled one another in respect for royal authority; only they wished to become its masters so as to get the upper hand themselves. But in course of time, as the struggle became embittered, Catholicism itself grew revolutionary; and this twofold fanaticism, Catholic and Protestant, even more than the ambition of the leaders, made the war a ferocious one from the very first. Beginning with surprise attacks, if these failed, the struggle was continued by means of sieges and by terrible exploits like those of the Catholic Montluc and the Protestant des Adrets in the south of France. Neither of these two parties was strong enough to crush the other, owing to the apathy and continual desertions of the gentlemen-cavaliers who formed the élite of the Protestant army and the insufficient numbers of the Catholic forces. Allies from outside were therefore called in, and this it was that gave a European character to these wars of religion; the two parties were parties of foreigners, the Protestants being supported by German *Landsknechts* and Elizabeth of England's cavalry, and the royal army by Italian, Swiss or Spanish auxiliaries. It was no longer patriotism but religion that distinguished the two camps. There were three principal theatres of war: in the north Normandy and the valley of the Loire, where Orleans, the general centre of reform, ensured communications between the south and Germany; in the south-west Gascony and Guienne; in the south-east Lyonnais and Vivarais.

In the first war, which lasted for a year (1562-1563), the triumvirs wished to secure Orleans, previously isolated. The threat of an English landing decided them to lay siege to Rouen, and it was taken by assault; but this cost the life of the versatile Antoine de Bourbon. On the 19th of December 1562 the duke of Guise barred the way to Dreux against the German reinforcements of d'Andelot, who after having threatened Paris were marching to join forces with the English troops for whom Coligny and Condé had paid by the cession of Havre. The death of marshal de St André, and the capture of the constable de Montmorency and of Condé, which marked this indecisive battle, left Coligny and Guise face to face. The latter's success was of brief duration; for on the 18th of February 1563 Poltrot de Méré assassinated him before Orleans, which he was trying to take once and for all. Catherine, relieved by the loss of an inconvenient preceptor, and by the disappearance of the other leaders, became mistress of the Catholic party, of whose strength and popularity she had now had proof, and her idea was to make peace at once on the best terms possible. The egoism of Condé, who got himself made lieutenant-general of the kingdom, and bargained for freedom of worship for the Protestant nobility only, compromised the future of both his church and his party, though rendering possible the peace of Amboise, concluded the 19th of March

Edict of tolerance.

Character of the religious wars.

First religious war.

The parties.

1563. All now set off together to recapture Havre from the English.

The peace, however, satisfied no one; neither Catholics (because of the rupture of religious unity) nor the parlements; the pope, the emperor and king of Spain alike protested against it. Nor yet did it satisfy the Protestants, who considered its concessions insufficient, above all for the people. It was, however, the maximum of

Peace of Amboise (1563).

tolerance possible just then, and had to be reverted to; Catherine and Charles IX. soon saw that the times were not ripe for a third party, and that to enforce real toleration would require an absolute power which they did not possess. After three years the Guises reopened hostilities against Coligny, whom they accused of having plotted the murder of their chief; while the Catholics, egged on by the Spaniards, rose against the Protestants, who had been made uneasy by an interview between Catherine and her daughter Elizabeth, wife of Philip II. of Spain, at Bayonne, and by the duke of Alva's persecutions of the reformed church of the Netherlands—a daughter-church of Geneva, like their own. The second civil war began like the

Second civil war.

first with a frustrated attempt to kidnap the king, at the castle of Montceaux, near Meaux, in September 1567; and with a siege of Paris, the general centre of Catholicism, in the course of which the constable de Montmorency was killed at Saint-Denis. Condé, with the men-at-arms of John Casimir, son of the Count Palatine, tried to starve out the capital; but once more the defection of the nobles obliged him to sign a treaty of peace at Longjumeau on the 23rd of March 1568, by which the conditions of Amboise were re-established. After the attempt at Montceaux the Protestants had to be contented with Charles IX.'s word.

Peace of Longjumeau.

This peace was not of long duration. The fall of Michel de l'Hôpital, who had so often guaranteed the loyalty of the Huguenots, ruined the moderate party (May 1568).

Third war.

Catholic propaganda, revived by the monks and the Jesuits, and backed by the armed confraternities and by Catherine's favourite son, the duke of Anjou, now entrusted with a prominent part by the cardinal of Lorraine; Catherine's complicity in the duke of Alva's terrible persecution in the Netherlands; and her attempt to capture Coligny and Condé at Noyers all combined to cause a fresh outbreak of hostilities in the west. Thanks to Tavannes, the duke of Anjou gained easy victories at Jarnac over the prince of Condé, who was killed, and at Moncontour over Coligny, who was wounded (March-October 1569); but these successes were rendered fruitless by the jealousy of Charles IX. Allowing the queen of Navarre to shut herself up in La Rochelle, the citadel of the reformers, and the king to loiter over the siege of Saint Jean d'Angély, Coligny pushed boldly forward towards Paris and, having reached Burgundy, defeated the royal army at Arnay-le-duc. Catherine had exhausted all her resources; and having failed in her project of remarrying Philip II. to one of her daughters, and of betrothing Charles IX. to the eldest of the Austrian archduchesses, exasperated also by the presumption of the Lorraine family, who aspired to the marriage of their nephew with Charles IX.'s

Peace of St Germain (1570.)

sister, she signed the peace of St Germain on the 8th of August 1570. This was the culminating point of Protestant liberty; for Coligny exacted and obtained, first, liberty of conscience and of worship, and then, as a guarantee of the king's word, four fortified places: La Rochelle, a key to the sea; La Charité, in the centre; Cognac and Montauban in the south.

The Guises set aside, Coligny, supported as he was by Jeanne d'Albret, queen of Navarre, now received all Charles IX.'s favour. Catherine de' Medici, an inveterate match-maker, and also uneasy at Philip II.'s increasing power, made advances to Jeanne, proposing to marry her own daughter, Marguerite deValois, to Jeanne's son, Henry of Navarre, now chief of the Huguenot party. Coligny was a Protestant, but he was a Frenchman before all; and wishing to reconcile all parties in a national struggle, he

Coligny and the Netherlands.

"trumpeted war" (*cornait la guerre*) against Spain in the Netherlands—despite the lukewarmness of Elizabeth of England and the Germans, and despite the counter-intrigues of the pope and of Venice. He succeeded in getting French troops sent to the Netherlands, but they suffered defeat. None the less Charles IX. still seemed to see only through the eyes of Coligny; till Catherine, fearing to be supplanted by the latter, dreading the results of the threatened war with Spain, and egged on by a crowd of Italian adventurers in the pay of Spain—men like Gondi and Birague, reared like herself in the political theories and customs of their native land—saw no hope but in the assassination of this rival in her son's esteem. A murderous attack upon Coligny, who had opposed the candidature of Catherine's favourite son, the duke of Anjou, for the throne of Poland, having only succeeded in wounding him and in exciting the Calvinist leaders, who were congregated in Paris for the occasion of Marguerite deValois' marriage with the king of Navarre, Catherine and the Guises resolved together to put them all to death. There followed the wholesale massacre of St Bartholomew's Eve, in Paris and in the provinces; a natural consequence of public and private hatreds which had poisoned the entire social organism. This massacre had the effect of preventing the expedition into Flanders, and destroying Francis I.'s policy of alliance with the Protestants against the house of Austria.

St Bartholomew, August 24, 1572.

Catherine de' Medici soon perceived that the massacre of St Bartholomew had settled nothing. It had, it is true, dealt a blow to Calvinism just when, owing to the reforms of the council of Trent, the religious ground had been crumbling beneath it. Moreover, within the party itself a gulf had been widening between the pastors, supported by the Protestant democracy and the political nobles. The reformers had now no leaders, and their situation seemed as perilous as that of their co-religionists in the Netherlands; while the sieges of La Rochelle and Leiden, the enforced exile of the prince of Orange, and the conversion under pain of death of Henry of Navarre and the prince of Condé, made the common danger more obvious. Salvation came from the very excess of the repressive measures. A third party was once more formed, composed of moderates from the two camps, and it was recruited quite as much by jealousy of the Guises and by ambition as by horror at the massacres. There were the friends of the Montmorency party—Damville at their head; Coligny's relations; the king of Navarre; Condé; and a prince of the blood, Catherine de' Medici's third son, the duke of Alençon, tired of being kept in the background. This party took shape at the end of the fourth war, followed by the edict of Boulogne (1573), forced from Charles IX. when the Catholics were deprived of their leader by the election of his brother, the duke of Anjou, as king of Poland. A year later the latter succeeded his brother on the throne of France as Henry III. This meant a new lease of power for the queen-mother.

The party of the politiques.

Fourth War. Edict of Boulogne (1573.)

The *politiques*, as the supporters of religious tolerance and an energetic repression of faction were called, offered their alliance to the Huguenots, but these, having formed themselves, by means of the Protestant Union, into a sort of republic within the kingdom, hesitated to accept. It is, however, easy to bring about an understanding between people in whom religious fury has been extinguished either by patriotism or by ambition, like that of the duke of Alençon, who had now escaped from the Louvre where he had been confined on account of his intrigues. The compact was concluded at Millau; Condé becoming a Protestant once more in order to treat with Damville, Montmorency's brother. Henry of Navarre escaped from Paris. The new king, Henry III., vacillating and vicious, and Catherine herself, eager for war as she was, had no means of separating the Protestants and the *politiques*. Despite the victory of Guise at Dormans, the agreement between the duke of Alençon and John Casimir's German army obliged the royal party to grant all that the allied forces demanded of them

Fifth War.

Henry III. (1574-1589).

in the "peace of Monsieur," signed at Beaulieu on the 6th of May 1576, the duke of Alençon receiving the appanage of Anjou, Touraine and Berry, the king of Navarre Guienne, and Condé Picardy, while the Protestants were granted freedom of worship in all parts of the kingdom except Paris, the rehabilitation of Coligny and the other victims of St Bartholomew, their fortified towns, and an equal number of seats in the courts of the parlements.

This was going too fast; and in consequence of a reaction against this too liberal edict a fourth party made its appearance, that of the Catholic League, under the Guises—Henry le Balaféré, duke of Guise, and his two brothers, Charles, duke of Mayenne, and Louis, archbishop of Reims and cardinal. With the object of destroying Calvinism by effective opposition, they imitated the Protestant organization of provincial associations, drawing their chief supporters from the upper middle class and the lesser nobility. It was not at first a demagogy maddened by the preaching of the irreconcilable clergy of Paris, but a union of the more honest and prudent classes of the nation in order to combat heresy. Despite the immorality and impotence of Henry III. and the Protestantism of Henry of Navarre, this party talked of re-establishing the authority of the king; but in reality it inclined more to the Guises, martyrs in the good cause, who were supported by Philip II. of Spain and Pope Gregory XIII. A sort of popular government was thus established to counteract the incapacity of royalty, and it was in the name of the imperilled rights of the people that, from the States of Blois onward, this Holy League demanded the re-establishment of Catholic unity, and set the religious right of the nation in opposition to the divine right of incapable or evil-doing kings (1576).

In order to oust his rival Henry of Guise, Henry III. made a desperate effort to outbid him in the eyes of the more extreme Catholics, and by declaring himself head of the League degraded himself into a party leader. The League, furious at this stroke of policy, tried to impose a council of thirty-six advisers upon the king. But the deputies of the third estate did not support the other two orders, and the latter in their turn refused the king money for making war on the heretics, desiring, they said, not war but the destruction of heresy. This would have reduced Henry III. to impotence; fortunately for him, however, the break of the Huguenots with the "Malcontents," and the divisions in the court of Navarre and in the various parties at La Rochelle, allowed Henry III., after two little wars in the south west, during which fighting gradually degenerated into brigandage, to sign terms of peace at Bergerac (1577), which much diminished the concessions made in the edict of Beaulieu. This peace was confirmed three years after by that of Fleix. The suppression of both the leagues was stipulated for (1580). It remained, however, a question whether the Holy League would submit to this.

The death of the duke of Anjou after his mad endeavour to establish himself in the Netherlands (1584), and the accession of Henry of Navarre, heir to the effeminate Henry III., reversed the situations of the two parties: the Protestants again became supporters of the principle of heredity and divine right; the Catholics appealed to right of election and the sovereignty of the people.

Could the crown of the eldest daughter of the Church be allowed to devolve upon a relapsed heretic? Such was the doctrine officially preached in pulpit and pamphlet. But between Philip II. on the one hand—now master of Portugal and delivered from William of Orange, involved in strife with the English Protestants, and desirous of avenging the injuries inflicted upon him by the Valois in the Netherlands—and the Guises on the other hand, whose cousin Mary Stuart was a prisoner of Queen Elizabeth, there was a common interest in supporting one another and pressing things forward. A definite agreement was made between them at Joinville (December 31, 1584), the religious and popular pretext being the danger of leaving the

kingdom to the king of Navarre, and the ostensible end to secure the succession to a Catholic prince, the old Cardinal de Bourbon, an ambitious and violent man of mean intelligence; while the secret aim was to secure the crown for the Guises, who had already attempted to fabricate for themselves a genealogy tracing their descent from Charlemagne. In the meantime Philip II., being rid of Don John of Austria, whose ambition he dreaded, was to crush the Protestants of England and the Netherlands; and the double result of the compact at Joinville was to allow French politics to be controlled by Spain, and to transform the wars of religion into a purely political quarrel.

The pretensions of the Guises were, in fact, soon manifested in the declaration of Péronne (March 30, 1585) against the foul court of the Valois; they were again manifested in a furious agitation, fomented by the secret council of the League at Paris, which favoured the Guises, and which now worked on the people through their terror of Protestant retaliations and the Church's peril. Incited by Philip II., who wished to see him earning his pension of 600,000 golden crowns, Henry of Guise began the war in the end of April, and in a few days the whole kingdom was on fire. The situation was awkward for Henry III., who had not the courage to ask Queen Elizabeth for the soldiers and money that he lacked. The crafty king of Navarre being unwilling to alienate the Protestants save by an apostasy profitable to himself, Henry III., by the treaty of Nemours (July 7, 1585), granted everything to the head of the League in order to save his crown. By a stroke of the pen he suppressed Protestantism, while Pope Sixtus V., who had at first been unfavourable to the treaty of Joinville as a purely political act, though he eventually yielded to the solicitations of the League, excommunicated the two Bourbons, Henry and Condé. But the duke of Guise's audacity did not make Henry III. forget his desire for vengeance. He hoped to ruin him by attaching him to his cause. His favourite Joyeuse was to defeat the king of Navarre, whose forces were very weak, while Guise was to deal with the strong reinforcement of Germans that Elizabeth was sending to Henry of Navarre. Exactly the contrary happened. By the defeat of Joyeuse at Coutras Henry III. found himself wounded on his strongest side; and by Henry of Guise's successes at Vimory and Auneau the Germans, who should have been his best auxiliaries against the League, were crushed (October-November 1587).

The League now thought they had no longer anything to fear. Despite the king's hostility the duke of Guise came to Paris, urged thereto by Philip II., who wanted to occupy Paris and be master of the Channel coasts whilst he launched his invincible Armada to avenge the death of Mary Stuart in 1587. On the Day of the Barricades (May 12, 1588) Henry III. was besieged in the Louvre by the populace in revolt; but his rival dared not go so far as to depose the king, and appeased the tumult. The king, having succeeded in taking refuge at Chartres, ended, however, by granting him in the Act of Union all that he had refused in face of the barricades—the post of lieutenant-general of the kingdom and the proscription of Protestantism. At the second assembly of the states of Blois, called together on account of the need for money (1588), all of Henry III.'s enemies who were elected showed themselves even bolder than in 1576 in claiming the control of the financial administration of the kingdom; but the destruction of the Armada gave Henry III., already exasperated by the insults he had received, new vigour. He had the old Cardinal de Bourbon imprisoned, and Henry of Guise and his brother the cardinal assassinated (December 23, 1588). On the 5th of January, 1589, died his mother, Catherine de' Medici, the astute Florentine.

"Now I am king!" cried Henry III. But Paris being dominated by the duke of Mayenne, who had escaped assassination, and by the council of "Sixteen," the chiefs of the League, most of the provinces replied by open revolt, and Henry III.

had no alternative but an alliance with Henry of Navarre.

Thanks to this he was on the point of seizing Paris, when in his turn he was assassinated on the 1st of August 1589 by a Jacobin monk, Jacques Clément; with his dying breath he designated the king of Navarre as his successor.

Between the popular League and the menace of the Protestants it was a question whether the new monarch was to be powerless in his turn. Henry IV. had almost the whole of his kingdom to conquer. The Cardinal de Bourbon, king according to the League and proclaimed under the title of Charles X., could count upon the Holy League itself, upon the Spaniards of the Netherlands, and upon the pope. Henry IV. was only supported by a certain number of the Calvinists and by the Catholic minority of the *Politiques*, who, however, gradually induced the rest of the nation to rally round the only legitimate prince. The nation wished for the establishment of internal unity through religious tolerance and the extinction of private organizations; it looked for the extension of France's external power through the abasement of the house of Spain, protection of the Protestants in the Netherlands and Germany, and independence of Rome. Henry IV., moreover, was forced to take an oath at the camp of Saint Cloud to associate the nation in the affairs of the kingdom by means of the states-general. These three conditions were interdependent; and Henry IV., with his persuasive manners, his frank and charming character, and his personal valour, seemed capable of keeping them all three.

The first thing for this soldier-king to do was to conquer his kingdom and maintain its unity. He did not waste time by withdrawing towards the south; he kept in the neighbourhood of Paris, on the banks of the Seine, within reach of help from Elizabeth; and twice—at Arques and at Ivry (1589-1590)—he vanquished the duke of Mayenne, lieutenant-general of the League. But after having tried to seize Paris (as later Rouen) by a *coup-de-main*, he was obliged to raise the siege in view of reinforcements sent to Mayenne by the duke of Parma. Pope Gregory XIV., an enthusiastic supporter of the League and a strong adherent of Spain, having succeeded Sixtus V., who had been very lukewarm towards the League, made Henry IV.'s position still more serious just at the moment when, the old Cardinal de Bourbon having died, Philip II. wanted to be declared the protector of the kingdom in order that he might dismember it, and when Charles Emmanuel of Savoy, a grandson of Francis I., and Charles III., duke of Lorraine, a son-in-law of Henry II., were both of them claiming the crown. Fortunately, however, the Sixteen had disgusted the upper bourgeoisie by their demagogic airs; while their open alliance with Philip II., and their acceptance of a Spanish garrison in Paris had offended the patriotism of the *Politiques* or moderate members of the League. Mayenne, who oscillated between Philip II. and Henry IV., was himself obliged to break up and subdue this party of fanatics and theologians (December 1591). This game of see-saw between the *Politiques* and the League furthered his secret ambition, but also the dissolution of the kingdom; and the pressure of public opinion, which desired an effective monarchy, put an end to this temporizing policy and caused the convocation of the states-general in Paris (December 1592). Philip II., through the duke of Feria's instrumentality, demanded the throne for his daughter Isabella, grand-daughter of Henry II. through her mother. But who was to be her

States-general of 1592.

husband? The archduke Ernest of Austria, Guise or Mayenne? The parlement cut short these bargainings by condemning all ultramontane pretensions and Spanish intrigues. The unpopularity of Spain, patriotism, the greater predominance of national questions in public opinion, and weariness of both religious disputation and indecisive warfare, all these sentiments were expressed in the wise and clever pamphlet entitled the *Satire Ménippée*. What had been a slow movement between 1585 and 1592 was quickened by Henry IV.'s abjuration of Protestantism at Saint-Denis on the 23rd of July 1593.

The coronation of the king at Chartres in February 1594 completed the rout of the League. The parlement of Paris declared against Mayenne, who was simply the mouth-piece of Spain, and Brissac, the governor, surrendered the capital to the king. The example of Paris and Henry IV.'s clemency rallied round him all prudent Catholics, like Villeroy and Jeannin, anxious for national unity; but he had to buy over the adherents of the League, who sold him his own kingdom for sixty million francs. The pontifical absolution of September 17, 1595, finally stultified the League, which had been again betrayed by the unsuccessful plot of Jean Chastel, the Jesuit's pupil.

Nothing was now left but to expel the Spaniards, who under cover of religion had worked for their own interests alone. Despite the brilliant charge of Fontaine-Française in Burgundy (June 5, 1595), and the submission of the heads of the League, Guise, Mayenne, Joyeuse, and Mercœur, the years 1595-1597 were not fortunate for Henry IV.'s armies. Indignant at his conversion, Elizabeth, the Germans, and the Swiss Protestants deserted him; while the taking of Amiens by the Spaniards compromised for the moment the future both of the king and the country. But exhaustion of each other, by which only England and Holland profited, brought about the Peace of Vervins. This confirmed the results of the treaty of Cateau-Cambrésis (May 2, 1598), that is to say, the decadence of Spanish power, and its inability either to conquer or to dismember France.

The League, having now no reason for existence, was dissolved; but the Protestant party remained very strong, with its political organization and the fortified places which the assemblies of Millau, Nîmes and La Rochelle (1573-1574) had established in the south and the west. It was a republican state within the kingdom, and, being unwilling to break with it, Henry IV. came to terms by the edict of Nantes, on the 13th of April 1598. This was a compromise between the royal government and the Huguenot government, the latter giving up the question of public worship, which was only authorized where it had existed before 1597 and in two towns of each *bailliage*, with the exception of Paris; but it secured liberty of conscience throughout the kingdom, state payment for its ministers, admission to all employments, and courts composed equally of Catholics and Protestants in the parlements. An authorization to hold synods and political assemblies, to open schools, and to occupy a hundred strong places for eight years at the expense of the king, assured to the Protestants not only rights but privileges. In no other country did they enjoy so many guarantees against a return of persecution. This explains why the edict of Nantes was not registered without some difficulty.

Thus the blood-stained 16th century closed with a promise of religious toleration and a dream of international arbitration. This was the end of the long tragedy of civil strife and of wars of conquest, mingled with the sound of madrigals and psalms and pavaues. It had been the golden age of the arquebus and the viol, of sculptors and musicians, of poets and humanists, of fratricidal conflicts and of love-songs, of *mignons* and martyrs. At the close of this troubled century peace descends upon exhausted passions; and amidst the choir of young and ardent voices celebrating the national reconciliation, the tocsin no longer sounds its sinister and persistent bass. Despite the leagues of either faith, religious liberty was now confirmed by the more free and generous spirit of Henry IV.

Why was this king at once so easygoing and so capricious? Why, again, had the effort and authority of feudal and popular resistance been squandered in the follies of the League and to further the ambitions of the rebellious Guises? Why had the monarchy been forced to purchase the obedience of the upper classes and the provinces with immunities which enfeebled it without limiting it? At all events, when the kingdom had been reconquered from the Spaniards and religious strife ended, in order to fulfil his engagements, Henry IV. need only have

Abjuration of Henry IV., July 23, 1593.

Peace of Vervins.

Edict of Nantes, 1598.

Results of the religious wars.

associated the nation with himself in the work of reconstructing the shattered monarchy. But during the atrocious holocausts formidable states had grown up around France, observing her and threatening her; and on the other hand, as on the morrow of the Hundred Years' War, the lassitude of the country, the lack of political feeling on the part of the upper classes and their selfishness, led to a fresh abdication of the nation's rights. The need of living caused the neglect of that necessity for control which had been maintained by the states-general from 1560 to 1593. And this time, moderation on the part of the monarchy no longer made for success. Of the two contrary currents which have continually mingled and conflicted throughout the course of French history, that of monarchic absolutism and that of aristocratic and democratic liberty, the former was now to carry all before it.

The kingdom was now issuing from thirty-eight years of civil war. Its inhabitants had grown unaccustomed to work; *The Bourbons.* its finances were ruined by dishonesty, disorder, and a very heavy foreign debt. The most characteristic symptom of this distress was the brigandage carried on incessantly from 1598 to 1610. Side by side with this temporary disorder there was a more serious administrative disorganization, a habit of no longer obeying the king. The harassed population, the municipalities which under cover of civil war had resumed the right of self-government, and the parlements elated with their social importance and their security of position, were not alone in abandoning duty and obedience. Two powers faced each other threateningly: the organized and malcontent Protestants; and the provincial governors, all great personages possessing an armed following, theoretically agents of the king, but practically independent. The Montmorencys, the D'Epernons, the Biron, the Guises, were accustomed to consider their offices as hereditary property. Not that these two powers entered into open revolt against the king; but they had adopted the custom of recriminating, of threatening, of coming to understandings with the foreign powers, which with some of them, like Marshal Biron, the D'Entragues and the duc de Bouillon, amounted to conspiracy (1602-1606).

As to the qualifications of the king: he had had the good fortune not to be educated for the throne. Without much learning and sceptical in religious matters, he had the lively intelligence of the Gascon, more subtle than profound, more brilliant than steady. Married to a woman of loose morals, and afterwards to a devout Italian, he was gross and vulgar in his appetites and pleasures. He had retained all the habits of a country gentleman of his native Béarn, careless, familiar, boastful, thrifty, cunning, combined since his sojourn at the court of the Valois with a taint of corruption. He worked little but rapidly, with none of the bureaucratic pedantry of a Philip II. cloistered in the dark towers of the Escorial. Essentially a man of action and a soldier, he preserved his tone of command after he had reached the throne, the inflexibility of the military chief, the conviction of his absolute right to be master. Power quickly intoxicated him, and his monarchy was therefore anything but parliamentary. His personality was everything, institutions nothing. If, at the gathering of the notables at Rouen in 1596, Henry IV. spoke of putting himself in tutelage, that was but preliminary to a demand for money. The states-general, called together ten times in the 16th century, and at the death of Henry III. under promise of convocation, were never assembled. To put his absolute right beyond all control he based it upon religion, and to this sceptic disobedience became a heresy. He tried to make the clergy into an instrument of government by recalling the Jesuits, who had been driven away in 1594, partly from fear of their regicides, partly because they have always been the best teachers of servitude; and he gave the youth of the nation into the hands of this cosmopolitan and ultramontane clerical order. His government was personal, not through departments; he retained the old council though reducing its members; and his ministers, taken from every party, were never—not even Sully—anything more than mere clerks, without independent position,

mere instruments of his good pleasure. Fortunately this was not always capricious.

Henry IV. soon realized that his most urgent duty was to resuscitate the corpse of France. Pilfering was suppressed, and the revolts of the malcontents—the *Gauthiers* of Normandy, the *Croquants* and *Tard-avisés* of Périgord and Limousin—were quelled, adroitly at first, and later with a sterner hand. He then provided for the security of the country districts, and reduced the taxes on the peasants, the most efficacious means of making them productive and able to pay. Inspired by Barthélemy de Laffémas (1545-1612), controller-general of commerce, and by Olivier de Serres (1539-1619),¹ Henry IV. encouraged the culture of silk, though without much result, had orchards planted and marshes drained; while though he permitted the free circulation of wine and corn, this depended on the harvests. But the twofold effect of civil war—the ruin of the farmers and the scarcity and high price of rural labour—was only reduced arbitrarily and by fits and starts.

Despite the influence of Sully, a convinced agrarian because of his horror of luxury and love of economy, Henry IV. likewise attempted amelioration in the towns, where the state of affairs was even worse than in the country. But the edict of 1597, far from inaugurating individual liberty, was but a fresh edition of that of 1581, a second preface to the legislation of Colbert, and in other ways no better respected than the first. As for the new features, the syndical courts proposed by Laffémas, they were not even put into practice. Various industries, nevertheless, concurrent with those of England, Spain and Italy, were created or reorganized: silk-weaving, printing, tapestry, &c. Sully at least provided nascent manufacture with the roads necessary for communication and planted them with trees. In external commerce Laffémas and Henry IV. were equally the precursors of Colbert, freeing raw material and prohibiting the import of products similar to those manufactured within the kingdom. Without regaining that preponderance in the Levant which had been secured after the victory of Lepanto and before the civil wars, Marseilles still took an honourable place there, confirmed by the renewal in 1604 of the capitulations of Francis I. with the sultan. Finally, the system of commercial companies, anti-pathetic to the French bourgeoisie, was for the first time practised on a grand scale; but Sully never understood that movement of colonial expansion, begun by Henry II. in Brazil and continued in Canada by Champlain, which had so marvellously enlarged the European horizon. His point of view was altogether more limited than that of Henry IV.; and he did not foresee, like Elizabeth, that the future would belong to the peoples whose national energy took that line of action.

His sphere was essentially the superintendence of finance, to which he brought the same enthusiasm that he had shown in fighting the League. Vain and imaginative, his reputation was enormously enhanced by his "Économies royales"; he was no innovator, and being a true representative of the nation at that period, like it he was but lukewarm towards reform, accepting it always against the grain. He was not a financier of genius; but he administered the public moneys with the same probity and exactitude which he used in managing his own, retrieving alienated property, straightening accounts, balancing expenditure and receipts, and amassing a reserve in the Bastille. He did not reform the system of *aides* and *tailles* established by Louis XI. in 1482; but by charging much upon indirect taxation, and slightly lessening the burden of direct taxation, he avoided an appeal to the states-general and gave an illusion of relief.

Nevertheless, economic disasters, political circumstances and the personal government of Henry IV. (precursor in this also

¹ Olivier de Serres, sieur de Pradel, spent most of his life on his model farm at Pradel. In 1599 he dedicated a pamphlet on the cultivation of silk to Henry IV., and in 1600 published his *Théâtre d'agriculture et ménage des champs*, which passed through nineteen editions up to 1675.

of Louis XIV.) rendered his task impossible or fatal. The nobility remained in debt and disaffected; and the clergy, more remarkable for wealth and breeding than for virtues, were won over to the ultramontane ideas of the triumphant Jesuits. The rich bourgeoisie began more and more to monopolize the magistracy; and though the country-people were somewhat relieved from the burden which had been crushing them, the working-classes remained impoverished, owing to the increase of prices which followed at a distance the rise of wages. Moreover, under insinuating and crafty pretexts, Henry IV. undermined as far as he could the right of control by the states-general, the right of remonstrance by the parlements, and the communal franchises, while ensuring the impoverishment of the municipalities by his fiscal methods. Arbitrary taxation, scandalous intervention in elections, forced candidatures, confusion in their financial administration, bankruptcy and revolt on the part of the tenants: all formed an anticipation of the personal rule of Richelieu and Louis XIV.

Thus Henry IV. evinced very great activity in restoring order and very great poverty of invention in his methods. His sole original creation, the edict of La Paulette in 1604, was disastrous. In consideration of an annual payment of one-sixtieth of the salary, it made hereditary offices which had hitherto been held only for life; and the millions which it daily poured into the royal exchequer removed the necessity for seeking more regular and better distributed resources. Political liberty and social justice were equally the losers by this extreme financial measure, which paved the way for a catastrophe.

In foreign affairs the abasement of the house of Austria remained for Henry IV., as it had been for Francis I. and Henry II., a political necessity, while under his successors it was to become a mechanical obsession. The peace of Vervins had concluded nothing. The difference concerning the marquisate of Saluzzo, which the duke of Savoy had seized upon in 1588, profiting by Henry III.'s embarrassments, is only worth mentioning because the treaty of Lyons (1601) finally dissipated the Italian mirage, and because, in exchange for the last of France's possessions beyond the Alps, it added to the royal domain the really French territory of La Bresse, Bugey, Valromey and the district of Gex. The great external affair of the reign was the projected war upon which Henry IV. was about to embark when he was assassinated. The "grand design" of Sully, the organization of a "Christian Republic" of the European nations for the preservation of peace, was but the invention of an irresponsible minister, soured by defeat and wishing to impress posterity. Henry IV., the least visionary of kings, was between 1598 and 1610 really hesitating between two great contradictory political schemes: the war clamoured for by the Protestants, politicians like Sully, and the nobility; and the Spanish alliance, to be cemented by marriages, and preached by the ultramontane Spanish camarilla formed by the queen, Père Coton, the king's confessor, the minister Villeroy, and Ubaldini, the papal nuncio. Selfish and suspicious, Henry IV. consistently played this double game of policy in conjunction with president Jeannin. By his alliance with the Grisons (1603) he guaranteed the integrity of the Valtellina, the natural approach to Lombardy for the imperial forces; and by his intimate union with Geneva he controlled the routes by which the Spaniards could reach their hereditary possessions in Franche-Comté and the Low Countries from Italy. But having defeated the duke of Savoy he had no hesitation in making sure of him by a marriage; though the Swiss might have misunderstood the treaty of Brusol (1610) by which he gave one of his daughters to the grandson of Philip II. On the other hand he astonished the Protestant world by the imprudence of his mediation between Spain and the rebellious United Provinces (1609). When the succession of Cleves and Jülich, so long expected and already discounted by the treaty of Halle (1610), was opened up in Germany, the great war was largely due to an access of senile passion for the charms of the

princesse de Condé. The stroke of Ravallac's knife caused a timely descent of the curtain upon this new and tragi-comic Trojan War. Thus, here as elsewhere, we see a vacillating hand-to-mouth policy, at the mercy of a passion for power or for sensual gratification. The *Cornette blanche* of Arques, the *Poule au pôt* of the peasant, successes as a lover and a dashing spirit, have combined to surround Henry IV. with a halo of romance not justified by fact.

The extreme instability of monarchical government showed itself afresh after Henry IV.'s death. The reign of Louis XIII., a perpetual regency by women, priests, and favourites, was indeed a curious prelude to the grand age of the French monarchy. The eldest son of Henry IV. being a minor, Marie de' Medici induced the parlement to invest her with the regency, thanks to Villeroy and contrary to the last will of Henry IV. This second Florentine, at once jealous of power and incapable of exercising it, bore little resemblance to her predecessor. Light-minded, haughty, apathetic and cold-hearted, she took a sort of passionate delight in changing Henry IV.'s whole system of government. Who would support her in this? On one side were the former ministers, Sillery and president Jeannin, ex-leaguers but loyalists, no lovers of Spain and still less of Germany; on the other the princes of the blood and the great nobles, Condé, Guise, Mayenne and Nevers, apparently still much more faithful to French ideas, but in reality convinced that the days of kings were over and that their own had arrived. Instead of weakening this aristocratic agitation by the see-saw policy of Catherine de' Medici, Marie could invent no other device than to despoil the royal treasure by distributing places and money to the chiefs of both parties. The savings all expended and Sully fallen into disgrace, she lost her influence and became the almost unconscious instrument of an ambitious man of low birth, the Florentine Concini, who was to drag her down with him in his fall; petty shifts became thenceforward the order of the day.

Thus Villeroy thought fit to add still further to the price already paid to triumphant Madrid and Vienna by disbanding the army, breaking the treaty of Brusol, and abandoning the Protestant princes beyond the Rhine and the trans-Pyrenean Moriscos. France joined hands with Spain in the marriages of Louis XIII. with Anne of Austria and Princess Elizabeth with the son of Philip III., and the Spanish ambassador was admitted to the secret council of the queen. To soothe the irritation of England the duc de Bouillon was sent to London to offer the hand of the king's sister to the prince of Wales. Meanwhile, however, still more was ceded to the princes than to the kings; and after a pretence of drawing the sword against the prince of Condé, rebellious through jealousy of the Italian surroundings of the queen-mother, recourse was had to the purse. The peace of Sainte Menneould, four years after the death of Henry IV., was a virtual abdication of the monarchy (May 1614); it was time for a move in the other direction. Villeroy inspired the regent with the idea of an armed expedition, accompanied by the little king, into the West. The convocation of the states-general was about to take place, wrung, as in all minorities, from the royal weakness—this time by Condé; so the elections were influenced in the monarchist interest. The king's majority, solemnly proclaimed on the 28th of October 1614, further strengthened the throne; while owing to the bungling of the third estate, who did not contrive to gain the support of the clergy and the nobility by some sort of concessions, the states-general, the last until 1789, proved like the others a mere historic episode, an impotent and inorganic expedient. In vain Condé tried to play with the parlement of Paris the same game as with the states-general, in a sort of anticipation of the Fronde. Villeroy demurred; and the parlement, having illegally assumed a political rôle, broke with Condé and effected a reconciliation with the court. After this double victory Marie de' Medici could at last undertake the famous journey to Bordeaux and consummate the Spanish marriages. In order not to countenance by his presence an act which had been the pretext for his opposition, Condé rebelled

Louis XIII. (1610-1643).

once more in August 1615; but he was again pacified by the governorships and pensions of the peace of Loudun (May 1616).

But Villeroy and the other ministers knew not how to reap the full advantage of their victory. They had but one desire,

to put themselves on a good footing again with Condé, instead of applying themselves honestly to the service of the king. The "marshals," Concini and his wife

Leonora Galigai, more influential with the queen and more exacting than ever, by dint of clever intrigues forced the ministers to retire one after another; and with the last of Henry IV.'s "greybeards" vanished also all the pecuniary reserves left. Concini surrounded himself with new men, insignificant persons ready to do his bidding, such as Barbin or Mangot, while in the background was Richelieu, bishop of Luçon. Condé now began intrigues with the princes whom he had previously betrayed; but his pride dissolved in piteous entreaties when Thémînes, captain of the guard, arrested him in September 1616. Six months later Concini had not even time to protest when another captain, Vitry, slew him at the Louvre, under orders from Louis XIII., on the 24th of April 1617.

Richelieu had appeared behind Marie de' Medici; Albert de Luynes rose behind Louis XIII., the neglected child whom he had contrived to amuse. "The tavern remained the same, having changed nothing but the bush." De Luynes was made a duke and marshal in Concini's place, with no better title; while the duc d'Epèrnon, supported by the queen-mother (now in disgrace at Blois), took Condé's place at the head of the opposition. The treaties of Angoulême and Angers (1619-1620), negotiated by Richelieu, recalled the "unwholesome" treaties of Sainte-Menehould and Loudun. The revolt of the Protestants was more serious. Goaded by the vigorous revival of militant Catholicism which marked the opening of the 17th century, de Luynes tried to put a finishing touch to the triumph of Catholicism in France, which he had assisted, by abandoning in the treaty of Ulm the defence of the small German states against the ambition of the ruling house of Austria, and by sacrificing the Protestant Grisons to Spain. The re-establishment of Catholic worship in Béarn was the pretext for a rising among the Protestants, who had remained loyal during these troublous years; and although the military organization of French Protestantism, arranged by the assembly of La Rochelle, had been checked in 1621, by the defection of most of the reformed nobles, like Bouillon and Lesdiguières, de Luynes had to raise the disastrous siege of Montauban. Death alone saved him from the disgrace suffered by his predecessors (December 15, 1621).

From 1621 to 1624 Marie de' Medici, re-established in credit, prosecuted her intrigues; and in three years there were three

different ministries: de Luynes was succeeded by the prince de Condé, whose Montauban was found at Montpellier; the Brûlarts succeeded Condé, and

having, like de Luynes, neglected France's foreign interests, they had to give place to La Vieuville; while this latter was arrested in his turn for having sacrificed the interests of the English Catholics in the negotiations regarding the marriage of Henrietta of France with the prince of Wales. All these personages were undistinguished figures beyond whom might be discerned the cold clear-cut profile of Marie de' Medici's secretary, now a cardinal, who was to take the helm and act as viceroy during eighteen years.

Richelieu came into power at a lucky moment. Every one was sick of government by deputy; they desired a strong hand

and an energetic foreign policy, after the defeat of the Czechs at the White Mountain by the house of Austria, the Spanish intrigues in the Valtellina, and the resumption of war between Spain and Holland.

Richelieu contrived to raise hope in the minds of all. As president of the clergy at the states-general of 1614 he had figured as an adherent of Spain and the ultramontane interest; he appeared to be a representative of that religious party which was identical with the Spanish party. But he had also been put into the ministry by the party of the *Politiques*, who had

terminated the civil wars, acclaimed Henry IV., applauded the Protestant alliance, and by the mouth of Miron, president of the third estate, had in 1614 proclaimed its intention to take up the national tradition once more. Despite the concessions necessary at the outset to the partisans of a Catholic alliance, it was the programme of the *Politiques* that Richelieu adopted and laid down with a master's hand in his Political Testament.

To realize it he had to maintain his position. This was very difficult with a king who "wished to be governed and yet was impatient at being governed." Incapable of applying himself to great affairs, but of sane and even acute judgment, Louis XIII. excelled only in a passion for detail and for manual pastimes. He realized the superior qualities of his minister, though with a lively sense of his own dignity he often wished him more discreet and less imperious; he had confidence in him but did not love him. Cold-hearted and formal by nature, he had not even self-love, detested his wife Anne of Austria—too good a Spaniard—and only attached himself fitfully to his favourites, male or female, who were naturally jealously suspected by the cardinal. He was accustomed to listen to his mother, who detested Richelieu as her ungrateful protégé. Neither did he love his brother, Gaston of Orleans, and the feeling was mutual; for the latter, remaining for twenty years heir-presumptive to a crown which he could neither defend nor seize, posed as the beloved prince in all the conspiracies against Richelieu, and issued from them each time as a Judas. Add to this that Louis XIII., like Richelieu himself, had wretched health, aggravated by the extravagant medicines of the day; and it is easy to understand how this pliable disposition which offered itself to the yoke caused Richelieu always to fear that his king might change his master, and to declare that "the four square feet of the king's cabinet had been more difficult for him to conquer than all the battlefields of Europe."

Richelieu, therefore, passed his time in safeguarding himself from his rivals and in spying upon them; his suspicious nature, rendered still more irritable by his painful practice of a dissimulation repugnant to his headstrong character, making him fancy himself threatened more than was actually the case. He brutally suppressed six great plots, several of which were scandalous, and had more than fifty persons executed; and he identified himself with the king, sincerely believing that he was maintaining the royal authority and not merely his own. He had a preference for irregular measures rather than legal prosecutions, and a jealousy of all opinions save his own. He maintained his power through the fear of torture and of special commissions. It was Louis XIII. whose cold decree ordained most of the rigorous sentences, but the stain of blood rested on the cardinal's robe and made his reasons of state pass for private vengeance. Chalais was beheaded at Nantes in 1626 for having upheld Gaston of Orleans in his refusal to wed Mademoiselle de Montpensier, and Marshal d'Ornano died at Vincennes for having given him bad advice in this matter; while the duellist de Boutteville was put to the torture for having braved the edict against duels. The royal family itself was not free from his attacks; after the Day of Dupes (1630) he allowed the queen-mother to die in exile, and publicly dishonoured the king's brother Gaston of Orleans by the publication of his confessions; Marshal de Marillac was put to the torture for his ingratitude, and the constable de Montmorency for rebellion (1632). The birth of Louis XIV. in 1638 confirmed Richelieu in power. However, at the point of death he roused himself to order the execution of the king's favourite, Cinq-Mars, and his friend de Thou, guilty of treason with Spain (1642).

Absolute authority was not in itself sufficient; much money was also needed. In his state-papers Richelieu has shown that at the outset he desired that the Huguenots should share no longer in public affairs, that the nobles should cease to behave as rebellious subjects, and the powerful provincial governors as suzerains over the lands committed to their charge. With his passion for the uniform and the useful on a grand scale, he hoped by means of the Code

Michaud to put an end to the sale of offices, to lighten imposts, to suppress brigandage, to reduce the monasteries, &c. To do this it would have been necessary to make peace, for it was soon evident that war was incompatible with these reforms. He chose war, as did his Spanish rival and contemporary Olivares. War is expensive sport; but Richelieu maintained a lofty attitude towards finance, disdained figures, and abandoned all petty details to subordinate officials like D'Effiat or Bullion. He therefore soon reverted to the old and worse measures, including the debasement of coinage, and put an extreme tension on all the springs of the financial system. The land-tax was doubled and trebled by war, by the pensions of the nobles, by an extortion the profits of which Richelieu disdained neither for himself nor for his family; and just when the richer and more powerful classes had been freed from taxes, causing the wholesale oppression of the poorer, these few remaining were jointly and severally answerable. Perquisites, offices, forced loans were multiplied to such a point that a critic of the times, Guy Patin, facetiously declared that duties were to be exacted from the beggars basking in the sun. Richelieu went so far as to make poverty systematic and use famine as a means of government. This was the price paid for the national victories.

Thus he procured money at all costs, with an extremely crude fiscal judgment which ended by exasperating the people; hence numerous insurrections of the poverty-stricken; Dijon rose in revolt against the *aides* in 1630, Provence against the tax-officers (*élus*) in 1631, Paris and Lyons in 1632, and Bordeaux against the increase of customs in 1635. In 1636 the *Croquants* ravaged Limousin, Poitou, Angoumois, Gascony and Périgord; in 1639 it needed an army to subdue the *Va-nu-pieds* (bare-feet) in Normandy. Even the *rentiers* of the Hôtel-de-Ville, big and little, usually very peaceable folk, were excited by the curtailment of their incomes, and in 1639 and 1642 were roused to fury.

Every one had to bend before this harsh genius, who insisted on uniformity in obedience. After the feudal vassals, decimated by the wars of religion and the executioner's hand, and after the recalcitrant taxpayers, the Protestants, in their turn, and by their own fault, experienced this.

While Richelieu was opposing the designs of the pope and of the Spaniards in the Valtellina, while he was arming the duke of Savoy and subsidizing Mansfeld in Germany, Henri, duc de Rohan, and his brother Benjamin de Rohan, duc de Soubise, the Protestant chiefs, took the initiative in a fresh revolt despite the majority of their party (1625). This Huguenot rising, in stirring up which Spanish diplomacy had its share, was a revolt of discontented and ambitious individuals who trusted for success to their compact organization and the ultimate assistance of England. Under pressure of this new danger and urged on by the Catholic *dévôts*, supported by the influence of Pope Urban VIII., Richelieu concluded with Spain the treaty of Monzon (March 5, 1626), by which the interests of his allies Venice, Savoy and the Grisons were sacrificed without their being consulted. The Catholic Valtellina, freed from the claims of the Protestant Grisons, became an independent state under the joint protection of France and Spain; the question of the right of passage was left open, to trouble France during the campaigns that followed; but the immediate gain, so far as Richelieu was concerned, was that his hands were freed to deal with the Huguenots.

Soubise had begun the revolt (January 1625) by seizing Port Blavet in Brittany, with the royal squadron that lay there, and in command of the ships thus acquired, combined with those of La Rochelle, he ranged the western coast, intercepting commerce. In September, however, Montmorency succeeded, with a fleet of English and Dutch ships manned by English seamen, in defeating Soubise, who took refuge in England. La Rochelle was now invested, the Huguenots were hard pressed also on land, and, but for the reluctance of the Dutch to allow their ships to be used for such a purpose, an end might have been made of the Protestant opposition in France; as it was, Richelieu was forced to accept the mediation of England and conclude a treaty with the Huguenots (February 1626).

He was far, however, from forgiving them for their attitude or being reconciled to their power. So long as they retained their compact organization in France he could undertake no successful action abroad, and the treaty was in effect no more than a truce that was badly observed. The oppression of the French Protestants was but one of the pretexts for the English expedition under James I.'s favourite, the duke of Buckingham, to La Rochelle in 1627; and, in the end, this intervention of a foreign power compromised their cause. When at last the citizens of the great Huguenot stronghold, caught between two dangers, chose what seemed to them the least and threw in their lot with the English, they definitely proclaimed their attitude as anti-national; and when, on the 29th of October 1628, after a heroic resistance, the city surrendered to the French king, this was hailed not as a victory for Catholicism only, but for France. The taking of La Rochelle was a crushing blow to the Huguenots, and the desperate alliance which Rohan, entrenched in the Cévennes, entered into with Philip IV. of Spain, could not prolong their resistance. The amnesty of Alais, prudent and moderate in religious matters, gave back to the Protestants their common rights within the body politic. Unfortunately what was an end for Richelieu was but a first step for the Catholic party.

The little Protestant group eliminated, Richelieu next wished to establish Catholic religious uniformity; for though in France the Catholic Church was the state church, unity did not exist in it. There were no fixed principles in the relations between king and church, hence incessant conflicts between Gallicans and Ultramontanians, in which Richelieu claimed to hold an even balance. Moreover, a Catholic movement for religious reform in the Church of France began during the 17th century, marked by the creation of seminaries, the foundation of new orthodox religious orders, and the organization of public relief by Saint Vincent de Paul. Jansenism was the most vigorous contemporary effort to renovate not only morals but Church doctrine (see JANSENISM). But Richelieu had no love for innovators, and showed this very plainly to du Vergier de Hauranne, abbot of Saint Cyran, who was imprisoned at Vincennes for the good of Church and State. In affairs of intellect dragooning was equally the policy; and, as Corneille learnt to his cost, the French Academy was created in 1635 simply to secure in the republic of letters the same unity and conformity to rules that was enforced in the state.

Before Richelieu, there had been no effective monarchy and no institutions for controlling affairs; merely advisory institutions which collaborated somewhat vaguely in the administration of the kingdom. Had the king been willing these might have developed further; but Richelieu ruthlessly suppressed all such growth, and they remained embryonic. According to him, the king must decide in secret, and the king's will must be law. No one might meddle in political affairs, neither parlements nor states-general; still less had the public any right to judge the actions of the government. Between 1631 and the edict of February 1641 Richelieu strove against the continually renewed opposition of the parlements to his system of special commissions and judgments; in 1641 he refused them any right of interference in state affairs; at most would he consent occasionally to take counsel with assemblies of notables. Provincial and municipal liberties were no better treated when through them the king's subjects attempted to break loose from the iron ring of the royal commissaries and intendants. In Burgundy, Dijon saw her municipal liberties restricted in 1631; the provincial assembly of Dauphiné was suppressed from 1628 onward, and that of Languedoc in 1629; that of Provence was in 1639 replaced by communal assemblies, and that of Normandy was prorogued from 1639 to 1642. Not that Richelieu was hostile to them in principle; but he was obliged at all hazards to find money for the upkeep of the army, and the provincial states were a slow and heavy machine to put in motion. Through an excessive reaction against the disintegration that had menaced the kingdom after the dissolution of the League, he fell into the abuse of

Peace of Alais, 1629.

Richelieu and the Catholics.

Destruction of public spirit.

Struggle with the Protestants.

over-centralization; and depriving the people of the habit of criticizing governmental action, he taught them a fatal acquiescence in uncontrolled and undisputed authority. Like one of those physical forces which tend to reduce everything to a dead level, he battered down alike characters and fortresses; and in his endeavours to abolish faction, he killed that public spirit which, formed in the 16th century, had already produced the *République* of Bodin, de Thou's *History of his Times*, La Boetie's *Contre un*, the *Satire Ménippée*, and Sully's *Économies royales*.

In order to establish this absolute despotism Richelieu created no new instruments, but made use of a revolutionary institution of the 16th century, namely "intendants" (*q.v.*), **Methods employed by Richelieu.** agents who were forerunners of the commissaries of the Convention, gentlemen of the long robe of inferior condition, hated by every one, and for that reason the more trustworthy. He also drew most of the members of his special commissions from the grand council, a supreme administrative tribunal which owed all its influence to him.

However, having accomplished all these great things, the treasury was left empty and the reforms were but ill-established; **The results.** for Richelieu's policy increased poverty, neglected the toiling and suffering peasants, deserted the cause of the workers in order to favour the privileged classes, and left idle and useless that bourgeoisie whose intellectual activity, spirit of discipline, and civil and political culture would have yielded solid support to a monarchy all the stronger for being limited. Richelieu completed the work of Francis I.; he endowed France with the fatal tradition of autocracy. This priest by education and by turn of mind was indifferent to material interests, which were secondary in his eyes; he could organize neither finance, nor justice, nor an army, nor the colonies, but at the most a system of police. His method was not to reform, but to crush. He was great chiefly in negotiation, the art *par excellence* of ecclesiastics. His work was entirely abroad; there it had more continuity, more future, perhaps because only in his foreign policy was he unhampered in his designs. He sacrificed everything to it; but he ennobled it by the genius and audacity of his conceptions, by the energetic tension of all the muscles of the body politic.

The Thirty Years' War in fact dominated all Richelieu's foreign policy; by it he made France and unmade Germany.

External policy of Richelieu. It was the support of Germany which Philip II. had lacked in order to realize his Catholic empire; and the election of the archduke Ferdinand II. of Styria as emperor gave that support to his Spanish cousins (1619). Thenceforward all the forces of the Habsburg monarchy would be united, provided that communication could be maintained in the north with the Netherlands and in the south with the duchy of Milan, so that there should be no flaw in the iron vice which locked France in on either side. It was therefore of the highest importance to France that she should dominate the valleys of the Alps and Rhine. As soon as Richelieu became minister in 1624 there was an end to cordial relations with Spain. He resumed the policy of Henry IV., confining his military operations to the region of the Alps, and contenting himself at first with opposing the coalition of the Habsburgs with a coalition of Venice, the Turks, Bethlen Gabor, king of Hungary, and the Protestants of Germany and Denmark. But the revolts of the French Protestants, the resentment of the nobles at his dictatorial power, and the perpetual ferment of intrigues and treason in the court, obliged him almost immediately to draw back. During these eight years, however, Richelieu had pressed on matters as fast as possible.

While James I. of England was trying to get a general on the cheap in Denmark to defend his son-in-law, the elector palatine, Richelieu was bargaining with the Spaniards in the **Temporizing policy, except in Italy, 1624-1630.** treaty of Monzon (March 1626); but as the strained relations between France and England forced him to conciliate Spain still further by the treaty of April 1627, the Spaniards profited by this to carry on an intrigue with Rohan, and in concert with the duke of Savoy, to occupy Montferrat when the death of Vincenzo II.

(December 26, 1627) left the succession of Mantua, under the will of the late duke, to Charles Gonzaga, duke of Nevers, a Frenchman by education and sympathy. But the taking of La Rochelle allowed Louis to force the pass of Susa, to induce the duke of Savoy to treat with him, and to isolate the Spaniards in Italy by a great Italian league between Genoa, Venice and the dukes of Savoy and Mantua (April 1629). Unlike the Valois, Richelieu only desired to free Italy from Spain in order to restore her independence.

The fact that the French Protestants in the Cévennes were again in arms enabled the Habsburgs and the Spaniards to make a fresh attack upon the Alpine passes; but after the peace of Alais Richelieu placed himself at the head of forty thousand men, and stirred up enemies everywhere against the emperor, victorious now over the king of Denmark as in 1621 over the elector palatine. He united Sweden, now reconciled with Poland, and the Catholic and Protestant electors, disquieted by the edict of Restitution and the omnipotence of Wallenstein; and he aroused the United Provinces. But the disaffection of the court and the more extreme Catholics made it impossible for him as yet to enter upon a struggle against both Austria and Spain; he was only able to regulate the affairs of Italy with much prudence. The intervention of Mazarin, despatched by the pope, who saw no other means of detaching Italy from Spain than by introducing France into the affair, brought about the signature of the armistice of Rivalte on the 4th of September 1630, soon developed into the peace of Cherasco, which re-established the agreement with the still fugitive duke of Savoy (June 1631). Under the harsh tyranny of Spain, Italy was now nothing but a lifeless corpse; young vigorous Germany was better worth saving. So Richelieu's envoys, Brulart de Léon and Father Joseph, disarmed¹ the emperor at the diet of Regensburg, while at the same time Louis XIII. kept Casale and Pinerolo, the gates of the Alps. Lastly, by the treaty of Fontainebleau (May 30th, 1631), Maximilian of Bavaria, the head of the Catholic League, engaged to defend the king of France against all his enemies, even Spain, with the exception of the emperor. Thus by the hand of Richelieu a union against Austrian imperialism was effected between the Bavarian Catholics and the Protestants who dominated in central and northern Germany.

Twice had Richelieu, by means of the purse and not by force of arms, succeeded in reopening the passes of the Alps and of the Rhine. The kingdom at peace and the Huguenot party ruined, he was now able to engage upon his **Richelieu and Gustavus Adolphus.** policy of prudent acquisitions and apparently disinterested alliances. But Gustavus Adolphus, king of Sweden, called in by Richelieu and Venice to take the place of the played-out king of Denmark, brought danger to all parties. He would not be content merely to serve French interests in Germany, according to the terms of the secret treaty of Bärwalde (June 1631); but, once master of Germany and the rich valley of the Rhine, considered chiefly the interests of Protestantism and Sweden. Neither the prayers nor the threats of Richelieu, who wished indeed to destroy Spain but not Catholicism, nor the death of Gustavus Adolphus at Lützen (1632), could repair the evils caused by this immoderate ambition. A violent Catholic reaction against the Protestants ensued; and the union of Spain and the Empire was consolidated just when that of the Protestants was dissolved at Nördlingen, despite the efforts of Oxenstierna (September 1634). Moreover, Wallenstein, who had been urged by Richelieu to set up an independent kingdom in Bohemia, had been killed on the 23rd of February 1634. In the course of a year Württemberg and Franconia were reconquered from the Swedes; and the duke of Lorraine, who had taken the side of the Empire, called in the Spanish and the imperial forces to open the road to the Netherlands through Franche-Comté.

His allies no longer able to stand alone, Richelieu was obliged to intervene directly (May 19th, 1635). By the treaty of Saint-Germain-en-Laye he purchased the army of Bernard of Saxe-

¹ Ferdinand is reported to have said: "Le capucin m'a désarmé avec son scapulaire et a mis dans capuchon six bonnets électoraux."

Weimar; by that of Rivoli he united against Spain the dukes of Modena, Parma and Mantua; he signed an open alliance with the league of Heilbronn, the United Provinces and Sweden; and after these alliances military operations began, Marshal de la Force occupying the duchy of Lorraine. Richelieu attempted to operate simultaneously in the Netherlands by joining hands with the Dutch, and on the Rhine by uniting with the Swedes; but the bad organization of the French armies, the double invasion of the Spaniards as far as Corbie and the imperial forces as far as the gates of Saint-Jean-de-Losne (1636), and the death of his allies, the dukes of Hesse-Cassel, Savoy and Mantua at first frustrated his efforts. A decided success was, however, achieved between 1638 and 1640, thanks to Bernard of Saxe-Weimar and afterwards to Guébriant, and to the parallel action of the Swedish generals, Banér, Wrangel and Torstensson. Richelieu obtained Alsace, Breisach and the forest-towns on the Rhine; while in the north, thanks to the Dutch and owing to the conquest of Artois, marshals de la Meilleraye, de Châtillon and de Brézé forced the barrier of the Netherlands. Turin, the capital of Piedmont, was taken by Henri de Lorraine, comte d'Harcourt; the alliance with rebellious Portugal facilitated the occupation of Roussillon and almost the whole of Catalonia, and Spain was reduced to defending herself; while the embarrassments of the Habsburgs at Madrid made those of Vienna more tractable. The diet of Regensburg, under the mediation of Maximilian of Bavaria, decided in favour of peace with France, and on the 25th of December 1641 the preliminary settlement at Hamburg fixed the opening of negotiations to take place at Münster and Osnabrück. Richelieu's death (December 4, 1642) prevented him from seeing the triumph of his policy, but it can be judged by its results; in 1624 the kingdom had in the east only the frontier of the Meuse to defend it from invasion; in 1642 the whole of Alsace, except Strassburg, was occupied and the Rhine guarded by the army of Guébriant. Six months later, on the 14th of May 1643, Louis XIII. rejoined his minister in his true kingdom, the land of shades.

But thanks to Mazarin, who completed his work, France gathered in the harvest sown by Richelieu. At the outset no one believed that the new cardinal would have any success. Every one expected from Anne of Austria a change in the government which appeared to be justified by the persecutions of Richelieu and the disdainful unscrupulousness of Louis XIII. On the 16th of May the queen took the little four-year-old Louis XIV. to the parlement of Paris which, proud of playing a part in politics, hastened, contrary to Louis XIII.'s last will, to acknowledge the command of the little king, and to give his mother "free, absolute and entire authority." The great nobles were already looking upon themselves as established in power, when they learnt with amazement that the regent had appointed as her chief adviser, not Gaston of Orleans, but Mazarin. The political revenge which in their eyes was owing to them as a body, the queen claimed for herself alone, and she made it a romantic one. This Spaniard of waning charms, who had been neglected by her husband and insulted by Richelieu, now gave her indolent and full-blown person, together with absolute power, into the hands of the Sicilian. Whilst others were triumphing openly, Mazarin, in the shadow and silence of the interregnum, had kept watch upon the heart of the queen; and when the old party of Marie de' Medici and Anne of Austria wished to come back into power, to impose a general peace, and to substitute for the Protestant alliances an understanding with Spain, the arrest of François de Vendôme, duke of Beaufort, and the exile of other important nobles proved to the great families that their hour had gone by (September 1643).

Mazarin justified Richelieu's confidence and the favour of Anne of Austria. It was upon his foreign policy that he relied to maintain his authority within the kingdom. Thanks to him, the duke of Enghien (Louis de Bourbon, afterwards prince of Condé), appointed commander-in-chief at the age of twenty-two, caused the downfall of the renowned Spanish infantry at

Turoi; and he discovered Turenne, whose prudence tempered Condé's overbold ideas. It was he too who by renewing the traditional alliances and resuming against Bavaria, Ferdinand III.'s most powerful ally, the plan of common action with Sweden which Richelieu had sketched out, pursued it year after year: in 1644 at Freiburg im Breisgau, despite the death of Guébriant at Rottweil; in 1645 at Nördlingen, despite the defeat of Marienthal; and in 1646 in Bavaria, despite the rebellion of the Weimar cavalry; to see it finally triumph at Zusmarshausen in May 1648. With Turenne dominating the Eiser and the Inn, Condé victorious at Lens, and the Swedes before the gates of Prague, the emperor, left without a single ally, finally authorized his plenipotentiaries to sign on the 24th of October 1648 the peace about which negotiations had been going on for seven years. Mazarin had stood his ground notwithstanding the treachery of the duke of Bavaria, the defection of the United Provinces, the resistance of the Germans, and the general confusion which was already pervading the internal affairs of the kingdom.

The dream of the Habsburgs was shattered. They had wished to set up a centralized empire, Catholic and German; but the treaties of Westphalia kept Germany in its passive and fragmentary condition; while the Catholic and Protestant princes obtained formal recognition of their territorial independence and their religious equality. Thus disappeared the two principles which justified the Empire's existence; the universal sovereignty to which it laid claim was limited simply to a German monarchy much crippled in its powers; and the enfranchisement of the Lutherans and Calvinists from papal jurisdiction cut the last tie which bound the Empire to Rome. The victors' material benefits were no less substantial: the congress of Münster ratified the final cession of the Three Bishoprics and the conquest of Alsace, and Breisach and Philippsburg completed these acquisitions. The Spaniards had no longer any hope of adding Luxemburg to their Franche-Comté; while the Holy Roman Empire in Germany, taken in the rear by Sweden (now mistress of the Baltic and the North Sea), cut off for good from the United Provinces and the Swiss cantons, and enfeebled by the recognized right of intervention in German affairs on the part of Sweden and France, was now nothing but a meaningless name.

Mazarin had not been so fortunate in Italy, where in 1642 the Spanish remained masters. Venice, the duchy of Milan and the duke of Modena were on his side; the pope and the grand-duke of Tuscany were trembling, but the romantic expedition of the duke of Guise to Naples, and the outbreak of the Fronde, saved Spain, who had refused to take part in the treaties of Westphalia and whose ruin Mazarin wished to compass.

It was, however, easier for Mazarin to remodel the map of Europe than to govern France. There he found himself face to face with all the difficulties that Richelieu had neglected to solve, and that were now once more giving trouble. The *Lit de Justice* of the 18th of May 1643 had proved authority to remain still so personal an affair that the person of the king, insignificant though that was, continued to be regarded as its absolute depository. Thus regular obedience to an abstract principle was under Mazarin as incomprehensible to the idle and selfish nobility as it had been under Richelieu. The parlement still kept up the same extra-judicial pretensions; but beyond its judicial functions it acted merely as a kind of town-crier to the monarchy, charged with making known the king's edicts. Yet through its right of remonstrance it was the only body that could legally and publicly intervene in politics; a large and independent body, moreover, which had its own demands to make upon the monarchy and its ministers. Richelieu, by setting his special agents above the legal but complicated machinery of financial administration, had so corrupted it as to necessitate radical reform; all the more so because financial charges had been increased to a point far beyond what the nation could bear. With four armies to keep up, the insurrection in Portugal to maintain, and pensions to serve the needs of the allies, the burden had become a crushing one.

of the
kingdom.

Richelieu had been able to surmount these difficulties because he governed in the name of a king of full age, and against isolated adversaries; while Mazarin had the latter against him in a coalition which had lasted ten years, with the further disadvantages of his foreign origin and a royal minority at a time when every one was sick of government by ministers. He was the very opposite of Richelieu, as wheedling in his ways as the other had been haughty and scornful, as devoid of vanity and rancour as Richelieu had been full of jealous care for his authority; he was gentle where the other had been passionate and irritable, with an intelligence as great and more supple, and a far more grasping nature.

It was the fiscal question that arrayed against Mazarin a coalition of all petty interests and frustrated ambitions; this was always the Achilles' heel of the French monarchy, which in 1648 was at the last extremity for money. All imposts were forestalled, and every expedient for obtaining either direct or indirect taxes had been exhausted by the methods of the financiers. As the country districts could yield nothing more, it became necessary to demand money from the Parisians and from the citizens of the various towns, and to search out and furbish up old disused edicts—edicts as to measures and scales of prices—at the very moment when the luxury and corruption of the *parvenus* was insulting the poverty and suffering of the people, and exasperating all those officials who took their functions seriously.

A storm burst forth in the parlement against Mazarin as the patron of these expedients, the occasion for this being the edict of redemption by which the government renewed for nine years the "Paulette" which had now expired, by withholding four years' salary from all officers of the Great Council, of the *Chambres des comptes*, and of the *Cour des aides*. The parlement, although expressly exempted, associated itself with their protest by the decree of union of May 13, 1648, and deliberations in a body upon the reform of the state. Despite the queen's express prohibition, the insurrectionary assembly of the *Chambre Saint Louis* criticized the whole financial system, founded as it was upon usury, claimed the right of voting taxes, respect for individual liberty, and the suppression of the intendants, who were a menace to the new bureaucratic feudalism. The queen, haughty and exasperated though she was, yielded for the time being, because the invasion of the Spaniards in the north, the arrest of Charles I. of England, and the insurrection of Masaniello at Naples made the moment a critical one for monarchies; but immediately after the victory at Lens she attempted a *coup d'état*, arresting the leaders, and among them Broussel, a popular member of the parlement (August 26, 1648). Paris at once rose in revolt—a Paris of swarming and unpoliced streets, that had been making French history ever since the reign of Henry IV., and that had not forgotten the barricades of the League. Once more a pretence of yielding had to be made, until Condé's arrival enabled the court to take refuge at Saint-Germain (January 15, 1649).

Civil war now began against the rebellious coalition of great nobles, lawyers of the parlement, populace, and mercenaries just set free from the Thirty Years' War. It lasted four years, for motives often as futile as the Grande Mademoiselle's ambition to wed little Louis XIV., Cardinal de Retz's red hat, or Madame de Longueville's stool at the queen's side; it was, as its name of *Fronde* indicates, a hateful farce, played by grown-up children, in several acts.

Its first and shortest phase was the Fronde of the Parlement. At a period when all the world was a little mad, the parlement had imagined a loyalist revolt, and, though it raised an armed protest, this was not against the king but against Mazarin and the persons to whom he had delegated power. But the parlement soon became disgusted with its allies—the princes and nobles, who had only drawn their swords in order to beg more effectively with arms in their hands; and the Parisian mob, whose fanaticism had been aroused by Paul de Gondi, a warlike ecclesiastic, a Catiline in a cassock, who preached the gospel at the dagger's point.

When a suggestion was made to the parlement to receive an envoy from Spain, the members had no hesitation in making terms with the court by the peace of Rueil (March 11, 1649), which ended the first Fronde.

As an *entr'acte*, from April 1649 to January 1650, came the affair of the *Petits Maitres*: Condé, proud and violent; Gaston of Orleans, pliable and contemptible; Conti, the simpleton; and Longueville, the betrayed husband. The victor of Lens and Charenton imagined that every one was under an obligation to him, and laid claim to a dictatorship so insupportable that Anne of Austria and Mazarin—assured by Gondi of the concurrence of the parlement and people—had him arrested. To defend Condé the great conspiracy of women was formed: Madame de Chevreuse, the subtle and impassioned princess palatine, and the princess of Condé vainly attempted to arouse Normandy, Burgundy and the mob of Bordeaux; while Turenne, bewitched by Madame de Longueville, allowed himself to become involved with Spain and was defeated at Rethel (December 15, 1650). Unfortunately, after his custom when victor, Mazarin forgot his promises—above all, Gondi's cardinal's hat. A union was effected between the two Frondes, that of the *Petits Maitres* and that of the parlements, and Mazarin was obliged to flee for safety to the electorate of Cologne (February 1651), whence he continued to govern the queen and the kingdom by means of secret letters. But the heads of the two Frondes—Condé, now set free from prison at Havre, and Gondi who detested him—were not long in quarrelling fatally. Owing to Mazarin's exile and to the king's attainment of his majority (September 5, 1651) quiet was being restored, when the return of Mazarin, jealous of Anne of Austria, nearly brought about another reconciliation of all his opponents (January 1652). Condé resumed civil war with the support of Spain, because he was not given Mazarin's place; but though he defeated the royal army at Bléneau, he was surprised at Étampes, and nearly crushed by Turenne at the gate of Saint-Antoine. Saved, however, by the Grande Mademoiselle, daughter of Gaston of Orleans, he lost Paris by the disaster of the Hôtel de Ville July 4, 1652), where he had installed an insurrectionary government. A general weariness of civil war gave plenty of opportunity after this to the agents of Mazarin, who in order to facilitate peace made a pretence of exiling himself for a second time to Bouillon. Then came the final collapse: Condé having taken refuge in Spain for seven years, Gaston of Orleans being in exile, Retz in prison, and the parlement reduced to its judiciary functions only, the field was left open for Mazarin, who, four months after the king, re-entered in triumph that Paris which had driven him forth with jeers and mockery (February 1653).

The task was now to repair these four years of madness and folly. The nobles who had hoped to set up the League again, half counting upon the king of Spain, were held in check by Mazarin with the golden dowries of his numerous nieces, and were now employed by him in warfare and in decorative court functions; while others, De Retz and La Rochefoucauld, sought consolation in their Memoirs or their Maxims, one for his mortifications and the other for his rancour as a statesman out of employment. The parlement, which had confused political power with judiciary administration, was given to understand, in the session of April 13, 1655, at Vincennes, that the era of political manifestations was over; and the money expended by Gourville, Mazarin's agent, restored the members of the parlement to docility. The power of the state was confided to middle-class men, faithful servants during the evil days: Abel Servien, Michel le Tellier, Hugues de Lionne. Like Henry IV. after the League, Mazarin, after having conquered the Fronde, had to buy back bit by bit the kingdom he had lost, and, like Richelieu, he spread out a network of agents, thenceforward regular and permanent, who assured him of that security without which he could never have carried on his vast plunderings in peace and quiet. His imitator and superintendent, Fouquet, the Maecenas of the future Augustus, concealed this gambling policy beneath the lustre of the arts and the glamour of a literature remarkable for

elevation of thought and vigour of style, and further characterized by the proud though somewhat restricted freedom conceded to men like Corneille, Descartes and Pascal, but soon to disappear.

It was also necessary to win back from Spain the territory which the Frondeurs had delivered up to her. Both countries,

War with Spain.

exhausted by twenty years of war, were incapable of bringing it to a successful termination, yet neither would be first to give in; Mazarin, therefore, disquieted by Condé's victory at Valenciennes (1656), reknit the bond of Protestant alliances, and, having nothing to expect from Holland, he deprived Spain of her alliance with Oliver Cromwell (March 23, 1657). A victory in the Dunes by Turenne, now reinstated in honour, and above all the conquest of the Flemish seaboard, were the results (June 1658); but when, in order to prevent the emperor's intervention in the Netherlands, Mazarin attempted, on the death of Ferdinand III., to wrest the Empire from the Habsburgs, he was foiled by the gold of the Spanish envoy Peñaranda (1657). When the abdication of Christina of Sweden caused a quarrel between Charles Gustavus of Sweden and John Casimir of Poland, by which the emperor and the elector of Brandenburg hoped to profit, Mazarin (August 15, 1658) leagued the Rhine princes against them; while at the same time the substitution of Pope Alexander VII. for Innocent X., and the marriage of Mazarin's two nieces with the duke of Modena and a prince of the house of Savoy, made Spain anxious about her Italian possessions. The suggestion of a marriage between Louis XIV. and a princess of Savoy

Peace of the Pyrenees.

decided Spain, now brought to bay, to accord him the hand of Maria Theresa as a chief condition of the peace of the Pyrenees (November 1659). Roussillon and Artois, with a line of strongholds constituting a formidable northern frontier, were ceded to France; and the acquisition of Alsace and Lorraine under certain conditions was ratified. Thus from this long duel between the two countries Spain issued much enfeebled, while France obtained the preponderance in Italy, Germany, and throughout northern Europe, as is proved by Mazarin's successful arbitration at Copenhagen and at Oliva (May-June 1660). That dream of Henry IV. and Richelieu, the ruin of Philip II.'s Catholic empire, was made a realized fact by Mazarin; but the clever engineer, dazzled by success, took the wrong road in national policy when he hoped to crown his work by the Spanish marriage.

The development of events had gradually enlarged the royal prerogative, and it now came to its full flower in the administrative monarchy of the 17th century. Of this system

Louis XIV. (1661-1715).

Louis XIV. was to be the chief exponent. His reign may be divided into two very distinct periods. The death of Colbert and the revocation of the edict of Nantes brought the first to a close (1661-1683-1685); coinciding with the date when the Revolution in England definitely reversed the traditional system of alliances, and when the administration began to disorganize. In the second period (1685-1715) all the germs of decadence were developed until the moment of final dissolution.

In a monarchy so essentially personal the preparation of the heir to the throne for his position should have been the chief task. Anne of Austria, a devoted but unintelligent

Education of Louis XIV.

mother, knew no method of dealing with her son, save devotion combined with the rod. His first preceptors were nothing but courtiers; and the most intelligent, his valet Laporte, developed in the royal child's mind his natural instinct of command, a very lively sense of his rank, and that nobly majestic air of master of the world which he preserved even in the commonest actions of his life. The continual agitations of the Fronde prevented him from persevering in any consistent application during those years which are the most valuable for study, and only instilled in him a horror of revolution, parliamentary remonstrance, and disorder of all kinds; so that this recollection determined the direction of his government. Mazarin, in his later years, at last taught him his trade as king by admitting him to the council, and by instructing him in the details of politics and of administration.

In 1661 Louis XIV. was a handsome youth of twenty-two, of splendid health and gentle serious mien; eager for pleasure, but discreet and even dissimulating; his rather mediocre intellectual qualities relieved by solid common sense; fully alive to his rights and his duties.

The duties he conscientiously fulfilled, but he considered he need render no account of them to any one but his Maker, the last humiliation for God's vicegerent being "to take the law from his people." In the solemn language of the "Memoirs for the Instruction of the Dauphin" he did but affirm the arbitrary and capricious character of his predecessors' action. As for his rights, Louis XIV. looked upon these as plenary and unlimited. Representative of God upon earth, heir to the sovereignty of the Roman emperors, a universal suzerain and master over the goods and the lives of his vassals, he could conceive no other bounds to his authority than his own interests or his obligations towards God, and in this he was a willing believer of Bossuet. He therefore had but two aims: to increase his power at home and to enlarge his kingdom abroad. The army and taxation were the chief instruments of his policy. Had not Bodin, Hobbes and Bossuet taught that the force which gives birth to kingdoms serves best also to feed and sustain them? His theory of the state, despite Grotius and Jurieu, rejected as odious and even impious the notion of any popular rights, anterior and superior to his own. A realist in principle, Louis XIV. was terribly utilitarian and egotistical in practice; and he exacted from his subjects an absolute, continual and obligatory self-abnegation before his public authority, even when improperly exercised.

His political ideas.

This deified monarch needed a new temple, and Versailles, where everything was his creation, both men and things, adored its maker. The highest nobility of France, beginning with the princes of the blood, competed for posts in the royal household, where an army of ten thousand soldiers, four thousand servants, and five thousand horses played its costly and luxurious part in the ordered and almost religious pageant of the king's existence. The "anciennes *cohues de France*," gay, familiar and military, gave place to a stilted court life, a perpetual adoration, a very ceremonious and very complicated ritual, in which the demigod "pontificated" even "in his dressing-gown." To pay court to himself was the first and only duty in the eyes of a proud and haughty prince who saw and noted everything, especially any one's absence. Versailles, where the delicate refinements of Italy and the grave politeness of Spain were fused and mingled with French vivacity, became the centre of national life and a model for foreign royalties; hence if Versailles has played a considerable part in the history of civilization, it also seriously modified the life of France. Etiquette and self-seeking became the chief rules of a courtier's life, and this explains the division of the nobility into two sections: the provincial squires, embittered by neglect; and the courtiers, who were ruined materially and intellectually by their way of living. Versailles sterilized all the idle upper classes, exploited the industrious classes by its extravagance, and more and more broke relations between king and kingdom.

But however divine, the king could not wield his power unaided. Louis XIV. called to his assistance a hierarchy of humbly submissive functionaries, and councils over which he regularly presided. Holding the very name of *roi fainéant* in abhorrence, he abolished the office of mayor of the palace—that is to say, the prime minister—thus imposing upon himself work which he always regularly performed. In choosing his collaborators his principle was never to select nobles or ecclesiastics, but persons of inferior birth. Neither the immense fortunes amassed by these men, nor the venality and robust vitality which made their families veritable races of ministers, altered the fact that De Lionne, Le Tellier, Louvois and Colbert were in themselves of no account, even though the parts they played were much more important than Louis XIV. imagined. This was the age of plebeians, to the great indignation of the duke and peer Saint Simon. Mere

Louis XIV.'s ministers.

reflected lights, these satellites professed to share their master's horror of all individual and collective rights of such a nature as to impose any check upon his public authority.

Royal despotism.

Louis XIV. detested the states-general and never convoked them, and the parlements were definitely reduced to silence in 1673; he completed the destruction of municipal liberties, under pretext of bad financial administration; suffered no public, still less private criticism; was ruthless when his exasperated subjects had recourse to force; and made the police the chief bulwark of his government. Prayers and resignation were the only solace left for the hardships endured by his subjects. All the ties of caste, class, corporation and family were severed; the jealous despotism of Louis XIV. destroyed every opportunity of taking common action; he isolated every man in private life, in individual interests, just as he isolated himself more and more from the body social. Freedom he tolerated for himself alone.

His passion for absolutism made him consider himself master of souls as well as bodies, and Bossuet did nothing to contravene an opinion which was, indeed, common to every

Louis XIV. and the Church.

sovereign of his day. Louis XIV., like Philip II., pretending to not only political but religious authority, would not allow the pope to share it, still less would he abide any religious dissent; and this gave rise to many conflicts, especially with the pope, at that time a temporal sovereign both at Rome and at Avignon, and as the head of Christendom bound to interfere in the affairs of France. Louis XIV.'s pride caused the first struggle, which turned exclusively upon questions of form, as in the affair of the Corsican Guard in 1662. The question of the right of *regale* (right of the Crown to the revenues of vacant abbeys and bishoprics), which touched the essential rights of sovereignty, further inflamed the hostility between Innocent XI. and Louis XIV. Conformably with the traditions of the administrative monarchy in 1673, the king wanted to extend to the new additions to the kingdom his rights of receiving the revenues of vacant bishoprics and making appointments to their benefices, including taking oaths of fidelity from the new incumbents. A protest raised by the bishops of Pamiers and Aleth, followed by the seizure of their revenues, provoked the intervention of Innocent XI. in 1678; but the king was supported by the general assembly of the clergy, which declared that, with certain exceptions, the *regale* extended over the whole kingdom (1681). The pope ignored the decisions of the assembly; so, dropping the *regale*, the king demanded that, to obviate further conflict, the assembly should define the limits of the authority due respectively to the king, the Church and the pope. This was the object of the Declaration of the Four

Declaration of the Four Articles.

Articles: the pope has no power in temporal matters; general councils are superior to the pope in spiritual affairs; the rules of the Church of France are inviolable; decisions of the pope in matters of faith are only irrevocable by consent of the Church. The French laity transferred to the king this quasi-divine authority, which became the political theory of the *ancien régime*; and since the pope refused to submit, or to institute the new bishops, the Sorbonne was obliged to interfere. The affair of the "diplomatic prerogatives," when Louis XIV. was decidedly in the wrong, made relations even more strained (1687), and the idea of a schism was mooted with greater insistence than in 1681. The death of Innocent XI. in 1689 allowed Louis XIV. to engage upon negotiations rendered imperative by his check in the affair of the Cologne bishopric, where his candidate was ousted by the pope's. In 1693, under the pontificate of Innocent XII., he went, like so many others, to Canossa.

Recipient now of immense ecclesiastical revenues, which, owing to the number of vacant benefices, constituted a powerful engine of government, Louis XIV. had immense power over the French Church. Religion began to be identified with the state; and the king combated heresy and dissent, not only as a religious duty, but as a matter of political expediency, unity of faith being obviously conducive to unity of law.

Richelieu having deprived the Protestants of all political guarantees for their liberty of conscience, an anti-Protestant

party (directed by a cabal of religious devotees, the *Compagnie du Saint Sacrement*) determined to suppress it completely by conversions and by a jesuitical interpretation of the terms of the edict of Nantes. Louis XIV. made this impolitic policy his own. His passion for absolutism, a religious zeal that was the more active because

Louis XIV. and the Protestants.

it had to compensate for many affronts to public and private morals, the financial necessity of augmenting the free donations of the clergy, and the political necessity of relying upon that body in his conflicts with the pope, led the king between 1661 and 1685 to embark upon a double campaign of arbitrary proceedings with the object of nullifying the edict, conversions being procured either by force or by bribery. The promulgation and application of systematic measures from above had a response from below, from the corporation, the urban workshop, and the village street, which supported ecclesiastical and royal authority in its suppression of heresy, and frequently even went further: individual and local fanaticism co-operating with the head of the state, the *intendants*, and the military and judiciary authorities. Protestants were successively removed from the states-general, the consulates, the town councils, and even from the humblest municipal offices; they were deprived of the charge of their hospitals, their academies, their colleges and their schools, and were left to ignorance and poverty; while the intolerance of the clergy united with chicanery of procedure to invade their places of worship, insult their adherents, and put a stop to the practice of their ritual. Pellisson's methods of conversion, considered too slow, were accelerated by the violent persecution of Louvois and by the king's galleys, until the day came when Louis XIV., deceived by the clergy, crowned his record of complaisant legal methods by revoking the edict of Nantes. This was the signal for a Huguenot renaissance, and the Camisards of the Cévennes held the royal armies in check from 1703 to 1711. Notwithstanding this, however, Louis XIV. succeeded only too well, since Protestantism was reduced both numerically and intellectually. He never perceived how its loss threw France back a full century, to the great profit of foreign nations; while neither did the Church perceive that she had been firing on her own troops.

Suppression of the edict of Nantes (1685).

The same order of ideas produced the persecution of the Jansenists, as much a political as a religious sect. Founded by a bishop of Ypres on the doctrine of predestination, and growing by persecution, it had speedily recruited adherents among the disillusioned followers of the Fronde, the Gallican clergy, the higher nobility, even at court, and more important still, among learned men and thinkers, such as the great Arnauld, Pascal and Racine. Pure and austere, it enjoined the strictest morals in the midst of corruption, and the most dignified self-respect in face of idolatrous servility. Amid general silence it was a formidable and much dreaded body of opinion; and in order to stifle it Louis XIV., the tool of his confessor, the Jesuit Le Tellier, made use of his usual means. The nuns of Port Royal were in their turn subjected to persecution, which, after a truce between 1666 and 1679, became aggravated by the affair of the *regale*, the bishops of Aleth and Pamiers being Jansenists. Port Royal was destroyed, the nuns dispersed, and the ashes of the dead scattered to the four winds. The bull *Unigenitus* launched by Pope Clement XI. in 1713 against a Jansenist book by Father Quesnel rekindled a quarrel, the end of which Louis XIV. did not live to see, and which raged throughout the 18th century.

Louis XIV. and the Jansenists.

Bossuet, Louis XIV.'s mouthpiece, triumphed in his turn over the quietism of Madame Guyon, a mystic who recognized neither definite dogmas nor formal prayers, but abandoned herself "to the torrent of the forces of God." Fénelon, who in his *Maximes des Saints* had given his adherence to her doctrine, was obliged to submit in 1699; but Bossuet could not make the spirit of authority prevail against the religious criticism of a Richard Simon or the philosophical polemics of a Bayle. He might exile their persons; but their doctrines, supported by the

Louis XIV. and the Libertins.

scientific and philosophic work of Newton and Leibnitz, were to triumph over Church and religion in the 18th century.

The chaos of the administrative system caused difficulties no less great than those produced by opinions and creeds. Traditional rights, differences of language, provincial autonomy, ecclesiastical assemblies, parlements, governors, intendants—vestiges of the past, or promises for the future—all jostled against and thwarted each other. The central authority had not yet acquired a vigorous constitution, nor destroyed all the intermediary authorities. Colbert now offered his aid in making Louis XIV. the sole pivot of public life, as he had already become the source of religious authority, thanks to the Jesuits and to Bossuet.

Colbert, an agent of Le Tellier, the honest steward of Mazarin's dishonest fortunes, had a future opened to him by the fall of Fouquet (1661). Harsh and rough, he compelled admiration for his delight in work, his aptitude in disentangling affairs, his desire of continually augmenting the wealth of the state, and his regard for the public welfare without forgetting his own. Born in a draper's shop, this great administrator always preserved its narrow horizon, its short-sighted imagination, its taste for detail, and the conceit of the parvenu; while with his insinuating ways, and knowing better than Fouquet how to keep his distance, he made himself indispensable by his *savoir-faire* and his readiness for every emergency. He gradually got everything into his control: finance, industry, commerce, the fine arts, the navy and colonies, the administration, even the fortifications, and—through his uncle Pussort—the law, with all the profits attaching to its offices.

His first care was to restore the exhausted resources of the country and to re-establish order in finance. He began by measures of liquidation: the *Chambre ardente* of 1661 to 1665 to deal with the farmers of the revenue, the condemnation of Fouquet, and a revision of the funds. Next, like a good man of business, Colbert determined that the state accounts should be kept as accurately as those of a shop; but though in this respect a great minister, he was less so in his manner of levying contributions. He kept to the old system of revenues from the demesne and from imposts that were reactionary in their effect, such as the *taille*, aids, salt-tax (*gabelle*) and customs; only he managed them better. His forest laws have remained a model. He demanded less of the *taille*, a direct impost, and more from indirect aids, of which he created the code—not, however, out of sympathy for the common people, towards whom he was very harsh, but because these aids covered a greater area and brought in larger returns. He tried to import more method into the very unequal distribution of taxation, less brutality in collection, less confusion in the fiscal machine, and more uniformity in the matter of rights; while he diminished the debts of the much-involved towns by putting them through the bankruptcy court. With revolutionary intentions as to reform, this only ended, after several years of normal budgets, in ultimate frustration. He could never make the rights over the drink traffic uniform and equal, nor restrict privileges in the matter of the *taille*; while he was soon much embarrassed, not only by the coalition of particular interests and local immunities, which made despotism acceptable by tempering it, but also by Louis XIV.'s two master-passions for conquest and for building. To his great chagrin he was obliged to begin borrowing again in 1672, and to have recourse to "*affaires extraordinaires*"; and this brought him at last to his grave.

Order was for Colbert the prime condition of work. He desired all France to set to work as he did "with a contented air and rubbing his hands for joy"; but neither general theories nor individual happiness preoccupied his attention. He made economy truly political: that is to say, the prosperity of industry and commerce afforded him no other interest than that of making the country wealthy and the state powerful. Louis XIV.'s aspirations towards glory chimed in very well with the extremely positive

views of his minister; but here too Colbert was an innovator and an unsuccessful one. He wanted to give 17th-century France the modern and industrial character which the New World had imprinted on the maritime states; and he created industry on a grand scale with an energy of labour, a prodigious genius for initiative and for organization; while, in order to attract a foreign clientèle, he imposed upon it the habits of meticulous probity common to a middle-class draper. But he maintained the legislation of the Valois, who placed industry in a state of strict dependency on finance, and he instituted a servitude of labour harder even than that of individuals; his great factories of soap, glass, lace, carpets and cloth had the same artificial life as that of contemporary Russian industry, created and nourished by the state. It was therefore necessary, in order to compensate for the fatal influence of servitude, that administrative protection should be lavished without end upon the royal manufactures; moreover, in the course of its development, industry on a grand scale encroached in many ways upon the resources of smaller industries. After Colbert's day, when the crutches lent by privilege were removed, his achievements lost vigour; industries that ministered to luxury alone escaped decay; the others became exhausted in struggling against the persistent and teasing opposition of the municipal bodies and the bourgeoisie—conceited, ignorant and terrified at any innovation—and against the blind and intolerant policy of Louis XIV.

Colbert, in common with all his century, believed that the true secret of commerce and the indisputable proof of a country's prosperity was to sell as many of the products of national industry to the foreigner as possible, while purchasing as little as possible. In order to do this, he sometimes figured as a free-trader and sometimes as a protectionist, but always in a practical sense; if he imposed prohibitive tariffs, in 1664 and 1667, he also opened the free ports of Marseilles and Dunkirk, and engineered the *Canal du midi*. But commerce, like industry, was made to rely only on the instigation of the state, by the intervention of officials; here, as throughout the national life, private initiative was kept in subjection and under suspicion. Once more Colbert failed; with regard to internal affairs, he was unable to unify weights and measures, or to suppress the many custom-houses which made France into a miniature Europe; nor could he in external affairs reform the consulates of the Levant. He did not understand that, in order to purge the body of the nation from its traditions of routine, it would be necessary to reawaken individual energy in France. He believed that the state, or rather the bureaucracy, might be the motive power of national activity.

His colonial and maritime policy was the newest and most fruitful part of his work. He wished to turn the eyes of contemporary adventurous France towards her distant interests, the wars of religion having diverted her attention from them to the great profit of English and Dutch merchants. Here too he had no preconceived ideas; the royal and monopolist companies were never for him an end but a means; and after much experimenting he at length attained success. In the course of twenty years he created many dependencies of France beyond sea. To her colonial empire in America he added the greater part of Santo Domingo, Tobago and Dominica; he restored Guiana; prepared for the acquisition of Louisiana by supporting Cavelier de la Salle; extended the suzerainty of the king on the coast of Africa from the Bay of Arguin to the shores of Sierra Leone, and instituted the first commercial relations with India. The population of the Antilles doubled; that of Canada quintupled; while if in 1672 at the time of the war with Holland Louis XIV. had listened to him, Colbert would have sacrificed his pride to the acquisition of the rich colonies of the Netherlands. In order to attack and defend these colonies Colbert created a navy which became his passion; he took convicts to man the galleys in the Mediterranean, and for the fleet in the Atlantic he established the system of naval reserve which still obtains. But, in the 18th century, the monarchy, hypnotized by the classical battle-fields

of Flanders and Italy, madly squandered the fruits of Colbert's work as so much material for barter and exchange.

In the administration, the police and the law, Colbert preserved all the old machinery, including the inheritance of office. In the great codification of laws, made under the direction of his uncle Pussort, he set aside the parlement of Paris, and justice continued to be ill-administered and cruel. The police, instituted in 1667 by La Reynie, became a public force independent of magistrates and under the direct orders of the ministers, making the arbitrary royal and ministerial authority absolute by means of *lettres de cachet* (*q.v.*), which were very convenient for the government and very terrible for the individuals concerned.

Provincial administration was no longer modified; it was regularized. The intendant became the king's factotum, not purchasing his office but liable to dismissal, the government's confidential agent and the real repository of royal authority, the governor being only for show (see INTENDANT).

Colbert's system went on working regularly up to the year 1675; from that time forward he was cruelly embarrassed for money, and, seeking new sources of revenue, begged for subsidies from the assembly of the clergy.

He did not succeed either in stemming the tide of expense, nor in his administration, being in no way in advance of his age, and not perceiving that decisive reform could not be achieved by a government dealing with the nation as though it were inert and passive material, made to obey and to pay. Like a good Cartesian he conceived of the state as an immense machine, every portion of which should receive its impulse from outside—that is from him, Colbert. Leibnitz had not yet taught that external movement is nothing, and inward spirit everything. As the minister of an ambitious and magnificent king, Colbert was under the hard necessity of sacrificing everything to the wars in Flanders and the pomp of Versailles—a gulf which swallowed up all the country's wealth;—and, amid a society which might be supposed submissively docile to the wishes of Louis XIV., he had to retain the most absurd financial laws, making the burden of taxation weigh heaviest on those who had no other resources than their labour, whilst landed property escaped free of charge. Habitual privation during one year in every three drove the peasants to revolt: in Boulonnais, the Pyrenees, Vivarais, in Guyenne from 1670 onwards and in Brittany in 1675. Cruel means of repression assisted natural hardships and the carelessness of the administration in depopulating and laying waste the countryside; while Louis XIV.'s martial and ostentatious policy was even more disastrous than pestilence and famine, when Louvois' advice prevailed in council over that of Colbert, now embittered and desperate. The revocation of the edict of Nantes vitiated through a fatal contradiction all the efforts of the latter to create new manufactures; the country was impoverished for the benefit of the foreigner to such a point that economic conditions began to alarm those private persons most noted for their talents, their character, or their regard for the public welfare; such as La Bruyère and Fénelon in 1692, Bois-Guillebert in 1697 and Vauban in 1707. The movement attracted even the ministers, Boullainvilliers at their head, who caused the intendants to make inquiry into the causes of this general ruin. There was a volume of attack upon Colbert; but as the fundamental system remained unchanged, because reform would have necessitated an attack upon privilege and even upon the constitution of the monarchy, the evil only went on increasing. The social condition of the time recalls that of present-day Morocco, in the high price of necessaries and the extortions of the financial authorities; every man was either soldier, beggar or smuggler.

Under Pontchartrain, Chamillard and Desmarets, the expenses of the two wars of 1688 and 1701 attained to nearly five milliards. In order to cover this recourse was had as usual, not to remedies, but to palliatives worse than the evil: heavy usurious loans, debasement of the coinage, creation of stocks that were perpetually being converted, and ridiculous charges which the

bourgeois, sickened with officialdom, would endure no longer. Richelieu himself had hesitated to tax labour; Louis XIV. trod the trade organizations under foot. It was necessary to have recourse to revolutionary measures, to direct taxation, ignoring all class distinction. In 1695 the graduated poll-tax was a veritable *coup d'état* against privileged persons, who were equally brought under the tax; in 1710 was added the tithe (*dixième*), a tax upon income from all landed property. Money scarce, men too were lacking; the institution of the militia, the first germ of obligatory enlistment, was a no less important innovation. But these were only provisional and desperate expedients, superposed upon the old routine, a further charge in addition to those already existing; and this entirely mechanical system, destructive of private initiative and the very sources of public life, worked with difficulty even in time of peace. As Louis XIV. made war continually the result was the same as in Spain under Philip II.: depopulation and bankruptcy within the kingdom and the coalitions of Europe without.

In 1660 France was predominant in Europe; but she aroused no jealousy except in the house of Habsburg, enfeebled and divided against itself. It was sufficient to remain faithful to the practical policy of Henry IV., of Richelieu and of Mazarin: that of moderation in strength. This Louis XIV. very soon altered, while yet claiming to continue it; he superseded it by one principle: that of replacing the proud tyranny of the Habsburgs of Spain by another. He claimed to lay down the law everywhere, in the preliminary negotiations between his ambassador and the Spanish ambassador in London, in the affair of the salute exacted from French vessels by the English, and in that of the Corsican guard in Rome; while he proposed to become the head of the crusade against the Turks in the Mediterranean as in Hungary.

The eclipse of the great idea of the balance of power in Europe was no sudden affair; the most flourishing years of the reign were still enlightened by it: witness the repurchase of Dunkirk from Charles II. in 1662, the cession of the duchies of Bar and of Lorraine and the war against Portugal. But soon the partial or total conquest of the Spanish inheritance proved "the grandeur of his beginnings and the meanness of his end." Like Philip the Fair and like Richelieu, Louis XIV. sought support for his external policy in that public opinion which in internal matters he held so cheap; and he found equally devoted auxiliaries in the jurists of his parlements.

It was thus that the first of his wars for the extension of frontiers began, the War of Devolution. On the death of his father-in-law, Philip IV. of Spain, he transferred into the realm of politics a civil custom of inheritance prevailing in Brabant, and laid claim to Flanders in the name of his wife Maria Theresa. The Anglo-Dutch War (1665-1667), in which he was by way of supporting the United Provinces without engaging his fleet, retarded this enterprise by a year. But after his mediation in the treaty of Breda (July 1667), when Hugues de Lionne, secretary of state for foreign affairs, had isolated Spain, he substituted soldiers for the jurists and cannon for diplomacy in the matter of the queen's rights.

The secretary of state for war, Michel le Tellier, had organized his army; and thanks to his great activity in reform, especially after the Fronde, Louis XIV. found himself in possession of an army that was well equipped, well clothed, well provisioned, and very different from the rabble of the Thirty Years' War, fitted out by dishonest jobbing contractors. Severe discipline, suppression of fraudulent interference, furnishing of clothes and equipment by the king, regulation of rank among the officers, systematic revictualling of the army, settled means of manufacturing and furnishing arms and ammunition, placing of the army under the direct authority of the king, abolition of great military charges, subordination of the governors of strongholds, control by the civil authority over the soldiers effected by means of paymasters and commissaries of stores; all this organization of the royal army was the work of le Tellier.

Colbert and the administration.

Ruin of Colbert's work.

Recourse to revolutionary measures.

Foreign policy of Louis XIV.

War of Devolution, 1667.

His son, François Michel le Tellier, marquis de Louvois, had one sole merit, that of being his father's pupil. A *parvenu* of the middle classes, he was brutal in his treatment of the lower orders and a sycophant in his behaviour towards the powerful; prodigiously active, ill-obeyed—as was the custom—but much dreaded. From 1677 onwards he did but finish perfecting Louis XIV.'s army in accordance with the suggestions left by his father, and made no fundamental changes: neither the definite abandonment of the feudal *arrière-ban* and of recruiting—sources of disorder and insubordination—nor the creation of the militia, which allowed the nation to penetrate into all the ranks of the army, nor the adoption of the gun with the bayonet,—which was to become the *ultima ratio* of peoples as the cannon was that of sovereigns,—nor yet the uniform, intended to strengthen *esprit de corps*, were due to him. He maintained the institutions of the day, though seeking to diminish their abuse, and he perfected material details; but misfortune would have it that instead of remaining a great military administrator he flattered Louis XIV.'s megalomania, and thus caused his perdition.

Under his orders Turenne conquered Flanders (June-August 1667); and as the queen-mother of Spain would not give in, Condé occupied Franche Comté in fourteen days (February 1668). But Europe rose up in wrath; the United Provinces and England, jealous and disquieted by this near neighbourhood, formed with Sweden the triple alliance of the Hague (January 1668), ostensibly to offer their mediation, though in reality to prevent the occupation of the Netherlands. Following the advice of Colbert and de Lionne, Louis XIV. appeared to accede, and by the treaty of Aix-la-Chapelle he preserved his conquests in Flanders (May 1668).

This peace was neither sufficient nor definite enough for Louis XIV.; and during four years he employed all his diplomacy to isolate the republic of the United Provinces in Europe, as he had done for Spain. He wanted to ruin this nation both in a military and an economic sense, in order to annex to French Flanders the rest of the Catholic Netherlands allotted to him by a secret treaty for partitioning the Spanish possessions, signed with his brother-in-law the emperor Leopold on the 19th of January 1668. Colbert—very envious of Holland's wealth—prepared the finances, le Tellier the army and de Lionne the alliances. In vain did the grand-

pensionary of the province of Holland, Jan de Witt, offer concessions of all kinds; both England, bound by the secret treaty of Dover (January 1670), and France had need of this war. Avoiding the Spanish Netherlands, Louis XIV. effected the passage of the Rhine in June 1672; and the disarmed United Provinces, which had on their side only Brandenburg and Spain, were occupied in a few days. The brothers de Witt, in consequence of their fresh offer to treat at any price, were assassinated; the broken dykes of Muiden arrested the victorious march of Condé and Turenne; while the popular and military party, directed by the stadtholder William of Orange, took the upper hand and preached resistance to the death. "The war is over," said the new secretary of state for foreign affairs, Arnauld de Pomponne; but Louvois and Louis XIV. said no. The latter wished not only to take possession of the Netherlands, which were to be given up to him with half of the United Provinces and their colonial empire; he wanted "to play the Charlemagne," to re-establish Catholicism in that country as Philip II. had formerly attempted to do, to occupy all the territory as far as the Lech, and to exact an annual oath of fealty. But the patriotism and the religious fanaticism of the Dutch revolted against this insupportable tyranny. Power had passed from the hands of the burghers of Amsterdam into those of William of Orange, who on the 30th

of August 1673, profiting by the arrest of the army brought about by the inundation and by the fears of Europe, joined in a coalition with the emperor, the king of Spain, the duke of Lorraine, many of the princes of the Empire, and with England, now at last enlightened as to the projects of Catholic restoration which Louis XIV. was

planning with Charles II. It was necessary to evacuate and then to settle with the United Provinces, and to turn against Spain. After fighting for five years against the whole of Europe by land and by sea, the efforts of Turenne, Condé and Duquesne culminated at Nijmegen in fresh acquisitions (1678). Spain had to cede to Louis XIV., Franche Comté, Dunkirk and half of Flanders. This was another natural and glorious result of the treaty of the Pyrenees. The Spanish monarchy was disarmed.

But Louis XIV. had already manifested that unmeasured and restless passion for glory, that claim to be the exclusive arbiter of western Europe, that blind and narrow insistence, which were to bear out his motto "*Seul contre tous*." Whilst all Europe was disarming he kept his troops, and used peace as a means of conquest. Under orders from Colbert de Croissy the jurists came upon the scene once more, and their unjust decrees were sustained by force of arms. The *Chambres de Réunion* sought for and joined to the kingdom those lands which were not actually dependent upon his new conquests, but which had formerly been so: such as Saarbrücken, Deux Ponts (Zweibrücken) and Montbéliard in 1680, Strassburg and Casale in 1681. The power of the house of Habsburg was paralysed by an invasion of the Turks, and Louis XIV. sent 35,000 men into Belgium; while Luxemburg was occupied by Créqui and Vauban. The truce of Ratisbon (Regensburg) imposed upon Spain completed the work of the peace of Nijmegen (1684); and thenceforward Louis XIV.'s terrified allies avoided his clutches while making ready to fight him.

This was the moment chosen by Louis XIV.'s implacable enemy, William of Orange, to resume the war. His surprise of Marshal Luxembourg near Mons, after the signature of the peace of Nijmegen, had proved that in his eyes war was the basis of his authority in Holland and in Europe. His sole arm of support amidst all his allies was not the English monarchy, sold to Louis XIV., but Protestant England, jealous of France and uneasy about her independence. Being the husband of the duke of York's daughter, he had an understanding in this country with Sunderland, Godolphin and Temple—a party whose success was retarded for several years by the intrigues of Shaftesbury. But Louis XIV. added mistake to mistake; and the revocation of the edict of Nantes added religious hatreds to political jealousies. At the same time the Catholic powers responded by the league of Augsburg (July 1686) to his policy of unlimited aggrandisement. The unsuccessful attempts of Louis XIV. to force his partisan Cardinal Wilhelm Egon von Fürstenberg (see *FÜRSTENBERG: HOUSE*) into the electoral see of Cologne; the bombardment of Genoa; the humiliation of the pope in Rome itself by the marquis de Lavardin; the seizure of the Huguenot emigrants at Mannheim, and their imprisonment at Vincennes under pretext of a plot, precipitated the conflict. The question of the succession in the Palatinate, where Louis XIV. supported the claims of his sister-in-law the duchess of Orleans, gave the signal for a general war. The French armies devastated the Palatinate instead of attacking William of Orange in the Netherlands, leaving him free to disembark at Torbay, usurp the throne of England, and construct the Grand Alliance of 1689.

Far from reserving all his forces for an important struggle elsewhere, foreshadowed by the approaching death of Charles II. of Spain, Louis XIV., isolated in his turn, committed the error of wasting it for a space of ten years in a war of conquest, by which he alienated all that remained to him of European sympathy. The French armies, notwithstanding the disappearance of Condé and Turenne, had still glorious days before them with Luxembourg at Fleurus, at Steenkirk and at Neerwinden (1690–1693), and with Catinat in Piedmont, at Staffarda, and at Marsaglia; but these successes alternated with reverses. Tourville's fleet, victorious at Beachy Head, came to grief at La Hogue (1692); and though the expeditions to Ireland in favour of James II. were unsuccessful, thanks to the Huguenot Schomberg, Jean Bart and Duguay-

Trouin ruined Anglo-Dutch maritime commerce. Louis XIV. assisted in person at the sieges of Mons and Namur, operations for which he had a liking, because, like Louvois, who died in 1691, he thought little of the French soldiery in the open field. After three years of strife, ruinous to both sides, he made the first overtures of peace, thus marking an epoch in his foreign policy; though William took no unfair advantage of this, remaining content with the restitution of places taken by the *Chambres de Réunion*, except Strassburg, with a frontier-line of fortified places for the Dutch, and with the official deposition of the Stuarts. But the treaty of Ryswick (1697) marked the condemnation of the policy pursued since that of Nijmegen. While signing this peace Louis XIV. was only thinking of the succession in Spain. By partitioning her in advance with the other strong powers, England and Holland, by means of the treaties of the Hague and of London (1698-1699),—as he had formerly done with the emperor in 1668,—he seemed at first to wish for a pacific solution of the eternal conflict between the Habsburgs and the Bourbons, and to restrict himself to the perfecting of his natural frontiers; but on the death of Charles II. of Spain (1700) he claimed everything in favour of his grandson, the duke of Anjou, now appointed universal heir, though risking the loss of all by once more letting himself fall into imprudent and provocative action in the dynastic interest.

English public opinion, desirous of peace, had forced William III. to recognize Philip V. of Spain; but Louis XIV.'s maintenance of the eventual right of his grandson to the crown of France, and the expulsion of the Dutch, who had not recognized Philip V., from the Barrier towns, brought about the Grand Alliance of 1701 between the maritime Powers and the court of Vienna, desirous of partitioning the inheritance of Charles II. The recognition of the Old Pretender as James III., king of England, was only a response to the Grand Alliance, but it drew the English Tories into an inevitable war. Despite the death of William III. (March 19, 1702) his policy triumphed, and in this war, the longest in the reign, it was the names of the enemy's generals, Prince Eugène of Savoy, Mazarin's grand-nephew, and the duke of Marlborough, which sounded in the ear, instead of Condé, Turenne and Luxembourg. Although during the first campaigns (1701-1703) in Italy, in Germany and in the Netherlands success was equally balanced, the successors of Villars—thanks to the treason of the duke of Savoy—were defeated at Höchstädt and Landau, and were reduced to the defensive (1704). In 1706 the defeats at Ramillies and Turin led to the evacuation of the Netherlands and Italy, and endangered the safety of Dauphiné. In 1708 Louis XIV. by a supreme effort was still able to maintain his armies; but the rout at Oudenarde, due to the misunderstanding between the duke of Burgundy and Vendôme, left the northern frontier exposed, and the cannons of the Dutch were heard at Marly. Louis XIV. had to humble himself to the extent of asking the Dutch for peace; but they forgot the lesson of 1673, and revolted by their demands at the Hague, he made a last appeal to arms and to the patriotism of his subjects at Malplaquet (September 1709). After this came invasion. Nature herself conspired with the enemy in the disastrous winter of 1709.

What saved Louis XIV. was not merely his noble constancy of resolve, the firmness of the marquis de Torcy, secretary of state for foreign affairs, the victory of Vendôme at Villaviciosa, nor the loyalty of his people. The interruption of the conferences at Gertruydenberg having obliged the Whigs and Marlborough to resign their power into the hands of the Tories, now sick of war, the death of the emperor Joseph I. (April 1711), which risked the reconstruction of Charles V.'s colossal and unwieldy monarchy upon the shoulders of the archduke Charles, and Marshal Villars' famous victory of Denain (July 1712) combined to render possible the treaties of Utrecht, Rastatt and Baden (1713-1714). These gave Italy and the Netherlands to the Habsburgs, Spain and her colonies to the Bourbons, the places on the coast and the colonial commerce to England (who had the lion's share), and a royal crown to the duke of Savoy

and the elector of Brandenburg. The peace of Utrecht was to France what the peace of Westphalia had been to Austria, and curtailed the former acquisitions of Louis XIV.

The ageing of the great king was betrayed not only by the fortune of war in the hands of Villeroy, la Feuillade, or Marsin; disgrace and misery at home were worse than defeat. By the strange and successive deaths of the Grand Dauphin (1711), the duke and duchess of Burgundy (1712)—who had been the only joy of the old monarch—and of his two grandsons (1712-1714), it seemed as though his whole family were involved under the same curse. The court, whose sentimental history has been related by Madame de la Fayette, its official splendours by Loreet, and its intrigues by the duc de Saint-Simon, now resembled an infirmary of morose invalids, presided over by Louis XIV.'s elderly wife, Madame de Maintenon, under the domination of the Jesuit le Tellier. Neither was it merely the clamours of the people that arose against the monarch. All the more remarkable spirits of the time, like prophets in Israel, denounced a tyranny which put Chamillart at the head of the finances because he played billiards well, and Villeroy in command of the armies although he was utterly untrustworthy; which sent the "patriot" Vauban into disgrace, banished from the court Catinat, the Père la Pensée, "exiled" to Cambrai the too clear sighted Fénelon, and suspected Racine of Jansenism and La Fontaine of independence.

Disease and famine; crushing imposts and extortions; official debasement of the currency; bankruptcy; state prisons; religious and political inquisition; suppression of all institutions for the safe-guarding of rights; tyranny by the intendants; royal, feudal and clerical oppression burdening every faculty and every necessary of life; "monstrous and incurable luxury"; the horrible drama of poison; the twofold adultery of Madame de Montespan; and the narrow bigotry of Madame de Maintenon—all concurred to make the end of the reign a sad contrast with the splendour of its beginning. When reading Molière and Racine, Bossuet and Fénelon, the campaigns of Turenne, or Colbert's ordinances; when enumerating the countless literary and scientific institutions of the great century; when considering the port of Brest, the Canal du Midi, Perrault's colonnade of the Louvre, Mansart's Invalides and the palace of Versailles, and Vauban's fine fortifications—admiration is kindled for the radiant splendour of Louis XIV.'s period. But the art and literature expressed by the genius of the masters, reflected in the tastes of society, and to be taken by Europe as a model throughout a whole century, are no criterion of the social and political order of the day. They were but a magnificent drapery of pomp and glory thrown across a background of poverty, ignorance, superstition, hypocrisy and cruelty; remove it, and reality appears in all its brutal and sinister nudity. The corpse of Louis XIV., left to servants for disposal, and saluted all along the road to Saint Denis by the curses of a noisy crowd sitting in the *cabarets*, celebrating his death by drinking more than their fill as a compensation for having suffered too much from hunger during his lifetime—such was the coarse but sincere epitaph which popular opinion placed on the tomb of the "Grand Monarque." The nation, restive under his now broken yoke, received with a joyous anticipation, which the future was to discount, the royal infant whom they called Louis the Well-beloved, and whose funeral sixty years later was to be greeted with the same proofs of disillusionment.

The death of Louis XIV. closed a great era of French history; the 18th century opens upon a crisis for the monarchy. From 1715 to 1723 came the reaction of the Regency, with its marvellous effrontery, innovating spirit and frivolous immorality. From 1723 to 1743 came the mealy-mouthed despotism of Cardinal Fleury, and his apathetic policy within and without the kingdom. From 1743 to 1774 came the personal rule of Louis XV., when all the different powers were in conflict—the bishops and parlement quarrelling, the government fighting against the clergy and the magistracy, and public opinion in declared opposition to the state. Till at last, from 1774 to 1789, came Louis XVI. with his honest illusions.

his moral pusillanimity and his intellectual impotence, to aggravate still further the accumulated errors of ages and to prepare for the inevitable Revolution.

The 18th century, like the 17th, opened with a political *coup d'état*. Louis XV. was five years old, and the duke of Orleans held the regency. But Louis XIV. had in his will delegated all the power of the government to a council on which the duke of Maine, his legitimated son, had the first, but Madame de Maintenon and the Jesuits the predominant place. This collective administration, designed to cripple the action of the regent, encountered a two-fold opposition from the nobles and the parlement; but on the 2nd of September 1715 the emancipated parlement set aside the will in favour of the duke of Orleans, who thus together with the title of regent had all the real power. He therefore reinstated the parlement in its ancient right of remonstrance (suspended since the declarations of 1667 and 1673), and handed over ministerial power to the nobility, replacing the secretaries of state by six councils composed in part of great nobles, on the advice of the famous duc de Saint-Simon. The duc de Noailles, president of the council of finance, had the direction of this "Polysynodie."

The duke of Orleans, son of the princess palatine and Louis XIV.'s brother, possessed many gifts—courage, intelligence and agility of mind—but he lacked the one gift of using these to good advantage. The political crisis that had placed him in power had not put an end to the financial crisis, and this, it was hoped, might be effected by substituting partial and petty bankruptcies for the general bankruptcy cynically advocated by Saint-Simon. The reduction of the royal revenues did not suffice to fill the treasury; while the establishment of a chamber of justice (March 1716) had no other result than that of demoralizing the great lords and ladies already mad for pleasure, by bringing them into contact with the farmers of the revenue who purchased impunity from them.

A very clever Scotch adventurer named John Law (*q.v.*) now offered his assistance in dealing with the enormous debt of more than three milliards, and in providing the treasury. Being well acquainted with the mechanism of banking, he had adopted views as to cash, credit and the circulation of values which contained an admixture of truth and falsehood. Authorized after many difficulties to organize a private bank of deposit and account, which being well conceived prospered and revived commerce, Law proposed to lighten the treasury by the profits accruing to a great maritime and colonial company. Payment for the shares in this new Company of the West, with a capital of a hundred millions, was to be made in credit notes upon the government, converted into 4% stock. These aggregated funds, needed to supply the immense and fertile valley of the Mississippi, and the annuities of the treasury destined to pay for the shares, were non-transferable. Law's idea was to ask the bank for the floating capital necessary, so that the bank and the Company of the West were to be supplementary to each other; this is what was called Law's system. After the chancellor D'Aguesseau and the duc de Noailles had been replaced by D'Argenson alone, and after the *lit de justice* of the 26th of August 1718 had deprived the parlement, hostile to Law, of the authority left to it, the bank became royal and the Company of the West universal. But the royal bank, as a state establishment, asked for compulsory privilege to increase the emission of its credit notes, and that they should receive a premium upon all metallic specie. The Company of the Indies became the grantee for the farming of tobacco, the coinage of metals, and farming in general; and in order to procure funds it multiplied the output of shares, which were adroitly launched and became more and more sought for on the exchange in the rue Quincampoix. This soon caused a frenzy of stock-jobbing, which disturbed the stability of private fortunes and social positions, and depraved customs and manners with the seductive notion of easily obtained riches. The nomination of Law to the controller-generalship, re-established for his benefit on the resignation of D'Argenson (January 5, 1720), let loose still wilder speculation;

till the day came when he could no longer face the terrible difficulty of meeting both private irredeemable shares with a variable return, and the credit notes redeemable at sight and guaranteed by the state. Gold and silver were proscribed; the bank and the company were joined in one; the credit notes and the shares were assimilated. But credit cannot be commanded either by violence or by expedients; between July and September 1720 came the suspension of payments, the flight of Law, and the disastrous liquidation which proved once again that respect for the state's obligations had not yet entered into the law of public finance.

Reaction on a no less extensive scale characterized foreign policy during the Regency. A close alliance between France and her ancient enemies, England and Holland, was concluded and maintained from 1717 to 1739: France, after thirty years of fighting, between two periods of bankruptcy; Holland reinstated in her commercial position; and England, seeing before her the beginning of her empire over the seas—all three had an interest in peace. On the other hand, peace was imperilled by Philip V. of Spain and by the emperor (who had accepted the portion assigned to them by the treaty of Utrecht, while claiming the whole), by Savoy and Brandenburg (who had profited too much by European conflicts not to desire their perpetuation), by the crisis from which the maritime powers of the Baltic were suffering, and by the Turks on the Danube. The dream of Cardinal Alberoni, Philip V.'s minister, was to set fire to all this inflammable material in order to snatch therefrom a crown of some sort to satisfy the maternal greed of Elizabeth Farnese; and this he might have attained by the occupation of Sardinia and the expedition to Sicily (1717-1718), if Dubois, a priest without a religion, a greedy parvenu and a diplomatist of second rank, though tenacious and full of resources as a minister, had not placed his common sense at the disposal of the regent's interests and those of European peace. He signed the triple alliance at the Hague, succeeding with the assistance of Stanhope, the English minister, in engaging the emperor therein, after attempting this for a year and a half. Whilst the Spanish fleet was destroyed before Syracuse by Admiral Byng, the intrigue of the Spanish ambassador Cellamare with the duke of Maine to exclude the family of Orleans from the succession on Louis XV.'s death was discovered and repressed; and Marshal Berwick burned the dockyards at Pasajes in Spain. Alberoni's dream was shattered by the treaty of London in 1720.

Seized in his turn with a longing for the cardinal's hat, Dubois paid for it by the registering of the bull *Unigenitus* and by the persecution of the Jansenists which the regent had stopped. After the majority of Louis XV. had been proclaimed on the 16th of February 1723, Dubois was the first to depart; and four months after his disappearance the duke of Orleans, exhausted by his excesses, carried with him into the grave that spirit of reform which he had compromised by his frivolous voluptuousness (December 2, 1723).

The Regency had been the making of the house of Orleans; thenceforward the question was how to humble it, and the duc de Bourbon, now prime minister—a great-grandson of the great Condé, but a narrow-minded man of limited intelligence, led by a worthless woman—set himself to do so. The marquise de Prie was the first of a series of publicly recognized mistresses; from 1723 to 1726 she directed foreign policy and internal affairs despite the king's majority, moved always more by a spirit of vengeance than by ambition. This sad pair were dominated by the self-interested and continual fear of becoming subject to the son of the Regent, whom they detested; but danger came upon them from elsewhere. They found standing in their way the very man who had been the author of their fortunes, Louis XV.'s tutor, uneasy in the exercise of a veiled authority; for the churchman Fleury knew how to wait, on condition of ultimately attaining his end. Neither the festivities given at Chantilly in honour of the king, nor the dismissal (despite the most solemn promises) of the Spanish infanta, who had been betrothed

to Louis XV., nor yet the young king's marriage to Maria Leszczynska (1725)—a marriage negotiated by the marquise de Prie in order to bar the throne from the Orleans family—could alienate the sovereign from his old master. The irritation kept up by the agents of Philip V., incensed by this affront, and the discontent aroused by the institutions of the *cinquantième* and the militia, by the re-establishment of the feudal tax on Louis XV.'s joyful accession, and by the resumption of a persecution of the Protestants and the Jansenists which had apparently died out, were cleverly exploited by Fleury; and a last ill-timed attempt by the queen to separate the king from him brought about the fall of the duc de Bourbon, very opportunely for France, in June 1726.

From the hands of his unthinking pupil Fleury eventually received the supreme direction of affairs, which he retained for seventeen years. He was aged seventy-two when he thus obtained the power which had been his unmeasured though not ill-calculated ambition. Soft-spoken and polite, crafty and suspicious, he was pacific by temperament and therefore allowed politics to slumber. His turn for economics made Orry,¹ the controller-general of finance, for long his essential partner. The latter laboured at re-establishing order in fiscal affairs; and various measures like the impost of the *dixième* upon all property save that of the clergy, together with the end of the corn famine, sufficed to restore a certain amount of well-being. Religious peace was more difficult to secure; in fact politico-religious quarrels dominated all the internal policy of the kingdom during forty years, and gradually compromised the royal authority. The Jesuits, returned to power in 1723 with the duc de Bourbon and in 1726 with Fleury, rekindled the old strife regarding the bull *Unigenitus* in opposition to the Gallicans and the Jansenists. The retractation imposed upon Cardinal de Noailles, and his replacement in the archbishopric of Paris by Vintimille, an unequivocal Molinist, excited among the populace a very violent agitation against the court of Rome and the Jesuits, the prelude to a united Fronde of the Sorbonne and the parlement. Fleury found no other remedy for this agitation—in which appeal was made even to miracles—than *lits de justice* and *lettres de cachet*; Jansenism remained a potent source of trouble within the heart of Catholicism.

This worn-out septuagenarian, who prized rest above everything, imported into foreign policy the same mania for economy and the same sloth in action. He naturally adopted the idea of reconciling Louis XIV.'s descendants, who had all been embroiled ever since the Polish marriage. He succeeded in this by playing very adroitly on the ambition of Elizabeth Farnese and her husband Philip V., who was to reign in France notwithstanding any renunciation that might have taken place. Despite the birth of a dauphin (September 1729), which cut short the Spanish intrigues, the reconciliation was a lasting one (treaty of Seville); it led to common action in Italy, and to the installation of Spanish royalties at Parma, Piacenza, and soon after at Naples. Fleury, supported by the English Hanoverian alliance, to which he sacrificed the French navy, obliged the emperor Charles VI. to sacrifice the trade of the Austrian Netherlands to the maritime powers and Central Italy to the Bourbons, in order to gain recognition for his Pragmatic Sanction. The question of the succession in France lay dormant until the end of the century, and Fleury thought he had definitely obtained peace in the treaty of Vienna (1731).

The war of the Polish succession proved him to have been deceived. On the death of Augustus II. of Saxony, king of Poland, Louis XV.'s father-in-law had been proclaimed king by the Polish diet. This was an ephemeral success, ill-prepared and obtained by taking a sudden advantage of national sentiment; it was soon followed by a check, owing to a Russian and

¹ Jean Orry Louis Orry de Fulvy (1703–1751), counsel to the parlement in 1723, intendant of finances in 1737, founded at Vincennes the manufactory of porcelain which was bought in 1750 by the farmers general and transferred to Sèvres.

German coalition and the baseness of Cardinal Fleury, who, in order to avoid intervening, pretended to tremble before an imaginary threat of reprisals on the part of England. But Chauvelin, the keeper of the seals, supported by public opinion, avenged on the Rhine and the Po the unlucky heroism of the comte de Pléto at Danzig,² the vanished dream of the queen, the broken word of Louis XV., and the treacherous abandonment of Poland. Fleury never forgave him for this: Chauvelin had checkmated him with war; he checkmated Chauvelin with peace, and hastened to replace Marshals Berwick and Villars by diplomatists. The third treaty of Vienna (1738), the reward of so much effort, would only have claimed for France the little duchy of Bar, had not Chauvelin forced Louis XV. to obtain Lorraine for his father-in-law—still hoping for the reversion of the crown; but Fleury thus rendered impossible any influence of the queen, and held Stanislaus at his mercy. In order to avenge himself upon Chauvelin he sacrificed him to the cabinets of Vienna and London, alarmed at seeing him revive the national tradition in Italy.

Fleury hardly had time to breathe before a new conflagration broke out in the east. The Russian empress Anne and the emperor Charles VI. had planned to begin dismembering the Turkish empire. More fortunate than Pléto, Villeneuve, the French ambassador at Constantinople, endeavoured to postpone this event, and was well supported; he revived the courage of the Turks and provided them with arms, thanks to the comte de Bonneval (*q.v.*), one of those adventurers of high renown whose influence in Europe during the first half of the eighteenth century is one of the most piquant features of that period. The peace of Belgrade (September 1739) was, by its renewal of the capitulations, a great material success for France, and a great moral victory by the rebuff to Austria and Russia.

France had become once more the arbiter of Europe, when the death of the emperor Charles VI. in 1740 opened up a new period of wars and misfortunes for Europe and for the pacific Fleury. Every one had signed Charles VI.'s Pragmatic Sanction, proclaiming the succession-rights of his daughter, the archduchess Maria Theresa; but on his death there was a general renunciation of signatures and an attempt to divide the heritage. The safety of the house of Austria depended on the attitude of France; for Austria could no longer harm her. Fleury's inclination was not to misuse France's traditional policy by exaggerating it, but to respect his sworn word; he dared not press his opinion, however, and yielded to the fiery impatience of young hot-heads like the two Belle-Isles, and of all those who, infatuated by Frederick II., felt sick of doing nothing at Versailles and were hacked up by Louis XV.'s bellicose mistresses. He had to experience the repeated defections of Frederick II. in his own interests, and the precipitate retreat from Bohemia. He had to humble himself before Austria and the whole of Europe; and it was high time for Fleury, now fallen into second childhood, to vanish from the scene (January 1743).

Louis XV. was at last to become his own prime minister and to reign alone; but in reality he was more embarrassed than pleased by the responsibility incumbent upon him. He therefore retained the persons who had composed Fleury's staff; though instead of being led by a single one of them, he fell into the hands of several, who disputed among themselves for the ascendancy: Maurepas, incomparable in little things, but neglectful of political affairs; D'Argenson, bold, and strongly attached to his work as minister

² Louis Robert Hippolyte de Bréhan, comte de Pléto (1699–1734), a Breton by birth, originally a soldier, was at the time of the siege of Danzig French ambassador to Denmark. Enraged at the return to Copenhagen, without having done anything, of the French force sent to help Stanislaus, he himself led it back to Danzig and fell in an attack on the Russians on the 27th of May 1734. Pléto was a poet of considerable charm, and well-read both in science and literature.

See Marquis de Bréhan, *Le Comte de Pléto* (Nantes, 1874); R. Rathery, *Le Comte de Pléto* (Paris, 1876); and P. Boyé, *Stanislaus Leszczynski et le troisième traité de Vienne* (Paris, 1898).

War of the Polish Succession (1733-1738).

The Eastern question.

War of the Austrian Succession.

Personal rule of Louis XV.

of war; and the cardinal de Tencin, a frivolous and worldly priest. Old Marshal de Noailles tried to incite Louis XV. to take his kingship in earnest, thinking to cure him by war of his effeminate passions; and, in the spring of 1744, the king's grave illness at Metz gave a momentary hope of reconciliation between him and the deserted queen. But the duc de Richelieu, a roué who had joined hands with the sisters of the house of Nesle and was jealous of Marshal de Noailles, soon regained his lost ground; and, under the influence of this panderer to his pleasures, Louis XV. settled down into a life of vice. Holding aloof from active affairs, he tried to relieve the incurable boredom of satiety in the violent exercise of hunting, in supper-parties with his intimates, and in spicy indiscretions. Brought up religiously and to shun the society of women, his first experiences in adultery had been made with many scruples and intermittently. Little by little, however, jealous of power, yet incapable of exercising it to any purpose, he sank into a sensuality which became utterly shameless under the influence of his chief mistress the duchesse de Châteauroux.

Hardly had a catastrophe snatched her away in the zenith of her power when complete corruption and the flagrant triumph of egoism supervened with the accession to power of the marquise de Pompadour, and for nearly twenty years (1745-1764) the whims and caprices of this little *bourgeoise* ruled the realm. A prime minister in petticoats, she had her political system: reversed the time-honoured alliances of France, appointed or disgraced ministers, directed fleets and armies, concluded treaties, and failed in all her enterprises! She was the queen of fashion in a society where corruption blossomed luxuriantly and exquisitely, and in a century of wit hers was second to none. Amidst this extraordinary instability, when everything was at the mercy of a secret thought of the master, the mistress alone held lasting sway; in a reign of all-pervading satiety and tedium, she managed to remain indispensable and bewitching to the day of her death.

Meanwhile the War of the Austrian Succession broke out again, and never had secretary of state more intricate questions to solve than had D'Argenson. In the attempt to make a stage-emperor of Charles Albert of Bavaria, defeat was incurred at Dettingen, and the French were driven back on the Rhine (1743). The Bavarian dream dissipated, victories gained in Flanders by Marshal Saxe, another adventurer of genius, at Fontenoy, Raucoux and Lawfield (1745-1747), were hailed with joy as continuing those of Louis XIV.; even though they resulted in the loss of Germany and the doubling of English armaments. The "disinterested" peace of Aix-la-Chapelle (October 1748) had no effectual result other than that of destroying in Germany, and for the benefit of Prussia, a balance of power that had yet to be secured in Italy, despite the establishment of the Spanish prince Philip at Parma. France, meanwhile, was beaten at sea by England, Maria Theresa's sole ally. While founding her colonial empire England had come into collision with France; and the rivalry of the Hundred Years' War had immediately sprung up again between the two countries. Engaged already in both Canada and in India (where Dupleix was founding an empire with a mere handful of men), it was to France's interest not to become involved in war upon the Rhine, thus falling into England's continental trap. She did fall into it, however: for the sake of conquering Silesia for the king of Prussia, Canada was left exposed by the capture of Cape Breton; while in order to restore this same Silesia to Maria Theresa, Canada was lost and with it India.

France had worked for the king of Prussia from 1740 to 1748; now it was Maria Theresa's game that was played in the Seven Years' War. In 1755, the English having made a sudden attack upon the French at sea, and Frederick II. having by a fresh *volte-face* passed into alliance with Great Britain, Louis XV.'s government accepted an alliance with Maria Theresa in the treaty of the 1st of May 1756. Instead of remaining upon the defensive in this continental war—merely accessory as it was—he made

it his chief affair, and placed himself under the petticoat government of three women, Maria Theresa, Elizabeth of Russia and the marquise de Pompadour. This error—the worst of all—laid the foundations of the Prussian and British empires. By three battles, victories for the enemies of France—Rossbach in Germany, 1757, Plassey in India, 1757, and Quebec in Canada, 1759 (owing to the recall of Dupleix, who was not bringing in large enough dividends to the Company of the Indies, and to the abandonment of Montcalm, who could not interest any one in "a few acres of snow"), the expansion of Prussia was assured, and the British relieved of French rivalry in the expansion of their empire in India and on the North American continent.

Owing to the blindness of Louis XV. and the vanity of the favourite, the treaties of Paris and Hubertusburg (1763) once more proved the French splendid in their conceptions, *Treaties of Paris and Hubertusburg.* but deficient in action. Moreover, Choiseul, secretary of state for foreign affairs since 1758, made out of this deceptive Austrian alliance a system which put the finishing touch to disaster; and after having thrown away everything to satisfy Maria Theresa's hatred of Frederick II., the reconciliation between these two irreconcilable Germans at Neisse and at Neustadt (1769-1770) was witnessed by France, to the prejudice of Poland, one of her most ancient adherents. The expedient of the Family Compact, concluded with Spain in 1761—with a view to taking vengeance upon England, whose fleets were a continual thorn in the side to France—served only to involve Spain herself in misfortune. Choiseul, who at least had a policy that was sometimes in the right, and who was very anxious to carry it out, then realized that the real quarrel had to be settled with England. Amid the anguish of defeat and of approaching ruin, he had an acute sense of the actualities of the case, and from 1763 to 1766 devoted himself passionately to the reconstruction of the navy. To compensate for the loss of the colonies he annexed Lorraine (1766), and by the acquisition of Corsica in 1768 he gave France an intermediary position in the Mediterranean, between friendly Spain and Italy, looking forward to the time when it should become a stepping-stone to Africa.

But Louis XV. had two policies. The incoherent efforts which he made to repair by the secret diplomacy of the comte de Broglie the evils caused by his official policy only aggravated his shortcomings and betrayed his weakness. The contradictory intrigues of the king's secret proceedings in the candidature of Prince Xavier, the dauphine's brother, and the patriotic efforts of the confederation of Bar, contributed to bring about the Polish crisis which the partition of 1772 resolved in favour of Frederick II.; and the Turks were in their turn dragged into the same disastrous affair. Of the old allies of France, Choiseul preserved at least Sweden by the *coup d'état* of Gustavus III.; but instead of being as formerly the centre of great affairs, the cabinet of Versailles lost all its credit, and only exhibited before the eyes of contemptuous Europe France's extreme state of decay.

The nation felt this humiliation, and showed all the greater irritation as the want of cohesion in the government and the anarchy in the central authority became more and more intolerable in home affairs. Though the administration still possessed a fund of tradition and a personnel which, including many men of note, protected it from the enfeebling influence of the court, it looked as though chance regulated everything so far as the government was concerned. These fluctuations were owing partly to the character of Louis XV., and partly also to the fact that society in the 18th century was too advanced in its ideas to submit without resistance to the caprice of such a man. His mistresses were not the only cause of this; for ever since Fleury's advent political parties had come to the fore. From 1749 to 1757 the party of religious devotees grouped round the queen and the king's daughters, with the dauphin as chief and the comte D'Argenson and Machault d'Arnouville, keeper of the seals, as lieutenants, had worked against Madame de Pompadour (who leant for support upon the parlements, the Jansenists and the philosophers),

Madame de Pompadour.

Peace of Aix-la-Chapelle.

First partition of Poland.

Internal policy of Louis XV.

The Seven Years' War, 1756-1763.

and had gained the upper hand. Thenceforward poverty, disorders, and consequently murmurs increased. The financial reform attempted by Machault d'Arnouville between 1745 and 1749—a reduction of the debt through the impost of the twentieth and the edict of 1749 against the extensive property held in mortmain by the Church—after his disgrace only resulted in failure. The army, which D'Argenson (likewise dismissed by Madame de Pompadour) had been from 1743 to 1747 trying to restore by useful reforms, was riddled by cabals. Half the people in the kingdom were dying of hunger, while the court was insulting poverty by its luxury and waste; and from 1750 onwards political ferment was everywhere manifest. It found all the more favourable foothold in that the Church, the State's best ally, had made herself more and more unpopular. Her refusal of the sacraments to those who would not accept the bull *Unigenitus* (1746) was exploited in the eyes of the masses, as in those of more enlightened people was her selfish and short-sighted resistance to the financial plans of Machault. The general discontent was expressed by the parlements in their attempt to establish a political supremacy amid universal confusion, and by the popular voice in pamphlets recalling by their violence those of the League. Every one expected and desired a speedy revolution that should put an end to a policy which alternated between overheated effervescence, abnormal activity and lethargy. Nothing can better show the point to which things had descended than the attempted assassination of Louis the Well-beloved by Damiens in 1757.

Choiseul was the means of accelerating this revolution, not only by his abandonment of diplomatic traditions, but still more by his improvidence and violence. He reversed the policy of his predecessors in regard to the parlement. Supported by public opinion, which clamoured for guarantees against arbitrary power, the parlements had dared not only to insist on being consulted as to the budget of the state in 1763, but to enter upon a confederation throughout the whole of France, and on repeated occasions to ordain a general strike of the judicial authorities. Choiseul did not hesitate to attack through *lits de justice* or by exile a judiciary oligarchy which doubtless rested its pretensions merely on wealth, high birth, or that encroaching spirit that was the only counteracting agency to the monarchy. Louis XV., wearied with their clamour, called them to order. Choiseul's religious policy was no less venturesome; after the condemnation in 1759 of the Jesuits who were involved in the bankruptcy of Father de la Valette, their general, in the Antilles, he had the order dissolved for refusing to modify its constitution (1761-1764). Thus, not content with encouraging writers with innovating ideas to the prejudice of traditional institutions, he attacked, in the order of the Jesuits, the strongest defender of these latter, and delivered over the new generation to revolutionary doctrines.

A woman had elevated him into power; a woman brought him to the ground. He succumbed to a coalition of the chancellor Maupeou, the duc d'Aiguillon and the Abbé Terray, which depended on the favour of the king's latest mistress, Madame du Barry (December 1770); and the Jesuits were avenged by a stroke of authority similar to that by which they themselves had suffered. Following on an edict registered by the *lit de justice*, which forbade any remonstrance in political matters, the parlement had resigned, and had been imitated by the provincial parlements; whereupon Maupeou, an energetic chancellor, suppressed the parlements and substituted superior councils of magistrates appointed by the king (1771). This reform was justified by the religious intolerance of the parlements; by their scandalous trials of Calas, Pierre Paul Sirven (1709-1777), the chevalier de la Barre and the comte de Lally; by the retrograde spirit that had made them suppress the Encyclopaedia in 1759 and condemn *Émile* in 1762; and by their selfishness in perpetuating abuses by which they profited. But this reform, being made by the minister of a hated sovereign, only aided in exasperating public opinion, which was grateful to the parlements in that their remonstrances had not always been fruitless.

Thus all the buttresses of the monarchical institution began to fall to pieces: the Church, undermined by the heresy of Jansenism, weakened by the inroads of philosophy, discredited by evil-livers among the priesthood, and divided against itself, like all losing parties; the nobility of the court, still brave at heart, though incapable of exertion and reduced to beggary, having lost all respect for discipline and authority, not only in the camp, but in civilian society; and the upper-class officials, narrow-minded and egotistical, unsettling by their opposition the royal authority which they pretended to safeguard. Even the "liberties," among the few representative institutions which the *ancien régime* had left intact in some provinces, turned against the people. The estates opposed most of the intelligent and humane measures proposed by such intendants as Tourny and Turgot to relieve the peasants, whose distress was very great; they did their utmost to render the selfishness of the privileged classes more oppressive and vexatious.

Thus the terrible prevalence of poverty and want; the successive famines; the mistakes of the government; the scandals of the Parc aux Cerfs; and the parlements playing the Roman senate: all these causes, added together and multiplied, assisted in setting a general fermentation to work. The philosophers only helped to precipitate a movement which they had not created; without pointing to absolute power as the cause of the trouble, and without pretending to upset the traditional system, they attempted to instil into princes the feeling of new and more precise obligations towards their subjects. Voltaire, Montesquieu, the Encyclopaedists and the Physiocrats (recurring to the tradition of Bayle and Fontenelle), by dissolving in their analytical crucible all consecrated beliefs and all fixed institutions, brought back into the human society of the 18th century that humanity which had been so rudely eliminated. They demanded freedom of thought and belief with passionate insistence; they ardently discussed institutions and conduct; and they imported into polemics the idea of natural rights superior to all political arrangements. Whilst some, like Voltaire and the Physiocrats, representatives of the privileged classes and careless of political rights, wished to make use of the omnipotence of the prince to accomplish desirable reforms, or, like Montesquieu, adversely criticized despotism and extolled moderate governments, other, plebeians like Rousseau, proclaimed the theory of the social contract and the sovereignty of the people. So that during this reign of frivolity and passion, so bold in conception and so poor in execution, the thinkers contributed still further to mark the contrast between grandeur of plan and mediocrity of result.

The preaching of all this generous philosophy, not only in France, but throughout the whole of Europe, would have been in vain had there not existed at the time a social class interested in these great changes, and capable of compassing them. Neither the witty and lucid form in which the philosophers clothed their ideas in their satires, romances, stage-plays and treatises, nor the salons of Madame du Deffand, Madame Geoffrin and Mademoiselle de Lespinasse, could possibly have been sufficiently far-reaching or active centres of political propaganda. The former touched only the more highly educated classes; while to the latter, where privileged individuals alone had entry, novelties were but an undiluted stimulant for the jaded appetites of persons whose ideas of good-breeding, moreover, would have drawn the line at martyrdom.

The class which gave the Revolution its chiefs, its outward and visible forms, and the irresistible energy of its hopes, was the *bourgeoisie*, intelligent, ambitious and rich; in the forefront the capitalists and financiers of the *haute bourgeoisie*, farmers-general and army contractors, who had supplanted or swamped the old landed and military aristocracy, had insensibly reconstructed the interior of the ancient social edifice with the gilded and incongruous materials of wealth, and in order to consolidate or increase their monopolies, needed to secure themselves against the arbitrary action of royalty and the bureaucracy.

Ancient Influences and Institutions.

The new Ideas.

The Tri-umvirate, 1770-1774.

The bourgeoisie—the incarnation of new Ideas.

Next came the crowd of stockholders and creditors of the state, who, in face of the government's "extravagant anarchy," no longer felt safe from partial or total bankruptcy. More powerful still, and more masterful, was the commercial, industrial and colonial *bourgeoisie*; because under the Regency and under Louis XV. they had been more productive and more creative. Having gradually revolutionized the whole economic system, in Paris, in Lyons, in Nantes, in Bordeaux, in Marseilles, they could not tamely put up with being excluded from public affairs, which had so much bearing upon their private or collective enterprises. Finally, behind this *bourgeoisie*, and afar off, came the crowd of serfs, rustics whom the acquisition of land had gradually enfranchised, and who were the more eager to enjoy their definitive liberation because it was close at hand.

The habits and sentiments of French society showed similar changes. From having been almost exclusively national during Louis XIV.'s reign, owing to the perpetual state of war and to a sort of proud isolation, it had gradually become cosmopolitan. After the peace of Aix-la-Chapelle, France had been flooded from all quarters of the civilized world, but especially from England, by a concourse of refined and cultured men well acquainted with her usages and her universal language, whom she had received sympathetically. Paris became the brain of Europe. This revolution in manners and customs, coinciding with the revolution in ideas, led in its turn to a transformation in feeling, and to new aesthetic needs. Gradually people became sick of openly avowed gallantry, of shameless libertinism, of moral obliquity and of the flattering artifices of vice; a long shudder ran through the selfish torpor of the social body. After reading the *Nouvelle-Héloïse*, *Clarissa* and *Sir Charles Grandison*, fatigued and wearied society revived as though beneath the fresh breezes of dawn. The principle of examination, the reasoned analysis of human conditions and the discussion of causes, far from culminating in disillusioned nihilism, everywhere aroused the democratic spirit, the life of sentiment and of human feeling: in the drama, with Marivaux, Diderot and La Chaussée; in art, with Chardin and Greuze; and in the salons, in view of the suppression of privilege. So that to Louis XV.'s cynical and hopeless declaration: "Après moi le déluge," the setting 18th century responded by a belief in progress and an appeal to the future. A long-drawn echo from all classes hailed a revolution that was possible because it was necessary.

If this revolution did not burst forth sooner, in the actual lifetime of Louis XV., if in Louis XVI.'s reign there was a renewal of loyalty to the king, before the appeal to liberty was made, that is to be explained by this hope of recovery. But Louis XVI.'s reign (1774-1792) was only to be a temporary halting-place, an artifice of history for passing through the transition period whilst elaborating the transformation which was to revolutionize, together with France, the whole world.

Louis XVI. was twenty years of age. Physically he was stout, and a slave to the Bourbon fondness for good living; *Louis XVI.* intellectually a poor creature and but ill-educated, he loved nothing so much as hunting and locksmith's work. He had a taste for puerile amusements, a mania for useless little domestic economies in a court where millions vanished like smoke, and a natural idleness which achieved as its masterpiece the keeping a diary from 1766 to 1792 of a life so tragic, which was yet but a foolish chronicle of trifles. Add to this that he was a virtuous husband, a kind father, a fervent Christian and a good-natured man full of excellent intentions, yet a spectacle of moral pusillanimity and ineptitude.

From 1770 onwards lived side by side with this king, rather than at his side, the archduchess Marie Antoinette of Austria—*Marie Antoinette.* one of the very graceful and very frivolous women who were to be found at Versailles, opening to life like the flowers she so much loved, enamoured of pleasure and luxury, delighting to free herself from the formalities of court life, and mingling in the amusements

of society; lovable and loving, without ceasing to be virtuous. Flattered and adored at the outset, she very soon furnished a sinister illustration to Beaumarchais' *Basile*; for evil tongues began to calumniate the queen: those of her brothers-in-law, the duc d'Aiguillon (protector of Madame du Barry and dismissed from the ministry), and the Cardinal de Rohan, recalled from his embassy in Vienna. She was blamed for her friendship with the comtesse de Polignac, who loved her only as the dispenser of titles and positions; and when weary of this persistent begging for rewards, she was taxed with her preference for foreigners who asked nothing. People brought up against her the debts and expenditure due to her belief in the inexhaustible resources of France; and hatred became definite when she was suspected of trying to imitate her mother Maria Theresa and play the part of ruler, since her husband neglected his duty. They then became persuaded that it was she who caused the weight of taxation, in the most infamous libels comparison was made between her freedom of behaviour and that of Louis XV.'s former mistresses. Private envy and public misconceptions very soon summed up her excessive unpopularity in the menacing nickname, "L'Autrichienne." (See MARIE ANTOINETTE.)

All this shows that Louis XVI. was not a monarch capable of directing or suppressing the inevitable revolution. His reign was but a tissue of contradictions. External affairs seemed in even a more dangerous position than those at home. Louis XVI. confided to Vergennes *Foreign policy of Louis XVI.* the charge of reverting to the traditions of the crown and raising France from the humiliation suffered by the treaty of Paris and the partition of Poland. His first act was to release French policy from the Austrian alliance of 1756; in this he was aided both by public opinion and by the confidence of the king—the latter managing to set aside the desires of the queen, whom the ambition of Maria Theresa and Joseph II. hoped to use as an auxiliary. Vergennes' object was a double one: to free the kingdom from English supremacy and to shake off the yoke of Austria. Opportunities offered themselves simultaneously. In 1775 the English colonies in America rebelled, and Louis XVI., after giving them secret aid and encouragement almost from the first, finally in February 1778, despite Marie Antoinette, formed an open alliance with them; while when Joseph II., after having partitioned Poland, wanted in addition to balance the loss of Silesia with that of Bavaria, Vergennes prevented him from doing so. In vain was he offered a share in the partition of the Netherlands by way of an inducement. France's disinterested action in the peace of Teschen (1779) restored to her the lost adherence of the secondary states. Europe began to respect her again when she signed a Franco-Dutch-Spanish alliance (1779-1780), and when, after the capitulation of the English at Yorktown, the peace of Versailles (1783) crowned her efforts with at least formal success. Thenceforward, partly from prudence and partly from penury, Vergennes cared only for the maintenance of peace—a not too easy task, in opposition to the greed of Catherine II. and Joseph II., who now wished to divide the Ottoman empire. Joseph II., recognizing that Louis XVI. would not sacrifice the "sick man" to him, raised the question of the opening of the Scheldt, against the Dutch. Vainly did Joseph II. accuse his sister of ingratitude and complain of her resistance; the treaty of Fontainebleau in 1785 maintained the rights of Holland. Later on, Joseph II., sticking to his point, wanted to settle the house of Bavaria in the Netherlands; but Louis XVI. supported the confederation of princes (Fürstenbund) which Frederick II. called together in order to keep his turbulent neighbour within bounds. Vergennes completed his work by signing a commercial treaty in 1786 with England, whose commerce and industry were favoured above others, and a second in 1787 with Russia. He died in 1787, at an opportune moment for himself; though he had temporarily raised France's position in Europe, his work was soon ruined by the very means taken to secure its successes: warfare and armaments had hastened the "hideous bankruptcy."

From the very beginning of his reign Louis XVI. fell into

contradictions and hesitation in internal affairs, which could not but bring him to grief. He tried first of all to govern in accordance with public opinion, and was induced to flatter it beyond measure; in an extreme of inconsistency he re-established the parlements, the worst enemies of reform, at the very moment when he was calling in the reformers to his councils.

Turgot, the most notable of these latter, was well fitted to play his great part as an enlightened minister, as much from the principle of hard work and domestic economy traditional in his family, as from a maturity of mind developed by extensive study at the Sorbonne and by frequenting the salons of the Encyclopaedists.

He had proved this by his capable administration in the paymaster's office at Limoges, from 1761 to 1774. A disciple of Quesnay and of Gournay, he tried to repeat in great affairs the experience of liberty which he had found successful in small, and to fortify the unity of the nation and the government by social, political and economic reforms. He ordained the free circulation of grain within the kingdom, and was supported by Louis XVI. in the course of the flour-war (*guerre des farines*) (April-May 1775); he substituted a territorial subsidy for the royal *corvée*—so burdensome upon the peasants—and thus tended to abolish privilege in the matter of imposts; and he established the freedom of industry by the dissolution of privileged trade corporations (1776). Finance was in a deplorable state, and as controller-general he formulated a new fiscal policy, consisting of neither fresh taxation nor loans, but of retrenchment. At one fell stroke the two auxiliaries on which he had a right to count failed him: public opinion, clamouring for reform on condition of not paying the cost; and the king, too timid to dominate public opinion, and not knowing how to refuse the demands of privilege. Economy in the matter of public finance implies a grain of severity in the collection of taxes as well as in expenditure. By the former Turgot hampered the great interests; by the second he thwarted the desires of courtiers not only of the second rank but of the first. Therefore, after he had aroused the complaints of the commercial world and the bourgeoisie, the court, headed by Marie Antoinette, profited by the general excitement to overthrow him. The Choiseul party, which had gradually been reconstituted, under the influence of the queen, the princes, parlement, the prebendaries, and the trade corporations, worked adroitly to eliminate this reformer of lucrative abuses. The old courtier Maurepas, jealous of Turgot and desirous of remaining a minister himself, refrained from defending his colleague; and when Turgot, who never knew how to give in, spoke of establishing assemblies of freeholders in the communes and the provinces, in order to relax the tension of over-centralization, Louis XVI., who never dared to pass from sentiment to action, sacrificed his minister to the rancour of the queen, as he had already sacrificed Malesherbes (1776). Thus the first governmental act of the queen was an error, and dissipated the hope of replacing special privileges by a general guarantee given to the nation, which alone could have postponed a revolution. It was still too early for a Fourth of August; but the queen's victory was none the less vain, since Turgot's ideas were taken up by his successors.

The first of these was Necker, a Genevese financier. More able than Turgot, though a man of smaller ideas, he abrogated the edicts registered by the *lits de justice*; and unable or not daring to attack the evil at its root, he thought he could suppress its symptoms by a curative process of borrowing and economy. Like Turgot he failed, and for the same reasons. The American war had finally exhausted the exchequer, and, in order to replenish it, he would have needed to inspire confidence in the minds of capitalists; but the resumption in 1778 of the plan of provincial assemblies charged with remodelling the various imposts, and his *compte-rendu* in which he exhibited the monarchy paying its pensioners for their inactivity as it had never paid its agents for their zeal, aroused a fresh outburst of anger. Necker was carried away in his turn by the reaction he had helped to bring about (1781).

Having fought the oligarchy of privilege, the monarchy next tried to rally it to its side, and all the springs of the old régime were strained to the breaking-point. The military rule of the marquis de Ségur eliminated the plebeians from the army; while the great lords, drones in the hive, worked with a kind of fever at the enforcement of their seigniorial rights; the feudal system was making a last struggle before dying. The Church claimed her right of ordering the civil estate of all Frenchmen as an absolute mistress more strictly than ever. Joly de Fleury and D'Ormesson, Necker's successors, pushed their narrow spirit of reaction and the temerity of their inexperience to the furthest limit; but the reaction which reinforced the privileged classes was not sufficient to fill the coffers of the treasury, and Marie Antoinette, who seemed gifted with a fatal perversity of instinct, confided the finances of the kingdom to Calonne, an upper-class official and a veritable Cagliostro of finance.

From 1783 to 1787, this man organized his astounding system of falsification all along the line. His unbridled prodigality, by spreading a belief in unlimited resources, augmented the confidence necessary for the success of perpetual loans; until the day came when, having exhausted the system, he tried to suppress privilege and fall back upon the social reforms of Turgot, and the financial schemes of Necker, by suggesting once more to the assembly of notables a territorial subsidy from all landed property. He failed, owing to the same reaction that was causing the feudal system to make inroads upon the army, the magistracy and industry; but in his fall he put on the guise of a reformer, and by a last wild plunge he left the monarchy, already compromised by the affair of the Diamond Necklace (*q.v.*), hopelessly exposed (April 1787).

The volatile and brilliant archbishop Loménie de Brienne was charged with the task of laying the affairs of the *ancien régime* before the assembly of notables, and with asking the nation for resources, since the monarchy could no longer provide for itself; but the notables refused, and referred the minister to the states-general, the representative of the nation. Before resorting to this extremity, Brienne preferred to lay before the parlement his two edicts regarding a stamp duty and the territorial subsidy; to be met by the same refusal, and the same reference to the states-general. The exile of the parlement to Troyes, the arrest of various members, and the curt declaration of the king's absolute authority (November 9, 1787) were unsuccessful in breaking down its resistance. The threat of Chrétien François de Lamoignon, keeper of the seals, to imitate Maupeou, aroused public opinion and caused a fresh confederation of the parlements of the kingdom. The royal government was too much exhausted to overthrow even a decaying power like that of the parlements, and being still more afraid of the future representatives of the French people than of the supreme courts, capitulated to the insurgent parlements. The recalled parlement seemed at the pinnacle of power.

Its next action ruined its ephemeral popularity, by claiming the convocation of the states-general "according to the formula observed in 1614," as already demanded by the estates of Dauphiné at Vizille on the 21st of July 1788. The exchequer was empty; it was necessary to comply. The royal declaration of the 23rd of September 1788 convoked the states-general for the 1st of May 1789, and the fall of Brienne and Lamoignon followed the recall of Necker. Thenceforward public opinion, which was looking for something quite different from the superannuated formula of 1614, abandoned the parlements, which in their turn disappeared from view; for the struggle beginning between the privileged classes and the government, now at bay, had given the public, through the states-general, that means of expression which they had always lacked.

The conflict immediately changed ground, and an engagement began between privilege and the people over the twofold question of the number of deputies and the mode of voting. Voting by head, and the double representation of the third estate (*tiers état*); this was the great revolution; voting by order meant the

continued domination of privilege, and the lesser revolution. The monarchy, standing apart, held the balance, but needed a decisive policy. Necker, with little backing at court, could not act energetically, and Louis XVI., wavering between

Prelude to the states-general.

Necker and the queen, chose the attitude most convenient to his indolence and least to his interest: he remained neutral, and his timidity showed clearly in the council of the 27th of December 1788. Separating the two questions which were so closely connected, and despite the sensational brochure of the abbé Sieyès, "What is the Third Estate?" he pronounced for the doubling of the third estate without deciding as to the vote by head, yet leaving it to be divined that he preferred the vote by order. As to the programme there was no more decisive resolution; but the edict of convocation gave it to be understood that a reform was under consideration: "the establishment of lasting and permanent order in all branches of the administration." The point as to the place of convocation gave rise to a compromise between the too-distant centre of France and too-tumultuous Paris. Versailles was chosen "because of the hunting!" In the procedure of the elections

The electorate.

the traditional system of the states-general of 1614 was preserved, and the suffrage was almost universal, but in two kinds: for the third estate nearly all citizens over twenty-five years of age, paying a direct contribution, voted—peasants as well as bourgeois; the country clergy were included among the ecclesiastics; the smaller nobility among the nobles; and finally, Protestants were electors and eligible.

According to custom, documents (*cahiers*) were drawn up, containing a list of grievances and proposals for reform. All the orders were agreed in demanding prudently modified

The addresses.

reform: the vote on the budget, order in finance, regular convocation of the states-general, and a written constitution in order to get rid of arbitrary rule. The address of the clergy, inspired by the great prelates, sought to make inaccurate lamentations over the progress of impiety a means of safeguarding their enormous spiritual and temporal powers, their privileges and exemptions, and their vast wealth. The nobility demanded voting by order, the maintenance of their privileges, and, above all, laws to protect them against the arbitrary proceedings of royalty. The third estate insisted on the vote by head, the graduated abolition of privilege in all governmental affairs, a written constitution and union. The programme went on broadening as it descended in the social scale.

The elections sufficed finally to show that the *ancien régime*, characterized from the social point of view by inequality, from

The elections.

the political point of view by arbitrariness, and from the religious point of view by intolerance, was completed from the administrative point of view by inextricable disorder. As even the extent of the jurisdiction of the *bailliages* was unknown, convocations were made at haphazard, according to the good pleasure of influential persons, and in these assemblies decisions were arrived at by a process that confused every variety of rights and powers, and was governed by no logical principle; and in this extreme confusion terms and affairs were alike involved.

Whilst the bureaucracy of the *ancien régime* sought for desperate expedients to prolong its domination, the whole social body gave signs of a yet distant but ever nearing disintegration. The revolution was already complete before it was declared to the world. Two distinct currents of disaffection, one economic, the other philosophic, had for long been pervading the nation.

The counter-currents of the Revolution.

There had been much suffering throughout the 17th and 18th centuries; but no one had hitherto thought of a politico-social rising. But the other, the philosophic current, had been set going in the 18th century; and the policy of despotism tempered by privilege had been criticized in the name of liberty as no longer justifying itself by its services to the state. The ultramontane and oppressively burdensome church had been taunted with its lack of Christian charity, apostolic poverty and primitive virtue. All vitality had been sapped

from the old order of nobles, reduced in prestige by the *sauvonnelle à vilains* (office purchased to ennoble the holder), enervated by court life, and so robbed of its roots in the soil, from which it had once drawn its strength, that it could no longer live save as a ruinous parasite on the central monarchy. Lastly, to come to the bottom of the social scale, there were the common people, taxable at will, subject to the arbitrary and burdensome forced labour of the *corvée*, cut off by an impassable barrier from the privileged classes whom they hated. For them the right to work had been asserted, among others by Turgot, as a natural right opposed to the caprices of the arbitrary and selfish aristocracy of the corporations, and a breach had been made in the tyranny of the masters which had endeavoured to set a barrier to the astonishing outburst of industrial force which was destined to characterize the coming age.

The outward and visible progress of the Revolution, due primarily to profound economic disturbance, was thus accelerated and rendered irresistible. Economic reformers found a moral justification for their dissatisfaction in philosophical theories; the chance conjunction of a philosopho-political idea with a national deficit led to the preponderance of the third estate at the elections, and to the predominance of the democratic spirit in the states-general. The third estate wanted civil liberty above all; political liberty came second only, as a means and guarantee for the former. They wanted the abolition of the feudal system, the establishment of equality and a share in power. Neither the family nor property was violently attacked; the church and the monarchy still appeared to most people two respectable and respected institutions. The king and the privileged classes had but so to desire it, and the revolution would be easy and peaceful.

Louis XVI. was reluctant to abandon a tittle of his absolute power, nor would the privileged classes sacrifice their time-honoured traditions; they were inexorable. The king, more ponderous and irresolute every day, vacillated between Necker the liberal on one side and Marie Antoinette, whose feminine pride was opposed to any concessions, with the comte d'Artois, a mischievous nobody who could neither choose a side nor stick to one, on the other. When the states-general opened on the 5th of May 1789 Louis XVI. had decided nothing. The conflict between him and the Assembly immediately broke out, and became acute over the verification of the mandates; the third estate desiring this to be made in common by the deputies of the three orders, which would involve voting by head, the suppression of classes and the preponderance of the third estate. On the refusal of the privileged classes and after an interval of six weeks, the third estate, considering that they represented 96% of the nation, and in accordance with the proposal of Sieyès, declared that they represented the nation and therefore were authorized to take resolutions unaided, the first being that in future no arrangement for taxation could take place without their consent.

Meeting of the states-general.

The king, urged by the privileged classes, responded to this first revolutionary act, as in 1614, by closing the Salle des Menus Plaisirs where the third estate were sitting; whereupon, gathered in one of the tennis-courts under the presidency of Bailly, they swore on the 20th of June not to separate before having established the constitution of the kingdom.

Oath of the tennis-court.

Louis XVI. then decided, on the 23rd, to make known his policy in a royal *lit de justice*. He declared for the lesser reform, the fiscal, not the social; were this rejected, he declared that "he alone would arrange for the welfare of his people." Meanwhile he annulled the sitting of the 17th, and demanded the immediate dispersal of the Assembly. The third estate refused to obey, and by the mouth of Bailly and Mirabeau asserted the legitimacy of the Revolution. The refusal of the soldiers to coerce the Assembly showed that the monarchy could no longer rely on the army; and a few days later, when the lesser nobility and the lower ranks of the clergy had united with the third estate whose cause was their own, the king yielded, and on the 27th of June commanded both orders to join in the National Assembly, which was thereby

The Lit de Justice of June 23, 1789.

recognized and the political revolution sanctioned. But at the same time, urged by the "infernal cabal" of the queen and the comte d'Artois, Louis XVI. called in the foreign regiments—the only ones of which he could be certain—and dismissed Necker. The Assembly, dreading a sudden attack, demanded the withdrawal of the troops. Meeting with a refusal, Paris opposed the king's army with her citizen-soldiers; and by the taking of the Bastille, that mysterious dark fortress which personified the *ancien régime*, secured the triumph of the Revolution (July 14). The king was obliged to recall Necker, to mount the tricolor cockade at the Hôtel de Ville, and to recognize Bailly as mayor of Paris and La Fayette as commander of the National Guard, which remained in arms after the victory. The National Assembly had right on its side after the 20th of June and might after the 14th of July. Thus was accomplished the Revolution which was to throw into the melting-pot all that had for centuries appeared fixed and stable.

As Paris had taken her Bastille, it remained for the towns and country districts to take theirs—all the Bastilles of feudalism.

Want, terror and the contagion of examples precipitated the disruption of governmental authority and of the old political status; and sudden anarchy dislocated all the organs of authority. Upon the ruins of the central administration temporary authorities were founded in various isolated localities, limited in area but none the less defiant of the government. The provincial assemblies of Dauphiné and elsewhere gave the signal; and numerous towns, following the example of Paris, instituted municipalities which substituted their authority for that of the intendants and their subordinates. Clubs were openly organized, pamphlets and journals appeared, regardless of administrative orders; workmen's unions multiplied in Paris, Bordeaux and Lyons, in face of drastic prohibition; and anarchy finally set in with the defection of the army in Paris on the 23rd of June, at Nancy, at Metz and at Brest. The crying abuses of the old régime, an insignificant factor at the outset, soon combined with the widespread agrarian distress, due to the unjust distribution of land, the disastrous exploitation of the soil, the actions of the government, and the severe winter of 1788. Discontent showed itself in pillage and incendiarism on country estates; between March and July 1789 more than three hundred agrarian riots took place, uprooting the feudal idea of property, already compromised by its own excesses. Not only did pillaging take place; the boundaries or property were also ignored, and people no longer held themselves bound to pay taxes. These *jacqueries* hastened the movement of the regular revolution.

The decrees of the 4th of August, proposed by those noble "patriots" the duc d'Aiguillon and the vicomte de Noailles, who had already on the 23rd of June made armed resistance to the evacuation of the Hall of Assembly, put the final touch to the revolution begun by the provincial assemblies, by liberating land and labour, and proclaiming equality among all Frenchmen. Instead of exasperating the demands of the peasants and workmen by repression and raising civil war between the bourgeoisie and the proletariat, they drew a distinction between personal servitude, which was suppressed, and the rights of contract, which were to be redeemed—a laudable but impossible distinction. The whole feudal system crumbled before the revolutionary insistence of the peasants; for their masters, bourgeois or nobles, terrified by prolonged riots, capitulated and gradually had to consent to make the resolutions of the 4th of August a reality.

Overjoyed by this social liberation, the Assembly awarded Louis XVI. the title of "renewer of French liberty"; but remaining faithful to his hesitating policy of the 23rd of June, he ratified the decrees of the 4th of August, only with a very ill grace. On the other hand, the privileged classes, and notably the clergy, who saw the whole traditional structure of their power threatened, now rallied to him, and when after the 28th of August the Assembly

set to work on the new constitution, they combined in the effort to recover some of the position they had lost. But whatever their theoretical agreement on social questions, politically they were hopelessly at odds. The bourgeoisie, conscious of their opportunity, decided for a single chamber against the will of the noblesse; against that of the king they declared it permanent, and, if they accorded him a suspensory veto, this was only in order to guard them against the extreme assertion of popular rights. Thus the progress of the Revolution, so far, had left the mass of the people still excluded from any constitutional influence on the government, which was in the hands of the well-to-do classes, which also controlled the National Guard and the municipalities. The irritation of the disfranchised proletariat was moreover increased by the appalling dearness of bread and food generally, which the suspicious temper of the times—fomented by the tirades of Marat in the *Ami du peuple*—ascribed to English intrigues in revenge for the aid given by France to the American colonies, and to the treachery in high places that made these intrigues successful. The climax came with the rumour that the court was preparing a new military *coup d'état*, a rumour that seemed to be confirmed by indiscreet toasts proposed at a banquet by the officers of the guard at Versailles; and on the night of the 5th to the 6th of October a Parisian mob forced the king and royal family to return with them to Paris amid cries of "We are bringing the baker, the baker's wife and the little baker's boy!" The Assembly followed; and henceforth king and Assembly were more or less under the influence of the whims and passions of a populace maddened by want and suspicion, by the fanatical or unscrupulous incitements of an unfettered press, and by the unrestrained oratory of obscure demagogues in the streets, the cafés and the political clubs.

Convened for the purpose of elaborating a system that should conciliate all interests, the Assembly thus found itself forced into a conflict between the views of the people, who feared betrayal, and the court, which dreaded being overwhelmed. This schism was reflected in the parties of the Assembly; the absolutists of the extreme Right; the moderate monarchists of the Right and Centre; the constitutionalists of the Left Centre and Left; and, finally, on the extreme Left the democratic revolutionists, among whom Robespierre sat as yet all but unnoticed. Of talent there was enough and to spare in the Assembly; what was conspicuously lacking was common sense and a practical knowledge of affairs. Of all the orators who declaimed from the tribune, Mirabeau alone realized the perils of the situation and possessed the power of mind and will to have mastered them. Unfortunately, however, he was discredited by a disreputable past, and yet more by the equivocal attitude he had to assume in order to maintain his authority in the Assembly while working in what he believed to be the true interests of the court. His political ideal for France was that of the monarchy, rescued from all association with the abuses of the old régime and "broad-based upon the people's will"; his practical counsel was that the king should frankly proclaim this ideal to the people as his own, should compete with the Assembly for popular favour, while at the same time using every means to win over those by whom his authority was flouted. For a time Mirabeau influenced the counsels of the court through the comte de Montmorin; but the king neither trusted him nor could be brought to see his point of view, and Marie Antoinette, though she resigned herself to negotiating with him, was very far from sympathizing with his ideals. Finally, all hope of the conduct of affairs being entrusted to him was shattered when the Assembly passed a law forbidding its members to become ministers.

The attempted reconciliation with the king having failed, the Assembly ended by working alone, and made the control that it should have exerted an instrument, not of co-operation but of strife. It inaugurated its legislative labours by a metaphysical declaration of the Rights of Man and of the Citizen (October 2, 1789). This enunciation of universal verities, the bulk of which have, sooner

Elaboration of the constitution.

Declaration of the rights of man.

or later, been accepted by all civilized nations as "the gospel of modern times," was inspired by all the philosophy of the 18th century in France and by the *Contrat Social*. It comprised various rational and humane ideas, no longer theological, but profoundly and deliberately thought out: ideas as to the sovereign-right of the nation, law by general consent, man superior to the pretensions of caste and the fetters of dogma, the vindication of the ideal and of human dignity. Unable to rest on historic precedent like England, the Constituent Assembly took as the basis for its labours the tradition of the thinkers.

Upon the principles proclaimed in this Declaration the constitution of 1791 was founded. Its provisions are discussed elsewhere (see the section below on *Law and Institutions*); here it will suffice to say that it established under the sovereign people, for the king was to survive merely as the supreme executive official, a wholly new model of government in France, both in Church and State. The historic divisions of the realm were wiped out; for the old provinces were substituted eighty-three departments; and with the provinces vanished the whole organization, territorial, administrative and ecclesiastical, of the *ancien régime*. In one respect, indeed, the system of the old monarchy remained intact; the tradition of centralization established by Louis XIV. was too strong to be overthrown, and the destruction of the historic privileges and immunities with which this had been ever in conflict only served to strengthen this tendency. In 1791 France was pulverized into innumerable administrative atoms incapable of cohesion; and the result was that Paris became more than ever the brain and nerve-centre of France. This fact was soon to be fatal to the new constitution, though the administrative system established by it still survives. Paris was in effect dominated by the armed and organized proletariat, and this proletariat could never be satisfied with a settlement which, while proclaiming the sovereignty of the people, had, by means of the property qualification for the franchise, established the political ascendancy of the middle classes. The settlement had, in fact, settled nothing; it had, indeed, merely intensified the profound cleavage between the opposing tendencies; for if the democrats were alienated by the narrow franchise, the Civil Constitution of the Clergy, which cut at the very roots of the Catholic system, drove into opposition to the Revolution not only the clergy themselves but a vast number of their flocks.

The policy of the Assembly, moreover, hopelessly aggravated its misunderstanding with the king. Louis, indeed, accepted the constitution and attended the great Feast of Federation (July 14, 1790), when representatives from all the new departments assembled in the Champ de Mars to ratify the work of the Assembly; but the king either could not or would not say the expected word that would have dissipated mistrust. The Civil Constitution of the Clergy, too, seemed to him not only to violate his rights as a king, but his faith as a Christian also; and when the emigration of the nobility and the death of Mirabeau (April 2, 1791) had deprived him of his natural supporters and his only adviser, resuming the old plan of withdrawing to the army of the marquis de Bouillé at Metz, he made his ill-fated attempt to escape from Paris (June 20, 1791). The flight to Varennes was an irreparable error; for during the king's absence and until his return the insignificance of the royal power became apparent. La Fayette's fusillade of the republicans, who demanded the deposition of the king (July 17, 1791), led to a definite split between the democratic party and the bourgeois party. Vainly did Louis, brought back a captive to Paris, swear on the 14th of September 1791 solemnly mere lip-service to the constitution; the mistrustful party of revolution abandoned the constitution they had only just obtained, and to guard against the sovereign's mental reservations and the selfish policy of the middle classes, appealed to the main force of the people. The conflict between the *ancien régime* and the National Assembly ended in the defeat of the royalists.

Through lassitude or disinterestedness the men of 1791, on

Robespierre's suggestion, had committed one last mistake, by leaving the task of putting the constitution into practice to new men even more inexperienced than themselves. Thus the new Assembly's time was occupied in a conflict between the Legislative Assembly (Oct. 1, 1791-Sept. 20, 1792), and the king, who plotted against it; and, as a result, the monarchy, insulted by the proceedings of the 20th of June, was eliminated altogether by those of the 10th of August 1792.

The new Assembly which had met on the 1st of October 1791 had a majority favourable to the constitutional monarchy and to the bourgeois franchise. But, among these bourgeois those who were called Feuillants, from the name of their club (see FEUILLANTS, CLUB OF THE), desired the strict and loyal application of the constitution without encroaching upon the authority of the king; the triumvirate, Duport, Barnave and Lameth, were at the head of this party. The Jacobins, on the contrary, considered that the king should merely be hereditary president of the Republic, to be deposed if he attempted to violate the constitution, and that universal suffrage should be established. The dominant group among these was that of the Girondins or Girondists, so called because its most brilliant members had been elected in the Gironde (see GIRONDISTS). But the republican party was more powerful without than within. Their chief was not so much Robespierre, president of the parliamentary and bourgeois club of the Jacobins (*q.v.*), which had acquired by means of its two thousand affiliated branches great power in the provinces as the advocate Danton, president of the popular and Parisian club of the Cordeliers (*q.v.*). Between the Feuillants and the Jacobins, the independents, incapable of keeping to any fixed programme, vacillated sometimes to the right, sometimes to the left.

But the best allies of the republicans against the Feuillants were the royalists pure and simple, who cared nothing about the constitution, and claimed to "extract good from the excess of evil." The election of a Jacobin, Pétion, instead of Bailly, the resigning mayor, and La Fayette, the candidate for office, was their first achievement. The court, on its side, showed little sign of a conciliatory spirit, though, realizing its danger, it attempted to restrain the foolish violence of the *émigrés*, *i.e.* the nobles who after the suppression of titles of nobility in 1790 and the arrest of the king at Varennes, had fled in a body to Coblenz and joined Louis XVI.'s brothers, the counts of Provence and Artois. They it was who set in motion the national and European conflict. Under the prince of Condé they had collected a little army round Trier; and in concert with the "Austrian Committee" of Paris they solicited the armed intervention of monarchical Europe. The declaration of Pilnitz, which was but an excuse for non-interference on the part of the emperor and the king of Prussia, interested in the prolongation of these internal troubles, was put forward by them as an assurance of forthcoming support (August 27, 1791).

At the same time the application of the Civil Constitution of the Clergy roused the whole of western La Vendée; and in face of the danger threatened by the refractory clergy and by the army of the *émigrés*, the Girondins set about confounding the court with the Feuillants in the minds of the public, and compromising Louis XVI. by a national agitation, denouncing him as an accomplice of the foreigner. Owing to the decrees against the comte de Provence, the emigrants, and the refractory priests, voted by the Legislative Assembly in November 1791, they forced Louis XVI. to show his hand by using his veto, so that his complicity should be plainly declared, to replace his Feuillant ministry—disparate in birth, opinions and ambitions—by the Girondin ministry of Dumouriez-Roland (March 10), no more united than the other, but believers in a republican crusade for the overthrow of thrones, that of Louis XVI. first of all; and finally to declare war against the king of Bohemia and Hungary, a step also desired by the court in the hope of ridding itself of the Assembly at the first note of victory (April 20, 1792).

The war.

But when, owing to the disorganization of the army through emigration and desertion, the ill-prepared Belgian war was followed by invasion and the trouble in La Vendée increased, all France suspected a betrayal. The Assembly, in order to reduce the number of hostile forces, voted for the exile of all priests who had refused to swear to the Civil Constitution and the substitution of a body of twenty thousand volunteer national guards, under the authority of Paris for the king's constitutional guard (May 27 - June 8, 1792). Louis XVI.'s veto and the dismissal of the Girondin ministry—thanks to an intrigue of Dumouriez, analogous to that of Mirabeau and as ineffectual—dismayed the Feuillants and maddened the Girondins; the latter, to avert popular fury, turned it upon the king. The *émeute* of the 20th of June, a burlesque which, but for the persistent good-humour of Louis XVI., might have become a tragedy, alarmed but did not overthrow the monarchy.

The bourgeoisie, the Assembly, the country and La Fayette, one of the leaders of the army, now embarked upon a royalist reaction, which would perhaps have been efficacious, had it not been for the entry into the affair of the Prussians as allies of the Austrians, and for the insolent manifesto of the duke of Brunswick. The Assembly's cry of "the country in danger" (July 11) proved to the nation that the king was incapable of defending France against the foreigner; and the appeal of the federal volunteers in Paris gave to the opposition, together with the war-song of the Marseillaise, the army which had been refused by Louis XVI., now disarmed. The vain attempts of the Gironde to reconcile the king and the Revolution, the ill-advised decree of the Assembly on the 8th of August, freeing La Fayette from his guilt in forsaking his army; his refusal to vote for the deposition of the king, and the suspected treachery of the court, led to the success of the republican forces when, on the 10th of August, the mob of Paris organized by the revolutionary Commune rose against the monarchy.

The suspension and imprisonment of the king left the supreme authority nominally in the hands of the Assembly, but actually in those of the Commune, consisting of delegates from the administrative sections of Paris. Installed at the Hôtel de Ville this attempted to influence the discredited government, entered into conflict with the Legislative Assembly, which considered its mission at an end, and paralyzed the action of the executive council, particularly during the bloody days of September, provoked by the discovery of the court's intrigues with the foreigner, by the treachery of La Fayette, the capture of Longwy, the investiture of Verdun by the Prussians (August 19-30), and finally by the incendiary placards of Marat. Danton, a master of diplomatic and military operations, had to avoid any rupture with the Commune. Fortunately, on the very day of the dispersal of the Legislative Assembly, Dumouriez saved France from a Prussian invasion by the victory of Valmy, and by unauthorized negotiations which prefigured those of Bonaparte at Léoben (September 22, 1792).

The popular insurrection against Louis XVI. determined the simultaneous fall of the bourgeois régime and the establishment of the democracy in power. The Legislative Assembly, without a mandate for modifying a constitution that had become inapplicable with the suspension of the monarch, had before disappearing convoked a National Convention, and as the reward of the struggle for liberty had replaced the limited franchise by universal suffrage. Public opinion became republican from an excess of patriotism, and owing to the propaganda of the Jacobin club; while the decree of the 25th of August 1792, which marked the destruction of feudalism, now abolished in principle, caused the peasants to rally definitely to the Republic.

This had hardly been established before it became distracted by the fratricidal strife of its adherents, from September 22, 1792, to the 18th Fructidor (September 4, 1797). The electoral

assemblies, in very great majority, had desired this Republic to be democratic and equalizing in spirit, but on the face of it, liberal, uniform and propagandist; in consequence, the 782 deputies of the Convention were not divided on principles, but only by personal rivalries and ambition. They all wished for a unanimity and harmony impossible to obtain; and being unable to convince they destroyed one another.

The Girondins in the Convention played the part of the Feuillants in the Legislative Assembly. Their party was not well disciplined, they purposely refrained from making it so, and hence their ruin. Oratorically they represented the spirit of the South; politically, the ideas of the bourgeoisie in opposition to the democracy—which they despised although making use of it—and the federalist system, from an objection to the preponderance of Paris. Paris, on the other hand, had elected only deputies of the Mountain, as the more advanced of the Jacobins were called, that party being no more settled and united than the others. They drew support from the Parisian democracy, and considered the decentralization of the Girondins as endangering France's unity, circumstances demanding a strong and highly concentrated government; they opposed a republic on the model of that of Rome to the Polish republic of the Gironde. Between the two came the *Plaine*, the *Marais*, the troop of trembling bourgeois, sincerely attached to the Revolution, but very moderate in the defence of their ideas; some seeking a refuge from their timidity in hard-working committees, others partaking in the violence of the Jacobins out of weakness or for reasons of state.

The Girondins were the first to take the lead; in order to retain it they should have turned the Revolution into a government. They remained an exclusive party, relying on the mob but with no influence over it. Without a leader or popular power, they might have found both in Danton; for, occupied chiefly with the external danger, he made advances towards them, which they repulsed, partly in horror at the proceedings of September, but chiefly because they saw in him the most formidable rival in the path of the government. They waged war against him as relentlessly as did the Constitutionalists against Mirabeau, whom he resembled in his extreme ugliness and his volcanic eloquence. They drove him into the arms of Robespierre, Marat and the Commune of Paris. On the other hand, after the 23rd of September they declared Paris dangerous for the Convention, and wanted to reduce it to "eighty-three influential members." Danton and the Mountain responded by decreeing the unity and indivisibility of the Republic, in order to emphasize the suspicions of federalism which weighed upon the Girondins.

The trial of Louis XVI. still further enhanced the contrasts of ideas and characters. The discovery of fresh proofs of treachery in the iron chest (November 20, 1792) gave the Mountain a pretext for forcing on the clash of parties and raising the question not of legality but of public safety. By the execution of the king (January 21, 1793) they "cast down a king's head as a challenge to the kings of Europe." In order to preserve popular favour and their direction of the Republic, the Girondins had not dared to pronounce against the sentence of death, but had demanded an appeal to the people which was rejected; morally weakened by this equivocal attitude they were still more so by foreign events.

The king's death did not result in the unanimity so much desired by all parties; it only caused the reaction on themselves of the hatred which had been hitherto concentrated upon the king, and also an augmentation in the armies of the foreigner, which obliged the revolutionists to face all Europe. There was a coalition of monarchs, and the people of La Vendée rose in defence of their faith. Dumouriez, the conqueror of Jemappes (November 6, 1792), who invaded Holland, was beaten by the Austrians (March 1793). A levy of 300,000 men was ordered; a Committee of General Security was charged with the search for suspects; and thenceforward military occurrences called forth parliamentary crises

and popular upheavals. Girondins and Jacobins unjustly accused one another of leaving the traitors, the conspirators, the "stipendiaries of Coblenz" unpunished. To avert the danger threatened by popular dissatisfaction, the Gironde was persuaded to vote for the creation of a revolutionary tribunal to judge suspects, while out of spite against Danton who demanded it, they refused the strong government which might have made a stand against the enemy (March 10, 1793). This was the first of the exceptional measures which were to call down ruin upon them. Whilst the insurrection in La Vendée was spreading, and Dumouriez falling back upon Neerwinden, sentence of death was laid upon *émigrés* and refractory priests; the treachery of Dumouriez, disappointed in his Belgian projects, gave grounds

First committee of public safety.

for all kinds of suspicion, as that of Mirabeau had formerly done, and led the Gironde to propose the new government which they had refused to Danton. The transformation of the provisional executive council into the Committee of Public Safety—omnipotent save in financial matters—was voted because the Girondins meant to control it; but Danton got the upper hand (April 6).

The Girondins, discredited in Paris, multiplied their attacks upon Danton, now the master: they attributed the civil war and the disasters of the foreign campaign to the despotism of the Paris Commune and the clubs; they accused Marat of instigating the September massacres; and they began the supreme struggle by demanding the election of a committee of twelve deputies, charged with breaking up the anarchic authorities in Paris (May 18).

The complete success of the Girondin proposals; the arrest of Hébert—the violent editor of the *Père Duchêne*; the insurrection of the Girondins of Lyons against the Montagnard Commune; the bad news from La Vendée—the military reverses; and the economic situation which had compelled the fixing of a maximum price of corn (May 4) excited the "moral insurrections" of May 31 and June 2. Marat himself sounded the tocsin, and Hanriot, at the head of the Parisian army, surrounded the Convention. Despite the efforts of Danton and the Committee of Public Safety, the arrest of the Girondins sealed the victory of the Mountain.

The threat of the Girondin Isnard was fulfilled. The federalist insurrection, to avenge the violation of national representation, responded to the Parisian insurrection. Sixty-nine departmental governments protested against the violence done to the Convention; but the ultra-democratic constitution of 1793 deprived the Girondins,

Fall of the Girondins.

who were arming in the west, the south and the centre, of all legal force. To the departments that were hostile to the dictatorship of Paris, and the tyranny of Danton or Robespierre, it promised the referendum, an executive of twenty-four citizens, universal suffrage, and the free exercise of religion. The populace, who could not understand this parliamentary quarrel, and were in a hurry to set up a national defence, abandoned the Girondins, and the latter excited the enthusiasm of only one person, Charlotte Corday, who by the murder of Marat ruined them irretrievably. The battle of Brécourt was a defeat without a fight for their party without stamina and their general without troops (July 13); while on the 31st of October their leaders perished on the guillotine, where they had been preceded by the queen, Marie Antoinette. The Girondins and their adversaries were differentiated by neither religious dissensions nor political divergency, but merely by a question of time. The Girondins, when in power, had had scruples which had not troubled them while scaling the ladder; idols of Paris, they had flattered her in turn, and when Paris scorned them they sought support in the provinces. A great responsibility for this defeat of the liberal and republican bourgeoisie, whom they represented, is to be laid upon Madame Roland, the Egeria of the party. An ardent patriot and republican, her relations with Danton resembled those of Marie Antoinette with Mirabeau, in each case a woman spoilt by flattery, enraged at indifference. She was the ruin of the Gironde, but taught it how to die.

The fall of the Gironde left the country disturbed by civil war,

and the frontiers more seriously threatened than before Valmy. Bouchotte, a totally inefficient minister for war, the Commune's man of straw, left the army without food or ammunition, while the suspected officers remained inactive. In the Angevin Vendée the incapable leaders let themselves be beaten at Aubiers, Beaupréau and Thouars, at a time when Cathelineau was taking possession of Saumur and threatening Nantes, the capture of which would have permitted the insurgents in La Vendée to join those of Brittany and receive provisions from England. Meanwhile, the remnants of the Girondin federalists were overcome by the disguised royalists, who had aroused the whole of the Rhône valley from Lyons to Marseilles, had called in the Sardinians, and handed over the fleet and the arsenal at Toulon to the English, whilst Paoli left Corsica at their disposal. The scarcity of money due to the discrediting of the assignats, the cessation of commerce, abroad and on the sea, and the bad harvest of 1793, were added to all these dangers, and formed a serious menace to France and the Convention.

This meant a hard task for the first Committee of Public Safety and its chief Danton. He was the only one to understand the conditions necessary to a firm government; he caused the adjournment of the decentralizing constitution of 1793, and set up a revolutionary government. The Committee of Public Safety, now a permanency, annulled the Convention and was itself the central authority, its organization in Paris being the twelve committees substituted for the provisional executive committee and the six ministers, the Committee of General Security for the maintenance of the police, and the arbitrary Revolutionary Tribunal. The execution of its orders in the departments was carried out by omnipotent representatives "on mission" in the armies, by popular societies—veritable missionaries of the Revolution—and by the revolutionary committees which were its backbone.

The dictatorship of the first committee of public safety.

Despite this Reign of Terror Danton failed; he could neither dominate foes within nor divide those without. Representing the sane and vigorous democracy, and like Jefferson a friend to liberty and self-government, he had been obliged to set up the most despotic of governments in face of internal anarchy and foreign invasion. Being of a temperament that expressed itself only in action, and neither a theorist nor a cabinet-minister, he held the views of a statesman without having a following sufficient to realize them. Moreover, the proceedings of the 2nd of June, when the Commune of Paris had triumphed, had dealt him a mortal blow. He is his turn tried to stem the tumultuous current which had borne him along, and to prevent discord; but the check to his policy of an understanding with Prussia and with Sardinia, to whom, like Richelieu and D'Argenson, he offered the realization of her transalpine ambition in exchange for Nice and Savoy, was added to the failure of his temporizing methods in regard to the federalist insurgents, and of his military operations against La Vendée. A man of action and not of cunning shifts, he succumbed on the 10th of July to the blows of his own government, which had passed from his hands into those of Robespierre, his ambitious and crafty rival.

Danton's failure.

The second Committee of Public Safety lasted until the 27th of July 1794. Composed of twelve members, re-eligible every month, and dominated by the triumvirate, Robespierre, Saint-Just and Couthon, it was stronger than ever, since it obtained the right of appointing leaders, disposed of money, and muzzled the press. Many of its members were sons of the bourgeoisie, men who having been educated at college, thanks to some charitable agency, in the pride of learning, and raised above their original station, were ready for anything but had achieved nothing. They had plenty of talent at command, were full of classical tirades against tyranny, and, though sensitive enough in their private life, were bloodthirsty butchers in their public relations. Such were Robespierre, Saint-Just, Couthon, Billaud-Varenne, Cambon, Thuriot, Collot d'Herbois, Barrère and Prieur de la Marne. Working hand in hand with these politicians, not

Second committee of public safety.

always in accordance with them, but preserving a solid front, were the specialists, Carnot, Robert Lindet, Jean Bon Saint-André and Prieur de la Côte d'Or, honourable men, anxious above all to safeguard their country. At the head of the former type Robespierre, without special knowledge or exceptional talent, devoured by jealous ambition and gifted with cold grave eloquence, enjoyed a great moral ascendancy, due to his incorruptible purity of life and the invariably correct behaviour that had been wanting in Mirabeau, and by the persevering will which Danton had lacked. His marching orders were: no more temporizing with the federalists or with generals who are afraid of conquering; war to the death with all Europe in the name of revolutionary propaganda and the monarchical tradition of natural frontiers; and fear, as a means of government. The specialists answered foreign foes by their organization of victory; as for foes at home, the triumvirate crushed them beneath the Terror.

France was saved by them and by that admirable outburst of patriotism which provided 750,000 patriots for the army through the general levy of the 16th of August 1793, aided, moreover, by the mistakes of her enemies. Instead of profiting by Dumouriez's treachery and the successes in La Vendée, the Coalition, divided over the resuscitated Polish question, lost time on the frontiers of this new Poland of the west which was sacrificing itself for the sake of a Universal Republic. Thus in January 1794 the territory of France was cleared of the Prussians and Austrians by the victories at Hondschoote, Wattignies and Wissembourg; the army of La Vendée was repulsed from Granville, overwhelmed by Hoche's army at Le Mans and Savenay, and its leaders shot; royalist sedition was suppressed at Lyons, Bordeaux, Marseilles and Toulon; federalist insurrections were wiped out by the terrible massacres of Carrier at Nantes, the atrocities of Lebon at Arras, and the wholesale executions of Fouché and Collot d'Herbois at Lyons; Louis XVI. and Marie Antoinette guillotined, the *émigrés* dispersed, denied or forsaken by all Europe.

But the triumphant Mountain was not as united as it boasted. The second Committee of Public Safety had now to struggle against two oppositions: one of the left, represented by Hébert, the Commune of Paris and the Cordeliers; another of the right, Danton and his followers. The former would not admit that the Terror was only a temporary method of defence; for them it was a permanent system which was even to be strengthened in order to crush all who were hostile to the Revolution. Their sanguinary violence was combined with an anti-religious policy, not atheistical, but inspired by mistrust of the clergy, and by a civic and deistic creed that was a direct outcome of the federations. To these latter were due the substitution of the Republican for the Gregorian calendar, and the secular Feasts of Reason (November 19, 1793). The followers of Hébert wanted to push forward the movement of May 31, 1793, in order to become masters in their turn; while those of Danton were by way of arresting it. They considered it time to re-establish the reign of ordinary laws and justice; sick of bloodshed, with Camille Desmoulins they demanded a "Committee of Clemency." A deist and therefore hostile to "anti-religious masquerades," while uneasy at the absolute authority of the Paris Commune, which aimed at suppressing the State, and at its armed propaganda abroad, Robespierre resumed the struggle against its illegal power, so fatal to the Gironde. His boldness succeeded (March 24, 1794), and then, jealous of Danton's activity and statesmanship, and exasperated by the jeers of his friends, he rid himself of the party of tolerance by a parody of justice (April 5).

Robespierre now stood alone. During five months, while affecting to be the representative of "a reign of justice and virtue," he laboured at strengthening his politico-religious dictatorship—already so formidably armed—with new powers. "The incorruptible wanted to become the invulnerable" and the scaffold of the guillotine was crowded. By his dogma of the supreme state

Robespierre founded a theocratic government with the police as an Inquisition. The festival of the new doctrine, which turned the head of the new pontiff (June 8), the *loi de Prairial*, or "code of legal murder" (June 10), which gave the deputies themselves into his hand; and the multiplication of executions at a time when the victory of Fleurus (June 25) showed the uselessness and barbarity of this aggravation of the Reign of Terror provoked against him the victorious coalition of revenge, lassitude and fear. Vanquished and imprisoned, he refused to take part in the illegal action proposed by the Commune against the Convention. Robespierre was no man of action. On the 9th Thermidor (July 27, 1794) he fell into the gulf that had opened on the 31st of May, and through which the 18th Brumaire was visible.

Although brought about by the Terrorists, the tragic fall of Robespierre put an end to the Reign of Terror; for their chiefs having disappeared, the subordinates were too much divided to keep up the dictatorship of the third Committee of Public Safety, and reaction soon set in. After a change in *personnel* in favour of the surviving Dantonists, came a limitation to the powers of the Committee of Public Safety, now placed in dependence upon the Convention; and next followed the destruction of the revolutionary system, the Girondin decentralization and the resuscitation of departmental governments; the reform of the Revolutionary Tribunal on the 10th of August; the suppression of the Commune of Paris on the 1st of September, and of the salary of forty *sous* given to members of the sections; the abolition of the maximum, the suppression of the Guillotine, the opening of the prisons, the closing of the Jacobin club (November 11), and the henceforward insignificant existence of the popular societies.

Power reverted to the Girondins and Dantonists, who re-entered the Convention on the 18th of December; but with them re-entered likewise the royalists of Lyons, Marseilles and Toulon, and further, after the peace of Basel, many young men set free from the army, hostile to the Jacobins and defenders of the now moderate and peace-making Convention. These *muscadins* and *incroyables*, led by Fréron, Tallien and Barras—former revolutionists who had become aristocrats—profited by the restored liberty of the press to prepare for days of battle in the salons of the *merveilleuses* Madame Tallien, Madame de Staël and Madame Récamier, as the *sans-culottes* had formerly done in the clubs. The remnants of Robespierre's faction became alarmed at this Thermidor reaction, in which they scented royalism. Aided by famine, by the suppression of the maximum, and by the imminent bankruptcy of the assignats, they endeavoured to arouse the working classes and the former Hanriot companies against a government which was trying to destroy the republic, and had broken the busts of Marat and guillotined Carrier and Fouquier-Tinville, the former public prosecutor. Thus the risings of the 12th Germinal (April 1, 1795) and of the 1st Prairial (May 20) were economic revolts rather than insurrections excited by the deputies of the Mountain; in order to suppress them the reactionaries called in the army. Owing to this first intervention of the troops in politics, the Committee of Public Safety, which aimed not so much at a moderate policy as at steering a middle course between the Thermidorians of the Right and of the Left, was able to dispense with the latter.

The royalists now supposed that their hour had come. In the south, the companions of Jehu and of the Sun inaugurated a "White Terror," which had not even the apparent excuse of the public safety or of exasperated patriotism. At the same time they prepared for a twofold insurrection against the republic—in the west with the help of England, and in the east with that of Austria—by an attempt to bribe General Pichegru. But though the heads of the government wanted to put an end to the Revolution they had no thought of restoring the monarchy in favour of the Comte de Provence, who had taken the title of Louis XVIII. on hearing of the death of the dauphin in the Temple, and still less of bringing

Robespierre's dictatorship.

back the *ancien régime*. Hoche crushed the insurrection of the Chouans and the Bretons at Quiberon on the 2nd of July 1795, and Pichegru, scared, refused to entangle himself any further.

To cut off all danger from royalists or terrorists the Convention now voted the Constitution of the year III.; suppressing that of 1793, in order to counteract the terrorists, and re-establishing the bourgeois limited franchise with election in two degrees—a less liberal arrangement than that granted from 1789 to 1792. The chambers of the Five Hundred and of the Ancients were elected by the moneyed and intellectual aristocracy, and were to be re-elected by thirds annually. The executive authority, entrusted to five Directors, was no more than a definite and very strong Committee of Public Safety; but Sieyès, the author of the new constitution, in opposition to the royalists, had secured places of refuge for his party by reserving posts as directors for the regicides, and two-thirds of the deputies' seats for members of the Convention. In self-defence against this continuance of the policy and the *personnel* of the Convention—a modern “Long Parliament”—the royalists, persistent street-fighters and masters in the “sections” after the suppression of the daily indemnification of forty *sous*, attempted the insurrection of the 13th Vendémiaire (October 5, 1795), which was easily put down by General Bonaparte.

Thus the bourgeois republic reaped the fruits of its predecessor's external policy. After the freeing of the land in January 1794 an impulse had been given to the spirit of conquest which had gradually succeeded to the disinterested fever of propaganda and overheated patriotism. This it was which had sustained Robespierre's dictatorship; and, owing to the “amalgam” and the re-establishment of discipline, Belgium and the left bank of the Rhine had been conquered and Holland occupied, simultaneously with Kosciusko's rising in Poland, Prussia's necessity of keeping and extending her Polish acquisitions, Robespierre's death, the prevalent desires of the majority, and the continued victories of Pichegru, Jourdan and Moreau, enfeebled the coalition. At Basel (April–July 1795) republican France, having rejoined the concert of Europe, signed the long-awaited peace with Prussia, Spain, Holland and the grand-duke of Tuscany. But thanks to the past influence of the Girondin party, who had caused the war, and of the regicides of the Mountain, this peace not only ratified the conquest of Belgium, the left bank of the Rhine and Santo Domingo, but paved the way for fresh conquests; for the old spirit of domination and persistent hostility to Austria attracted the destinies of the Revolution definitely towards war.

The work of internal construction amidst this continued battle against the whole world had been no less remarkable. The Constituent Assembly had been more destructive than constructive; but the Convention preserved intact those fundamental principles of civil liberty which had been the main results of the Revolution: the equality so dear to the French, and the sovereignty of the people—the foundation of democracy. It also managed to engage private interests in state reform by creating the Grand Livre de la Dette Publique (September 13–26, 1793), and enlisted peasant and bourgeois savings in social reforms by the distribution and sale of national property. But with views reaching beyond equality of rights to a certain equality of property, the committees, as regards legislation, poor relief and instruction, laid down principles which have never been realized, save in the matter of the metric system; so that the Convention which was dispersed on the 16th of October 1795 made a greater impression on political history and social ideas than on institutions. Its disappearance left a great blank.

During four years the Directory attempted to fill this blank. Being the outcome of the Constitution of the year III., it should have been the organizing and pacifying government of the Republic; in reality it sought not to create, but to preserve its own existence. Its internal weakness, between the danger of anarchy and the opposition of the monar-

chists, was extreme; and it soon became discredited by its own *coups d'état* and by financial impotence in the eyes of a nation sick of revolution, aspiring towards peace and the resumption of economic undertakings. As to foreign affairs, its aggressive policy imperilled the conquests that had been the glory of the Convention, and caused the frontiers of France, the defence of which had been a point of honour with the Republic, to be called in question. Finally, there was no real government on the part of the five directors: La Révellière-Lépeaux, an honest man but weak; Reubell, the negotiator of the Hague; Letourneur, an officer of talent; Barras, a man of intrigue, corrupt and without real convictions; and Carnot, the only really worthy member. They never understood one another, and never consulted together in hours of danger, save to embroil matters in politics as in war. Leaning on the bourgeois, conservative, liberal and anti-clerical republicans, they were no more able than was the Thermidor party to re-establish the freedom that had been suspended by revolutionary despotism; they created a ministry of police, interdicted the clubs and popular societies, distracted the press, and with partiality undertook the separation of Church and State voted on the 18th of September 1794. Their real defence against counter revolution was the army; but, by a further contradiction, they reinforced the army attached to the Revolution while seeking an alliance with the peace-making bourgeoisie. Their party had therefore no more homogeneity than had their policy.

Moreover the Directory could not govern alone; it had to rely upon two other parties, according to circumstances: the republican-democrats and the disguised royalists. The former, purely anti-royalist, thought only of remedying the sufferings of the people. Roused by the collapse of the assignats, following upon the ruin of industry and the arrest of commerce, they were still further exasperated by the speculations of the financiers, by the jobbery which prevailed throughout the administration, and by the sale of national property which had profited hardly any but the bourgeoisie. After the 13th Vendémiaire the royalists too, deceived in their hopes, were expecting to return gradually to the councils, thanks to the high property qualification for the franchise. Under the name of “moderates” they demanded an end to this war which England continued and Austria threatened to recommence, and that the Directory from self-interested motives refused to conclude; they desired the abandonment of revolutionary proceedings, order in finance and religious peace.

The Directory, then, was in a minority in the country, and had to be ever on the alert against faction; all possible methods seemed legitimate, and during two years appeared successful. Order was maintained in France, even the royalist west being pacified, thanks to Hoche, who finished his victorious campaign of 1796 against Stofflet, Charette and Cadoudal, by using mild and just measures to complete the subjection of the country. The greatest danger lay in the republican-democrats and their socialist ally, François Noel (“Gracchus”) Babeuf (*q.v.*). The former had united the Jacobins and the more violent members of the Convention in their club, the Société du Panthéon; and their fusion, after the closing of the club, with the secret society of the Babouvists lent formidable strength to this party, with which Barras was secretly in league. The terrorist party, deprived of its head, had found a new leader, who, by developing the consequences of the Revolution's acts to their logical conclusion, gave first expression to the levelling principle of communism. He proclaimed the right of property as appertaining to the state, that is, to the whole community; the doctrine of equality as absolutely opposed to social inequality of any kind—that of property as well as that of rank; and finally the inadequacy of the solution of the agrarian question, which had profited scarcely any one, save a new class of privileged individuals. But these socialist demands were premature; the attack of the camp of Grenelle upon constitutional order

ended merely in the arrest and guillotining of Babeuf (September 9, 1796–May 25, 1797).

The liquidation of the financial inheritance of the Convention was no less difficult. The successive issues of assignats, and the

Financial policy of the Directory. multiplication of counterfeits made abroad, had so depreciated this paper money that an assignat of 100 francs was in February 1796 worth only 30 centimes; while the government, obliged to accept them at their nominal value, no longer collected any taxes and could not pay salaries. The destruction of the plate for printing assignats, on the 18th of February 1796, did not prevent the drop in the forty milliards still in circulation. Territorial mandates were now tried, which inspired no greater confidence, but served to liquidate two-thirds of the debt, the remaining third being consolidated by its dependence on the Grand Livre (September 30, 1797). This widespread bankruptcy, falling chiefly on the bourgeoisie, inaugurated a reaction which lasted until 1830 against the chief principle of the Constituent Assembly, which had favoured indirect taxation as producing a large sum without imposing any very obvious burden. The bureaucrats of the old system—having returned to their offices and being used to these indirect taxes—lent their assistance, and thus the Directory was enabled to maintain its struggle against the Coalition.

All system in finance having disappeared, war provided the Directory, now *in extremis*, with a treasury, and was its only source for supplying constitutional needs; while it opened a path to the military commanders who were to be the support and the glory of the state. England

External policy. remaining invulnerable in her insular position despite Hoche's attempt to land in Ireland in 1796, the Directory resumed the traditional policy against Austria of conquering the natural frontiers, Carnot furnishing the plans; hence the war in southern Germany, in which Jourdan and Moreau were repulsed by an inferior force under the archduke Charles, and Bonaparte's triumphant Italian campaign. Chief of an army that he had made irresistible, not by honour but by glory, and master of wealth by rapine, Bonaparte imposed his will upon the Directory, which he provided with funds. After having separated the Piedmontese from the Austrians, whom he drove back into Tyrol, and repulsed offensive reprisals of Wurmser and Alvinzi on four occasions, he stopped short at the preliminary negotiations of Léoben just at the moment when the Directory, discouraged by the problem of Italian reconstitution, was preparing the army of the Rhine to re-enter the field under the command of Hoche. Bonaparte thus gained the good opinion of peace-loving Frenchmen; he partitioned Venetian territory with Austria, contrary to French interests but conformably with his own in Italy, and henceforward was the decisive factor in French and European policy, like Caesar or Pompey of old. England, in consternation, offered in her turn to negotiate at Lille.

These military successes did not prevent the Directory, like the Thermidorians, from losing ground in the country. Every strategic truce since 1795 had been marked by a political crisis; peace reawakened opposition. The constitutional party, royalist in reality, had made alarming progress, chiefly owing to the Babouvist conspiracy; they now tried to corrupt the republican generals, and Condé procured the treachery of Pichegru, Kellermann and General Ferrand at Besançon. Moreover, their Clichy club, directed by the abbé Brottier, manipulated Parisian opinion; while many of the refractory priests, having returned after the liberal Public Worship Act of September 1795, made active propaganda against the principles of the Revolution, and plotted the fall of the Directory as maintaining the State's independence of the Church. Thus the partial elections of the year V. (May 20, 1797) had brought back into the two councils a counter-revolutionary majority of royalists, constitutionalists of 1791, Catholics and moderates. The Director Letourneur had been replaced by Barthélemy, who had negotiated the treaty of Basel and was a constitutional monarchist. So that the executive not only found it impossible to govern, owing to the opposition of the councils and a vehement press-campaign, but was distracted

by ceaseless internal conflict. Carnot and Barthélemy wished to meet ecclesiastical opposition by legal measures only, and demanded peace; while Barras, La Révellière and Reubell saw no other remedy save military force. The attempt of the counter-revolutionaries to make an army for themselves out of the guard of the Legislative Assembly, and the success of the Catholics, who had managed at the end of August 1797 to repeal the laws against refractory priests, determined the Directory to appeal from the rebellious parliament to the ready swords of Augereau and Bernadotte. On the 18th Fructidor (September 4, 1797) Bonaparte's lieutenants, backed up by the whole army, stopped the elections in forty-nine departments, and deported to Guiana many deputies of both councils, journalists and non-juring priests, as well as the director Barthélemy, though Carnot escaped into Switzerland. The royalist party was once more overthrown, but with it the republican constitution itself. Thus every act of violence still further confirmed the new empire of the army and the defeat of principles, preparing the way for military despotism.

Political and financial *coups d'état* were not enough for the directors. In order to win back public opinion, tired of internecine quarrels and sickened by the scandalous immorality of the generals and of those in power, and to remove from Paris an army which after having given them a fresh lease of life was now a menace to them, war appeared their only hopeful course. They attempted to renew the designs of Louis XIV. and anticipate those of Napoleon. But Bonaparte saw what they were planning; and to the rupture of the negotiations at Lille and an order for the resumption of hostilities he responded by a fresh act of disobedience and the infliction on the Directory of the peace of Campo-Formio, on October 17, 1797. The directors were consoled for this enforced peace by acquiring the left bank of the Rhine and Belgium, and for the forfeiture of republican principles by attaining what had for so long been the ambition of the monarchy. But the army continued a menace. To avoid disbanding it, which might, as after the peace of Basel, have given the counter-revolution further auxiliaries, the Directory appointed Bonaparte chief of the Army of England, and employed Jourdan to revise the conscription laws so as to make military service a permanent duty of the citizen, since war was now to be the permanent object of policy. The Directory finally conceived the gigantic project of bolstering up the French Republic—the triumph of which was celebrated by the peace of Campo-Formio—by forming the neighbouring weak states into tributary vassal republics. This system had already been applied to the Batavian republic in 1795, to the Ligurian and Cisalpine republics in June 1797; it was extended to that of Mülhausen on the 28th of January 1798, to the Roman republic in February, to the Helvetian in April, while the Parthenopæan republic (Naples) was to be established in 1799. This was an international *coup de force*, which presupposed that all these nations in whose eyes independence was flaunted would make no claim to enjoy it; that though they had been beaten and pillaged they would not learn to conquer in their turn; and that the king of Sardinia, dispossessed of Milan, the grand-duke of Tuscany who had given refuge to the pope when driven from Rome, and the king of Naples, who had opened his ports to Nelson's fleet, would not find allies to make a stand against this hypocritical system.

What happened was exactly the contrary. Meanwhile, the armies were kept in perpetual motion, procuring money for the impecunious Directory, making a diversion for internal discontent, and also permitting of a "reversed Fructidor," against the anarchists, who had got the upper hand in the partial elections of May 1798. The social danger was averted in its turn after the clerical danger had been dissipated. The next task was to relieve Paris of Bonaparte, who had already refused to repeat Hoche's unhappy expedition to Ireland and to attack England at home without either money or a navy. The pecuniary

resources of Berne and the wealth of Rome fortunately tided over the financial difficulty and provided for the expedition to Egypt, which permitted Bonaparte to wait "for the fruit to ripen"—i.e. till the Directory should be ruined in the eyes of France and of all Europe. The disaster of Aboukir (August 1, 1798) speedily decided the coalition pending between England, Austria, the Empire, Portugal, Naples, Russia and Turkey. The Directory had to make a stand or perish, and with it the Republic.

Bonaparte in Egypt.

The directors had thought France might retain a monopoly in numbers and in initiative. They soon perceived that enthusiasm is not as great for a war of policy and conquest as for a war of national defence; and the army dwindled, since a country cannot bleed itself to death. The law of conscription was voted on the 5th of September 1798; and the tragedy of Rastadt, where the French commissioners were assassinated, was the opening of a war, desired but ill-prepared for, in which the Directory showed hesitation in strategy and incoherence in tactics, over a disproportionate area in Germany, Switzerland and Italy. Military reverses were inevitable, and responsibility for them could not be shirked. As though shattered by a reverberant echo from the cannon of the Trebbia, the Directory crumbled to pieces, succumbing on the 18th of June 1799 beneath the reprobation showered on Treilhard, Merlin de Douai, and La Révellière-Lépeaux. A few more military disasters, royalist insurrections in the south, Chouan disturbances in Normandy, Orleanist intrigues and the end came. To soothe the populace and protect the frontier more was required than the resumption, as in all grave crises of the Revolution, of terrorist measures such as forced taxation or the law of hostages; the new Directory, Sieyès presiding, saw that for the indispensable revision of the constitution "a head and a sword" were needed. Moreau being unattainable, Joubert was to be the sword of Sieyès; but, when he was killed at the battle of Novi, the sword of the Revolution fell into the hands of Bonaparte.

Although Brune and Masséna retrieved the fight at Bergen and Zürich, and although the Allies lingered on the frontier as they had done after Valmy, still the fortunes of the Directory were not restored. Success was reserved for Bonaparte, suddenly landing at Fréjus with the prestige of his victories in the East, and now, after Hoche's death, appearing as sole master of the armies. He manoeuvred among the parties as on the 13th Vendémiaire. On the 18th Brumaire of the year VIII. France and the army fell together at his feet. By a twofold *coup d'état*, parliamentary and military, he culled the fruits of the Directory's systematic aggression and unpopularity, and realized the universal desires of the rich bourgeoisie, tired of warfare; of the wretched populace; of landholders, afraid of a return to the old order of things; of royalists, who looked upon Bonaparte as a future Monk; of priests and their people, who hoped for an indulgent treatment of Catholicism; and finally of the immense majority of the French, who love to be ruled and for long had had no efficient government. There was hardly any one to defend a liberty which they had never known. France had, indeed, remained monarchist at heart for all her revolutionary appearance; and Bonaparte added but a name, though an illustrious one, to the series of national or local dictatorships, which, after the departure of the weak Louis XVI., had maintained a sort of informal republican royalty.

On the night of the 19th Brumaire a mere ghost of an Assembly abolished the constitution of the year III., ordained the provisional Consulate, and legalized the *coup d'état* in favour of Bonaparte. A striking and singular event; for the history of France and a great part of Europe was now for fifteen years to be summed up in the person of a single man (see NAPOLEON).

The Consulate, Sept. 11, 1799-May 18, 1804.

This night of Brumaire, however, seemed to be a victory for Sieyès rather than for Bonaparte. He it was who originated the project which the legislative commissions, charged with elaborating the new constitution, had to discuss. Bonaparte's

cleverness lay in opposing Daunou's plan to that of Sieyès, and in retaining only those portions of both which could serve his ambition. Parliamentary institutions annulled by the complication of three assemblies—the Council of State which drafted bills, the Tribunalate which discussed them without voting them, and the Legislative Assembly which voted them without discussing them; popular suffrage, mutilated by the lists of notables (on which the members of the Assemblies were to be chosen by the conservative senate); and the triple executive authority of the consuls, elected for ten years: all these semblances of constitutional authority were adopted by Bonaparte. But he abolished the post of Grand Elector, which Sieyès had reserved for himself, in order to reinforce the real authority of the First Consul himself—by leaving the two other consuls, Cambacérès and Lebrun, as well as the Assemblies, equally weak. Thus the aristocratic constitution of Sieyès was transformed into an unavowed dictatorship, a public ratification of which the First Consul obtained by a third *coup d'état* from the intimidated and yet reassured electors—reassured by his dazzling but unconvincing offers of peace to the victorious Coalition (which repulsed them), by the rapid disarmament of La Vendée, and by the proclamations in which he filled the ears of the infatuated people with the new talk of stability of government, order, justice and moderation. He gave every one a feeling that France was governed once more by a real statesman, that a pilot was at the helm.

The constitution of the year VIII.

Bonaparte had now to rid himself of Sieyès and those republicans who had no desire to hand over the republic to one man, particularly of Moreau and Masséna, his military rivals. The victory of Marengo (June 14, 1800) momentarily in the balance, but secured by Desaix and Kellermann, offered a further opportunity to his jealous ambition by increasing his popularity. The royalist plot of the Rue Saint-Nicaise (December 24, 1800) allowed him to make a clean sweep of the democratic republicans, who despite their innocence were deported to Guiana, and to annul Assemblies that were a mere show by making the senate omnipotent in constitutional matters; but it was necessary for him to transform this deceptive truce into the general pacification so ardently desired for the last eight years. The treaty of Lunéville, signed in February 1801 with Austria who had been disarmed by Moreau's victory at Hohenlinden, restored peace to the continent, gave nearly the whole of Italy to France, and permitted Bonaparte to eliminate from the Assemblies all the leaders of the opposition in the discussion of the Civil Code. The Concordat (July 1801), drawn up not in the Church's interest but in that of his own policy, by giving satisfaction to the religious feeling of the country, allowed him to put down the constitutional democratic Church, to rally round him the consciences of the peasants, and above all to deprive the royalists of their best weapon. The "Articles Organiques" hid from the eyes of his companions in arms and councillors a reaction which, in fact if not in law, restored to a submissive Church, despoiled of her revenues, her position as the religion of the state. The peace of Amiens with England (March 1802), of which France's allies, Spain and Holland, paid all the costs, finally gave the peacemaker a pretext for endowing himself with a Consulate, not for ten years but for life, as a recompense from the nation. The Rubicon was crossed on that day: Bonaparte's march to empire began with the constitution of the year X. (August 1802).

The Consulate.

Before all things it was now necessary to reorganize France, ravaged as she was by the Revolution, and with her institutions in a state of utter corruption. The touch of the master was at once revealed to all the foreigners who rushed to gaze at the man about whom, after so many catastrophes and strange adventures, Paris, "la ville lumière," and all Europe were talking. First of all, Louis XV.'s system of roads was improved and that of Louis XVI.'s canals developed; then industry put its shoulder to the wheel; order and discipline were re-established everywhere, from the frontiers to the capital, and brigandage suppressed; and finally there was Paris, the city of cities! Everything was in process of transformation—

Internal reorganization.

a second Rome was arising, with its forum, its triumphal arches, its shows and parades; and in this new Rome of a new Caesar fancy, elegance and luxury, a radiance of art and learning from the age of Pericles, and masterpieces rifled from the Netherlands, Italy and Egypt illustrated the consular peace. The Man of Destiny renewed the course of time. He borrowed from the *ancien régime* its plenipotentiaries; its over-centralized, strictly utilitarian administrative and bureaucratic methods; and afterwards, in order to bring them into line, the subservient pedantic scholasticism of its university. On the basis laid down by the Constituent Assembly and the Convention he constructed or consolidated the funds necessary for national institutions, local governments, a judiciary system, organs of finance, banking, codes, traditions of conscientious well-disciplined labour, and in short all the organization which for three-quarters of a century was to maintain and regulate the concentrated activity of the French nation (see the section *Law and Institutions*). Peace and order helped to raise the standard of comfort. Provisions, in this Paris which had so often suffered from hunger and thirst, and lacked fire and light, had become cheap and abundant; while trade prospered and wages ran high. The pomp and luxury of the *nouveaux riches* were displayed in the salons of the good Joséphine, the beautiful Madame Tallien, and the "divine" Juliette Récamier.

But the republicans, and above all the military, saw in all this little but the fetters of system; the wily despotism, the bullying police, the prostration before authority, the sympathy lavished on royalists, the recall of the *émigrés*, the contempt for the Assemblies, the purification of the Tribune, the platitudes of the servile Senate, the silence of the press. In the formidable machinery of state, above all in the creation of the Legion of Honour, the Concordat, and the restoration of indirect taxes, they saw the rout of the Revolution. But the expulsion of persons like Benjamin Constant and Madame de Staël sufficed to quell this Fronde of the salons. The expedition to San Domingo reduced the republican army to a nullity; war demoralized or scattered the leaders, who were jealous of their "comrade" Bonaparte; and Moreau, the last of his rivals, cleverly compromised in a royalist plot, as Danton had formerly been by Robespierre, disappeared into exile. In contradistinction to this opposition of senators and republican generals, the immense mass of the people received the ineffaceable impression of Bonaparte's superiority. No suggestion of the possibility of his death was tolerated, of a crime which might cut short his career. The conspiracy of Cadoudal and Pichegru, after Bonaparte's refusal to give place to Louis XVIII., and the political execution of the duc d'Enghien, provoked an outburst of adulation, of which Bonaparte took advantage to put the crowning touch to his ambitious dream.

The decision of the senate on the 18th of May 1804, giving him the title of emperor, was the counterblast to the dread he had excited. Thenceforward "the brow of the emperor broke through the thin mask of the First Consul." Never did a harder master ordain more imperiously, nor understand better how to command obedience. "This was because," as Goethe said, "under his orders men were sure of accomplishing their ends. That is why they rallied round him, as one to inspire them with that kind of certainty." Indeed no man ever concentrated authority to such a point, nor showed mental abilities at all comparable to his: an extraordinary power of work, prodigious memory for details and fine judgment in their selection; together with a luminous decision and a simple and rapid conception, all placed at the disposal of a sovereign will. No head of the state gave expression more imperiously than this Italian to the popular passions of the French of that day: abhorrence for the emigrant nobility, fear of the *ancien régime*, dislike of foreigners, hatred of England, an appetite for conquest evoked by revolutionary propaganda, and the love of glory. In this Napoleon was a soldier of the people: because of this he judged and ruled his contemporaries. Having seen their actions in the stormy hours of the Revolution, he despised them and

looked upon them as incapable of disinterested conduct, conceited, and obsessed by the notion of equality. Hence his colossal egoism, his habitual disregard of others, his jealous passion for power, his impatience of all contradiction, his vain untruthful boasting, his unbridled self-sufficiency and lack of moderation—passions which were gradually to cloud his clear faculty of reasoning. His genius, assisted by the impoverishment of two generations, was like the oak which admits beneath its shade none but the smallest of saplings. With the exception of Talleyrand, after 1808 he would have about him only mediocre people, without initiative, prostrate at the feet of the giant: his tribe of paltry, rapacious and embarrassing Corsicans; his admirably subservient generals; his selfish ministers, docile agents, apprehensive of the future, who for fourteen long years felt a prognostication of defeat and discounted the inevitable catastrophe.

So France had no internal history outside the plans and transformations to which Napoleon subjected the institutions of the Consulate, and the after-effects of his wars. Well knowing that his fortunes rested on the delighted acquiescence of France, Napoleon expected to continue indefinitely fashioning public opinion according to his pleasure. To his contempt for men he added that of all ideas which might put a bridle on his ambition; and to guard against them, he inaugurated the Golden Age of the police that he might tame every moral force to his hand. Being essentially a man of order, he loathed, as he said, all demagogic action, Jacobinism and visions of liberty, which he desired only for himself. To make his will predominant, he stifled or did violence to that of others, through his bishops, his gendarmes, his university, his press, his catechism. Nourished like Frederick II. and Catherine the Great in 18th-century maxims, neither he nor they would allow any of that ideology to filter through into their rough but regular ordering of mankind. Thus the whole political system, being summed up in the emperor, was bound to share his fall.

Although an enemy of ideologues, in his foreign policy Napoleon was haunted by grandiose visions. A condottiere of the Renaissance living in the 19th century, he used France, and all those nations annexed or attracted by the Revolution, to resuscitate the Roman conception of the *Napoleon's political idea*. Empire for his own benefit. On the other hand, he was enslaved by the history and aggressive idealism of the Convention, and of the republican propaganda under the Directory; he was guided by them quite as much as he guided them. Hence the immoderate extension given to French activity by his classical Latin spirit; hence also his conquests, leading on from one to another, and instead of being mutually helpful interfering with each other; hence, finally, his not entirely coherent policy, interrupted by hesitation and counter-attractions. This explains the retention of Italy, imposed on the Directory from 1796 onward, followed by his criminal treatment of Venice, the foundation of the Cisalpine republic—a foretaste of future annexations—the restoration of that republic after his return from Egypt, and in view of his as yet inchoate designs, the postponed solution of the Italian problem which the treaty of Lunéville had raised.

Marengo inaugurated the political idea which was to continue its development until his Moscow campaign. Napoleon dreamed as yet only of keeping the duchy of Milan, setting aside Austria, and preparing some new enterprise in the East or in Egypt. The peace of Amiens, which cost him Egypt, could only seem to him a temporary truce; whilst he was gradually extending his authority in Italy, the cradle of his race, by the union of Piedmont, and by his tentative plans regarding Genoa, Parma, Tuscany and Naples. He wanted to make this his Cisalpine Gaul, laying siege to the Roman state on every hand, and preparing in the Concordat for the moral and material servitude of the pope. When he recognized his error in having raised the papacy from decadence by restoring its power over all the churches, he tried in vain to correct it by the *Articles Organiques*—wanting, like Charlemagne, to be the legal protector of the pope, and eventually master of the Church. To conceal his plan he aroused French colonial aspirations against England, and also

the memory of the spoliations of 1763, exasperating English jealousy of France, whose borders now extended to the Rhine, and laying hands on Hanover, Hamburg and Cuxhaven. By the "Recess" of 1803, which brought to his side Bavaria, Württemberg and Baden, he followed up the overwhelming tide of revolutionary ideas in Germany, to stem which Pitt, back in power, appealed once more to an Anglo-Austro-Russian coalition against this new Charlemagne, who was trying to renew the old Empire, who was mastering France, Italy and Germany; who finally on the 2nd of December 1804 placed the imperial crown upon his head, after receiving the iron crown of the Lombard kings, and made Pius VII. consecrate him in Notre-Dame.

After this, in four campaigns from 1805 to 1809, Napoleon transformed his Carolingian feudal and federal empire into one modelled on the Roman empire. The memories of imperial Rome were for a third time, after Caesar and Charlemagne, to modify the historical evolution of France. Though the vague plan for an invasion of England fell to the ground Ulm and Austerlitz obliterated Trafalgar, and the camp at Boulogne put the best military resources he had ever commanded at Napoleon's disposal.

In the first of these campaigns he swept away the remnants of the old Roman-Germanic empire, and out of its shattered fragments created in southern Germany the vassal states of Bavaria, Baden, Württemberg, Hesse-Darmstadt and Saxony, which he attached to France under the name of the Confederation of the Rhine; but the treaty of Presburg gave France nothing but the danger of a more centralized and less docile Germany. On the other hand, Napoleon's creation of the kingdom of Italy, his annexation of Venetia and her ancient Adriatic empire—wiping out the humiliation of 1797—and the occupation of Ancona, marked a new stage in his progress towards his Roman Empire. His good fortune soon led him from conquest to spoliation, and he complicated his master-idea of the grand empire by his Family Compact; the clan of the Bonapartes invaded European monarchies, wedding with princesses of blood-royal, and adding kingdom to kingdom. Joseph replaced the dispossessed Bourbons at Naples; Louis was installed on the throne of Holland; Murat became grand-duke of Berg, Jerome son-in-law to the king of Württemberg, and Eugène de Beauharnais to the king of Bavaria; while Stéphanie de Beauharnais married the son of the grand-duke of Baden.

Meeting with less and less resistance, Napoleon went still further and would tolerate no neutral power. On the 6th of August 1806 he forced the Habsburgs, left with only the crown of Austria, to abdicate their Roman-Germanic title of emperor. Prussia alone remained outside the Confederation of the Rhine, of which Napoleon was Protector, and to further her decision he offered her English Hanover. In a second campaign he destroyed at Jena both the army and the state of Frederick William III., who could not make up his mind between the Napoleonic treaty of Schönbrunn and Russia's counter-proposal at Potsdam (October 14, 1806). The butchery at Eylau and the

Eylau and Friedland.

vengeance taken at Friedland finally ruined Frederick the Great's work, and obliged Russia, the ally of England and Prussia, to allow the latter to be despoiled, and to join Napoleon against the maritime tyranny of the former. After Tilsit, however (July 1807), instead of trying to reconcile Europe to his grandeur, Napoleon had but one thought: to make use of his success to destroy England and complete his Italian dominion. It was from Berlin, on the 21st of November 1806, that he had dated the first decree of a continental blockade, a monstrous conception intended to paralyze his inveterate rival, but which on the contrary caused his own fall by its immoderate extension of the empire. To the coalition of the northern powers he added the league of the Baltic and Mediterranean ports, and to the bombardment of Copenhagen by an English fleet he responded by a second decree of blockade, dated from Milan on the 17th of December 1807.

Continental blockade.

But the application of the Concordat and the taking of Naples

led to the first of those struggles with the pope, in which were formulated two antagonistic doctrines: Napoleon declaring himself Roman emperor, and Pius VII. renewing the theocratic affirmations of Gregory VII. The former's Roman ambition was made more and more plainly visible by the occupation of the kingdom of Naples and of the Marches, and the entry of Miollis into Rome; while Junot invaded Portugal, Radet laid hands on the pope himself, and Murat took possession of formerly Roman Spain, whither Joseph was afterwards to be transferred. But Napoleon little knew the flame he was kindling. No more far-seeing than the Directory or the men of the year III., he thought that, with energy and execution, he might succeed in the Peninsula as he had succeeded in Italy in 1796 and 1797, in Egypt, and in Hesse, and that he might cut into Spanish granite as into Italian mosaic or "that big cake, Germany." He stumbled unawares upon the revolt of a proud national spirit, evolved through ten historic centuries; and the trap of Bayonne, together with the enthroning of Joseph Bonaparte, made the contemptible prince of the Asturias the elect of popular sentiment, the representative of religion and country.

Napoleon thought he had Spain within his grasp, and now suddenly everything was slipping from him. The Peninsula became the grave of whole armies and a battlefield for England. Dupont capitulated at Bailen into the hands of Castaños, and Junot at Cintra to Wellesley; while Europe trembled at this first check to the hitherto invincible imperial armies. To reduce Spanish resistance Napoleon had in his turn to come to terms with the tsar Alexander at Erfurt; so that abandoning his designs in the East, he could make the Grand Army evacuate Prussia and return in force to Madrid.

Thus Spain swallowed up the soldiers who were wanted for Napoleon's other fields of battle, and they had to be replaced by forced levies. Europe had only to wait, and he would eventually be found disarmed in face of a last coalition; but Spanish heroism infected Austria, and showed the force of national resistance. The provocations of Talleyrand and England strengthened the illusion: Why should not the Austrians emulate the Spaniards? The campaign of 1809, however, was but a pale copy of the Spanish insurrection. After a short and decisive action in Bavaria, Napoleon opened up the road to Vienna for a second time; and after the two days' battle at Essling, the stubborn fight at Wagram, the failure of a patriotic insurrection in northern Germany and of the English expedition against Antwerp, the treaty of Vienna (December 14, 1809), with the annexation of the Illyrian provinces, completed the colossal empire. Napoleon profited, in fact, by this campaign which had been planned for his overthrow.

Peace of Vienna.

The pope was deported to Savona beneath the eyes of indifferent Europe, and his domains were incorporated in the Empire; the senate's decision on the 17th of February 1810 created the title of king of Rome, and made Rome the capital of Italy. The pope banished, it was now desirable to send away those to whom Italy had been more or less promised. Eugène de Beauharnais, Napoleon's stepson, was transferred to Frankfort, and Murat carefully watched until the time should come to take him to Russia and instal him as king of Poland. Between 1810 and 1812 Napoleon's divorce of Josephine, and his marriage with Marie Louise of Austria, followed by the birth of the king of Rome, shed a brilliant light upon his future policy. He renounced a federation in which his brothers were not sufficiently docile; he gradually withdrew power from them; he concentrated all his affection and ambition on the son who was the guarantee of the continuance of his dynasty. This was the apogee of his reign.

But undermining forces were already at work: the faults inherent in his unwieldy achievement. England, his chief enemy, was persistently active; and rebellion both of the governing and the governed broke out everywhere. Napoleon felt his impotence in coping with the Spanish insurrection, which he underrated, while yet unable to suppress it altogether. Men like Stein, Hardenberg and Scharnhorst were secretly preparing Prussia's retaliation. Napoleon's material omnipotence could not stand

Beginning of the end. Uprising of nationalism.

against the moral force of the pope, a prisoner at Fontainebleau; and this he did not realize. The alliance arranged at Tilsit was seriously shaken by the Austrian marriage, the threat of a Polish restoration, and the unfriendly policy of Napoleon at Constantinople. The very persons whom he had placed in power were counteracting his plans: after four years' experience Napoleon found himself obliged to treat his Corsican dynasties like those of the *ancien régime*, and all his relations were betraying him. Caroline conspired against her brother and against her husband; the hypochondriacal Louis, now Dutch in his sympathies, found the supervision of the blockade taken from him, and also the defence of the Scheldt, which he had refused to ensure; Jerome, idling in his harem, lost that of the North Sea shores; and Joseph, who was attempting the moral conquest of Spain, was continually insulted at Madrid. The very nature of things was against the new dynasties, as it had been against the old.

After national insurrections and family recriminations came treachery from Napoleon's ministers. Talleyrand betrayed his designs to Metternich, and had to be dismissed; **Treachery.** Fouché corresponded with Austria in 1809 and 1810, entered into an understanding with Louis, and also with England; while Bourrienne was convicted of peculation. By a natural consequence of the spirit of conquest he had aroused, all these parvenus, having tasted victory, dreamed of sovereign power: Bernadotte, who had helped him to the Consulate, played Napoleon false to win the crown of Sweden; Soult, like Murat, coveted the Spanish throne after that of Portugal, thus anticipating the treason of 1813 and the defection of 1814; many persons hoped for "an accident" which might resemble the tragic end of Alexander and of Caesar. The country itself, besides, though flattered by conquests, was tired of self-sacrifice. It had become satiated; "the cry of the mothers rose threateningly" against "the Ogre" and his intolerable imposition of wholesale conscription. The soldiers themselves, discontented after Austerlitz, cried out for peace after Eylau. Finally, amidst profound silence from the press and the Assemblies, a protest was raised against imperial despotism by the literary world, against the excommunicated sovereign by Catholicism, and against the author of the continental blockade by the discontented bourgeoisie, ruined by the crisis of 1811.

Napoleon himself was no longer the General Bonaparte of his campaign in Italy. He was already showing signs of physical decay; the Roman medallion profile had coarsened, the obese body was often lymphatic. Mental degeneration, too, betrayed itself in an unwonted irresolution. **Degeneration of Napoleon.** At Eylau, at Wagram, and later at Waterloo, his method of acting by enormous masses of infantry and cavalry, in a mad passion for conquest, and his misuse of his military resources, were all signs of his moral and technical decadence; and this at the precise moment when, instead of the armies and governments of the old system, which had hitherto reigned supreme, the nations themselves were rising against France, and the events of 1792 were being avenged upon her. The three campaigns of two years brought the final catastrophe.

Napoleon had hardly succeeded in putting down the revolt in Germany when the tsar himself headed a European insurrection against the ruinous tyranny of the continental blockade. To put a stop to this, to ensure his own access to the Mediterranean and exclude his chief rival, Napoleon made a desperate effort in 1812 against a country as invincible as Spain. Despite his victorious advance, the taking of Smolensk, the victory on the Moskwa, and the entry into Moscow, he was vanquished by Russian patriotism and religious fervour, by the country and the climate, and by Alexander's refusal to make terms. After this came the lamentable retreat, while all Europe was concentrating against him. Pushed back, as he had been in Spain, from bastion to bastion, after the action on the Beresina, Napoleon had to fall back upon the frontiers of 1809, and then—having refused the peace offered him by Austria at the congress of Prague, from a dread of losing Italy, where each of his victories had marked a stage in the accomplishment of his dream—on those of 1805, despite

Lützen and Bautzen, and on those of 1802 after his defeat at Leipzig, where Bernadotte turned upon him, Moreau figured among the Allies, and the Saxons and Bavarians forsook him. Following his retreat from Russia came his retreat from Germany. After the loss of Spain, reconquered by Wellington, the rising in Holland preliminary to the invasion and the manifesto of Frankfort which proclaimed it, he had to fall back upon the frontiers of 1795; and then later was driven yet farther back upon those of 1792, despite the wonderful campaign of 1814 against the invaders, in which the old Bonaparte of 1796 seemed to have returned. Paris capitulated on the 30th of March, and the "Delenda Carthago," pronounced against England, was spoken of Napoleon. The great empire of East and West fell in ruins with the emperor's abdication at Fontainebleau.

The military struggle ended, the political struggle began. How was France to be governed? The Allies had decided on the eviction of Napoleon at the Congress of Châtillon; and the precarious nature of the Bonapartist monarchy in France itself was made manifest by the exploit of General Malet, which had almost succeeded during the Russian campaign, and by Lainé's demand for free exercise of political rights, when Napoleon made a last appeal to the Legislative Assembly for support. The defection of the military and civil aristocracy, which brought about Napoleon's abdication, the refusal of a regency, and the failure of Bernadotte, who wished to resuscitate the Consulate, enabled Talleyrand, vice-president of the senate and desirous of power, to persuade the Allies to accept the Bourbon solution of the difficulty. The declaration of St Ouen (May 2, 1814) indicated that the new monarchy was only accepted upon conditions. After Napoleon's abdication, and exile to the island of Elba, came the Revolution's abdication of her conquests: the first treaty of Paris (May 30th) confirmed France's renunciation of Belgium and the left bank of the Rhine, and her return within her pre-revolutionary frontiers, save for some slight rectifications.

After the scourge of war, the horrors of conscription, and the despotism which had discounted glory, every one seemed to rejoice in the return of the Bourbons, which atoned for humiliations by restoring liberty. But questions of form, which aroused questions of sentiment, speedily led to grave dissensions. The hurried armistice of the 23rd of April, by which the comte d'Artois delivered over disarmed France to her conquerors; Louis XVIII's excessive gratitude to the prince regent of England; the return of the *émigrés*; the declaration of St Ouen, dated from the nineteenth year of the new reign; the charter of June 4th, "*conclûe et octroyée*," maintaining the effete doctrine of legitimacy in a country permeated with the idea of national sovereignty; the slights put upon the army; the obligatory processions ordered by Comte Beugnot, prefect of police; all this provoked a conflict not only between two theories of government but between two groups of men and of interests. An avowedly imperialist party was soon again formed, a centre of heated opposition to the royalist party; and neither Baron Louis' excellent finance, nor the peace, nor the charter of June 4th—which despite the irritation of the *émigrés* preserved the civil gains of the Revolution—prevented the man who was its incarnation from seizing an opportunity to bring about another military *coup d'état*. Having landed in the Bay of Jouan on the 1st of March, on the 20th Napoleon re-entered the Tuileries in triumph, while Louis XVIII. fled to Ghent. By the *Acte additionnel* of the 22nd of April he induced Carnot and Fouché—the last of the Jacobins—and the heads of the Liberal opposition, Benjamin Constant and La Fayette, to side with him against the hostile Powers of Europe, occupied in dividing the spoils at Vienna. He proclaimed his intention of founding a new democratic empire; and French policy was thus given another illusion, which was to be exploited with fatal success by Napoleon's namesake. But the cannon of Waterloo ended this adventure (June 18, 1815), and, thanks to Fouché's treachery, the triumphal progress of

Milan, Rome, Naples, Vienna, Berlin, and even of Moscow, was to end at St Helena.

The consequences of the Hundred Days were very serious; France was embroiled with all Europe, though Talleyrand's clever diplomacy had succeeded in causing division over Saxony and Poland by the secret Austro-Anglo-French alliance of the 3rd of January 1815, and the Coalition destroyed both France's political independence and national integrity by the treaty of peace of November 20th: she found herself far weaker than before the Revolution, and in the power of the European Alliance. The Hundred Days divided the nation itself into two irreconcilable parties: one ultra-royalist, eager for vengeance and retaliation, refusing to accept the Charter; the other imperialist, composed of Bonapartists and Republicans, incensed by their defeat—of whom Béranger was the Tyrtæus—both parties equally revolutionary and equally obstinate. Louis XVIII., urged by his more fervent supporters towards the *ancien régime*, gave his policy an exactly contrary direction; he had common-sense enough to maintain the Empire's legal and administrative tradition, accepting its institutions of the Legion of Honour, the Bank, the University, and the imperial nobility—modifying only formally certain rights and the conscription, since these had aroused the nation against Napoleon. He even went so far as to accept advice from the imperial ministers Talleyrand and Fouché. Finally, as the chief political organization had become thoroughly demoralized, he imported into France the entire constitutional system of England, with its three powers, king, upper hereditary chamber, and lower elected chamber; with its plutocratic electorate, and even with details like the speech from the throne, the debate on the address, &c. This meant importing also difficulties such as ministerial responsibility, as well as electoral and press legislation.

Louis XVIII., taught by time and misfortune, wished not to reign over two parties exasperated by contrary passions and desires; but his dynasty was from the outset implicated in the struggle, which was to be fatal to it, between old France and revolutionary France. Anti-monarchical, liberal and anti-clerical France at once recommenced its revolutionary work; the whole 19th century was to be filled with great spasmodic upheavals, and Louis XVIII. was soon overwhelmed by the White Terrorists of 1815.

Vindictive sentences against men like Ney and Labédoyère were followed by violent and unpunished action by the White Terror, which in the south renewed the horrors of St Bartholomew and the September massacres. The elections of August 14, 1815, made under the influence of these royalist and religious passions, sent the "*Chambre introuvable*" to Paris, an unforeseen revival of the *ancien régime*. Neither the substitution of the duc de Richelieu's ministry for that of Talleyrand and Fouché, nor a whole series of repressive laws in violation of the charter, were successful in satisfying its tyrannical loyalism, and Louis XVIII. needed something like a *coup d'état*, in September 1816, to rid himself of the "ultras."

He succeeded fairly well in quieting the opposition between the dynasty and the constitution, until a reaction took place between 1820 and 1822. State departments worked regularly and well, under the direction of Decazes, Lainé, De Serre and Pasquier, power alternating between two great well-disciplined parties almost in the English fashion, and many useful measures were passed: the reconstruction of finance stipulated for as a condition of evacuation of territory occupied by foreign troops; the electoral law of February 5, 1817, which, by means of direct election and a qualification of three hundred francs, renewed the preponderance of the *bourgeoisie*; the Gouvion St-Cyr law of 1818, which for half a century based the recruiting of the French army on the national principle of conscription; and in 1819, after Richelieu's dismissal, liberal regulations for the press under control of a commission. But the advance of the Liberal movement, and the election of the generals—Foy, Lamarque, Lafayette and of Manuel, excited the "ultras" and caused the

dismissal of Richelieu; while that of the constitutional bishop Grégoire led to the modification in a reactionary direction of the electoral law of 1817. The assassination of the duc de Berry, second son of the comte d'Artois (attributed to the influence of Liberal ideas), caused the downfall of Decazes, and caused the king—more weak and selfish than ever—to override the charter and embark upon a reactionary path. After 1820, Madame du Cayla, a trusted agent of the ultra-royalist party, gained great influence over the king; and M. de Villèle, its leader, supported by the king's brother, soon eliminated the Right Centre by the dismissal of the duc de Richelieu, who had been recalled to tide over the crisis—just as the fall of M. Decazes had signalized the defeat of the Left Centre (December 15, 1821)—and moderate policy thus received an irreparable blow.

Thenceforward the government of M. de Villèle—a clever statesman, but tied to his party—did nothing for six years but promulgate a long series of measures against Liberalism and the social work of the Revolution; to retain power it had to yield to the impatience of the comte d'Artois and the majority. The suspension of individual liberty, the re-establishment of the censorship; the electoral right of the "double vote," favouring taxation of the most oppressive kind; and the handing over of education to the clergy: these were the first achievements of this anti-revolutionary ministry. The Spanish expedition, in which M. de Villèle's hand was forced by Montmorency and Chateaubriand, was the united work of the association of Catholic zealots known as the Congregation and of the autocratic powers of the Grand Alliance; it was responded to—as at Naples and in Spain—by secret Carbonari societies, and by severely repressed military conspiracies. Politics now bore the double imprint of two rival powers: the Congregation and Carbonarism. By 1824, nevertheless, the dynasty seemed firm—the Spanish War had reconciled the army, by giving back military prestige; the Liberal opposition had been decimated; revolutionary conspiracies discouraged; and the increase of public credit and material prosperity pleased the whole nation, as was proved by the "*Chambre retrouvée*" of 1824. The law of septennial elections tranquillized public life by suspending any legal or regular manifestation by the nation for seven years.

It was the monarchy which next became revolutionary, on the accession of Charles X. (September 16, 1824). This inconsistent prince soon exhausted his popularity, and remained the fanatical head of those *émigrés* who had learnt nothing and forgotten nothing. While the opposition became conservative as regards the Charter and French liberties, the king and the clerical party surrounding him challenged the spirit of modern France by a law against sacrilege, by a bill for re-establishing the right of primogeniture, by an indemnity of a milliard francs, which looked like compensation given to the *émigrés*, and finally by the "*loi de liberté et d'amour*" against the press. The challenge was so definite that in 1826 the Chamber of Peers and the Academy had to give the Villèle ministry a lesson in Liberalism, for having lent itself to this *ancien régime* reaction by its weakness and its party-promises. The elections "*de colère et de vengeance*" of January 1827 gave the Left a majority, and the resultant short-lived Martignac ministry tried to revive the Right Centre which had supported Richelieu and Decazes (January 1828). Martignac's accession to power, however, had only meant personal concessions from Charles X., not any concession of principle: he supported his ministry but was no real stand-by. The Liberals, on the other hand, made bargains for supporting the moderate royalists, and Charles X. profited by this to form a fighting ministry in conjunction with the prince de Polignac, one of the *émigrés*, an ignorant and visionary person, and the comte de Bourmont, the traitor of Waterloo. Despite all kinds of warnings, the former tried by a *coup d'état* to put into practice his theories of the supremacy of the royal prerogative; and the battle of Navarino, the French occupation of the Morea, and the Algerian expedition could not make the nation forget this conflict at home. The united opposition of monarchist

Liberals and imperialist republicans responded by legal resistance, then by a popular *coup d'état*, to the ordinances of July 1830, which dissolved the intractable Chamber, eliminated licensed dealers from the electoral list, and muzzled the press. After fighting for three days against the troops feebly led by the Marmont of 1814, the workmen, driven to the barricades by the deliberate closing of Liberal workshops, gained the victory, and sent the white flag of the Bourbons on the road to exile.

The rapid success of the "Three Glorious Days" ("les Trois Glorieuses"), as the July Days were called, put the leaders of the parliamentary opposition into an embarrassing position. While they had contented themselves with words, the small Republican-Imperialist party, aided by the almost entire absence of the army and police, and by the convenience which the narrow, winding, paved streets of those times offered for fighting, had determined upon the revolution and brought it to pass. But the Republican party, which desired to re-establish the Republic of 1793, recruited chiefly from among the students and workmen, and led by Godefroy Cavaignac, the son of a Conventionalist, and by the chemist Raspail, had no hold on the departments nor on the dominating opinion in Paris. Consequently this premature attempt was promptly seized upon by the Liberal *bourgeoisie* and turned to the advantage of the Orleanist party, which had been secretly organized since 1829 under the leadership of Thiers, with the *National* as its organ. Before the struggle was yet over, Benjamin Constant, Casimir Périer, Lafitte, and Odilon Barrot had gone to fetch the duke of Orleans from Neuilly, and on receiving his promise to defend the Charter and the tricolour flag, installed him at the Palais Bourbon as lieutenant-general of the realm, while La Fayette and the Republicans established themselves at the Hôtel de Ville.

An armed conflict between the two governments was imminent, when Lafayette, by giving his support to Louis Philippe, decided matters in his favour. In order to avoid a recurrence of the difficulties which had arisen with the Bourbons, the following preliminary conditions were imposed upon the king: the recognition of the supremacy of the people by the title of "king of the French by the grace of God and the will of the people," the responsibility of ministers, the suppression of hereditary succession to the Chamber of Peers, now reduced to the rank of a council of officials, the suppression of article 14 of the charter which had enabled Charles X. to supersede the laws by means of the ordinances, and the liberty of the press. The qualification for electors was lowered from 300 to 200 francs, and that for eligibility from 1000 to 500 francs, and the age to 25 and 30 instead of 30 and 40; finally, Catholicism lost its privileged position as the state religion. The *bourgeois* National Guard was made the guardian of the charter. The liberal ideas of the son of Philippe Égalité, the part he had played at Valmy and Jemappes, his gracious manner and his domestic virtues, all united in winning Louis Philippe the good opinion of the public.

He now believed, as did indeed the great majority of the electors, that the revolution of 1830 had changed nothing but the head of the state. But in reality the July monarchy was affected by a fundamental weakness. It sought to model itself upon the English monarchy, which rested upon one long tradition. But the tradition of France was both twofold and contradictory, *i.e.* the Catholic-legitimist and the revolutionary. Louis Philippe had them both against him. His monarchy had but one element in common with the English, namely, a parliament elected by a limited electorate. There was at this time a cause of violent outcry against the English monarchy, which, on the other hand, met with firm support among the aristocracy and the clergy. The July monarchy had no such support. The aristocracy of the *ancien régime* and of the Empire were alike without social influence; the clergy, which had paid for its too close alliance with Charles X. by a dangerous unpopularity, and foresaw the rise of democracy, was turning more and more towards the people, the future source of all power. Even the monarchical principle

itself had suffered from the shock, having proved by its easy defeat how far it could be brought to capitulate. Moreover, the victory of the people, who had shown themselves in the late struggle to be brave and disinterested, had won for the idea of national supremacy a power which was bound to increase. The difficulty of the situation lay in the doubt as to whether this expansion would take place gradually and by a progressive evolution, as in England, or not.

Now Louis Philippe, beneath the genial exterior of a bourgeois and peace-loving king, was entirely bent upon recovering an authority which was menaced from the very first on the one hand by the anger of the royalists at their failures, and on the other hand by the impatience of the republicans to follow up their victory. He wanted the insurrection to stop at a change in the reigning family, whereas it had in fact revived the revolutionary tradition, and restored to France the sympathies of the nationalities and democratic parties oppressed by Metternich's "system." The republican party, which had retired from power but not from activity, at once faced the new king with the serious problem of the acquisition of political power by the people, and continued to remind him of it. He put himself at the head of the party of progress ("parti du mouvement") as opposed to the ("parti de la cour") court party, and of the "resistance," which considered that it was now necessary "to check the revolution in order to make it fruitful, and in order to save it." But none of these parties were homogeneous; in the chamber they split up into a republican or radical Extreme Left, led by Garnier-Pagès and Arago; a dynastic Left, led by the honourable and sincere Odilon Barrot; a constitutional Right Centre and Left Centre, differing in certain slight respects, and presided over respectively by Thiers, a wonderful political orator, and Guizot, whose ideas were those of a strict doctrinaire; not to mention a small party which clung to the old legitimist creed, and was dominated by the famous *avocat* Berryer, whose eloquence was the chief ornament of the cause of Charles X.'s grandson, the comte de Chambord. The result was a ministerial majority which was always uncertain; and the only occasion on which Guizot succeeded in consolidating it during seven years resulted in the overthrow of the monarchy.

Louis Philippe first summoned to power the leaders of the party of "movement," Dupont de l'Eure, and afterwards Lafitte, in order to keep control of the progressive forces for his own ends. They wished to introduce democratic reforms and to uphold throughout Europe the revolution, which had spread from France into Belgium, Germany, Italy and Poland, while Paris was still in a state of unrest. But Louis Philippe took fright at the attack on the Chamber of Peers after the trial of the ministers of Charles X., at the sack of the church of Saint Germain l'Auxerrois and the archbishop's palace (February, 1831), and at the terrible strike of the silk weavers at Lyons. Casimir Périer, who was both a Liberal and a believer in a strong government, was then charged with the task of heading the resistance to advanced ideas, and applying the principle of non-intervention in foreign affairs (March 13, 1831). After his death by cholera in May 1832, the agitation which he had succeeded by his energy in checking at Lyons, at Grenoble and in the Vendée, where it had been stirred up by the romantic duchess of Berry, began to gain ground. The struggle against the republicans was still longer; for having lost all their chance of attaining power by means of the Chamber, they proceeded to reorganize themselves into armed secret societies. The press, which was gaining that influence over public opinion which had been lost by the parliamentary debates, openly attacked the government and the king, especially by means of caricature. Between 1832 and 1836 the Soult ministry, of which Guizot, Thiers and the duc de Broglie were members, had to combat the terrible insurrections in Lyons and Paris (1834). The measures of repression were threefold: military repression, carried out by the National Guard and the regulars, both under the command of Bugeaud; judicial repression, effected by the great trial of April 1835;

The Revolution of 1830.

Republican and Orleanist parties.

The Republicans crushed.

and legislative repression, consisting in the laws of September, which, when to mere ridicule had succeeded acts of violence, such as that of Fieschi (July 28th, 1835), aimed at facilitating the condemnation of political offenders and at intimidating the press. The party of "movement" was vanquished.

But the July Government, born as it was of a popular movement, had to make concessions to popular demands. Casimir Périér had carried a law dealing with municipal organization, which made the municipal councils elective, as they had been before the year VIII.; and in 1833 Guizot had completed it by making the

conseils généraux also elective. In the same year the law dealing with primary instruction had also shown the mark of new ideas. But now that the bourgeoisie was raised to power it did not prove itself any more liberal than the aristocracy of birth and fortune in dealing with educational, fiscal and industrial questions. In spite of the increase of riches, the bourgeois régime maintained a fiscal and social legislation which, while it assured to the middle class certainty and permanence of benefits, left the labouring masses poor, ignorant, and in a state of incessant agitation.

The Orleanists, who had been unanimous in supporting the king, disagreed, after their victory, as to what powers he was to be given. The Left Centre, led by Thiers, held that he should reign but not govern; the Right

Centre, led by Guizot, would admit him to an active part in the government; and the third party (*tiers-parti*) wavered between these two. And so between 1836 and 1840, as the struggle against the king's claim to govern passed from the sphere of outside discussion into parliament, we see the rise of a bourgeois socialist party, side by side with the now dwindling republican party. It no longer confined its demands to universal suffrage, on the principle of the legitimate representation of all interests, or in the name of justice. Led by Saint-Simon, Fourier, P. Leroux and Lamennais, it aimed at realizing a better social organization for and by means of the state. But the question was by what means this was to be accomplished. The secret societies, under the influence of Blanqui and Barbès, two revolutionaries who had revived the traditions of Babeuf, were not willing to wait for the complete education of the masses, necessarily a long process. On the 12th of May 1839 the *Société des Saisons* made an attempt to overthrow the bourgeoisie by force, but was defeated. Democrats like Louis Blanc, Ledru-Rollin and Lamennais continued to repeat in support of the wisdom of universal suffrage the old profession of faith: *vox populi, vox Dei*. And finally this republican doctrine, already confused, was still further complicated by a kind of mysticism which aimed at reconciling the most extreme differences of belief, the Catholicism of Buchez, the Bonapartism of Cormenin, and the humanitarianism of the cosmopolitans. It was in vain that Auguste Comte, Michelet and Quinet denounced this vague humanitarian mysticism and the pseudo-liberalism of the Church. The movement had now begun.

At first these moderate republicans, radical or communist, formed only imperceptible groups. Among the peasant classes,

and even in the industrial centres, warlike passions were still rife. Louis Philippe tried to find an outlet for them in the Algerian war, and later by the revival of the Napoleonic legend, which was held to be no

longer dangerous, since the death of the duke of Reichstadt in 1832. It was imprudently recalled by Thiers' *History of the Consulate and Empire*, by artists and poets, in spite of the prophecies of Lamartine, and by the solemn translation of Napoleon I.'s ashes in 1840 to the Invalides at Paris.

All theories require to be based on practice, especially those which involve force. Now Louis Philippe, though as active as his predecessors had been slothful, was the least warlike

of men. His only wish was to govern personally, as George III. and George IV. of England had done, especially in foreign affairs, while at home was being waged the great duel between Thiers and Guizot, with Molé as intermediary. Thiers, head of the cabinet of the 22nd of February 1836, an astute man but not pliant

enough to please the king, fell after a few months, in consequence of his attempt to stop the Carlist civil war in Spain, and to support the constitutional government of Queen Isabella. Louis Philippe hoped that, by calling upon Molé to form a ministry, he would be better able to make his personal authority felt. From 1837 to 1839 Molé aroused opposition on all hands; this was emphasized by the refusal of the Chambers to vote one of those endowments which the king was continually asking them to grant for his children, by two dissolutions of the Chambers, and finally by the Strasburg affair and the stormy trial of Louis Napoleon, son of the former king of Holland (1836-1837). At the elections of 1839 Molé was defeated by Thiers, Guizot and Barrot, who had combined to oppose the tyranny of the "Château," and after a long ministerial crisis was replaced by Thiers (March 1, 1840). But the latter was too much in favour of war to please the king, who was strongly disposed towards peace and an alliance with Great Britain, and consequently fell at the time of the Egyptian question, when, in answer to the treaty of London concluded behind his back by Nicholas I. and Palmerston on the 15th of July 1840, he fortified Paris and proclaimed his intention to give armed support to Mehemet Ali, the ally of France (see MEHEMET ALI). But the violence of popular Chauvinism and the renewed attempt of Louis Napoleon at Boulogne proved to the holders of the doctrine of peace at any price that in the long-run their policy tends to turn a peaceful attitude into a warlike one, and to strengthen the absolutist idea.

In spite of all, from 1840 to 1848 Louis Philippe still further extended his activity in foreign affairs, thus bringing himself into still greater prominence, though he was already frequently held responsible for failures in foreign *Guizot's* politics and unpopular measures in home affairs. The *ministry*. The catchword of Guizot, who was now his minister, was: Peace and no reforms. With the exception of the law of 1842 concerning the railways, not a single measure of importance was proposed by the ministry. France lived under a régime of general corruption: parliamentary corruption, due to the illegal conduct of the deputies, consisting of slavish or venal officials; electoral corruption, effected by the purchase of the 200,000 electors constituting the "*pays légal*," who were bribed by the advantages of power; and moral corruption, due to the reign of the plutocracy, the bourgeoisie, a hard-working, educated and honourable class, it is true, but insolent, like all newly enriched parvenus in the presence of other aristocracies, and with unyielding selfishness maintaining an attitude of suspicion towards the people, whose aspirations they did not share and with whom they did not feel themselves to have anything in common. This led to a slackening in political life, a sort of exhaustion of interest throughout the country, an excessive devotion to material prosperity. Under a superficial appearance of calm a tempest was brewing, of which the industrial writings of Balzac, Eugène Sue, Lamartine, H. Heine, Vigny, Montalembert and Tocqueville were the premonitions. But it was in vain that they denounced this supremacy of the bourgeoisie, relying on its two main supports, the suffrage based on a property qualification and the National Guard, for its rallying-cry was the "Enrichissez-vous" of Guizot, and its excessive materialism gained a sinister distinction from scandals connected with the ministers Teste and Cubières, and such mysterious crimes as that of Choiseul-Praslin.¹ In vain also did they point out that mere riches are not so much a protection to the ministry who are in power as a temptation to the majority excluded from power by this barrier of wealth.

¹ Charles Laure Hugues Théobald, duc de Choiseul-Praslin (1805-1847), was deputy in 1839, created a peer of France in 1840. He had married a daughter of General Sebastiani, with whom he lived on good terms till 1840, when he entered into open relations with his children's governess. The duchess threatened a separation; and the duke consented to send his mistress out of the house, but did not cease to correspond with and visit her. On the 18th of August 1847 the duchess was found stabbed to death, with more than thirty wounds, in her room. The duke was arrested on the 20th and imprisoned in the Luxembourg, where he died of poison, self-administered on the 24th. It was, however, popularly believed that the government had smuggled him out of the country and that he was living under a feigned name in England.

It was in vain that beneath the inflated *haute bourgeoisie* which speculated in railways and solidly supported the Church, behind the shopkeeper clique who still remained Voltairian, who enviously applauded the pamphlets of Cormenin on the luxury of the court, and who were bitterly satirized by the pencil of Daumier and Gavarni, did the thinkers give voice to the mutterings of an immense industrial proletariat, which were re-echoing throughout the whole of western Europe.

In face of this tragic contrast Guizot remained unmoved, blinded by the superficial brilliance of apparent success and prosperity. He adorned by flights of eloquence his invariable theme: no new laws, no reforms, no foreign complications, the policy of material interests. He preserved his yielding attitude towards Great Britain in the affair of the right of search in 1841, and in the affair of the missionary Pritchard at Tahiti (1843-1845). And when the marriage of the duc de Montpensier with a Spanish infanta in 1846 had broken this *entente cordiale* to which he clung, it was only to yield in turn to Metternich, when he took possession of Cracow, the last remnant of Poland, to protect the *Sonderbund* in Switzerland, to discourage the Liberal ardour of Pius IX., and to hand over the education of France to the Ultramontane clergy. Still further strengthened by the elections of 1846, he refused the demands of the Opposition formed by a coalition of the Left Centre and the Radical party for parliamentary and electoral reform, which would have excluded the officials from the Chambers, reduced the electoral qualification to 100 francs, and added to the number of the electors the *capacitaires* whose competence was guaranteed by their education. For Guizot the whole country was represented by the "*pays légal*," consisting of the king, the ministers, the deputies and the electors. When the Opposition appealed to the country, he flung down a disdainful challenge to what "*les brouillons et les badauds appellent le peuple*." The challenge was taken up by all the parties of the Opposition in the campaign of the banquets got up somewhat artificially in 1847 in favour of the extension of the franchise. The monarchy had arrived at such a state of weakness and corruption that a determined minority was sufficient to overthrow it. The prohibition of a last banquet in Paris precipitated the catastrophe. The monarchy which for fifteen years had overcome its adversaries collapsed on the 24th of February 1848 to the astonishment of all.

The industrial population of the faubourgs on its way towards the centre of the town was welcomed by the National Guard, among cries of "*Vive la réforme*." Barricades were raised after the unfortunate incident of the firing on the crowd in the Boulevard des Capucines. On the 23rd Guizot's cabinet resigned, abandoned by the *petite bourgeoisie*, on whose support they thought they could depend. The heads of the Left Centre and the dynastic Left, Molé and Thiers, declined the offered leadership. Odilon Barrot accepted it, and Bugeaud, commander-in-chief of the first military division, who had begun to attack the barricades, was recalled. But it was too late. In face of the insurrection which had now taken possession of the whole capital, Louis Philippe decided to abdicate in favour of his grandson, the comte de Paris. But it was too late also to be content with the regency of the duchess of Orleans. It was now the turn of the Republic, and it was proclaimed by Lamartine in the name of the provisional government elected by the Chamber under the pressure of the mob.

This provisional government with Dupont de l'Eure as its president, consisted of Lamartine for foreign affairs, Crémieux for justice, Ledru-Rollin for the interior, Carnot for public instruction, Gondchaux for finance, Arago for the navy, and Bedeau for war. Garnier-Pagès was mayor of Paris. But, as in 1830, the republican-socialist party had set up a rival government at the Hôtel de Ville, including L. Blanc, A. Marrast, Flocon, and the workman Albert, which bid fair to involve discord and civil war. But this time the Palais Bourbon was not victorious over the Hôtel de Ville. It had to consent to a fusion of the two bodies,

in which, however, the predominating elements were the moderate republicans. It was doubtful what would eventually be the policy of the new government. One party, seeing that in spite of the changes in the last sixty years of all political institutions, the position of the people had not been improved, demanded a reform of society itself, the abolition of the privileged position of property, the only obstacle to equality, and as an emblem hoisted the red flag. The other party wished to maintain society on the basis of its ancient institutions, and rallied round the tricolour.

The first collision took place as to the form which the revolution of 1848 was to take. Were they to remain faithful to their original principles, as Lamartine wished, and accept the decision of the country as supreme, or were they, as the revolutionaries under Ledru-Rollin claimed, to declare the republic of Paris superior to the universal suffrage of an insufficiently educated people? On the 5th of March the government, under the pressure of the Parisian clubs, decided in favour of an immediate reference to the people, and direct universal suffrage, and adjourned it till the 26th of April. In this fateful and unexpected decision, which instead of adding to the electorate the educated classes, refused by Guizot, admitted to it the unqualified masses, originated the Constituent Assembly of the 4th of May 1848. The provisional government having resigned, the republican and anti-socialist majority on the 9th of May entrusted the supreme power to an executive commission consisting of five members: Arago, Marie, Garnier-Pagès, Lamartine and Ledru-Rollin. But the spell was already broken. This revolution which had been peacefully effected with the most generous aspirations, in the hope of abolishing poverty by organizing industry on other bases than those of competition and capitalism, and which had at once aroused the fraternal sympathy of the nations, was doomed to be abortive.

The result of the general election, the return of a constituent assembly predominantly moderate if not monarchical, dashed the hopes of those who had looked for the establishment, by a peaceful revolution, of their ideal socialist state; but they were not prepared to yield without a struggle, and in Paris itself they commanded a formidable force. In spite of the preponderance of the "*tricolour*" party in the provisional government, so long as the voice of France had not spoken, the socialists, supported by the Parisian proletariat, had exercised an influence on policy out of all proportion to their relative numbers or personal weight. By the decree of the 24th of February the provisional government had solemnly accepted the principle of the "*right to work*," and decided to establish "*national workshops*" for the unemployed; at the same time a sort of industrial parliament was established at the Luxembourg, under the presidency of Louis Blanc, with the object of preparing a scheme for the organization of labour; and, lastly, by the decree of the 8th of March the property qualification for enrolment in the National Guard had been abolished and the workmen were supplied with arms. The socialists thus formed, in some sort, a state within the state, with a government, an organization and an armed force.

In the circumstances a conflict was inevitable; and on the 15th of May an armed mob, headed by Raspail, Blanqui and Barbès, and assisted by the proletariat Guard, attempted to overwhelm the Assembly. They were defeated by the bourgeois battalions of the National Guard; but the situation none the less remained highly critical. The national workshops were producing the results that might have been foreseen. It was impossible to provide remunerative work even for the genuine unemployed, and of the thousands who applied the greater number were employed in perfectly useless digging and refilling; soon even this expedient failed, and those for whom work could not be invented were given a half wage of 1 franc a day. Even this pitiful dole, with no obligation to work, proved attractive, and all over France workmen threw up their jobs and streamed to Paris, where they swelled the ranks of the army under the red flag. It was soon clear that the continuance of this experiment would mean financial ruin; it had been proved by the *émeute* of the 15th of May that it constituted a perpetual menace

Guizot's Foreign Policy.

The Executive Commission.

to the state; and the government decided to end it. The method chosen was scarcely a happy one. On the 21st of June M. de Falloux decided in the name of the parliamentary commission on labour that the workmen should be discharged within three days and such as were able-bodied should be forced to enlist.

The June Days.

A furious insurrection at once broke out. Throughout the whole of the 24th, 25th and 26th of June, the eastern industrial quarter of Paris, led by Pujol, carried on a furious struggle against the western quarter, led by Cavaignac, who had been appointed dictator. Vanquished and decimated, first by fighting and afterwards by deportation, the socialist party was crushed. But they dragged down the Republic in their ruin. This had already become unpopular with the peasants, exasperated by the new land tax of 45 centimes imposed in order to fill the empty treasury, and with the *bourgeois*, in terror of the power of the revolutionary clubs and hard hit by the stagnation of business. By the "massacres" of the June Days the working classes were also alienated from it; and abiding fear of the "Reds" did the rest. "France," wrote the duke of Wellington at this time, "needs a Napoleon! I cannot yet see him . . . Where is he?"¹

France indeed needed, or thought she needed, a Napoleon; and the demand was soon to be supplied. The granting of universal suffrage to a society with Imperialist sympathies, and unfitted to reconcile the principles of order with the consequences of liberty, was indeed bound, now that the political balance in France was so radically changed, to prove a formidable instrument of reaction; and this was proved by the election of the president of the Republic. On the 4th of November 1848 was promulgated the new constitution, obviously the work of inexperienced hands, proclaiming a democratic republic, direct universal suffrage and the separation of powers; there was to be a single permanent assembly of 750 members elected for a term of three years by the *scrutin de liste*, which was to vote on the laws prepared by a council of state elected by the Assembly for six years; the executive power was delegated to a president elected for four years by direct universal suffrage, *i.e.* on a broader basis than that of the chamber, and not eligible for re-election; he was to choose his ministers, who, like him, would be responsible. Finally, all revision was made impossible since it involved obtaining three times in succession a majority of three-quarters of the deputies in a special assembly. It was in vain that M. Grévy, in the name of those who perceived the obvious and inevitable risk of creating, under the name of a president, a monarch and more than a king, proposed that the head of the state should be no more than a removable president of the ministerial council. Lamartine, thinking that he was sure to be the choice of the electors under universal suffrage, won over the support of the Chamber, which did not even take the precaution of rendering ineligible the members of families which had reigned over France. It made the presidency an office dependent upon popular acclamation.

The election was keenly contested; the socialists adopted as their candidate Ledru-Rollin, the republicans Cavaignac; and the recently reorganized Imperialist party Prince Louis Bonaparte. Louis Napoleon, unknown in 1835, and forgotten or despised since 1840, had in the last eight years advanced sufficiently in the public estimation to be elected to the Constituent Assembly in 1848 by five departments. He owed this rapid increase of popularity partly to blunders of the government of July, which had unwisely aroused the memory of the country, filled as it was with recollections of the Empire, and partly to Louis Napoleon's campaign carried on from his prison at Ham by means of pamphlets of socialistic tendencies. Moreover, the monarchists, led by Thiers and the committee of the Rue de Poitiers, were no longer content even with the safe dictatorship of the upright Cavaignac, and joined forces with the Bonapartists. On the 10th of December the peasants gave over 5,000,000 votes to a name: Napoleon, which stood for order at all costs, against 1,400,000 for Cavaignac.

¹ T. de Martens, *Recueil des traités, &c.*, xii. 248.

For three years there went on an indecisive struggle between the heterogeneous Assembly and the prince who was silently awaiting his opportunity. He chose as his ministers men but little inclined towards republicanism, for preference Orleanists, the chief of whom was Odilon Barrot. In order to strengthen his position, he endeavoured to conciliate the reactionary parties, without committing himself to any of them. The chief instance of this was the expedition to Rome, voted by the Catholics with the object of restoring the papacy, which had been driven out by Garibaldi and Mazzini. The prince-president was also in favour of it, as beginning the work of European renovation and reconstruction which he already looked upon as his mission. General Oudinot's entry into Rome provoked in Paris a foolish insurrection in favour of the Roman republic, that of the Château d'Eau, which was crushed on the 13th of June 1849. On the other hand, when Pius IX., though only just restored, began to yield to the general movement of reaction, the president demanded that he should set up a Liberal government. The pope's dilatory reply having been accepted by his ministry, the president replaced it on the 1st of November by the Fould-Rouher cabinet.

Expedition to Rome.

This looked like a declaration of war against the Catholic and monarchist majority in the Legislative Assembly which had been elected on the 28th of May in a moment of panic. But the prince-president again pretended to be playing the game of the Orleanists, as he had done in the case of the Constituent-Assembly. The complementary elections of March and April 1850 having resulted in an unexpected victory for the advanced republicans, which struck terror into the reactionary leaders, Thiers, Berryer and Montalembert, the president gave his countenance to a clerical campaign against the republicans at home. The Church, which had failed in its attempts to gain control of the university under Louis XVIII. and Charles X., aimed at setting up a rival establishment of its own. The *Loi Falloux* of the 15th of March 1850, under the pretext of establishing the liberty of instruction promised by the charter, again placed the teaching of the university under the direction of the Catholic Church, as a measure of social safety, and, by the facilities which it granted to the Church for propagating teaching in harmony with its own dogmas, succeeded in obstructing for half a century the work of intellectual enfranchisement effected by the men of the 18th century and of the Revolution. The electoral law of the 31st of May was another class law directed against subversive ideas. It required as a proof of three years' domicile the entries in the record of direct taxes, thus cutting down universal suffrage by taking away the vote from the industrial population, which was not as a rule stationary. The law of the 16th of July aggravated the severity of the press restrictions by re-establishing the "caution money" (*cautionnement*) deposited by proprietors and editors of papers with the government as a guarantee of good behaviour. Finally, a skilful interpretation of the law on clubs and political societies suppressed about this time all the Republican societies. It was now their turn to be crushed like the socialists.

The Legislative Assembly.

"Loi Falloux."

Electoral law of May 31.

But the president had only joined in Montalembert's cry of "Down with the Republicans!" in the hope of effecting a revision of the constitution without having recourse to a *coup d'état*. His concessions only increased the boldness of the monarchists; while they had only accepted Louis Napoleon as president in opposition to the Republic and as a step in the direction of the monarchy. A conflict was now inevitable between his personal policy and the majority of the Chamber, who were, moreover, divided into legitimists and Orleanists, in spite of the death of Louis Philippe in August 1850. Louis Napoleon skilfully exploited their projects for a restoration of the monarchy, which he knew to be unpopular in the country, and which gave him the opportunity of furthering his own personal ambitions. From the 8th of August to the 12th of November 1850 he went about France stating the case for a revision of the constitution in speeches which he varied according to each place; he held

Struggle between the President and the Assembly.

reviews, at which cries of "*Vive Napoléon*" showed that the army was with him; he superseded General Changarnier, on whose arms the parliament relied for the projected monarchical *coup d'état*; he replaced his Orleanist ministry by obscure men devoted to his own cause, such as Morny, Fleury and Persigny, and gathered round him officers of the African army, broken men like General Saint-Arnaud; in fact he practically declared open war.

His reply to the votes of censure passed by the Assembly, and their refusal to increase his civil list, was to hint at a vast communistic plot in order to scare the bourgeoisie, and to denounce the electoral law of the 31st of May in order to gain the support of the mass of the people. The Assembly retaliated by throwing out the proposal for a partial reform of that article of the constitution which prohibited the re-election of the president and the re-establishment of universal suffrage (July). All hope of a peaceful issue was at an end. When the questors called upon the Chamber to have posted up in all barracks the decree of the 6th of May 1848 concerning the right of the Assembly to demand the support of the troops if attacked, the Mountain, dreading a restoration of the monarchy, voted with the Bonapartists against the measure, thus disarming the legislative power. Louis Napoleon saw his opportunity. On the night between the 1st and 2nd of December 1851, the anniversary of Austerlitz, he dissolved the Chamber, re-established universal suffrage, had all the party leaders arrested, and summoned a new assembly to prolong his term of office for ten years. The deputies who had met under Berryer at the *Mairie* of the tenth arrondissement to defend the constitution and proclaim the deposition of Louis Napoleon were scattered by the troops at Mazas and Mont Valérien. The resistance organized by the republicans within Paris under Victor Hugo was soon subdued by the intoxicated soldiers. The more serious resistance in the departments was crushed by declaring a state of siege and by the "mixed commissions." The plebiscite of the 20th of December ratified by a huge majority the *coup d'état* in favour of the prince-president, who alone reaped the benefit of the excesses of the Republicans and the reactionary passions of the monarchists.

The second attempt to revive the principle of 1789 only served as a preface to the restoration of the Empire. The new anti-parliamentary constitution of the 14th of January 1852 was to a large extent merely a repetition of that of the year VIII. All executive power was entrusted to the head of the state, who was solely responsible to the people, now powerless to exercise any of their rights. He was to nominate the members of the council of state, whose duty it was to prepare the laws, and of the senate, a body permanently established as a constituent part of the empire. One innovation was made, namely, that the Legislative Body was elected by universal suffrage, but it had no right of initiative, all laws being proposed by the executive power. This new and violent political change was rapidly followed by the same consequence as had attended that of Brumaire. On the 2nd of December 1852, France, still under the effect of the Napoleonic *virus*, and the fear of anarchy, conferred almost unanimously by a plebiscite the supreme power, with the title of emperor, upon Napoleon III.

But though the machinery of government was almost the same under the Second Empire as it had been under the First, the principles upon which its founder based it were different. The function of the Empire, as he loved to repeat, was to guide the people internally towards justice and externally towards perpetual peace. Holding his power by universal suffrage, and having frequently, from his prison or in exile, reproached former oligarchical governments with neglecting social questions, he set out to solve them by organizing a system of government based on the principles of the "Napoleonic Idea," *i.e.* of the emperor, the elect of the people as the representative of the democracy, and as such supreme; and of himself, the representative of the great Napoleon, "who had sprung armed from the Revolution like Minerva from the head of Jove," as the guardian of the

social gains of the revolutionary epoch. But he soon proved that social justice did not mean liberty; for he acted in such a way that those of the principles of 1848 which he had preserved became a mere sham. He proceeded to paralyze all those active national forces which tend to create the public spirit of a people, such as parliament, universal suffrage, the press, education and associations. The Legislative Body was not allowed either to elect its own president or to regulate its own procedure, or to propose a law or an amendment, or to vote on the budget in detail, or to make its deliberations public. It was a dumb parliament. Similarly, universal suffrage was supervised and controlled by means of official candidature, by forbidding free speech and action in electoral matters to the Opposition, and by a skilful adjustment of the electoral districts in such a way as to overwhelm the Liberal vote in the mass of the rural population. The press was subjected to a system of *cautionnements*, *i.e.* "caution money," deposited as a guarantee of good behaviour, and *avertissements*, *i.e.* requests by the authorities to cease publication of certain articles, under pain of suspension or suppression; while books were subject to a censorship. France was like a sick-room, where nobody might speak aloud. In order to counteract the opposition of individuals, a *surveillance* of suspects was instituted. Orsini's attack on the emperor in 1858, though purely Italian in its motive, served as a pretext for increasing the severity of this régime by the law of general security (*sûreté générale*) which authorized the internment, exile or deportation of any suspect without trial. In the same way public instruction was strictly supervised, the teaching of philosophy was suppressed in the *Lycées*, and the disciplinary powers of the administration were increased. In fact for seven years France had no political life. The Empire was carried on by a series of plebiscites. Up to 1857 the Opposition did not exist; from then till 1860 it was reduced to five members: Darimon, Émile Ollivier, Hénon, J. Favre and E. Picard. The royalists waited inactive after the new and unsuccessful attempt made at Frohsdorf in 1853, by a combination of the legitimists and Orleanists, to re-create a living monarchy out of the ruin of two royal families. Thus the events of that ominous night in December were closing the future to the new generations as well as to those who had grown up during forty years of liberty.

But it was not enough to abolish liberty by conjuring up the spectre of demagogy. It had to be forgotten, the great silence had to be covered by the noise of festivities and material enjoyment, the imagination of the French people had to be distracted from public affairs by the taste for work, the love of gain, the passion for good living. The success of the imperial despotism, as of any other, was bound up with that material prosperity which would make all interests dread the thought of revolution. Napoleon III., therefore, looked for support to the clergy, the great financiers, industrial magnates and landed proprietors. He revived on his own account the "Let us grow rich" of 1840. Under the influence of the Saint-Simonians and men of business great credit establishments were instituted and vast public works entered upon: the *Crédit foncier de France*, the *Crédit mobilier*, the conversion of the railways into six great companies between 1852 and 1857. The rage for speculation was increased by the inflow of Californian and Australian gold, and consumption was facilitated by a general fall in prices between 1856 and 1860, due to an economic revolution which was soon to overthrow the tariff wall, as it had done already in England. Thus French activity flourished exceedingly between 1852 and 1857, and was merely temporarily checked by the crisis of 1857. The universal Exhibition of 1855 was its culminating point. Art felt the effects of this increase of comfort and luxury. The great enthusiasms of the romantic period were over; philosophy became sceptical and literature merely amusing. The festivities of the court at Compiègne set the fashion for the bourgeoisie, satisfied with this energetic government which kept such good guard over their bank balances.

If the Empire was strong, the emperor was weak. At once headstrong and a dreamer, he was full of rash plans, but irresolute

in carrying them out. An absolute despot, he remained what his life had made him, a conspirator through the very mysticism of his mental habit, and a revolutionary by reason of his demagogic imperialism and his democratic chauvinism. In his opinion the artificial work of the congress of Vienna, involving the downfall of his own family and of France, ought to be destroyed, and Europe organized as a collection of great industrial states, united by community of interests and bound together by commercial treaties, and expressing this unity by periodical congresses presided over by himself, and by universal exhibitions. In this way he would reconcile the revolutionary principle of the supremacy of the people with historical tradition, a thing which neither the Restoration nor the July monarchy nor the Republic of 1848 had been able to achieve. Universal suffrage, the organization of Rumanian, Italian and German nationality, and commercial liberty; this was to be the work of the Revolution. But the creation of great states side by side with France brought with it the necessity for looking for territorial compensation elsewhere, and consequently for violating the principle of nationality and abjuring his system of economic peace. Napoleon III.'s foreign policy was as contradictory as his policy in home affairs, "L'Empire, c'est la paix," was his cry; and he proceeded to make war.

So long as his power was not yet established, Napoleon III. made especial efforts to reassure European opinion, which had been made uneasy by his previous protestations against the treaties of 1815. The Crimean War, in which, supported by England and the king of Sardinia, he upheld against Russia the policy of the integrity of the Turkish empire, a policy traditional in France since Francis I., won him the adherence both of the old parties and the Liberals. And this war was the prototype of all the rest. It was entered upon with no clearly defined military purpose, and continued in a hesitating way. This was the cause, after the victory of the allies at the Alma (September 14, 1854), of the long and costly siege of Sevastopol (September 8, 1855). Napoleon III., whose joy was at its height owing to the signature of a peace which excluded Russia from the Black Sea, and to the birth of the prince imperial, which ensured the continuation of his dynasty, thought that the time had arrived to make a beginning in applying his system. Count Walewski, his minister for foreign affairs, gave a sudden and unexpected extension of scope to the deliberations of the congress which met at Paris in 1856 by inviting the plenipotentiaries to consider the questions of Greece, Rome, Naples, &c. This motion contained the principle of all the upheavals which were to effect such changes in Europe between 1859 and 1871. It was Cavour and Piedmont who immediately benefited by it, for thanks to Napoleon III. they were able to lay the Italian question before an assembly of diplomatic Europe.

It was not Orsini's attack on the 14th of January 1858 which brought this question before Napoleon. It had never ceased to occupy him since he had taken part in the patriotic conspiracies in Italy in his youth. The triumph of his armies in the East now gave him the power necessary to accomplish this mission upon which he had set his heart. The suppression of public opinion made it impossible for him to be enlightened as to the conflict between the interests of the country and his own generous visions. The sympathy of all Europe was with Italy, torn for centuries past between so many masters; under Alexander II. Russia, won over since the interview of Stuttgart by the emperor's generosity rather than conquered by armed force, offered no opposition to this act of justice; while England applauded it from the first. The emperor, divided between the empress Eugénie, who as a Spaniard and a devout Catholic was hostile to anything which might threaten the papacy, and Prince Napoleon, who as brother-in-law of Victor Emmanuel favoured the cause of Piedmont, hoped to conciliate both sides by setting up an Italian federation, intending to reserve the presidency of it to Pope Pius IX., as a mark of respect to the moral authority of the Church. Moreover, the

very difficulty of the undertaking appealed to the emperor, elated by his recent success in the Crimea. At the secret meeting between Napoleon and Count Cavour (July 20, 1858) the eventual armed intervention of France, demanded by Orsini before he mounted the scaffold, was definitely promised.

The ill-advised Austrian ultimatum demanding the immediate cessation of Piedmont's preparations for war precipitated the Italian expedition. On the 3rd of May 1859 Napoleon declared his intention of making Italy "free from the Alps to the Adriatic." As he had done four years ago, he plunged into the war with no settled scheme and without preparation; he held out great hopes, but without reckoning what efforts would be necessary to realize them. Two months later, in spite of the victories of Montebello, Magenta and Solferino, he suddenly broke off, and signed the patched-up peace of Villafranca with Francis Joseph (July 9). Austria ceded Lombardy to Napoleon III., who in turn ceded it to Victor Emmanuel; Modena and Tuscany were restored to their respective dukes, the Romagna to the pope, now president of an Italian federation. The mountain had brought forth a mouse.

The reasons for this breakdown on the part of the emperor in the midst of his apparent triumph were many. Neither Magenta nor Solferino had been decisive battles. Further, his idea of a federation was menaced by the revolutionary movement which seemed likely to drive out all the princes of central Italy, and to involve him in an unwelcome dispute with the French clerical party. Moreover, he had forgotten to reckon with the Germanic Confederation, which was bound to come to the assistance of Austria. The mobilization of Prussia on the Rhine, combined with military difficulties and the risk of a defeat in Venetian territory, rather damped his enthusiasm, and decided him to put an end to the war. The armistice fell upon the Italians as a bolt from the blue, convincing them that they had been betrayed; on all sides despair drove them to sacrifice their jealously guarded independence to national unity. On the one hand the Catholics were agitating throughout all Europe to obtain the independence of the papal territory; and the French republicans were protesting, on the other hand, against the abandonment of those revolutionary traditions, the revival of which they had hailed so enthusiastically. The emperor, unprepared for the turn which events had taken, attempted to disentangle this confusion by suggesting a fresh congress of the Powers, which should reconcile dynastic interests with those of the people. After a while he gave up the attempt and resigned himself to the position, his actions having had more wide-reaching results than he had wished. The treaty of Zürich proclaimed the fallacious principle of non-intervention (November 10, 1859); and then, by the treaty of Turin of the 24th of May 1860, Napoleon threw over his ill-timed confederation. He conciliated the mistrust of Great Britain by replacing Walewski, who was hostile to his policy, by Thouvenel, an anti-clerical and a supporter of the English alliance, and he counterbalanced the increase of the new Italian kingdom by the acquisition of Nice and Savoy. Napoleon, like all French governments, only succeeded in finding a provisional solution for the Italian problem.

But this solution would only hold good so long as the emperor was in a powerful position. Now this Italian war, in which he had given his support to revolution beyond the Alps, and, though unintentionally, compromised the temporal power of the popes, had given great offence to the Catholics, to whose support the establishment of the Empire was largely due. A keen Catholic opposition sprang up, voiced in L. Veuillot's paper the *Univers*, and was not silenced even by the Syrian expedition (1860) in favour of the Catholic Maronites, who were being persecuted by the Druses. On the other hand, the commercial treaty with Great Britain which was signed in January 1860, and which ratified the free-trade policy of Richard Cobden and Michael Chevalier, had brought upon French industry the sudden shock of foreign competition. Thus both Catholics and protectionists made the discovery that absolutism may be an excellent thing when it

serves their ambitions or interests, but a bad thing when it is exercised at their expense. But Napoleon, in order to restore the prestige of the Empire before the newly-awakened hostility of public opinion, tried to gain from the Left the support which he had lost from the Right. After the return from Italy the general amnesty of the 16th of August 1859 had marked the evolution of the absolutist empire towards the liberal, and later parliamentary empire, which was to last for ten years.

Napoleon began by removing the gag which was keeping the country in silence. On the 24th of November 1860, "by a *coup d'état* matured during his solitary meditations," like a conspirator in his love of hiding his mysterious thoughts even from his ministers, he granted to the Chambers the right to vote an address annually in answer to the speech from the throne, and to the press the right of reporting parliamentary debates. He counted on the latter concession to hold in check the growing Catholic opposition, which was becoming more and more alarmed by the policy of *laissez-faire* practised by the emperor in Italy. But the government majority already showed some signs of independence. The right of voting on the budget by sections, granted by the emperor in 1861, was a new weapon given to his adversaries. Everything conspired in their favour: the anxiety of those candid friends who were calling attention to the defective budget; the commercial crisis, aggravated by the American Civil War; and above all, the restless spirit of the emperor, who had annoyed his opponents in 1860 by insisting on an alliance with Great Britain in order forcibly to open the Chinese ports for trade, in 1863 by his ill-fated attempt to put down a republic and set up a Latin empire in Mexico in favour of the archduke Maximilian of Austria, and from 1861 to 1863 by embarking on colonizing experiments in Cochin China and Annam.

The same inconsistencies occurred in the emperor's European politics. The support which he had given to the Italian cause had aroused the eager hopes of other nations. The proclamation of the kingdom of Italy on the 18th of February 1861 after the rapid annexation of Tuscany and the kingdom of Naples had proved the danger of half-measures. But when a concession, however narrow, had been made to the liberty of one nation, it could hardly be refused to the no less legitimate aspirations of the rest. In 1863 these "new rights" again clamoured loudly for recognition, in Poland, in Schleswig and Holstein, in Italy, now indeed united, but with neither frontiers nor capital, and in the Danubian principalities. In order to extricate himself from the Polish *impasse*, the emperor again had recourse to his expedient—always fruitless because always inopportune—of a congress. He was again unsuccessful: England refused even to admit the principle of a congress, while Austria, Prussia and Russia gave their adhesion only on conditions which rendered it futile, *i.e.* they reserved the vital questions of Venetia and Poland.

Thus Napoleon had yet again to disappoint the hopes of Italy, let Poland be crushed, and Germany triumph over Denmark in the Schleswig-Holstein question. These inconsistencies resulted in a combination of the opposition parties, Catholic, Liberal and Republican, in the *Union libérale*. The elections of May-June 1863 gained the Opposition forty seats and a leader, Thiers, who at once urgently gave voice to its demand for "the necessary liberties."

It would have been difficult for the emperor to mistake the importance of this manifestation of French opinion, and in view of his international failures, impossible to repress it. The sacrifice of Persigny, minister of the interior, who was responsible for the elections, the substitution for the ministers without portfolio of a sort of presidency of the council filled by Rouher, the "Vice-Emperor," and the nomination of V. Duruy, an anti-clerical, as minister of public instruction, in reply to those attacks of the Church which were to culminate in the Syllabus of 1864, all indicated a distinct rapprochement between the emperor and the Left. But though the opposition represented by Thiers was rather constitutional than dynastic, there was another and irreconcilable opposition,

that of the amnestied or voluntarily exiled republicans, of whom Victor Hugo was the eloquent mouthpiece. Thus those who had formerly constituted the governing classes were again showing signs of their ambition to govern. There appeared to be some risk that this movement among the *bourgeoisie* might spread to the people. As Antaeus recruited his strength by touching the earth Napoleon believed that he would consolidate his menaced power by again turning to the labouring masses, by whom that power had been established.

This industrial policy he embarked upon as much from motives of interest as from sympathy, out of opposition to the *bourgeoisie*, which was ambitious of governing or desirous of his overthrow. His course was all the easier, since he had only to exploit the prejudices of the working classes. They had never forgotten the *loi Chapelle* of 1791, which by forbidding all combinations among the workmen had placed them at the mercy of their employers, nor had they forgotten how the limited suffrage had conferred upon capital a political monopoly which had put it out of reach of the law, nor how each time they had left their position of rigid isolation in order to save the Charter or universal suffrage, the triumphant *bourgeoisie* had repaid them at the last with neglect. The silence of public opinion under the Empire and the prosperous state of business had completed the separation of the labour party from the political parties. The visit of an elected and paid labour delegation to the Universal Exhibition of 1862 in London gave the emperor an opportunity for re-establishing relations with that party, and these relations were to his mind all the more profitable, since the labour party, by refusing to associate their social and industrial claims with the political ambitions of the *bourgeoisie*, maintained a neutral attitude between the parties, and could, if necessary, divide them, while by its keen criticism of society it aroused the conservative instincts of the *bourgeoisie* and consequently checked their enthusiasm for liberty. A law of the 23rd of May 1863 gave the workmen the right, as in England, to save money by creating co-operative societies. Another law, of the 25th of May 1864, gave them the right to enforce better conditions of labour by organizing strikes. Still further, the emperor permitted the workmen to imitate their employers by establishing unions for the permanent protection of their interests. And finally, when the *ouvriers*, with the characteristic French tendency to insist on the universal application of a theory, wished to substitute for the narrow utilitarianism of the English trade-unions the ideas common to the wage-earning classes of the whole world, he put no obstacles in the way of their leader M. Tolain's plan for founding an International Association of Workers (*Société Internationale des Travailleurs*). At the same time he encouraged the provision made by employers for thrift and relief and for improving the condition of the working-classes.

Thus assured of support, the emperor, through the mouth-piece of M. Rouher, who was a supporter of the absolutist régime, was able to refuse all fresh claims on the part of the Liberals. He was aided by the cessation of the industrial crisis as the American civil war came to an end, by the apparent closing of the Roman question by the convention of the 15th of September, which guaranteed to the papal states the protection of Italy, and finally by the treaty of the 30th of October 1864, which temporarily put an end to the crisis of the Schleswig-Holstein question. But after 1865 the momentary agreement which had united Austria and Prussia for the purpose of administering the conquered duchies gave place to a silent antipathy which foreboded a rupture. Yet, though the Austro-Prussian War of 1866 was not unexpected, its rapid termination and fateful outcome came as a severe and sudden shock to France. Napoleon had hoped to gain fresh prestige for his throne and new influence for France by an intervention at the proper moment between combatants equally matched and mutually exhausted. His calculations were upset and his hopes dashed by the battle of Sadowa (Königgrätz) on the 4th of July. The treaty of Prague put an end to the secular rivalry of Habsburg and Hohenzollern for the hegemony of Germany, which had been France's

opportunity; and Prussia could afford to humour the just claims of Napoleon by establishing between her North German Confederation and the South German states the illusory frontier of the Main. The belated efforts of the French emperor to obtain "compensation" on the left bank of the Rhine, at the expense of the South German states, made matters worse. France realized with an angry surprise that on her eastern frontier had arisen a military power by which her influence, if not her existence, was threatened; that in the name of the principle of nationality unwilling populations had been brought under the sway of a dynasty by tradition militant and aggressive, by tradition the enemy of France; that this new and threatening power had destroyed French influence in Italy, which owed the acquisition of Venetia to a Prussian alliance and to Prussian arms; and that all this had been due to Napoleon, outwitted and outmanœuvred at every turn, since his first interview with Bismarck at Biarritz in October 1865.

All confidence in the excellence of imperial régime vanished at once. Thiers and Jules Favre as representatives of the Opposition denounced in the Legislative Body the blunders of 1866. Émile Ollivier split up the official majority by the amendment of the 45, and gave it to be understood that a reconciliation with the Empire would be impossible until the emperor would grant entire liberty. The recall of the French troops from Rome, in accordance with the convention of 1864, also led to further attacks by the Ultramontane party, who were alarmed for the papacy. Napoleon III. felt the necessity for developing "the great act of 1860" by the decree of the 19th of January 1867. In spite of Rouher, by a secret agreement with Ollivier the right of interpellation was restored to the Chambers. Reforms in press supervision and the right of holding meetings were promised. It was in vain that M. Rouher tried to meet the Liberal opposition by organizing a party for the defence of the Empire, the "Union dynastique." But the rapid succession of international reverses prevented him from effecting anything.

The year 1867 was particularly disastrous for the Empire. In Mexico "the greatest idea of the reign" ended in a humiliating withdrawal before the ultimatum of the United States, while Italy, relying on her new alliance with Prussia and already forgetful of her promises, was mobilizing the revolutionary forces to complete her unity by conquering Rome. The chassepots of Mentana were needed to check the Garibaldians. And when the imperial diplomacy made a belated attempt to obtain from the victorious Bismarck those territorial compensations on the Rhine, in Belgium and in Luxemburg, which it ought to have been possible to exact from him earlier at Biarritz, Benedetti added to the mistake of asking at the wrong time the humiliation of obtaining nothing (see LUXEMBURG). Napoleon did not dare to take courage and confess his weakness. And finally was seen the strange contrast of France, though reduced to such a state of real weakness, courting the mockery of Europe by a display of the external magnificence which concealed her decline. In the Paris transformed by Baron Haussmann and now become almost exclusively a city of pleasure and frivolity, the opening of the Universal Exhibition was marked by Berezowski's attack on the tsar Alexander II., and its success was clouded by the tragic fate of the unhappy emperor Maximilian of Mexico. Well might Thiers exclaim, "There are no blunders left for us to make."

But the emperor managed to commit still more, of which the consequences both for his dynasty and for France were irreparable. Old, infirm and embittered, continually keeping his ministers in suspense by the uncertainty and secrecy of his plans, surrounded by a people now bent almost entirely on pleasure, and urged on by a growing opposition, there now remained but two courses open to Napoleon III.: either to arrange a peace which should last, or to prepare for a decisive war. He allowed himself to drift in the direction of war, but without bringing things to a necessary state of preparation. It was in vain that Count Beust revived on behalf of the Austrian

government the project abandoned by Napoleon since 1866 of a settlement on the basis of the *status quo* with reciprocal disarmament. Napoleon refused, on hearing from Colonel Stoffel, his military attaché at Berlin, that Prussia would not agree to disarmament. But he was more anxious than he was willing to show. A reconstitution of the military organization seemed to him to be necessary. This Marshal Niel was unable to obtain either from the Bonapartist Opposition, who feared the electors, in whom the old patriotism had given place to the commercial or cosmopolitan spirit, or from the Republican opposition, who were unwilling to strengthen the despotism. Both of them were blinded by party interest to the danger from outside.

The emperor's good fortune had departed; he was abandoned by men and disappointed by events. He had vainly hoped that, though by the laws of May-June 1868, granting the freedom of the press and authorizing meetings, he had conceded the right of speech, he would retain the right of action; but he had played into the hands of his enemies. Victor Hugo's *Châtiments*, the insults of Rochefort's *Lanterne*, the subscription for the monument to Baudin, the deputy killed at the barricades in 1851, followed by Gambetta's terrible speech against the Empire on the occasion of the trial of Delescluze, soon showed that the republican party was irreconcilable, and bent on the Republic. On the other hand, the Ultramontane party were becoming more and more discontented, while the industries formerly protected were equally dissatisfied with the free-trade reform. Worse still, the working classes had abandoned their political neutrality, which had brought them nothing but unpopularity, and gone over to the enemy. Despising Proudhon's impassioned attacks on the slavery of communism, they had gradually been won over by the collectivist theories of Karl Marx or the revolutionary theories of Bakounine, as set forth at the congresses of the International. At these Labour congresses, the fame of which was only increased by the fact that they were forbidden, it had been affirmed that the social emancipation of the worker was inseparable from his political emancipation. Henceforth the union between the internationalists and the republican bourgeois was an accomplished fact. The Empire, taken by surprise, sought to curb both the middle classes and the labouring classes, and forced them both into revolutionary actions. On every side took place strikes, forming as it were a review of the effective forces of the Revolution.

The elections of May 1869, made during these disturbances, inflicted upon the Empire a serious moral defeat. In spite of the revival by the government of the cry of the red terror, Ollivier, the advocate of conciliation, was rejected by Paris, while 40 irreconcilables and 116 members of the Third Party were elected. Concessions had to be made to these, so by the *senatus-consulte* of the 8th of September 1869 a parliamentary monarchy was substituted for personal government. On the 2nd of January 1870 Ollivier was placed at the head of the first homogeneous, united and responsible ministry. But the republican party, unlike the country, which hailed this reconciliation of liberty and order, refused to be content with the liberties they had won; they refused all compromise, declaring themselves more than ever decided upon the overthrow of the Empire. The murder of the journalist Victor Noir by Pierre Bonaparte, a member of the imperial family, gave the revolutionaries their long desired opportunity (January 10). But the *émeute* ended in a failure, and the emperor was able to answer the personal threats against him by the overwhelming victory of the plebiscite of the 8th of May 1870.

But this success, which should have consolidated the Empire, determined its downfall. It was thought that a diplomatic success should complete it, and make the country forget liberty for glory. It was in vain that after the parliamentary revolution of the 2nd of January that prudent statesman Comte Daru revived, through Lord Clarendon, Count Beust's plan of disarmament after Sadowa. He met with a refusal from Prussia and from the imperial *entourage*. The Empress Eugénie was credited with

the remark, "If there is no war, my son will never be emperor." The desired pretext was offered on the 3rd of July 1870 by the candidature of a Hohenzollern prince for the throne of Spain. To the French people it seemed that Prussia, barely mistress of Germany, was reviving against France the traditional policy of the Habsburgs. France, having rejected for dynastic reasons the candidature of a Frenchman, the duc de Montpensier, saw herself threatened with a German prince. Never had the emperor, now both physically and morally ill, greater need of the counsels of a clear-headed statesman and the support of an enlightened public opinion if he was to defeat the statecraft of Bismarck. But he could find neither.

Ollivier's Liberal ministry, wishing to show itself as jealous for national interests as any absolutist ministry, bent upon doing something great, and swept away by the force of that opinion which it had itself set free, at once accepted the war as inevitable, and prepared for it with a light heart. In face of the decided declaration of the duc de Gramont, the minister for foreign affairs, before the Legislative Body of the 6th of July, Europe, in alarm, supported the efforts of French diplomacy and obtained the withdrawal of the Hohenzollern candidature. This did not suit the views either of the war party in Paris or of Bismarck, who wanted the other side to declare war. The ill-advised action of Gramont in demanding from King William one of those promises for the future which are humiliating but never binding, gave Bismarck his opportunity, and the king's refusal was transformed by him into an insult by the "editing" of the Ems telegram. The chamber, in spite of the desperate efforts of Thiers and Gambetta, now voted by 246 votes to 10 in favour of the war.

France found herself isolated, as much through the duplicity of Napoleon as through that of Bismarck. The disclosure to the diets of Munich and Stuttgart of the written text of the claims laid by Napoleon on the territories of Hesse and Bavaria had since the 22nd of August 1866 estranged southern Germany from France, and disposed the southern states to sign the military convention with Prussia. Owing to a similar series of blunders, the rest of Europe had become hostile. Russia, which it had been Bismarck's study both during and after the Polish insurrection of 1863 to draw closer to Prussia, learnt with annoyance, by the same indiscretion, how Napoleon was keeping his promises made at Stuttgart. The hope of gaining a revenge in the East for her defeat of 1856 while France was in difficulties made her decide on a benevolent neutrality. The disclosure of Benedetti's designs of 1867 on Belgium and Luxemburg equally ensured an unfriendly neutrality on the part of Great Britain. The emperor counted at least on the alliance of Austria and Italy, for which he had been negotiating since the Salzburg interview (August 1867). But Austria, having suffered at his hands in 1859 and 1866, was not ready and asked for a delay before joining in the war; while the hesitating friendships of Italy could only be won by the evacuation of Rome. The chassepots of Mentana, Rouher's "Never," and the hostility of the Catholic empress to any secret article which should open to Italy the gates of the capital, deprived France of her last friend.

Marshal Leboeuf's armies were no more effective than Gramont's alliances. The incapacity of the higher officers of the French army, the lack of preparation for war at headquarters, the selfishness and shirking of responsibility on the part of the field officers, the absence of any fixed plan when failure to mobilize had destroyed all chance of the strong offensive which had been counted on, and the folly of depending on chance, as the emperor had so often

*Sedan.
Fall of the
Empire.*

¹ In the 14th volume of his *L'Empire libéral* (1909) M. Émile Ollivier gives a detailed and illuminating account of the events that led up to the war. He indignantly denies that he ever said that he contemplated it "with a light heart," and says that he disapproved of Gramont's demand for "guarantees," to which he was not privy. His object is to prove that France was entrapped by Bismarck into a position in which she was bound in honour to declare war. (E.D.)

done successfully, instead of scientific warfare, were all plainly to be seen as early as the insignificant engagement of Saarbrücken. Thus the French army proceeded by diastrous stages from Weissenburg, Forbach, Froeschweiler, Borny, Gravelotte, Noisseville and Saint-Privat to the siege of Metz and the slaughter at Illy. By the capitulation of Sedan the Empire lost its only support, the army, and fell. Paris was left unprotected and emptied of troops, with only a woman at the Tuileries, a terrified Assembly at the Palais-Bourbon, a ministry, that of Palikao, without authority, and leaders of the Opposition who fled as the catastrophe approached. (P. W.)

THE THIRD REPUBLIC 1870-1909

The Third Republic may be said to date from the revolution of the 4th of September 1870, when the republican deputies of Paris at the hôtel de ville constituted a provisional government under the presidency of General Trochu, military governor of the capital. The Empire had fallen, and the emperor was a prisoner in Germany. As, however, since the great Revolution régimes in France have been only passing expedients, not inextricably associated with the destinies of the people, but bound to disappear when accounted responsible for national disaster, the surrender of Louis Napoleon's sword to William of Prussia did not disarm the country. Hostilities were therefore continued. The provisional government had to assume the part of a Committee of National Defence, and while insurrection was threatening in Paris, it had, in the face of the invading Germans, to send a delegation to Tours to maintain the relations of France with the outside world. Paris was invested, and for five months endured siege, bombardment and famine. Before the end of October the capitulation of Metz, by the treason of Marshal Bazaine, deprived France of the last relic of its regular army. With indomitable courage the garrison of Paris made useless sorties, while an army of irregular troops vainly essayed to resist the invader, who had reached the valley of the Loire. The acting Government of National Defence, thus driven from Tours, took refuge at Bordeaux, where it awaited the capitulation of Paris, which took place on the 29th of January 1871. The same day the preliminaries of peace were signed at Versailles, which, confirmed by the treaty of Frankfurt of the 10th of May, transferred from France to Germany the whole of Alsace, excepting Belfort, and a large portion of Lorraine, including Metz, with a money indemnity of two hundred millions sterling.

On the 13th of February 1871 the National Assembly, elected after the capitulation of Paris, met at Bordeaux and assumed the powers hitherto exercised by the Government of National Defence. Since the meeting of the states-general in 1789 no representative body in France had ever contained so many men of distinction. Elected to conclude a peace, the great majority of its members were monarchists, Gambetta, the rising hope of the republicans, having discredited his party in the eyes of the weary population by his efforts to carry on the war. The Assembly might thus have there and then restored the monarchy had not the monarchists been divided among themselves as royalist supporters of the comte de Chambord, grandson of Charles X., and as Orleanists favouring the claims of the comte de Paris, grandson of Louis Philippe. The majority being unable to unite on the essential point of the choice of a sovereign, decided to allow the Republic, declared on the morrow of Sedan, to liquidate the disastrous situation. Consequently, on the 17th of February the National Assembly elected Thiers as "Chief of the Executive Power of the French Republic," the abolition of the Empire being formally voted a fortnight later. The old minister of Louis Philippe, who had led the opposition to the Empire, and had been the chief opponent of the war, was further marked out for the position conferred on him by his election to the Assembly in twenty-six departments in recognition of his tour through Europe after the first defeats, undertaken in the patriotic hope of obtaining the intervention of the Powers on behalf of France. Thiers composed a ministry, and announced that the first duty of the government,

before examining constitutional questions, would be to reorganize the forces of the nation in order to provide for the enormous war indemnity which had to be paid to Germany before the territory could be liberated from the presence of the invader. The tacit acceptance of this arrangement by all parties was known as the "*pacte de Bordeaux*." Apart from the pressure of patriotic considerations, it pleased the republican minority to have the government of France officially proclaimed a Republic, while the monarchists thought that pending their choice of a monarch it might popularize their cause not to have it associated with the imposition of the burden of war taxation. From this fortuitous and informal transaction, accepted by a monarchical Assembly, sprang the Third Republic, the most durable régime established in France since the ancient monarchy disappeared in 1792.

The Germans marched down the Champs Elysées on the 1st of March 1871, and occupied Paris for forty-eight hours.

The National Assembly then decided to remove its sittings to Versailles; but two days before its arrival at the palace, where the king of Prussia had just been proclaimed German emperor, an insurrection broke out in Paris. The revolutionary element, which had been foremost in proclaiming the Republic on the 4th of September, had shown signs of disaffection during the siege. On the conclusion of the peace the triumphal entry of the German troops, the threatened disbanding of the national guard by an Assembly known to be anti-republican, and the resumption of orderly civic existence after the agitated life of a suffering population isolated by siege, had excited the nerves of the Parisians, always prone to revolution. The Commune was proclaimed on the 18th of March, and Paris was declared to be a free town, which recognized no government but that chosen by the people within its walls, the communard theory being that the state should consist of a federation of self-governing communes subject to no central power. Administrative autonomy was not, however, the real aim of the insurgent leaders. The name of the Commune had always been a rallying sign for violent revolutionaries ever since the Terrorists had found their last support in the municipality of Paris in 1794. In 1871 among the communard chiefs were revolutionaries of every sect, who, disagreeing on governmental and economic principles, were united in their vague but perpetual hostility to the existing order of things. The regular troops of the garrison of Paris followed the National Assembly to Versailles, where they were joined by the soldiers of the armies of Sedan and Metz, liberated from captivity in Germany. With this force the government of the Republic commenced the second siege of Paris, in order to capture the city from the Commune, which had established the parody of a government there, having taken possession of the administrative departments and set a minister at the head of each office. The second siege lasted six weeks under the eyes of the victorious Germans encamped on the heights overlooking the capital. The presence of the enemy, far from restraining the humiliating spectacle of Frenchmen waging war on Frenchmen in the hour of national disaster, seemed to encourage the fury of the combatants. The communards, who had begun their reign by the murder of two generals, concluded it, when the Versailles troops were taking the city, with the massacre of a number of eminent citizens, including the archbishop of Paris, and with the destruction by fire of many of the finest historical buildings, including the palace of the Tuileries and the hôtel de ville. History has rarely known a more unpatriotic crime than that of the insurrection of the Commune; but the punishment inflicted on the insurgents by the Versailles troops was so ruthless that it seemed to be a counter-manifestation of French hatred for Frenchmen in civil disturbance rather than a judicial penalty applied to a heinous offence. The number of Parisians killed by French soldiers in the last week of May 1871 was probably 20,000, though the partisans of the Commune declared that 36,000 men and women were shot in the streets or after summary court-martial.

It is from this point that the history of the Third Republic commences. In spite of the doubly tragic ending of the war

the vitality of the country seemed unimpaired. With ease and without murmur it supported the new burden of taxation called for by the war indemnity and by the reorganization of the shattered forces of France. Thiers was thus aided in his task of liberating the territory from the presence of the enemy. His proposal at Bordeaux to make the "*essai loyal*" of the Republic, as the form of government which caused the least division among Frenchmen, was discouraged by the excesses of the Commune which associated republicanism with revolutionary disorder. Nevertheless, the monarchists of the National Assembly received a note of warning that the country might dispense with their services unless they displayed governmental capacity, when in July 1871 the republican minority was largely increased at the bye-elections. The next month, within a year of Sedan, a provisional constitution was voted, the title of president of the French Republic being then conferred on Thiers. The monarchists consented to this against their will; but they had their own way when they conferred constituent powers on the Assembly in opposition to the republicans, who argued that it was a usurpation of the sovereignty of the people for a body elected for another purpose to assume the power of giving a constitution to the land without a special mandate from the nation. The debate gave Gambetta his first opportunity of appearing as a serious politician. The "*fou furieux*" of Tours, whom Thiers had denounced for his efforts to prolong the hopeless war, was about to become the chief support of the aged Orleanist statesman whose supreme achievement was to be the foundation of the Republic.

It was in 1872 that Thiers practically ranged himself with Gambetta and the republicans. The divisions in the monarchical party made an immediate restoration impossible.

This situation induced some of the moderate deputies, whose tendencies were Orleanist, to support the organization of a Republic which now no longer found its chief support in the revolutionary section of the nation, and it suited the ideas of Thiers, whose personal ambition was not less than his undoubted patriotism. Having become unexpectedly chief of the state at seventy-four he had no wish to descend again to the position of a minister of the Orleans dynasty which he had held at thirty-five. So, while the royalists refused to admit the claims of the comte de Paris, the old minister of Louis Philippe did his best to undermine the popularity of the Orleans tradition, which had been great among the Liberals under the Second Empire. He moved the Assembly to restore to the Orleans princes the value of their property confiscated under Louis Napoleon. This he did in the well-founded belief that the family would discredit itself in the eyes of the nation by accepting two millions sterling of public money at a moment when the country was burdened with the war indemnity. The incident was characteristic of his wary policy, as in the face of the anti-republican majority in the Assembly he could not openly break with the Right; and when it was suggested that he was too favourable to the maintenance of the Republic he offered his resignation, the refusal of which he took as indicating the indispensable nature of his services. Meanwhile Gambetta, by his popular eloquence, had won for himself in the autumn a triumphal progress, in the course of which he declared at Grenoble that political power had passed into the hands of "*une couche sociale nouvelle*," and he appealed to the new social strata to put an end to the comedy of a Republic without republicans. When the Assembly resumed its sittings, order having been restored in the land disturbed by war and revolution, the financial system being reconstituted and the reorganization of the army planned, Thiers read to the house a presidential message which marked such a distinct movement towards the Left that Gambetta led the applause. "The Republic exists," said the president, "it is the lawful government of the country, and to devise anything else is to devise the most terrible of revolutions."

The year 1873 was full of events fateful for the history of France. It opened with the death of Napoleon III. at Chislehurst; but the disasters amid which the Second Empire had ended were too

Thiers and
Gambetta.

recent for the youthful promise of his heir to be regarded as having any connexion with the future fortunes of France, except by the small group of Bonapartists. Thiers remained the centre of interest. Much as the monarchists disliked him, they at first shrank from upsetting him before they were ready with a scheme of monarchical restoration, and while Gambetta's authority was growing in the land. But when the Left Centre took alarm at the return of radical deputies at numerous by-elections the reactionaries utilized the divisions in the republican party, and for the only time in the history of the Third Republic they gave proof of parliamentary adroitness. The date for the evacuation of France by the German troops had been advanced, largely owing to Thiers' successful efforts to raise the war indemnity. The monarchical majority, therefore, thought the moment had arrived when his services might safely be dispensed with, and the campaign against him was ably conducted by a coalition of Legitimists, Orleanists and Bonapartists. The attack on Thiers was led by the duc de Broglie, the son of another minister of Louis Philippe and grandson of Madame de Staël. Operations began with the removal from the chair of the Assembly of Jules Grévy, a moderate republican, who was chosen president at Bordeaux, and the substitution of Buffet, an old minister of the Second Republic who had rallied to the Empire. A debate on the political tendency of the government brought Thiers himself to the tribune to defend his policy. He maintained that a conservative Republic was the only régime possible, seeing that the monarchists in the Assembly could not make a choice between their three pretenders to the throne. A resolution, however, was carried which provoked the old statesman into tendering his resignation. This time it was not declined, and the majority with unseemly haste elected as president of the Republic Marshal MacMahon, duc de Magenta, an honest soldier of royalist sympathies, who had won renown and a ducal title on the battlefields of the Second Empire. In the eyes of Europe the curt dismissal of the aged liberator of the territory was an act of ingratitude. Its justification would have been the success of the majority in forming a stable monarchical government; but the sole result of the 24th of May 1873 was to provide a definite date to mark the opening of the era of anti-republican incompetency in France which has lasted for more than a generation, and has been perhaps the most effective guardian of the Third Republic.

Resignation of Thiers.

The political incompetency of the reactionaries was fated never to be corrected by the intelligence of its princes or of its chiefs, and the year which saw Thiers dismissed to make way for a restoration saw also that restoration indefinitely postponed by the fatal action of the legitimist pretender. The comte de Paris went to Frohsdorf to abandon to the comte de Chambord his claims to the crown as the heir of the July Monarchy, and to accept the position of dauphin, thus implying that his grandfather Louis Philippe was a usurper. With the "Government of Moral Order" in command the restoration of the monarchy seemed imminent, when the royalists had their hopes dashed by the announcement that "Henri V." would accept the throne only on the condition that the nation adopted as the standard of France the white flag—at the very sight of which Marshal MacMahon said the rifles in the army would go off by themselves. The comte de Chambord's refusal to accept the tricolour was probably only the pretext of a childless man who had no wish to disturb his secluded life for the ultimate benefit of the Orleans family which had usurped his crown, had sent him as a child into exile, and outraged his mother the duchesse de Berry. Whatever his motive, his decision could have no other effect than that of establishing the Republic, as he was likely to live for years, during which the comte de Paris' claims had to remain suspended. It was not possible to leave the land for ever under the government improvised at Bordeaux when the Germans were masters of France; so the majority in the Assembly decided to organize another provisional government on more regular lines, which might possibly last till the comte de Chambord had taken the white flag

Marshal MacMahon president of the Republic.

to the grave, leaving the way to the throne clear for the comte de Paris. On the 19th of November 1873 a Bill was passed which instituted the Septennate, whereby the executive power was confided to Marshal MacMahon for seven years. It also provided for the nomination of a commission of the National Assembly to take in hand the enactment of a constitutional law. Before this an important constitutional innovation had been adopted. Under Thiers there were no changes of ministry. The president of the Republic was perpetual prime minister, constantly dismissing individual holders of portfolios, but never changing at one moment the whole council of ministers. Marshal MacMahon, the day after his appointment, nominated a cabinet with a vice-president of the council as premier, and thus inaugurated the system of ministerial instability which has been the most conspicuous feature of the government of the Third Republic. Under the Septennate the ministers, monarchist or moderate republican, were socially and perhaps intellectually of a higher class than those who governed France during the last twenty years of the 19th century. But the duration of the cabinets was just as brief, thus displaying the fact, already similarly demonstrated under the Restoration and the July Monarchy, that in France parliamentary government is an importation not suited to the national temperament.

The duc de Broglie was the prime minister in MacMahon's first two cabinets which carried on the government of the country up to the first anniversary of Thiers' resignation. The duc de Broglie's defeat by a coalition of Legitimists and Bonapartists with the Republicans displayed the mutual attitude of parties. The Royalists, chagrined that the fusion of the two branches of the Bourbons had not brought the comte de Chambord to the throne, vented their rage on the Orleanists, who had the chief share in the government without being able to utilize it for their dynasty. The Bonapartists, now that the memory of the war was receding, were winning elections in the provinces, and were further encouraged by the youthful promise of the Prince Imperial. The republicans had so improved their position that the duc d'Audiffret-Pasquier, great-nephew of the chancellor Pasquier, tried to form a coalition ministry with M. Waddington, afterwards ambassador of the Republic in London, and other members of the Left Centre. Out of this uncertain state of affairs was evolved the constitution which has lasted the longest of all those that France has tried since the abolition of the old monarchy in 1792. Its birth was due to chance. Not being able to restore a monarchy, the National Assembly was unwilling definitively to establish a republic, and as no limit was set by the law on the duration of its powers, it might have continued the provisional state of things had it not been for the Bonapartists. That party displayed so much activity in agitating for a plebiscite, that when the rural voters at by-elections began to rally to the Napoleonic idea, alarm seized the constitutionalists of the Right Centre who had never been persuaded by Thiers' exhortations to accept the Republic. Consequently in January 1875 the Assembly, having voted the general principle that the legislative power should be exercised by a Senate and a Chamber of Deputies, without any mention of the executive régime, accepted by a majority of one a momentous resolution proposed by M. Wallon, a member of the Right Centre. It provided that the president of the Republic should be elected by the absolute majority of the Senate and the Chamber united as a National Assembly, that he should be elected for seven years, and be eligible for re-election. Thus by one vote the Republic was formally established, "the Father of the Constitution" being M. Wallon, who began his political experiences in the Legislative Assembly of 1849, and survived to take an active part in the Senate until the twentieth century.

The comte de Chambord.

The Republic being thus established, General de Cissey, who had become prime minister, made way for M. Constitution voted, 1875.

The Republic being thus established, General de Cissey, who had become prime minister, made way for M. Buffet, but retained his portfolio of war in the new coalition cabinet, which contained some distinguished members of the two central groups, including M. Léon Say. A fortnight previously, at the end of February

1875, were passed two statutes defining the legislative and executive powers in the Republic, and organizing the Senate.

Provisions of the Constitution of 1875. These joined to a third enactment, voted in July, form the body of laws known as the "Constitution of 1875," which though twice revised, lasted without essential alteration to the twentieth century. The legislative

power was conferred on a Senate and a Chamber of Deputies, which might unite in congress to revise the constitution, if they both agreed that revision was necessary, and which were bound so to meet for the election of the president of the Republic when a vacancy occurred. It was enacted that the president so elected should retain office for seven years, and be eligible for re-election at the end of his term. He was also held to be irresponsible, except in the case of high treason. The other principal prerogatives bestowed on the presidential office by the constitution of 1875 were the right of initiating laws concurrently with the members of the two chambers; the promulgation of the laws; the right of dissolving the Chamber of Deputies before its legal term on the advice of the Senate, and that of adjourning the sittings of both houses for a month; the right of pardon; the disposal of the armed forces of the country; the reception of diplomatic envoys, and, under certain limitations, the power to ratify treaties. The constitution relieved the president of the responsibility of private patronage, by providing that every act of his should be countersigned by a minister. The constitutional law provided that the Senate should consist of 300 members, 75 being nominated for life by the National Assembly, and the remaining 225 elected for nine years by the departments and the colonies. Vacancies among the life members, after the dissolution of the National Assembly, were filled by the Senate until 1884, when the nominative system was abolished, though the survivors of it were not disturbed. The law of 1875 enacted that the elected senators, who were distributed among the departments on a rough basis of population, should be elected for nine years, a third of them retiring triennially. It was provided that the senatorial electors in each department should be the deputies, the members of the *conseil général* and of the *conseils d'arrondissement*, and delegates nominated by the municipal councils of each commune. As the municipal delegates composed the majority in each electoral college, Gambetta called the Senate the Grand Council of the Communes; but in practice the senators elected have always been the nominees of the local deputies and of the departmental councillors (*conseillers généraux*).

The Constitutional Law further provided that the deputies should be elected to the Chamber for four years by direct manhood suffrage, which had been enjoyed in France ever since 1848. The laws relating to registration, which is of admirable simplicity in France, were left practically the same as under the Second Empire. From 1875 to 1885 the elections were held on the basis of *scrutin d'arrondissement*, each department being divided into single-member districts. In 1885 *scrutin de liste* was tried, the department being the electoral unit, and each elector having as many votes as there were seats ascribed to the department without the power to cumulate—like the voting in the city of London when it returned four members. In 1889 *scrutin d'arrondissement* was resumed. The payment of members continued as under the Second Empire, the salary now being fixed at 9000 francs a year in both houses, or about a pound sterling a day. The Senate and the Chamber were endowed with almost identical powers. The only important advantage given to the popular house in the paper constitution was its initiative in matters of finance, but the right of rejecting or of modifying the financial proposals of the Chamber was successfully upheld by the Senate. In reality the Chamber of Deputies has overshadowed the upper house. The constitution did not prescribe that ministers should be selected from either house of parliament, but in practice the deputies have been in cabinets in the proportion of five to one in excess of the senators. Similarly the very numerous ministerial crises which have taken place under the Third Republic have with the rarest exceptions been caused by votes in the lower chamber. Among minor differences between the two houses

ordained by the constitution was the legal minimum age of their members, that of senators being forty and of deputies twenty-five. It was enacted, moreover, that the Senate, by presidential decree, could be constituted into a high court for the trial of certain offences against the security of the state.

The constitution thus produced, the fourteenth since the Revolution of 1789, was the issue of a monarchical Assembly forced by circumstances to establish a republic. It was therefore distinguished from others which preceded it in that it contained no declaration of principle and no doctrinal theory. The comparative excellence of the work must be recognized, seeing that it has lasted. But it owed its duration, as it owed its origin and its character, to the weakness of purpose and to the dissensions of the monarchical parties. The first legal act under the new constitution was the selection by the expiring National Assembly of seventy-five nominated senators, and here the reactionaries gave a crowning example of that folly which has ever marked their conduct each time they have had the chance of scoring an advantage against the Republic. The principle of nomination had been carried in the National Assembly by the Right and opposed by the Republicans. But the quarrels of the Legitimists with the duc de Broglie and his party were so bitter that the former made a present of the nominated element in the Senate to the Republicans in order to spite the Orleanists; so out of seventy-five senators nominated by the monarchical Assembly, fifty-seven Republicans were chosen. Without this suicidal act the Republicans would have been in a woeful minority in the Senate when parliament met in 1876 after the first elections under the new system of parliamentary government. The slight advantage which, in spite of their self-destruction, the reactionaries maintained in the upper house was outbalanced by the republican success at the elections to the Chamber. In a house of over 500 members only about 150 monarchical deputies were returned, of whom half were Bonapartists. The first cabinet under the new constitution was formed by Dufaure, an old minister of Louis Philippe like Thiers, and like him born in the 18th century. The premier now took the title of president of the council, the chief of the state no longer presiding at the meetings of ministers, though he continued to be present at their deliberations. Although the republican victories at the elections were greatly due to the influence of Gambetta, none of his partisans was included in the ministry, which was composed of members of the two central groups. At the end of 1876 Dufaure retired, but nearly all his ministers retained their portfolios under the presidency of Jules Simon, a pupil of Victor Cousin, who first entered political life in the Constituent Assembly of 1848, and was later a leading member of the opposition in the last seven years of the Second Empire.

The premiership of Jules Simon came to an end with the abortive *coup d'état* of 1877, commonly called from its date the *Seize Mai*. After the election of Marshal MacMahon to the presidency, the clerical party, irritated at the failure to restore the comte de Chambord, commenced a campaign in favour of the restitution of the temporal power to the Pope. It provoked the Italian government to make common cause with Germany, as Prince Bismarck was likewise attacked by the French clericals for his ecclesiastical policy. At last Jules Simon, who was a liberal most friendly to Catholicism, had to accept a resolution of the Chamber, inviting the ministry to adopt the same disciplinary policy towards the Church which had been followed by the Second Empire and the Monarchy of July. It was on this occasion that Gambetta used his famous expression, "*Le cléricalisme, voilà l'ennemi.*" Some days later a letter appeared in the *Journal officiel*, dated 16th May 1877, signed by President MacMahon, informing Jules Simon that he had no longer his confidence, as it was clear that he had lost that influence over the Chamber which a president of the Council ought to exercise. The dismissal of the prime minister and the presidential acts which followed did not infringe the letter of the new constitution; yet the proceeding was regarded as a *coup d'état* in favour of the clerical reactionaries. The duc de

Mai* 1877.

Brogie formed an anti-republican ministry, and Marshal MacMahon, in virtue of the presidential prerogative conferred by the law of 1875, adjourned parliament for a month. When the Chamber reassembled the republican majority of 363 denounced the coalition of parties hostile to the Republic. The president, again using his constitutional prerogative, obtained the authorization of the Senate to dissolve the Chamber. Meanwhile the Broglie ministry had put in practice the policy, favoured by all parties in France, of replacing the functionaries hostile to it with its own partisans. But in spite of the administrative electoral machinery being thus in the hands of the reactionaries, a republican majority was sent back to the Chamber, the sudden death of Thiers on the eve of his expected return to power, and the demonstration at his funeral, which was described as a silent insurrection, aiding the rout of the monarchists. The duc de Broglie resigned, and Marshal MacMahon sent for General de Rochebouet, who formed a cabinet of unknown reactionaries, but it lasted only a few days, as the Chamber refused to vote supply. Dufaure was then called back to office, and his moderate republican ministry lasted for the remainder of the MacMahon presidency.

Thus ended the episode of the *Seize Mai*, condemned by the whole of Europe from its inception. Its chief effects were to prove again to the country the incompetency of the monarchists, and by associating in the public mind the Church with this ill-conceived venture, to provoke reprisals from the anti-clericals when they came into power. After the storm, the year 1878 was one of political repose. The first international exhibition held at Paris after the war displayed to Europe how the secret of France's recuperative power lay in the industry and artistic instinct of the nation. Marshal MacMahon presided with dignity over the fêtes held in honour of the exhibition, and had he pleased he might have tranquilly fulfilled the term of his Septennate. But in January 1879 he made a difference of opinion on a military question an excuse for resignation, and Jules Grévy, the president of the Chamber, was elected to succeed him by the National Assembly, which thus met for the first time under the Constitutional Law of 1875.

Henceforth the executive as well as the legislative power was in the hands of the republicans. The new president was a leader of the bar, who had first become known in the Constituent Assembly of 1848 as the advocate of the principle that a republic would do better without a president. M. Waddington was his first prime minister, and Gambetta was elected president of the Chamber. The latter, encouraged by his rivals in the idea that the time was not ripe for him openly to direct the affairs of the country, thus put himself, in spite of his occult dictatorship, in a position of official self-effacement from which he did not emerge until the jealousies of his own party-colleagues had undermined the prestige he had gained as chief founder of the Republic. The most active among them was Jules Ferry, minister of Education, who having been a republican deputy for Paris at the end of the Empire, was one of the members of the provisional government proclaimed on 4th September 1870. Borrowing Gambetta's cry that clericalism was the enemy, he commenced the work of reprisal for the *Seize Mai*. His educational projects of 1879 were thus anti-clerical in tendency, the most famous being article 7 of his education bill, which prohibited members of any "unauthorized" religious orders exercising the profession of teaching in any school in France, the disability being applied to all ecclesiastical communities, excepting four or five which had been privileged by special legislation. This enactment, aimed chiefly at the Jesuits, was advocated with a sectarian bitterness which will be associated with the name of Jules Ferry long after his more statesmanlike qualities are forgotten. The law was rejected by the Senate, Jules Simon being the eloquent champion of the clericals, whose intrigues had ousted him from office. The unauthorized orders were then dissolved by decree; but though the forcible expulsion of aged priests and nuns gave rise to painful scenes, it cannot be said that popular feeling was excited in their favour, so

Jules
Ferry.

grievously had the Church blundered in identifying itself with the conspiracy of the *Seize Mai*.

Meanwhile the death of the Prince Imperial in Zululand had shattered the hopes of the Bonapartists, and M. de Freycinet, a former functionary of the Empire, had become prime minister at the end of 1879. He had retained Jules Ferry at the ministry of Education, but unwilling to adopt all his anti-clerical policy, he resigned the premiership in September 1880. The constitution of the first Ferry cabinet secured the further exclusion from office of Gambetta, to which, however, he preferred his "occult dictatorship." In August he had, as president of the Chamber, accompanied M. Grévy on an official visit to Cherbourg, and the acclamations called forth all over France by his speech, which was a hopeful defiance to Germany, encouraged the wily chief of the state to aid the republican conspiracy against the hero of the Republic. In 1881 the only political question before the country was the destiny of Gambetta. His influence in the Chamber was such that in spite of the opposition of the prime minister he carried his electoral scheme of *scrutin de liste*, descending from the presidential chair to defend it. Its rejection by the Senate caused no conflict between the houses. The check was inflicted not on the Chamber, but on Gambetta, who counted on his popularity to carry the lists of his candidates in all the republican departments in France as a quasi-plebiscitary demonstration in his favour. His rivals dared not openly quarrel with him. There was the semblance of a reconciliation between him and Ferry, and his name was the rallying-cry of the Republic at the general election, which was conducted on the old system of *scrutin d'arrondissement*.

The triumph for the Republic was great, the combined force of reactionary members returned being less than one-fifth of the new Chamber. M. Grévy could no longer abstain from asking Gambetta to form a ministry, but he had bided his time till jealousy of the "occult power" of the president of the Chamber had undermined his position in parliament. Consequently, when on the 14th of November 1881 Gambetta announced the composition of his cabinet, ironically called the "*grand ministère*," which was to consolidate the Republic and to be the apotheosis of its chief, a great feeling of disillusion fell on the country, for his colleagues were untried politicians. The best known was Paul Bert, a man of science, who as the "reporter" in the Chamber of the Ferry Education Bill had distinguished himself as an aggressive free-thinker, and he inappropriately was named minister of public worship. All the conspicuous republicans who had held office refused to serve under Gambetta. His cabinet was condemned in advance. His enemies having succeeded in ruining its composition, declared that the construction of a one-man machine was ominous of dictatorship, and the "*grand ministère*" lived for only ten weeks.

Gambetta was succeeded in January 1882 by M. de Freycinet, who having first taken office in the Dufaure cabinet of 1877, and having continued to hold office at intervals until 1899, was the most successful specimen of a "*ministrable*"—as recurrent portfolio-holders have been called under the Third Republic. His second ministry lasted only six months. The failure of Gambetta, though pleasing to his rivals, discouraged the republican party and disorganized its majority in the Chamber. M. Duclerc, an old minister of the Second Republic, then became president of the council, and before his short term of office was run Gambetta died on the last day of 1882, without having had the opportunity of displaying his capacity as a minister or an administrator. He was only forty-four at his death, and his fame rests on the unfulfilled promise of a brief career. The men who had driven him out of public life and had shortened his existence were the most ostentatious of the mourners at the great pageant with which he was buried, and to have been of his party was in future the popular trade-mark of his republican enemies.

Gambetta's death was followed by a period of anarchy, during which Prince Napoleon, the son of Jerome, king of Westphalia, placarded the walls of Paris with a manifesto. The Chamber thereupon voted the exile of the members of the families which

Gambetta
prime
minister.

Death of
Gambetta.

had reigned in France. The Senate rejected the measure, and a conflict arose between the two houses. M. Duclerc resigned the premiership in January 1883 to his minister of the Interior, M. Fallières, a Gascon lawyer, who became president of the Senate in 1899 and president of the Republic in 1906. He held office for three weeks, when Jules Ferry became president of the council for the second time. Several of the closest of Gambetta's friends accepted office under the old enemy of their chief, and the new combination adopted the epithet "opportunist," which had been invented by Gambetta in 1875 to justify the expediency of his alliance with Thiers. The Opportunists thenceforth formed an important group standing between the Left Centre, which was now excluded from office, and the Radicals. It claimed the tradition of Gambetta, but the guiding principle manifested by its members was that of securing the spoils of place. To this end it often allied itself with the Radicals, and the Ferry cabinet practised this policy in 1883 when it removed the Orleans princes from the active list in the army as the illogical result of the demonstration of a Bonaparte. How needless was this proceeding was shown a few months later when the comte de Chambord died, as his death, which finally fused the Royalists with the Orleanists, caused no commotion in France.

The year 1884 was unprecedented seeing that it passed without a change of ministry. Jules Ferry displayed real administrative ability, and as an era of steady government seemed to be commencing, the opportunity was taken to revise the Constitution. The two Chambers therefore met in congress, and enacted that the republican form of government could never be the subject of revision, and that all members of families which had reigned in France were ineligible for the presidency of the Republic—a repetition of the adventure of Louis Bonaparte in the middle of the century being thus made impossible. It also decided that the clauses of the law of 1875 relating to the organization of the Senate should no longer have a constitutional character. This permitted the reform of the Upper House by ordinary parliamentary procedure. So an organic law was passed to abolish the system of nominating senators, and to increase the number of municipal delegates in the electoral colleges in proportion to the population of the communes. The French nation, for the first time since it had enjoyed political life, had revised a constitution by pacific means without a revolution. Gambetta being out of the way, his favourite electoral system of *scrutin de liste* had no longer any terror for his rivals, so it was voted by the Chamber early in 1885. Before the Senate had passed it into law the Ferry ministry had fallen at the end of March, after holding office for twenty-five months, a term rarely exceeded in the annals of the Third Republic. This long tenure of power had excited the dissatisfaction of jealous politicians, and the news of a slight disaster to the French troops in Tongking called forth all the pent-up rancour which Jules Ferry had inspired in various groups. By the exaggerated news of defeat Paris was excited to the brink of a revolution. The approaches of the Chamber were invaded by an angry mob, and Jules Ferry was the object of public hate more bitter than any man had called forth in France since Napoleon III. on the days after Sedan. Within the Chamber he was attacked in all quarters. The Radicals took the lead, supported by the Monarchists, who remembered the anti-clerical rigour of the Ferry laws, by the Left Centre, not sorry for the tribulation of the group which had supplanted it, and by place-hunting republicans of all shades. The attack was led by a politician who disdained office. M. Georges Clémenceau, who had originally come to Paris from the Vendée as a doctor, had as a radical leader in the Chamber used his remarkable talent as an overthrower of ministries, and nearly every one of the eight ministerial crises which had already occurred during the presidency of Grévy had been hastened by his mordant eloquence.

The next prime minister was M. Brisson, a radical lawyer and journalist, who in April 1885 formed a cabinet of "concentration"—that is to say, it was recruited from various groups with the

idea of concentrating all republican forces in opposition to the reactionaries. MM. de Freycinet and Carnot, afterwards president of the Republic, represented the moderate element in this ministry, which superintended the general elections under *scrutin de liste*. That system was recommended by its advocates as a remedy for the rapid decadence in the composition of the Chamber. Manhood suffrage, which had returned to the National Assembly a distinguished body of men to conclude peace with Germany, had chosen a very different type of representative to sit in the Chamber created by the constitution of 1875. At each succeeding election the standard of deputies returned grew lower, till Gambetta described them contemptuously as "*sous-vétérinaires*," indicating that they were chiefly chosen from the petty professional class, which represented neither the real democracy nor the material interests of the country. His view was that the election of members by departmental lists would ensure the candidature of the best men in each region, who under the system of single-member districts were apt to be neglected in favour of local politicians representing narrow interests. When his death had removed the fear of his using *scrutin de liste* as a plebiscitary organization, parliament sanctioned its trial. The result was not what its promoters anticipated. The composition of the Chamber was indeed transformed, but only by the substitution of reactionary deputies for republicans.

Of the votes polled, 45% were given to the Monarchists, and if they had obtained one-half of the abstentions the Republic would have come to an end. At the same time the character of the republican deputies returned was not improved; so the sole effect of *scrutin de liste* was to show that the electorate, weary of republican dissensions, was ready to make a trial of monarchical government, if only the reactionary party proved that it contained statesmen capable of leading the nation. So menacing was the situation that the republicans thought it wise not further to expose their divisions in the presidential election which was due to take place at the end of the year. Consequently, on the 28th of December 1885, M. Grévy, in spite of his growing unpopularity, was elected president of the Republic for a second term of seven years.

The Brisson cabinet at once resigned, and on the 7th of January 1886 its most important member, M. de Freycinet, formed his third ministry, which had momentous influence on the history of the Republic. The new minister of war was General Boulanger, a smart soldier of no remarkable military record; but being the nominee of M. Clémenceau, he began his official career by taking radical measures against commanding officers of reactionary tendencies. He thus aided the government in its campaign against the families which had reigned in France, whose situation had been improved by the result of the elections. The fêtes given by the comte de Paris to celebrate his daughter's marriage with the heir-apparent of Portugal moved the republican majority in the Chambers to expel from France the heads of the houses of Orleans and of Bonaparte, with their eldest sons. The names of all the princes on the army list were erased from it, the decree being executed with unseemly ostentation by General Boulanger, who had owed early promotion to the protection of the duc d'Aumale, and on that prince protesting he was exiled too. Meanwhile General Boulanger took advantage of Grévy's unpopularity to make himself a popular hero, and at the review, held yearly on the 14th of July, the anniversary of the fall of the Bastille, his acclamation by the Parisian mob showed that he was taking an unexpected place in the imagination of the people. He continued to work with the Radicals, so when they turned out M. de Freycinet in December 1886, one of their group, M. Goblet, a lawyer from Amiens, formed a ministry, and retained Boulanger as minister of war. M. Clémenceau, however, withdrew his support from the general, who was nevertheless loudly patronized by the violent radical press. His bold attitude towards Germany in connexion with the arrest on the German frontier of a French official named Schnaebele so roused the enthusiasm of the public, that M. Goblet was not sorry to resign in May 1887 in order to get rid of his too popular colleague.

To form the twelfth of his ministries, Grévy called upon M. Rouvier, an Opportunist from Marseilles, who had first held office in Gambetta's short-lived cabinet. General Boulanger *The Wilson scandal.* was sent to command a *corps d'armée* at Clermont-Ferrand; but the popular press and the people clamoured for the hero who was said to have terrorized Prince Bismarck, and they encouraged him to play the part of a plebiscitary candidate. There were grave reasons for public discontent. Parliament in 1887 was more than usually sterile in legislation, and in the autumn session it had to attend to a scandal which had long been rumoured. The son-in-law of Grévy, Daniel Wilson, a prominent deputy who had been an under secretary of state, was accused of trafficking the decoration of the Legion of Honour, and of using the Elysée, the president's official residence, where he lived, as an agency for his corrupt practices. The evidence against him was so clear that his colleagues in the Chamber put the government into a minority in order to precipitate a presidential crisis, and on Grévy refusing to accept this hint, a long array of politicians, representing all the republican groups, declined his invitation to aid him in forming a new ministry, all being bent on forcing his resignation. Had General Boulanger been a man of resolute courage he might at this crisis have made a *coup d'état*, for his popularity in the street and in the army increased as the Republic sank deeper into scandal and anarchy. At last, when Paris was on the brink of revolution, Grévy was prevailed on to resign. The candidates for his succession to the presidency were two ex-prime ministers, MM. Ferry and de Freycinet, and Floquet, a barrister, who had been conspicuous in the National Assembly for his sympathy with the Commune. The Monarchists had no candidate ready, and resolved to vote for Ferry, because they believed that if he were elected his unpopularity with the democracy would cause an insurrection in Paris and the downfall of the Republic. MM. de Freycinet and Floquet each looked for the support of the Radicals, and each had made a secret compact, in the event of his election, to restore General Boulanger to the war office. But M. Clémenceau, fearing the election of Jules Ferry, advised his followers to vote for an "outsider," and after some manoeuvring the congress elected by a large majority Sadi Carnot.

The new president, though the nominee of chance, was an excellent choice. The grandson of Lazare Carnot, the "organizer of victory" of the Convention, he was also a man of unsullied probity. The tradition of his family name, only less glorious than that of Bonaparte in the annals of the Revolution, was welcome to France, almost ready to throw herself into the arms of a soldier of fortune, while his blameless repute reconciled some of those whose opposition to the Republic had been quickened by the mean vices of Grévy. But the name and character of Carnot would have been powerless to check the Boulangist movement without the incompetency of its leader, who was getting the democracy at his back without knowing how to utilize it. The new president's first prime minister was M. Tirard, a senator who had held office in six of Grévy's ministries, and he formed a cabinet of politicians as colourless as himself. The early months of 1888 were occupied with the trial of Wilson, who was sentenced to two years' imprisonment for fraud, and with the conflicts of the government with General Boulanger, who was deprived of his command for coming to Paris without leave. Wilson appealed against his sentence, and General Boulanger was elected deputy for the department of the Aisne by an enormous majority. It so happened that the day after his election a presidential decree was signed on the advice of the minister of war removing General Boulanger from the army, and the court of appeal quashed Wilson's conviction. Public feeling was profoundly moved by the coincidence of the release of the relative of the ex-president by the judges of the Republic on the same day that its ministers expelled from the army the popular hero of universal suffrage.

As General Boulanger had been invented by the Radicals it was thought that a Radical cabinet might be a remedy to cope with him, so M. Floquet became president of the council

in April 1888, M. de Freycinet taking the portfolio of war, which he retained through many ministries. M. Floquet's chief achievement was a duel with General Boulanger, *Boulangism.* in which, though an elderly civilian, he wounded him. Nothing, however, checked the popularity of the military politician, and though he was a failure as a speaker in the Chamber, several departments returned him as their deputy by great majorities. The Bonapartists had joined him, and while in his manifestos he described himself as the defender of the Republic, the mass of the Monarchists, with the consent of the comte de Paris, entered the Boulangist camp, to the dismay both of old-fashioned Royalists and of many Orleanists, who resented his recent treatment of the duc d'Aumale. The centenary of the taking of the Bastille was to be celebrated in Paris by an international exhibition, and it appeared likely that it would be inaugurated by General Boulanger, so irresistible seemed his popularity. In January 1889 he was elected member for the metropolitan department of the Seine with a quarter of a million votes, and by a majority of eighty thousand over the candidate of the government. Had he marched on the Elysée the night of his election, nothing could have saved the parliamentary Republic; but again he let his chance go by. The government in alarm proposed the restoration of *scrutin d'arrondissement* as the electoral system for *scrutin de liste*. The change was rapidly enacted by the two Chambers, and was a significant commentary on the respective advantages of the two systems. M. Tirard was again called to form a ministry, and he selected as minister of the interior M. Constans, originally a professor at Toulouse, who had already proved himself a skilful manipulator of elections when he held the same office in 1881. He was therefore given the supervision of the machinery of centralization with which it was supposed that General Boulanger would have to be fought at the general election. That incomplete hero, however, saved all further trouble by flying the country *Boulangier's flight.* when he heard that his arrest was imminent. The government, in order to prevent any plebiscitary manifestation in his favour, passed a law forbidding a candidate to present himself for a parliamentary election in more than one constituency; it also arraigned the general on the charge of treason before the Senate sitting as a high court, and he was sentenced in his absence to perpetual imprisonment. Such measures were needless. The flight of General Boulanger was the death of Boulangism. He alone had saved the Republic which had done nothing to save itself. Its government had, on the contrary, displayed throughout the crisis an anarchic feebleness and incoherency which would have speeded its end had the leader of the plebiscitary movement possessed sagacity or even common courage.

The elections of 1889 showed how completely the reactionaries had compromised their cause in the Boulangist failure. Instead of 45% of the votes polled as in 1885, they obtained only 21%, and the comte de Paris, the pretender of constitutional monarchy, was irretrievably prejudiced by his alliance with the military adventurer who had outraged the princes of his house. A period of calm succeeded the storm of Boulangism, and for the first time under the Third Republic parliament set to work to produce legislation useful for the state, without rousing party passion, as in its other period of activity when the Ferry education laws were passed. Before the elections of 1889 the reform of the army was undertaken, the general term of active compulsory service was made three years, while certain classes hitherto dispensed from serving, including ecclesiastical seminarists and lay professors, had henceforth to undergo a year's military training. The new parliament turned its attention to social and labour questions, as the only clouds on the political horizon were the serious strikes in the manufacturing districts, which displayed the growing political organization of the socialist party. Otherwise nothing disturbed the calm of the country. The young duc d'Orléans vainly tried to ruffle it by breaking his exile in order to claim his citizen's right to perform his military service. The cabinet was rearranged in March 1890, M. de Freycinet becoming prime minister for the fourth time, and

retaining the portfolio of war. All seemed to point to the consolidation of the Republic, and even the Church made signals of reconciliation. Cardinal Lavigerie, a patriotic missionary and statesman, entertained the officers of the fleet at Algiers, and proposed the toast of the Republic to the tune of the "Marseillaise" played by his *pères blancs*. The royalist Catholics protested, but it was soon intimated that the archbishop of Algiers' demonstration was approved at Rome. The year 1891 was one of the few in the annals of the Republic which passed without a change of ministry, but the agitations of 1892 were to counterbalance the repose of the two preceding years.

The first crisis arose out of the peacemaking policy of the Pope. Following up his intimation to the archbishop of Algiers, Leo XIII. published in February 1892 an encyclical, bidding French Catholics accept the Republic as the firmly established form of government. The papal injunction produced a new political group called the "Ralliés," the majority of its members being Monarchists who rallied to the Republic in obedience to the Vatican. The most conspicuous among them was Comte Albert de Mun, an eloquent exponent in the Chamber of legitimism and Christian socialism. The extreme Left mistrusted the adhesion of the new converts to the Republic, and ecclesiastical questions were the constant subjects of acrimonious debates in parliament. In the course of one of them M. de Freycinet found himself in a minority. He ceased to be prime minister, being succeeded by M. Loubet, a lawyer from Montélimar, who had previously held office for three months in the first Tirard cabinet; but M. de Freycinet continued to hold his portfolio of war. The confusion of the republican groups kept pace with the disarray of the reactionaries, and outside parliament the frequency of anarchist outrages did not increase public confidence. The only figure in the Republic which grew in prestige was that of M. Carnot, who in his frequent presidential tours dignified his office, though his modesty made him unduly efface his own personality.

When the autumn session of 1892 began all other questions were overwhelmed by the bursting of the Panama scandal.

The company associated for the piercing of the Isthmus of Panama, undertaken by M. de Lesseps, the maker of the Suez Canal, had become insolvent some years before. Fifty millions sterling subscribed by the thrift of France had disappeared, but the rumours involving political personages in the disaster were so confidently asserted to be reactionary libels, that a minister of the Republic, afterwards sent to penal servitude for corruption, obtained damages for the publication of one of them. It was known that M. de Lesseps was to be tried for misappropriating the money subscribed; but considering the vast sums lost by the public, little interest was taken in the matter till it was suddenly stirred by the dramatic suicide of a well-known Jewish financier closely connected with republican politicians, driven to death, it was said, by menaces of blackmail. Then succeeded a period of terror in political circles. Every one who had a grudge against an enemy found vent for it in the press, and the people of Paris lived in an atmosphere of delation. Unhappily it was true that ministers and members of parliament had been subsidized by the Panama company. Floquet, the president of the Chamber, avowed that when prime minister he had laid hands on £12,000 of the company's funds for party purposes, and his justification of the act threw a light on the code of public morality of the parliamentary Republic. Other politicians were more seriously implicated on the charge of having accepted subsidies for their private purposes, and emotion reached its height when the cabinet ordered the prosecution of two of its members for corrupt traffic of their offices. These two ministers were afterwards discharged, and they seem to have been accused with recklessness; but their prosecution by their own colleagues proved that the statesmen of the Republic believed that their high political circles were sapped with corruption. Finally, only twelve senators and deputies were committed for trial, and the only one convicted was a minister of M. de Freycinet's third cabinet, who pleaded guilty to receiving large bribes from the Panama company. The

public regarded the convicted politician as a scapegoat, believing that there were numerous delinquents in parliament, more guilty than he, who had not even been prosecuted. This feeling was aggravated by the sentence passed, but afterwards remitted, on the aged M. de Lesseps, who had involved French people in misfortune only because he too sanguinely desired to repeat the triumph he had achieved for France by his great work in Egypt.

Within the nation the moral result of the Panama affair was a general feeling that politics had become under the Republic a profession unworthy of honest citizens. The sentiment evoked by the scandal was one of sceptical lassitude rather than of indignation. The reactionaries had crowned their record of political incompetence. At a crisis which gave legitimate opportunity to a respectable and patriotic Opposition they showed that the country had nothing to expect from them but incoherent and exaggerated invective. If the scandal had come to light in the time of General Boulanger the parliamentary Republic would not have survived it. As it was, the sordid story did little more than produce several changes of ministry. M. Loubet resigned the premiership in December 1892 to M. Ribot, a former functionary of the Empire, whose ministry lived for three stormy weeks. On the first day of 1893 M. Ribot formed his second cabinet, which survived till the end of March, when he was succeeded by his minister of education, M. Charles Dupuy, an ex-professor who had never held office till four months previously. M. Dupuy, having taken the portfolio of the interior, supervised the general election of 1893, which took place amid the profound indifference of the population, except in certain localities where personal antagonisms excited violence. An intelligent Opposition would have roused the country at the polls against the régime compromised by the Panama affair. Nothing of the sort occurred, and the electorate preferred the doubtful probity of their republican representatives to the certain incompetence of the reactionaries. The adversaries of the Republic polled only 16% of the votes recorded, and the chief feature of the election was the increased return of socialist and radical-socialist deputies. When parliament met it turned out the Dupuy ministry, and M. Casimir-Périer quitted the presidency of the Chamber to take his place. The new prime minister was the bearer of an eminent name, being the grandson of the statesman of 1831, and the great-grandson of the owner of Vizille, where the estates of Dauphiné met in 1788, as a prelude to the assembling of the states-general the next year. His acceptance of office aroused additional interest because he was a minister possessed of independent wealth, and therefore a rare example of a French politician free from the imputation of making a living out of politics. Neither his repute nor his qualities gave long life to his ministry, which fell in four months, and M. Dupuy was sent for again to form a cabinet in May 1894.

Before the second Dupuy ministry had been in office a month President Carnot died by the knife of an anarchist at Lyons. He was perhaps the most estimable politician of the Third Republic. Although the standard of political life was not elevated under his presidency, he at all events set a good personal example, and to have filled unscathed the most conspicuous position in the land during a period unprecedented for the scurrility of libels on public men was a testimony to his blameless character. As the term of his septennate was near, parliament was not unprepared for a presidential election, and M. Casimir-Périer, who had been spoken of as his possible successor, was elected by the Congress which met at Versailles on the 27th of June 1894, three days after Carnot's assassination. The election of one who bore respectably a name not less distinguished in history than that of Carnot seemed to ensure that the Republic would reach the end of the century under the headship of a president of exceptional prestige. But instead of remaining chief of the state for seven years, in less than seven months M. Casimir-Périer astonished France and Europe by his resignation. Scurrilously defamed by the socialist press, the new president found that the Republicans in the Chamber were not disposed to defend him in his high office; so, on the 15th of January 1895, he seized

the occasion of the retirement of the Dupuy ministry to address a message to the two houses intimating his resignation of the presidency, which, he said, was endowed with too many responsibilities and not sufficient powers.

This time the Chambers were unprepared for a presidential vacancy, and to fill it in forty-eight hours was necessarily a matter of haphazard. The choice of the congress fell

Félix Faure
president,
1895.

on Félix Faure, a merchant of Havre, who, though minister of marine in the retiring cabinet, was one of the least-known politicians who had held office. The selection was a good one, and introduced to the presidency a type of politician unfortunately rare under the Third Republic—a successful man of business. Félix Faure had a fine presence and polished manners, and having risen from a humble origin he displayed in his person the fact that civilization descends to a lower social level in France than elsewhere. Although he was in a sense a man of the people the Radicals and Socialists in the Chambers had voted against him. Their candidate, like almost all democratic leaders in France, had never worked with his hands—M. Brisson, the son of an attorney at Bourges, a member of the Parisian bar, and perpetual candidate for the presidency. Nevertheless the Left tried to take possession of President Faure. His first ministry, composed of moderate republicans and presided over by M. Ribot, lasted until the autumn session of 1895, when it was turned out and a radical cabinet was formed by M. Léon Bourgeois, an ex-functionary, who when a prefect had been suspected of reactionary tendencies.

The Bourgeois cabinet of 1895 was remarkable as the first ministry formed since 1877 which did not contain a single member of the outgoing cabinet. It was said to be exclusively radical in its composition, and thus to indicate that the days of "republican concentration" were over, and that the Republic, being firmly established, an era of party government on the English model had arrived. The new ministry, however, on analysis did not differ in character from any of its predecessors. Seven of its members were old office-holders of the ordinary "ministrable" type. The most conspicuous was M. Cavaignac, the son of the general who had opposed Louis Bonaparte in 1848, and the grandson of J. B. Cavaignac, the regicide member of the Convention. Like Carnot and Casimir-Périer, he was, therefore, one of those rare politicians of the Republic who possessed some hereditary tradition. An ambitious man, he was now classed as a Radical on the strength of his advocacy of the income-tax, the principle of which has never been popular in France, as being adverse to the secretive habits of thrift cultivated by the people, which are a great source of the national wealth. The radicalism of the rest of the ministry was not more alarming in character, and its tenure of office was without legislative result. Its fall, however, occasioned the only constitutionally interesting ministerial crisis of the twenty-four which had taken place since Grévy's election to the presidency sixteen years before. The Senate, disliking the fiscal policy of the government, refused to vote supply in spite of the support which the Chamber gave to the ministry. The collision between the two houses did not produce the revolutionary rising which the Radicals predicted, and the Senate actually forced the Bourgeois cabinet to resign amid profound popular indifference.

The new prime minister was M. Méline, who began his long political career as a member of the Commune in 1871, but was so little compromised in the insurrection that Jules Simon gave him an under-secretaryship in his ministry of 1876. After that he was once a cabinet minister, and was for a year president of the Chamber. He was chiefly known as a protectionist; but it was as leader of the Progressists, as the Opportunists now called themselves, that he formed his cabinet in April 1896, which was announced as a moderate ministry opposed to the policy of the Radicals. It is true that it made no attempt to tax incomes, but otherwise its achievements did not differ from those of other ministries, radical or concentration, except in its long survival. It lasted for over two years, and lived as long as the second Ferry cabinet. Its existence was prolonged by certain incidents of the Franco-Russian alliance. The visit of the Tsar to Paris

in October 1896, being the first official visit paid by a European sovereign to the Republic, helped the government over the critical period at which ministries usually succumbed, and it was further strengthened in parliament by the invitation to the president of the Republic to return the imperial visit at St Petersburg in 1897. The Chamber came to its normal term that autumn; but a law had been passed fixing May as the month for general elections, and the ministry was allowed to retain office till the dissolution at Easter 1898.

Franco-Russian alliance.

The long duration of the Méline government was said to be a further sign of the arrival of an era of party government with its essential accompaniment, ministerial stability. But in the country there was no corresponding sign that the electorate was being organized into two parties of Progressists and Radicals; while in the Chamber it was ominously observed that persistent opposition to the moderate ministry came from nominal supporters of its views, who were dismayed at one small band of fellow-politicians monopolizing office for two years. The last election of the century was therefore fought on a confused issue, the most tangible results being the further reduction of the Monarchists, who secured only 12% of the total poll, and the advance of the Socialists, who obtained nearly 20% of the votes recorded. The Radicals returned were less numerous than the Moderates, but with the aid of the Socialists they nearly balanced them. A new group entitled Nationalist made its appearance, supported by a miscellaneous electorate representing the malcontent element in the nation of all political shades from monarchist to revolutionary socialist. The Chamber, so composed, was as incoherent as either of its predecessors. It refused to reelect the radical leader M. Brisson as its president, and then refused its confidence to the moderate leader M. Méline. M. Brisson, the rejected of the Chamber, was sent for to form a ministry, on the 28th of June 1898, which survived till the adjournment, only to be turned out when the autumn session began. M. Charles Dupuy thus became prime minister for the third time with a cabinet of the old concentration pattern, and for the third time in less than five years under his premiership the Presidency of the Republic became vacant. Félix Faure had increased in pomposity rather than in popularity. His contact with European sovereigns seems to have made him over-conscious of his superior rank, and he cultivated habits which austere republicans make believe to be the monopoly of frivolous courts. The regular domesticity of middle-class life may not be disturbed with impunity when age is advancing, and Félix Faure died with tragic unexpectedness on the 16th of February 1899. The joys of his high office were so dear to him that nothing but death would have induced him to lay it down before the term of his septennate. There was therefore no candidate in waiting for the vacancy; and as Paris was in an agitated mood the majority in the Congress elected M. Loubet president of the Republic, because he happened to hold the second place of dignity in the state, the presidency of the Senate, and was, moreover, a politician who had the confidence of the republican groups as an adversary of plebiscitary pretensions. His only competitor was M. Méline, whose ambitions were not realized, in spite of the alliance of his Progressist supporters with the Monarchists and Nationalists. The Dupuy ministry lasted till June 1899, when a new cabinet was formed by M. Waldeck-Rousseau, who, having held office under Gambetta and Jules Ferry, had relinquished politics for the bar, of which he had become a distinguished leader. Though a moderate republican, he was the first prime minister to give portfolios to socialist politicians. This was the distinguishing feature of the last cabinet of the century—the thirty-seventh which had taken office in the twenty-six years which had elapsed since the resignation of Thiers in 1873.

1899: death of President Faure.

M. Loubet president.

It is now necessary to go back a few years in order to refer to a matter which, though not political in its origin, in its development filled the whole political atmosphere of France in the closing period of the 19th century. Soon after the failure of the Boulangist movement a journal was founded at Paris called the

Libre Parole. Its editor, M. Drumont, was known as the author of *La France juive*, a violent anti-Semitic work, written to denounce the influence exercised by Jewish financiers in the politics of the Third Republic. It may be said to have started the anti-Semitic movement in France, where hostility to the Jews had not the pretext existing in those lands which contain a large Jewish population exercising local rivalry with the natives of the soil, or spoiling them with usury. That state of things existed in Algeria, where the indigenous Jews were made French citizens during the Franco-Prussian War to secure their support against the Arabs in rebellion. But political anti-Semitism was introduced into Algeria only as an offshoot of the movement in continental France, where the great majority of the Jewish community were of the same social class as the politicians of the Republic. Primarily directed against the Jewish financiers, the movement was originally looked upon as a branch of the anti-capitalist propaganda of the Socialists. Thus the *Libre Parole* joined with the revolutionary press in attacking the repressive legislation provoked by the dynamite outrages of the anarchists, clerical reactionaries who supported it being as scurrilously abused by the anti-Semitic organ as its republican authors. The Panama affair, in the exposure of which the *Libre Parole* took a prominent part soon after its foundation, was also a bond between anti-Semites and Socialists, to whom, however, the Monarchists, always incapable of acting alone, united their forces. The implication of certain Jewish financiers with republican politicians in the Panama scandal aided the anti-Semites in their special propaganda, of which a main thesis was that the government of the Third Republic had been organized by its venal politicians for the benefit of Jewish immigrants from Germany, who had thus enriched themselves at the expense of the laborious and unsuspecting French population. The *Libre Parole*, which had become a popular organ with reactionaries and with malcontents of all classes, enlisted the support of the Catholics by attributing the anti-religious policy of the Republic to the influence of the Jews, skilfully reviving bitter memories of the enactment of the Ferry decrees, when sometimes the laicization of schools or the expulsion of monks and nuns had been carried out by a Jewish functionary. Thus religious sentiment and race prejudice were introduced into a movement which was at first directed against capital; and the campaign was conducted with the weapons of scurrility and defamation which had made an unlicensed press under the Third Republic a demoralizing national evil.

An adroit feature of the anti-Semitic campaign was an appeal to national patriotism to rid the army of Jewish influence. The Jews, it was said, not content with directing the financial, and thereby the general policy of the Republic, had designs on the French army, in which they wished to act as secret agents of their German kindred. In October 1894 the *Libre Parole* announced that a Jewish officer of artillery attached to the general staff, Captain Alfred Dreyfus, had been arrested on the charge of supplying a government of the Triple Alliance with French military secrets. Tried by court-martial, he was sentenced to military degradation and to detention for life in a fortress. He was publicly degraded at Paris in January 1895, a few days before Casimir-Périer resigned the presidency of the Republic, and was transported to the Île du Diable on the coast of French Guiana. His conviction, on the charge of having betrayed to a foreign power documents relating to the national defence, was based on the alleged identity of his handwriting with that of an intercepted covering-letter, which contained a list of the papers treasonably communicated. The possibility of his innocence was not raised outside the circle of his friends; the Socialists, who subsequently defended him, even complained that common soldiers were shot for offences less than that for which this richly connected officer had been only transported. The secrecy of his trial did not shock public sentiment in France, where at that time all civilians charged with crime were interrogated by a judge in private, and where all accused persons are presumed guilty until proved innocent. In a land subject to invasion there was

less disposition to criticize the decision of a military tribunal acting in the defence of the nation even than there would have been in the case of a doubtful judgment passed in a civil court. The country was practically unanimous that Captain Dreyfus had got his deserts. A few, indeed, suggested that had he not been a Jew he would never have been accused; but the greater number replied that an ordinary French traitor of Gentile birth would have been forgotten from the moment of his condemnation. The pertinacity with which some of his co-religionists set to work to show that he had been irregularly condemned seemed to justify the latter proposition. But it was not a Jew who brought about the revival of the affair. Colonel Picquart, an officer of great promise, became head of the intelligence department at the war office, and in 1896 informed the minister of his suspicion that the letter on which Dreyfus had been condemned was written by a certain Major Esterhazy. The military authorities, not wishing to have the case reopened, sent Colonel Picquart on foreign service, and put in his place Colonel Henry. The all-seeing press published various versions of the incident, and the anti-Semitic journals denounced them as proofs of a Jewish conspiracy against the French army.

At the end of 1897 M. Scheurer-Kestner, an Alsatian devoted to France and a republican senator, tried to persuade his political friends to reopen the case; but M. Méline, the prime minister, declared in the name of the Republic that the Dreyfus affair no longer existed. The fact that the senator who championed Dreyfus was a Protestant encouraged the clerical press in its already marked tendency to utilize anti-Semitism as a weapon of ecclesiastical warfare. But the religious side-issues of the question would have had little importance had not the army been involved in the controversy, which had become so keen that all the population, outside that large section of it indifferent to all public questions, was divided into "Dreyfusards" and "anti-Dreyfusards." The strong position of the latter was due to their assuming the position of defenders of the army, which, at an epoch when neither the legislature nor the government inspired respect, and the Church was the object of polemic, was the only institution in France to unite the nation by appealing to its martial and patriotic instincts. That is the explanation of the enthusiasm of the public for generals and other officers by whom the trial of Dreyfus and subsequent proceedings had been conducted in a manner repugnant to those who do not favour the arbitrary ways of military dictatorship, which, however, are not unpopular in France. The acquittal of Major Esterhazy by a court-martial, the conviction of Zola by a civil tribunal for a violent criticism of the military authorities, and the imprisonment without trial of Colonel Picquart for his efforts to exonerate Dreyfus, were practically approved by the nation. This was shown by the result of the general elections in May 1898. The clerical reactionaries were almost swept out of the Chamber, but the overwhelming republican majority was practically united in its hostility to the defenders of Dreyfus, whose only outspoken representatives were found in the socialist groups. The moderate Méline ministry was succeeded in June 1898 by the radical Brisson ministry. But while the new prime minister was said to be personally disposed to revise the sentence on Dreyfus, his civilian minister of war, M. Cavaignac, was as hostile to revision as any of his military predecessors—General Mercier, under whom the trial took place, General Zurlinden, and General Billot, a republican soldier devoted to the parliamentary régime.

The radical minister of war in July 1898 laid before the Chamber certain new proofs of the guilt of Dreyfus, in a speech so convincing that the house ordered it to be placarded in all the communes of France. The next month Colonel Henry, the chief of the intelligence department, confessed to having forged those new proofs, and then committed suicide. M. Cavaignac thereupon resigned office, but declared that the crime of Henry did not prove the innocence of Dreyfus. Many, however, who had hitherto accepted the judgment of 1894, reflected that the offence of a guilty man did not need new crime for its proof. It was further remarked that

Political results of Dreyfus agitation.

the forgery had been committed by the intimate colleague of the officers of the general staff, who had zealously protected Esterhazy, the suspected author of the document on which Dreyfus had been convicted. An uneasy misgiving became widespread; but partisan spirit was too excited for it to cause a general revulsion of feeling. Some journalists and politicians of the extreme Left had adopted the defence of Dreyfus as an anti-clerical movement in response to the intemperate partisanship of the Catholic press on the other side. Other members of the socialist groups, not content with criticizing the conduct of the military authorities in the Dreyfus affair, opened a general attack on the French army,—an unpopular policy which allowed the anti-Dreyfusards to utilize the old revolutionary device of making the word "patriotism" a party cry. The defamation and rancour with which the press on both sides flooded the land obscured the point at issue. However, the Brisson ministry just before its fall remitted the Dreyfus judgment to the criminal division of the cour de cassation—the supreme court of revision in France. M. Dupuy formed a new cabinet in November 1898, and made M. de Freycinet minister of war, but that adroit office-holder, though a civilian and a Protestant, did not favour the anti-military and anti-clerical defenders of Dreyfus. The refusal of the Senate, the stronghold of the Republic, to re-elect M. Scheurer-Kestner as its vice-president, showed that the opportunist minister of war understood the feeling of parliament, which was soon displayed by an extraordinary proceeding. The divisional judges, to whom the case was remitted, showed signs that their decision would be in favour of a new trial of Dreyfus. The republican legislature, therefore, disregarding the principle of the separation of the powers, which is the basis of constitutional government, took the arbitrary step of interfering with the judicial authority. It actually passed a law withdrawing the partly-heard cause from the criminal chamber of the cour de cassation, and transferring it to the full court of three divisions, in the hope that a majority of judges would thus be found to decide against the revision of the sentence on Dreyfus.

This flagrant confusion of the legislative with the judicial power displayed once more the incompetence of the French rightly to use parliamentary institutions; but it left the nation indifferent. It was during the passage of the bill that the president of the Republic suddenly died. Félix Faure was said to be hostile to the defenders of Dreyfus and disposed to utilize the popular enthusiasm for the army as a means of making the presidential office independent of parliament. The Chambers, therefore, in spite of their anti-Dreyfusard bias, were determined not to relinquish any of their constitutional prerogative. The military and plebiscitary parties were now fomenting the public discontent by noisy demonstrations. The president of the Senate, M. Loubet, as has been mentioned, was known to have no sympathy with this agitation, so he was elected president of the Republic by a large majority at the congress held at Versailles on 18th February 1899. The new president, who was unknown to the public, though he had once been prime minister for nine months, was respected in political circles; but his elevation to the first office of the State made him the object of that defamation which had become the chief characteristic of the partisan press under the Third Republic. He was recklessly accused of having been an accomplice of the Panama frauds, by screening certain guilty politicians when he was prime minister in 1892, and because he was not opposed to the revision of the Dreyfus sentence he was wantonly charged with being bought with Jewish money. Meanwhile the united divisions of the cour de cassation were, in spite of the intimidation of the legislature, reviewing the case with an independence worthy of praise in an ill-paid magistracy which owed its promotion to political influence. Instead of justifying the suggestive interference of parliament it revised the judgment of the court-martial, and ordered Dreyfus to be re-tried by a military tribunal at Rennes. The Dupuy ministry, which had wished to prevent this decision, resigned, and M. Waldeck-Rousseau formed a heterogeneous cabinet in which Socialists, who for the first time took office, had for their colleague as minister of war General de Gallifet, whose chief

political fame had been won as the executioner of the Communards after the insurrection of 1871. Dreyfus was brought back from the Devil's Island, and in August 1899 was put upon his trial a second time. His old accusers, led by General Mercier, the minister of war of 1894, redoubled their efforts to prove his guilt, and were permitted by the officers composing the court a wide license according to English ideas of criminal jurisprudence. The published evidence did not, however, seem to connect Dreyfus with the charges brought against him. Nevertheless the court, by a majority of five to two, found him guilty, and with illogical inconsequence added that there were in his treason extenuating circumstances. He was sentenced to ten years' detention, and while it was being discussed whether the term he had already served would count as part of his penalty, the ministry completed the inconsequence of the situation by advising the president of the Republic to pardon the prisoner. The result of the second trial satisfied neither the partisans of the accused, who desired his rehabilitation, some of them reproaching him for accepting a pardon, nor his adversaries, whose vindictiveness was unsated by the penalty he had already suffered. But the great mass of the French people, who are always ready to treat a public question with indifference, were glad to be rid of a controversy which had for years infected the national life.

The Dreyfus affair was severely judged by foreign critics as a miscarriage of justice resulting from race-prejudice. If that simple appreciation rightly describes its origin, it became in its development one of those scandals symptomatic of the unhealthy political condition of France, which on a smaller scale had often recurred under the Third Republic, and which were made the pretext by the malcontents of all parties for gratifying their animosities. That in its later stages it was not a question of race-persecution was seen in the curious phenomenon of journals owned or edited by Jews leading the outcry against the Jewish officer and his defenders. That it was not a mere episode of the rivalry between Republicans and Monarchists, or between the advocates of parliamentarism and of military autocracy, was evident from the fact that the most formidable opponents of Dreyfus, without whose hostility that of the clericals and reactionaries would have been ineffective, were republican politicians. That it was not a phase of the anti-capitalist movement was shown by the zealous adherence of the socialist leaders and journalists to the cause of Dreyfus; indeed, one remarkable result of the affair was its diversion of the socialist party and press for several years from their normal campaign against property. The Dreyfus affair was utilized by the reactionaries against the Republic, by the clericals against the non-Catholics, by the anti-clericals against the Church, by the military party against the parliamentarians, and by the revolutionary socialists against the army. It was also conspicuously utilized by rival republican politicians against one another, and the chaos of political groups was further confused by it.

An epilogue to the Dreyfus affair was the trial for treason before the Senate, at the end of 1899, of a number of persons, mostly obscure followers either of M. Déroulède the poet, who advocated a plebiscitary republic, or of the duc d'Orléans, the pretender of the constitutional monarchy. On the day of President Faure's funeral M. Déroulède had vainly tried to entice General Roget, a zealous adversary of Dreyfus, who was on duty with his troops, to march on the Elysée in order to evict the newly-elected president of the Republic. Other demonstrations against M. Loubet ensued, the most offensive being a concerted assault upon him on the racecourse at Auteuil in June 1899. The subsequent resistance to the police of a band of anti-Semites threatened with arrest, who barricaded themselves in a house in the rue Chabrol, in the centre of Paris, and, with the marked approval of the populace, sustained a siege for several weeks, indicated that the capital was in a condition not far removed from anarchy. M. Déroulède, indicted at the assizes of the Seine for his misdemeanour on the day of President Faure's funeral, had been triumphantly

The State trial of 1899.

acquitted. It was evident that no jury would convict citizens prosecuted for political offences and the government therefore decided to make use of the article of the Law of 1875, which allowed the Senate to be constituted a high court for the trial of offences endangering the state. A respectable minority of the Senate, including M. Wallon, the venerable "Father of the Constitution" of 1875, vainly protested that the framers of the law intended to invest the upper legislative chamber with judicial power only for the trial of grave crimes of high treason, and not of petty political disorders which a well-organized government ought to be able to repress with the ordinary machinery of police and justice. The outvoted protest was justified by the proceedings before the High Court, which, undignified and disorderly, displayed both the fatuity of the so-called conspirators and the feebleness of the government which had to cope with them. The trial proved that the plebiscitary faction was destitute of its essential factor, a chief to put forward for the headship of the state, and that it was resolved, if it overturned the parliamentary system, not to accept under any conditions the duc d'Orléans, the only pretender before the public. It was shown that royalists and plebiscitary republicans alike had utilized as an organization of disorder the anti-Semitic propaganda which had won favour among the masses as a nationalist movement to protect the French from foreign competition. The evidence adduced before the high court revealed, moreover, the curious fact that certain Jewish royalists had given to the duc d'Orléans large sums of money to found anti-Semitic journals as the surest means of popularizing his cause.

The last year of the 19th century, though uneventful for France, was one of political unrest. This, however, did not take the form of ministerial crises, as, for the fourth time since responsible cabinets were introduced in 1873, a whole year, from the 1st of January to the 31st of December, elapsed without a change of ministry. The prime minister, M. Waldeck-Rousseau, though his domestic policy exasperated a large section of the political world, including one half of the Progressive group which he had helped to found, displayed qualities of statesmanship always respected in France, but rarely exhibited under the Third Republic. He had proved himself to be what the French call *un homme de gouvernement*—that is to say, an authoritative administrator of unimpassioned temperament capable of governing with the arbitrary machinery of Napoleonic centralization. His alliance with the extreme Left and the admission into his cabinet of socialist deputies, showed that he understood which wing of the Chamber it was best to conciliate in order to keep the government in his hands for an abnormal term. The advent to office of Socialists disquieted the respectable and prosperous commercial classes, which in France take little part in politics, though they had small sympathy with the nationalists, who were the most violent opponents of the Waldeck-Rousseau ministry. The alarm caused by the handing over of important departments of the state to socialist politicians arose upon a danger which is not always understood beyond the borders of France. Socialism in France is a movement appealing to the revolutionary instincts of the French democracy, advocated in vague terms by the members of rival groups or sects. Thus the increasing number of socialist deputies in parliament had produced no legislative results, and their presence in the cabinet was not feared on that account. The fear which their office-holding inspired was due to the immense administrative patronage which the centralized system confides to each member of the government. French ministers are wont to bestow the places at their disposal on their political friends, so the prospect of administrative posts being filled all over the land by revolutionaries caused some uneasiness. Otherwise the presence of Socialists on the ministerial bench seemed to have no other effect than that of partially muzzling the socialist groups in the Chamber. The opposition to the government was heterogeneous. It included the few Monarchists left in the Chamber, the Nationalists, who resembled the Boulangists of twelve years before, and who had added anti-Semitism to the articles of the revisionist

creed, and a number of republicans, chiefly of the old Opportunist group, which had renewed itself under the name of Progressist at the time when M. Waldeck-Rousseau was its most important member in the Senate.

The ablest leaders of this Opposition were all malcontent Republicans; and this fact seemed to show that if ever any form of monarchy were restored in France, political office would probably remain in the hands of men who were former ministers of the Third Republic. Thus the most conspicuous opponents of the cabinet were three ex-prime ministers, MM. Méline, Charles Dupuy and Ribot. Less distinguished republican "ministrables" had their normal appetite for office whetted in 1900 by the international exhibition at Paris. It brought the ministers of the day into unusual prominence, and endowed them with large subsidies voted by parliament for official entertainments. The exhibition was planned on too ambitious a scale to be a financial success. It also called forth the just regrets of those who deplored the tendency of Parisians under the Third Republic to turn their once brilliant city into an international casino. Its most satisfactory feature was the proof it displayed of the industrial inventiveness and the artistic instinct of the French. The political importance of the exhibition lay in the fact that it determined the majority in the Chamber not to permit the foreigners attracted by it to the capital to witness a ministerial crisis. Few strangers of distinction, however, came to it, and not one sovereign of the great powers visited Paris; but the ministry remained in office, and M. Waldeck-Rousseau had uninterrupted opportunity of showing his governmental ability. The only change in his cabinet took place when General de Galliffet resigned the portfolio of war to General André. The army, as represented by its officers, had shown symptoms of hostility to the ministry in consequence of the pardon of Dreyfus. The new minister of war repressed such demonstrations with proceedings of the same arbitrary character as those which had called forth criticism in England when used in the Dreyfus affair. In both cases the high-handed policy was regarded either with approval or with indifference by the great majority of the French nation, which ever since the Revolution has shown that its instincts are in favour of authoritative government. The emphatic support given by the radical groups to the autocratic policy of M. Waldeck-Rousseau and his ministers was not surprising to those who have studied the history of the French democracy. It has always had a taste for despotism since it first became a political power in the days of the Jacobins, to whose early protection General Bonaparte owed his career. On the other hand liberalism has always been repugnant to the masses, and the only period in which the Liberals governed the country was under the régime of limited suffrage—during the Restoration and the Monarchy of July.

The most important event in France during the last year of the century, not from its political result, but from the lessons it taught, was perhaps the Paris municipal election. The quadrennial renewal of all the municipal councils of France took place in May 1900. The municipality of the capital had been for many years in the hands of the extreme Radicals and the revolutionary Socialists. The Parisian electors now sent to the Hôtel de Ville a council in which the majority were Nationalists, in general sympathy with the anti-Semitic and plebiscitary movements. The nationalist councillors did not, however, form one solid party, but were divided into five or six groups, representing every shade of political discontent, from monarchism to revisionist-socialism. While the electorate of Paris thus pronounced for the revision of the Constitution, the provincial elections, as far as they had a political bearing, were favourable to the ministry and to the Republic. M. Waldeck-Rousseau accepted the challenge of the capital, and dealt with its representatives with the arbitrary weapons of centralization which the Republic had inherited from the Napoleonic settlement of the Revolution. Municipal autonomy is unknown in France, and the town council of Paris has to submit to special restrictions on its liberty of action. The prefect of the Seine is always present at its meetings as agent of the government and the minister of

French parties at the close of the 19th century.

the interior can veto any of its resolutions. The Socialists, when their party ruled the municipality, clamoured in parliament for the removal of this administrative control. But now being in a minority they supported the government in its anti-autonomic rigours. The majority of the municipal council authorized its president to invite to a banquet, in honour of the international exhibition, the provincial mayors and a number of foreign municipal magnates, including the lord mayor of London. The ministers were not invited, and the prefect of the Seine thereupon informed the president of the municipality that he had no right, without consulting the agent of the government, to offer a banquet to the provincial mayors; and they, with the deference which French officials instinctively show to the central authority, almost all refused the invitation to the Hôtel de Ville. The municipal banquet was therefore abandoned, but the government gave one in the Tuileries gardens, at which no fewer than 22,000 mayors paid their respects to the chief of the state. These events showed that, as in the Terror, as at the *coup d'état* of 1851, and as in the insurrection of the Commune, the French provinces were never disposed to follow the political lead of the capital, whether the opinions prevailing there were Jacobin or reactionary. These incidents displayed the tendency of the French democracy, in Paris and in the country alike, to submit to and even to encourage the arbitrary working of administrative centralization. The elected mayors of the provincial communes, urban and rural, quitted themselves like well-drilled functionaries of the state, respectful of their hierarchical superiors, just as in the days when they were the nominees of the government; while the population of Paris, in spite of its perennial proneness to revolution, accepted the rebuff inflicted on its chosen representatives without any hostile demonstration. The municipal elections in Paris afforded fresh proof of the unchanging political ineptitude of the reactionaries. The dissatisfaction of the great capital with the government of the Republic might, in spite of the reluctance of the provinces to follow the lead of Paris, have had grave results if skilfully organized. But the anti-republican groups, instead of putting forward men of high ability or reputation to take possession of the Hôtel de Ville, chose their candidates among the same inferior class of professional politicians as the Radicals and the Socialists whom they replaced on the municipal council.

The beginning of a century of the common era is a purely artificial division of time. Yet it has often marked a turning-point in the history of nations. This was notably the case in France in 1800. The violent and anarchical phases of the Revolution of 1789 came to an end with the 18th century; and the dawn of the 19th was coincident with the administrative reconstruction of France by Napoleon, on lines which endured with little modification till the end of that century, surviving seven revolutions of the executive power. The opening years of the 20th century saw no similar changes in the government of the country. The Third Republic, which was about to attain an age double that reached by any other régime since the Revolution, continued to live on the basis of the Constitution enacted in 1875, before it was five years old. Yet it seems not unlikely that historians of the future may take the date 1900 as a landmark between two distinct periods in the evolution of the French nation.

With the close of the 19th century the Dreyfus affair came practically to an end. Whatever the political and moral causes of the agitation which attended it, its practical result was to strengthen the Radical and Socialist parties in the Republic, and to reduce to unprecedented impotence the forces of reaction. This was due more to the maladroitness of the Reactionaries than to the virtues or the prescience of the extreme Left, as the imprisonment of the Jewish captain, which agitated and divided the nation, could not have been inflicted without the ardent approval of Republicans of all shades of opinion. But when the majority at last realized that a mistake had been committed, the Reactionaries, in great

measure through their own unwise policy, got the chief credit for it. Consequently, as the clericals formed the militant section of the anti-Republican parties, and as the Radical-Socialists were at that time keener in their hostility to the Church than in their zeal for social or economic reform, the issue of the Dreyfus affair brought about an anti-clerical movement, which, though initiated and organized by a small minority, met with nothing to resist it in the country, the reactionary forces being effete and the vast majority of the population indifferent. The main and absorbing feature therefore of political life in France in the first years of the 20th century was a campaign against the Roman Catholic Church, unparalleled in energy since the Revolution. Its most striking result was the rupture of the Concordat between France and the Vatican. This act was additionally important as being the first considerable breach made in the administrative structure reared by Napoleon, which had hitherto survived all the vicissitudes of the 19th century. Concurrently with this the influence of the Socialist party in French policy largely increased. A primary principle professed by the Socialists throughout Europe is pacificism, and its dissemination in France acted in two very different ways. It encouraged in the French people a growth of anti-military spirit, which showed some sign of infecting the national army, and it impelled the government of the Republic to be zealous in cultivating friendly relations with other powers. The result of the latter phase of pacificism was that France, under the Radical-Socialist administrations of the early years of the 20th century, enjoyed a measure of international prestige of that superficial kind which is expressed by the state visits of crowned heads to the chief of the executive power, greater than at any period since the Second Empire.

The voting of the law which separated the Church from the state will probably mark a capital date in French history; so, as the ecclesiastical policy of successive ministries filled almost entirely the interior chronicles of France for the first five years of the new century, it will be convenient to set forth in order the events which during that period led up to the passing of the Separation Act.

The French legislature during the first session of the 20th century was chiefly occupied with the passing of the Associations Law. That measure, though it entirely changed the legal position of all associations in France, was primarily directed against the religious associations of the Roman Catholic Church. Their influence in the land, according to the anti-clericals, had been proved by the Dreyfus affair to be excessive. The Jesuits were alleged, on their own showing, to exercise considerable power over the officers of the army, and in this way to have been largely responsible for the blunders of the Dreyfus case. Another less celebrated order, which took an active part against Dreyfus, the Assumptionists, had achieved notoriety by its journalistic enterprise, its cheap newspapers of wide circulation being remarkable for the violence of their attacks on the institutions and men of the Republic. The mutual antagonism between the French government and religious congregations is a tradition which dates from the ancient monarchy and was continued by Napoleon I. long before the Third Republic adopted it in the legislation associated with the names of Jules Ferry and Paul Bert. The prime minister, under whose administration the 20th century succeeded the 19th, was M. Waldeck-Rousseau, who had been the colleague of Paul Bert in Gambetta's *grand ministère*, and in 1883 had served under Jules Ferry in his second ministry. He had retired from political life, though he remained a member of the Senate, and was making a large fortune at the bar, when in June 1899, at pecuniary sacrifice, he consented to form a ministry for the purpose of "liquidating" the Dreyfus affair. In 1900, the year after the second condemnation of Dreyfus and his immediate pardon by the government, M. Waldeck-Rousseau in a speech at Toulouse announced that legislation was about to be undertaken on the subject of associations.

At that period the hostility of the Revolution to the principle of associations of all kinds, civil as well as religious, was still enforced by the law. With the exception of certain commercial

societies subject to special legislation, no association composed of more than twenty persons could be formed without governmental authorization which was always revocable, the restriction applying equally to political and social clubs and to religious communities. The law was the same for all, but was differently applied. Authorization was rarely refused to political or social societies, though any club was liable to have its authorization withdrawn and to be shut up or dissolved. But to religious orders new authorization was practically never granted. Only four of them, the orders of Saint Lazare, of the Saint Esprit, of the Missions Étrangères and of Saint Sulpice, were authorized under the Third Republic—their authorization dating from the First Empire and the Restoration. The Frères de la Doctrine Chrétienne were also recognized, not, however, as a religious congregation under the jurisdiction of the minister of public worship, but as a teaching body under that of the minister of education. All the great historical orders, preaching, teaching or contemplative, were “unauthorized”; they led a precarious life on sufferance, having as corporations no civil existence, and being subject to dissolution at a moment’s notice by the administrative authority. In spite of this disability and of the decrees of 1880 directed against unauthorized monastic orders they had so increased under the anti-clerical Republic, that the religious of both sexes were more numerous in France at the beginning of the 20th century than at the end of the ancient monarchy. Moreover, in the twenty years during which unauthorized Orders had been supposed to be suppressed under the Ferry Decrees, their numbers had become six times more numerous than before, while it was the authorized Congregations which had diminished. The bare catalogue of the religious houses in the land, with the value of their properties (estimated by M. Waldeck-Rousseau at a milliard—£40,000,000) filled two White Books of two thousand pages, presented to parliament on the 4th of December 1900. The hostility to the Congregations was not confined to the anti-clericals. The secular clergy were suffering materially from the enterprising competition of their old rivals the regulars. Had the legislation for defining the legal situation of the religious orders been undertaken with the sole intention of limiting their excessive growth, such a measure would have been welcome to the parochial clergy. But they saw that the attack upon the congregations was only preliminary to a general attack upon the Church, in spite of the sincere assurances of the prime minister, a statesman of conservative temperament, that no harm would accrue to the secular clergy from the passing of the Associations Law.

In January 1901, on the eve of the first debate in the Chamber of Deputies on the Associations bill, a discussion took place which showed that the rupture of the Concordat might be nearing the range of practical politics, though parliament was as yet unwilling to take it into consideration. The archbishop of Paris, Cardinal Richard, had published a letter addressed to him by Leo XIII. deploring the projected legislation as being a breach of the Concordat under which the free exercise of the Catholic religion in France was assured. The Socialists argued that this letter was an intolerable intervention on the part of the Vatican in the domestic politics of the Republic, and proposed that parliament should after voting the Associations Law proceed to separate Church and State. M. Waldeck-Rousseau, the prime minister, calm and moderate, declined to take this view of the pope’s letter, and the resolution was defeated by a majority of more than two to one. But another motion, proposed by a Nationalist, that the Chamber should declare its resolve to maintain the Concordat, was rejected by a small majority. The discussion of the Associations bill was then commenced by the Chamber and went on until the Easter recess. Its main features when finally voted were that the right to associate for purposes not illicit should be henceforth free of all restrictions, though “juridical capacity” would be accorded only to such associations as were formally notified to the administrative authority. The law did not, however, accord liberty of association to religious “Congregations,” none of which could be formed without a special statute, and

any constituted without such authorization would be deemed illicit. The policy of the measure, as applying to religious orders, was attacked by the extreme Right and the extreme Left from their several standpoints. The clericals proposed that under the new law all associations, religious as well as civil, should be free. The Socialists proposed that all religious communities, authorized or unauthorized, should be suppressed. The prime minister took a middle course. But he went farther than the moderate Republicans, with whom he was generally classed. While he protected the authorized religious orders against the attacks of the extreme anti-clericals, he accepted from the latter a new clause which disqualified any member of an unauthorized order from teaching in any school. This was a blow at the principle of liberty of instruction, which had always been supported by Liberals of the old school, who had no sympathy with the pretensions of clericalism. Consequently this provision, though voted by a large majority, was opposed by the Liberals of the Republican party, notably by M. Ribot, who had been twice prime minister, and M. Aynard, almost the sole survivor of the Left Centre. It was remarked that in these, as in all subsequent debates on ecclesiastical questions, the ablest defenders of the Church were not found among the clericals, but among the Liberals, whose primary doctrine was that of tolerance, which they believed ought to be applied to the exercise of the religion nominally professed by a large majority of the nation. Few of the ardent professors of that religion gave effective aid to the Church during that period of crisis. M. de Mun still used his eloquence in its defence, but the brilliant Catholic orator had entered his sixtieth year with health impaired, and among the young reactionary members there was not one who displayed any talent. At the other end of the Chamber M. Viviani, a Socialist member for Paris, made an eloquent speech. As was anticipated the bill received no serious opposition in the Senate. Though not in sympathy with the attacks of the Socialists in the Chamber on property, the Upper House had as a whole no objection to their attacks on the Church, and had become a more persistently anti-clerical body than the Chamber of Deputies. The bill was therefore passed without any serious amendments, even those which were moved for the purpose of affirming the principle of liberty of education being supported by very few Republican senators. In the debates some of the utterances of the prime minister were important. On the proposal of M. Rambaud, a professor who was minister of education in the Méline cabinet of 1896, that religious associations should be authorized by decree and not by law, M. Waldeck-Rousseau said that inasmuch as vows of poverty and celibacy were illegal, nothing but a law would suffice to give legality to any association in which such vows were imposed on the members. It was thus laid down by the responsible author of the law that the third clause, providing that any association founded for an illicit cause was null, applied to religious communities. On the other hand the prime minister in another speech repudiated the suggestion that the proposed law was aimed against any form of religion. He argued that the religious orders, far from being essential to the existence of the Church, were a hindrance to the work of the parochial clergy, and that inasmuch as the religious orders were organizations independent of the State they were by their nature and influence a danger to the State. Consequently their regulation had become necessary in the interests both of Church and State. The general suppression of religious congregations, the prime minister said, was not contemplated; the case of each one would be decided on its merits, and he had no doubt that parliament would favourably consider the authorization of those whose aim was to alleviate misery at home or to extend French influence abroad. The tenor of M. Waldeck-Rousseau’s speech was eminently Concordatory. One of his chief arguments against the religious orders was that they were not mentioned in the Concordat, and that their unregulated existence prejudiced the interests of the Concordatory clergy. The speech was therefore an official declaration in favour of the maintenance of the relations between Church and State. That being so, it is important to notice that

by a majority of nearly two to one the Senate voted the placarding of the prime minister's speech in all the communes of France, and that the mover of the resolution was M. Combes, senator of the Charente-Inférieure, a politician of advanced views who up to that date had held office only once, when he was minister of education and public worship for about six months, in the Bourgeois administration in 1895-1896.

The "Law relating to the contract of Association" was promulgated on the 2nd of July 1901, and its enactment was the only political event of high importance that year.

Socialism. The Socialists, except in their anti-clerical capacity, were more active outside parliament than within. Early in the year some formidable strikes took place. At Montceau-les-Mines in Burgundy, where labour demonstrations had often been violent, a new feature of a strike was the formation of a trade-union by the non-strikers, who called their organization "the yellow trade-union" (*le syndicat jaune*) in opposition to the red trade-union of the strikers, who adopted the revolutionary flag and were supported by the Socialist press. At the same time the dock-labourers at Marseilles went out on strike, by the orders of an international trade-union in that port, as a protest against the dismissal of a certain number of foreigners. The number of strikes in France had increased considerably under the Waldeck-Rousseau government. Its opponents attributed this to the presence in the cabinet of M. Millerand, who had been ranked as a Socialist. On the other hand, the revolutionary Socialists excommunicated the minister of commerce for having joined a "bourgeois government" and retired from the general congress of the Socialist party at Lyons, where MM. Briand and Viviani, themselves future ministers, persuaded the majority not to go so far. The federal committee of miners projected a general strike in all the French coal-fields, and to that end organized a referendum. But of 125,000 miners inscribed on their lists nearly 70,000 abstained from voting, and although the general strike was voted in October by a majority of 34,000, it was not put into effect. Another movement favoured by the Socialists was that of anti-militarism. M. Hervé, a professor at the lycée of Sens, had written, in a local journal, the *Pioupiau de l'Yonne*, on the occasion of the departure of the conscripts for their regiments, some articles outraging the French flag. He was prosecuted and acquitted at the assizes at Auxerre in November, a number of his colleagues in the teaching profession coming forward to testify that they shared his views. The local educational authority, the academic council of Dijon, however, dismissed M. Hervé from his official functions, and its sentence was confirmed by the superior council of public education to which he had appealed. Thereupon the Socialists in the Chamber, under the lead of M. Viviani, violently attacked the Government shortly before the prorogation at the end of the year. M. Leygues, the minister of education, defended the policy of his department with equal vigour, declaring that if a professor in the "university" claimed the right of publishing unpatriotic and anti-military opinions he could exercise it only on the condition of giving up his employment under government—a thesis which was supported by the entire Chamber with the exception of the Socialists. This manifestation of anti-military spirit, though not widespread, was the more striking as it followed close upon a second visit of the emperor and empress of Russia to France, which took place in September 1901 and was of a military rather than of a popular character. The Russian sovereigns did not come to Paris. After a naval display at Dunkirk, where they landed, they were the guests of President Loubet at Compiègne, and concluded their visit by attending a review near Reims of the troops which had taken part in the Eastern manœuvres. Compared with the welcome given by the French population to the emperor and empress in 1896 their reception on this occasion was not enthusiastic. By not visiting Paris they seemed to wish to avoid contact with the people, who were persuaded by a section of the press that the motive of the imperial journey to France was financial. The Socialists openly repudiated the Russian alliance, and one of them, the mayor of Lille, who refused to decorate his municipal buildings when the

sovereigns visited the department of the Nord, was neither revoked nor suspended, although he publicly based his refusal on grounds insulting to the tsar.

It may be mentioned that the census returns of 1901 showed that the total increase of the population of France since the previous census in 1896 amounted only to 412,364, of which 289,662 was accounted for by the capital, while on the other hand the population of sixty out of eighty-seven departments had diminished.

As the quadrennial election of the Chamber of Deputies was due to take place in the spring of 1902, the first months of that year were chiefly occupied by politicians in preparing for it, though none of them gave any sign of being aware that the legislation to be effected by the new Chamber would be the most important which any parliament had undertaken under the constitution of 1875. At the end of the recess the prime minister in a speech at Saint Etienne, the capital of the Loire, of which department he was senator, passed in review the work of his ministry. With regard to the future, on the eve of the election which was to return the Chamber destined to disestablish the Church, he assured the secular clergy that they must not consider the legislation of the last session as menacing them: far from that, the recent law, directed primarily against those monastic orders which were anti-Republican associations, owning political journals and organizing electioneering funds (whose members he described as "moines ligueurs et moines d'affaires"), would be a guarantee of the Republic's protection of the parochial clergy. The presence of his colleague, M. Millerand, on this occasion showed that M. Waldeck-Rousseau did not intend to separate himself from the Radical-Socialist group which had supported his government; and the next day the Socialist minister of commerce, at Firminy, a mining centre in the same department, made a speech deprecating the pursuit of unpractical social ideals, which might have been a version of Gambetta's famous discourse on opportunism edited by an economist of the school of Léon Say. The Waldeck-Rousseau programme for the elections seemed therefore to be an implied promise of a moderate opportunist policy which would strengthen and unite the Republic by conciliating all sections of its supporters. When parliament met, M. Delcassé, minister for foreign affairs, on a proposal to suppress the Embassy to the Vatican, declared that even if the Concordat were ever revoked it would still be necessary for France to maintain diplomatic relations with the Holy See. On the other hand, the ministry voted, against the moderate Republicans, for an abstract resolution, proposed by M. Brisson, in favour of the abrogation of the Loi Falloux of 1850, which law, by abolishing the monopoly of the "university," had established the principle of liberty of education. Another abstract resolution, supported by the government, which subsequently became law, was voted in favour of the reduction of the terms of compulsory military service from three years to two.

The general elections took place on the 27th of April 1902, with the second ballots on the 11th of May, and were favourable to the ministry, 321 of its avowed supporters being returned and 268 members of the Opposition, including 140 "Progressist" Republicans, many of whom were deputies whose opinions differed little from those of M. Waldeck-Rousseau. In Paris the government lost a few seats which were won by the Nationalist group of reactionaries. The chief surprise of the elections was the announcement made by M. Waldeck-Rousseau on the 20th of May, while the president of the Republic was in Russia on a visit to the tsar, of his intention to resign office. No one but the prime minister's intimates knew that his shattered health was the true cause of his resignation, which was attributed to the unwillingness of an essentially moderate man to be the leader of an advanced party and the instrument of an immoderate policy. His retirement from public life at this crisis was the most important event of its kind since the death of his old master Gambetta. He had learned opportunist statesmanship in the short-lived *grand ministère* and in the long-lived Ferry administration of 1883-

1885, after which he had become an inactive politician in the Senate, while making a large fortune at the bar. In spite of having eschewed politics he had been ranked in the public mind with Gambetta and Jules Ferry as one of the small number of politicians of the Republic who had risen high above mediocrity. While he had none of the magnetic exuberance which furthered the popularity of Gambetta, his cold inexpansiveness had not made him unpopular as was his other chief, Jules Ferry. Indeed, his unemotional coldness was one of the elements of the power with which he dominated parliament; and being regarded by the nation as the strong man whom France is always looking for, he was the first prime minister of the Republic whose name was made a rallying cry at a general election. Yet the country gave him a majority only for it to be handed over to other politicians to use in a manner which he had not contemplated. On the 3rd of June 1902 he formally resigned office, his ministry having lasted for three years, all but a few days, a longer duration than that of any other under the Third Republic.

M. Loubet called upon M. Léon Bourgeois, who had already been prime minister under M. Félix Faure, to form a ministry, but he had been nominated president of the new Chamber. **M. Combes** prime minister. The president of the Republic then offered the post to M. Brisson, who had been twice prime minister in 1885 and 1898, but he also refused. A third member of the Radical party was then sent for, M. Emile Combes, and he accepted. The senator of the Charente Inférieure, in his one short term of office in the Bourgeois ministry, had made no mark. But he had attained a minor prominence in the debates of the Senate by his ardent anti-clericalism. He had been educated as a seminarist and had taken minor orders, without proceeding to the priesthood, and had subsequently practised as a country doctor before entering parliament. M. Combes retained two of the most important members of the Waldeck-Rousseau cabinet, M. Delcassé, who had been at the foreign office for four years, and General André, who had become war minister in 1900 on the resignation of General de Galliffet. General André was an ardent Dreyfusard, strongly opposed to clerical and reactionary influences in the army. Among the new ministers was M. Rouvier, a colleague of Gambetta in the *grand ministère* and prime minister in 1887, whose participation in the Panama affair had caused his retirement from official life. Being a moderate opportunist and reputed the ablest financier among French politicians, his return to the ministry of finance reassured those who feared the fiscal experiments of an administration supported by the Socialists. The nomination as minister of marine of M. Camille Pelletan (the son of Eugène Pelletan, a notable adversary of the Second Empire), who had been a Radical-Socialist deputy since 1881, though new to office, was less reassuring. M. Combes reserved for himself the departments of the interior and public worship, meaning that the centralized administration of France should be in his own hands while he was keeping watch over the Church. But in spite of the prime minister's extreme anti-clericalism there was no hint made in his ministerial declaration, on the 10th of June 1902, on taking office that there would be any question of the new Chamber dealing with the Concordat or with the relations of Church and state. M. Combes, however, warned the secular clergy not to make common cause with the religious orders, against which he soon began vigorous action. Before the end of June he directed the Préfets of the departments to bring political pressure to bear on all branches of the public service, and he obtained a presidential decree closing a hundred and twenty-five schools, which had been recently opened in buildings belonging to private individuals, on the ground that they were conducted by members of religious associations and that this brought the schools under the law of 1901. Such action seemed to be opposed to M. Waldeck-Rousseau's interpretation of the law; but the Chamber having supported M. Combes he ordered in July the closing of 2,500 schools, conducted by members of religious orders, for which authorization had not been requested. This again seemed contrary to the assurances of M. Waldeck-Rousseau, and it called forth vain protests in the name of liberty from Radicals of the

old school, such as M. Goblet, prime minister in 1886, and from Liberal Protestants, such as M. Gabriel Monod. The execution of the decrees closing the schools of the religious orders caused some violent agitation in the provinces during the parliamentary recess. But the majority of the departmental councils, at their meetings in August, passed resolutions in favour of the governmental policy, and a movement led by certain Nationalists, including M. Drumont, editor of the anti-semitic *Libre Parole*, and M. François Coppée, the Academician, to found a league having similar aims to those of the "passive resisters" in our country, was a complete failure. On the reassembling of parliament, both houses passed votes of confidence in the ministry and also an act supplementary to the Associations Law penalizing the opening of schools by members of religious orders.

In spite of the ardour of parliamentary discussions the French public was less moved in 1902 by the anti-clerical action of the government than by a vulgar case of swindling known as the "Humbert affair." The wife of a former deputy for Seine-et-Marne, who was the son of M. Gustave Humbert, minister of justice in 1882, had for many years maintained a luxurious establishment, which included a political salon, on the strength of her assertion that she and her family had inherited several millions sterling from one Crawford, an Englishman. Her story being believed by certain bankers she had been enabled to borrow colossal sums on the legend, and had almost married her daughter as a great heiress to a Moderate Republican deputy who held a conspicuous position in the Chamber. The flight of the Humberts, the exposure of the fraud and their arrest in Spain excited the French nation more deeply than the relative qualities of M. Waldeck-Rousseau and M. Combes or the woes of the religious orders. A by-election to the Senate in the spring of 1902 merits notice as it brought back to parliament M. Clémenceau, who had lived in comparative retirement since 1893 when he lost his seat as deputy for Draguignan, owing to a series of unusually bitter attacks made against him by his political enemies. He had devoted his years of retirement to journalism, taking a leading part in the Dreyfus affair on the side of the accused. His election as senator for the Var, where he had formerly been deputy, was an event of importance unanticipated at the time.

The year 1903 saw in progress a momentous development of the anti-clerical movement in France, though little trace of this is found in the statute-book. The chief act of parliament of that year was one which interested the population much more than any law affecting the Church. This was an act regulating the privileges of the *bouilleurs de cru*, the peasant proprietors who, permitted to distil from their produce an annual quantity of alcohol supposed to be sufficient for their domestic needs, in practice fabricated and sold so large an amount as to prejudice gravely the inland revenue. As there were a million of these illicit distillers in the land they formed a powerful element in the electorate. The crowded and excited debates affecting their interests, in which Radicals and Royalists of the rural districts made common cause against Socialists and Clericals of the towns, were in striking contrast with the less animated discussions concerning the Church. The prime minister, an anti-clerical zealot, bitterly hostile to the Church of which he had been a minister, took advantage of the relative indifference of parliament and of the nation in matters ecclesiastical. The success of M. Combes in his campaign against the Church was an example of what energy and pertinacity can do. There was no great wave of popular feeling on the question, no mandate given to the deputies at the general election or asked for by them. Neither was M. Combes a popular leader or a man of genius. He was rather a trained politician, with a fixed idea, who knew how to utilize to his ends the ability and organization of the extreme anti-clerical element in the Chamber, and the weakness of the extreme clerical party. The majority of the Chamber did not share the prime minister's animosity towards the Church, for which at the same time it had not the least enthusiasm, and under the concordatory lead of M. Waldeck-Rousseau it would have been content to

curb clerical pretensions without having recourse to extreme measures of repression. It was, however, equally content to follow the less tolerant guidance of M. Combes. Thus, early in the session of 1903 it approved of his circular forbidding the priests of Brittany to make use of the Breton language in their religious instruction under pain of losing their salaries. It likewise followed him on the 26th of January when he declined to accept, as being premature and unpractical, a Socialist resolution in favour of suppressing the budget of public worship, though the majority was indeed differently composed on those two occasions. In the Senate on the 29th of January M. Waldeck-Rousseau indicated what his policy would have been had he retained office, by severely criticizing his successor's method of applying the Associations Law. Instead of asking parliament to judge on its merits each several demand for authorization made by a congregation, the government had divided the religious orders into two chief categories, teaching orders and preaching orders, and had recommended that all should be suppressed by a general refusal of authorization. The Grande Chartreuse was put into a category by itself as a trading association and was dissolved; but Lourdes, which with its crowds of pilgrims enriched the Pyrenean region and the railway companies serving it, was spared for electioneering reasons. A dispute arose between the government and the Vatican on the nomination of bishops to vacant sees. The Vatican insisted on the words "*nobis nominavit*" in the papal bulls instituting the bishops nominated by the chief of the executive in France under the Concordat. M. Combes objected to the pronoun, and maintained that the complete nomination belonged to the French government, the Holy See having no choice in the matter, but only the power of canonical institution. This produced a deadlock, with the consequence that no more bishops were ever again appointed under the Concordat, which both before and after the Easter recess M. Combes now threatened to repudiate. These menaces derived an increased importance from the failing health of the pope. Leo XIII. had attained the great age of ninety-three, and on the choice of his successor grave issues depended. He died on the 20th of July 1903. The conclave indicated as his successor his secretary of state, Cardinal Rampolla, an able exponent of the late pope's diplomatic methods and also a warm friend of France. It was said to be the latter quality which induced Austria to exercise its ancient power of veto on the choice of a conclave, and finally Cardinal Sarto, patriarch of Venice, a pious prelate inexperienced in diplomacy, was elected and took the title of Pius X. In September the inauguration of a statue of Renan at Tréguier, his birthplace, was made the occasion of an anti-clerical demonstration in Catholic and reactionary Brittany, at which the prime minister made a militant speech in the name of the freethinkers of France, though Renan was a Voltairian aristocrat who disliked the aims and methods of modern Radical-Socialists. In the course of his speech M. Combes pointed out that the anti-clerical policy of the government had not caused the Republic to lose prestige in the eyes of the monarchies of Europe, which were then showing it unprecedented attentions. This assertion was true, and had reference to the visit of the king of England to the president of the Republic in May and the projected visit of the king of Italy. That of Edward VII., which was the first state visit of a British sovereign to France for nearly fifty years, was returned by President Loubet in July, and was welcomed by all parties, excepting some of the reactionaries. M. Millevoye, a Nationalist deputy for Paris, in the *Patrie* counselled the Parisians to remember Fashoda, the Transvaal War, and the attitude of the English in the Dreyfus affair, and to greet the British monarch with cries of "*Vivent les Boers*." M. Déroulède, the most interesting member of the Nationalist party, wrote from his exile at Saint-Sébastien protesting against the folly of this proceeding, which merits to be put on record as an example of the incorrigible ineptitude of the reactionaries in France. The incident served only to prove their complete lack of influence on popular feeling, while it damaged the cause of the Church at a most critical moment by showing that the only persons in France willing to insult a

friendly monarch who was the guest of the nation, belonged to the clerical party. Of the royal visits that of the king of Italy was the more important in its immediate effects on the history of France, as will be seen in the narration of the events of 1904.

The session of 1904 began with the election of a new president of the Chamber, on the retirement of M. Bourgeois. The choice fell on M. Henri Brisson, an old Radical, but not a Socialist, who had held that post in 1881 and had subsequently filled it on ten occasions, the election to the office being annual. The narrow majority he obtained over M. Paul Bertrand, a little-known moderate Republican, by secret ballot, followed by the defeat of M. Jaurès, the Socialist leader, for one of the vice-presidential chairs, showed that one half of the Chamber was of moderate tendency. But, as events proved, the Moderates lacked energy and leadership, so the influence of the Radical prime minister prevailed. In a debate on the 22nd of January on the expulsion of an Alsatian priest of French birth from a French frontier department by the French police, M. Ribot, who set an example of activity to younger men of the moderate groups, reproached M. Combes with reducing all questions in which the French nation was interested to the single one of anti-clericalism, and the prime minister retorted that it was solely for that purpose that he took office. In pursuance of this policy a bill was introduced, and was passed by the Chamber before Easter, interdicting from teaching all members of religious orders, authorized or not authorized. Among other results this law, which the Senate passed in the summer, swept out of existence the schools of the Frères de la Doctrine Chrétienne (Christian Brothers) and closed in all 2400 schools before the end of the year.

This drastic act of anti-clerical policy, which was a total repudiation by parliament of the principle of liberty of education, should have warned the authorities of the Church of the relentless attitude of the government. The most superficial observation ought to have shown them that the indifference of the nation would permit the prime minister to go to any length, and common prudence should have prevented them from affording him any pretext for more damaging measures. The President of the Republic accepted an invitation to return the visit of the king of Italy. When it was submitted to the Chamber on March 25th, 1904, a reactionary deputy moved the rejection of the vote for the expenses of the journey on the ground that the chief of the French executive ought not to visit the representative of the dynasty which had plundered the papacy. The amendment was rejected by a majority of 502 votes to 12, which showed that at a time of bitter controversy on ecclesiastical questions French opinion was unanimous in approving the visit of the president of the Republic to Rome as the guest of the king of Italy. Nothing could be more gratifying to the entire French nation, both on racial and on traditional grounds, than such a testimony of a complete revival of friendship with Italy, of late years obscured by the Triple Alliance. Yet the Holy See saw fit to advance pretensions inevitably certain to serve the ends of the extreme anti-clericals, whose most intolerant acts at that moment, such as the removal of the crucifixes from the law-courts, were followed by new electoral successes. Thus the reactionary majority on the Paris municipal council was displaced by the Radical-Socialists on the 1st of May, the day that M. Loubet returned from his visit to Rome. On the 16th of May M. Jaurès' Socialist organ, *L'Humanité*, published the text of a protest, addressed by the pope to the powers having diplomatic relations with the Vatican, against the visit of the president of the Republic to the King of Italy. This document, dated the 28th of April, was offensive in tone both to France and to Italy. It intimated that while Catholic sovereigns refrained from visiting the person who, contrary to right, exercised civil sovereignty in Rome, that "duty" was even more "imperious" for the ruler of France by reason of the "privileges" enjoyed by that country from the Concordat; that the journey of M. Loubet to "pay homage" within the pontifical see to that person was an insult to the sovereign pontiff; and that only for reasons of special gravity was the nuncio permitted to remain

in Paris. The publication of this document caused some joy among the extreme clericals, but this was nothing to the exultation of the extreme anti-clericals, who saw that the prudent diplomacy of Leo XIII., which had risen superior to many a provocation of the French government, was succeeded by a papal policy which would facilitate their designs in a manner unhopd for. Moderate men were dismayed, seeing

*Diplomatic
crisis with
Rome.*

that the Concordat was now in instant danger; but the majority of the French nation remained entirely indifferent to its fate. Within a week France took the initiative by recalling the ambassador to the Vatican, M. Nisard, leaving a third-secretary in charge. In the debate in the Chamber upon the incident, the foreign minister, M. Delcassé, said that the ambassador was recalled, not because the Vatican had protested against the visit of the president to the king of Italy, but because it had communicated this protest, in terms offensive to France, to foreign powers. The Chamber on the 27th of May approved the recall of the ambassador by the large majority of 420 to 90. By a much smaller majority it rejected a Socialist motion that the Nuncio should be given his passports. The action of the Holy See was not actually an infringement of the Concordat; so the government, satisfied with the effect produced on public opinion, which was now quite prepared for a rupture with the Vatican, was willing to wait for a new pretext, which was not long in coming. Two bishops, Mgr. Geay of Laval and Mgr. Le Nordez of Dijon, were on bad terms with the clerical reactionaries in their dioceses. The friends of the prelates, including some of their episcopal brethren, thought that their chief offence was their loyalty to the Republic, and it was an unfortunate coincidence that these bishops, subjected to proceedings which had been unknown under the long pontificate of Leo XIII., should have been two who had incurred the animosity of anti-republicans. Their enemies accused Mgr. Geay of immorality and Mgr. Le Nordez of being in league with the freemasons. The bishop of Laval was summoned by the Holy Office, without any communication with the French government, to resign his see, and he submitted the citation forthwith to the minister of public worship. The French chargé d'affaires at the Vatican was instructed to protest against this grave infringement of an article of the Concordat, and, soon after, against another violation of the Concordat committed by the Nuncio, who had written to the bishop of Dijon ordering him to suspend his ordinations, the Nuncio being limited, like all other ambassadors, to communicating the instructions of his government through the intermediary of the minister for foreign affairs. The Vatican declined to give any satisfaction to the French government and summoned the two bishops to Rome under pain of suspension. So the French chargé d'affaires was directed to leave Rome, after having informed the Holy See that the government of the Republic considered that the mission of the apostolic Nuncio in Paris was terminated. Thus came to an end on the 30th of July 1904 the diplomatic relations which under the Concordat had subsisted between France and the Vatican for more than a hundred years.

Twelve days later M. Waldeck-Rousseau died, having lived just long enough to see this unanticipated result of his policy. It was said that his resolve to regulate the religious associations arose from his feeling that whatever injustice had been committed in the Dreyfus case had been aggravated by the action of certain unauthorized orders. However that may be, his own utterances showed that he believed that his policy was one of finality. But he had not reckoned that his legislation, which needed hands as calm and impartial as his own to apply it, would be used in a manner he had not contemplated by sectarian politicians who would be further aided by the self-destructive policy of the highest authorities of the Church. When parliament assembled for the autumn session a general feeling was expressed, by moderate politicians as well as by supporters of the Combes ministry, that disestablishment was inevitable. The prime minister said that he had been long in favour of it, though the previous year he had intimated to M. Nisard, ambassador to the Vatican, that he had not a majority in parliament to vote

it. But the papacy and the clergy had since done everything to change that situation. The Chamber did not move in the matter beyond appointing a committee to consider the general question, to which M. Combes submitted in his own name a bill for the separation of the churches from the State.

During the last three months of 1904 public opinion was diverted to the cognate question of the existence of masonic delation in the army. M. Guyot de Villeneuve, Nationalist deputy for Saint Denis, who had been dismissed from the army by General de Galliffet in connexion with the Dreyfus affair, brought before the Chamber a collection of documents which, it seemed, had been abstracted from the Grand Orient of France, the headquarters of French freemasonry, by an official of that order. These papers showed that an elaborate system of espionage and delation had been organized by the freemasons throughout France for the purpose of obtaining information as to the political opinions and religious practices of the officers of the army, and that this system was worked with the connivance of certain officials of the ministry of war. Its aim appeared to be to ascertain if officers went to mass or sent their children to convent schools or in any way were in sympathy with the Roman Catholic religion, the names of officers so secretly denounced being placed on a black-list at the War Office, whereby they were disqualified for promotion. There was no doubt about the authenticity of the documents or of the facts which they revealed. Radical ex-ministers joined with moderate Republicans and reactionaries in denouncing the system. Anti-clerical deputies declared that it was no use to cleanse the war office of the influence of the Jesuits, which was alleged to have prevailed there, if it were to be replaced by another occult power, more demoralizing because more widespread. Only the Socialists and a few of the Radical-Socialists in the Chamber supported the action of the freemasons. General André, minister of war, was so clearly implicated, with the evident approval of the prime minister, that a revulsion of feeling against the policy of the anti-clerical cabinet began to operate in the Chamber. Had the opposition been wisely guided there can be little doubt that a moderate ministry would have been called to office and the history of the Church in France might have been changed. But the reactionaries, with their accustomed folly, played into the hands of their adversaries. The minister of war had made a speech which produced a bad impression. As he stepped down from the tribune he was struck in the face by a Nationalist deputy for Paris, a much younger man than he. The cowardly assault did not save the minister, who was too deeply compromised in the delationscandal. But it saved the anti-clerical party, by rallying a number of waverers who, until this exhibition of reactionary policy, were prepared to go over to the Moderates, from the "bloc," as the ministerial majority was called. The Nationalist deputy was committed to the assizes on the technical charge of assaulting a functionary while performing his official duties. Towards the end of the year, on the eve of his trial, he met with a violent death, and the circumstances which led to it, when made public, showed that this champion of the Church was a man of low morality. General André had previously resigned and was succeeded as minister of war by M. Berteaux, a wealthy stock-broker and a Socialist.

*War

diffi-
culties.*

The Combes cabinet could not survive the delation scandal, in spite of the resignation of the minister of war and the ineptitude of the opposition. On the 8th of January 1905, two days before parliament met, an election took place in Paris to fill the vacancy caused by the death of the Nationalist deputy who had assaulted General André. The circumstances of his death, at that time partially revealed, did not deter the electors from choosing by a large majority a representative of the same party, Admiral Bienaimé, who the previous year had been removed for political reasons from the post of maritime prefect at Toulon, by M. Camille Pelletan, minister of marine. A more serious check to the Combes ministry was given by the refusal of the Chamber to re-elect as president M. Brisson, who was defeated by a majority of twenty-

Combes
ministry.*

five by M. Doumer, ex-Governor-General of Indo-China, who, though he had entered politics as a Radical, was now supported by the anti-republican reactionaries as well as by the moderate Republicans. A violent debate arose on the question of expelling from the Legion of Honour certain members of that order, including a general officer, who had been involved in the delation scandal. M. Jaurès, the eloquent Socialist deputy for Albi, who played the part of *Eminence grise* to M. Combes in his anti-clerical campaign, observed that the party which was now demanding the purification of the order had been in no hurry to expel from it Esterhazy long after his crimes had been proved in connexion with the Dreyfus case. The debate was inconclusive, and the government on the 14th of January obtained a vote of confidence by a majority of six. But M. Combes, whose animosity towards the church was keener than his love of office, saw that his ministry would be constantly liable to be put in a minority, and that thus the consideration of separation might be postponed until after the general elections of 1906. So he announced his resignation in an unprecedented manifesto addressed to the president of the Republic on the 18th January.

M. Rouvier, minister of finance in the outgoing government, was called upon for the second time in his career to form a ministry.

Second Rouvier ministry. A moderate opportunist himself, he intended to form a coalition cabinet in which all groups of Republicans, from the Centre to the extreme Left, would be represented. But he failed, and the ministry of the 24th of January 1905 contained no members of the Republican opposition which had combated M. Combes. The prime minister retained the portfolio of finance; M. Delcassé remained at the foreign office, which he had directed since 1898, and M. Bertheaux at the war office; M. Etienne, member for Oran, went to the ministry of the interior; another Algerian deputy, M. Thomson, succeeded M. Camille Pelletan at the ministry of marine, which department was said to have fallen into inefficiency; public worship was separated from the department of the interior and joined with that of education under M. Bienvenu-Martin, Radical-Socialist deputy for Auxerre, who was new to official life. Although M. Rouvier, as befitted a politician of the school of Waldeck-Rousseau, disliked the separation of the churches from the state, he accepted that policy as inevitable. After the action of the Vatican in 1904, which had produced the rupture of diplomatic relations with France, many moderates who had been persistent in their opposition to the Combes ministry, and even certain Nationalists, accepted the principle of separation, but urged that it should be effected on liberal terms. So on the 27th of January, after the minister of education and public worship had announced that the government intended to introduce a separation bill, a vote of confidence was obtained by a majority of 373 to 99, half of the majority being opponents of the Combes ministry of various Republican and reactionary groups, while the minority was composed of 84 Radicals and Socialists and only 15 reactionaries.

The Separation Law. On the 21st of March the debates on the separation of the churches from the state began. A commission had been appointed in 1904 to examine the subject. Its reporter was M. Aristide Briand, Socialist member for Saint Etienne. According to French parliamentary procedure, the reporter of a commission, directed to draw up a great scheme of legislation, can make himself a more important person in conducting it through a house of legislature than the minister in charge of the bill. This is what M. Briand succeeded in doing. He produced with rapidity a "report" on the whole question, in which he traced with superficial haste the history of the Church in France from the baptism of Clovis, and upon this drafted a bill which was accepted by the government. He thus at one bound came from obscurity into the front rank of politicians, and in devising a revolutionary measure learned a lesson of moderate statesmanship. In conducting the debates he took the line of throwing the responsibility for the rupture of the Concordat on the pope. The leadership of the Opposition fell on M. Ribot, who had been twice prime minister of the Republic and was not a practising Catholic. He recognized that separation

had become inevitable, but argued that it could be accomplished as a permanent act only in concert with the Holy See. The clerical party in the Chamber did little in defence of the Church. The abbés Lemire and Gayraud, the only ecclesiastics in parliament, spoke with moderation, and M. Groussau, a Catholic jurist, attacked the measure with less temperate zeal; but the best serious defence of the interests of the Church came from the Republican centre. Few amendments from the extreme Left were accepted by M. Briand, whose general tone was moderate and not illiberal. One feature of the debates was the reluctance of the prime minister to take part in them, even when financial clauses were discussed in which his own office was particularly concerned. The bill finally passed the Chamber on the 3rd of July by 341 votes against 233, the majority containing a certain number of conservative Republicans and Nationalists. At the end the Radical-Socialists manifested considerable discontent at the liberal tendencies of M. Briand, and declared that the measure as it left the Chamber could be considered only provisional. In the Senate it underwent no amendment whatever, not a single word being altered. The prime minister, M. Rouvier, never once opened his lips during the lengthy debates, in the course of which M. Clémenceau, as a philosophical Radical who voted for the bill, criticized it as too concordatory, while M. Méline, as a moderate Republican, who voted against it, predicted that it would create such a state of things as would necessitate new negotiations with Rome a few years later. It was finally passed by a majority of 181 to 102, the complete number of senators being 300, and three days later, on the 9th of December 1905, it was promulgated as law by the president of the Republic.

The main features of the act were as follows. The first clauses guaranteed liberty of conscience and the free practice of public worship, and declared that henceforth the Republic neither recognized nor remunerated any form of religion, except in the case of chaplains to public schools, hospitals and prisons. It provided that after inventories had been taken of the real and personal property in the hands of religious bodies, hitherto remunerated by the state, to ascertain whether such property belonged to the state, the department, or the commune, all such property should be transferred to associations of public worship (*associations cultuelles*) established in each commune in accordance with the rules of the religion which they represented, for the purpose of carrying on the practices of that religion. As the Vatican subsequently refused to permit Catholics to take part in these associations, the important clauses relating to their organization and powers became a dead letter, except in the case of the Protestant and Jewish associations, which affected only a minute proportion of the religious establishments under the act. Nothing, therefore, need be said about them except that the chief discussions in the Chamber took place with regard to their constitution, which was so amended, contrary to the wishes of the extreme anti-clericals, that many moderate critics of the original bill thought that thereby the regular practice of the Catholic religion, under episcopal control, had been safeguarded. A system of pensions for ministers of religion hitherto paid by the state was provided, according to the age and the length of service of the ecclesiastics interested, while in small communes of under a thousand inhabitants the clergy were to receive in any case their full pay for eight years. The bishops' palaces were to be left gratuitously at the disposal of the occupiers for two years, and the presbyteries and seminaries for five years. This provision too became a dead letter, owing to the orders given by the Holy See to the clergy. Other provisions enacted that the churches should not be used for political meetings, while the services held in them were protected by the law from the acts of disturbers. As the plenary operation of the law depended on the *associations cultuelles*, the subsequent failure to create those bodies makes it useless to give a complete exposition of a statute of which they were an essential feature.

The passing of the Separation Law was the chief act of the last year of the presidency of M. Loubet. One other important measure has to be noted, the law reducing compulsory military

service to two years. The law of 1889 had provided a general service of three years, with an extensive system of dispensations accorded to persons for domestic reasons, or because they belonged to certain categories of students, such citizens being let off with one year's service with the colours or being entirely exempted. The new law exacted two years' service from every Frenchman, no one being exempted save for physical incapacity. Under the act of 1905 even the cadets of the military college of Saint Cyr and of the Polytechnic had to serve in the ranks before entering those schools. Anti-military doctrines continued to be encouraged by the Socialist party, M. Hervé, the professor who had been revoked in 1901 for his suggestion of a military strike in case of war and for other unpatriotic utterances, being elected a member of the administrative committee of the Unified Socialist party, of which M. Jaurès was one of the chiefs. At a congress of elementary schoolmasters at Lille in August, anti-military resolutions were passed and a general adherence was given to the doctrines of M. Hervé. At Longwy, in the Eastern coal-field, a strike took place in September, during which the military was called out to keep order and a workman was killed in a cavalry charge. The minister of war, M. Berteaux, visited the scene of the disturbance, and was reported to have saluted the red revolutionary flag which was borne by a procession of strikers singing the "Internationale."

During the autumn session in November M. Berteaux suddenly resigned the portfolio of war during a sitting of the Chamber, and was succeeded by M. Etienne, minister of the interior, a moderate politician who inspired greater confidence. Earlier in the year other industrial strikes of great gravity had taken place, notably at Limoges, among the potters, where several deaths took place in a conflict with the troops and a factory was burnt. Even more serious were the strikes in the government arsenals in November. At Cherbourg and Brest only a small proportion of the workmen went out, but at Lorient, Rochefort and especially at Toulon the strikes were on a much larger scale. In 1905 solemn warnings were given in the Chamber of the coming crisis in the wine-growing regions of the South. Radical-Socialists such as M. Doumergue, the deputy for Nîmes and a member of the Combes ministry, joined with monarchists such as M. Lasies, deputy of the Gers, in calling attention to the distress of the populations dependent on the vine. They argued that the wines of the South found no market, not because of the alleged over-production, but because of the competition of artificial wines; that formerly only twenty departments of France were classed in the atlas as wine-producing, but that thanks to the progress of chemistry seventy departments were now so described. The deputies of the north of France and of Paris, irrespective of party, opposed these arguments, and the government, while promising to punish fraud, did not seem to take very seriously the legitimate warnings of the representatives of the South.

The Republic continued to extend its friendly relations with foreign powers, and the end of M. Loubet's term of office was signalized by a procession of royal visits to Paris, some of which the president returned. At the end of May the king of Spain came and narrowly escaped assassination from a bomb which was thrown at him by a Spaniard as he was returning with the president from the opera. In October M. Loubet returned this visit at Madrid and went on to Lisbon to see the king of Portugal, being received by the queen, who was the daughter of the comte de Paris and the sister of the duc d'Orléans, both exiled by the Republic. In November the king of Portugal came to Paris, and the president of the Republic also received during the year less formal visits from the kings of England and of Greece.

One untoward international event affecting the French ministry occurred in June 1905. M. Delcassé (see section on *Exterior Policy*), who had been foreign minister longer than any holder of that office under the Republic, resigned, and it was believed that he had been sacrificed by the prime minister to the exigencies of Germany, which power was said to be disquieted at his having, in connexion

with the Morocco question, isolated Germany by promoting the friendly relations of France with England, Spain and Italy. Whether it be true or not that the French government was really in alarm at the possibility of a declaration of war by Germany, the impression given was unfavourable, nor was it removed when M. Rouvier himself took the portfolio of foreign affairs.

The year 1906 is remarkable in the history of the Third Republic in that it witnessed the renewal of all the public powers in the state. A new president of the Republic *M. Fallières* was elected on the 17th of January ten days after the *president* triennial election of one third of the senate, and the *of the* general election of the chamber of deputies followed *Republic.* in May—the ninth which had taken place under the constitution of 1875. The senatorial elections of the 7th of January showed that the delegates of the people who chose the members of the upper house and represented the average opinion of the country approved of the anti-clerical legislation of parliament. The election of M. Fallières, president of the senate, to the presidency of the Republic was therefore anticipated, he being the candidate of the parliamentary majorities which had disestablished the church. At the congress of the two chambers held at Versailles on the 17th of January he received the absolute majority of 449 votes out of 849 recorded. The candidate of the Opposition was M. Paul Doumer, whose anti-clericalism in the past was so extreme that when married he had dispensed with a religious ceremony and his children were unbaptized. So the curious spectacle was presented of the Moderate Opportunist M. Fallières being elected by Radicals and Socialists, while the Radical candidate was supported by Moderates and Reactionaries. For the second time a president of the senate, the second official personage in the Republic, was advanced to the chief magistracy, M. Loubet having been similarly promoted. As in his case, M. Fallières owed his election to M. Clémenceau. When M. Loubet was elected M. Clémenceau had not come to the end of his retirement from parliamentary life; but in political circles, with his powerful pen and otherwise, he was resuming his former influence as a "king-maker." He knew of the precariousness of Félix Faure's health and of the indiscretions of the elderly president. So when the presidency suddenly became vacant in January 1899 he had already fixed his choice on M. Loubet, as a candidate whose unobtrusive name excited no jealousy among the republicans. At that moment, owing to the crisis caused by the Dreyfus affair, the Republic needed a safe man to protect it against the attacks of the plebiscitary party which had been latterly favoured by President Faure. M. Constans, it was said, had in 1899 desired the presidency of the senate, vacant by M. Loubet's promotion, in preference to the post of ambassador at Constantinople. But M. Clémenceau, deeming that his name had been too much associated with polemics in the past, contrived the election of M. Fallières to the second place of dignity in the Republic, so as to have another safe candidate in readiness for the Elysée in case President Loubet suddenly disappeared. M. Loubet, however, completed his septennate, and to the end of it M. Fallières was regarded as his probable successor. As he fulfilled his high duties in the senate inoffensively without making enemies among his political friends, he escaped the fate which had awaited other presidents-designate of the Republic. Previously to presiding over the senate this Gascon advocate, who had represented his native Lot-et-Garonne, in either chamber, since 1876, had once been prime minister for three weeks in 1883. He had also held office in six other ministries, so no politician in France had a larger experience in administration and in public affairs.

On New Year's Day 1906, the absence of the Nuncio from the presidential reception of the diplomatic body marked conspicuously the rupture of the Concordat; for hitherto the representative of the Holy See had ranked as *doyen* of the ambassadors to the Republic, whatever the relative seniority of his colleagues, and in the name of all the foreign powers had officially saluted the chief of the state. On the 20th of January the inventories of the churches were commenced, under the 3rd clause of the

Resignation of M. Delcassé.

Separation Act, for the purpose of assessing the value of the furniture and other objects which they contained. In Paris they occasioned some disturbance; but as the protesting rioters were led by persons whose hostility to the Republic was more notorious than their love for religion, the demonstrations were regarded as political rather than religious. In certain rural districts, where the church had retained its influence and where its separation from the state was unpopular, the taking of the inventories was impeded by the inhabitants, and in some places, where the troops were called out to protect the civil authorities, further feeling was aroused by the refusal of officers to act. But, as a rule, this first manifest operation of the Separation Law was received with indifference by the population. One region where popular feeling was displayed in favour of the church was

The Sarrien ministry.

Flanders, where, in March, at Boeschepe on the Belgian frontier, a man was killed during the taking of an inventory. This accident caused the fall of the ministry. The moderate Republicans in the Chamber,

who had helped to keep M. Rouvier in office, withheld their support in a debate arising out of the incident, and the government was defeated by thirty-three votes. M. Rouvier resigned, and the new president of the Republic sent for M. Sarrien, a Radical of the old school from Burgundy, who had been deputy for his native Saône-et-Loire from the foundation of the Chamber in 1876 and had previously held office in four cabinets. In M. Sarrien's ministry of the 14th of March 1906 the president of the council was only a minor personage, its real conductor being M. Clémenceau, who accepted the portfolio of the interior. Upon him, therefore devolved the function of "making the elections"

M. Clémenceau minister of the interior.

of 1906, as it is the minister at the Place Beauvau, where all the wires of administrative government are centralized, who gives the orders to the prefectures at each general election. As in France ministers sit and speak in both houses of parliament, M. Clémenceau,

though a senator, now returned, after an absence of thirteen years, to the Chamber of Deputies, in which he had played a mighty part in the first seventeen years of its existence. His political experience was unique. From an early period after entering the Chamber in 1876 he had exercised there an influence not exceeded by any deputy. Yet it was not until 1906, thirty years after his first election to parliament, that he held office—though in 1888 he just missed the presidency of the Chamber, receiving the same number of votes as M. Méline, to whom the post was allotted by right of seniority. He now returned to the tribune of the Palais Bourbon, on which he had been a most formidable orator. During his career as deputy his eloquence was chiefly destructive, and of the nineteen ministries which fell between the election of M. Grévy to the presidency of the Republic in 1879 and his own departure from parliamentary life in 1893 there were few of which the fall had not been expedited by his mordant criticism or denunciation. He now came back to the scene of his former achievements not to attack but to defend a ministry. Though his old occupation was gone, his re-entry excited the keenest interest, for at sixty-five he remained the biggest political figure in France. After M. Clémenceau the most interesting of the new ministers was M. Briand, who was not nine years old when M. Clémenceau had become conspicuous in political life as the mayor of Montmartre on the eve of the Commune. M. Briand had entered the Chamber, as Socialist deputy for Saint Étienne, only in 1902. The mark he had made as "reporter" of the Separation Bill has been noted, and on that account he became minister of education and public worship—the terms of the Separation Law necessitating the continuation of a department for ecclesiastical affairs. As he had been a militant Socialist of the "unified" group of which M. Jaurès was the chief, and also a member of the superior council of labour, his appointment indicated that the new ministry courted the support of the extreme Left. It, however, contained some moderate men, notably M. Poincaré, who had the repute of making the largest income at the French bar after M. Waldeck-Rousseau gave up his practice, and who became for the second time minister of finance. The portfolios of the colonies and of public works were

also given to old ministers of moderate tendencies, M. Georges Leygues and M. Barthou. A former prime minister, M. Léon Bourgeois, went to the foreign office, over which he had already presided, besides having represented France at the peace conference at the Hague; while MM. Étienne and Thomson retained their portfolios of war and marine. The cabinet contained so many men of tried ability that it was called the ministry of all the talents. But the few who understood the origin of the name knew that it would be even more ephemeral than was the British ministry of 1806; for the fine show of names belonged to a transient combination which could not survive the approaching elections long enough to leave any mark in politics.

Before the elections took place grave labour troubles showed that social and economical questions were more likely to give anxiety to the government than any public movement resulting from the disestablishment of the church. *Progress of socialism.* Almost the first ministerial act of M. Clémenceau was to visit the coal basin of the Pas de Calais, where an accident causing great loss of life was followed by an uprising of the working population of the region, which spread into the adjacent department of the Nord and caused the minister of the interior to take unusual precautions to prevent violent demonstrations in Paris on Labour Day, the 1st of May. The activity of the Socialist leaders in encouraging anti-capitalist agitation did not seem to alarm the electorate. Nor did it show any sympathy with the appeal of the pope, who in his encyclical letter, *Vehementer nos*, addressed to the French cardinals on the 11th of February, denounced the Separation Law. So the result of the elections of May 1906 was a decisive victory for the anti-clericals and Socialists.

A brief analysis of the composition of the Chamber of Deputies is always impossible, the limits of the numerous groups being ill-defined. But in general terms the majority supporting the radical policy of the *bloc* in the last parliament, which had usually mustered about 340 votes, now numbered more than 400, including 230 Radical-Socialists and Socialists. The gains of the extreme Left were chiefly at the expense of the moderate or progressist republicans, who, about 120 strong in the old Chamber, now came back little more than half that number. The anti-republican Right, comprising Royalists, Bonapartists and Nationalists, had maintained their former position and were about 130 all told. The general result of the polls of the 6th and 20th of May was thus an electoral vindication of the advanced policy adopted by the old Chamber and a repudiation of moderate Republicanism; while the stationary condition of the reactionary groups showed that the tribulations inflicted by the last parliament on the church had not provoked the electorate to increase its support of clerical politicians.

The Vatican, however, declined to recognize this unmistakable demonstration. The bishops, taking advantage of their release from the concordatory restrictions which had withheld from them the faculty of meeting in assembly, had met at a preliminary conference to consider their plan of action under the Separation Law. They had adjourned for further instructions from the Holy See, which were published on the 10th of August 1906, in a new encyclical *Gravissimo officii*, wherein, to the consternation of many members of the episcopate, the pope interdicted the *associations cultuelles*, the bodies which, under the Separation Law, were to be established in each parish, to hold and to organize the church property and finances, and were essential to the working of the act. On the 4th of September the bishops met again and passed a resolution of submission to the Holy See. In spite of their loyalty they could not but deplore an injunction which inevitably would cause distress to the large majority of the clergy after the act came into operation on the 12th of December 1906. They knew only too well how hopeless was the idea that the distress of the clergy would call forth any revulsion of popular feeling in France. The excitement of the public that summer over a painful clerical scandal in the diocese of Chartres showed that the interest taken by the mass of the population in church matters was not of a kind which would aid the clergy in their difficult situation.

At the close of the parliamentary recess M. Sarrien resigned the premiership on the pretext of ill-health, and by a presidential decree of the 25th of October 1906 M. Clémenceau, who had been called to fill the vacancy, took office. *The Clémenceau ministry.* MM. Bourgeois, Poincaré, Étienne and Leygues retired with M. Sarrien. The new prime minister placed at the foreign office M. Pichon, who had learned politics on the staff of the *Justice*, the organ of M. Clémenceau, by whose influence he had entered the diplomatic service in 1893, after eight years in the chamber of deputies. He had been minister at Peking during the Boxer rebellion and resident at Tunis, and he was now radical senator for the Jura. M. Caillaux, a more adventurous financier than M. Rouvier or M. Poincaré, who had been Waldeck-Rousseau's minister of finance, resumed that office. The most significant appointment was that of General Picquart to the war office. The new minister when a colonel had been willing to sacrifice his career, although he was an anti-Semite, to redressing the injustice which he believed had been inflicted on a Jewish officer—whose second condemnation, it may be noted, had been quashed earlier in 1906. M. Viviani became the first minister of labour (*Travail et Prévoyance sociale*). The creation of the office and the appointment of a socialist lawyer and journalist to fill it showed that M. Clémenceau recognized the increasing prominence of social and industrial questions and the growing power of the trade-unions.

The acts and policy of the Clémenceau ministry and the events which took place during the years that it held office are too near the present time to be appraised historically. It seems not unlikely that the first advent to power, after thirty-five years of strenuous political life, of one who must be ranked among the ablest of the twenty-seven prime ministers of the Third Republic will be seen to have been coincident with an important evolution in the history of the French nation. The separation of the Roman Catholic Church from the state, by the law of December 1905, had deprived the Socialists, the now most powerful party of the extreme Left, of the chief outlet for their activity, which hitherto had chiefly found its scope in anti-clericalism. Having no longer the church to attack they turned their attention to economical questions, the solution of which had always been their theoretical aim. At the same period the law relating to the Contract of Association of 1901, by removing the restrictions (save in the case of religious communities) which previously had prevented French citizens from forming association without the authorization of the government, had formally abrogated the individualistic doctrine of the Revolution, which in all its phases was intolerant of associations. The law of June 1791 declared the destruction of all corporations of persons engaged in the same trade or profession to be a fundamental article of the French constitution, and it was only in the last six years of the Second Empire that some tolerance was granted to trade-unions, which was extended by the Third Republic only in 1884. In that year the prohibition of 1791 was repealed. Not quite 70 unions existed at the end of 1884. In 1890 they had increased to about 1000, in 1894 to 2000, and in 1901, when the law relating to the Contract of Association was passed, they numbered 3287 with 588,832 members. The law of 1901 did not specially affect them; but this general act, completely emancipating all associations formed for secular purposes, was a definitive break with the individualism of the Revolution which had formed the basis of all legislation in France for nearly a century after the fall of the ancient monarchy. It was an encouragement and at the same time a symptom of the spread of anti-individualistic doctrine. This was seen in the accelerated increase of syndicated workmen during the years succeeding the passing of the Associations Law, who in 1909 were over a million strong. The power exercised by the trade-unions moved the functionaries of the government, a vast army under the centralized system of administration, numbering not less than 800,000 persons, to demand equal freedom of association for the purpose of regulating their salaries paid by the state and their conditions of labour. This movement brought into new relief the long-recognized incompatibility of parliamentary government with administrative centralization as organized by Napoleon.

In another direction the increased activity in the rural districts of the Socialists, who hitherto had chiefly worked in the industrial centres, indicated that they looked for support from the peasant proprietors, whose ownership in the soil had hitherto opposed them to the practice of collectivist doctrine. In the summer of 1907 an economic crisis in the wine-growing districts of the South created a general discontent which spread to other rural regions. The Clémenceau ministry, while opposing the excesses of revolutionary socialism and while incurring the strenuous hostility of M. Jaurès, the Socialist leader, adopted a programme which was more socialistic than that of any previous government of the republic. Under its direction a bill for the imposition of a graduated income tax was passed by the lower house, involving a scheme of direct taxation which would transform the interior fiscal system of France. But the income tax was still only a project of law when M. Clémenceau unexpectedly fell in July 1909, being succeeded as prime minister by his colleague M. Briand. His ministry had, however, passed one important measure which individualists regarded as an act of state-socialism. It took a long step towards the nationalization of railways by purchasing the important Western line and adding it to the relatively small system of state railways. Previously a more generally criticized act of the representatives of the people was not of a nature to augment the popularity of parliamentary institutions at a period of economic crisis, when senators and deputies increased their own annual salary, or indemnity as it is officially called, to 15,000 francs. (J. E. C. B.)

EXTERIOR POLICY 1870-1909

The Franco-German War marks a turning-point in the history of the exterior policy of France as distinct as does the fall of the ancient monarchy or the end of the Napoleonic epoch. *The new epoch.* With the disappearance of the Second Empire, by its own fault, on the field of Sedan in September 1870, followed in the early months of 1871 by the proclamation of the German empire at Versailles and the annexation of Alsace and Lorraine under the treaty of peace of Frankfurt, France descended from its primacy among the nations of continental Europe, which it had gradually acquired in the half-century subsequent to Waterloo. It was the design of Bismarck that united Germany, which had been finally established under his direction by the war of 1870, should take the place hitherto occupied by France in Europe. The situation of France in 1871 in no wise resembled that after the French defeat of 1815, when the First Empire, issue of the Revolution, had been upset by a coalition of the European monarchies which brought back and supported on his restored throne the legitimate heir to the French crown. In 1871 the Republic was founded in isolation. France was without allies, and outside its frontiers the form of its executive government was a matter of interest only to its German conquerors. Bismarck desired that France should remain isolated in Europe and divided at home. He thought that the Republican form of government would best serve these ends. The revolutionary tradition of France would, under a Republic, keep aloof the monarchies of Europe, whereas, in the words of the German ambassador at Paris, Prince Hohenlohe, a "monarchy would strengthen France and place her in a better position to make alliances and would threaten our alliances." At the same time Bismarck counted on governmental instability under a Republic to bring about domestic disorganization which would so disintegrate the French nation as to render it unformidable as a foe and ineffective as an ally. The Franco-German War thus produced a situation unprecedented in the mutual relations of two great European powers. From that situation resulted all the exterior policy of France, for a whole generation, colonial as well as foreign.

In 1875 Germany saw France in possession of a constitution which gave promise of durability if not of permanence. German opinion had already been perturbed by the facility and speed with which France had paid off the colossal war indemnity exacted by the conqueror, thus giving proof of the inexhaustible resources of the country and of its powers of recuperation. The

successful reorganization of the French army under the military law of 1872 caused further alarm when there appeared to be some possibility of the withdrawal of Russia from the Dreikaiserbund, which had set the seal on Germany's triumph and France's abasement in Europe. It seemed, therefore, as though it might be expedient for Germany to make a sudden aggression upon France before that country was adequately prepared for war, in order to crush the nation irreparably and to remove it from among the great powers of Europe.

The constitution of the Third Republic was voted by the National Assembly on the 25th of February 1875. The new constitution had to be completed by electoral laws and other complementary provisions, so it could not become effective until the following year, after the first elections of the newly founded Senate and Chamber of Deputies. M. Buffet was then charged by the president of the republic, Marshal MacMahon, to form a provisional ministry in which the duc Decazes, who had been foreign minister since 1873, was retained at the Quai d'Orsay. The cabinet met for the first time on the 11th of March, and ten days later the National Assembly adjourned for a long recess.

It was during that interval that occurred the incident known as "The Scare of 1875." The Kulturkampf had left Prince Bismarck in a state of nervous irritation. In all directions he was on the look out for traces of Ultramontane intrigue. The clericals in France after the fall of Thiers had behaved with great indiscretion in their desire to see the temporal power of the pope revived. But when the reactionaries had placed MacMahon at the head of the state, their divisions and their political ineptitude had shown that the government of France would soon pass from their hands, and of this the voting of the Republican constitution by a monarchical assembly was the visible proof. Nevertheless Bismarck, influenced by the presence at Berlin of a French ambassador, M. de Gontaut-Biron, whom he regarded as an Ultramontane agent, seems to have thought otherwise. A military party at Berlin affected alarm at a law passed by the French Assembly on the 12th of March, which continued a provision increasing from three to four the battalions of each infantry regiment, and certain journals, supposed to be inspired by Bismarck, argued that as the French were preparing, it might be well to anticipate their designs before they were ready. Europe was scared by an article on the 6th of May in *The Times*, professing to reveal the designs of Bismarck, from its Paris correspondent, Blowitz, who was in relations with the French foreign minister, the duc Decazes, and with Prince Hohenlohe, German ambassador to France, both being prudent diplomatists, and, though Catholics, opposed to Ultramontane pretensions. Europe was astounded at the revelation and alarmed at the alleged imminence of war. In England the Disraeli ministry addressed the governments of Russia, Austria and Italy, with a view to restraining Germany from its aggressive designs, and Queen Victoria wrote to the German emperor to plead the cause of peace. It is probable that there was no need either for this intervention or for the panic which had produced it. We know now that the old emperor William was steadfastly opposed to a fresh war, while his son, the crown prince Frederick, who then seemed likely soon to succeed him for a long reign, was also determined that peace should be maintained. The scare had, however, a most important result, in sowing the seeds of the subsequent Franco-Russian alliance. Notwithstanding that the tsar Alexander II. was on terms of affectionate intimacy with his uncle, the emperor William, he gave a personal assurance to General Le Flô, French ambassador at St Petersburg, that France should have the "moral support" of Russia in the case of an aggression on the part of Germany. It is possible that the danger of war was exaggerated by the French foreign minister and his ambassador at Berlin, as is the opinion of certain French historians, who think that M. de Gontaut-Biron, as an old royalist, was only too glad to see the Republic under the protection, as it were, of the most reactionary monarchy of Europe. At the same time Bismarck's denials of having acted with

terrorizing intent cannot be accepted. He was more sincere when he criticized the ostentation with which the Russian Chancellor, Prince Gortchakoff, had claimed for his master the character of the defender of France and the obstacle to German ambitions. It was in memory of this that, in 1878 at the congress of Berlin, Bismarck did his best to impair the advantages which Russia had obtained under the treaty of San Stefano.

The events which led to that congress put into abeyance the prospect of a serious understanding between France and Russia. The insurrection in Herzegovina in July 1875 reopened the Eastern question, and in the Orient the interests of France and Russia had been for many years conflicting, as witness the controversy concerning the Holy Places, which was one of the causes of the Crimean War. France had from the reign of Louis XIV. claimed the exclusive right of protecting Roman Catholic interests in the East. This claim was supported not only by the monarchists, for the most part friendly to Russia in other respects, who directed the foreign policy of the Third Republic until the Russo-Turkish War of 1877, but by the Republicans, who were coming into perpetual power at the time of the congress of Berlin—the ablest of the anti-clericals, Gambetta, declaring in this connexion that "anti-clericalism was not an article of exportation." The defeat of the monarchists at the elections of 1877, after the "Seize Mai," and the departure from office of the duc Decazes, whose policy had tended to prepare the way for an alliance with the tsar, changed the attitude of French diplomacy towards Russia. M. Waddington, the first Republican minister for foreign affairs, was not a Russophil, while Gambetta was ardently anti-Russian, and he, though not a minister, was exercising that preponderant influence in French politics which he retained until 1882, the last year of his life. Many Republicans considered that the monarchists, whom they had turned out, favoured the support of Russia not only as a defence against Germany, which was not likely to be effective so long as a friendly uncle and nephew were reigning at Berlin and at St Petersburg respectively, but also as a possible means of facilitating a monarchical restoration in France. Consequently at the congress of Berlin M. Waddington and the other French delegates maintained a very independent attitude towards Russia. They supported the resolutions which aimed at diminishing the advantages obtained by Russia in the war, they affirmed the rights of France over the Holy Places, and they opposed the anti-Semitic views of the Russian representatives. The result of the congress of Berlin seemed therefore to draw France and Russia farther apart, especially as Gambetta and the Republicans now in power were more disposed towards an understanding with England. The contrary, however, happened. The treaty of Berlin, which took the place of the treaty of San Stefano, was the ruin of Russian hopes. It was attributed to the support given by Bismarck to the anti-Russian policy of England and Austria at the congress, the German chancellor having previously discouraged the project of an alliance between Russia and Germany. The consequence was that the tsar withdrew from the Dreikaiserbund, and Germany, finding the support of Austria inadequate for its purposes, sought an understanding with Italy. Hence arose the Triple Alliance of 1882, which was the work of Bismarck, who thus became eventually the author of the Franco-Russian alliance, which was rather a sedative for the nervous temperament of the French than a remedy necessary for their protection. The twofold aim of the Triplice was the development of the Bismarckian policy of the continued isolation of France and of the maintenance of the situation in Europe acquired by the German empire in 1871. The most obvious alliance for Germany was that with Russia, but it was clear that it could be obtained only at the price of Russia having a free hand to satisfy its ambitions in the East. This not only would have irritated England against Germany, but also Austria, and so might have brought about a Franco-Austrian alliance, and a day of reckoning for Germany for the combined rancours of two nations, left by 1866 and 1871. It was thus that Germany allied itself first

Congress
of Berlin.

The crisis
of 1875.

with Austria and then with Italy, leaving Russia eventually to unite with France.

As the congress of Berlin took in review the general situation of the Turkish empire, it was natural that the French delegates should formulate the position of France in Egypt. *Egyptian question.* Thus the powers of Europe accepted the maintenance of the *condominium* in Egypt, financial and administrative, of England and France. Egypt, nominally a province of the Turkish empire, had been invested with a large degree of autonomy, guaranteed by an agreement made in 1840 and 1841 between the Porte and the then five great powers, though some opposition was made to France being a party to this compact. By degrees Austria, Prussia and Russia (as well as Italy when it attained the rank of a great power) had left the international control of Egypt to France and England by reason of the preponderance of the interests of those two powers on the Nile.

In 1875 the interests of England in Egypt, which had hitherto been considered inferior to those of France, gained a superiority owing to the purchase by the British government of the shares of the khedive Ismail in the Suez Canal. Whatever rivalry there may have been between England and France, they had to present a united front to the pretensions of Ismail, whose prodigalities made him impatient of the control which they exercised over his finances. This led to his deposition and exile. The control was re-established by his successor Tewfik on the 4th of September 1879. The revival ensued of a so-called national party, which Ismail for his own purposes had encouraged in its movement hostile to foreign domination. In September 1881 took place the rising led by Arabi, by whose action an assembly of notables was convoked for the purpose of deposing the government authorized by the European powers. The fear lest the sultan should intervene gave an appearance of harmony to the policy of England and France, whose interests were too great to permit of any such interference. At the end of 1879 the first Freycinet cabinet had succeeded that of M. Waddington and had in turn been succeeded in September 1880 by the first Ferry cabinet. In the latter the foreign minister was M. Barthélemy Saint-Hilaire, an aged philosopher who had first taken part in politics when he helped to dethrone Charles X. in 1830. In September 1881 he categorically invited the British government to join France in a military intervention to oppose any interference which the Porte might attempt, and the two powers each sent a war-ship to Alexandria. On the 14th of November Gambetta formed his *grand ministère*, in which he was foreign minister. Though it lasted less than eleven weeks, important measures were taken by it, as Arabi had become under-secretary for war at Cairo, and was receiving secret encouragement from the sultan. On the 7th of January 1882, at the instance of Gambetta, a joint note was presented by the British and French consuls to the khedive, to the effect that their governments were resolved to maintain the *status quo*, Gambetta having designed this as a consecration of the Anglo-French alliance in the East. Thereupon the Porte protested, by a circular addressed to the powers, against this infringement of its suzerainty in Egypt. Meanwhile, the assembly of notables claimed the right of voting the taxes and administering the finances of the country, and Gambetta, considering this as an attempt to emancipate Egypt from the financial control of Europe, moved the British government to join with France in protesting against any interference on the part of the notables in the budget. But when Lord Granville accepted this proposal Gambetta had fallen, on the 26th of January, being succeeded by M. de Freycinet, who for the second time became president of the council and foreign minister. Gambetta fell nominally on a scheme of partial revision of the constitution. It included the re-establishment of *scrutin de liste*, a method of voting to which many Republicans were hostile, so this gave his enemies in his own party their opportunity. He thus fell the victim of republican jealousy, nearly half the Republicans in the chamber voting against him in the fatal division. The subsequent debates of 1882 show that many of Gambetta's adversaries were also opposed to his policy of uniting with England on the Egyptian question. Henceforth the interior

affairs of Egypt have little to do with the subject we are treating; but some of the incidents in France which led to the English occupation of Egypt ought to be mentioned. M. de Freycinet was opposed to any armed intervention by France; but in the face of the feeling in the country in favour of maintaining the traditional influence of France in Egypt, his declarations of policy were vague. On the 23rd of February 1882 he said that he would assure the non-exclusive preponderance in Egypt of France and England by means of an understanding with Europe, and on the 11th of May that he wished to retain for France its peculiar position of privileged influence. England and France sent to Alexandria a combined squadron, which did not prevent a massacre of Europeans there on the 11th of June, the khedive being now in the hands of the military party under Arabi. On the 11th of July the English fleet bombarded Alexandria, the French ships in anticipation of that action having departed the previous day. On the 18th of July the Chamber debated the supplementary vote for the fleet in the Mediterranean, M. de Freycinet declaring that France would take no active part in Egypt except as the mandatory of the European powers. This was the occasion for the last great speech of Gambetta in parliament. In it he earnestly urged close co-operation with England, which he predicted would otherwise become the mistress of Egypt, and in his concluding sentences he uttered the famous "*Ne rompez jamais l'alliance anglaise.*" A further vote, proposed in consequence of Arabi's open rebellion, was abandoned, as M. de Freycinet announced that the European powers declined to give France and England a collective mandate to intervene in their name. In the Senate on the 25th of July M. Scherer, better known as a philosopher than as a politician, who had Gambetta's confidence, read a report on the supplementary votes which severely criticized the timidity and vacillation of the government in Egyptian policy. Four days later in the Chamber M. de Freycinet proposed an understanding with England limited to the protection of the Suez Canal. Attacked by M. Clémenceau on the impossibility of separating the question of the canal from the general Egyptian question, the ministry was defeated by a huge majority, and M. de Freycinet fell, having achieved the distinction of being the chief instrument in removing Egypt from the sphere of French interest.

Some of the Republicans whose votes turned out M. de Freycinet wanted Jules Ferry to take his place, as he was considered to be a strong man in foreign policy, and Gambetta, for this reason, was willing to see his personal enemy at the head of public affairs. But this was prevented by M. Clémenceau and the extreme Left, and the new ministry was formed by M. Duclerc, an old senator whose previous official experience had been under the Second Republic. On its taking office on the 7th of August, the ministerial declaration announced that its policy would be in conformity with the vote which, by refusing supplies for the occupation of the Suez Canal, had overthrown M. de Freycinet. The declaration characterized this vote as "a measure of reserve and of prudence but not as an abdication." Nevertheless the action of the Chamber—which was due to the hostility to Gambetta of rival leaders, who had little mutual affection, including MM. de Freycinet, Jules Ferry, Clémenceau and the president of the Republic, M. Grévy, rather than to a desire to abandon Egypt—did result in the abdication of France. After England single-handed had subdued the rebellion and restored the authority of the khedive, the latter signed a decree on the 11th of January 1883 abolishing the joint control of England and France. Henceforth Egypt continued to be a frequent topic of debate in the Chambers; the interests of France in respect of the Egyptian finances, the judicial system and other institutions formed the subject of diplomatic correspondence, as did the irritating question of the eventual evacuation of Egypt by England. But though it caused constant friction between the two countries up to the Anglo-French convention of the 8th of April 1904, there was no longer a French active policy with regard to Egypt. The lost predominance of France in that country did, however, quicken French activity in other regions of northern Africa.

The idea that the Mediterranean might become a French lake has, in different senses, been a preoccupation for France and for its rivals in Europe ever since Algeria became a French province by a series of fortuitous incidents—an insult offered by the dey to a French consul, his refusal to make reparation, and the occasion it afforded of diverting public attention in France from interior affairs after the Revolution of 1830. The French policy of preponderance in Egypt had only for a secondary aim the domination of the Mediterranean. The French tradition in Egypt was a relic of Napoleon's vain scheme to become emperor of the Orient even before he had made himself emperor of the West. It was because Egypt was the highway to India that under Napoleon III. the French had constructed the Suez Canal, and for the same reason England could never permit them to become masters of the Nile delta. But the possessors of Algeria could extend their coast-line of North Africa without seriously menacing the power which held Gibraltar and Malta. It was Italy which objected to a French occupation of Tunis. Algeria has never been officially a French "colony." It is in many respects administered as an integral portion of French territory, the governor-general, as agent of the central power, exercising wide jurisdiction. Although the Europeans in Algeria are less than a seventh of the population, and although the French are actually a minority of the European inhabitants—Spaniards prevailing in the west, Italians and Maltese in the east—the three departments of Constantine, Algiers and Oran are administered like three French departments. Consequently, when disturbances occurred on the borderland separating Constantine from Tunis, the French were able to say to Europe that the integrity of their national frontier was threatened by the proximity of a turbulent neighbour. The history of the relations between Tunis and France were set forth, from the French standpoint, in a circular, of which Jules Ferry was said to be the author, addressed by the foreign minister, M. Barthélemy Saint-Hilaire on the 9th of May 1881, to the diplomatic agents of France abroad. The most important point emphasized by the French minister was the independence of Tunis from the Porte, a situation which would obviate difficulties with Turkey such as had always hampered the European powers in Egypt. In support of this contention a protest made by the British government in 1830, against the French conquest of Algiers, was quoted, as in it Lord Aberdeen had declared that Europe had always treated the Barbary states as independent powers. On the other hand, there was the incident of the bey of Tunis having furnished to Turkey a contingent during the Crimean War, which suggested a recognition of its vassalage to the Sublime Porte. But in 1864, when the sultan had sent a fleet to La Goulette to affirm his "rights" in Tunis, the French ambassador at Constantinople intimated that France declined to have Turkey for a neighbour in Algeria. France also in 1868 essayed to obtain control over the finances of the regency; but England and Italy had also large interests in the country, so an international financial commission was appointed. In 1871, when France was disabled after the war, the bey obtained from Constantinople a firman of investiture, thus recognizing the suzerainty of the Porte. Certain English writers have reproached the Foreign Office for its lack of foresight in not taking advantage of France's disablement by establishing England as the preponderant power in Tunis. The fact that five-sixths of the commerce of Tunis is now with France and Algeria may seem to justify such regrets. Yet by the light of subsequent events it seems probable that England would have been diverted from more profitable undertakings had she been saddled with the virtual administration and military occupation of a vast territory which such preponderance would have entailed. The wonder is that this opportunity was not seized by Italy; for Mazzini and other workers in the cause of Italian unity, before the Bourbons had been driven from Naples, had cast eyes on Tunis, lying over against the coasts of Sicily at a distance of barely 100 m., as a favourable field for colonization and as the key of the African Mediterranean. But when Rome became once more the capital of Italy, Carthage was not fated to fall again under its domination

and the occasion offered by France's temporary impotence was neglected. In 1875 when France was rapidly recovering, there went to Tunis as consul an able Frenchman, M. Roustan, who became virtual ruler of the regency in spite of the resistance of the representative of Italy. French action was facilitated by the attitude of England. On the 26th of July 1878 M. Waddington wrote to the marquis d'Harcourt, French ambassador in London, that at the congress of Berlin Lord Salisbury had said to him—the two delegates being the foreign ministers of their respective governments—in reply to his protest, on behalf of France, against the proposed English occupation of Cyprus, "Do what you think proper in Tunis: England will offer no opposition." This was confirmed by Lord Salisbury in a despatch to Lord Lyons, British ambassador in Paris, on the 8th of August, and it was followed in October by an intimation made by the French ambassador at Rome that France intended to exercise a preponderant influence in Tunis. Italy was not willing to accept this situation. In January 1881 a tour made by King Humbert in Sicily, where he received a Tunisian mission, was taken to signify that Italy had not done with Tunis, and it was answered in April by a French expedition in the regency sent from Algeria, on the pretext of punishing the Kroumirs who had been marauding on the frontier of Constantine. It was on this occasion that M. Barthélemy Saint-Hilaire issued the circular quoted above. France nominally was never at war with Tunis; yet the result of the invasion was that that country became virtually a French possession, although officially it is only under the protection of France. The treaty of El Bardo of the 12th of May 1881, confirmed by the decree of the 22nd of April 1882, placed Tunis under the protectorate of France. The country is administered under the direction of the French Foreign Office, in which there is a department of Tunisian affairs. The governor is called minister resident-general of France, and he also acts as foreign minister, being assisted by seven French and two native ministers.

The annexation of Tunis was important for many reasons. It was the first successful achievement of France after the disasters of the Franco-German War, and it was the first enterprise of serious utility to France undertaken beyond its frontiers since the early period of the Second Empire. It was also important as establishing the hegemony of France on the southern shores of the Mediterranean. When M. Jules Cambon became governor-general of Algeria, his brother M. Paul Cambon having been previously French resident in Tunis and remaining the vigilant ambassador to a Mediterranean power, a Parisian wit said that just as Switzerland had its *Lac des quatre Cantons*, so France had made of the midland sea its *Lac des deux Cambons*. The *jeu d'esprit* indicated what was the primary significance to the French of their becoming masters of the Barbary coast from the boundary of Morocco to that of Tripoli. Apart from the Mediterranean question, when the scramble for Africa began and the Hinterland doctrine was asserted by European powers, the possession of this extended coast-line resulted in France laying claim to the Sahara and the western Sudan. Consequently, on the maps, the whole of north-west Africa, from Tunis to the Congo, is claimed by France with the exception of the relatively small areas on the coast belonging to Morocco, Spain, Portugal, Liberia, Germany and England. On this basis, in point of area, France is the greatest African power, in spite of British annexations in south and equatorial Africa, its area being estimated at 3,866,950 sq. m. (including 227,950 in Madagascar) as against 2,101,411 more effectively possessed by Great Britain. The immensity of its domain on paper is no doubt a satisfaction to a people which prefers to pursue its policy of colonial expansion without the aid of emigration. The acquisition of Tunis by France is also important as an example of the system of protectorate as applied to colonization. Open annexation might have more gravely irritated the powers having interests in the country. England, in spite of Lord Salisbury's suggestions to the French foreign minister, was none too pleased with France's policy; while Italy, with its subjects outnumbering all other European settlers in the

*Extension
of African
territory.*

regency, was in a mood to accept a pretext for a quarrel for the reasons already mentioned. Apart from these considerations the French government favoured a protectorate because it did not wish to make of Tunis a second Algeria. While the annexation of the latter had excellent commercial results for France, it had not been followed by successful colonization, though it had cost France 160 millions sterling in the first sixty years after it became French territory. The French cannot govern at home or abroad without a centralized system of administration. The organization of Algeria, as departments of France with their administrative divisions, was not an example to imitate. In the beylical government France found, ready-made, a sufficiently centralized system, such as did not exist in Algeria under native rule, which could form a basis of administration by French functionaries under the direction of the Quai d'Orsay. The result has not been unpleasing to the numerous advocates in France of protectorates as a means of colonization. According to M. Paul Leroy-Beaulieu, the most eminent French authority on colonization, who knows Tunis well, a protectorate is the most pacific, the most supple, and the least costly method of colonization in countries where an organized form of native government exists; it is the system in which the French can most nearly approach that of English crown colonies. One evil which it avoids is the so-called representative system, under which senators and deputies are sent to the French parliament not only from Algeria as an integral part of France, but from the colonies of Martinique, Guadeloupe and French India, while Cochinchina, Guiana and Senegal send deputies alone. These sixteen deputies and seven senators attach themselves to the various Moderate, Radical and Socialist groups in parliament, which have no connexion with the interests of the colonies; and the consequent introduction of French political controversies into colonial elections has not been of advantage to the oversea possessions of France. From this the protectorate system has spared Tunis, and the paucity of French immigration will continue to safeguard that country from parliamentary representation. After twenty years of French rule, of 120,000 European residents in Tunis, not counting the army, only 22,000 were French, while nearly 70,000 were Italian. If under a so-called representative system the Italians had demanded nationalization, for the purpose of obtaining the franchise, complications might have arisen which are not to be feared under a protectorate.

But of all the results of the French annexation of Tunis, the most important was undoubtedly the Triple Alliance, into which Italy entered in resentment at having been deprived of the African territory which seemed marked out as its natural field for colonial expansion. The most manifest cause of Italian hostility towards France had passed away four years before the annexation of Tunis, when the reactionaries, who had favoured the restitution of the temporal power of the pope, fell for ever from power. The clericalism of the anti-republicans, who favoured a revival of the fatal policy of the Second Empire whereby France, after Magenta and Solferino, had by leaving its garrison at St Angelo, been the last obstacle to Italian unity, was one of the chief causes of their downfall. For after the war with Germany, the mutilated land and the vanquished nation had need to avoid wanton provocations of foreign powers. Henceforth the French Republic, governed by Republicans, was to be an anti-clerical force in Europe, sympathizing with the Italian occupation of Rome. But to make Italy realize that France was no longer the enemy of complete Italian unity it would have been necessary that all causes of irritation between the two Latin sister nations were removed. Such causes of dissension did, however, remain, arising from economic questions. The maritime relations of the two chief Mediterranean powers were based on a treaty of navigation of 1862—when Venice was no party to it being an Austrian port—which Crispi denounced as a relic of Italian servility towards Napoleon III. Commercial rivalry was induced by the industrial development of northern Italy, when freed from Austrian rule. Moreover, the emigrant propensity

of the Italians flooded certain regions of France with Italian cheap labour, with the natural result of bitter animosity between the intruders and the inhabitants of the districts thus invaded. The annexation of Tunis, coming on the top of these causes of irritation, exasperated Italy. A new treaty of commerce was nevertheless signed between the two countries on the 3rd of November 1881. Unfortunately for its stability, King Humbert the previous week had gone to Vienna to see the emperor of Austria. In visiting in his capital the former arch-enemy of Italian unity, who could never return the courtesy, Rome being interdicted for Catholic sovereigns by the "prisoner of the Vatican," Humbert had only followed the example of his father Victor Emmanuel, who went both to Berlin and to Vienna in 1873. But that was when in France the duc de Broglie was prime minister of a clerical government of which many of the supporters were clamouring for the restitution of the temporal power. King Humbert's visit to Vienna at the moment when Gambetta, the great anti-clerical champion, was at the height of his influence was significant for other reasons. Since the 7th of October 1879 Germany and Austria had been united by a defensive treaty, and though its provisions were not published until 1888, the two central empires were known to be in the closest alliance. The king of Italy's visit to Vienna, where he was accompanied by his ministers Depretis and Mancini, had therefore the same significance as though he had gone to Berlin also. On the 20th of May 1882 was signed the treaty of the Triple Alliance, which for many years bound Italy to Germany in its relations with the continental powers. The alliance was first publicly announced on the 13th of March 1883, in the Italian Chamber, by Signor Mancini, minister for foreign affairs. The aim of Italy in joining the combination was alliance with Germany, the enemy of France. The connexion with Austria was only tolerated because it secured a union with the powerful government of Berlin. It effected the complete isolation of France in Europe. An understanding between the French Republic and Russia, which alone could alter that situation, was impracticable, as its only basis seemed to be the possibility of having a common enemy in Germany or even in England. But that double eventuality was anticipated by a secret convention concluded at Skiernewice in September 1884 by the tsar and the German emperor, in which they guaranteed to one another a benevolent neutrality in case of hostilities between England and Russia arising out of the Afghan question.

It will be convenient here to refer to the relations of France with Germany and Italy respectively in the years succeeding the signature of the Triple Alliance. With Germany both Gambetta, who died ten weeks before the treaty was announced and who was a strong Russophobe, and his adversary Jules Ferry were inclined to come to an understanding. But in this they had not the support of French opinion. In September 1883 the king of Spain had visited the sovereigns of Austria and Germany. Alphonso XII, to prove that this journey was not a sign of hostility to France, came to Paris on his way home on Michaelmas Day on an official visit to President Grévy. Unfortunately it was announced that the German emperor had made the king colonel of a regiment of Uhlans garrisoned at Strassburg, the anniversary of the taking of which city was being celebrated by the emperor by the inauguration of a monument made out of cannon taken from the French, on the very eve of King Alphonso's arrival. Violent protests were made in Paris in the monarchical and in not a few republican journals, with the result that the king of Spain was hooted by the crowd as he drove with the president from the station to his embassy, and again on his way to dine the same night at the Elysée. The incident was closed by M. Grévy's apologies and by the retirement of the minister of war, General Thibaudin, who under pressure from the extreme Left had declined to meet *le roi uhlan*. Though it displayed the bitter hostility of the population towards Germany, the incident did not aggravate Franco-German relations. This was due to the policy of the prime minister, Jules Ferry, who to carry it out made himself foreign minister in November, in the place of Challemeil-Lacour, who resigned.

Jules Ferry's idea was that colonial expansion was the surest means for France to recover its prestige, and that this could be obtained only by maintaining peaceful relations with all the powers of Europe. His consequent unpopularity caused his fall in April 1885, and the next year a violent change of military policy was marked by the arrival of General Boulanger at the ministry of war, where he remained, in the Freycinet and Goblet cabinets, from January 1886 to the 17th of May 1887. His growing popularity in France was answered by Bismarck, who asked for an increased vote for the German army, indicating that he considered Boulanger the coming dictator for the war of revenge; so when the Reichstag, on the 14th of January 1887, voted the supplies for three years, instead of for the seven demanded by the chancellor, it was dissolved. Bismarck redoubled his efforts in the press and in diplomacy, vainly attempting to come to an understanding with Russia and with more success moving the Vatican to order the German Catholics to support him. He obtained his vote for seven years in March, and the same month renewed the Triple Alliance. In April the Schnaebelé incident seemed nearly to cause war between France and Germany. The commissary-special, an agent of the ministry of the interior, at Pagny-sur-Moselle, the last French station on the frontier of the annexed territory of Lorraine, having stepped across the boundary to regulate some official matter with the corresponding functionary on the German side, was arrested. It was said that Schnaebelé was arrested actually on French soil, and on whichever side of the line he was standing he had gone to meet the German official at the request of the latter. Bismarck justified the outrage in a speech in the Prussian Landtag which suggested that it was impossible to live at peace with a nation so bellicose as the French. In France the incident was regarded as a trap laid by the chancellor to excite French opinion under the aggressive guidance of Boulanger, and to produce events which would precipitate a war. The French remained calm, in spite of the growing popularity of Boulanger. The Goblet ministry resigned on the 17th of May 1887 after a hostile division on the budget, and the opportunity was taken to get rid of the minister of war, who posed as the coming restorer of Alsace and Lorraine to France. The Boulangist movement soon became anti-Republican, and the opposition to it of successive ministries improved the official relations of the French and German governments. The circumstances attending the fall of President Grévy the same year strengthened the Boulangist agitation, and Jules Ferry, who seemed indicated as his successor, was discarded by the Republican majority in the electoral congress, as a revolution was threatened in Paris if the choice fell on "the German Ferry." Sadi Carnot was consequently elected president of the Republic on the 3rd of December 1887. Three months later, on the 9th of March 1888, died the old emperor William who had personified the conquest of France by Germany. His son, the pacific emperor Frederick, died too, on the 15th of June, so the accession of William II., the pupil of Bismarck, at a moment when Boulanger threatened to become plebiscitary dictator of France, was ominous for the peace of Europe. But in April 1889 Boulanger ignominiously fled the country, and in March 1890 Bismarck fell. France none the less rejected all friendly overtures made by the young emperor. In February 1891 his mother came to Paris and was unluckily induced to visit the scenes of German triumph near the capital—the ruins of St Cloud and the Château of Versailles where the German empire was proclaimed. The incident called forth such an explosion of wrath from the French press that it was clear that France had not forgotten 1871. By this time, however, France was no longer isolated and at the mercy of Germany, which by reason of the increase of its population while that of France had remained almost stationary, was, under the system of compulsory military service in the two countries, more than a match for its neighbour in a single-handed conflict. Even the Triple Alliance ceased to be a terror for France. An understanding arose between France and Russia preliminary to the Franco-Russian alliance, which became the pivot of French exterior relations until the defeat of Russia

in the Japanese war of 1904. So the second renewal of the Triple Alliance was forthwith answered by a visit of the French squadron to Kronstadt in July 1891.

While such were the relations between France and the principal party to the Triple Alliance, the same period was marked by bitter dissension between France and Italy. Tunisia had made Italy Gallophobe, but the diplomatic relations between the two countries had been courteous until the death of Depretis in 1887. When Crispi succeeded him as prime minister, and till 1891 was the director of the exterior policy of Italy, a change took place. Crispi, though not the author of the Triple Alliance, entered with enthusiasm into its spirit of hostility to France. The old Sicilian revolutionary hastened to pay his respects to Bismarck at Friedrichsruh in October 1887, the visit being highly approved in Italy. Before that the French Chamber had, in July 1886, by a small majority, rejected a new treaty of navigation between France and Italy, this being followed by the failure to renew the commercial treaty of 1881. Irritating incidents were of constant occurrence. In 1888 a conflict between the French consul at Massowah and the Italians who occupied that Abyssinian port induced Bismarck to instruct the German ambassador in Paris to tell M. Goblet, minister for foreign affairs in the Floquet cabinet, in case he should refer to the matter, that if Italy were involved thereby in complications it would not stand alone—this menace being communicated to Crispi by the Italian ambassador at Berlin and officially printed in a green-book. But after Bismarck's fall relations improved a little, and in April 1890 the Italian fleet was sent to Toulon to salute President Carnot in the name of King Humbert, though this did not prevent the French government being suspected of having designs on Tripoli. Italian opinion was again incensed against France by the action of the French clericals, represented by a band of Catholic "pilgrims" who went to Rome to offer their sympathy to the pope in the autumn of 1891, and outraged the burial-place of Victor Emmanuel by writing in the visitors' register kept at the Pantheon the words "*Vive le pape.*" In August 1893 a fight took place at Aigues Mortes, the medieval walled city on the salt marshes of the Gulf of Lyons, between French and Italian workmen, in which seven Italians were killed. But Crispi had gone out of office early in 1891, and the ministers who succeeded him were more disposed to prevent a rupture between Italy and France. Crispi became prime minister again in December 1893, but this time without the portfolio of foreign affairs. He placed at the Consulta Baron Blanc, who though a strong partisan of the Triple Alliance was closely attached to France, being a native of Savoy, where he spent his yearly vacations on French soil. That the relations between the two nations were better was shown by what occurred after the murder of President Carnot in June 1894. The fact that the assassin was an Italian might have caused trouble a little earlier; but the grief of the Italians was so sincere, as shown by popular demonstrations at Rome, that no anti-Italian violence took place in France, and in the words of the French ambassador, M. Billot, Caserio's crime seemed likely to further an understanding between the two peoples. The movement was very slight and made no progress during the short presidency of M. Casimir-Périer. On the 1st of November 1894 Alexander III. died, when the Italian press gave proof of the importance attributed by the Triple Alliance to the Franco-Russian understanding by expressing a hope that the new tsar would put an end to it. But on the 10th of June 1895, the foreign minister, M. Hanotaux, intimated to the French Chamber that the understanding had become an alliance, and on the 17th the Russian ambassador in Paris conveyed to M. Félix Faure, who was now president of the Republic, the collar of St Andrew, while the same day the French and Russian men-of-war, invited to the opening of the Kiel Canal, entered German waters together. The union of France with Russia was no doubt one cause of the cessation of Italian hostility to France; but others were at work. The inauguration of the statue of MacMahon at Magenta the same week as the announcement of the Franco-Russian alliance showed that

France
and
Italy.

there was a disposition to revive the old sentiment of fraternity which had once united France with Italy. More important was the necessity felt by the Italians of improved commercial relations with the French. Crispi fell on the 4th of March 1896, after the news of the disaster to the Italian troops at Adowa, the war with Abyssinia being a disastrous legacy left by him. The previous year he had caused the withdrawal from Paris of the Italian ambassador Signor Ressimann, a friend of France, transferring thither Count Tornielli, who during his mission in London had made a speech, after the visit of the Italian fleet to Toulon, which qualified him to rank as a *misogallo*. But with the final disappearance of Crispi the relations of the two Latin neighbours became more natural. Commerce between them had diminished, and the business men of both countries, excepting certain protectionists, felt that the commercial rupture was mutually prejudicial. Friendly negotiations were initiated on both sides, and almost the last act of President Félix Faure before his sudden death—M. Delcassé being then foreign minister—was to promulgate, on the 2nd of February 1899, a new commercial arrangement between France and Italy which the French parliament had adopted. By that time M. Barrère was ambassador at the Quirinal and was engaged in promoting cordial relations between Italy and France, of which Count Tornielli in Paris had already become an ardent advocate. Italy remained a party to the Triple Alliance, which was renewed for a third period in 1902. But so changed had its significance become that in October 1903 the French Republic received for the first time an official visit from the sovereigns of Italy. This reconciliation of France and Italy was destined to have most important results outside the sphere of the Triple Alliance. The return visit which President Loubet paid to Victor Emmanuel III. in April 1904, it being the first time that a French chief of the state had gone to Rome since the pope had lost the temporal sovereignty, provoked a protest from the Vatican which caused the rupture of diplomatic relations between France and the Holy See, followed by the repudiation of the Concordat by an act passed in France, in 1905, separating the church from the state.

While the decadence of the Triple Alliance had this important effect on the domestic affairs of France, its inception had produced the Franco-Russian alliance, which took France out of its isolation in Europe, and became the pivot of its exterior policy. It has been noted that in the years succeeding the Franco-Prussian War the tsar Alexander II. had shown a disposition to support France against German aggression, as though to make up for his neutrality during the war, which was so benevolent for Germany that his uncle William I. had ascribed to it a large share of the German victory. The assassination of Alexander II. by revolutionaries in 1881 made it difficult for the new autocrat to cultivate closer relations with a Republican government, although the Third Republic, under the influence of Gambetta, to whom its consolidation was chiefly due, had repudiated that proselytizing spirit, inherited from the great Revolution, which had disquieted the monarchies of Europe in 1848 and had provoked their hostility to the Second Republic. But the Triple Alliance which was concluded the year after the murder of the tsar indicated the possible expediency of an understanding between the two great powers of the West and the East, in response to the combination of the three central powers of Europe,—though Bismarck after his fall revealed that in 1884 a secret treaty was concluded between Germany and Russia, which was, however, said to have in view a war between England and Russia. Internal dissension on the subject of colonial policy in the far East, followed by the fall of Jules Ferry and the Boulangist agitation were some of the causes which prevented France from strengthening its position in Europe by seeking a formal understanding with Russia in the first part of the reign of Alexander III. But when the Boulangist movement came to an end, entirely from the incompetency of its leader, it behoved the government of the Republic to find a means of satisfying the strong patriotic sentiment revealed in the nation, which, directed by a capable and daring soldier, would have swept away the parliamentary republic and estab-

lished a military dictatorship in its place. The Franco-Russian understanding provided that means, and Russia was ready for it, having become, by the termination in 1890 of the secret treaty with Germany, not less isolated in Europe than France. In July 1891, when the French fleet visited Kronstadt the incident caused such enthusiasm throughout the French nation that the exiled General Boulanger's existence would have been forgotten, except among his dwindling personal followers, had he not put an end to it by suicide two months later at Brussels. The Franco-Russian understanding united all parties, not in love for one another but in the idea that France was thereby about to resume its place in Europe. The Catholic Royalists ceased to talk of the restitution of the temporal power of the pope in their joy at the deference of the government of the republic for the most autocratic monarchy of Christendom; the Boulangists, now called Nationalists, hoped that it would lead to the war of revenge with Germany, and that it might also be the means of humiliating England, as shown by their resentment at the visit of the French squadron to Portsmouth on its way home from Kronstadt. It is, however, extremely improbable that the understanding and subsequent alliance would have been effected had the Boulangist movement succeeded. For the last thing that the Russian government desired was war with Germany. What it needed and obtained was security against German aggression on its frontier and financial aid from France; so a French plebiscitary government, having for its aim the restitution of Alsace and Lorraine, would have found no support in Russia. As the German chancellor, Count von Caprivi, said in the Reichstag on the 27th of November 1891, a few weeks after a Russian loan had been subscribed in France nearly eight times over, the naval visit to Kronstadt had not brought war nearer by one single inch. Nevertheless when in 1893 the Russian fleet paid a somewhat tardy return visit to Toulon, where it was reviewed by President Carnot, a party of Russian officers who came to Paris was received by the population of the capital, which less than five years before had acclaimed General Boulanger, with raptures which could not have been exceeded had they brought back to France the territory lost in 1871. In November 1894, Alexander III. died, and in January 1895, M. Casimir-Périer resigned the presidency of the Republic, to which he had succeeded only six months before on the assassination of M. Carnot. So it was left to Nicholas II. and President Félix Faure to proclaim the existence of a formal alliance between France and Russia. It appears that in 1891 and 1892, at the time of the first public manifestations of friendship between France and Russia, in the words of M. Ribot, secret conventions were signed by him, being foreign minister, and M. de Freycinet, president of the council, which secured for France "the support of Russia for the maintenance of the equilibrium in Europe"; and on a later occasion the same statesman said that it was after the visit of the empress Frederick to Paris in 1891 that Alexander III. made to France certain offers which were accepted. The word "alliance" was not publicly used by any minister to connote the relations of France with Russia until the 10th of June 1895, when M. Hanotaux used the term with cautious vagueness amid the applause of the Chamber of Deputies. Yet not even when Nicholas II. came to France in October 1896 was the word "alliance" formally pronounced in any of the official speeches. But the reception given to the tsar and tsaritsa in Paris, where no European sovereign had come officially since William of Germany passed down the Champs Elysées as a conqueror, was of such a character that none could doubt that this was the consecration of the alliance. It was at last formally proclaimed by Nicholas II., on board a French man-of-war, on the occasion of the visit of the president of the Republic to Russia in August 1897. From that date until the formation of M. Briand's cabinet in 1909, nine different ministries succeeded one another and five ministers of foreign affairs; but they all loyally supported the Franco-Russian alliance, although its popularity diminished in France long before the war between Russia and Japan, which deprived it of its efficacy in Europe. In 1901 Nicholas II. came again to France and was the guest of President

Loubet at Compiègne. His visit excited little enthusiasm in the nation, which was disposed to attribute it to Russia's financial need of France; while the Socialists, now a strong party which provided the Waldeck-Rousseau ministry with an important part of its majority in the Chamber, violently attacked the alliance of the Republic with a reactionary autocracy. However anomalous that may have been it did not prevent the whole French nation from welcoming the friendship between the governments of Russia and of France in its early stages. Nor can there be any doubt that the popular instinct was right in according it that welcome. France in its international relations was strengthened morally by the understanding and by the alliance, which also served as a check to Germany. But its association with Russia had not the results hoped for by the French reactionaries. It encouraged them in their opposition to the parliamentary Republic during the Dreyfus agitation, the more so because the Russian autocracy is anti-Semitic. It also made a Nationalist of one president of the Republic, Félix Faure, whose head was so turned by his imperial frequentations that he adopted some of the less admirable practices of princes, and also seemed ready to assume the bearing of an autocrat. His sudden death was as great a relief to the parliamentary Republicans as it was a disappointment to the plebiscitary party, which anti-Dreyfusism, with its patriotic pretensions, had again made a formidable force in the land. But the election of the pacific and constitutional M. Loubet as president of the Republic at this critical moment in its history counteracted any reactionary influence which the Russian alliance might have had in France; so the general effect of the alliance was to strengthen the Republic and to add to its prestige. The visit of the tsar to Paris, the first paid by a friendly sovereign since the Second Empire, impressed a population, proud of its capital, by an outward sign which seemed to show that the Republic was not an obstacle to the recognition by the monarchies of Europe of the place still held by France among the great powers. Before M. Loubet laid down office the nation, grown more republican, saw the visit of the tsar followed by those of the kings of England and of Italy, who might never have been moved to present their respects to the French Republic had not Russia shown them the way.

While the French rejoiced at the Russian alliance chiefly as a check to the aggressive designs of Germany, they also liked the association of France with a power regarded as hostile to England. This traditional feeling was not discouraged by one of the chief artificers of the alliance, Baron Mohrenheim, Russian ambassador in Paris, who until 1884 had filled the same position in London, where he had not learned to love England, and who enjoyed in France a popularity rarely accorded to the diplomatic agent of a foreign power. An *entente cordiale* has since been initiated between England and France. But it is necessary to refer to the less agreeable relations which existed between the two countries, as they had some influence on the exterior policy of the Third Republic. England and France had no causes of friction within Europe. But in its policy of colonial expansion, during the last twenty years of the 19th century, France constantly encountered England all over the globe. The first important enterprise beyond the seas seriously undertaken by France after the Franco-German War, was, as we have seen, in Tunis. But even before that question had been mentioned at the congress of Berlin, in 1878, France had become involved in an adventure in the Far East, which in its developments attracted more public attention at home than the extension of French territory in northern Africa. Had these pages been written before the end of the 19th century it would have seemed necessary to trace the operations of France in Indo-China with not less detail than has been given to the establishment of the protectorate in Tunis. But French hopes of founding a great empire in the Far East came to an end with the partial resuscitation of China and the rise to power of Japan. As we have seen, Jules Ferry's idea was that in colonial expansion France would find the best means of recovering prestige after the defeat of 1870-71 in the years

of recuperation when it was essential to be diverted from European complications. Jules Ferry was not a friend of Gambetta, in spite of later republican legends. But the policy of colonial expansion in Tunis and in Indo-China, associated with Ferry's name, was projected by Gambetta to give satisfaction to France for the necessity, imposed, in his opinion, on the French government, of taking its lead in foreign affairs from Berlin. How Jules Ferry developed that system we know now from Bismarck's subsequent expressions of regret at Ferry's fall. He believed that, had Ferry remained in power, an amicable arrangement would have been made between France and Germany, a formal agreement having been almost concluded to the effect that France should maintain peaceable and friendly relations with Germany, while Bismarck supported France in Tunis, in Indo-China and generally in its schemes of oversea colonization. Even though the friendly attitude of Germany towards those schemes was not official the contrast was manifest between the benevolent tone of the German press and that of the English, which was generally hostile. Jules Ferry took his stand on the position that his policy was one not of colonial conquest, but of colonial conservation, that without Tunis, Algeria was insecure, that without Tongking and Annam, there was danger of losing Cochinchina, where the French had been in possession since 1861. It was on the Tongking question that Ferry fell. On the 30th of March 1885, on the news of the defeat of the French troops at Lang-Son, the Chamber refused to vote the money for carrying on the campaign by a majority of 306 to 149. Since that day public opinion in France has made amends to the memory of Jules Ferry. His patriotic foresight has been extolled. Criticism has not been spared for the opponents of his policy in parliament of whom the most conspicuous, M. Clémenceau and M. Ribot, have survived to take a leading part in public affairs in the 20th century. The attitude of the Parisian press, which compared Lang-Son with Sedan and Jules Ferry with Émile Ollivier, has been generally deplored, as has that of the public which was ready to offer violence to the fallen minister, and which was still so hostile to him in 1887 that the congress at Versailles was persuaded that there would be a revolution in Paris if it elected "the German Ferry" president of the Republic. Nevertheless his adversaries in parliament, in the press and in the street have been justified—not owing to their superior sagacity, but owing to a series of unexpected events which the most foreseeing statesmen of the world never anticipated. The Indo-China dream of Jules Ferry might have led to a magnificent empire in the East to compensate for that which Dupleix lost and Napoleon failed to reconquer.

The Russian alliance, which came at the time when Ferry's policy was justified in the eyes of the public, too late for him to enjoy any credit, gave a new impetus to the French idea of establishing an empire in the Far East. In the opinion of all the prophets of Europe the great international struggle in the near future was to be that of England with Russia for the possession of India. If Russia won, France might have a share in the dismembered Indian empire, of which part of the frontier now marched with that of French Indo-China, since Burma had become British and Tongking French. Such aspirations were not formulated in white-books or in parliamentary speeches. Indeed, the apprehension of difficulty with England limited French ambition on the Siamese frontier. That did not prevent dangerous friction arising between England and France on the question of the Mekong, the river which flows from China almost due south into the China Sea traversing the whole length of French Indo-China, and forming part of the eastern boundary of Upper Burma and Siam. The aim of France was to secure the whole of the left bank of the Mekong, the highway of commerce from southern China. The opposition of Siam to this delimitation was believed by the French to be inspired by England, the supremacy of France on the Mekong river being prejudicial to British commerce with China. The inevitable rivalry between the two powers reached an acute crisis in 1893, the British ambassador in Paris being Lord Dufferin, who well understood the question, upper Burma having been annexed to India under

Relations
with
England.

his vicerealty in 1885. The matter was not settled until 1894, when not only was the French claim to the left bank of the Mekong allowed, but the neutrality of a 25-kilometre zone on the Siamese bank was conceded as open to French trade. It is said that at one moment in July 1893 England and France were more nearly at war than at any other international crisis under the Third Republic, not excluding that of Fashoda, though the acute tension between the governments was unknown to the public.

The Panama affair had left French public opinion in a nervous condition. Fantastic charges were brought not only in the press, but in the chamber of deputies, against newspapers and politicians of having accepted bribes from the British government. At the general election in August and September 1893 M. Clémenceau was pursued into his distant constituency in the Var by a crowd of Parisian politicians, who brought about his defeat less by alleging his connexion with the Panama scandal than by propagating the legend that he was the paid agent of England. The official republic, which changed its prime minister three times and its foreign minister twice in 1893, M. Develle filling that post in the Ribot and Dupuy ministries and M. Casimir-Périer in his own, repudiated with energy the calumnies as to the attempted interference of England in French domestic affairs. But the successive governments were not in a mood to make concessions in foreign questions, as all France was under the glamour of the preliminary manifestations of the Russian alliance. This was seen, a few weeks after the elections, in the wild enthusiasm with which Paris received Admiral Avelane and his officers, who had brought the Russian fleet to Toulon to return the visit of the French fleet to Kronstadt in 1891. The death of Marshal MacMahon, who had won his first renown in the Crimea, and his funeral at the Invalides while the Russians were in Paris, were used to emphasize the fact that the allies before Sebastopol were no longer friends. The projector of the French empire in the Far East did not live to see this phase of the seeming justification of the policy which had cost him place and popularity. Jules Ferry had died on the 17th of March 1893, only three weeks after his triumphant rehabilitation in the political world by his election to the presidency of the Senate, the second post in the state. The year he died it seemed as though with the active aid of Russia and the sympathy of Germany the possessions of France in south-eastern Asia might have indefinitely expanded into southern China. A few years later the defeat of Russia by Japan and the rise of the sea-power of the Japanese practically ended the French empire in Indo-China. What the French already had at the end of the last century is virtually guaranteed to them only by the Anglo-Japanese alliance. It is in the irony of things that these possessions which were a sign of French rivalry with England should now be secured to France by England's friendliness. For it is now recognized by the French that the defence of Indo-China is impossible.

Had the French dream been realized of a large expansion of territory into southern China, the success of the new empire would have been based on free Chinese labour. This might have counterbalanced an initial obstacle to all French colonial schemes, more important than those which arise from international difficulties—the reluctance of the French to establish themselves as serious colonists in their oversea possessions. We have noted how Algeria, which is nearer to Toulon and Marseilles than are Paris and Havre, has been comparatively neglected by the French, after eighty years of occupation, in spite of the amenity of its climate and its soil for European settlers. The new French colonial school advocates the withdrawal of France from adventures in distant tropical countries which can be reached only by long sea voyages, and the concentration of French activity in the northern half of the African continent. Madagascar is, as we have seen, counted as Africa in computing the area of French colonial territory. But it lies entirely outside the scheme of African colonization, and in spite of the loss of life and money incurred in its conquest, its retention is not popular with the new school, although the first claim of France to it was as long ago as the reign of Louis XIII., when in 1642 a company was founded under

African policy.

the protection of Richelieu for the colonization of the island. The French of the 19th and 20th centuries may well be considered less enterprising in both hemispheres than were their ancestors of the 17th, and Madagascar, after having been the cause of much ill-feeling between England and France under the Third Republic down to the time of its formal annexation, by the law of the 9th of August 1896, is not now the object of much interest among French politicians. On the African continent it is different. When the Republic succeeded to the Second Empire the French African possessions outside Algiers were inconsiderable in area. The chief was Senegal, which though founded as a French station under Louis XIII., was virtually the creation of Faidherbe under the Second Empire, even in a greater degree than were Tunis and Tongking of Jules Ferry under the Third Republic. There was also Gabun, which is now included in French Congo. Those outposts in the tropics became the starting-points for the expansion of a French sphere of influence in north Africa, which by the beginning of the 20th century made France the nominal possessor of a vast territory stretching from the equatorial region on the gulf of Guinea to the Mediterranean. A large portion of it is of no importance, including the once mysterious Timbuktu and the wilds of the waterless Sahara desert. But the steps whereby these wide tracts of wilderness and of valuable territory came to be marked on the maps in French colours, by international agreement, are important, as they were associated with the last serious official dispute between England and France before the period of *entente*. M. Hanotaux, who was foreign minister for the then unprecedented term of four years, from 1894 to 1898, with one short interval of a few months, has thrown an instructive light on the feeling with which French politicians up to the end of the 19th century regarded England. He declared in 1909, with the high authority of one who was during years of Anglo-French tension the mouth-piece of the Republic in its relations with other powers, that every move in the direction of colonial expansion made by France disquieted and irritated England. He complained that when France, under the stimulating guidance of Jules Ferry, undertook the reconstitution of an oversea domain, England barred the way—in Egypt, in Tunis, in Madagascar, in Indo-China, in the Congo, in Oceania. Writing with the knowledge of an ex-foreign minister, who had enjoyed many years of retirement to enable him to weigh his words, M. Hanotaux asserted without any qualification that when he took office England "had conceived a triple design, to assume the position of heir to the Portuguese possessions in Africa, to destroy the independence of the South African republics, and to remain in perpetuity in Egypt." We have not to discuss the truth of those propositions, we have only to note the tendency of French policy; and in so doing it is useful to remark that the official belief of the Third Republic in the last period of the 19th century was that England was the enemy of French colonial expansion all over the globe, and that in the so-called scramble for Africa English ambition was the chief obstacle to the schemes of France. M. Hanotaux, with the authority of official knowledge, indicated that the English project of a railway from the Cape of Good Hope to Cairo was the provocation which stimulated the French to essay a similar adventure; though he denied that the Marchand mission and other similar expeditions about to be mentioned were conceived with the specific object of preventing the accomplishment of the British plan. The explorations of Stanley had demonstrated that access to the Great Lakes and the Upper Nile could be effected as easily from the west coast of Africa as from other directions. The French, from their ancient possession of Gabun, had extended their operations far to the east, and had by treaties with European powers obtained the right bank of the Ubanghi, a great affluent of the Congo, as a frontier between their territory and that of the Congo Independent State. They thus found themselves, with respect to Europe, in possession of a region which approached the valley of the Upper Nile. Between the fall of Jules Ferry in 1885 and the beginning of the Russian alliance came a period

French and English rivalry.

of decreased activity in French colonial expansion. The unpopularity of the Tongking expedition was one of the causes of the popularity of General Boulanger, who diverted the French public from distant enterprises to a contemplation of the German frontier, and when Boulangism came to an end the Panama affair took its place in the interest it excited. But the colonial party in France did not lose sight of the possibility of establishing

Upper Nile exploration. a position on the Upper Nile. The partition of Africa seemed to offer an occasion for France to take compensation for the English occupation of Egypt. In 1892 the Budget Commission, on the proposal of M. Étienne, deputy for Oran, who had three times been colonial under secretary, voted 300,000 francs for the despatch of a mission to explore and report on those regions, which had not had much attention since the days of Emin. But the project was not then carried out. Later, parliament voted a sum six times larger for strengthening the French positions on the Upper Ubanghi and their means of communication with the coast. But Colonel Monteil's expedition, which was the consequence of this vote, was diverted, and the 1,800,000 francs were spent at Loango, the southern port of French Congo, and on the Ivory Coast, the French territory which lies between Liberia and the British Gold Coast Colony, where a prolonged war ensued with Samory, a Nigerian chieftain. In September 1894, M. Delcassé being colonial minister, M. Liotard was appointed commissioner of the Upper Ubanghi with instructions to extend French influence in the Bahr-el-Ghazal up to the Nile. In addition to official missions, numerous expeditions of French explorers took place in Central Africa during this period, and negotiations were continually going on between the British and French governments. Towards the end of 1895 Lord Salisbury, who had succeeded Lord Kimberley at the foreign office, informed Baron de Courcel, the French ambassador, that an expedition to the Upper Nile was projected for the purpose of putting an end to Mahdism. M. Hanotaux was not at this moment minister of foreign affairs. He had been succeeded by M. Berthelot, the eminent chemist, who resigned that office on the 26th of March 1896, a month before the fall of the Bourgeois cabinet of which he was a member, in consequence of a question raised in the chamber on this subject of the English expedition to the Soudan. According to M. Hanotaux, who returned to the Quai d'Orsay, in the Méline ministry, on the 29th of April 1896, Lord Salisbury at the end of the previous year, in announcing the expedition confidentially to M. de Courcel, had assured him that it would not go beyond Dongola without a preliminary understanding with France. There must have been a misunderstanding on this point, as after reaching Dongola in September 1896 the Anglo-Egyptian army proceeded up the Nile in the direction of Khartoum. Before M. Hanotaux resumed office the Marchand mission had been formally planned. On the 24th of February 1896 M. Guieysse, colonial minister in the Bourgeois ministry, had signed Captain Marchand's instructions to the effect that he must march through the Upper Ubanghi, in order to extend French influence as far as the Nile, and try to reach that river before Colonel Colville, who was leading an expedition from the East. He was also advised to conciliate the Mahdi if the aim of the mission could be benefited thereby. M. Liotard was raised to the rank of governor of the Upper Ubanghi, and in a despatch to him the new colonial minister, M. André Lebon, wrote that the Marchand mission was not to be considered a military enterprise, it being sent out with the intention of maintaining the political line which for two years M. Liotard had persistently been following, and of which the establishment of France in the basin of the Nile ought to be the crowning reward. Two days later, on the 25th of June 1896, Captain Marchand embarked for Africa. This is not the place for a description of his adventures in crossing the continent or when he encountered General Kitchener at Fashoda, two months after his arrival there in July 1898 and a fortnight after the battle of Omdurman and the capture of Khartoum. The news was made known to Europe by the

Marchand mission.

sirdar's telegrams to the British government in September announcing the presence of the French mission at Fashoda. Then ensued a period of acute tension between the French and English governments, which gave the impression to the public that war between the two countries was inevitable. But those who were watching the situation in France on the spot knew that there was no question of fighting. France was unprepared, and was also involved in the toils of the Dreyfus affair. Had the situation been that of a year later, when the French domestic controversy was ending and the Transvaal War beginning, England might have been in a very difficult position. General Kitchener declined to recognize a French occupation of any part of the Nile valley. A long discussion ensued between the British and French governments, which was ended by the latter deciding on the 6th of November 1898 not to maintain the Marchand mission at Fashoda. Captain Marchand refused to return to Europe by way of the Nile and Lower Egypt, marching across Abyssinia to Jibuti in French Somaliland, where he embarked for France. He was received with well-merited enthusiasm in Paris. But the most remarkable feature of his reception was that the ministry became so alarmed lest the popularity of the hero of Fashoda should be at the expense of that of the parliamentary republic, that it put an end to the public acclamations by despatching him secretly from the capital—a somewhat similar treatment having been accorded to General Dodds in 1893 on his return to France after conquering Dahomey. The Marchand mission had little effect on African questions at issue between France and Great Britain, as a great settlement had been effected while it was on its way across the continent. On the 14th of June 1898, the day before the fall of the Méline ministry, when M. Hanotaux finally quitted the Quai d'Orsay, a convention of general delimitation was signed at Paris by that minister and by the British ambassador, Sir Edmund Monson, which as regards the respective claims of England and France covered in its scope the whole of the northern half of Africa from Senegambia and the Congo to the valley of the Nile. Comparatively little attention was paid to it amid the exciting events which followed, so little that M. de Courcel has officially recorded that three months later, on the eve of the Fashoda incident, Lord Salisbury declared to him that he was not sufficiently acquainted with the geography of Africa to express an opinion on certain questions of delimitation arising out of the success of the British expedition on the Upper Nile. The convention of June 1898 was, however, of the highest importance, as it affirmed the junction into one vast territory of the three chief African domains of France, Algeria and Tunis, Senegal and the Niger, Chad and the Congo, thus conceding to France the whole of the north-western continent with the exception of Morocco, Liberia and the European colonies on the Atlantic. This arrangement, which was completed by an additional convention on the 21st of March 1899, made Morocco a legitimate object of French ambition.

The other questions which caused mutual animosity between England and France in the decline of the 19th century had nothing whatever to do with their conflicting international interests. The offensive attitude of the English press towards France on account of the Dreyfus affair was repaid by the French in their criticism of the Boer War. When those sentimental causes of mutual irritation had become less acute, the press of the two countries was moved by certain influences to recognize that it was in their interest to be on good terms with one another. The importance of their commercial relations was brought into relief as though it were a new fact. At last in 1903 state visits between the rulers of England and of France took place in their respective capitals, for the first time since the early days of the Second Empire, followed by an Anglo-French convention signed on the 8th of April 1904. By this an arrangement was come to on outstanding questions of controversy between England and France in various parts of the world. France undertook not to interfere with the action of England in Egypt,

Convention of 1898.

The entente with England.

while England made a like undertaking as to French influence in Morocco. France conceded certain of its fishing rights in Newfoundland which had been a perpetual source of irritation between the two countries for nearly two hundred years since the treaty of Utrecht of 1713. In return England made several concessions to France in Africa, including that of the Los Islands off Sierra Leone and some rectifications of frontier on the Gambia and between the Niger and Lake Chad. Other points of difference were arranged as to Siam, the New Hebrides and Madagascar. The convention of 1904 was on the whole more advantageous for England than for France. The free hand which England conceded to France in dealing with Morocco was a somewhat burdensome gift owing to German interference; but the incidents which arose from the Franco-German conflict in that country are as yet too recent for any estimate of their possible consequences.

One result was the retirement of M. Delcassé from the foreign office on the 6th of June 1905. He had been foreign minister for seven years, a consecutive period of rare length, only once exceeded in England since the creation of the office, when Castlereagh held it for ten years, and one of prodigious duration in the history of the Third Republic. He first went to the Quai d'Orsay in the Brisson ministry of June 1898, remained there during the Dupuy ministry of the same year, was reappointed by M. Waldeck-Rousseau in his cabinet which lasted from June 1899 to June 1902, was retained in the post by M. Combes till his ministry fell in January 1905, and again by his successor M. Rouvier till his own resignation in June of that year. M. Delcassé had thus an uninterrupted reign at the foreign office during a long critical period of transition both in the interior politics of France and in its exterior relations. He went to the Quai d'Orsay when the Dreyfus agitation was most acute, and left it when parliament was absorbed in discussing the separation of church and state. He saw the Franco-Russian alliance lose its popularity in the country even before the Russian defeat by the Japanese in the last days of his ministry. Although in the course of his official duties at the colonial office he had been partly responsible for some of the expeditions sent to Africa for the purpose of checking British influence, he was fully disposed to pursue a policy which might lead to a friendly understanding with England. In this he differed from M. Hanotaux, who was essentially the man of the Franco-Russian alliance, owing to it much of his prestige, including his election to the French Academy, and Russia, to which he gave exclusive allegiance, was then deemed to be primarily the enemy of England. M. Delcassé on the contrary, from the first, desired to assist a *rapprochement* between England and Russia as preliminary to the arrangement he proposed between England and France. He was foreign minister when the tsar paid his second visit to France, but there was no longer the national unanimity which welcomed him in 1896. M. Delcassé also accompanied President Loubet to Russia when he returned the tsar's second visit in 1902. But exchange of compliments between France and Russia were no longer to be the sole international ceremonies within the attributes of the French foreign office; M. Delcassé was minister when the procession of European sovereigns headed by the kings of England and of Italy in 1903 came officially to Paris, and he went with M. Loubet to London and to Rome on the president's return visits to those capitals—the latter being the immediate cause of the rupture of the concordat with the Vatican, though M. Delcassé was essentially a concordatory minister. His retirement from the Rouvier ministry in June 1905 was due to pressure from Germany in consequence of his opposition to German interference in Morocco. His resignation took place just a week after the news had arrived of the destruction of the Russian fleet by the Japanese, which completed the disablement of the one ally of France. The impression was current in France that Germany wished to give the French nation a fright before the understanding with England had reached an effective stage, and it was actually believed that the resignation of M. Delcassé averted a declaration of war. Although that belief revived to some extent the fading enmity

of the French towards the conquerors of Alsace-Lorraine, the fear which accompanied it moved a considerable section of the nation to favour an understanding with Germany in preference to, or even at the expense of, friendly relations with England. M. Clémenceau, who only late in life came into office, and attained it at the moment when a better understanding with England was progressing, had been throughout his long career, of all French public men in all political groups, the most consistent friend of England. His presence at the head of affairs was a guarantee of amicable Anglo-French relations, so far as they could be protected by statesmanship.

By reason of the increased duration and stability of ministries, the personal influence of ministers in directing the foreign policy of France has in one sense become greater in the 20th century than in those earlier periods when France had first to recuperate its strength after the war and then to take its exterior policy from Germany. Moreover, not only have cabinets lasted longer, but the foreign minister has often been retained in a succession of them. Of the thirty years which in 1909 had elapsed since Marshal MacMahon retired and the republic was governed by republicans, in the first fifteen years from 1879 to 1894 fourteen different persons held the office of minister of foreign affairs, while six sufficed for the fifteen years succeeding the latter date. One must not, however, exaggerate the effect of this greater stability in office-holding upon continuity of policy, which was well maintained even in the days when there was on an average a new foreign minister every year. Indeed the most marked breach in the continuity of the foreign policy of France has been made in that later period of long terms of office, which, with the repudiation of the Concordat, has seen the withdrawal of the French protectorate over Roman Catholic missions in the East—though it is too soon to estimate the result. In another respect France has under the republic departed a long way from a tradition of the Quai d'Orsay. It no longer troubles itself on the subject of nationalities. Napoleon III., who had more French temperament than French blood in his constitution, was an idealist on this question, and one of the causes of his own downfall and the defeat of France was his sympathy in this direction with German unity. Since Sedan little has been done in France to further the doctrine of nationalities. A faint echo of it was heard during the Boer war, but French sympathy with the struggling Dutch republics of South Africa was based rather on anti-English sentiment than on any abstract theory. (J. E. C. B.)

BIBLIOGRAPHY OF FRENCH HISTORY.—The scientific study of the history of France only begins with the 16th century. It was hampered at first by the traditions of the middle ages and by a servile imitation of antiquity. Paulus Aemilius of Verona (*De rebus gestis Francorum*, 1517), who may be called the first of modern historians, merely applies the oratorical methods of the Latin historiographers. It is not till the second half of the century that history emancipates itself; Catholics and Protestants alike turn to it for arguments in their religious and political controversies. François Hotman published (1574) his *Franco-Gallia*; Claude Fauchet his *Antiquités gauloises et françaises* (1579); Étienne Pasquier his *Recherches de la France* (1611), "the only work of erudition of the 16th century which one can read through without being bored." Amateurs like Petau, A. de Thou, Bongars and Peiresc collected libraries to which men of learning went to draw their knowledge of the past; Pierre Pithou, one of the authors of the *Satire Ménippée*, published the earliest annals of France (*Annales Francorum*, 1588, and *Historiae Francorum scriptores coetanei XI.*, 1596); Jacques Bongars collected in his *Gesta Dei per Francos* (1611–1617) the principal chroniclers of the Crusades. Others made a study of chronology like J. J. Scaliger (*De emendatione temporum*, 1583; *Thesaurus temporum*, 1606), sketched the history of literature, like François Grudé, sieur of La Croix in Maine (*Bibliothèque française*, 1584); and Antoine du Verdier (*Catalogue de tous les auteurs qui ont écrit ou traduit en français*, 1585), or discussed the actual principles of historical research, like Jean Bodin (*Methodus ad facilem historiarum cognitionem*, 1566) and Henri Lancelot Voisin de La Popelinière (*Histoire des histoires*, 1599).

But the writers of history are as yet very inexpert; the *Histoire générale des rois de France* of Bernard de Girard, seigneur de Haillan (1576), the *Grandes Annales de France* of François de Belleforest (1579), the *Inventaire général de l'histoire de France* of Jean de Serres (1597), the *Histoire générale de France depuis Pharamond* of Scipion Dupleix (1621–1645), the *Histoire de France* (1643–1651) of François Eudes de Mézeray, and above all his *Abrégé chronologique de l'histoire*

de France (1668), are compilations which were eagerly read when they appeared, but are worthless nowadays. Historical research lacked method, leaders and trained workers; it found them all in the 17th century, the golden age of learning which was honoured alike by laymen, priests and members of the monastic orders, especially the Benedictines of the congregation of St Maur. The publication of original documents was carried on with enthusiasm. To André Duchesne we owe two great collections of chronicles: the *Historiae Normannorum scriptores antiqui* (1619) and the *Historiae Francorum scriptores*, continued by his son François (5 vols., 1636-1649). These publications were due to a part only of his prodigious activity; his papers and manuscripts, preserved in the Bibliothèque Nationale at Paris, are an inexhaustible mine. Charles du Fresne, seigneur du Cange, published Villehardouin (1657) and Joinville (1668); Étienne Baluze, the *Capitularia regum Francorum* (1674), the *Nova collectio conciliorum* (1677), the *Vitae paparum Avenionensium* (1693). The clergy were very much aided in their work by their private libraries and by their co-operation; Père Philippe Labbe published his *Bibliotheca nova manuscritorum* (1657), and began (1671) his *Collectio des conciles*, which was successfully completed by his colleague Père Cosart (18 vols.). In 1643 the Jesuit Jean Bolland brought out vol. i. of the *Acta sanctorum*, a vast collection of stories and legends which has not yet been completed beyond the 4th of November. (See BOLLANDISTS.) The Benedictines, for their part, published the *Acta sanctorum ordinis sancti Benedicti* (9 vols., 1668-1701). One of the chief editors of this collection, Dom Jean Mabillon, published on his own account the *Vetera analecta* (4 vols., 1675-1685) and prepared the *Annales ordinis sancti Benedicti* (6 vols., 1703-1793). To Dom Thierry Ruinat we owe good editions of Gregory of Tours and Fredegarius (1699). The learning of the 17th century further inaugurated those specialized studies which are important aids to history. Mabillon in his *De re diplomatica* (1681) creates the science of documents or diplomatics. Adrien de Valois lays a sound foundation for historical geography by his critical edition of the *Notitia Galliarum* (1675). Numismatics finds an enlightened pioneer in François Leblanc (*Traité historique des monnaies de France*, 1690). Du Cange, one of the greatest of the French scholars who have studied the middle ages, has defined terms bearing on institutions in his *Glossarium mediae et infimae latinitatis* (1678), recast by the Benedictines (1733), with an important supplement by Dom Carpentier (1768), republished twice during the 19th century, with additions, by F. Didot (1840-1850), and by L. Favre at Niort (1883-1888); this work is still indispensable to every student of medieval history. Finally, great biographical or bibliographical works were undertaken; the *Gallia christiana*, which gave a chronological list of the archbishops, bishops and abbots of the Gauls and of France, was compiled by two twin brothers, Scévole and Louis de Sainte-Marthe, and by the two sons of Louis (4 vols., 1656); a fresh edition, on a better plan, and with great additions, was begun in 1715 by Denys de Sainte-Marthe, continued throughout the 18th century by the Benedictines, and finished in the 19th century by Barthélemy Haureau (1856-1861).

As to the nobility, a series of researches and publications, begun by Pierre d'Hozier (d. 1660) and continued well on into the 19th century by several of his descendants, developed into the *Armorial général de la France*, which was remodelled several times. A similar work, of a more critical nature, was carried out by Père Anselme (*Histoire généalogique de la maison de France et des grands officiers de la couronne*, 1674) and by Père Ange and Père Simplicien, who completed the work (3rd ed. in 9 vols., 1726-1733). Critical bibliography is especially represented by certain Protestants, expelled from France by the revocation of the Edict of Nantes. Pierre Bayle, the sceptic, famous for his *Dictionnaire critique* (1699), which is in part a refutation of the *Dictionnaire historique et géographique* published in 1673 by the Abbé Louis Moréri, was the first to publish the *Nouvelles de la république des lettres* (1684-1687), which was continued by Henri Basnage de Beauval under the title of *Histoire des ouvrages des savants* (24 vols.). In imitation of this, Jean Le Clerc successively edited a *Bibliothèque universelle et historique* (1686-1693), a *Bibliothèque choisie* (1703-1713), and a *Bibliothèque ancienne et moderne* (1714-1727). These were the first of our "periodicals."

The 18th century continues the traditions of the 17th. The Benedictines still for some time hold the first place. Dom Edmond Martène visited numerous archives (which were then closed) in France and neighbouring countries, and drew from them the material for two important collections: *Thesaurus novus anecdotorum* (9 vols., 1717, in collaboration with Dom Ursin Durand) and *Veterum scriptorum collectio* (9 vols., 1724-1733). Dom Bernard de Montfaucon also travelled in search of illustrated records of antiquity; private collections, among others the celebrated collection of Gaignières (now in the Bibliothèque Nationale), provided him with the illustrations which he published in his *Monuments de la monarchie française* (5 vols., 1729-1733). The text is in two languages, Latin and French. Dom Martin Bouquet took up the work begun by the two Duchesnes, and in 1738 published vol. i. of the *Historians of France* (*Rerum Galliarum et Francicarum scriptores*), an enormous collection which was intended to include all the sources of the history of France, grouped under centuries and reigns. He produced the first eight volumes himself; his work was continued by several

collaborators, the most active of whom was Dom Michel J. Brial, and already comprised thirteen volumes when it was interrupted by the Revolution. In 1733, Antoine Rivet de La Grange produced vol. i. of the *Histoire littéraire de la France*, which in 1789 numbered twelve volumes. While Dom C. François Toussaint and Dom René Prosper Tassin published a *Nouveau Traité de diplomatique* (6 vols., 1750-1765), others were undertaking the *Art de vérifier les dates* (1750; new and much enlarged edition in 1770). Still others, with more or less success, attempted histories of the provinces.

In the second half of the 18th century, the ardour of the Benedictines of St Maur diminished, and scientific work passed more and more into the hands of laymen. The Académie des Inscriptions et Belles-lettres, founded in 1663 and reorganized in 1701, became its chief instrument, numbering among its members Denis François Secousse, who continued the collection of *Ordonnances des rois de France*, begun (1723) by J. de Laurière; J.-B. de La Curne de Sainte-Palaye (*Mémoires sur l'ancienne chevalerie*, 1759-1781; *Glossaire de la langue française depuis son origine jusqu'à la fin de Louis XIV.*, printed only in 1875-1882); J.-B. d'Anville (*Notice sur l'ancienne Gaule tirée des monuments*, 1760); and L. G. de Bréquigny, the greatest of them all, who continued the publication of the *Ordonnances*, began the *Table chronologique des diplômes concernant l'histoire de France* (3 vols., 1769-1783), published the *Diplomata, chartae, ad res Francicas spectantia* (1791, with the collaboration of La Porte du Theil), and directed fruitful researches in the archives in London, to enrich the *Cabinet des chartes*, where Henri Bertin (1719-1792), an enlightened minister of Louis XV., had in 1764 set himself the task of collecting the documentary sources of the national history. The example set by the religious orders and the government bore fruit. The general assembly of the clergy gave orders that its *Procès verbaux* (9 vols., 1767-1789) should be printed; some of the provinces decided to have their history written, and mostly applied to the Benedictines to have this done. Brittany was treated by Dom Lobineau (1707) and Dom Morice (1742); the duchy of Burgundy by Dom Urbain Plancher (1739-1748); Languedoc by Dom Dominique Vaissète (1730-1749, in collaboration with Dom Claude de Vic; new ed. 1873-1893); for Paris, its secular history was treated by Dom Michel Félibien and Dom Lobineau (1725), and its ecclesiastical history by the abbé Lebeuf (1745-1760; new ed. 1883-1890).

This ever-increasing stream of new evidence aroused curiosity, gave rise to pregnant comparisons, developed and sharpened the critical sense, but further led to a more and more urgent need for exact information. The Académie des Inscriptions brought out its *Histoire de l'Académie avec les mémoires de littérature tirés de ses registres* (vol. i. 1717; 51 vols. appeared before the Revolution, with five indexes; vide the *Bibliographie* of Lasteyrie, vol. iii. pp. 256 et seq.). Other collections, mostly of the nature of bibliographies, were the *Journal des savants* (111 vols., from 1665 to 1792; vide the *Table méthodique* by H. Cocheris, 1860); the *Journal de Trévoux*, or *Mémoires pour l'histoire des sciences et des beaux-arts*, edited by Jesuits (265 vols., 1701-1790); the *Mercur de France* (977 vols., from 1724 to 1791). To these must be added the dictionaries and encyclopaedias: the *Dictionnaire de Moréri*, the last edition of which numbers 10 vols. (1759); the *Dictionnaire géographique, historique et politique des Gaules et de la France*, by the abbé J. J. Expilly (6 vols., 1762-1770; unfinished); the *Répertoire universel et raisonné de jurisprudence civile, criminelle, canonique et bénéficiale*, by Guyot (64 vols., 1775-1786; supplement in 17 vols., 1784-1785), reorganized and continued by Merlin de Douai, who was afterwards one of the *Montagnards*, a member of the Directory, and a count under the Empire.

The historians did not use to the greatest advantage the treasures of learning provided for them; they were for the most part superficial, and dominated by their political or religious prejudices. Thus works like that of Père Gabriel Daniel (*Histoire de France*, 3 vols., 1713), of Président Hénault (*Abrégé chronologique*, 1744; 25 editions between 1770 and 1834), of the abbé Paul François Velly and those who completed his work (*Histoire de France*, 33 vols., 1765 to 1783), of G. H. Gaillard (*Histoire de la rivalité de la France et de l'Angleterre*, 11 vols., 1771-1777), and of L. P. Anquetil (1805), in spite of the brilliant success with which they met at first, have fallen into a just oblivion. A separate place must be given to the works of the theorists and philosophers: *Histoire de l'ancien gouvernement de la France*, by the Comte de Boulainvilliers (1727), *Histoire critique de l'établissement de la monarchie française dans les deux Gaules*, by the abbé J. B. Dubos (1734); *L'Esprit des lois*, by the président de Montesquieu (1748); the *Observations sur l'histoire de France*, by the abbé de Mably (1765); the *Théorie de la politique de la monarchie française*, by Marie Pauline de Lézardière (1792). These works have, if nothing else, the merit of provoking reflection.

At the time of the Revolution this activity was checked. The religious communities and royal academies were suppressed, and France violently broke with even her most recent past, which was considered to belong to the *ancien régime*. When peace was re-established, she began the task of making good the damage which had been done, but a greater effort was now necessary in order to revive the spirit of the institutions which had been overthrown. The new state, which was, in spite of all, bound by so many ties to the former order of things, seconded this effort, and during the

whole of the 19th century, and even longer, had a strong influence on historical production. The section of the Institut de France, which in 1816 assumed the old name of Académie des Inscriptions et Belles-lettres, began to reissue the two series of the *Mémoires* and of the *Notices et extraits des manuscrits tirés de la bibliothèque royale* (the first volume had appeared in 1787); began (1844) that of the *Mémoires présentés par divers savants* and the *Comptes rendus* (subject index 1857-1900, by G. Ledos, 1906); and continued the *Recueil des historiens de France*, the plan of which was enlarged by degrees (*Historiens des croisades, obituaires, pouillés, comptes, &c.*), the *Ordonnances* and the *Table chronologique des diplômes*. During the reign of Louis Philippe, the ministry of the interior reorganized the administration of the archives of the departments, communes and hospitals, of which the *Inventaires sommaires* are a mine of precious information (see the *Rapport au ministre*, by G. Servois, 1902). In 1834 the ministry of public instruction founded a committee, which has been called since 1881 the Comité des Travaux historiques et scientifiques, under the direction of which have been published: (1) the *Collection des documents inédits relatifs à l'histoire de France* (more than 260 vols. have appeared since 1836); (2) the *Catalogue général des manuscrits des bibliothèques de France*; (3) the *Dictionnaires topographiques* (25 vols. have appeared); and the *Répertoires archéologiques* of the French departments (8 vols. between 1861 and 1888); (4) several series of *Bulletins*, the details of which will be found in the *Bibliographie de Lasteurie*. At the same time were founded or reorganized, both in Paris and the departments, numerous societies, devoted sometimes partially and sometimes exclusively to history and archaeology; the Académie Celtique (1804), which in 1813 became the Société des Antiquaires de France (general index by M. Prou, 1894); the Société de l'Histoire de France (1834); the Société de l'École des Chartes (1839); the Société de l'Histoire de Paris et de l'Île-de-France (1874; four decennial indexes), &c. The details will be found in the excellent *Bibliographie générale des travaux historiques et archéologiques publiés par les sociétés savantes de France*, which has appeared since 1885 under the direction of Robert de Lasteyrie.

Individual scholars also associated themselves with this great literary movement. Guizot published a *Collection de mémoires relatifs à l'histoire de France* (31 vols., 1824-1835); Buchon, a *Collection des chroniques nationales françaises écrites en langue vulgaire du XIII^e au XVI^e siècle* (47 vols., 1824-1829), and a *Choix de chroniques et mémoires sur l'histoire de France* (14 vols., 1836-1841); Petitot and Monmerqué, a *Collection de mémoires relatifs à l'histoire de France* (131 vols., 1819-1829); Michaud and Poujoulat, a *Nouvelle Collection de mémoires pour servir à l'histoire de France* (32 vols., 1836-1839); Barrière and de Lescure, a *Bibliothèque de mémoires relatifs à l'histoire de France pendant le XVIII^e siècle* (30 vols., 1855-1875); and finally Berville and Barrière, a *Collection des mémoires relatifs à la Révolution Française* (55 vols., 1820-1827). The details are to be found in the *Sources de l'histoire de France*, by Alfred Franklin (1876). The abbé J. P. Migne in his *Patrologia Latina* (221 vols., 1844-1864), re-edited a number of texts anterior to the 13th century. Under the second empire, the administration of the imperial archives at Paris published ten volumes of documents (*Monuments historiques*, 1866; *Layette du trésor des chartes*, 1863, which were afterwards continued up to 1270; *Actes du parlement de Paris*, 1863-1867), not to mention several volumes of *Inventaires*. The administration of the Bibliothèque impériale had printed the *Catalogue général de l'histoire de France* (10 vols., 1855-1870; vol. xi., containing the alphabetical index to the names of the authors, appeared in 1895). Other countries also supplied a number of useful texts; there is much in the English Rolls series, in the collection of *Chroniques belges*, and especially in the *Monumenta Germaniae historica*.

At the same time the scope of history and its auxiliary sciences becomes more clearly defined; the École des Chartes produces some excellent palaeographers, as for instance Natalis de Wailly (*Éléments de paléographie*, 1838), and L. Delisle (*q.v.*), who has also left traces of his profound researches in the most varied departments of medieval history (*Bibliographie des travaux de M. Léopold Delisle*, 1902); Anatole de Barthélemy made a study of coins and medals, Douët d'Arcq and G. Demay of seals. The works of Alexandre Lenoir (*Musée des monuments français*, 1800-1822), of Arcisse de Caumont (*Histoire de l'architecture du moyen âge*, 1837; *Abécédaire ou rudiment d'archéologie*, 1850), of A. Napoléon Didron (*Annales archéologiques*, 1844), of Jules Quicherat (*Mélanges d'archéologie et d'histoire*, published after his death, 1886), and the dictionaries of Viollet le Duc (*Dictionnaire raisonné de l'architecture française*, 1853-1868; *Dictionnaire du mobilier français*, 1855) displayed to the best advantage one of the most brilliant sides of the French intellect, while other sciences, such as geology, anthropology, the comparative study of languages, religions and folk-lore, and political economy, continued to enlarge the horizon of history. The task of writing the general history of a country became more and more difficult, especially for one man, but the task was none the less undertaken by several historians, and by some of eminence. François Guizot treated of the *Histoire de la civilisation en France* (1828-1830); Augustin Thierry after the *Récits des temps mérovingiens* (1840) published the *Monuments de l'histoire du tiers état* (1849-1856), the introduction to which was expanded into a book (1855); Charles Simonde

de Sismondi produced a mediocre *Histoire des français* in 31 vols. (1821-1844), and Henri Martin a *Histoire de France* in 16 vols. (1847-1854), now of small use except for the two or three last centuries of the *ancien régime*. Finally J. Michelet, in his *Histoire de France* (17 vols., 1833-1856) and his *Histoire de la Révolution* (7 vols., 1847-1853), aims at reviving the very soul of the nation's past.

After the Franco-German War begins a better organization of scientific studies, modelled on that of Germany. The École des Hautes Études, established in 1868, included in its programme the critical study of the sources, both Latin and French, of the history of France; and from the *séminaire* of Gabriel Monod came men of learning, already prepared by studying at the École des Chartes: Paul Viollet, who revived the study of the history of French law; Julien Havet, who revived that of Merovingian diplomatics; Arthur Giry, who resumed the study of municipal institutions where it had been left by A. Thierry, prepared the *Annales carolingiennes* (written by his pupils, Eckel, Favre, Lauer, Lot, Poupardin), and brought back into honour the study of diplomatics (*Manuel de diplomatique*, 1894); Auguste Molinier, author of the *Sources de l'histoire de France* (1902-1904; general index, 1906), &c. Auguste Longnon introduced at the École des Hautes Études the study of historical geography (*Atlas historique de la France*, in course of publication since 1888). The universities, at last reorganized, popularized the employment of the new methods. The books of Fustel de Coulanges and Achille Luchaire on the middle ages, and those of A. Aulard on the revolution, gave a strong, though well-regulated, impetus to historical production. The École du Louvre (1881) increased the value of the museums and placed the history of art among the studies of higher education, while the Musée archéologique de St-Germain-en-Laye offered a fruitful field for research on Gallic and Gallo-Roman antiquities. Rich archives, hitherto inaccessible, were thrown open to students; at Rome those of the Vatican (*Registres pontificaux*, published by students at the French school of archaeology, since 1884); at Paris, those of the Foreign Office (*Recueil des instructions données aux ambassadeurs depuis le traité de Westphalie*, 16 vols., 1885-1901; besides various collections of diplomatic papers, inventories, &c.). Those of the War Office were used by officers who published numerous documents bearing on the wars of the Revolution and the Empire, and on that of 1870-1871. In 1904 a commission, generously endowed by the French parlement, was entrusted with the task of publishing the documents relating to economic and social life of the time of the Revolution, and four volumes had appeared by 1908. Certain towns, Paris, Bordeaux, &c., have made it a point of honour to have their chief historical monuments printed. The work now becomes more and more specialized. *L'Histoire de France*, by Ernest Lavisse (1900, &c.), is the work of fifteen different authors. It is therefore more than ever necessary that the work should be under sound direction. The *Manuel de bibliographie historique* of Ch. V. Langlois (2nd edition, 1901-1904) is a good guide, as is his *Archives de l'histoire de France* (1891, in collaboration with H. Stein).

Besides the special bibliographies mentioned above, it will be useful to consult the *Bibliothèque historique* of Père Jacques Lelong (1719; new ed. by Fevret de Fontette, 5 vols., 1768-1778); the *Geschichte der historischen Forschung und Kunst* of Ludwig Wachler (2 vols., 1812-1816); the *Bibliographie de la France*, established in 1811 (1st series, 1811-1856, 45 vols.; 2nd series, 1 vol. per annum since 1857); the publications of the Société de Bibliographie (*Polybiblion*, from 1868 on, &c.); the *Bibliographie de l'histoire de France*, by Gabriel Monod (1888); the *Répertoire* of the abbé Ulysse Chevalier (*Biobibliographie*; new ed. 1903-1907; and *Topobibliographie*, 1894-1899). Bearing exclusively on the middle ages are the *Bibliotheca historica mediæ ævi* of August Potthaast (new ed. 1896) and the *Manuel (Les Sources de l'histoire de France, 1901, &c.)* of A. Molinier; but the latter is to be continued up to modern times, the 16th century having already been begun by Henri Hausser (1st part, 1906). Finally, various special reviews, besides teaching historical method by criticism and by example, try to keep their readers au courant with literary production; the *Revue critique d'histoire et de littérature* (1866 fol.), the *Revue des questions historiques* (1866 fol.), the *Revue historique* (1876 fol.), the *Revue d'histoire moderne et contemporaine*, accompanied annually by a valuable *Répertoire méthodique* (1898 fol.); the *Revue de synthèse historique* (1900 fol.), &c. (C. B. *)

FRENCH LAW AND INSTITUTIONS

Celtic Period.—The remotest times to which history gives us access with reference to the law and institutions formerly existing in the country which is now called France are those in which the dominant race at least was Celtic. On the whole, our knowledge is small of the law and institutions of these Celts, or Gauls, whose tribes constituted independent Gaul. For their reconstruction, modern scholars draw upon two sources; firstly, there is the information furnished by the classical writers and by Caesar and Strabo in particular, which is trustworthy but somewhat scanty; the other source, which is not so pure, consists in

the accounts found in those legal works of the middle ages written in the neo-Celtic dialects, the most important and the greater number of which belong to Ireland. A reconstruction from them is always hazardous, however delicate and scientific be the criticism which is brought to bear on it, as in the case of d'Arbois de Jubainville, for example. Moreover, in the historical evolution of French institutions those of the Celts or Gauls are of little importance. Not one of them can be shown to have survived in later law. What has survived of the Celtic race is the blood and temperament, still found in a great many Frenchmen, certain traits which the ancients remarked in the Gauls being still recognizable: *bellum gerere et argute loqui*.

Roman Period.—It was the Roman conquest and rule which really formed Gaul, for she was Romanized to the point of losing almost completely that which persists most stubbornly in a conquered nation, namely, the language; the Breton-speaking population came to France later, from Britain. The institutions of Roman Gaul became identical with those of the Roman empire, provincial and municipal government undergoing the same evolution as in the other parts of the empire. It was under Roman supremacy too, as M. d'Arbois de Jubainville has shown, that the ownership of land became personal and free in Gaul. The law for the Gallo-Romans was that which was administered by the *conventus* of the magistrate; there are only a few peculiarities, mere Gallicisms, resulting from conventions or usage, which are pointed out by Roman juriconsults of the classical age. The administrative reforms of Diocletian and Constantine applied to Gaul as to the rest of the empire. Gaul under this rule consisted of seventeen provinces, divided between two dioceses, ten in the diocese of the Gauls, under the authority of the praetorian prefect, who resided at Treves; and the other seven in the *diocesis septem provinciarum*, under the authority of a *vicarius*. The Gallo-Romans became Christian with the other subjects of the empire; the Church extended thither her powerful organization modelled on the administrative organization, each *civitas* having a bishop, just as it had a *curia* and municipal magistrates. But, although endowed with privileges by the Christian emperors, the Church did not yet encroach upon the civil power. She had the right of acquiring property, of holding councils, subject to the imperial authority, and of the free election of bishops. But only the first germs of ecclesiastical jurisdiction are to be traced. In virtue of the laws, the bishops were privileged arbitrators, and in the matter of public sins exercised a disciplinary jurisdiction over the clergy and the faithful. In the second half of the 4th century, monasteries appeared in Gaul. After the fall of the Western empire, there was left to the Gallo-Romans as an expression of its law, which was also theirs, a written legislation. It consisted of the imperial constitutions, contained in the Gregorian, Hermogenian and Theodosian codes (the two former being private compilations, and the third an official collection), and the writings of the five jurists (Gaius, Papinian, Paulus, Ulpian and Modestinus), to which Valentinian III. had in 426 given the force of law.

The Barbarian Invasion.—The invasions and settlements of the barbarians open a new period. Though there were robbery and violence in every case, the various barbarian kingdoms set up in Gaul were established under different conditions. In those of the Burgundians and Visigoths, the owners of the great estates, which had been the prevailing form of landed property in Roman Gaul, suffered partial dispossession, according to a system the rules regulating which can, in the case of the Burgundians, be traced almost exactly. It is doubtful whether a similar process took place in the case of the Frankish settlements, but their first conquests in the north and east seem to have led to the extermination or total expulsion of the Gallo-Roman population. It is impossible to say to what extent, in these various settlements, the system of collective property prevailing among the Germanic tribes was adopted. Another important difference was that, in embracing Christianity, some of the barbarians became Arians, as in the case of the Visigoths and Burgundians; others Catholic, as in the case of the Franks. This was probably the main cause of the absorption of the other

kingdoms into the Frankish monarchy. In each case, however, the barbarian king appeared as wishing not to overthrow the Roman administration, but to profit by its continuation. The kings of the Visigoths and Burgundians were at first actually representatives of the Western empire, and Clovis himself was ready to accept from the emperor Anastasius the title of consul; but these were but empty forms, similar to the fictitious ties which long existed or still exist between China or Turkey and certain parts of their former empires, now separated from them for ever.

As soon as the Merovingian monarch had made himself master of Gaul, he set himself to maintain and keep in working order the administrative machinery of the Romans, save that the administrative unit was henceforth no longer the *provincia* but the *civitas*, which generally took the name of *pagus*, and was placed under the authority of a count, *comes* or *grafio* (*Graf*). Perhaps this was not entirely an innovation, for it appears that at the end of the Roman supremacy certain *civitates* had already a *comes*. Further, several *pagi* could be united under the authority of a *dux*. The *pagus* seems to have generally been divided into hundreds (*centenae*).

But the Roman administrative machinery was too delicate to be handled by barbarians; it could not survive for long, but underwent changes and finally disappeared. Thus the Merovingians tried to levy the same direct taxes as the Romans had done, the *capitatio terrena* and the *capitatio humana*, but they ceased to be imposts reassessed periodically in accordance with the total sum fixed as necessary to meet the needs of the state, and became fixed annual taxes on lands or persons; finally, they disappeared as general imposts, continuing to exist only as personal or territorial dues. In the same way the Roman municipal organization, that of the *curiae*, survived for a considerable time under the Merovingians, but was used only for the registration of written deeds; under the Carolingians it disappeared, and with it the old senatorial nobility which had been that of the Empire. The administration of justice (apart from that of the king's tribunal) seems to have been organized on a system borrowed partly from Roman and partly from Germanic institutions; it naturally tends to assume popular forms. Justice is administered by the count (*comes*) or his deputy (*centenarius* or *vicarius*), but on the verdict of notables called in the texts *boni homines* or *rachimburgii*. This takes place in an assembly of all the free subjects, called *mallus*, at which every free man is bound to attend at least a certain number of times a year, and in which are promulgated the general acts emanating from the king. The latter could issue commands or prohibitions under the name of *bannus*, the violation of which entailed a fine of 60 *solidi*; the king also administered justice (*in palatio*), assisted by the officers of his household, his jurisdiction being unlimited and at the same time undefined. He could hear all causes, but was not bound to hear any, except, apparently, accusations of deliberate failure of justice and breach of trust on the part of the *rachimburgii*.

But what proved the great disturbing element in Gallo-Roman society was the fact that the conquerors, owing to their former customs and the degree of their civilization, were all warriors, men whose chief interest was to become practised in the handling of arms, and whose normal state was that of war. It is true that under the Roman empire all the men of a *civitas* were obliged, in case of necessity, to march against the enemy, and under the Frankish monarchy the count still called together his *pagenses* for this object. But the condition of the barbarian was very different; he lived essentially for fighting. Hence those gatherings or annual reviews of the *Campus Martius*, which continued so long, in Austrasia at least. They constituted the chief armed force; for mercenary troops, in spite of the assertions of some to the contrary, play at this period only a small part. But this military class, though not an aristocracy (for among the Franks the royal race alone was noble), was to a large extent independent, and the king had to attach these *leudes* or *fideles* to himself by gifts and favours. At the same time the authority of the king gradually underwent a

change in character, though he always claimed to be the successor of the Roman emperor. It gradually assumed that domestic or personal character that, among the Germans, marked most of the relations between men. The household of the king gained in political importance, by reason that the heads of the principal offices in the palace became at the same time high public officials. There was, moreover, a body of men more especially attached to the king, the *antrustions* (*q.v.*) and the commensals (*convivae regis*) whose *weregeld* (*i.e.* the price of a man's life in the system of compensation then prevalent) was three times greater than that of the other subjects of the same race.

The Frankish monarch had also the power of making laws, which he exercised after consulting the chief men of the kingdom, both lay and ecclesiastical, in the *placita*, which were meetings differing from the *Campus Martius* and apparently modelled principally on the councils of the Church. But throughout the kingdom in many places the direct authority of the king over the people ceased to make itself felt. The *immunitates*, granted chiefly to the great ecclesiastical properties, limited this authority in a curious way by forbidding public officials to exercise their functions in the precinct of land which was *immunis*. The judicial and fiscal rights frequently passed to the landowner, who in any case became of necessity the intermediary between the supreme power and the people. In regard to this last point, moreover, the case seems to have been the same with all the great landowners or *potentes*, whose territory was called *potestas*, and who gained a real authority over those living within it; later in the middle ages they were called *homines potestatis* (*hommes de poeste*).

Other principles, arising perhaps less from Germanic custom strictly speaking than from an inferior level of civilization, also contributed towards the weakening of the royal power. The monarch, like his contemporaries, considered the kingdom and the rights of the king over it to be his property; consequently, he had the power of dealing with it as if it were a private possession; it is this which gave rise to the concessions of royal rights to individuals, and later to the partitions of the kingdom, and then of the empire, between the sons of the king or emperor, to the exclusion of the daughters, as in the division of an inheritance in land. This proved one of the chief weaknesses of the Merovingian monarchy.

In order to rule the Gallo-Romans, the barbarians had had inevitably to ask the help of the Church, which was the representative of Roman civilization. Further, the Merovingian monarch and the Catholic Church had come into close alliance in their struggle with the Arians. The result for the Church had been that she gained new privileges, but at the same time became to a certain extent dependent. Under the Merovingians the election of the bishop *a clero et populo* is only valid if it obtains the assent (*assensus*) of the king, who often directly nominates the prelate. But at the same time the Church retains her full right of acquiring property, and has her jurisdiction partially recognized; that is to say, she not only exercises more freely than ever a disciplinary jurisdiction, but the bishop, in place of the civil power, administers civil and criminal justice over the clergy. The councils had for a long time forbidden the clergy to cite one another before secular tribunals; they had also, in the 6th century, forbidden secular judges under pain of excommunication to cite before them and judge the clergy, without permission of the bishop. A decree of Clotaire II. (614) acknowledged the validity of these claims; but not completely; a precise interpretation of the text is, however, difficult.

The Merovingian dynasty perished of decay, amid increasing anarchy. The crown passed, with the approval of the papacy, to an Austrasian mayor of the palace and his family, one of those mayors of the palace (*i.e.* chief officer of the king's household) who had been the last support of the preceding dynasty. It was then that there developed a certain number of institutions, which offered themselves as useful means of consolidating the political organism,

and were in reality the direct precursors of feudalism. One was the royal benefice (*beneficium*), of which, without doubt, the Church provided both the model and, in the first instance, the material. The model was the *precaria*, a form of concession by which it was customary for the Church to grant the possession of her lands to free men; this practice she herself had copied from the five-years leases granted by the Roman exchequer. Gradually, however, the *precaria* had become a concession made, in most cases, free and for life. As regards the material, when the Austrasian mayors of the palace (probably Charles Martel) wished to secure the support of the *fideles* by fresh benefits, the royal treasury being exhausted, they turned to the Church, which was at that time the greatest landowner, and took lands from her to give to their warriors. In order to disguise the robbery it was decided—perhaps as an afterthought—that these lands should be held as *precariae* from the Church, or from the monastic houses which had furnished them. Later, when the royal treasury was reorganized, the grants of land made by the kings naturally took a similar form: the *beneficium*, as a free grant for life. Under the Merovingians royal grants of land were in principle made in full ownership, except, as Brunner has shown, that provision was made for a revocation under certain circumstances. No special services seem to have been attached to the benefice, whether granted by the king or by some other person, but, in the second half of the 9th century at least, the possession of the benefice is found as the characteristic of the military class and the form of their pay. This we find clearly set forth in the treatise *de ecclesiis et capellis* of Hincmar of Reims. The *beneficium*, in obedience to a natural law, soon tended to crystallize into a perpetual and hereditary right. Another institution akin to the *beneficium* was the *senioratus*; by the *commendatio*, a form of solemn contract, probably of Germanic origin, and chiefly characterized by the placing of the hands between those of the lord, a man swore absolute fidelity to another man, who became his *senior*. It became the generally received idea (as expressed in the capitularies) that it was natural and normal for every free man to have a *senior*. At the same time a benefice was never granted unless accompanied by the *commendatio* of the beneficiary to the grantor. As the most important *seniores* were thus bound to the king and received from him their benefices, he expected through them to command their men; but in reality the king disappeared little by little in the *senior*. The king granted as benefices not only lands, but public functions, such as those of count or *dux*, which thus became possessions, held, first for life, and later as hereditary properties. The Capitulary of Kiersy-sur-Oise (877), which was formerly considered to have made fiefs legally and generally hereditary, only proves that it was already the custom for benefices of this kind, *honores*, to pass from the father to one of the sons.

Charlemagne, while sanctioning these institutions, tried to arrest the political decomposition. He reorganized the administration of justice, fixing the respective jurisdictions of the count and the *centenarius*, substituting for the *rachimburgii* permanent *scabini*, chosen by the count in the presence of the people, and defining the relations of the count, as the representative of the central authority, with the *advocati* or *judices* of *immunitates* and *potestates*. He reorganized the army, determining the obligations and the military outfit of free men according to their means. Finally, he established those regular inspections by the *missi dominici* which are the subject of so many of his capitularies. From the *De ordine palatii* of Hincmar of Reims, who follows the account of a contemporary of the great emperor, we learn that he also regularly established two general assemblies, *conventus* or *placita*, in the year, one in the autumn; the other in the spring, which were attended by the chief officials, lay and ecclesiastical. It was here that the capitularies (*q.v.*) and all important measures were first drawn up and then promulgated. The revenues of the Carolingian monarch (which are no longer identical with the finances of the state) consisted chiefly in the produce of the royal lands (*villae*), which the king and his suite often came and

consumed on the spot; and it is known how carefully Charlemagne regulated the administration of the *villae*. There were also the free gifts which the great men were bound, according to custom, to bring to the *conventus*, the contributions

**Carolin-
gian fiscal
system.** of this character from the monasteries practically amounting to a tax; the regular personal or territorial dues into which the old taxes had resolved themselves;

the profits arising from the courts (the royal *bannus*, and the *fredum*, or part of the compensation-money which went to the king); finally, numberless requisitions in kind, a usage which had without doubt existed continuously since Roman times. The Church was loaded with honours and had added a fresh prerogative to her former privileges, namely, the right of levying a real tax in kind, the *tithe*. Since the 3rd century she had tried to exact the payment of tithes from the faithful, interpreting as applicable to the Christian clergy the texts in the Old Testament bearing on the Levites; Gallican councils had repeatedly proclaimed it as an obligation, though, it appears, with little success. But from the reign of Pippin the Short onwards the civil law recognized and sanctioned this obligation, and the capitularies of Charlemagne and Louis the Debonnaire contain numerous provisions dealing with it. Ecclesiastical jurisdiction

**The
Church
under
Charle-
magne.** extended farther and farther, but Charlemagne, the protector of the papacy, maintained firmly his authority over the Church. He nominated its dignitaries, both bishops and abbots, who were true ecclesiastical officials, parallel with the lay officials. In each *pagus*, bishop and count owed each other mutual support, and the *missi* on the same circuit were ordinarily a count and a bishop. In the first collection of capitularies, that of Ansegisus, two books out of four are devoted to ecclesiastical capitularies.

What, then, was the private and criminal law of this Frankish monarchy which had come to embrace so many different races?

**The law
under the
Frank
monarchy.** The men of Roman descent continued under the Roman law, and the conquerors could not hope to impose their customs upon them. The authorized expression of the Roman law was henceforth to be found in the *Lex romana Wisigothorum* or *Breviarium Alarici*, drawn up by order of Alaric II. in 506. It is an abridgment of the codes, of that of Theodosius especially, and of certain of the writings of the jurists included under the Law of Citations. As to the barbarians, they had hitherto had nothing but customs, and these customs, of which the type nearest to the original is to be found in the oldest text of the *Lex Salica*, were nothing more than a series of tariffs of compensations, that is to say, sums of money due to the injured party or his family in case of crimes committed against individuals, for which crimes these compensations were the only penalty. They also introduced a barbarous system of trial, that by compurgation, *i.e.* exculpation by the oath of the defendant supported by a certain number of *cojurantes*, and that by ordeal, later called *judicium Dei*. In each new kingdom the barbarians naturally kept their own laws, and when these men of different races all became subject to the Frankish monarchy, there evolved itself a system (called the *personnalité des lois*) by which every subject had, in principle, the right to be tried by the law of the race to which he belonged by birth (or sometimes for some other reason, such as emancipation or marriage). When the two adversaries were of different race, it was the law of the defendant which had to be applied. The customs of the barbarians had been drawn up in Latin. Sometimes, as in the case of the first text of the Salic law, the system on which they were compiled is not exactly known; but it was generally done under the royal authority. At this period only these written documents bear the name of "law" (*leges romanorum; leges barbarorum*), and at least the tacit consent of the people seems to have been required for these collections of laws, in accordance with an axiom laid down in a later capitulary; *lex fit consensu populi et constitutione regis*. It is noteworthy, too, that in the process of being drawn up in Latin, most of the *leges barbarorum* were very much Romanized.

In the midst of this diversity, a certain number of causes tended to produce a partial unity. The capitularies, which had in themselves the force of law, when there was no question of

modifying the *leges*, constituted a legislation which was the same for all; often they inflicted corporal punishment for grave offences, which applied to all subjects without distinction. Usage and individual convenience led to the same result. The Gallo-Romans, and even the Church itself, to a certain extent, adopted the methods of trial introduced by the Germans, as was likely in a country relapsing into barbarism. On the other hand, written acts became prevalent among the barbarians, and at the same time they assimilated a certain amount of Roman law; for these acts continued to be drawn up in Latin, after Roman models, which were in most cases simply misinterpreted owing to the general ignorance. The type is preserved for us in those collections of *Formulae*, of which complete and scientific editions have been published by Eugène de Rozière and Carl Zeumer. During this period, too, the Gallican Church adopted the collection of councils and decretals, called later the *Codex canonum ecclesiae Gallicanae*, which she continued to preserve. This collection was that of Dionysius Exiguus, which was sent to Charlemagne in 774 by Pope Adrian I. But in the course of the 9th century apocryphal collections were also formed in the Gallican Church: the False Capitularies of Benedictus Levita, and the False Decretals of Isidorus Mercator (see DECRETALS).

All the subjects of the Frankish monarchy were not of equal status. There was, strictly speaking, no nobility, both the Roman and the Germanic nobility having died out; but slavery continued to exist. The Church, however, was preparing the transformation of the slave into the serf, by giving force and validity to their marriages, in cases, at least, when the master had approved of them, and by forbidding the latter unjustly to seize the slave's *peculium*. But between the free man (*ingenuus*) and the slave lay a number of persons of intermediate status; they possessed legal personality but were subject to incapacities of various kinds, and had to perform various duties towards other men. There was, to begin with, the Roman colonist (*colonus*), a class as to the origin of which there is still a controversy, and of which there is no clear mention in the laws before the 4th century; they and their children after them were attached perpetually to a certain piece of land, which they were allowed to cultivate on payment of a rent. There were, further, the *liti* (*litus* or *lidus*), a similar class of Germanic origin; also the greater number of the freedmen or descendants of freedmen. Many free men who had fled to the great landowners for protection took, by arrangement or by custom, a similar position. Under the Merovingian régime, and especially under the Carolingians, the occupation of the land tended to assume the character of tenure; but free ownership of land continued to exist under the name of *alod* (*alodis*), and there is even evidence for the existence of this in the form of small properties, held by free men; the capitularies contain numerous complaints and threats against the counts, who endeavoured by the abuse of their power to obtain the surrender of these properties.

Period of Anarchy and the Rise of Feudalism.—The 10th and 11th centuries were a period of profound anarchy, during which feudalism was free to develop itself and to take definite shape. At that time the French people may be said to have lived without laws, without even fixed customs and without government. The legislative power was no longer exercised, for the last Carolingian capitularies date from the year 884, and the first laws of the Capetian kings (if they may be called laws) do not appear till during the 12th century. During this period the old capitularies and *leges* fell into disuse and in their place territorial customs tended to grow up, their main constituents being furnished by the law of former times, but which were at the outset ill-defined and strictly local. As to the government, if the part played by the Church be excepted, we shall see that it could be nothing but the application of brute force. In this anarchy, as always happens under similar conditions, men drew together and formed themselves into groups for mutual defence. A nucleus was formed which was to become the new social unit, that is to say, the feudal group. Of this the centre was a chief, around whom gathered men capable of bearing arms, who commended themselves to

**Anarchy
and feudal
origins.**

him according to the old form of vassalage, *per manus*. They owed him fidelity and assistance, the support of their arms but not of their purse, save in quite exceptional cases; while he owed them protection. Some of them lived in his castle or fortified house, receiving their equipment only and eating at his table. Others received lands from him, which were, or later became, fiefs, on which they lived *casati*. The name fief, *feudum*, does not appear, however, till towards the end of this period; these lands are frequently called *beneficia* as before; the term most in use at first, in many parts, is *casamentum*. The fief, moreover, was generally held for life and did not become generally hereditary till the second half of the 11th century. The lands kept by the chief and those which he granted to his men were for the most part rented from him, or from them, for a certain amount in money or in kind. All these conditions had already existed previously in much the same form; but the new development is that the chief was no longer, as before, merely an intermediary between his men and the royal power. The group had become in effect independent, so organized as to be socially and politically self-sufficient. It constituted a small army, led, naturally, by the chief, and composed of his feudatories, supplemented in case of need by the *rustici*. It also formed an assembly in which common interests were discussed, the lord, according to custom, being bound to consult his feudatories and they to advise him to the best of their power. It also formed a court of justice, in which the feudatories gave judgment under the presidency of their lord; and all of them claimed to be subject only to the jurisdiction of this tribunal composed of their peers. Generally they also judged the villeins (*villani*) and the serfs dependent on the group, except in cases where the latter obtained as a favour judges of their own status, which was, however, at that time a very rare occurrence.

Under these conditions a nobility was formed, those men becoming nobles who were able to devote themselves to the profession of arms and were either chiefs or soldiers in one of the groups which have just been described. The term designating a noble, *miles*, corresponds also to that of knight (Fr. *chevalier*, Low Lat. *caballerius*), for the reason that chivalry, of which the origins are uncertain, represents essentially the technical skill and professional duties of this military class. Every noble was destined on coming of age to become a knight, and the knight equally as a matter of course received a fief, if he had not one already by hereditary title. This nobility, moreover, was not a caste but could be indefinitely recruited by the granting of fiefs and admission to knighthood (see KNIGHTHOOD AND CHIVALRY).

The state of anarchy was by now so far advanced that war became an individual right, and the custom of private war arose.

Every man had in principle the right of making war to defend his rights or to avenge his wrongs. Later on, doubtless, in the 13th century, this was a privilege of the noble (*gentilhomme*); but the texts defining the limits which the Church endeavoured to set to this abuse, namely, the Peace of God and the Truce of God, show that this was at the outset a power possessed by men of all classes. Even a man who had appeared in a court of law and received judgment had the choice of refusing to accept the judgment and of making war instead. Justice, moreover, with its frequent employment of trial by combat, did not essentially differ from private war.

It is unnecessary to go further and to affirm, with certain historians of our time, for example Guilhermoz and Sée, that the only free men at that time, besides the clergy, were the nobles, all the rest being serfs. There are many indications which lead us to assume, not only in the towns but even in the country districts, the existence of a class of men of free status who were not *militēs*, the class later known in the 13th century as *villains*, *hommes de poeste*, and, later, *roturiers*. The fact more probably was that only the nobles and ecclesiastics were exempt from the exactions of the feudal lords; while from all the others the seigneurs could at pleasure levy the *taille* (a direct and arbitrary tax), and those innumerable rights then called *consuetudines*.

Free ownership, the *allodium*, even under the form of small freeholds, still existed by way of exception in many parts.

Had, then, the main public authority disappeared? This is practically the contention of certain writers, who, like M. Sée, maintain that real property, the possession of a domain, conferred on the big landed proprietor all rights of taxation, command and coercion over the inhabitants of his domain, who, according to this view, were always serfs. But this is an exaggeration of the thesis upheld by old French authors, who saw in feudalism, though in a different sense, a confusion of property with sovereignty. It appears that in this state of political disintegration each part of the country which had a homogeneous character tended to form itself into a higher unit. In this unit there arose a powerful lord, generally a duke, a count, or a viscount, who sometimes came to be called the *capitalis dominus*. He was either a former official of the monarchy, whose function had become hereditary, or a usurper who had formed himself on this model. He laid claim to an authority other than that conferred by the possession of real property. He still claimed to exercise over the whole of his former district certain rights, which we see him sometimes surrendering for the benefit of churches or monasteries. His court of justice was held in the highest honour, and to it were referred the most important affairs. But in this district there were generally a number of more or less powerful lords, who as a rule had as yet no particular feudal title and are often given the name of *principes*. Often, but not always, they had commended themselves to this duke or count by doing homage.

On the other hand, the royal power continued to exist; being recognized by a considerable part of old Gaul, the *regnum Francorum*. But under the last of the Carolingians it had in fact become elective, as is shown by the elections of Odo and Robert before that of Hugh Capet. The electors were the chief lords and prelates of the *regnum Francorum*. But following a clever policy, each king during his lifetime took as partner of his kingdom his eldest son and consecrated and crowned him in advance, so that the first of the Capetians revived the principle of heredity in favour of the eldest son, while establishing the hereditary indivisibility of the kingdom. This custom was recognized at the accession of Louis the Fat, but the authority of the king was very weak, being merely a vague allegiance. His only real authority lay where his own possessions were, or where there had not arisen a duke, a count, or lord of equal rank with them. He maintained, however, a general right of administering justice, a *curia*, the jurisdiction of which seems to have been universal. It is true that the parties in a suit had to submit themselves to it voluntarily, and could accept or reject the judgment given, but this was at that time the general rule. The king dispensed justice surrounded by the officers of his household (*domestici*), who thus formed his council; but these were not the only ones to assist him, whether in court or council. Periodically, at the great yearly festivals, he called together the chief lords and prelates of his kingdom, thus carrying on the tradition of the Carolingian *placita* or *conventus*; but little by little, with the appropriation of the *honores*, the character of the gathering changed; it was no longer an assembly of officials but of independent lords. This was now called the *curia regis*.

While the power of the State was almost disappearing, that of the Church, apart from the particular acts of violence of which she was often the victim, continued to grow. Her jurisdiction gained ground, since her procedure was reasonable and comparatively scientific (except that she admitted to a certain extent compurgation by oath and the *judicia Dei*, with the exception of trial by combat). Not only was the privilege of clergy, by which accused clerks were brought under her jurisdiction, almost absolute, but she had cognizance of a number of causes in which laymen only were concerned, marriage and everything nearly or remotely affecting it, wills, crimes and offences against religion; and even contracts, when the two parties wished it or when the agreement was made on oath, came within her competence. Such, then, were the

ecclesiastical or Christian courts (*cours d'église, cour de chrétienté*). The Church, moreover, remained in close connexion with the crown, the king preserving a quasi-ecclesiastical character, while the royal prerogatives with regard to the election of bishops were maintained more successfully than the rights of the crown, though in many of the great fiefs they none the less passed to the count or the duke. It was at this time too that the Church tried to break the last ties which still kept her more or less dependent on the civil power; this was the true import of the Investiture Contest (see INVESTITURE, and CHURCH HISTORY), though this was not very acute in France.

The period of the true feudal monarchy is embraced by the 12th and 13th centuries, that is to say, it was at this time that the crown again assumed real strength and authority; but so far it had no organs and instruments save those which were furnished by feudalism, now organized under a regular hierarchy, of which the king was the head, the "sovereign enfeoffor of the kingdom" (*souverain seigneur du royaume*), as he came later on to be called. This new position of affairs was the result of three great factors: the revival of Roman Law, the final organization of feudalism and the rise of the privileged towns. The revival of Roman

law began in France and Italy in the second half of the 11th century, developing with extraordinary brilliance in the latter country at the university of Bologna, which was destined for a long time to dominate Europe. Roman law spread rapidly in the French schools and universities, except that of Paris, which was closed to it by the papacy; and the influence of this study was so great that it transformed society. On the one hand it contributed largely to the re-constitution of the royal power, modelling the rights of the king on those of the Roman emperor. On the other hand it wrought a no less profound change in private law. From this time dates the division of old France into the *Pays de droit écrit*, in which Roman law, under the form in which it was codified by Justinian,

was received as the ordinary law; and the *Pays de coutume*, where it played only a secondary part, being generally valid only as *ratio scripta* and not as *lex scripta*. In this period the customs also took definitive form, and over and above the local customs properly so called there were formed customs known as *general*, which held good through a whole province or *bailliage*, and were based on the jurisprudence of the higher jurisdictions.

The final organization of feudalism resulted from the struggle for organization which was proceeding in each district where the more powerful lords compelled the others to do them homage and become their vassals; the *capitalis dominus* had beneath him a whole hierarchy, and was himself a part of the feudal system of France (see FEUDALISM). Doubtless in the case of lords like the dukes of Brittany and Burgundy, the king could not actually demand the strict fulfilment of the feudal obligations; but the principle was established. The question now arises, did free and absolute property, the *allodium*, entirely disappear in this process, and were all lands held as tenures? It continued to exist, by way of exception, in most districts, unchanged save in the burden of proof of ownership, with which, according to the customs, sometimes the lord and sometimes the holder of the land was held

charged. In one respect, however, namely in the administration of justice, the feudal hierarchy had absolute sway. Towards the end of the 13th century Beaumanoir clearly laid down this principle: "All secular jurisdiction in France is held from the king as a fief or an *arrière-fief*." Henceforth it could also be said that "All justice emanates from the king." The law concerning fiefs became settled also from another point of view, the fief becoming patrimonial; that is to say, not only hereditary, but freely alienable by the vassal, subject in both cases to certain rights of transfer due to the lord, which were at first fixed by agreement and later by custom. The most salient features of feudal succession were the right of primogeniture and the preference given to heirs-male; but from the 13th century onwards the

right of primogeniture, which had at first involved the total exclusion of the younger members of a family, tended to be modified, except in the case of the chief lords, the eldest son obtaining the preponderant share or *préciput*. Non-noble (*roturier*) tenancies also became patrimonial in similar circumstances, except that in their case there was no right of primogeniture nor any privilege of males. The tenure of serfs did not become alienable, and only became hereditary by certain devices.

Feudal society next saw the rise of a new element within it: the privileged towns. At this time many towns acquired privileges, the movement beginning towards the end of the 11th century; they were sanctioned by a formal concession from the lord to whom the town was subject, the concession being embodied in a charter or in a record of customs (*coutume*). Some towns won for themselves true political rights, for instance the right of self-administration, rights of justice over the inhabitants, the right of not being taxed except by their own consent, of maintaining an armed force, and of controlling it themselves. Others only obtained civil rights, e.g. guarantees against the arbitrary rights of justice and taxation of the lord or his provost. The chief forms of municipal organization at this time were the *commune jurée* of the north and east, and the *consulat*, which came from Italy and penetrated as far as Auvergne and Limousin. The towns with important privileges formed in feudal society as it were a new class of lordships; but their lords, that is to say their burgesses, were inspired by quite a new spirit. The crown courted their support, taking them under its protection, and championing the causes in which they were interested (see COMMUNE). Finally, it is in this period, under Philip Augustus, that the great fiefs began to be effectually reannexed to the crown, a process which, continued by the kings up to the end of the *ancien régime*, re-founded for their profit the territorial sovereignty of France.

The crown maintained the machinery of feudalism, the chief central instruments of which were the great officers of the crown, the seneschal, butler, constable and chancellor, who were to become irremovable officials, those at least who survived. But this period saw the rise of a special college of dignitaries, that of the Twelve Peers of France, consisting of six laymen and six ecclesiastics, which took definitive shape at the beginning of the 13th century. We cannot yet discern with any certainty by what process it was formed, why those six prelates and those six great feudatories in particular were selected rather than others equally eligible. But there is no doubt that we have here a result of that process of feudal organization mentioned above; the formation of a similar assembly of twelve peers occurs also in a certain number of the great fiefs. Besides the part which they played at the consecration of kings, the peers of France formed a court in which they judged one another under the presidency of the king, their overlord, according to feudal custom. But the *cour des pairs* in this sense was not separate from the *curia regis*, and later from the parlement of Paris, of which the peers of France were by right members. From this time, too, dates another important institution, that of the *maîtres des requêtes*.

The legislative power of the crown again began to be exercised during the 12th century, and in the 13th century had full authority over all the territories subject to the crown. Beaumanoir has a very interesting theory on this subject. The right of war tends to regain its natural equilibrium, the royal power following the Church in the endeavour to check private wars. Hence arose the *quarantaine le roi*, due to Philip Augustus or Saint Louis, by which those relatives of the parties to a quarrel who had not been present at the quarrel were rendered immune from attack for forty days after it; and above all the *assurements* imposed by the king or lord; on these points too Beaumanoir has an interesting theory. The rule was, moreover, already in force by which private wars had to cease during the time that the king was engaged in a foreign war. But the most appreciable progress took place in the

Growth of the royal power.

given to heirs-male; but from the 13th century onwards the

administrative and judicial institutions. Under Philip Augustus arose the royal *baillis* (see *BAILLIFF*: section *Bailli*), and seneschals (*q.v.*); who were the representatives of the king in the provinces, and superior judges. At the same time the form of the feudal courts tended to change, as they began more and more to be influenced by the Romano-canonical law. Saint Louis had striven to abolish trial by combat, and the Church had condemned other forms of ordeal, the *purgatio vulgaris*. In most parts of the country the feudal lords began to give place in the courts of law to the provosts (*prévôts*) and *baillis* of the lords or of the crown, who were the judges, having as their councillors the *avocats* (advocates) and *procureurs* (procurators) of the assize. The feudal courts, which were founded solely on the relations of homage and tenure, before which the vassals and tenants as such appeared, disappeared in part from the 13th century on. Of the seigniorial jurisdictions there soon remained only the *hautes* or *basses justices* (in the 14th century arose an intermediate grade, the *moyenne justice*), all of which were considered to be concessions of the royal power, and so delegations of the public authority. As a result of the application of Roman and canon law, there arose the *appel* strictly so called, both in the class of royal and of seigniorial jurisdictions, the case in the latter instance going finally before a royal court, from which henceforth there was no appeal. In the 13th century too appeared the theory of crown cases (*cas royaux*), cases which the lords became incompetent to try and which were reserved for the royal court. Finally, the *curia regis* was gradually transformed into a regular court of justice, the *Parlement* (*q.v.*), as it was already called in the second half of the 13th century. At this time the king no longer appeared in it regularly, and before each session (for it was not yet a permanent body) a list of properly qualified men was drawn up in advance to form the parlement, only those whose names were on the list being capable of sitting in it. Its main function had come to be that of a final court of appeal. At the various sessions, which were regularly held at Paris, appeared the *baillis* and seneschals, who were called upon to answer for the cases they had judged and also for their administration. The accounts were received by members of the parlement at the Temple, and this was the origin of the Cour or Chambre des Comptes.

At the end of this period the nobility became an exclusive class. It became an established rule that a man had to be noble in order to be made a knight, and even in order to acquire a fief; but in this latter respect the king made exceptions in the case of *roturiers*, who were licensed to take up fiefs, subject to a payment known as the *droits de franc-fief*. The *roturiers*, or villeins who were not in a state of thralldom, were already a numerous class not only in the towns but in the country. The Church maintained her privileges; a few attempts only were made to restrain the abuse, not the extent, of her jurisdiction. This jurisdiction was, during the 12th century, to a certain extent regularized, the bishop nominating a special functionary to hold his court; this was the *officialis* (Fr. *official*), whence the name of *officialité* later applied in France to the ecclesiastical jurisdictions. On one point, however, her former rights were diminished. She preserved the right of freely acquiring personal and real property, but though she could still acquire feudal tenures she could not keep them; the customs decided that she must *vider les mains*, that is, alienate the property again within a year and a day. The reason for this new rule was that the Church, the ecclesiastical establishment, is a proprietor who does not die and in principle does not surrender her property; consequently, the lords had no longer the right of exacting the transfer duties on those tenures which she acquired. It was possible, however, to compromise and allow the Church to keep the tenure on condition of the consent not only of the lord directly concerned, but of all the higher lords up to the *capitalis dominus*; it goes without saying that this concession was only obtained by the payment of pecuniary compensations, the chief of which was the *droit d'amortissement*, paid to these different lords. In this period the form of the episcopal elections under-

went a change, the electoral college coming to consist only of the canons composing the chapter of the cathedral church. But except for the official candidatures, which were abused by the kings and great lords, the elections were regular; the Pragmatic Sanction, attributed to Saint Louis, which implies the contrary, is nowadays considered apocryphal by the best critics.

Finally, it must be added that during the 13th century criminal law was profoundly modified. Under the influence of Roman law a system of arbitrary penalties replaced those laid down by the customs, which had usually been fixed and cruel. The criminal procedure of the feudal courts had been based on the right of accusation vested only in the person wronged and his relations; for this was substituted the inquisitorial procedure (*processus per inquisitionem*), which had developed in the canon law at the very end of the 12th century, and was to become the *procédure à l'extraordinaire* of the *ancien régime*, which was conducted in secret and without free defence and debate. Of this procedure torture came to be an ordinary and regular part.

The customs, which at that time contained almost the whole of the law for a great part of France, were not fixed by being written down. In that part of France which was subject to customary law (*la France coutumière*) they were defined when necessary by the verdict of a jury of practitioners in what was called the *enquête par turbes*; some of them, however, were, in part at least, authentically recorded in seigniorial charters, *chartes de ville* or *chartes de coutume*. Their rules were also recorded by experts in private works or collections called *livres coutumiers*, or simply *coutumiers* (customaries). The most notable of these are *Les Coutumes de Beauvoisis* of Philippe de Beaumanoir, which Montesquieu justly quotes as throwing light on those times; also the *Très ancienne coutume de Normandie* and the *Grand Coutumier de Normandie*; the *Conseil à un ami* of Pierre des Fontaines, the *Établissements de Saint Louis*; the *Livre de justice et de pléi*. At the same time the clerks of important judges began to collect in registers notable decisions; it is in this way that we have preserved to us the old decisions of the exchequer of Normandy, and the *Olim* registers of the parlement of Paris.

The Limited Monarchy.—The 14th and 15th centuries were the age of the limited monarchy. Feudal institutions kept their political importance; but side by side with them arose others of which the object was the direct exercise of the royal authority; others also arose from the very heart of feudalism, but at the same time transformed its laws in order to adapt them to the new needs of the crown. In this period certain rules for the succession to the throne were fixed by precedents: the exclusion of women and of male descendants in the female line, and the principle that a king could not by an act of will change the succession of the crown. The old *curia regis* disappeared and was replaced by the parlement as to its judicial functions, while to fulfil its deliberative functions there was formed a new body, the royal council (*conseil du roi*), an administrative and governing council, which was in no way of a feudal character. The number of its members was at first small, but they tended to increase; soon the brevet of *conseiller du roi en ses conseils* was given to numerous representatives of the clergy and nobility, the great officers of the crown becoming members by right. Side by side with these officials, whose power was then at its height, there were gradually evolved more subservient ministers who could be dispensed with at will; the *secrétaires des commandements du roi* of the 15th century, who in the 16th century developed into the *secrétaires d'état*, and were themselves descended from the *clercs du secret* and *secrétaires des finances* of the 14th century. The College of the Twelve Peers of France had not its full numbers at the end of the 13th century; the six ecclesiastical peerages existed and continued to exist to the end, together with the archbishopric and bishoprics to which they were attached, not being suppressed; but several of the great fiefs to which six lay peerages had been attached had been annexed to the crown. To fill these vacancies, Philip the Fair raised the duchies of Brittany and Anjou and

the countship of Artois to the rank of peerages of France. This really amounted to changing the nature of the institution; for the new peers held their rank merely at the king's will, though the rank continued to belong to a great barony and to be handed down with it. Before long peers began to be created when there were no gaps in the ranks of the College, and there was a constant increase in the numbers of the lay peers.

At the beginning of the 14th century appeared the states general (*états généraux*), which were often convoked, though not at fixed intervals, throughout the whole of the 14th century and the greater part of the 15th. Their power reached its height at a critical moment of the Hundred Years' War during the reign of King John. At the same time there arose side by side with them, and from the same causes, the provincial estates, which were in miniature for each province what the states general were for the whole kingdom. Of these provincial assemblies some were founded in one or other of the great fiefs, being convoked by the duke or count under the pressure of the same needs which led the king to convoke the states general; others, in provinces which had already been annexed to the crown, probably had their origin in the councils summoned by the *bailli* or seneschal to aid him in his administration. Later it became a privilege for a province to have its own assembly; those which did so were never of right subject to the royal *taille*, and kept, at least formally, the right of sanctioning, by means of the assembly, the subsidies which took its place. Hence it became the endeavour of the crown to suppress these provincial assemblies, which in the 14th century were to be found everywhere; from the outset of the 15th century they began to disappear in central France.

The most characteristic feature of this period was the institution of universal taxation by the crown. So far the king's sole revenues were those which he exacted, in his capacity of feudal lord, wherever another lord did not intervene between him and the inhabitants, in addition to the income arising from certain crown rights which he had preserved or regained. But these revenues, known later as the income of the royal domain and later still as the *finances ordinaires*, became insufficient in proportion as the royal power increased; it became a necessity for the monarch to be able to levy imposts throughout the whole extent of the provinces annexed to the crown, even upon the subjects of the different lords. This he could only do by means of the co-operation of those lords, lay and ecclesiastical, who alone had the right of taxing their subjects; the co-operation of the privileged towns, which had the right to tax themselves, was also necessary. It was in order to obtain this consent that the states general, in most cases, and the provincial assemblies, in all cases, were convoked. In some cases, however, the king adopted different methods; for instance, he sometimes utilized the principle of the feudal aids. In cases where his vassals owed him, as overlord, a pecuniary aid, he substituted for the sum paid directly by his vassals a tax levied by his own authority on their subjects. It is in this way that for thirty years the necessary sums were raised, without any vote from the states general, to pay the ransom of King John. But in principle the taxes were in the 14th century sanctioned by the states general. Whatever form they took, they were given the generic name of Aids or *auxilia*, and were considered as occasional and extraordinary subsidies, the king being obliged in principle to "live of his own" (*vivre de son domaine*). Certain aids, it is true, tended to become permanent under the reign of Charles VI.; but the taxes subject to the consent of the states general were at first the sole resource of Charles VII. In the second half of his reign the two chief taxes became permanent: in 1435 that of the aids (a tax on the sale of articles of consumption, especially on wine), with the formal consent of the states general, and that of the *taille* in 1439. In the latter case the consent of the states general was not given; but only the nobility protested, for at the same time as the royal *taille* became permanent the seigniorial *taille* was suppressed. These imposts were increased, on the royal authority, by Louis XI. After his death the states general, which met at Tours in 1484, endeavoured

to re-establish the periodical vote of the tax, and only granted it for two years, reducing it to the sum which it had reached at the death of Charles VII. But the promise that they would again be convoked before the expiry of two years was not kept. These imposts and that of the *gabelle* were henceforth permanent. Together with the taxes there was evolved the system of their administration. Their main outlines were laid down by the states general in the reign of King John, in 1355 and the following years. For the administration of the subsidies which they granted, they nominated from among their own numbers *surintendants généraux* or *généraux des finances*, and further, for each diocese or equivalent district, *élus*. Both had not only the active administration but also judicial rights, the latter constituting courts of the first instance and the former courts of final appeal. After 1360 the crown again adopted this organization, which had before been only temporary; but henceforth *généraux* and *élus* were nominated by the king. The *élus*, or *officiers des élections*, only existed in districts which were subject to the royal *taille*; hence the division, so important in old France, into *pays d'élections* and *pays d'états*. The *élus* kept both administration and jurisdiction; but in the higher stage a differentiation was made: the *généraux des finances*, who numbered four, kept the administration, while their jurisdiction as a court of final appeal was handed over to another body, the *cour des aides*, which had already been founded at the end of the 14th century. Besides the four *généraux des finances*, who administered the taxation, there were four Treasurers of France (*trésoriers de France*), who administered the royal domain; and these eight officials together formed in the 15th century a kind of ministry of finance to the monarchy.

The army also was organized. On the one hand, the military service attached to the fiefs was transformed for the profit of the king, who alone had the right of making war; it became the *arrière-ban*, a term which had formerly applied to the *levée en masse* of all the inhabitants in times of national danger. Before the 14th century the king had only had the power of calling upon his own immediate vassals for service. Henceforth all possessors of fiefs owed him, whether within the kingdom or on the frontiers, military service without pay and at their own expense. This was for long an important resource for the king. But Charles VII. organized an army on another footing. It comprised the *francs-archers* furnished by the parishes, a militia which was only summoned in case of war, but in time of peace had to practise archery, and companies of *gendarmerie* or heavy cavalry, forming a permanent establishment, which were called *compagnies d'ordonnance*. It was chiefly to provide for the expense of the first nucleus of a permanent army that the *taille* itself had been made permanent.

The new army led to the institution of the governors of provinces, who were to command the troops quartered there. At first they were only appointed for the frontiers and fortified places, but later the kingdom was divided into *gouvernements généraux*. There were at first twelve of these, which were called in the middle of the 16th century the *douze anciens gouvernements*. Although, strictly speaking, they had only military powers, the governors, always chosen from among the great lords, became in the provinces the direct representatives of the king and caused the *baillis* and seneschals to take a secondary place.

The courts of law continued to develop on the lines already laid down. The parlement, which had come to be a judicial committee nominated every year, but always consisting in fact of the same persons, changed in the course of the 14th century into a body of magistrates who were permanent but as yet subject to removal. During this period were evolved its organization and definitive features (see PARLEMENT). The provincial parlements had arisen after and in imitation of that of Paris, and had for the most part taken the place of some superior jurisdiction which had formerly existed in the same district when it had been independent (like Provence) or had formed one of the great fiefs (like Normandy or Burgundy). It was during this period also that the parlements acquired the right of opposing the registration, that is to say, the promulgation

of laws, of revising them, and of making representations (*remonstrances*) to the king when they refused the registration, giving the reasons for such refusal. The other royal jurisdictions were completed (see BAILIFF, CHATELET). Besides them arose another of great importance, which was of military origin, but came to include all citizens under its sway. These were the provosts of the marshals of France (*prévôts des marchaux de France*), who were officers of the *Maréchaussée* (the gendarmerie of the time); they exercised criminal jurisdiction without appeal in the case of crimes committed by vagabonds and fugitives from justice, this class being called their *gibier* (game), and of a number of crimes of violence, whatever the rank of the offender. Further, another class of officers was created in connexion with the law courts: the "king's men" (*gens du roi*), the *procureurs* and *avocats du roi*, who were at first simply those lawyers who represented the king in the law courts, or pleaded for him when he had some interest to follow up or to defend. Later they became officers of the crown. In the case of the *procureurs du roi* this development took place in the first half of the 14th century. Their duty was not only to represent the king in the law courts, whether as plaintiff or defendant, but also to take care that in each case the law was applied, and to demand its application. From this time on the *procureurs du roi* had full control over matters concerning the public interest, and especially over public prosecution. In this period, too, appeared what was afterwards called *justice retenue*, that is to say, the justice which the king administered, or was supposed to administer, in person. It was based on the idea that, since all justice and all judicial power reside in the king, he could not deprive himself of them by delegating their exercise to his officers and to the feudal lords. Consequently he could, if he thought fit, take the place of the judges and call up a case before his own council. He could reverse even the decisions of the courts of final appeal, and in some cases used this means of appealing against the decrees of the parlements (*proposition d'erreur, requête civile, pourvoi en révision*). In these cases the king was supposed to judge in person; in reality they were examined by the *maîtres des requêtes* and submitted to the royal council (*conseil du roi*), at which the king was always supposed to be present and which had in itself no power of giving a decision. For this purpose there was soon formed a special committee of the council, which was called the *conseil privé* or *de justice*. At the end of the 15th century, Charles VIII., in order to relieve the council of some of its functions, created a new final court, the *grand conseil*, to deal with a number of these cases. But before long it again became the custom to appeal to the *conseil du roi*, so that the *grand conseil* became almost useless. The king frequently, by means of *lettres de justice*, intervened in the procedure of the courts, by granting *benefices*, by which rules which were too severe were modified, and faculties or facilities for overcoming difficulties arising from flaws in contracts or judgments, cases at that time not covered by the common law. By *lettres de grâce* he granted reprieve or pardon in individual cases. The most extreme form of intervention by the king was made by means of *lettres de cachet* (*q.v.*), which ordered a subject to go without trial into a state prison or into exile.

The condition of the Church changed greatly during this period. The jurisdiction of the *officialités* was very much reduced, even over the clergy. They ceased to be competent to judge actions concerning the possession of real property, in which the clergy were defendants. In criminal law the theory of the *cas privilégié*, which appears in the 14th century, enabled the royal judges to take action against and judge the clergy for all serious crimes, though without the power of inflicting any penalties but arbitrary fines, the ecclesiastical judge remaining competent, in accordance with the privileges of clergy, to try the offender for the same crime as what was technically called a *délit commun*. The development of jurisprudence gradually removed from the *officialités* causes of a purely secular character in which laymen only were concerned, such as wills and contracts; and in matrimonial cases their jurisdiction was limited to those in which the *foedus matrimonii*

was in question. For the acquisition of real property by ecclesiastical establishments the consent of the king to the amortization was always necessary, even in the case of allodial lands; and if it was a case of feudal tenures the king and the direct overlords alone kept their rights, the intermediate lords being left out of the question.

As regards the conferring of ecclesiastical benefices, from the 14th century onwards the papacy encroached more and more upon the rights of the bishops, in whose gift the inferior benefices generally were, and of the electors, who usually conferred the superior benefices; at the same time it exacted from newly appointed incumbents heavy dues, which were included under the generic name of annates (*q.v.*). During the Great Schism of the Western Church, these abuses became more and more crying, until by a series of edicts, promulgated with the consent and advice of the parlement and the clergy, the Gallican Church was restored to the possession of its former liberties, under the royal authority. Thus France was ready to accept the decrees of reform issued by the council of Basel (*q.v.*), which she did, with a few modifications, in the Pragmatic Sanction of Charles VII., adopted after a solemn assembly of the clergy and nobles at Bourges and registered by the parlement of Paris in 1438. It suppressed the annates and most of the means by which the popes disposed of the inferior benefices: the reservations and the *gratiae expectativae*. For the choice of bishops and abbots, it restored election by the chapters and convents. The Pragmatic Sanction, however, was never recognized by the papacy, nor was it consistently and strictly applied by the royal power. The transformation of the civil and criminal law under the influence of Roman and canon law had become more and more marked. The production of the *coutumiers*, or *livres de pratiques*, also continued. The chief of them were: in the 14th century, the *Stylus Vetus Curiae Parliamenti* of Guillaume de Breuil; the *Très ancienne coutume de Bretagne*; the *Grand Coutumier de France*, or *Coutumier de Charles VI.*; the *Somme rural* of Boutillier; in the 15th century, for Auvergne, the *Practica forensis* of Masuer. Charles VII., in an article of the Grand Ordonnance of Montil-les-Tours (1453), ordered the general customs to be officially recorded, under the supervision of the crown. It was an enormous work, which would almost have transformed them into written laws; but up to the 16th century little recording was done, the procedure established by the Ordonnance for the purpose not being very suitable.

The Absolute Monarchy.—From the 16th century to the Revolution was the period of the absolute monarchy, but it can be further divided into two periods: that of the establishment of this régime, from 1515 to about 1673; and that of the *ancien régime* when definitively established, from 1673 to 1789. The reigns of Francis I. and Henry II. clearly laid down the principle of the absolute power of the crown and applied it effectually, as is plainly seen from the temporary disappearance of the states general, which were not assembled under these two reigns. There were merely a few assemblies of notables chosen by the royal power, the most important of which was that of Cognac, under Francis I., summoned to advise on the non-fulfilment of the treaty of Madrid. It is true that in the second half of the 16th century the states general reappeared. They were summoned in 1560 at Orleans, then in 1561 at Pontoise, and in 1576 and 1588 at Blois. The League even convoked one, which was held at Paris in 1593. This represented a crucial and final struggle. Two points were then at issue: firstly, whether France was to be Protestant or Catholic; secondly, whether she was to have a limited or an absolute monarchy. The two problems were not necessarily bound up with one another. For if the Protestants desired political liberty, many of the Catholics wished for it too, as is proved by the writings of the time, and even by the fact that the League summoned the estates. But the states general of the 16th century, in spite of their good intentions and the great talents which were at their service, were dominated by religious passions, which made them powerless

Papal encroachments.

Government under the absolute monarchy.

for any practical purpose. They only produced a few great ordinances of reform, which were not well observed. They were, however, to be called together yet again, as a result of the disturbances which followed the death of Henry IV.; but their dissensions and powerlessness were again strikingly exemplified and they did not reappear until 1789. Other bodies, however, which the royal power had created, were to carry on the struggle against it. There were the parlements, the political rivals of the states general. Thanks to the principle according to which no law came into effect so long as it had not been registered by them, they had, as we have seen, won for themselves the right of a preliminary discussion of those laws which were presented to them, and of refusing registration, explaining their reasons to the king by means of the *remontrances*. The royal power saw in this merely a concession from itself, a consultative power, which ought to yield before the royal will, when the latter was clearly manifested, either by *lettres de jussion* or by the actual words and presence of the king, when he came in person to procure the registration of a law in a so-called *lit de justice*. But from the 16th century onwards the members of the parlements claimed, on the strength of a historical theory, to have inherited the powers of the ancient assemblies (the Merovingian and Carolingian *placita* and the *curia regis*), powers which they, moreover, greatly exaggerated. The successful assertion of this claim would have made them at once independent of and necessary to the crown. During the minority of kings, they had possessed, in fact, special opportunities for asserting their pretensions, particularly when they had been called upon to intervene in the organization of the regency. It is on this account that at the beginning of the reign of Louis XIV. the parlement of Paris wished to take part in the government, and in 1648, in concert with the other supreme courts of the capital, temporarily imposed a sort of charter of liberties. But the first Fronde, of which the parlement was the centre and soul, led to its downfall, which was completed when later on Louis XIV. became all-powerful. The ordinance of 1667 on civil procedure, and above all a declaration of 1673, ordered the parlement to register the laws as soon as it received them and without any modification. It was only after this registration that they were allowed to draw up remonstrances, which were henceforth futile. The nobles, as a body, had also become politically impotent. They had been sorely tried by the wars of religion, and Richelieu, in his struggles against the governors of the provinces, had crushed their chief leaders. The second Fronde was their last effort (see FRONDE). At the same time the central government underwent changes. The great officers of the crown disappeared one by one. The office of constable of France was suppressed by purchase during the first half of the 17th century, and of those in the first rank only the chancellor survived till the Revolution. But though his title could only be taken from him by condemnation on a capital charge, the king was able to deprive him of his functions by taking from him the custody and use of the seal of France, which were entrusted to a *garde des sceaux*. Apart from the latter, the king's real ministers were the secretaries of state, generally four in number, who were always removable and were not chosen from among the great nobles. For purposes of internal administration, the provinces were divided among them, each of them corresponding by despatches with those which were assigned to him. Any other business (with the exception of legal affairs, which belonged to the chancellor, and finance, of which we shall speak later) was divided among them according to convenience. At the end of the 16th century, however, were evolved two regular departments, those of war and foreign affairs. Under Francis I. and Henry II., the chief administration of finance underwent a change; for the four *généraux des finances*, who had become too powerful, were substituted the *intendants des finances*, one of whom soon became a chief minister of finance, with the title *surintendant*. The *généraux des finances*, like the *trésoriers de France*, became provincial officials, each at the head of a *généralité* (a superior administrative district for purposes of finance); under Henry III. the two functions were combined and assigned to the *bureaux des finances*. The fall of Fouquet

led to the suppression of the office of *surintendant*; but soon Colbert again became practically a minister of finance, under the name of *contrôleur général des finances*, both title and office continuing to exist up to the Revolution.

The *conseil du roi*, the origin of which we have described, was an important organ of the central government, and for a long time included among its members a large number of representatives of the nobility and clergy. Besides the councillors of state (*conseillers d'état*), its ordinary members, the great officers of the crown and secretaries of state, princes of the blood and peers of France were members of it by right. Further, the king was accustomed to grant the brevet of councillor to a great number of the nobility and clergy, who could be called upon to sit in the council and give an opinion on matters of importance. But in the 17th century the council tended to differentiate its functions, forming three principal sections, one for political, one for financial, and the third for legal affairs. Under Louis XIV. it took a definitely professional, administrative and technical character. The *conseillers à brevet* were all suppressed in 1673, and the peers of France ceased to be members of the council. The political council, or *conseil d'en haut*, had no *ex officio* members, not even the chancellor; the secretary of state for foreign affairs, however, necessarily had entry to it; it also included a small number of persons chosen by the king and bearing the title of ministers of state (*ministres d'état*). The other important sections of the *conseil du roi* were the *conseil des finances*, organized after the fall of Fouquet, and the *conseil des dépêches*, in which sat the four secretaries of state and where everything concerned with internal administration (except finance) was dealt with, including the legal business connected with this administration. As to the government and the preparation of laws, under Louis XIV. and Louis XV., the *conseil du roi* often passed into the background, when, as the saying went, a minister who was projecting some important measure *travaillait seul avec le roi* (worked alone with the king), having from the outset gained the king's ear.

The chief authority in the provincial administration belonged in the 16th century to the governors of the provinces, though, strictly speaking, the governor had only military powers in his *gouvernement*; for, as we have seen, he was the direct representative of the king for general purposes. But at the end of this century were created the intendants of the provinces, who, after a period of conflict with the governors and the parlements, became absolute masters of the administration in all those provinces which had no provincial estates, and the instruments of a complete administrative centralization (see INTENDANT).

The towns having a *corps de ville*, that is to say, a municipal organization, preserved in the 16th century a fairly wide autonomy, and played an important part in the wars of religion, especially under the League. But under Louis XIV. their independence rapidly declined. They were placed under the tutelage of the intendants, whose sanction, or that of the *conseil du roi*, was necessary for all acts of any importance. In the closing years of the 17th century, the municipal officials ceased, even in principle, to be elective. Their functions ranked as offices which were, like royal offices, saleable and heritable. The pretext given by the edicts were the intrigues and dissensions caused by the elections; the real cause was that the government wanted to sell these offices, which is proved by the fact that it frequently allowed towns to redeem them and to re-establish the elections.

The sale of royal offices is one of the characteristic features of the *ancien régime*. It had begun early, and, apparently, with the office of councillor of the parlement of Paris, when this became permanent, in the second half of the 14th century. It was first practised by magistrates who wished to dispose of their office in favour of a successor of their own choice. The *resignatio in favorem* of ecclesiastical benefices served as model, and at first care was taken to conceal the money transaction between the parties. The crown winked at these resignations in consideration of a payment in money.

But in the 16th century, under Francis I. at the latest, the crown itself began officially to sell offices, whether newly created or vacant by the death of their occupiers, taking a fee from those upon whom they were conferred. Under Charles IX. the right of resigning *in favorem* was recognized by law in the case of royal officials, in return for a payment to the treasury of a certain proportion of the price. In the case of judicial offices there was a struggle for at least two centuries between the system of sale and another, also imitated from canon law, *i.e.* the election or presentation of candidates by the legal corporations. The ordinances of the second half of the 16th century, granted in answer to complaints of the states general, restored and confirmed the latter system, giving a share in the presentation to the towns or provincial notables and forbidding sales. The system of sale, however, triumphed in the end, and, in the case of judges, had, moreover, a favourable result, assuring to them that irremovability which Louis XI. had promised in vain; for, under this system, the king could not reasonably dismiss an official arbitrarily without refunding the fee which he had paid. On the other hand, it contributed to the development of the *épices*, or dues paid by litigants to the judges. The system of sale, and with it irremovability, was extended to all official functions, even to financial posts. The process was completed by the recognition of the rights in the sale of offices as hereditary, *i.e.* the right of resigning the office on payment of a fee, either in favour of a competent descendant or of a third party, passed to the heirs of an official who had died without having exercised this right himself. It was established under Henry IV. in 1604 by the system called the *Paulette*, in return for the payment by the official of an annual fee (*droit annuel*) which was definitely fixed at a hundredth part of the price of the office. Thus these offices, though the royal nomination was still required as well as the professional qualifications required by the law, became heritable property in virtue of the finance attached to them. This led to the formation of a class of men who, though bound in many ways to the crown, were actually independent. Hence the tendency in the 18th century to create new and important functions under the form, not of offices, but of simple commissions.

In this period of the history of France were evolved and defined the essential principles of the old public law. There were, in the first place, the *fundamental laws of the realm*, which were true constitutional principles, established for the most part not by law but by custom, and considered as binding in respect of the king himself; so that, although he was sovereign, he could neither abrogate, nor modify, nor violate them. There was, however, some discussion as to what rules actually came under this category, except in the case of two series about which there was no doubt. These were, on the one hand, those which dealt with the succession to the crown, and forbade the king to change its order, and those which proclaimed the inalienability of the royal domain, against which no title by prescription was valid. This last principle, introduced in the 14th century, had been laid down and defined by the edict of Moulins in 1566; it admitted only two exceptions: the formation of appanages (*q.v.*), and selling (*engagement*), to meet the necessities of war, with a perpetual option of redeeming it.

There was in the second place the theory of the rights, franchises and liberties of the Gallican Church, formed of elements some of which were of great antiquity, and based on the conditions which had determined the relations of the Gallican Church with the crown and papacy during the Great Schism and under the Pragmatic Sanction of Bourges, and defined at the end of the 16th and the beginning of the 17th century. This body of doctrine was defined by the writings of three men especially, Guy Coquille, Pierre Pithou and Pierre Dupuy, and was solemnly confirmed by the declaration of the clergy of France, or *Déclaration des quatre articles* of 1682, and by the edict which promulgated it. Its substance was based chiefly on three principles: firstly, that the temporal power was absolutely independent of the spiritual power; secondly, that the pope had authority over the clergy of France in temporal matters and matters of

discipline only by the consent of the king; thirdly, that the king had authority over and could legislate for the Gallican Church in temporal matters and matters of discipline. The old public law provided a safeguard against the violation of these rules. This was the process known as the *appel comme d'abus*, formed of various elements, some of them very ancient, and definitely established during the 16th century. It was heard before the parlements, but could, like every other case, be evoked before the royal council. Its effect was to annul any act of the ecclesiastical authority due to abuse or contrary to French law. The clergy were, when necessary, reduced to obedience by means of arbitrary fines and by the seizure of their temporalities. The Pragmatic Sanction had been abrogated and replaced by the Concordat of 1515, concluded between Francis I. and Leo X., which remained in force until suppressed by the Constituent Assembly. The Concordat, moreover, preserved many of the enactments of the Pragmatic Sanction, notably those which protected the collation of the inferior benefices from the encroachments of the papacy, and which had introduced reforms in certain points of discipline. But in the case of the superior benefices (bishoprics and abbeys) election by the chapters was suppressed. The king of France nominated the candidate, to whom the pope gave canonical institution. As a matter of fact, the pope had no choice; he had to institute the nominee of the king, unless he could show his unworthiness or incapacity, as the result of inquiries regularly conducted in France; for the pope it was, as the ancient French authors used to say, a case of compulsory collation. The annates were re-established at the time of the Concordat, but considerably diminished in comparison with what they had been before the Pragmatic Sanction. We must add, to complete this account, that many of the inferior benefices, in France as in the rest of Christendom, were conferred according to the rules of patronage, the patron, whether lay or ecclesiastic, presenting a candidate whom the bishop was bound to appoint, provided he was neither incapable nor unsuitable. There was some difficulty in getting the Concordat registered by the parlement of Paris, and the latter even announced its intention of not taking the Concordat into account in those cases concerning benefices which might come before it. The crown found an easy method of making this opposition ineffectual, namely, to transfer to the Grand Conseil the decision of cases arising out of the application of the Concordat.

In the 16th century also, contributions to the public services drawn from the immense possessions of the clergy were regularized. Since the second half of the 12th century at least, the kings had in times of urgent need asked for subsidies from the church, and ever since the Saladin tithe (*dime saladine*) of Philip Augustus this contribution had assumed the form of a tithe, taking a tenth part of the revenue of the benefices for a given period. Tithes of this kind were fairly frequently granted by the clergy of France, either with the pope's consent or without (this being a disputed point). After the conclusion of the Concordat, Leo X. granted the king a tithe (*décime*) under the pretext of a projected war against the Turks; hitherto concessions of this kind had been made by the papacy in view of the Crusades or of wars against heretics. The concession was several times renewed, until, by force of custom, the levying of these tithes became permanent. But in the middle of the 16th century the system changed. The crown was heavily in debt, and its needs had increased. The property of the clergy having been threatened by the states general of 1560 and 1561, the king proposed to them to remit the bulk of the tithes and other dues, in return for the payment by them of a sum equivalent to the proceeds of the taxes which he had mortgaged. A formal contract to this effect was concluded at Poissy in 1561 between the king and the clergy of France, represented by the prelates who were then gathered together for the Colloquy of Poissy with the Protestants, and some of those who had been sitting at the states general of Pontoise. The fulfilment of this agreement was, however, evaded by the king, who diverted part of the funds provided by the clergy from their proper purpose. In 1580.

after a period of ten years which had been agreed on; a new assembly of the clergy was called together and, after protesting against this action, renewed the agreement, which was henceforward always renewed every ten years. Such was the definitive form of the contribution of the clergy, who also acquired the right of themselves assessing and levying these taxes on the holders of benefices. Thus every ten years there was a great assembly of the clergy, the members of which were elected. There were two stages in the election, a preliminary one in the dioceses and a further election in the ecclesiastical provinces, each province sending four deputies to the general assembly, two of the first rank, that is to say, chosen from the episcopate, and two of the second rank, which included all the other clergy. The *dons gratuits* (benevolences) voted by the assembly comprised a fixed sum equivalent to the old tithes and supplementary sums paid on one occasion only, which were sometimes considerable. The church, on her side, profited by this arrangement in order to obtain the commutation or redemption of the taxes affecting ecclesiastics considered as individuals. This settlement only applied to the "clergy of France," that is to say, to the clergy of those districts which were united to the crown before the end of the 16th century. The provinces annexed later, called *pays étrangers*, or *pays conquis*, had in this matter, as in many others, an arrangement of their own. At last, under Louis XV. the edict of 1749, *concernant les établissements et acquisitions des gens de mainmorte*, was completely effective in subordinating the acquisition of property by ecclesiastical establishments to the consent and control of the crown, rendering them incapable of acquiring real property by bequests.

At the end of the 16th century a wise law had been made which, in spite of the traces which it bore of past struggles, had established a reasonable balance among the Christians of France. The edict of Nantes, in 1598, granted the Protestants full civil rights, liberty of conscience and public worship in many places, and notably in all the royal *bailliages*. The Catholics, whose religion was essentially a state religion, had never accepted this arrangement as final, and at last, in 1685, under Louis XIV., the edict of Nantes was revoked and the Protestant pastors expelled from France. Their followers were forbidden to leave the country, but many succeeded nevertheless in escaping abroad. The position of those who remained behind was peculiar. Laws passed in 1715 and 1724 established the legal theory that there were no longer any Protestants in France, but only *vieux catholiques* and *nouveaux convertis*. The result was that henceforth they had no longer any regular civil status, the registers containing the lists of Catholics enjoying civil rights being kept by the Catholic clergy.

The form of government established under Louis XIV. was preserved without any fundamental modification under Louis XV. After the death of Louis XIV., however, the regent, under the inspiration of the duc de St Simon, made trial of a system of which the latter had made a study while in a close correspondence with the duke of Burgundy. It consisted in substituting for the authority of the ministers, secretaries of state and controller-general councils, or governmental bodies, mainly composed of great lords and prelates. These only lasted for a few years, when a return was made to the former organization. The parlements had regained their ancient rights in consequence of the parlement of Paris having, in 1715, set aside the will of Louis XIV. as being contrary to the fundamental laws of the kingdom, in that it laid down rules for the composition of the council of regency, and limited the power of the regent. This newly revived power they exercised freely, and all the more so since they were the last surviving check on the royal authority. During this reign there were numerous conflicts between them and the government, the causes of this being primarily the innumerable incidents to which the bull *Unigenitus* gave rise, and the increase of taxation; proceedings against Jesuits also figure conspicuously in the action of the parlements. They became at this period the avowed representatives of the nation; they contested the validity of the registration of laws in the *lits de justice*, asserting that laws could only be made obligatory when the registration

had been freely endorsed by themselves. Before the registration of edicts concerning taxation they demanded a statement of the financial situation and the right of examining the accounts. Finally, by the theory of the *classes*, which considered the various parlements of France as parts of one and the same body, they established among them a political union. These pretensions the crown refused to recognize. Louis XV. solemnly condemned them in a *lit de justice* of December 1770, and in 1771 the chancellor Maupeou took drastic measures against them. The magistrates of the parlement of Paris were removed, and a new parlement was constituted, including the members of the *grand conseil*, which had also been abolished. The *cour des aides* of Paris, which had made common cause with the parlement, was also suppressed. Many of the provincial parlements were re-organized, and a certain number of useful reforms were carried out in the jurisdiction of the parlement of Paris; the object of these, however, was in most cases that of diminishing its importance. These actions, the *coup d'état* of the chancellor Maupeou, as they were called, produced an immense sensation. The repeated conflicts of the reign of Louis XV. had already given rise to a whole literature of books, pamphlets and tracts in which the rights of the crown were discussed. At the same time the political philosophy of the 18th century was disseminating new principles, and especially those of the supremacy of the people and the differentiation of powers; the government of England also became known among the French. Thus men's minds were being prepared for the Revolution.

The personal government of Louis XVI. from 1774 to 1789 was chiefly marked by two series of facts. Firstly, there was the partial application of the principles propounded by the French economists of this period, the Physiocrats, who had a political doctrine peculiar to themselves. They were not in favour of political liberty, but attached on the contrary to the absolute monarchy, of which they did not fear the abuses, because they were convinced that so soon as they should be known, reason (*evidence*) alone would suffice to make the crown respect the "natural and essential laws of bodies politic" (*Lois naturelles et essentielles des sociétés politiques*, the title of a book by Mercier de La Rivière). On the other hand, they favoured civil and economic liberty. They wished, in particular, to decentralize the administration and restore to the landed proprietors the administration and levying of taxes, which they wished to reduce to a tax on land only. This school came into power with Turgot, who was appointed controller-general of the finances, and laid the foundations of many reforms. He actually accomplished for the moment one very important reform, namely, the suppression of the trade and craft guilds (*communautés, jurandes et maîtrises*). This organization, which was common to the whole of Europe (see GILDS), had taken definitive shape in France in the 13th and 14th centuries, but had subsequently been much abused. Turgot suppressed the privileges of the *maîtres*, who alone had been able to work on their own account, or to open shops and workshops, and thus proclaimed the freedom of labour, industry and commerce. However, the old organization, slightly amended, was restored under his successor Necker. It was Turgot's purpose to organize provincial and other inferior assemblies, whose chief business was to be the assessment of taxes. Necker applied this idea, partially and experimentally, by creating a few of these provincial assemblies in various *généralités* of the *pays d'élections*. A general reform on these lines and on a very liberal basis was proposed by Calonne to the assembly of notables in 1787, and it was brought into force for all the *pays d'élections*, though not under such good conditions, by an edict of the same year. Louis XVI. had inaugurated his reign by the restoration of the parlements; all the bodies which had been suppressed by Maupeou and all the officials whom he had dismissed were restored, and all the bodies and officials created by him were suppressed. But it was not long before the old struggle between the crown and parlements again broke out. It began by the conservative opposition offered by the parlement of Paris to Turgot's reforms. But the real struggle broke out in 1787

over the edicts coming from the assembly of notables, and particularly over the two new taxes, the stamp duty and the land tax. The parlement of Paris refused to register them, asserting that the consent of the taxpayers, as represented by the states general, was necessary to fresh taxation. The struggle seemed to have come to an end in September; but in the following November it again broke out, in spite of the king's promise to summon the states general. It reached its height in May 1788, when the king had created a *cour plénière* distinct from the parlements, the chief function of which was to register the laws in their stead. A widespread agitation arose, amounting to actual anarchy, and was only ended by the recall of Necker to power and the promise to convoke the states general for 1789.

Various Institutions.—The permanent army which, as has been stated above, was first established under Charles VII., was developed and organized during the *ancien régime*. The *gendarmerie* or heavy cavalry was continuously increased in numbers. On the other hand, the *francs archers* fell into disuse after Louis XI.; and, after a fruitless attempt had been made under Francis I. to establish a national infantry, the system was adopted for this also of recruiting permanent bodies of mercenaries by voluntary enlistment. First there were the "old bands" (*vieilles bandes*), chiefly those of Picardy and Piedmont, and at the end of the 16th century appeared the first regiments, the number of which was from time to time increased. There were also in the service and pay of the king French and foreign regiments, the latter principally Swiss, Germans and Scots. The system of purchase penetrated also to the army. Each regiment was the property of a great lord; the captain was, so to speak, owner of his company, or rather a contractor, who, in return for the sums paid him by the king, recruited his men and gave them their uniform, arms and equipment. In the second half of the reign of Louis XIV. appeared the militia (*milices*). To this force each parish had to furnish one recruit, who was at first chosen by the assembly of the inhabitants, later by drawing lots among the bachelors or widowers without children, who were not exempt. The militia was very rarely raised from the towns. The purpose for which these men were employed varied from time to time. Sometimes, as under Louis XIV., they were formed into special active regiments. Under Louis XV. and Louis XVI. they were formed into *régiments provinciaux*, which constituted an organized reserve. But their chief use was during war, when they were individually incorporated into various regiments to fill up the gaps.

Under Louis XV., with the duc de Choiseul as minister of war, great and useful reforms were effected in the army. Choiseul suppressed what he called the "farming of companies" (*compagnie-ferme*); recruiting became a function of the state, and voluntary enlistment a contract between the recruit and the state. Arms, uniform and equipment were furnished by the king. Choiseul also equalized the numbers of the military units, and his reforms, together with a few others effected under Louis XVI., produced the army which fought the first campaigns of the Revolution.

One of the most distinctive features of the *ancien régime* was excessive taxation. The taxes imposed by the king were numerous, and, moreover, hardly any of them fell on all parts of the kingdom. To this territorial inequality was added the inequality arising from privileges. Ecclesiastics, nobles, and many of the crown officials were exempted from the heaviest imposts. The chief taxes were the *taille* (*q.v.*), the *aides* and the *gabelle* (*q.v.*), or monopoly of salt, the consumption of which was generally made compulsory up to the amount determined by regulations. In the 17th and 18th centuries certain important new taxes were established: from 1695 to 1698 the *capitation*, which was re-established in 1701 with considerable modifications, and in 1710 the tax of the *ditième*, which became under Louis XV. the tax of the *vingtièmes*. These two imposts had been established on the principle of equality, being designed to affect every subject in proportion to his income; but so strong was the system of privileges, that

as a matter of fact the chief burden fell upon the roturiers. The income of a roturier who was not exempt was thus subject in turn to three direct imposts: the *taille*, the *capitation* and the *vingtièmes*, and the apportioning or assessment of these was extremely arbitrary. In addition to indirect taxation strictly so called, which was very extensive in the 17th and 18th centuries, France under the *ancien régime* was subject to the *traites*, or customs, which were not only levied at the frontiers on foreign trade, but also included many internal custom-houses for trade between different provinces. Their origin was generally due to historical reasons; thus, among the *provinces repeulées étrangères* were those which in the 14th century had refused to pay the aids for the ransom of King John, also certain provinces which had refused to allow customs offices to be established on their foreign frontier. Colbert had tried to abolish these internal duties, but had only succeeded to a limited extent.

The indirect taxes, the *traites* and the revenues of the royal domain were farmed out by the crown. At first a separate contract had been made for each impost in each *élection*, but later they were combined into larger lots, as is shown by the name of one of the customs districts, *l'enceinte des cinq grosses fermes*. From the reign of Henry IV. on the levying of each indirect impost was farmed *en bloc* for the whole kingdom, a system known as the *fermes générales*; but the real *ferme générale*, including all the imposts and revenues which were farmed in the whole of France, was only established under Colbert. The *ferme générale* was a powerful company, employing a vast number of men, most of whom enjoyed various privileges. Besides the royal taxes, seigniorial imposts survived under the form of tolls and market dues. The lords also often possessed local monopolies, e.g. the right of the common bakehouse (*four banal*), which were called the *banalités*.

The organization of the royal courts of justice underwent but few modifications during the *ancien régime*. The number of parlements, of *cours des aides* and of *cours des comptes* increased; in the 17th century the name of *conseil supérieur* was given to some new bodies which actually discharged the functions of the parlement, this being the period of the decline of the parlement. In the 16th century, under Henry II., had been created *présidiaux*, or courts of final jurisdiction, intended to avoid numerous appeals in small cases, and above all to avoid a final appeal to the parlements. Seigniorial courts survived, but were entirely subordinate to the royal jurisdictions and were badly officered by ill-paid and ignorant judges, the lords having long ago lost the right to sit in them in person. Their chief use was to deal with cases concerning the payment of feudal dues to the lord. Both lawyers and people would have preferred only two degrees of justice; and an ordinance of May 1788 realized this desire in the main. It did not suppress the seigniorial jurisdictions, but made their extinction a certainty by allowing litigants to ignore them and go straight to the royal judges. This was, however, reversed on the recall of Necker and the temporary triumph of the parlements.

The ecclesiastical jurisdictions survived to the end, but with diminished scope. Their competency had been considerably reduced by the Ordinance of Villers Cotterets of 1539, and by an edict of 1693. But a series of ingenious legal theories had been principally efficacious in gradually depriving them of most of the cases which had hitherto come under them. In the 18th century the privilege of clergy did not prevent civil suits in which the clergy were defendants from being almost always taken before secular tribunals, and ever since the first half of the 17th century, for all grave offences, or *cas privilégiés*, the royal judge could pronounce a sentence of corporal punishment on a guilty cleric without this necessitating his previous degradation. The inquiry into the case was, it is true, conducted jointly by the royal and the ecclesiastical judge, but each of them pronounced his sentence independently. All cases concerning benefices came before the royal judges. Finally, the *officialités* had no longer as a rule any jurisdiction over laymen, even in the matter of marriage, except in questions of betrothals, and sometimes in cases of opposition to marriages.

Courts of law.

Ecclesiastical courts.

The parish priests, however, continued to enter declarations of baptisms, marriages and burials in registers kept according to the civil laws.

The general customs of the *pays coutumiers* were almost all officially recorded in the 16th century, definite procedure for this purpose having been adopted at the end of the 15th century. Drafts were prepared by the officials of the royal courts in the chief town of the district in which the particular customs were valid, and were then submitted to the government. The king then appointed commissioners to visit the district and promulgate the customs on the spot. For the purpose of this publication the lords, lay and ecclesiastical, of the district, with representatives of the towns and of various bodies of the inhabitants, were summoned for a given day to the chief town. In this assembly each article was read, discussed and put to the vote. Those which were approved by the majority were thereupon decreed (*décrotés*) by the commissioners in the king's name; those which gave rise to difficulties were put aside for the parlement to settle when it registered the *coutume*. The *coutumes* in this form became practically written law; henceforward their text could only be modified by a formal revision carried out according to the same procedure as the first version. Throughout the 16th century a fair number of *coutumes* were thus revised (*reformées*), with the express object of profiting by the observations and criticisms on the first text which had appeared in published commentaries and notes, the most important of which were those of Charles Dumoulin. In the 16th century there had been a revival of the study of Roman law, thanks to the historical school, among the most illustrious representatives of which were Jacques Cujas, Hugues Doneau and Jacques Godefroy; but this study had only slight influence on practical jurisprudence. Certain institutions, however, such as contracts and obligations, were regulated throughout the whole of France by the principles of Roman law.

Legislation by *ordonnances*, *édits*, *déclarations* or *lettres patentes*, emanating from the king, became more and more frequent; but the character of the *grandes ordonnances*, which were of a far-reaching and comprehensive nature, underwent a change during this period. In the 14th, 15th and 16th centuries they had been mainly *ordonnances de réformation* (i.e. revising previous laws), which were most frequently drawn up after a sitting of the states general, in accordance with the suggestions submitted by the deputies. The last of this type was the ordinance of 1620, promulgated after the states general of 1614 and the assemblies of notables which had followed it. In the 17th and 18th centuries they became essentially *codifications*, comprising a systematic and detailed statement of the whole branch of law. There are two of these series of codifying ordinances: the first under Louis XIV., inspired by Colbert and carried out under his direction. The chief ordinances of this group are that of 1667 on civil procedure (code of civil procedure); that of 1670 on the examination of criminal cases (code of penal procedure); that of 1673 on the commerce of merchants, and that of 1681 on the regulation of shipping, which form between them a complete code of commerce by land and sea. The ordinance of 1670 determined the formalities of that secret and written criminal procedure, as opposed to the hearing of both parties in a suit, which formerly obtained in France; it even increased its severity, continuing the employment of torture, binding the accused by oath to speak the truth, and refusing them counsel save in exceptional cases. The second series of codifications was made under Louis XV., through the action of the chancellor d'Aguesseau. Its chief result was the regulation, by the ordinances of 1731, 1735 and 1747, of deeds of gift between living persons, wills, and property left in trust. Under Louis XVI. some mitigation was made of the criminal law, notably the abolition of torture.

The feudal régime, in spite of the survival of seigniorial courts and tolls, was no longer of any political importance; but it still furnished the common form of real property. The fief, although it still implied homage from the vassal, no longer involved any service on his part (excepting that of the *arrière-ban* due to the

king); but when a fief changed hands the lord still exacted his *profits*. Tenures held by *roturiers*, in addition to some similar rights of transfer, were generally subject to periodical and fixed contributions for the profit of the lord. This system was still further complicated by tenures which were simply real and not feudal, e.g. that by payment of ground rent, which were superadded to the others, and had become all the heavier since, in the 18th century, royal rights of transfer had been added to the feudal rights. The inhabitants of the country districts were longing for the liberation of real property.

Serfdom had disappeared from most of the provinces of the kingdom; among all the *coutumes* which were officially codified, not more than ten or so still recognized this institution. This had been brought about especially by the agency of the custom by which serfs had been transformed into *roturiers*. An edict of Louis XVI. of 1779 abolished serfdom on crown lands, and mitigated the condition of the serfs who still existed on the domains of individual lords. The nobility still remained a privileged class, exempt from certain taxes. Certain offices were restricted to the nobility; according to an edict of Louis XVI. (1781) it was even necessary to be a noble in order to become an officer in the army. In fact, the royal favours were reserved for the nobility. Certain rules of civil and criminal procedure also distinguished nobles from *roturiers*. The acquisition of fiefs had ceased to bring nobility with it, but the latter was derived from three sources: birth, *lettres d'anoblissement* granted by the king and appointment to certain offices. In the 17th and 18th centuries the peers of France can be reckoned among the nobility, forming indeed its highest grade, though the rank of peer was still attached to a fief, which was handed down with it; on the eve of the Revolution there were thirty-eight lay peers. The rest of the nation, apart from the ecclesiastics, consisted of the *roturiers*, who were not subject to the disabilities of the serfs, but had not the privileges of the nobility. Hence the three orders (estates) of the kingdom: the clergy, the nobility and the *tiers état* (third estate). An edict of Louis XVI. had made a regular civil status possible to the Protestants, and had thrown open offices and professions to them, though not entirely; but the exercise of their religion was still forbidden.

The Revolution.—With the Revolution France entered the ranks of constitutional countries, in which the liberty of men is guaranteed by fixed and definite laws; from this time on, she has had always (except in the interval between two revolutions) a written constitution, which could not be touched by the ordinary legislative power. The first constitution was that of 1791; the states general of 1789, transformed by their own will, backed by public opinion, into the Constituent Assembly, drew it up on their own authority. But their work did not stop there. They abolished the whole of the old public law of France and part of the criminal law, or rather, transformed it in accordance with the principles laid down by the political philosophy of the 18th century. The principles which were then proclaimed are still, on most points, the foundation of modern French law. The development resulting from this extraordinary impetus can be divided into two quite distinct phases: the first, from 1789 to the *coup d'état* of the 18th Brumaire in the year VIII., was the continuation of the impulse of the Revolution; the second includes the Consulate and the first Empire, and was, as it were, the marriage or fusion of the institutions arising from the Revolution with those of the *ancien régime*.

On the whole, the constitutional law of the Revolution is a remarkably united whole, if we consider only the two constitutions which were effectively applied during this first phase, that of the 3rd of September 1791, and that of the 5th Fructidor in the year III. It is true that between them occurred the ultra-democratic constitution of the 24th of June 1793, the first voted by the Convention; but although this was ratified by the popular vote, to which it had been directly submitted, in accordance with a principle proclaimed by the Convention and kept in force under the Consulate

tion.

and the Empire, it was never carried into effect. It was first suspended by the establishment of the revolutionary government strictly so called, and after Thermidor, under the pretext of completing it, the Convention put it aside and made a new one, being taught by experience. As long as it existed it was the sovereign assembly of the Convention itself which really exercised the executive power, governing chiefly by means of its great committees.

The constitution of 1791 was without doubt monarchical, in so far as it preserved royalty. The constitution of the year III. was, on the contrary, republican. The horror of monarchy was still so strong at that time that an executive college was created, a Directory of five members, one of whom retired every year; they were elected by a complicated and curious procedure, in which each of the two legislative councils played a distinct part. But this difference, though apparently essential, was not in reality very profound; this is proved, for example, by the fact that the Directory had distinctly more extensive powers than those conferred on Louis XVI. by the Constituent Assembly. On almost all points of importance the two constitutions were similar. They were both preceded by a statement of principles, a "Declaration of the Rights of Man and of the Citizen." They were both based on two principles which they construed alike: the sovereignty of the people and the separation of powers. Both of them (with the exception of what has been said with regard to the ratification of constitutions after 1793) recognized only representative government. From the principle of the sovereignty of the people they had not deduced universal suffrage; though, short of this, they had extended the suffrage as far as possible. According to the constitution of 1791, in addition to the conditions of age and residence, an elector was bound to pay a direct contribution equivalent to three days' work; the constitution of the year III. recognized the payment of any direct contribution as sufficient; it even conferred on every citizen the right of having himself enrolled, without any other qualification than a payment equivalent to three days' work, and thus to become an elector. Further, neither of the two constitutions admitted of a direct suffrage; the elections were carried out in two stages, and only those who paid at a higher rating could be chosen as electors for the second stage. The executive power, which was in the case of both constitutions clearly separated from the legislative, could not initiate legislation. The Directory had no veto; Louis XVI. had with difficulty obtained a merely suspensive veto, which was overridden in the event of three legislatures successively voting against it. The right of dissolution was possessed by neither the king nor the Directory. Neither the king's ministers nor those of the Directory could be members of the legislative body, nor could they even be chosen from among its ranks. The ministers of Louis XVI. had, however, thanks to an unfortunate inspiration of the Constituent Assembly of 1791, the right of entry to, and, to a certain extent, of speaking in the Legislative Assembly; the constitution of the year III. showed greater wisdom in not bringing them in any way into contact with the legislative power. The greatest and most notable difference between the two constitutions was that that of 1791 established a single chamber which was entirely renewed every two years; that of the year III., on the contrary, profiting by the lessons of the past, established two chambers, one-third of the members of which were renewed every year. Moreover, the two chambers, the Council of Five Hundred and the Council of Ancients, were appointed by the same electors, and almost the only difference between their members was that of age.

The Revolution entirely abolished the *ancien régime*, and in the first instance whatever remained of feudalism. The Constituent Assembly, in the course of its immense work of settlement, wished to draw distinctions, abolishing absolutely, without indemnity, all rights which had amounted in the beginning to a usurpation and could not be justified, e.g. serfdom and seigniorial courts of justice. On the other hand, it declared subject to redemption such feudal charges as had been the subject of contract or of a concession of lands. But as it was almost impossible to discover the exact

origin of various feudal rights, the Assembly had proceeded to do this by means of certain legal assumptions which sometimes admitted of a proof to the contrary. It carefully regulated the conditions and rate of repurchase, and forbade the creation in the future of any perpetual charge which could not be redeemed: a principle that has remained permanent in French law. This was a rational and equitable solution; but in a period of such violent excitement it could not be maintained. The Legislative Assembly declared the abolishment without indemnity of all feudal rights for which the original deed of concession could not be produced; and to produce this was, of course, in most cases impossible. Finally, the Convention entirely abolished all feudal rights, and commanded that the old deeds should be destroyed; it maintained on the contrary, though subject to redemption, those tenures and charges which were solely connected with landed property and not feudal.

With feudalism had been abolished serfdom. Further, the Constituent Assembly suppressed nobility; it even forbade any one to assume and bear the titles, emblems and arms of nobility. Thus was established the equality of citizens before the law. The Assembly also proclaimed the liberty of labour and industry, and suppressed the corporations of artisans and workmen, the *jurandes* and *matrises*, as Turgot had done. But, in order to maintain this liberty of the individual, it forbade all associations between workers or employers, fearing that such contracts would again lead to the formation of corporations similar to the old ones. It even forbade and declared punishable, as being contrary to the declaration of the rights of man and the citizen, combinations or strikes, or an agreement between workmen or employers to refuse to work or to give work except on given conditions. Such, for a long time, was French legislation on this point.

The Constituent Assembly gave to France a new administrative division, that into departments, districts, cantons and communes; and this division, which was intended to make the old provincial distinctions disappear, had to serve all purposes, the department being the unit for all public services. This settlement was definitive, with the exception of certain modifications in detail, and exists to the present day. But there was a peculiar administrative organism depending on this arrangement. The constitution of 1791, it is true, made the king the titular head of the executive power; but the internal administration of the kingdom was not actually in his hands. It was deputed, under his orders, to bodies elected in each department, district and commune. The municipal bodies were directly elected by citizens duly qualified; other bodies were chosen by the method of double election. Each body consisted of two parts: a council, for deliberative purposes, and a *bureau* or *directoire* chosen by the council from among its numbers to form the executive. These were the only instruments for the general administration and for that of the direct taxes. The king could, it is true, annul the illegal acts of these bodies, but not dismiss their members; he could merely suspend them from exercising their functions, but the matter then went before the Legislative Assembly, which could maintain or remit the suspension as it thought fit. The king had not a single agent chosen by himself for general administrative purposes. This was a reaction, though a very exaggerated one, against the excessive centralization of the *ancien régime*, and resulted in an absolute administrative anarchy. The organization of the revolutionary government partly restored the central authority; the councils of the departments were suppressed; the Committee of Public Safety and the "representatives of the people on mission" were able to remove and replace the members of the elected bodies; and also, by an ingenious arrangement, national agents were established in the districts. The constitution of the year III. continued in this course, simplifying the organization established by the Constituent Assembly, while maintaining its principle. The department had an administration of five members, elected as in the past, but having executive as well as deliberative functions. The district was suppressed. The communes retained only a

Admini-
strative
reorgani-
zation.

municipal agent elected by themselves, and the actual municipal body, the importance of which was considerably increased, was removed to the canton, and consisted of the municipal agents from each commune, and a president elected by the duly qualified citizens of the canton. The Directory was represented in each departmental and communal administration by a commissary appointed and removable by itself, and could dismiss the members of these administrations.

The Constituent Assembly decided on the complete reorganization of the judicial organization. This was accomplished on a

Judicial system.

very simple plan, which realized that ideal of the two degrees of justice which, as we have noticed, was that of France under the *ancien régime*. In the lower degrees it created in each canton a justice of the peace (*juge de paix*), the idea and name of which were borrowed from England, but which differed very much from the English justice of the peace. He judged, both with and without appeal, civil cases of small importance; and, in cases which did not come within his competency, it was his duty to try to reconcile the parties. In each district was established a civil court composed of five judges. This completed the judicial organization, except for the court of cassation, which had functions peculiar to itself, never judging the facts of the case but only the application of the law. For cases coming under the district court, the Assembly had not thought fit to abolish the guarantee of the appeal in cases involving sums above a certain figure. But by a curious arrangement the district tribunals could hear appeals from one another. With regard to penal prosecutions, there was in each department a criminal court which judged crimes with the assistance of a jury; it consisted of judges borrowed from district courts, and had its own president and public prosecutor. Correctional tribunals, composed of *juges de paix*, dealt with misdemeanours. The Assembly preserved the commercial courts, or consular jurisdictions, of the *ancien régime*. There was a court of cassation, the purpose of which was to preserve the unity of jurisprudence in France; it dealt with matters of law and not of fact, considering appeals based on the violation of law, whether in point of matter or of form, and if such violation were proved, sending the matter before another tribunal of the same rank for re-trial. All judges were elected for a term of years; the *juges de paix* by the primary assembly of the canton, the district judges by the electoral assembly consisting of the electors of the second degree for the district, the members of the court of cassation by the electors of the departments, who were divided for the purpose into two series, which voted alternately. The Constituent Assembly did, it is true, require professional guarantees, by proof of a more or less extended exercise of the profession of lawyer from all judges except the *juges de paix*. But the system was really the same as that of the administrative organization. The king only appointed the *commissaires du roi* attached to the district courts, criminal tribunals and the court of cassation; but the appointment once made could not be revoked by him. These commissaries fulfilled one of the functions of the old *ministère public*, their duty being to demand the application of laws. The Convention did not change this general organization; but it suppressed the professional guarantees required in the case of candidates for a judgeship, so that henceforth all citizens were eligible; and it also caused new elections to take place. Moreover, the Convention, either directly or by means of one of its committees, not infrequently removed and replaced judges without further election. The constitution of the year III. preserved this system, but introduced one considerable modification. It suppressed the district courts, and in their place created in each department a civil tribunal consisting of twenty judges. The idea was a happy one, for it gave the courts more importance, and therefore more weight and dignity. But this reform, beneficial as it would be nowadays, was at the time premature, in view of the backward condition of means of communication.

The Constituent Assembly suppressed the militia and maintained the standing army, according to the old type, the numbers of which were henceforth to be fixed every year by the Legis-

lative Assembly. The army was to be recruited by voluntary enlistment, careful rules for which were drawn up; the only change was in the system of appointment to ranks; The army, promotion went chiefly by seniority, and in the lower ranks a system of nomination by equals or inferiors was organized. The Assembly proclaimed, however, the principle of compulsory and personal service, but under a particular form, that of the National Guard, to which all qualified citizens belonged, and in which almost all ranks were conferred by election. Its chief purpose was to maintain order at home; but it could be called upon to furnish detachments for defence against foreign invasion. This was an institution which, with many successive modifications, and after various long periods of inactivity followed by a revival, lasted more than three-quarters of a century, and was not suppressed till 1871. For purposes of war the Convention, in addition to voluntary enlistments and the resources furnished by the National Guards, and setting aside the forced levy of 200,000 men in 1793, decided on the expedient of calling upon the communes to furnish men; a course which revived the principle of the old militia. But the Directory drew up an important military law, that of the 6th Fructidor of the year VI., which established compulsory military service for all, under the form of conscription strictly so called. Frenchmen aged from 20 to 25 (*défenseurs conscrits*) were divided into five classes, each including the men born in the same year, and were liable until they were 25 years old to be called up for active service; the whole period of service not exceeding four years. No class was called upon until the younger classes had been exhausted, and the sending of substitutes was forbidden. This law, with a few later modifications, provided for the French armies up to the end of the Empire.

The Constituent Assembly abolished nearly all the taxes of the *ancien régime*. Almost the only taxes preserved were the stamp duty and that on the registration of acts. Taxation. (the old *contrôle* and *centième denier*), and these were completely reorganized; the customs were maintained only at the frontiers for foreign trade. In the establishment of new taxes the Assembly was influenced by two sentiments: the hatred which had been inspired by the former arbitrary taxation, and the influence of the school of the Physiocrats. Consequently it did away with indirect taxation on objects of consumption, and made the principal direct tax the tax on land. Next in importance were the *contribution personnelle et mobilière* and the *patentes*. The essential elements of the former were a sort of capitation-tax equivalent to three days' work, which was the distinctive and definite sign of a qualified citizen, and a tax on personal income, calculated according to the rent paid. The *patentes* were paid by traders, and were also based on the amount of rent. These taxes, though considerably modified later, are still essentially the basis of the French system of direct taxation. The Constituent Assembly had on principle repudiated the tax on the gross income, much favoured under the *ancien régime*, which everybody had felt to be arbitrary and oppressive. The system of public contributions under the Convention was arbitrary and revolutionary, but the councils of the Directory, side by side with certain bad laws devised to tide over temporary crises, made some excellent laws on the subject of taxation. They resumed the regulation of the land tax, improving and partly altering it, and also dealt with the *contribution personnelle et mobilière*, the *patentes*, and the stamp and registration duties. It was at this time, too, that the door and window tax, which still exists, was provisionally established; there was also a partial reappearance of indirect taxation; in particular the *octrois* of the towns, which had been suppressed by the Constituent Assembly.

The Constituent Assembly gave the Protestants liberty of worship and full rights; it also gave Jews the status of citizen, which they had not had under the *ancien régime*. Religious liberty. together with political rights. With regard to the Catholic Church, the Assembly placed at the disposal of the nation the property of the clergy, which had already, in the course of the 18th century, been regarded by most political

writers as a national possession; at the same time it provided for salaries for the members of the clergy and pensions for those who had been monks. It abolished tithes and the religious orders, and forbade the re-formation of the latter in the future. The ecclesiastical districts were next reorganized, the department being always taken as the chief unit, and a new church was organized by the civil constitution of the clergy, the bishops being elected by the electoral assembly of the department (the usual electors), and the curés by the electoral assembly of the district. This was an unfortunate piece of legislation, inspired partly by the old Gallican spirit, partly by the theories on civil religion of J. J. Rousseau and his school, and, together with the civic oath imposed on the clergy, it was a source of endless troubles. The constitutional church established in this way was, however, abolished as a state institution by the Convention. By laws of the years III. and IV. the Convention and the Directory, in proclaiming the liberty of worship, declared that the Republic neither endowed nor recognized any form of worship. Buildings formerly consecrated to worship, which had not been alienated, were again placed at the disposal of worshippers for this purpose, but under conditions which were hard for them to accept.

The Assemblies of the Revolution, besides the laws which, by abolishing feudalism, altered the character of real property, passed many others concerning civil law. The most important are those of 1792, passed by the Legislative Assembly, which organized the registers of the *état civil* kept by the municipalities, and laid down rules for marriage as a purely civil contract. Divorce was admitted to a practically unlimited extent; it was possible not only for causes determined by law, and by mutual consent, but also for incompatibility of temper and character proved, by either husband or wife, to be of a persistent nature. Next came the laws of the Convention as to inheritance, imposing perfect equality among the natural heirs and endeavouring to ensure the division of properties. Illegitimate children were considered by these laws as on the same level with legitimate children. The Convention and the councils of the Directory also made excellent laws on the administration of *hypothèques*, and worked at the preparation of a Civil Code (see CODE NAPOLÉON). In criminal law

their work was still more important. In 1791 the Constituent Assembly gave France her first penal code. It was inspired by humanitarian ideas, still admitting capital punishment, though accompanied by no cruelty in the execution; but none of the remaining punishments was for life. Long imprisonment with hard labour was introduced. Finally, as a reaction against the former system of arbitrary penalties, there came a system of fixed penalties determined, both as to its assessment and its nature, for each offence, which the judge could not modify. The Constituent Assembly also reformed the procedure of criminal trials, taking English law as model. It introduced the jury, with the double form of *jury d'accusation* and *jury de jugement*. Before the judges procedure was always public and oral. The prosecution was left in principle to the parties concerned, plaintiffs or *dénonciateurs civiques*, and the preliminary investigation was handed over to two magistrates; one was the *juge de paix*, as in English procedure at this period, and the other a magistrate chosen from the district court and called the *directeur du jury*. The Convention, before separating, passed the *Code des délits et des peines* of the 3rd Brumaire in the year IV. This piece of work, which was due to Merlin de Douai, was intended to deal with criminal procedure and penal law; but only the first part could be completed. It was the procedure established by the Constituent Assembly, but further organized and improved.

The Consulate and the Empire.—The constitutional law of the Consulate and the Empire is to be found in a series of documents called later the *Constitutions de l'Empire*, the constitution promulgated during the Hundred Days being consequently given the name of *Acte additionnel aux Constitutions de l'Empire*. These documents consist of (1) the Constitution of the 22nd Frimaire of the year VIII., the work of Sieyès and Bonaparte,

the text on which the others were based; (2) the *senatus consulte* of the 16th Thermidor in the year X., establishing the consulate for life; and (3) the *senatus consulte* of the 28th Floréal in the year XII., which created the Empire. These constitutional acts, which were all, whether in their full text or in principle, submitted to the popular vote by means of a *plébiscite*, had all the same object: to assure absolute power to Napoleon, while preserving the forms and appearance of liberty. Popular suffrage was maintained, and even became universal; but, since the system was that of suffrage in many stages, which, moreover, varied very much, the citizens in effect merely nominated the candidates, and it was the Senate, playing the part of *grand électeur* which Sieyès had dreamed of as his own, which chose from among them the members of the various so-called elected bodies, even those of the political assemblies. According to the constitution of the year VIII., the first consul (to whom had been added two colleagues, the second and third consuls, who did not disappear until the Empire) possessed the executive power in the widest sense of the word, and he alone could initiate legislation. There were three representative assemblies in existence, elected as we have seen; but one of them, the Corps Législatif, passed laws without discussing them, and without the power of amending the suggestions of the government. The Tribunal, on the contrary, discussed them, but its vote was not necessary for the passing of the law. The Senate was the guardian and preserver of the constitution; in addition to its role of *grand électeur*, its chief function was to annul laws and acts submitted to it by the Tribunal as being unconstitutional. This original organization was naturally modified during the course of the Consulate and the Empire; not only did the emperor obtain the right of directly nominating senators, and the princes of the imperial family, and grant dignitaries of the Empire that of entering the Senate by right; but a whole body, the Tribunal, which was the only one which could preserve some independence, disappeared, without resort having been had to a plebiscite; it was modified and weakened by *senatus consulte* of the year X., and was suppressed in 1807 by a mere *senatus consulte*. The importance of another body, on the contrary, the *conseil d'état*, which had been formed on the improved type of the ancient *conseil du roi*, and consisted of members appointed by Napoleon and carefully chosen, continually increased. It was this body which really prepared and discussed the laws; and it was its members who advocated them before the Corps Législatif, to which the Tribunal also sent orators to speak on its behalf. The ministers, who had no relation with the legislative power, were merely the agents of the head of the state, freely chosen by himself. Napoleon, however, found these powers insufficient, and arrogated to himself others, a fact which the Senate did not forget when it proclaimed his downfall. Thus he frequently declared war upon his own authority, in spite of the provisions to the contrary made by the constitution of the year VIII.; and similarly, under the form of *décrets*, made what were really laws. They were afterwards called *décrets-lois*, and those that were not indissolubly associated with the political régime of the Empire, and survived it, were subsequently declared valid by the court of cassation, on the ground that they had not been submitted to the Senate as unconstitutional, as had been provided by the constitution of the year VIII.

This period saw the rise of a whole new series of great organic laws. For administrative organization, the most important was that of the 28th Pluviôse in the year VIII. It established as chief authority for each department a prefect, and side by side with him a *conseil général* for deliberative purposes; for each *arrondissement* (corresponding to the old *district*) a sub-prefect (*sous-préfet*) and a *conseil d'arrondissement*; and for each *commune*, a mayor and a municipal council. But all these officials, both the members of the councils and the individual agents, were appointed by the head of the state or by the prefect, so that centralization was restored more completely than ever. Together with the prefect there was also established a *conseil*

Admin-
strative
changes
under
Consulate
and
Empire.

de préfecture, having administrative functions, and generally acting as a court of the first instance in disputes and litigation arising out of the acts of the administration; for the Constituent Assembly had removed such cases from the jurisdiction of the civil tribunals, and referred them to the administrative bodies themselves. The final appeal in these disputes was to the *conseil d'état*, which was supreme judge in these matters. In 1807 was created another great administrative jurisdiction, the *cour des comptes*, after the pattern of that which had existed under the *ancien régime*.

Judicial organization had also been fundamentally altered.

The system of election was preserved for a time in the case of

Judicial changes. the *juges de paix* and the members of the court of cassation, but finally disappeared there, even where it had already been no more than a form. The

magistrates were in principle appointed for life, but under the Empire a device was found for evading the rule of irremovability. For the judgment of civil cases there was a court of first instance in every *arrondissement*, and above these a certain number of courts of appeal, each of which had within its province several departments. The separate criminal tribunals were abolished in 1809 by the *Code d'Instruction Criminelle*, and the magistrates forming the *cour d'assises*, which judged crimes with the aid of a jury, were drawn from the courts of appeal and from the civil tribunals. The *jury d'accusation* was also abolished by the *Code d'Instruction Criminelle*, and the right of pronouncing the indictment was transferred to a chamber of the court of appeal. The correctional tribunals were amalgamated with the civil tribunals of the first instance. The *tribunal de cassation*, which took under the Empire the name of *cour de cassation*, consisted of magistrates appointed for life, and still kept its powers. The *ministère public* (consisting of imperial *avocats* and *procureurs*) was restored in practically the same form as under the *ancien régime*.

The former system of taxation was preserved in principle, but with one considerable addition: Napoleon re-established

Taxation. indirect taxation on articles of consumption, which had been abolished by the Constituent Assembly; the chief of these were the duties on liquor (*droits réunis*, or excise) and the monopoly of tobacco.

The Concordat concluded by Napoleon with the papacy on the 26th Messidor of the year IX. re-established the Catholic

The Concordat. religion in France as the form of worship recognized and endowed by the state. It was in principle drawn

up on the lines of that of 1516, and assured to the head of the French state in his dealings with the papacy the same prerogatives as had formerly been enjoyed by the kings; the chief of these was that he appointed the bishops, who afterwards had to ask the pope for canonical institution. The territorial distribution of dioceses was preserved practically as it had been left by the civil constitution of the clergy. The state guaranteed the payment of salaries to bishops and curés; and the pope agreed to renounce all claims referring to the appropriation of the goods of the clergy made by the Constituent Assembly. Later on, a decree restored to the *fabriques* (vestries) such of their former possessions as had not been alienated, and the churches which had not been alienated were restored for the purposes of worship. The law of the 18th Germinal in the year X., ratifying the Concordat, reasserted, under the name of *articles organiques du culte catholique*, all the main principles contained in the old doctrine of the liberties of the Gallican Church. The Concordat did not include the restoration of the religious orders and congregations; Napoleon sanctioned by decrees only a few establishments of this kind.

One important creation of the Empire was the university.

The *ancien régime* had had its universities for purposes of instruction and for the conferring of degrees; it had

The university. also, though without any definite organization, such secondary schools as the towns admitted within their

walls, and the primary schools of the parishes. The Revolution suppressed the universities and the teaching congregations. The constitution of the year III. proclaimed the liberty of

instruction and commanded that public schools, both elementary and secondary, should be established. Under the Directory there was in each department an *école centrale*, in which all branches of human knowledge were taught. Napoleon, developing ideas which had been started in the second half of the 18th century, founded by laws and decrees of 1806, 1808 and 1811 the *Université de France*, which provided and organized higher, secondary and primary education; this was to be the monopoly of the state, carried on by its *facultés*, *lycées* and primary schools. No private educational establishment could be opened without the authorization of the state.

But chief among the documents dating from this period are the Codes, which still give laws to France. These are the Civil Code of 1804, the *Code de Procédure Civile* of 1806, the *Code de Commerce* of 1807, the *Code d'Instruction Criminelle* of 1809, and the *Code Pénal* of 1810. **The Codes.**

These monumental works, in the elaboration of which the *conseil d'état* took the chief part, contributed, to a greater or less extent, towards the fusion of the old law of France with the laws of the Revolution. It was in the case of the *Code Civil* that this task presented the greatest difficulty (see *CODE NAPOLEON*). The *Code de Commerce* was scarcely more than a revised and emended edition of the *ordonnances* of 1673 and 1681; while the *Code de Procédure Civile* borrowed its chief elements from the *ordonnance* of 1667. In the case of the *Code d'Instruction Criminelle* a distinctly new departure was made; the procedure introduced by the Revolution into courts where judgment was given remained public and oral, with full liberty of defence; the preliminary procedure, however, before the examining court (*judge d'instruction* or *chambre des mises en accusation*) was borrowed from the *ordonnance* of 1670; it was the procedure of the old law, without its cruelty, but secret and written, and generally not in the presence of both parties. The *Code Pénal* maintained the principles of the Revolution, but increased the penalties. It substituted for the system of fixed penalties, in cases of temporary punishment, a maximum and a minimum, between the limits of which judges could assess the amount. Even in the case of misdemeanours, it admitted the system of extenuating circumstances, which allowed them still further to decrease and alter the penalty in so far as the offence was mitigated by such circumstances. (See further under *NAPOLEON I.*)

The Restored Monarchy.—The Restoration and the Monarchy of July, though separated by a revolution, form one period in the history of French institutions, a period in which the same régime was continued and developed. This was the constitutional monarchy, with a parliamentary body consisting of two chambers, a system imitated from England. **Constitutional monarchy.** The same constitution was preserved under these two monarchies—the charter granted by Louis XVIII. in 1814. The revolution of 1830 took place in defence of the charter which Charles X. had violated by the *ordonnances* of July, so that this charter was naturally preserved under the "July Monarchy." It was merely revised by the Chamber of Deputies, which had been one of the movers of the revolution, and by what remained of the House of Peers. In order to give the constitution the appearance of originating in the will of the people, the preface, which made it appear to be a favour granted by the king, was destroyed. The two chambers acquired the initiative in legislation, which had not been recognized as theirs under the Restoration, but from this time on belonged to them equally with the king. The sittings of the House of Peers were henceforth held in public; but this chamber underwent another and more fundamental transformation. The peers were nominated by the king, with no limit of numbers, and according to the charter of 1814 their appointment could be either for life or hereditary; but, in execution of an ordinance of Louis XVIII., during the Restoration they were always appointed under the latter condition. Under the July Monarchy their tenure of office was for life, and the king had to choose them from among twenty-two classes of notables fixed by law. The franchise for the election of the Chamber of Deputies had been limited by a system of money qualifications; but while, under the

Restoration, it had been necessary, in order to be an elector, to pay three hundred francs in direct taxation, this sum was reduced in 1831 to two hundred francs, while in certain cases even a smaller amount sufficed. In order to be elected as a deputy it was necessary, according to the charter of 1814, to pay a thousand francs in direct taxation, and according to that of 1830 five hundred francs. From 1817 onwards there was direct suffrage, the electors directly electing the deputies. The idea of those who had framed the charter of 1814 had been to give the chief influence to the great landed proprietors, though the means adopted to this end were not adequate: in 1830 the chief aim had been to give a preponderating influence to the middle and lower middle classes, and this had met with greater success. The House of Peers, under the name of *cour des pairs*, had also the function of judging attempts and plots against the security of the state, and it had frequently to exercise this function both under the Restoration and the July Monarchy.

This was a period of parliamentary government; that is, of government by a cabinet, resting on the responsibility of the ministers to the Chamber of Deputies. The only interruption was that caused by the resistance of Charles X. at the end of his reign, which led to the revolution of July. Parliamentary government was practised regularly and in an enlightened spirit under the Restoration, although the Chamber had not then all the powers which it has since acquired. It is noteworthy that during this period the right of the House of Peers to force a ministry to resign by a hostile vote was not recognized. By the creation of a certain number of new peers, a *journée de pairs*, as it was then called, the majority in this House could be changed when necessary. But the government of the Restoration had to deal with two extreme parties of a very opposite nature: the *Ultras*, who wished to restore as far as possible the *ancien régime*, to whom were due the acts of the *chambre introuvable* of 1816, and later the laws of the ministry of Villèle, especially the law of sacrilege and that voting compensation to the dispossessed nobles, known as the *milliard des émigrés*; and on the other hand the *Liberals*, including the Bonapartists and Republicans, who were attached to the principles of the Revolution. In order to prevent either of these parties from predominating in the chamber, the government made a free use of its power of dissolution. It further employed two means to check the progress of the Liberals; firstly, there were various alterations successively made in the electoral law, and the press laws, frequently restrictive in their effect, which introduced the censorship and a preliminary authorization in the case of periodical publications, and gave the correctional tribunals jurisdiction in cases of press offences. The best electoral law was that of 1817, and the best press laws were those of 1819; but these were not of long duration. Under the July Monarchy parliamentary government, although its machinery was further perfected, was not so brilliant. The majorities in the Chamber of Deputies were often uncertain, so much so, that more than once the right of dissolution was exercised in order to try by new elections to arrive at an undivided and certain majority. King Louis Philippe, though sober-minded, wished to exercise a personal influence on the policy of the cabinet, so that there were then two schools, represented respectively by Thiers and Guizot, one of which held the theory that "the king reigns but does not govern"; while the other maintained that he might exercise a personal influence, provided that he could rely on a ministry supported by a majority of the Chamber of Deputies. But the weak point in the July Monarchy was above all the question of the franchise. A powerful movement of opinion set in towards demanding an extension, some wishing for universal suffrage, but the majority proposing what was called the *adjonction des capacités*, that is to say, that to the number of qualified electors should be added those citizens who, by virtue of their professions, capacity or acquisitions, were inscribed after them on the general list for juries. But the government obstinately refused all electoral reform, and held to the law of 1831. It also refused parliamentary reform, by which was meant a rule which would have made most public offices incompatible with the position of deputy, the Chamber of

Deputies being at that time full of officials. The press, thanks to the Charter, was perfectly free, without either censorship or preliminary authorization, and press offences were judged by a jury.

In another respect also the Restoration and the July Monarchy were at one, the second continuing the spirit of the first, viz. in maintaining in principle the civil, legal and administrative institutions of the Empire. The preface to the charter of 1814 sanctioned and guaranteed most of the legal rights won by the Revolution; even the alienation of national property was confirmed. It was said, it is true, that the old nobility regained their titles, and that the nobility of the Empire kept those which Napoleon had given them; but these were merely titles and nothing more; there was no privileged nobility, and the equality of citizens before the law was maintained. Judicial and administrative organization, the system of taxation, military organization, the relations of church and state, remained the same, and the university also continued to exist. The government did, it is true, negotiate a new Concordat with the papacy in 1817, but did not dare even to submit it to the chambers. The most important reform was that of the law concerning recruiting for the army. The charter of 1814 had promised the abolition of conscription, in the form in which it had been created by the law of the year VI. The law of the 10th of March 1818 actually established a new system. The contingent voted by the chambers for annual incorporation into the standing army was divided up among all the cantons; and, in order to furnish it, lots were drawn among all the men of a certain class, that is to say, among the young Frenchmen who arrived at their majority that year. Those who were not chosen by lot were definitely set free from military service. The sending of substitutes, a custom which had been permitted by Napoleon, was recognized. This was the type of all the laws on recruiting in France, of which there were a good number in succession up to 1867. On other points they vary, in particular as to the duration of service, which was six years, and later eight years, under the Restoration; but the system remained the same.

The Restoration produced a code, the *Code forestier* of 1827, for the regulation of forests (*eaux et forêts*). In 1816 a law had abolished divorce, making marriage indissoluble, as it had been in the old law. But the best laws of this period were those on finance. Now, for the first time, was introduced the practice of drawing up regular budgets, voted before the year to which they applied, and divided since 1819 into the budget of expenditure and budget of receipts.

Together with other institutions of the Empire, the Restoration had preserved the exaggerated system of administrative centralization established in the year VIII.; and proposals for its relaxation submitted to the chambers had come to nothing. It was only under the July Monarchy that it was relaxed. The municipal law of the 21st of March 1831 made the municipal councils elective, and extended widely the right of voting in the elections for them; the *maires* and their assistants continued to be appointed by the government, but had to be chosen from among the members of the municipal councils. The law of the 22nd of June 1833 made the general councils of the departments also elective, and brought the *adjonction des capacités* into effect for their election. The powers of these bodies were enlarged in 1838, and they gained the right of electing their president. In 1833 was granted another liberty, that of primary education; but in spite of violent protestations, coming especially from the Catholics, secondary and higher education continued to be a monopoly of the state. Many organic laws were promulgated, one concerning the National Guard, which was reorganized in order to adapt it to the system of citizen qualifications; one in 1832 on the recruiting of the army, fixing the period of service at seven years; and another in 1834 securing the status of officers. A law of the 11th of June 1842 established the great railway lines. In 1832 the *Code Pénal* and *Code d'Instruction Criminelle* were revised, with the object of lightening penalties; the system of extenuating circumstances, as recognized by a jury, was

The
system
of the
Empire
retained.

extended to the judgment of all crimes. There was also a revision of Book III. of the *Code de Commerce*, treating of bankruptcy. Finally, from this period date the laws of the 3rd of May 1841, on expropriation for purposes of public utility, and of the 30th of June 1838, on the treatment of the insane, which is still in force. Judicial organization remained as it was, but the amount of the sum up to which civil tribunals of the first instance could judge without appeal was raised from 1000 francs to 1500; and the competency of the *juges de paix* was widened.

The Second Republic and the Second Empire.—From the point of view of constitutional law, the Second Republic and the Second Empire were each in a certain sense a return to the past. The former revived the tradition of the Assemblies of the Revolution; the latter was obviously and avowedly an imitation of the Consulate and the First Empire.

The provisional government set up by the revolution of the 24th of February, 1848 proclaimed universal suffrage, and by this means was elected a Constituent Assembly, which sat till May 1849, and, after first organizing various forms of another provisional government, passed the Republican constitution of the 4th of November 1848.

This constitution, which was preceded by a preface recalling the Declarations of Rights of the Revolution, gave the legislative power to a single permanent assembly, elected by direct universal suffrage, and entirely renewed every three years. The executive authority, with very extensive powers, was given to a president of the Republic, also elected by the universal and direct suffrage of the French citizens. The constitution was not very clear upon the point of whether it adopted parliamentary government in the strict sense, or whether the president, who was declared responsible, was free to choose his ministers and to retain or dismiss them at his own pleasure. This gave rise to an almost permanent dispute between the president, who claimed to have his own political opinions and to direct the government, and the Assembly, which wished to carry on the traditions of cabinet government and to make the ministers fully responsible to itself. Consequently, in January 1851, a solemn debate was held, which ended in the affirmation of the responsibility of ministers to the Assembly. On the other hand, the president, though very properly given great power by the constitution, was not immediately eligible for re-election on giving up his office. Now Louis Napoleon, who was elected president on the 10th of December 1848 by a huge majority, wished to be re-elected. Various propositions were submitted to the Assembly in July 1851 with a view to modifying the constitution; but they could not succeed, as the number of votes demanded by the constitution for the convocation of a Constituent Assembly was not reached. Moreover, the Legislative Assembly elected in May 1849 was very different from the Constituent Assembly of 1848. The latter was animated by that spirit of harmony and, in the main, of adhesion to the Republic which had followed on the February Revolution. The new assembly, on the contrary, was composed for the most part of representatives of the old parties, and had monarchist aspirations. By the unfortunate law of the 31st of May 1850 it even tried by a subterfuge to restrict the universal suffrage guaranteed by the constitution. It suspended the right of holding meetings, but, on the whole, respected the liberty of the press. It was especially impelled to these measures by the growing fear of socialism. The result was the *coup d'état* of the 2nd of December 1851. A detail of some constitutional importance is to be noticed in this period. The *conseil d'état*, which had remained under the Restoration and the July Monarchy an administrative council and the supreme arbiter in administrative trials, acquired new importance under the Second Republic. The ordinary *conseillers d'état* (*en service ordinaire*) were elected by the Legislative Assembly, and consultation with the *conseil d'état* was often insisted on by the constitution or by law. This was the means of obtaining a certain modifying power as a substitute for the second chamber, which had not met with popular approval. During its short existence the Second Republic produced many important laws. It abolished the penalty of death for political crimes, and suppressed negro slavery in the

colonies. The election of *conseillers généraux* was thrown open to universal suffrage, and the municipal councils were allowed to elect the *maires* and their colleagues. The law of the 15th of March 1850 established the liberty of secondary education, but it conferred certain privileges on the Catholic clergy, a clear sign of the spirit of social conservatism which was the leading motive for its enactment. Certain humanitarian laws were passed, applying to the working classes.

With the *coup d'état* of the 2nd of December 1851 began a new era of constitutional plebiscites and disguised absolutism. The proclamations of Napoleon on the 2nd of December contained a criticism of parliamentary government, and formulated the wish to restore to France the constitutional institutions of the Consulate and the Empire, just as she had preserved their civil, administrative and military institutions. Napoleon asked the people for the powers necessary to draw up a constitution on these principles; the plebiscite issued in a vast majority of votes in his favour, and the constitution of the 14th of January 1852 was the result. It bore a strong resemblance to the constitution of the First Empire after 1807. The executive power was conferred on Louis Napoleon for ten years, with the title of president of the Republic and very extended powers. Two assemblies were created. The conservative Senate, composed of *ex officio* members (cardinals, marshals of France and admirals) and life members appointed by the head of the state, was charged with the task of seeing that the laws were constitutional, of opposing the promulgation of unconstitutional laws, and of receiving the petitions of citizens; it had also the duty of providing everything not already provided but necessary for the proper working of the constitution. The second assembly was the *Corps Législatif*, elected by direct universal suffrage for six years, which passed the laws, the government having the initiative in legislation. This body was not altogether a *corps des muets*, as in the year VIII., but its powers were very limited; thus the general session assured to it by the constitution was only for three months, and it could only discuss and put to the vote amendments approved by the *conseil d'état*; the ministers did not in any way come into contact with it and could not be members of it, being responsible only to the head of the state, and only the Senate having the right of accusing them before a high court of justice. The *conseil d'état* was composed in the same way and had the same authority as it had possessed from the year VIII. to 1814; and it was the members of it who supported projected laws before the *Corps Législatif*. To this was added a Draconian press legislation; not only were press offences, many of which were mere expressions of opinion, judged not by a jury but by the correctional tribunals; but further, political papers could not be founded without an authorization, and were subject to a regular administrative discipline; they could be warned, suspended or suppressed without a trial, by a simple act of the administration. The constitution of January 1852 was still Republican in name, though less so than that of the year VIII. The period corresponding with the Consulate was also shorter in the case of Louis Napoleon. The year 1852 had not come to an end before a *senatus consulte*, that of the 10th of November, ratified by a plebiscite, re-established the imperial rank in favour of Napoleon III.; it also conferred on him certain new powers, especially with reference to the budget and foreign treaties; thus various cracks, which experience had revealed in the original structure of the Empire, were filled up. This period was called that of the *empire autoritaire*. Further features of it were the free appointment of the *maires* by the emperor, the oath of fidelity to him imposed on all officials, and the legal organization of official candidatures for the elections. Two measures marked the highest point reached by this system: the *loi de sûreté générale* of the 27th of February 1858, which allowed the government to intern in France or Algeria, or to exile certain French citizens, without a trial. The other was the *senatus consulte* of the 17th of February 1858, which made the validity of candidatures for the *Corps Législatif* subject

Constitution of Jan. 14, 1852.

Restoration of the Empire.

to a preliminary oath of fidelity on the part of the candidate. But for various causes, which cannot be examined here, a series of measures was soon to be initiated which were gradually to

**The
empire
libéral.**

lead back again to political liberty, and definitively to found what has been called the *empire libéral*. One by one the different rules and proceedings of parliamentary government as it had existed in France regained their force. The first step was the decree of the 24th of November 1860, which re-established for each ordinary session the address voted by the chambers in response to the speech from the throne. In 1867 this movement took a more decisive form. It led to a new constitution, that of the 21st of May 1870, which was again ratified by popular suffrage. While maintaining the Empire and the imperial dynasty, it organized parliamentary government practically in the form in which it had operated under the July Monarchy, with two legislative chambers, the Senate and the Corps Législatif, the consent of both of which was necessary for legislation, and which, together with the emperor, had the initiative in this matter. The laws of the 11th of May 1868 and the 6th of June 1868 restored to a certain extent the liberty of the press and of holding meetings, though without abolishing offences of opinion, or again bringing press offences under the jurisdiction of a jury. Laws of the 22nd and 23rd of July 1870 gave the *conseils généraux*, whose powers had been somewhat widened, the right of electing their presidents, and provided that the *maires* and their colleagues should be chosen from among the members of the municipal councils.

The legislation of the Second Empire led to a considerable number of reforms. Its chief aim was the development of

**Economic
and social
reforms
under the
Second
Empire.**

commerce, industry and agriculture, and generally the material prosperity of the country. The Empire, though restricting liberty in political matters, increased it in economic matters. Such were the decrees and laws of 1852 and 1853 relating to land-banks (*établissements de crédit foncier*) and that of 1857 on trade-marks, those of 1863 and 1867 on commercial companies, that of 1858 on general stores (*magasins généraux*) and warrants, that of 1856 on drainage, that of 1865 on the *associations syndicales de propriétaires*, that of 1866 on the mercantile marine. The law of the 14th of June 1865 introduced into France the institution, borrowed from England, of cheques. But of still greater importance for economic development than all these laws were the

**Com-
mercial
treaties.**

treaties concluded by the emperor with foreign powers, in order to introduce, as far as possible, free exchange of commodities; the chief of these, which was the model of all the others, was that concluded with Great Britain on the 23rd of January 1860. Moreover, the law of the 25th of May 1864 admitted for the first time the right of strikes and lock-outs among workmen or employers, annulling articles 414 and following of the *Code Pénal*, which had so far made them a penal offence, even when not accompanied by fraudulent practices, threats or violence, tending to hinder the liberty of labour. The superannuation fund (*caisse des retraites pour la vieillesse*), supported by voluntary payments from those participating in it, which had been created by the law of the 18th of June 1850, was reorganized and perfected, and a law of the 11th of July 1868 established, with the guarantee of the state, two funds for voluntary insurance, one in case of death, the other against accidents occurring in industrial or agricultural employment. A decree of 1863 established in principle the freedom of bakeries, and another in 1864 that of theatrical management.

Criminal law was the subject of important legislation. Two codes were promulgated on special points, the codes of military

**Reforms
in the
criminal
law.**

justice for the land forces (1857) and for the naval forces (1858). But the common law was also largely remodelled. A law of the 10th of June 1858, it is true, created certain new crimes, with a view to protecting the members of the imperial family, and that of the 17th of July 1856 increased the powers and independence of the *juges d'instruction*; but, on the other hand, useful improvements were introduced by laws of 1856 and 1865, and notably with regard to precautionary detention and provisional release with or

without bail. A law of the 20th of May 1863 organized a simple and rapid procedure, copied from that followed in England before the police courts, for summary jurisdiction. A law of 1868 permitted the revision of criminal trials after the death of the condemned person. But the most far-reaching reforms took place in 1854, namely, the abolition of the total loss of civil rights which formerly accompanied condemnation to imprisonment for life, and the law of the 30th of May on penal servitude (*travaux forcés*) which substituted transportation to the colonies for the system of continental convict prisons. Finally, in 1863, there was a revision of the *Code Pénal*, which, in the process of lightening penalties, made a certain number of crimes into misdemeanours, and in consequence transferred the judgment of them from the assize courts to the correctional tribunals. In civil legislation may be noted the law of the 23rd of March 1855 on hypothecs (see *CODE NAPOLEON*); that of the 22nd of July 1857, which abolished seizure of the person (*contrainte par corps*) for civil and commercial debts; and finally, the law of the 14th of July 1866, on literary copyright. The system of taxation was hardly modified at all, except for the establishment of a tax on the income arising from investments (shares and bonds of companies) in 1857, and the tax on carriages (1862). On the 1st of February 1868 was promulgated an important military law, which, however, passed the Corps Législatif with some difficulty. It asserted the principle of universal compulsory military service, at least, in time of war. It preserved, however, the system of drawing lots to determine the annual contingent to be incorporated into the standing army; the term of service was fixed at five years, and it was still permissible to send a substitute. But able-bodied men who were not included in the annual contingent formed a reserve force called the *garde nationale mobile*, each department organizing its own section. These *gardes mobiles*, though they were not effectively organized or exercised under the Empire, took part in the war of 1870-71.

army.**

The Third Republic.—The Third Republic had at first a provisional government, unanimously acclaimed by the people of Paris. It was accepted by France, exercised full powers, and sustained by no means ingloriously a desperate struggle against the enemy; a certain number of its *décrets-lois* are still in force. After the capitulation of Paris, a National Assembly was elected to treat with Germany. It was elected in accordance with the electoral law of 1849, which had been revived with a few modifications, and it met at Bordeaux to the number of 753 members on the 13th of February 1871. It was a sovereign assembly, since France had no longer a constitution, and for this very reason it claimed from the outset constituent powers; the Republican party at the time, however, contested this claim, the majority in the assembly being frankly monarchist, though divided as to the choice of a monarch. But for some time the National Assembly either could not or would not exercise this power, and up to 1875 affairs remained in a provisional state, legalized and regulated this time by the Assembly. This was an application, though unconscious, of a form of government which M. Grévy had proposed to the Constituent Assembly in 1848. There was a single assembly, with one man elected by it as head of the executive power (the first to be elected was M. Thiers, who received the title of president of the Republic in August 1871), who was responsible to the Assembly and governed with the help of ministers chosen by himself, who were also responsible to it. Thiers fell on the 24th of May 1873. His place was taken by Marshal MacMahon, on whom the Assembly later conferred, in November 1873, the position of president of the Republic for seven years, when the refusal of the comte de Chambord to accept the tricolour in place of the white flag of the Bourbons had made any attempt to restore the monarchy impossible. Henceforth the definitive adoption of the Republican form of government became inevitable, and the opinion of the country began to turn in this direction, as was shown by the elections of deputies which took place to fill up the gaps occurring in the Assembly. The Assembly, however, shrank from the inevitable

solution, and when a discussion was begun in January 1875 on the projected constitutional laws prepared by the *commission des trente*, the only proposals made by the latter were for a more complete organization of the powers of one man, Marshal MacMahon. But on the 30th of January 1875 was adopted, by 353 votes to 352, an amendment by M. Wallon which provided for the election of an indefinite succession of presidents of the

Republic; this amounted to a definitive recognition of the Republic. In this connexion it has often been said that the Republic was established by a majority of one. This is not an accurate statement, for it was only the case on the first reading of the law; the

majority on the second and third readings increased until it became considerable. There was a strong movement in the direction of a reconciliation between the parties; and there had been a *rapprochement* between the Republicans and the Right Centre. At the end of February were passed and promulgated two constitutional laws, that of the 25th of February 1875, on the organization of the public powers, and that of the 24th of February 1875, on the organization of the senate. In the middle of the year they were supplemented by a third, that of the 16th of July 1875, on the relations between the public powers.

This was built up the actual constitution of France. It differs fundamentally, both in form and contents, from previous constitutions. As to its form, instead of a single methodical text divided into an uninterrupted series of articles, it consisted of three distinct laws. As to matter, it is obviously a work of an essentially practical nature, the result of compromise and reciprocal concessions. It does not lay down any theoretical principles, and its provisions, which were arrived at with difficulty, confine themselves strictly to what is necessary to ensure the proper operation of the governmental machinery. The result is a compromise between Republican principles and the rules of constitutional and parliamentary monarchy. On this account it has been accused, though unjustly, of being too monarchical. Its duration, by far the longest of any French constitution since 1791, is a sign of its value and vitality. It is in fact a product of history, and not of imagination. Its composition is as follows. The legislative power was given to two elective chambers, having equal powers, the vote of both of which is necessary for legislation, and both having the right of initiating and amending laws. The constitution assures them an ordinary session of five months, which opens by right on the second Tuesday in January. One house, the Chamber of Deputies, is elected by direct universal suffrage and is entirely renewed every four years; the other, the Senate, consists of 300 members, divided by the law of the 27th of February 1875 into two categories; 75 of the senators were elected for life and irremovable, and the first of them were elected by the National Assembly, but afterwards it was the Senate itself which held elections to fill up vacancies. The 225 remaining senators were elected by the departments and by certain colonies, among which they were apportioned in proportion to the population; they are elected for nine years, a third of the house being renewed every three years. The electoral college in each department which nominated them included the deputies, the members of the general council of the department and of the councils of the *arrondissements*, and one delegate elected by each municipal council, whatever the importance of the commune. This was practically a system of election in two and, partly, three degrees, but with this distinguishing feature, that the electors of the second degree had not been chosen purely with a view to this election, but chiefly for the exercise of other functions. The most important elements in this electoral college were the delegates from the municipal councils, and by giving one delegate to each, to Paris just as to the smallest commune in France, the National Assembly intended to counterbalance the power of numbers, which governed the elections for the Chamber of Deputies, and, at the same time, to give a preponderance to the country districts. The 75 irremovable senators were another precaution against the danger from violent waves of public opinion. The executive power was entrusted to a president,

elected for seven years (as Marshal MacMahon had been in 1873), by the Chamber and the Senate, combined into a single body under the name of National Assembly. He is always eligible for re-election, and is irresponsible except in case of high treason. His powers are of the widest, including the initiative in legislation jointly with the two chambers, the appointment to all civil and military offices, the disposition, and, if he wish it, the leadership of the armed forces, the right of pardon, the right of negotiating treaties with foreign powers, and, in principle, of ratifying them on his own authority, the consent of the two chambers being required only in certain cases defined by the constitution. The nomination of *conseillers d'état* for ordinary service, whom the National Assembly had made elective, as in 1848, and elected itself, was restored to the president of the Republic, together with the right of dismissing them. But these powers he can only exercise through the medium of a ministry, politically and jointly responsible to the chambers, and forming a council, over which the president usually presides.

The French Republic is essentially a parliamentary republic. The right of dissolving the Chamber of Deputies before the expiration of its term of office belongs to the president, but in order to do so he must have, besides a ministry which will take the responsibility for it, the preliminary sanction of the Senate. The Senate is at the same time a high court of justice, which can judge the president of the Republic and ministers accused of crimes committed by them in the exercise of their functions; in these two cases the prosecution is instituted by the Chamber of Deputies. The Senate can also be called upon to judge any person accused of an attempt upon the safety of the state, who is then seized by a decree of the president of the Republic, drawn up in the council of ministers. Possible revision of the constitution is provided for very simply: it has to be proposed as a law, and for its acceptance a resolution passed by each chamber separately, by an absolute majority, is necessary. The revision is then carried out by the Senate and the Chamber of Deputies to form a National Assembly. There have been two revisions since 1875. The first time, in 1879, it was simply a question of transferring the seat of the government and of the chambers back to Paris from Versailles, where it had been fixed by one of the constitutional laws. The second time, in 1884, more fundamental modifications were required. The most important point was to change the composition and election of the Senate. With a view to this, the new constitutional law of the 14th of August 1884 abolished the constitutional character of a certain number of articles of the law of the 24th of February 1875, thus making it possible to modify them by an ordinary law. This took place in the same year; the 75 senators for life were suppressed for the future by a process of extinction, and their seats divided among the most populous departments. Further, in the electoral college which elects the senators, there was allotted to the municipal councils a number of delegates proportionate to the number of members of the councils, which depends on the importance of the commune. The law of the 14th of August 1884 also modified the constitution in another important respect. The law of the 25th of February 1875 had admitted the possibility not only of a partial, but even of a total revision, which could affect and even change the form of the state. The law of the 14th of August 1884, however, declared that no proposition for a revision could be accepted which aimed at changing the republican form of government. The composition of the Chamber of Deputies was not fixed by the constitution, and consequently admitted more easily of variation. Since 1871 the mode of election has oscillated between the *scrutin de liste* for the departments and the *scrutin uninominal* for the *arrondissements*. The organic law of the 30th of November 1875 had established the latter system; in 1885 the *scrutin de liste* was established by law, but in 1889 the *scrutin d'arrondissement* was restored; and in this same year, on account of the ambitions of General Boulanger and the suggestion which was made for a sort of plebiscite in his favour, was passed the law on plural candidatures, which forbids anyone to become a candidate for the Chamber of Deputies in more than one district at a time.

The system established by the constitution of 1875 has worked excellently in some of its departments; for instance, the mode of electing the president of the Republic. Between 1875 and 1906 there were seven elections, sometimes under tragic or very difficult conditions; the election has always taken place without delay or obstruction, and the choice has been of the best. The high court of justice, which has twice been called into requisition, in 1889 and in 1899-1900, has acted as an efficient check, in spite of the difficulties confronting such a tribunal when feeling runs high. Parliamentary government in the form set up by the constitution, besides the criticism to which this system is open in all countries where it is established, even in England, met with special difficulties in France. In the first place, the useful but rather secondary rôle assigned to the president of the Republic has by no means satisfied all those who have occupied this high office. Two presidents have resigned on the ground that their powers were insufficient. Another, even after re-election, had to withdraw in face of the opposition of the two chambers, being no longer able to obtain a parliamentary ministry. It is difficult, however, to accept the theory of an eminent American political writer, Mr John W. Burgess,¹ that in order to attain to a position of stable equilibrium, the French Republic ought to adopt the presidential system of the United States. In France this sharp division between the two powers has never been observed except in those periods when the representative assemblies were powerless, under the First and Second Empires. It is true that the apparent multiplicity of parties and their lack of discipline, together with the French procedure of *interpellations* and the orders of the day by which they are concluded, make the formation of homogeneous and lasting cabinets difficult; but since the end of the 19th century there has been great progress in this respect. Another difficulty arose in 1896. The Senate, appealing to the letter of the constitution and relying on its elective character, claimed the right of forcing a ministry to resign by its vote, in the same way as the Chamber of Deputies. The Senate was victorious in the struggle, and forced the ministry presided over by M. Léon Bourgeois to resign; but the precedent is not decisive, for in order to gain its ends the Senate had recourse to the means of refusing to sanction the taxes, declining to consider the proposals for the supplies necessary for the Madagascar expedition so long as the ministry which it was attacking was in existence. The weakest point in the French parliamentary organism is perhaps the right of dissolution. It is difficult of application, for the reason that the president must obtain the preliminary consent of the Senate before exercising it; moreover, this valuable right has been discredited by its abuse by Marshal MacMahon in the campaign of the 16th of May 1877, on which occasion he exercised his right of dissolution against a chamber, the moderate but decidedly republican majority in which was re-elected by the country.

The legislative reforms carried out under the Third Republic are very numerous. As to public law, it is only possible to mention here those of a really organic character, chief among which are those which safeguard and regulate the exercise of the liberties of the individual. The law of the 30th of June 1881, modified in 1901, established the right of holding meetings. Public meetings, whether for ordinary or electoral purposes, may be held without preliminary authorization; the law of 1881 prescribed a declaration made by a certain number of citizens enjoying full civil and political rights, which is now remitted. The only really restrictive provision is that which does not allow them to be held in the public highway, but only in an enclosed space. But this is made necessary by the customs of France. The law of the 21st of July 1881 on the press is one of the most liberal in the world. By it all offences committed by any kind of publication are submitted to a jury; the punishment for the mere expression of obnoxious opinions is abolished, the only punishment being for slander, libel, defamation, inciting to crime, and in certain

¹ *Political Science and Comparative Constitutional Law* (Boston, 1896).

cases the publication of false news. The law of the 1st of July 1901 established in France the right of forming associations. It recognizes the legality of all associations strictly so called, the objects of which are not contrary to law or to public order or morality. On condition of a simple declaration to the administrative authority, it grants them a civil status in a wide sense of the term. Religious congregations, on the contrary, which are not authorized by a law, are forbidden by this law. This was not a new principle, but the traditional rule in France both before and after the Revolution, except that under certain governments authorization by decree had sufficed. As a matter of fact the unauthorized congregations had been tolerated for a long time, although on various occasions, and especially in 1881, their partial dissolution had been proclaimed by decrees. The law of 1901 dissolved them all, and made it an offence to belong to such a congregation. The members of unauthorized congregations, and later, in 1904, even those of the authorized congregations, were disqualified from teaching in any kind of establishment. The liberty of primary education was confirmed and reorganized by the law of the 30th of October 1886, which simply deprived the clergy of the privileges granted them by the law of 1850, though the latter remains in force with regard to the liberty of secondary education. A law passed by the National Assembly (July 12, 1875) established the liberty of higher education. It even went beyond this, for it granted to students in private *facultés* who aspired to state degrees the right of being examined before a board composed partly of private and partly of state professors. The law of the 18th of March 1880 abolished this privilege. Another law, that of the 22nd of March 1882, made primary education obligatory, though allowing parents to send their children either to private schools or to those of the state; the law of the 16th of June 1881 established secular (*laïque*) education in the case of the latter. The Third Republic also organized secondary education for girls in lycées or special colleges (*collèges de fille*). Finally, a law of the 10th of July 1896 dealing with higher education and the faculties of the state reorganized the universities, which form distinct bodies, enjoying a fairly wide autonomy. A law of the 19th of December 1905, abrogating that of the 18th Germinal in the year X., which had sanctioned the Concordat, proclaimed the separation of the church from the state. It is based on the principle of the secular state (*état laïque*) which recognizes no form of religion, though respecting the right of every citizen to worship according to his beliefs, and it aimed at organizing associations of citizens, the object of which was to collect the funds and acquire the property necessary for the maintenance of worship, under the form of *associations cultuelles*, differing in certain respects from the associations sanctioned by the law of the 1st of July 1901, but having a wider scope. It also handed over to these regularly formed associations the property of the ecclesiastical establishments formerly in existence, while taking precautions to ensure their proper application, and allowed the associations the free use of the churches and places of worship belonging to the state, the departments or the communes. If no *association cultuelle* was founded in a parish, the property of the former *fabrique* should devolve to the commune. But this law was condemned by the papacy, as contrary to the church hierarchy; and almost nowhere were *associations cultuelles* formed, except by Protestants and Jews, who complied with the law. After many incidents, but no church having been closed, a new law of the 2nd of January 1907 was enacted. It permits the public exercise of any cult, by means of ordinary associations regulated by the law of the 1st of July 1901, and even of public meetings summoned by individuals. Failing all associations, either *cultuelles* or others, churches, with their ornaments and furniture, are left to the disposition of the faithful and ministers, for the purpose of exercising the cult; and, on certain conditions, the long use of them can be granted as a free gift to ministers of the cult.

Among the organic laws concerning administrative affairs there are two of primary importance; that of the 10th of

August 1871, on the *conseils généraux*, considerably increased the powers and independence of these elective bodies, which have become important deliberative assemblies, their sessions being held in public. The law of 1871 created a new administrative organ for the departments, the *commission départementale*, elected by the council-general of the department from among its own members and associated with the administration of the prefect. The other law is the municipal law of the 5th of April 1884, which effected a widespread decentralization; the *maires* and their *adjoints* are elected by the municipal council.

The war of 1870-71 necessarily led to a modification of the military organization. The law of the 25th of July 1872 established the principle of compulsory service for all, first in the standing army, the period of service in which was fixed at five years, then in the reserve, and finally in the territorial army. But the application of this principle was by no means absolute, only holding good in time of war. Each annual class was divided into two parts, by means of drawing lots, and in time of peace one of these parts had only a year of service with the active army. The previous exemptions, based either on the position of supporter of the family (as in the case of the son of a widow or aged father, &c.) or on equivalent services rendered to the state (as in the case of young ecclesiastics or members of the teaching profession), were preserved, but only held good for service in the active army in times of peace. Finally, the system of conditional engagement for a year allowed young men, for the purposes of study or apprenticeship to their profession, only to serve a year with the active army in time of peace. By this means it was sought to combine the advantages of an army of veterans with those of a numerous and truly national army. But the conditional volunteering (*volontariat conditionnel*) for a year was open to too great a number of people, and so brought the system into discredit. As those who profited by it had to be clothed and maintained at their own expense, and the sum which they had to furnish for this purpose was generally fixed at 1500 francs, it came to be considered the privilege of those who could pay this sum. A new law of the 15th of July 1889 lessened the difference between the two terms which it attempted to reconcile. It reduced the term of service in the active army to three years, and the exemptions, which were still preserved, merely reduced the period to a year in times of peace. The same reduction was also granted to those who were really pursuing important scientific, technical or professional studies; the system was so strict on this point that the number of those who profited by those exemptions did not amount to 2000 in a year. This was a compromise between two opposing principles; the democratic principle of equality, being the stronger, was bound to triumph. The law of the 21st of March 1905 reduced the term of service in the active army to two years, but made it equal for all, admitting of no exemption, but only certain facilities as to the age at which it had to be accomplished.

In 1883 the judicial *personnel* was reorganized and reduced in number. With the exception of a few modifications the main lines of judicial organization remained the same. In 1879 the conseil d'état was also reorganized. The whole fabric of administrative jurisdiction was carefully organized, and almost entirely separated from the active administration.

The system of taxation has remained essentially unaltered; we may notice, however, the laws of 1897, 1898 and 1900, which abolished or lessened the duties on so called *hygienic* drinks (wine, beer, cider), and the financial law of 1901, which rearranged and increased the transfer fees, and established a system of progressive taxation in the case of succession dues.

The labour laws, which generally partook of the nature both of public and of private law, are a sign of our times. Under the Third Republic they have been numerous, the most notable being: the law of the 21st of March 1884 on professional syndicates, which introduced the liberty of association in matters of this kind before it became part of the common law (see TRADE UNIONS);

the law of the 9th of April 1898 on the liability for accidents incurred during work, and those which have completed it; that of the 22nd of December 1892 on conciliation and arbitration in the case of collective disputes between employers and workmen; that of the 29th of June 1893 on the hygiene and safeguarding of workers in industrial establishments, and the laws which regulate the work of children and women in factories; finally, that of the 15th of July 1893 on free medical attendance (see LABOUR LEGISLATION).

As to criminal law, there have been more than fifty enactments, mostly involving important modifications, due to more scientific ideas of punishment, so that we may say that it has been almost entirely recast since the establishment of the Third Republic. The separate system applied in cases of preventive detention and imprisonment for short periods; liberation before the expiry of the term of sentence, subject to the condition that no fresh offence shall be committed within a given time; transportation to the colonies of habitual offenders; the remission of the penalty in the case of first offenders, and the lapsing of the penalty when a certain time has gone by without a fresh condemnation; greater facilities for the rehabilitation of condemned persons, which now became simply a matter for the courts, and occurred as a matter of course at the end of a certain time; such were the chief results of this legislation. Finally, the law of the 8th of December 1897 completely altered the form of the preliminary examination before the *juge d'instruction*, which had been the weakest point in the French criminal procedure, though it was still held in private; the new law made this examination really a hearing of both sides, and made the appearance of counsel for the defence practically compulsory.

As to private law, both civil and commercial, we could enumerate between 1871 and 1906 more than a hundred laws which have modified it, sometimes profoundly, and have for the most part done very useful work without attracting much attention. They are generally examined and drawn up by commissions of competent men, and pass both chambers almost without discussion. There have, however, been a few which aroused public interest and even deep feeling. Firstly, there was the law of the 27th of July 1884, and those which completed it; this law re-established divorce, which had been abolished since 1816, but only permitted it for certain definite causes determined by law. On the other hand, the law of the 6th of February 1893 increased the liberty and independence of a woman who was simply judicially separated, in order to encourage separation, as opposed to divorce, when the conditions allowed it. The law of the 25th of March 1896 on the succession of illegitimate children, who were recognized by the parents, treated them not in the same way as legitimate children, but gave them the title of heirs in the succession of their father and mother, together with much greater rights than they had possessed under the *Code Civil*. The law of the 24th of July 1899, on the protection of children who are ill-treated or morally neglected, also modified some of the provisions of the law as applied to the family, with a view to greater justice and humanity. Finally, on the occasion of the centenary of the *Code Civil* (see CODE NAPOLEON), a commission, composed of members of the chambers, magistrates, professors of law, lawyers, political writers, and even novelists and dramatic authors, was given the task of revising the whole structure of the code.

FRANCESCHI, JEAN BAPTISTE, BARON (1766-1813), French general, was born at Bastia on the 5th of December 1766 and entered the French service in 1793. He took part in the operations in Corsica in the following year, and received a wound at the siege of San Fiorenzo. After this he left the island and was appointed a field officer in the French Army of Italy, with which he served from 1795 to 1799. He served as a general officer in the campaign of Marengo, in the Naples campaign of 1805-1806, and in the Peninsular War from 1807 to 1809. He was created a baron by Napoleon. He commanded a Neapolitan brigade in the Russian War of 1812, and after the retreat from Moscow took refuge, with the remnant of his command, in Danzig, where in the course of the siege of 1813 he died on the 19th of March.

Two other generals of brigade in Napoleon's wars bore the name of Franceschi, and the three have often been mistaken for each other. The first was born at Lyons, **JEAN BAPTISTE MARIE FRANCESCHI-DELONNE** (1767-1810), who served throughout the Revolutionary campaign on the Rhine, took part in the campaign of Zürich in 1799, and distinguished himself very greatly by his escape from, and subsequent return to, Genoa, when in 1800 Masséna was closely besieged in that city. He became a cavalry colonel in 1803, was promoted general of brigade on the field of Austerlitz, and served in southern Italy and in Spain on the staff of King Joseph Bonaparte. During the Peninsular War he won great distinction as a cavalry general, and in 1810 Napoleon made him a baron. At this time he was a prisoner in the hands of the Spaniards, into whose hands he had fallen while bearing important despatches during the campaign of Talavera. He was harshly treated by his captors, and died at Carthage on the 23rd of October 1810. The second was **FRANÇOIS FRANCESCHI-LOSIO** (1770-1810), born at Milan, who entered the French Revolutionary army in 1795. He served through the Italian campaign of 1796-97, and subsequently, like Franceschi-Delonne, with Masséna at Zürich and at Genoa, and at the headquarters of King Joseph in Italy and Spain. He was killed in a duel by the Neapolitan colonel Filangieri in 1810.

FRANCESCHI, PIERO (or **PIETRO**) **DE'** (c. 1416-1492), Italian painter of the Umbrian school. This master is generally named Piero della Francesca (Peter, son of Frances), the tradition being that his father, a woollen-draper named Benedetto, had died before his birth. This is not correct, for the mother's name was Romana, and the father continued living during many years of Piero's career. The painter is also named Piero Borghese, from his birthplace, Borgo San Sepolcro, in Umbria. The true family name was, as above stated, Franceschi, and the family still exists under the name of Martini-Franceschi.

Piero first received a scientific education, and became an adept in mathematics and geometry. This early bent of mind and course of study influenced to a large extent his development as a painter. He had more science than either Paolo Uccello or Mantegna, both of them his contemporaries, the former older and the latter younger. Skilful in linear perspective, he fixed rectangular planes in perfect order and measured them, and thus got his figures in true proportional height. He preceded and excelled Domenico Ghirlandajo in projecting shadows, and rendered with considerable truth atmosphere, the harmony of colours, and the relief of objects. He was naturally therefore excellent in architectural painting, and, in point of technique, he advanced the practice of oil-colouring in Italy.

The earliest trace that we find of Piero as a painter is in 1439, when he was an apprentice of Domenico Veneziano, and assisted him in painting the chapel of S. Egidio, in S. Maria Novella of Florence. Towards 1450 he is said to have been with the same artist in Loreto; nothing of his, however, can now be identified in that locality. In 1451 he was by himself, painting in Rimini, where a fresco still remains. Prior to this he had executed some extensive frescoes in the Vatican; but these were destroyed when Raphael undertook on the same walls the "Liberation of St Peter" and other paintings. His most extensive extant series of frescoes is in the choir of S. Francesco in Arezzo,—the

"History of the Cross," beginning with legendary subjects of the death and burial of Adam, and going on to the entry of Heraclius into Jerusalem after the overthrow of Chosroes. This series is, in relation to its period, remarkable for effect, movement, and mastery of the nude. The subject of the "Vision of Constantine" is particularly vigorous in chiaroscuro; and a preparatory design of the same composition was so highly effective that it used to be ascribed to Giorgione, and might even (according to one authority) have passed for the handiwork of Correggio or of Rembrandt. A noted fresco in Borgo San Sepolcro, the "Resurrection," may be later than this series; it is preserved in the Palazzo de' Conservatori. An important painting of the "Flagellation of Christ," in the cathedral of Urbino, is later still, probably towards 1470. Piero appears to have been much in his native town of Borgo San Sepolcro from about 1445, and more especially after 1454, when he finished the series in Arezzo. He grew rich there, and there he died, and in October 1492 was buried.

Two statements made by Vasari regarding "Piero della Francesca" are open to much controversy. He says that Piero became blind at the age of sixty, which cannot be true, as he continued painting some years later; but scepticism need perhaps hardly go to the extent of inferring that he was never blind at all. Vasari also says that Fra Luca Pacioli, a disciple of Piero in scientific matters, defrauded his memory by appropriating his researches without acknowledgment. This is hard upon the friar, who constantly shows a great reverence for his master in the sciences. One of Pacioli's books was published in 1509, and speaks of Piero as still living. Hence it has been propounded that Piero lived to the patriarchal age of ninety-four or upwards; but, as it is now stated that he was buried in 1492, we must infer that there is some mistake in relation to Pacioli's remark—perhaps the date of writing was several years earlier than that of publication. Piero was known to have left a manuscript of his own on perspective; this remained undiscovered for a long time, but eventually was found by E. Harzen in the Ambrosian library of Milan, ascribed to some supposititious "Pietro, Pittore di Bruges." The treatise shows a knowledge of perspective as dependent on the point of distance.

In the National Gallery, London, are three paintings attributed to Piero de' Franceschi. Another work, a profile of Isotta da Rimini, may safely be rejected. The "Baptism of Christ," which used to be the altar-piece of the Priory of the Baptist in Borgo San Sepolcro, is an important example; and still more so the "Nativity," with the Virgin kneeling, and five angels singing to musical instruments. This is a very interesting and characteristic specimen, and has indeed been praised somewhat beyond its deservings on aesthetic grounds.

Piero's earlier style was energetic but unrefined, and to the last he lacked selectness of form and feature. The types of his visages are peculiar, and the costumes (as especially in the Arezzo series) singular. He used to work assiduously from clay models swathed in real drapery. Luca Signorelli was his pupil, and probably to some extent Perugino; and his own influence, furthered by that of Signorelli, was potent over all Italy. Belonging as he does to the Umbrian school, he united with that style something of the Siennese and more of the Florentine mode.

Besides Vasari and Crowe & Cavalcaselle, the work by W. G. Waters, *Piero della Francesca* (1899) should be consulted.

(W. M. R.)

FRANCESCHINI, BALDASSARE (1611-1689), Italian painter of the Tuscan school, named, from Volterra the place of his birth, Il Volterrano, or (to distinguish him from Ricciarelli) Il Volterrano Giuniore, was the son of a sculptor in alabaster. At a very early age he learned from Cosimo Daddi some of the elements of art, and he started as an assistant to his father. This employment being evidently below the level of his talents, the marquises Inghirami placed him, at the age of sixteen, under the Florentine painter Matteo Rosselli. In the ensuing year he had advanced sufficiently to execute in Volterra some frescoes, skilful in foreshortening, followed by other frescoes for the Medici family in the Valle della Petraia. In 1652 the marchese Filippo Niccolini, being minded to employ Franceschini upon the frescoes for the cupola and back-wall of his chapel in S. Croce, Florence, despatched him to various parts of Italy to perfect his style. The painter, in a tour which lasted some months, took more especially to the qualities distinctive of the schools of Parma and Bologna, and in a measure to those of Pietro da Cortona, whose acquaintance he made in Rome. He then undertook the paintings commissioned by Niccolini, which

constitute his most noted performance, the design being good, and the method masterly. Franceschini ranks higher in fresco than in oil painting. His works in the latter mode were not unfrequently left unfinished, although numerous specimens remain, the cabinet pictures being marked by much sprightliness of invention. Among his best oil paintings of large scale is the "St John the Evangelist" in the church of S. Chiara at Volterra. One of his latest works was the fresco of the cupola of the Annunziata, Florence, which occupied him for two years towards 1683, a production of much labour and energy. Franceschini died of apoplexy at Volterra on the 6th of January 1689. He is reckoned among those painters of the decline of art to whom the general name of "machinist" is applied.

He is not to be confounded with another Franceschini of the same class, and of rather later date, also of no small eminence in his time—the Cavaliere Marcantonio Franceschini (1648–1729), who was a Bolognese.

FRANCHE-COMTÉ, a province of France from 1674 to the Revolution. It was bounded on the E. by Switzerland, on the S. by Bresse and Bugey, on the N. by Lorraine, and on the W. by the duchy of Burgundy and by Bassigny, embracing to the E. of the Jura the valley of the Saône and most of that of the Doubs. Under the Romans it corresponded to *Maxima Sequanorum*, and after having formed part of the kingdom of Burgundy was in the early part of the middle ages split up into the four countships of Portoys, Varais, Amons and Escuens. In the 10th century these four countships were united to form a whole, which came to be called the countship of Burgundy, and belonged at that time to the family of the counts of Mâcon.

The limits of the countship were definitely settled under Otto William, son of Albert or Adalbert, king of Italy (†1027), who on the death of his father-in-law, Henry (1002), tried to seize the duchy of Burgundy, but without success. The countship, which formed a fief dependent on the kingdom of Burgundy, passed to Renaud I., the second son of Otto William. When the kingdom of Burgundy was joined to the Germanic empire, he refused to pay homage to the emperor Henry III., whose suzerainty over him never existed except in theory. William I., surnamed the Great or Headstrong (1059–1087), still further added to the power of his house by marrying Etiennette, heiress of the count of Vienne, and by acquiring from his cousin Guy, when the latter became a monk at Cluny, the countship of Mâcon. One of his sons, Guy, became pope, under the name of Calixtus II. His grandson, Renaud III. (1097–1148), in his turn refused to pay homage to the emperor Lothair, who retaliated by confiscating his dominions and giving them to Conrad of Zähringen. Renaud, however, succeeded in maintaining until his death his possession of the countships of Burgundy, Vienne and Mâcon. He left as sole heiress a daughter, Beatrix, whom his brother William III. imprisoned, in order to make an attempt on her inheritance; she was set free, however, by the emperor Frederick Barbarossa, who married her in 1156.

On the death of Beatrix (1185) the countship of Burgundy passed to Otto I. (1190–1200), the youngest but one of her sons, who had to dispute its possession with Stephen, count of Auxonne, the grandson of William III. Beatrix, the daughter and heiress of Otto I. (1200–1231), married Otto, duke of Meran (†1234), under whose government the inhabitants of Besançon, which had been since the time of Frederick Barbarossa an imperial city, formed themselves definitely into a *commune*. Alix, daughter of Beatrix and of Otto of Meran, and heiress to the countship of Burgundy, married Hugh of Chalon, son of John the Ancient or the Wise (d. 1248), and a descendant of William III. and consequently of William the Headstrong, thus bringing the countship back into the family of its former lords. His son Otto IV. (1279–1303) engaged in war against the bishop of Basel, and the German king Rudolph I., who supported the latter, entered Franche-Comté and besieged Besançon, but without success (1289). Otto, in fulfilment of the treaties of Ervennes and Vincennes (1291–1295) gave Jeanne, his daughter by Mahaut of Artois, in marriage to Philip, count of Poitiers, son of Philip the Fair. The latter took over the administration

of the countship in spite of strong opposition from the nobles of the country, but their leader, John of Chalon-Arly, was compelled to make his submission. Another of Otto's daughters married Charles IV., the Handsome, and both princesses, together with their sister-in-law Margaret of Burgundy, were concerned in the celebrated trial of the Tour de Nesle. Jeanne, however, continued to govern her countship when Philip her husband became king of France (Philip V., "the Long"). Jeanne, their daughter and heiress, married Odo IV., duke of Burgundy (1330–1347), and her sister Margaret became the wife of Louis II., count of Flanders. The countship returned to Margaret at the death of Odo IV., who was succeeded in his duchy by his grandson Philip of Rouvre.

The marriage of Philip the Bold with Margaret, daughter of Louis of Mâle, caused Franche-Comté to pass to the princes of the ducal house of Burgundy, who kept it up till the death of Charles the Bold (1477). On his death Louis XI. laid claim to the government of the countship as well as of the duchy, as trustee for the property of the princess Mary, who was closely related to him and destined to marry the dauphin (later Charles VIII.). French garrisons occupied the principal towns, and the lord of Craon was appointed governor of the country. In consequence of his severity there was a general rising, and at the same time Mary married Maximilian, archduke of Austria, to whom her father had formerly betrothed her (Aug. 1477). The French were expelled from the fortified towns and Craon beaten by the people of Dôle. Charles of Amboise, who took his place, reconquered the province, and even Besançon submitted to the authority of the king of France, who promised to respect its privileges.

On the death of Louis XI. (1483), the estates of Franche-Comté recognized as sovereign his son Charles, who was betrothed to the little Margaret of Burgundy, daughter of Maximilian and Mary (d. 1482), but when Charles VIII. refused Margaret's hand in order to marry Anne of Brittany there was a fresh rising, and the French were again driven out. The treaty of Senlis (23rd May 1483) put an end to the struggle: Charles abandoned all his pretensions, and Maximilian was thus left in possession of Franche-Comté, the sovereignty of which he handed on to his son Philip and ultimately to the crown of Spain. He had, however, constituted his daughter Margaret sovereign-governess of Franche-Comté for life, and under the administration of this princess (who died in 1530), as under the rule of Charles V., the country enjoyed comparative independence, paying a "*don gratuit*" of 200,000 livres every three years, and being actually governed by the parliament of Dôle, and by governors chosen from the nobility of the country. It was Franche-Comté which furnished Philip II. of Spain with one of his best counsellors, Cardinal Perrenot de Granvelle.

In the 16th century the country was disturbed by the preaching of Protestant doctrines, which gained adherents especially in the district of Montbéliard, and later by the wars between France and Spain. In 1595 the armies of Henry IV. levied contributions on Besançon and other towns; but the people of Franche-Comté succeeded in obtaining special terms of neutrality in order to shelter themselves from injury from either of the parties in the war, and enjoyed a period of calm under the government of the infanta Isabella Clara Eugénie and the archduke Albert (1599–1621). But the country suffered greatly from the ravages of the Thirty Years' War, from the presence of the army of the Condés, which besieged Dôle, from the devastation of the troops of Gallas, and later of those of Bernard of Saxe-Weimar. The peace of Westphalia (1648) confirmed Spain in the possession of Franche-Comté. In 1668 the French again entered it, and the conquest, of which the foundations had been laid by the intrigues of the abbot of Watteville and the French party constituted by him, was easily accomplished by Condé and Luxemburg, Louis XIV. directing the army in Franche-Comté for some time in person. None the less, the country was restored to Spain at the peace of Aix-la-Chapelle (1668), but in 1674 Louis headed another expedition there. Besançon capitulated after a siege of twenty-seven days, and Dôle and Salins also fell into the hands of the invaders.

In 1678 the treaty of Nijmegen gave Franche-Comté to France (the principality of Montbéliard remaining in the possession of the house of Würtemberg, which had acquired it by marriage), and it was in celebration of this conquest that the Arc de Triomphe of the Portes Saint Denis and Saint Martin at Paris was erected. Franche-Comté became a military government (*gouvernement*). The estates ceased to meet, and the old "*don gratuit*" was replaced by a tax which became increasingly heavy. Louis made Besançon, which Vauban fortified, into the capital of the province, and transferred to it the parliament and the university, the seat of which had hitherto been Dôle. For purposes of administration, the county was divided among the four great *bailliages* of Besançon, Dôle, Amont (chief town Vesoul) and Aval (chief town Salins). At the Revolution were formed from it the departments of Jura, Doubs and Haute-Saône.

See Dunod, *Histoire des Séquanais; Hist. du comté de Bourgogne* (Dijon, 1735-1740); E. Clerc, *Essai sur l'histoire de la Franche-Comté* (2nd ed., Besançon, 1870). (R. Po.)

FRANCHISE (from O. Fr. *franchise*, freedom, *franc*, free), in English law, a royal privilege or branch of the crown's prerogative subsisting in the hands of a subject. A franchise is an incorporeal hereditament, and arises either from royal grants or from prescription which presupposes a grant. Such franchises are bodies corporate, the right to hold a fair, market, ferry, free fishery, &c. The term is also applied to the right of voting at elections and the qualifications upon which that right is based (see REGISTRATION; REPRESENTATION; VOTE). In the United States the term is especially applied to the right or powers of partial appropriation of public property by exclusive use, or to a privilege of a public nature conferred on a corporation created for the purpose.

FRANCIA (c. 1450-1517), a Bolognese painter, whose real name was Francesco Raibolini, his father being Marco di Giacomo Raibolini, a carpenter, descended from an old and creditable family, was born at Bologna about 1450. He was apprenticed to a goldsmith currently named Francia, and from him probably he got the nickname whereby he is generally known; he moreover studied design under Marco Zoppo. The youth was thus originally a goldsmith, and also an engraver of dies and niellos, and in these arts he became extremely eminent. He was particularly famed for his dies for medals; he rose to be mint-master at Bologna, and retained that office till the end of his life. A famous medal of Pope Julius II. as liberator of Bologna is ascribed to his hand, but not with certainty. As a type-founder he made for Aldus Manutius the first italic type.

At a mature age—having first, it appears, become acquainted with Mantegna—he turned his attention to painting. His earliest known picture is dated 1494 (not 1490, as ordinarily stated). It shows so much mastery that one is compelled to believe that Raibolini must before then have practised painting for some few years. This work is now in the Bologna gallery,—the "Virgin enthroned, with Augustine and five other saints." It is an oil picture, and was originally painted for the church of S. Maria della Misericordia, at the desire of the Bentivoglio family, the rulers of Bologna. The same patrons employed him upon frescoes in their own palace; one of "Judith and Holofernes" is especially noted, its style recalling that of Mantegna. Francia probably studied likewise the works of Perugino; and he became a friend and ardent admirer of Raphael, to whom he addressed an enthusiastic sonnet. Raphael cordially responded to the Bolognese master's admiration, and said, in a letter dated in 1508, that few painters or none had produced Madonnas more beautiful, more devout, or better portrayed than those of Francia. If we may trust Vasari—but it is difficult to suppose that he was entirely correct—the exceeding value which Francia set on Raphael's art brought him to his grave. Raphael had consigned to Francia his famous picture of "St Cecilia," destined for the church of S. Giovanni in Monte, Bologna; and Francia, on inspecting it, took so much to heart his own inferiority, at the advanced age of about sixty-six, to the youthful Umbrian, that he sickened and shortly expired on the 6th of January 1517.

A contemporary record, after attesting his pre-eminence as a goldsmith, jeweller and painter, states that he was "most handsome in person and highly eloquent."

Distanced though he may have been by Raphael, Francia is rightly regarded as the greatest painter of the earlier Bolognese school, and hardly to be surpassed as representing the art termed "antico-moderno," or of the "quattrocento." It has been well observed that his style is a medium between that of Perugino and that of Giovanni Bellini; he has somewhat more of spontaneous naturalism than the former, and of abstract dignity in feature and form than the latter. The magnificent portrait in the Louvre of a young man in black, of brooding thoughtfulness and saddened profundity of mood, would alone suffice to place Francia among the very great masters, if it could with confidence be attributed to his hand, but in all probability its real author was Franciabigio; it had erewhile passed under the name of Raphael, of Giorgione, or of Sebastian del Piombo. The National Gallery, London, contains two remarkably fine specimens of Francia, once combined together as principal picture and lunette,—the "Virgin" and "Child and St Anna" enthroned, surrounded by saints, and (in the lunette) the "Pietà," or lamentation of angels over the dead Saviour. They come from the Buonvisi chapel in the church of S. Frediano, Lucca, and were among the master's latest paintings. Other leading works are—in Munich, the "Virgin" sinking on her knees in adoration of the Divine Infant, who is lying in a garden within a rose trellis; in the Borghese gallery, Rome, a Peter Martyr; in Bologna, the frescoes in the church of St Cecilia, illustrating the life of the saint, all of them from the design of Raibolini, but not all executed by himself. His landscape backgrounds are of uncommon excellence. Francia had more than 200 scholars. Marcantonio Raimondi, the famous engraver, is the most renowned of them; next to him Amico Aspertini, and Francia's own son Giacomo, and his cousin Julio. Lorenzo Costa was much associated with Francia in pictorial work.

Among the authorities as to the life and work of Francia may be mentioned J. A. Calvi, *Memorie della vita di Francesco Raibolini* (1812), and especially G. C. Williamson, *Francia* (1900). (W. M. R.)

FRANCIA, JOSÉ GASPAR RODRIGUEZ (c. 1757-1840), dictator of Paraguay, was born probably about 1757. According to one account he was of French descent; but the truth seems to be that his father, Garcia Rodriguez Francia, was a native of S. Paulo in Brazil, and came to Paraguay to take charge of a plantation of black tobacco for the government. He studied theology at the college of Cordova de Tucuman, and is said to have been for some time a professor in that faculty; but he afterwards turned his attention to the law, and practised in Asuncion. Having attained a high reputation at once for ability and integrity, he was selected for various important offices. On the declaration of Paraguayan independence in 1811, he was appointed secretary to the national junta, and exercised an influence on affairs greatly out of proportion to his nominal position. When the congress or junta of 1813 changed the constitution and established a duumvirate, Dr Francia and the Gaucho general Yegres were elected to the office. In 1814 he secured his own election as dictator for three years, and at the end of that period he obtained the dictatorship for life. In the accounts which have been published of his administration we find a strange mixture of capacity and caprice, of far-sighted wisdom and reckless infatuation, strenuous endeavours after a high ideal and flagrant violations of the simplest principles of justice. He put a stop to the foreign commerce of the country, but carefully fostered its internal industries; was disposed to be hospitable to strangers from other lands, and kept them prisoners for years; lived a life of republican simplicity, and punished with Dionysian severity the slightest want of respect. As time went on he appears to have grown more arbitrary and despotic. Deeply imbued with the principles of the French Revolution, he was a stern antagonist of the church. He abolished the Inquisition, suppressed the college of theology, did away with the tithes, and inflicted endless indignities on the priests. He discouraged marriage

both by precept and example, and left behind him several illegitimate children. For the extravagances of his later years the plea of insanity has been put forward. On the 20th of September 1840 he was seized with a fit and died.

The first and fullest account of Dr Francia was given to the world by two Swiss surgeons, Rengger and Longchamp, whom he had detained from 1819 to 1825—*Essai historique sur la révolution de Paraguay et la gouvernement dictatorial du docteur Francia* (Paris, 1827). Their work was almost immediately translated into English under the title of *The Reign of Doctor Joseph G. R. De Francia in Paraguay* (1827). About eleven years after there appeared at London *Letters on Paraguay*, by J. P. and W. P. Robertson, two young Scotsmen whose hopes of commercial success had been rudely destroyed by the dictator's interference. The account which they gave of his character and government was of the most unfavourable description, and they rehearsed and emphasized their accusations in *Francia's Reign of Terror* (1839) and *Letters on South America* (3 vols., 1843). From the very pages of his detractors Thomas Carlyle succeeded in extracting materials for a brilliant defence of the dictator "as a man or sovereign of iron energy and industry, of great and severe labour." It appeared in the *Foreign Quarterly Review* for 1843, and is reprinted in his *Critical and Miscellaneous Essays*. Sir Richard F. Burton gives a graphic sketch of Francia's life and a favourable notice of his character in his *Letters from the Battlefields of Paraguay* (1870), while C. A. Washburn takes up a hostile position in his *History of Paraguay* (1871).

FRANCIABIGIO (1482-1525), Florentine painter. The name of this artist is generally given as Mercantonio Franciabigio; it appears, however, that his only real ascertained name was Francesco di Cristofano; and that he was currently termed Francia Bigio, the two appellatives being distinct. He was born in Florence, and studied under Albertinelli for some months. In 1505 he formed the acquaintance of Andrea del Sarto; and after a while the two painters set up a shop in common in the Piazza del Grano. Franciabigio paid much attention to anatomy and perspective, and to the proportions of his figures, though these are often too squat and puffy in form. He had a large stock of artistic knowledge, and was at first noted for diligence. As years went on, and he received frequent commissions for all sorts of public painting for festive occasions, his diligence merged in something which may rather be called workmanly offhandedness. He was particularly proficient in fresco, and Vasari even says that he surpassed all his contemporaries in this method—a judgment which modern connoisseurship does not accept. In the court of the Servites (or cloister of the Annunziata) in Florence he painted in 1513 the "Marriage of the Virgin," as a portion of a series wherein Andrea del Sarto was chiefly concerned. The friars having uncovered this work before it was quite finished, Franciabigio was so incensed that, seizing a mason's hammer, he struck at the head of the Virgin, and some other heads; and the fresco, which would otherwise be his masterpiece in that method, remains thus mutilated. At the Scalzo, in another series of frescoes on which Andrea was likewise employed, he executed in 1518-1519 the "Departure of John the Baptist for the Desert," and the "Meeting of the Baptist with Jesus"; and, at the Medici palace at Poggio a Caiano, in 1521, the "Triumph of Cicero." Various works which have been ascribed to Raphael are now known or reasonably deemed to be by Franciabigio. Such are the "Madonna del Pozzo," in the Uffizi Gallery; the half figure of a "Young Man," in the Louvre (see also FRANCIA); and the famous picture in the Fuller-Maitland collection, a "Young Man with a Letter." These two works show a close analogy in style to another in the Pitti gallery, avowedly by Franciabigio, a "Youth at a Window," and to some others which bear this painter's recognized monogram. The series of portraits, taken collectively, placed beyond dispute the eminent and idiosyncratic genius of the master. Two other works of his, of some celebrity, are the "Calumny of Apelles," in the Pitti, and the "Bath of Bathsheba" (painted in 1523), in the Dresden gallery.

FRANCIS (Lat. *Franciscus*, Ital. *Francesco*, Span. *Francisco*, Fr. *François*, Ger. *Franz*), a masculine proper name meaning "Frenchman." As a Christian name it originated with St Francis of Assisi, whose baptismal name was Giovanni, but who was called Francesco by his father on returning from a journey

in France. The saint's fame made the name exceedingly popular from his day onwards.

FRANCIS I. (1708-1765), Roman emperor and grand duke of Tuscany, second son of Leopold Joseph, duke of Lorraine, and his wife Elizabeth Charlotte, daughter of Philip, duke of Orleans, was born on the 8th of December 1708. He was connected with the Habsburgs through his grandmother Eleanore, daughter of the emperor Ferdinand III., and wife of Charles Leopold of Lorraine. The emperor Charles VI. favoured the family, who, besides being his cousins, had served the house of Austria with distinction. He had designed to marry his daughter Maria Theresa to Clement, the elder brother of Francis. On the death of Clement he adopted the younger brother as her husband. Francis was brought up at Vienna with Maria Theresa on the understanding that they were to be married, and a real affection arose between them. At the age of fifteen, when he was brought to Vienna, he was established in the Silesian duchy of Teschen, which had been mediatized and granted to his father by the emperor in 1722. He succeeded his father as duke of Lorraine in 1729, but the emperor, at the end of the Polish War of Succession, desiring to compensate his candidate Stanislaus Leszczyński for the loss of his crown in 1735, persuaded Francis to exchange Lorraine for the reversion of the grand duchy of Tuscany. On the 12th of February 1736 he was married to Maria Theresa, and they went for a short time to Florence, when he succeeded to the grand duchy in 1737 on the death of John Gaston, the last of the ruling house of Medici. His wife secured his election to the Empire on the 13th of September 1745, in succession to Charles VII., and she made him co-regent of her hereditary dominions. Francis was well content to leave the reality of power to his able wife. He had a natural fund of good sense and some business capacity, and was a useful assistant to Maria Theresa in the laborious task of governing the complicated Austrian dominions, but his functions appear to have been of a purely secretarial character. He died suddenly in his carriage while returning from the opera at Innsbruck on the 18th of August 1765.

See A. von Arneth, *Geschichte Maria Theresias* (Vienna, 1863-1879).

FRANCIS II. (1768-1835), the last Roman emperor, and, as Francis I., first emperor of Austria, was the son of Leopold II., grand-duke of Tuscany, afterwards emperor, and of his wife Maria Louisa, daughter of Charles III. of Spain. He was born at Florence on the 12th of February 1768. In 1784 he was brought to Vienna to complete his education under the eye of his uncle the emperor Joseph II., who was childless. Joseph was repelled by the frigid and retiring character of his nephew, and is said to have treated him with an impatient contempt which confirmed his natural timidity; but after the marriage of Francis to Elizabeth of Würtemberg (1788) their relations improved. At the close of his uncle's reign he saw some service in the ill-conducted war with Turkey, and kept a careful diary of his experiences. The death of his wife in childbirth on the 18th of February 1790 was followed by the death of his uncle on the 20th; and Francis acted as regent with Prince Kaunitz until his father came from Florence. On the 19th of September he married his first cousin Maria Theresa, daughter of Ferdinand, king of Naples, by whom he was the father of his successor Ferdinand I., of Maria Louisa, wife of Napoleon, and of the archduke Francis, father of the emperor Francis Joseph. After her death (1807) he married Maria Ludovica Beatrix of Este (1808), and when she died he made a fourth marriage with Carolina Augusta of Bavaria (1816).

He succeeded to the Austrian dominions and the empire on the death of his father on the 1st of March 1792. The position was a trying one for a young prince twenty-four years of age. The dominions of the house of Austria, widely scattered in the Low Countries, Germany and Italy, were exposed to the attacks of the French revolutionary governments and of Napoleon. He was dragged into all the coalitions against France, and in the early days of his reign he had to guard against the ambition of Prussia, and the aggressions of Russia in Poland and Turkey.

For long he had no adviser save such diplomatists as Prince Kaunitz and Thugut, who had been trained in the old Austrian diplomacy. His own best quality was an invincible patience supported by reliance on the loyalty of his subjects, and a sense of his duty to the state. (For the general events of this reign till 1815 see EUROPE, AUSTRIA, NAPOLEON, FRENCH REVOLUTIONARY WARS, &c.) The emperor's firmness averted what would have been an irreparable loss of position. Seeing that the Empire was in the last stage of dissolution, and that, even were it to survive, it would pass from the house of Habsburg to that of Bonaparte, he in 1804 assumed the title of hereditary emperor of Austria. The object of this prudent measure was double. In the first place, he guarded against the danger that his house should sink to a lower rank than the Russian or the French. In the second place, he gave some semblance of unity to his complex dominions in Germany, Bohemia, Hungary and Italy, by providing a common title for the supreme ruler. His action was justified when, in 1806, the establishment of the Confederation of the Rhine forced him to abdicate the empty title of Holy Roman emperor.

In 1805 he made an important change in the working of his administration. He had hitherto been assisted by a cabinet minister who was in direct relation with all the "chanceries" and boards which formed the executive government, and who acted as the channel of communication between them and the emperor, and was in fact a prime minister. In 1805 Napoleon insisted on the removal of Count Colloredo, who held the post. From that time forward the emperor Francis acted as his own prime minister, superintending every detail of his administration. In foreign affairs after 1809 he reposed full confidence in Prince Metternich. But Metternich himself declared at the close of his life that he had sometimes held Europe in the palm of his hand, but never Austria. Francis was sole master, and is entitled to whatever praise is due to his government. It follows that he must bear the blame for its errors. The history of the Austrian empire under his rule and since his death bears testimony to both his merits and his limitations. His indomitable patience and loyalty to his inherited task enabled him to triumph over Napoleon. By consenting to the marriage of his daughter, Marie Louise, to Napoleon in 1810, he gained a respite which he turned to good account. By following the guidance of Metternich in foreign affairs he was able to intervene with decisive effect in 1813. The settlement of Europe in 1815 left Austria stronger and more compact than she had been in 1792, and that this was the case was largely due to the emperor.

During the twenty years which preceded his death in 1835, Francis continued to oppose the revolutionary spirit. He had none of the mystical tendencies of the tsar Alexander I., and only adhered to the half fantastic Holy Alliance of 1815 out of pure politeness. But he was wholly in sympathy with the policy of "repression" which came, in popular view, to be identified with the Holy Alliance; and though Metternich was primarily responsible for the part played by Austria in the "policing" of Europe, Francis cannot but be held personally responsible for the cruel and impolitic severities, associated especially with the sinister name of the fortress prison of the Spielberg, which made so many martyrs to freedom. It is not surprising that Francis was denounced by Liberals throughout Europe as a tyrant and an obscurantist. But though at home, as abroad, he met all suggestions of innovation by a steady refusal to depart from old ways, he was always popular among the mass of his subjects, who called him "our good Kaiser Franz." In truth, if in the spirit of the traditional *Landesvater* he chastised his disobedient children mercilessly, he was essentially a well-meaning ruler who forwarded the material and moral good of his subjects according to his lights. But he held that, by the will of God, the whole sovereign authority resided in his person, and could not be shared with others without a dereliction of duty on his part and disastrous consequences; and his capital error as a ruler of Austria was that he persisted in maintaining a system of administration which depended upon the indefatigable industry of a single man, and was entirely outgrown by the modern develop-

ment of his subjects. Before his death, government in Austria was almost choked, and it broke down under a successor who had not his capacity for work. Like his ancestor Philip II. of Spain, Francis carried caution, and a disposition to sleep upon every possible proposal, to a great length. He died on the 2nd of March 1835.

See Baron J. A. Helfert, *Kaiser Franz und die österreichischen Befreiungs-Kriege* (Vienna, 1867). Ample bibliographies will be found in Krones von Marchland's *Grundriss der österreichischen Geschichte* (Berlin, 1882).

FRANCIS I. (1494-1547), king of France, son of Charles of Valois, count of Angoulême, and Louise of Savoy, was born at Cognac on the 12th of September 1494. The count of Angoulême, who was the great-grandson of King Charles V., died in 1496, and Louise watched over her son with passionate tenderness. On the accession of Louis XII. in 1498, Francis became heir-presumptive. Louis invested him with the duchy of Valois, and gave him as tutor Marshal de Gié, and, after Gié's disgrace in 1503, the sieur de Boisy, Artus Gouffier. François de Rochefort, abbot of St Mesmin, instructed Francis and his sister Marguerite in Latin and history; Louise herself taught them Italian and Spanish; and the library of the château at Amboise was well stocked with romances of the Round Table, which exalted the lad's imagination. Francis showed an even greater love for violent exercises, such as hunting, which was his ruling passion, and tennis, and for tournaments, masquerades and amusements of all kinds. His earliest gallantries are described by his sister in the 25th and 42nd stories of the *Heptameron*. In 1507 Francis was betrothed to Claude, the daughter of Louis XII., and in 1508 he came to court. In 1512 he gained his first military experience in Guienne, and in the following year he commanded the army of Picardy. He married Claude on the 18th of May 1514, and succeeded Louis XII. on the 1st of January 1515. Of noble bearing, and, in spite of a very long and large nose, extremely handsome, he was a sturdy and valiant knight, affable, courteous, a brilliant talker and a facile poet. He had a sprightly wit, some delicacy of feeling, and some generous impulses which made him amiable. These brilliant qualities, however, were all on the surface. At bottom the man was frivolous, profoundly selfish, unstable, and utterly incapable of consistency or application. The ambassadors remarked his negligence, and his ministers complained of it. Hunting, tennis, jewelry and his gallantry were the chief preoccupations of his life.

His character was at once authoritative and weak. He was determined to be master and to decide everything himself, but he allowed himself to be dominated and easily persuaded. Favourites, too, without governing entirely for him, played an important part in his reign. His capricious humour elevated and deposed them with the same disconcerting suddenness. In the early years of his reign the conduct of affairs was chiefly in the hands of Louise of Savoy, Chancellor Antoine Duprat, Secretary Florimond Robertet, and the two Gouffiers, Boisy and Bonnivet. The royal favour then elevated Anne de Montmorency and Philippe de Chabot, and in the last years of the reign Marshal d'Annebaud and Cardinal de Tournon. Women too had always a great influence over Francis—his sister, Marguerite d'Angoulême, and his mistresses. Whatever the number of these, he had only two titular mistresses—at the beginning of the reign Françoise de Châteaubriant, and from about 1526 to his death Anne de Pisseleu, whom he created duchesse d'Étampes and who entirely dominated him. It has not been proved that he was the lover of Diane de Poitiers, nor does the story of "La belle Ferronnière" appear to rest on any historical foundation.¹

Circumstances alone gave a homogeneous character to the foreign policy of Francis. The struggle against the emperor Charles V. filled the greater part of the reign. In reality, the policy of Francis, save for some flashes of sagacity, was irresolute and vacillating. Attracted at first by Italy, dreaming of fair feats of prowess, he led the triumphal Marignano expedition, which gained him reputation as a knightly king and as the most powerful prince in Europe. In 1519, in spite of wise counsels,

¹ On this point see Paulin Paris, *Études sur le règne de François I^{er}*.

he stood candidate for the imperial crown. The election of Charles V. caused an inevitable rivalry between the two monarchs which accentuated still further the light and chivalrous temper of the king and the cold and politic character of the emperor. Francis's personal intervention in this struggle was seldom happy. He did not succeed in gaining the support of Henry VIII. of England at the interview of the Field of the Cloth of Gold in 1520; his want of tact goaded the Constable de Bourbon to extreme measures in 1522-1523; and in the Italian campaign of 1525 he proved himself a mediocre, vacillating and foolhardy leader, and by his blundering led the army to the disaster of Pavia (the 25th of February 1525), where, however, he fought with great bravery. "Of all things," he wrote to his mother after the defeat, "nothing remains to me but honour and life, which is safe"—the authentic version of the legendary phrase "All is lost save honour." He strove to play the part of royal captive heroically, but the prison life galled him. He fell ill at Madrid and was on the point of death. For a moment he thought of abdicating rather than of ceding Burgundy. But this was too great a demand upon his fortitude, and he finally yielded and signed the treaty of Madrid, after having drawn up a secret protest. After Madrid he wavered unceasingly between two courses, either that of continuing hostilities, or the policy favoured by Montmorency of peace and understanding with the emperor. At times he had the sagacity to recognize the utility of alliances, as was shown by those he concluded with the Porte and with the Protestant princes of Germany. But he could never pledge himself frankly in one sense or the other, and this vacillation prevented him from attaining any decisive results. At his death, however, France was in possession of Savoy and Piedmont.

In his religious policy Francis showed the same instability. Drawn between various influences, that of Marguerite d'Angoulême, the du Bellays, and the duchesse d'Etampes, who was in favour of the Reformation or at least of toleration, and the contrary influence of the uncompromising Catholics, Duprat, and then Montmorency and de Tournon, he gave pledges successively to both parties. In the first years of the reign, following the counsels of Marguerite, he protected Jacques Lefèvre of Etaples and Louis de Berquin, and showed some favour to the new doctrines. But the violence of the Reformers threw him into the arms of the opposite party. The affair of the Placards in 1534 irritated him beyond measure, and determined him to adopt a policy of severity. From that time, in spite of occasional indulgences shown to the Reformers, due to his desire to conciliate the Protestant powers, Francis gave a free hand to the party of repression, of which the most active and most pitiless member was Cardinal de Tournon; and the end of the reign was sullied by the massacre of the Waldenses (1545).

Francis introduced new methods into government. In his reign the monarchical authority became more imperious and more absolute. His was the government "*du bon plaisir*." By the unusual development he gave to the court he converted the nobility into a brilliant household of dependants. The Concordat brought the clergy into subjection, and enabled him to distribute benefices at his pleasure among the most docile of his courtiers. He governed in the midst of a group of favourites, who formed the *conseil des affaires*. The states-general did not meet, and the remonstrances of the parlement were scarcely tolerated. By centralizing the financial administration by the creation of the *Trésor de l'Épargne*, and by developing the military establishments, Francis still further strengthened the royal power. His government had the vices of his foreign policy. It was uncertain, irregular and disorderly. The finances were squandered in gratifying the king's unbridled prodigality, and the treasury was drained by his luxurious habits, by the innumerable gifts and pensions he distributed among his mistresses and courtiers, by his war expenses and by his magnificent buildings. His government, too, weighed heavily upon the people, and the king was less popular than is sometimes imagined.

Francis owes the greater measure of his glory to the artists and men of letters who vied in celebrating his praises. He was pre-eminently the king of the Renaissance. Of a quick and

cultivated intelligence, he had a sincere love of letters and art. He holds a high place in the history of humanism by the foundation of the Collège de France; he did not found an actual college, but after much hesitation instituted in 1530, at the instance of Guillaume Budé (Budæus), *Lecteurs royaux*, who in spite of the opposition of the Sorbonne were granted full liberty to teach Hebrew, Greek, Latin, mathematics, &c. The humanists Budé, Jacques Colin and Pierre Duchâtel were the king's intimates, and Clément Marot was his favourite poet. Francis sent to Italy for artists and for works of art, but he protected his own countrymen also. Here, too, he showed his customary indecision, wavering between the two schools. At his court he installed Benvenuto Cellini, Francesco Primaticcio and Rosso del Rosso, but in the buildings at Chambord, St Germain, Villers-Cotterets and Fontainebleau the French tradition triumphed over the Italian.

Francis died on the 31st of March 1547, of a disease of the urinary ducts according to some accounts, of syphilis according to others. By his first wife Claude (d. 1524) he had three sons and four daughters: Louise, who died in infancy; Charlotte, who died at the age of eight; Francis (d. 1536); Henry, who came to the throne as Henry II.; Madeleine, who became queen of Scotland; Charles (d. 1545); and Margaret, duchess of Savoy. In 1530 he married Eleanor, the sister of the emperor Charles V.

AUTHORITIES.—For the official acts of the reign, the *Catalogue des actes de François I^{er}*, published by the Académie des Sciences morales et politiques (Paris, 1887-1907), is a valuable guide. The *Bibliothèque Nationale*, the *National Archives*, &c., contain a mass of unpublished documents. Of the published documents, see N. Camuzat, *Mélanges historiques* . . . (Troyes, 1619); G. Ribier, *Lettres et mémoires d'état* (Paris, 1666); *Lettres de Marguerite d'Angoulême*, ed. by F. Genin (Paris, 1841 and 1842); the *Correspondence of Castillon and Marillac* (ed. by Kaulek, Paris, 1885), of *Odet de Selve* (ed. by Lefèvre-Pontalis, Paris, 1888), and of *Guillaume Pellicier* (ed. by Tausserat-Radel, Paris, 1900); *Captivité du roi François I^{er}*, and *Poésies de François I^{er}* (both ed. by Champollion-Figeac, Paris, 1847, of doubtful authenticity); *Relations des ambassadeurs vénitiens*, &c. Of the memoirs and chronicles, see the journal of Louise of Savoy in S. Guichenon's *Histoire de la maison de Savoie*, vol. iv. (ed. of 1778-1780); *Journal de Jean Barillon*, ed. by de Vaissière (Paris, 1897-1899); *Journal d'un bourgeois de Paris*, ed. by Lalanne (Paris, 1854); *Cronique du roy François I^{er}*, ed. by Guiffrey (Paris, 1868); and the memoirs of Fleuranges, Montluc, Tavannes, Vieilleville, Brantôme and especially Martin du Bellay (coll. Michaud and Poujoulat). Of the innumerable secondary authorities, see especially Paulin Paris, *Études sur le règne de François I^{er}* (Paris, 1885), in which the apologetic tendency is excessive; and H. Lémonnier in vol. v. (Paris, 1903-1904) of E. Lavisse's *Histoire de France*, which gives a list of the principal secondary authorities. There is a more complete bibliographical study by V. L. Bourrilly in the *Revue d'histoire moderne et contemporaine*, vol. iv. (1902-1903). The printed sources have been catalogued by H. Hauser, *Les Sources de l'histoire de France, XVI^e siècle*, tome ii. (Paris, 1907). (J. I.)

FRANCIS II. (1544-1560), king of France, eldest son of Henry II. and of Catherine de' Medici, was born at Fontainebleau on the 19th of January 1544. He married the famous Mary Stuart, daughter of James V. of Scotland, on the 25th of April 1558, and ascended the French throne on the 10th of July 1559. During his short reign the young king, a sickly youth and of feeble understanding, was the mere tool of his uncles Francis, duke of Guise, and Charles, cardinal of Lorraine, into whose hands he virtually delivered the reins of government. The exclusiveness with which they were favoured, and their high-handed proceedings, awakened the resentment of the princes of the blood, Anthony king of Navarre and Louis prince of Condé, who gave their countenance to a conspiracy (conspiracy of Amboise) with the Protestants against the house of Guise. It was, however, discovered shortly before the time fixed for its execution in March 1560, and an ambush having been prepared, most of the conspirators were either killed or taken prisoners. Its leadership and organization had been entrusted to Godfrey de Barri, lord of la Renaudie (d. 1560); and the prince of Condé, who was not present, disavowed all connexion with the plot. The duke of Guise was now named lieutenant-general of the kingdom, but his Catholic leanings were somewhat held in check by the

chancellor Michel de l'Hôpital, through whose mediation the edict of Romorantin, providing that all cases of heresy should be decided by the bishops, was passed in May 1560, in opposition to a proposal to introduce the Inquisition. At a meeting of the states-general held at Orleans in the December following, the prince of Condé, after being arrested, was condemned to death, and extreme measures were being enacted against the Huguenots; but the deliberations of the Assembly were broken off, and the prince was saved from execution, by the king's somewhat sudden death, on the 5th of the month, from an abscess in the ear.

F. Michaud and J. J. F. Poujoulat, series i. vol. vi. (1836 seq.); *Mémoires de Condé servant d'éclaircissement . . . à l'histoire de M. de Thou*, vols. i and ii. (1743); Pierre de la Place, *Commentaires de l'état de la religion et de la république sous les rois Henri II, François II, Charles IX* (1565); and Louis Régnier de la Planché, *Histoire de l'état de France . . . sous . . . François II* (*Pantheon littéraire*, new edition, 1884). See also Ernest Lavisse, *Histoire de France* (vol. vi. by J. H. Mariéjol, 1904), which contains a bibliography.

FRANCIS I. (1777-1830), king of the Two Sicilies, was the son of Ferdinand IV. (I.) and Maria Carolina of Austria. He married Clementina, daughter of the emperor Leopold II. of Austria, in 1796, and at her death Isabella, daughter of Charles IV. of Spain. After the Bourbon family fled from Naples to Sicily in 1806, and Lord William Bentinck, the British resident, had established a constitution and deprived Ferdinand IV. of all power, Francis was appointed regent (1812). On the fall of Napoleon his father returned to Naples and suppressed the Sicilian constitution and autonomy, incorporating his two kingdoms into that of the Two Sicilies (1816); Francis then assumed the revived title of duke of Calabria. While still heir-apparent he professed liberal ideas, and on the outbreak of the revolution of 1820 he accepted the regency apparently in a friendly spirit towards the new constitution. But he was playing a double game and proved to be the accomplice of his father's treachery. On succeeding to the throne in 1825 he cast aside the mask of liberalism and showed himself as reactionary as his father. He took little part in the government, which he left in the hands of favourites and police officials, and lived with his mistresses, surrounded by soldiers, ever in dread of assassination. During his reign the only revolutionary movement was the outbreak on the Cilento (1828), savagely repressed by the marquis Delcarretto, an ex-Liberal turned reactionary.

See Nisco, *Il Reame di Napoli sotto Francesco I* (Naples, 1893).

FRANCIS II. (1836-1894), king of the Two Sicilies, son of Ferdinand II. and Maria Cristina of Savoy, was the last of the Bourbon kings of Naples. His education had been much neglected and he proved a man of weak character, greatly influenced by his stepmother Maria Theresa of Austria, by the priests, and by the *Camarilla*, or reactionary court set. He ascended the throne on the death of his father (22nd of May 1859). As prime minister he at once appointed Carlo Filangieri, who, realizing the importance of the Franco-Piedmontese victories in Lombardy, advised Francis to accept the alliance with Piedmont proposed by Cavour. On the 7th of June a part of the Swiss Guard mutinied, and while the king mollified them by promising to redress their grievances, General Nunziante collected other troops, who surrounded the mutineers and shot them down. The incident resulted in the disbanding of the whole Swiss Guard, the strongest bulwark of the dynasty. Cavour again proposed an alliance to divide the papal states between Piedmont and Naples, the province of Rome excepted, but Francis rejected an idea which to him savoured of sacrilege. Filangieri strongly advocated a constitution as the only measure which might save the dynasty, and on the king's refusal he resigned. Meanwhile the revolutionary parties were conspiring for the overthrow of the Bourbons in Calabria and Sicily, and Garibaldi was preparing for a raid in the south. A conspiracy in Sicily was discovered and the plotters punished with brutal

severity, but Rosalino Pilo and Francesco Crispi had organized the movement, and when Garibaldi landed at Marsala (May 1860) he conquered the island with astonishing ease. These events at last frightened Francis into granting a constitution, but its promulgation was followed by disorders in Naples and the resignation of ministers, and Liborio Romano became head of the government. The disintegration of the army and navy proceeded apace, and Cavour sent a Piedmontese squadron carrying troops on board to watch events. Garibaldi, who had crossed the straits of Messina, was advancing northwards and was everywhere received by the people as a liberator. Francis, after long hesitations and even an appeal to Garibaldi himself, left Naples (6th of September) with his wife Maria Sophia, the court, the diplomatic corps (the French and English ministers excepted), and went by sea to Gaeta, where a large part of the army was concentrated. The next day Garibaldi entered Naples, was enthusiastically welcomed, and formed a provisional government. King Victor Emmanuel had decided on the invasion of the papal states, and after occupying Romagna and the Marche entered the Neapolitan kingdom. Garibaldi's troops defeated the Neapolitan royalists on the Volturno (1st and 2nd of October), while the Piedmontese captured Capua. Only Gaeta, Messina, and Civitella del Tronto still held out, and the siege of the former by the Piedmontese began on the 6th of November 1860. Both Francis and Maria Sophia behaved with great coolness and courage, and even when the French fleet, whose presence had hitherto prevented an attack by sea, was withdrawn, they still resisted; it was not until the 12th of February 1861 that the fortress capitulated. Thus the kingdom of Naples was incorporated in that of Italy, and the royal pair from that time forth led a wandering life in Austria, France and Bavaria. Francis died on the 27th of December 1894 at Arco in Tirol. His widow survived him.

Francis II. was weak-minded, stupid and vacillating, but, although his short reign was stained with some cruel massacres and persecutions, he was less of a tyrant than his father. The courage and dignity he displayed during his reverses inspired pity and respect. But the fact that he protected brigandage in his former dominions and countenanced the most abominable crimes in the name of legitimism greatly diminished the sympathy which was felt for the fallen monarch.

BIBLIOGRAPHY.—R. de Cesare, *La Fine d'un regno*, vol. ii. (Città di Castello, 1900) gives a detailed account of the reign of Francis II., while H. R. Whitehouse's *Collapse of the Kingdom of Naples* (New York, 1899) may be recommended to English readers; Nisco's *Francesco II* (Naples, 1887) should also be consulted. See under NAPLES; GARIBALDI; BIXIO; CAVOUR; ITALY; FILANGIERI; &c. (L. V.)*

FRANCIS IV. (1779-1846) duke of Modena, was the son of the archduke Ferdinand, Austrian governor of Lombardy, who acquired the duchy of Modena through his wife Marie Beatrice, heiress of the house of Este as well as of many fiefs of the Malaspina, Pio da Carpi, Pico della Mirandola, Cibò, and other families. At the time of the French invasion (1796) Francis was sent to Vienna to be educated, and in 1809 was appointed governor of Galicia. Later he went to Sardinia, where the exiled King Victor Emmanuel I. and his wife Maria Theresa were living in retirement. The latter arranged a marriage between her daughter Marie Beatrice and Francis, and a secret family compact was made whereby if the king and his two brothers died without male issue, the Salic law would be changed so that Francis should succeed to the kingdom instead of Charles Albert of Carignano (N. Bianchi, *Storia della diplomazia europea in Italia*, i. 42-43). On the fall of Napoleon in 1814 Francis received the duchy of Modena, including Massa-Carrara and Lunigiana; his mother's advice was "to be above the law . . . never to forgive the Republicans of 1796, nor to listen to the complaints of his subjects, whom nothing satisfies; the poorer they are the quieter they are" (Silingardi, "Ciro Menotti," in *Rivista europea*, Florence, 1880).

The duke was well received at Modena; inordinately ambitious, strong-willed, immensely rich, avaricious but not unintelligent, he soon proved one of the most reactionary despots in Italy.

He still hoped to acquire either Piedmont or some other part of northern Italy, and he was in touch with the Sanfedisti and the Concistoro, reactionary Catholic associations opposed to the Carbonari, but not always friendly to Austria. Against the Carbonari and other Liberals he issued the severest edicts, and although there was no revolt at Modena in 1821 as in Piedmont and Naples, he immediately instituted judicial proceedings against the supposed conspirators. Some 350 persons were arrested and tortured, 56 being condemned to death (only a few of them were executed) and 237 to imprisonment; a large number, however, escaped, including Antonio Panizzi (afterwards director of the British Museum). The ferocious police official Besini who conducted the trials was afterwards murdered. The duke actually proposed to Prince Metternich, the Austrian chancellor, an agreement whereby the various Italian rulers were to arrest every Liberal in the country on a certain day, but the project fell through owing to opposition from the courts of Florence and Rome. At the congress of Verona Metternich made another attempt to secure the Piedmontese succession for Francis, but without success. The duke became ever more despotic; Modena swarmed with spies and informers, education was hampered, feudalism strengthened; for the duke hoped to consolidate his power by means of the nobility, and the least expression of liberalism, or even failure to denounce a Carbonaro, involved arrest and imprisonment. But strange to say, in 1830 we find Francis actually coquetting with revolution. Having lost all hope of acquiring the Piedmontese throne, he entered into negotiations with the French Orleanist party with a view to obtaining its support in his plans for extending his dominions. He was thus brought into touch with Ciro Menotti (1798-1831) and the Modenese Liberals; what the nature of the connexion was is still obscure, but it was certainly short-lived and merely served to betray the Carbonari. As soon as Francis learned that a conspiracy was on foot to gain possession of the town, he had Menotti and several other conspirators arrested on the night of the 3rd of February 1831, and sent the famous message to the governor of Reggio: "The conspirators are in my hands; send me the hangman" (there is some doubt as to the authenticity of the actual words). But the revolt broke out in other parts of the duchy and in Romagna, and Francis retired to Mantua with Menotti. A provisional government was formed at Modena which proclaimed that "Italy is one," but the duke returned a few weeks later with Austrian troops, and resistance was easily quelled. Then the political trials began; Menotti and two others were executed, and hundreds condemned to imprisonment. The population was now officially divided into four classes, viz. "very loyal, loyal, less loyal, and disloyal," and the reaction became worse than ever, the duke interfering in the minutest details of administration, such as hospitals, schools, and roads. New methods of procedure were introduced to deal with political trials, but the ministerial cabal by which the country was administered intrigued and squabbled to such an extent that it had to be dismissed.

On the 20th of February 1846 Francis died. Although he had many domestic virtues and charming manners, was charitable in times of famine, and was certainly the ablest of the Italian despots, Liberalism was in his eyes the most heinous of crimes, and his reign is one long record of barbarous persecution. (L. V. *)

FRANCIS V. (1819-1875), duke of Modena, son of Francis IV., succeeded his father in 1846. Although less cruel and also less intelligent than his father, he had an equally high opinion of his own authority. His reign began with disturbances at Fivizzano and Pontremoli, which Tuscany surrendered to him according to treaty but against the wishes of the inhabitants (1847), and at Massa and Carrara, where the troops shot down the people. Feeling his position insecure, the duke asked for and obtained an Austrian garrison, but on the outbreak of revolution throughout Italy and at Vienna in 1848, further disorders occurred in the duchy, and on the 20th of March he fled with his family to Mantua. A provisional government was formed, and volunteers were raised who fought with the Piedmontese against Austria. But after the Piedmontese defeat Francis returned to

Modena, with Austrian assistance, in August and conferred many appointments on Austrian officers. Like his father, he interfered in the minutest details of administration, and instituted proceedings against all who were suspected of Liberalism. Not content with the severity of his judges, he overrode their sentences in favour of harsher punishments. The disturbances at Carrara were ruthlessly suppressed, and the prisons filled with politicals. In 1859 numbers of young Modenese fled across the frontier to join the Piedmontese army, as war with Austria seemed imminent; and after the Austrian defeat at Magenta the duke left Modena to lead his army in person against the Piedmontese, taking with him the contents of the state treasury and many valuable books, pictures, coins, tapestries and furniture from the palace. The events of 1859-1860 made his return impossible; and after a short spell of provisional government the duchy was united to Italy. He retired to Austria, and died at Munich in November 1875.

FRANCIS OF ASSISI, ST. (1181 or 1182-1226), founder of the Franciscans (*q.v.*), was born in 1181 or 1182 at Assisi, one of the independent municipal towns of Umbria. He came from the upper middle class, his father, named Pietro Bernardone, being one of the larger merchants of the city. Bernardone's commercial enterprises made him travel abroad, and it was from the fact that the father was in France at the time of his son's birth that the latter was called Francesco. His education appears to have been of the slightest, even for those days. It is difficult to decide whether words of the early biographers imply that his youth was not free from irregularities; in any case, he was the recognized leader of the young men of the town in their revels; he was, however, always conspicuous for his charity to the poor. When he was twenty (1201) the neighbouring and rival city of Perugia attempted to restore by force of arms the nobles who had been expelled from Assisi by the burghers and the populace, and Francis took part in the battle fought in the plain that lies between the two cities; the men of Assisi were defeated and Francis was among the prisoners. He spent a year in prison at Perugia, and when peace was made at the end of 1202 he returned to Assisi and recommenced his old life.

Soon a serious and prolonged illness fell upon him, during which he entered into himself and became dissatisfied with his way of life. On his recovery he set out on a military expedition, but at the end of the first day's march he fell ill, and had to stay at Spoleto and return to Assisi. This disappointment brought on again the spiritual crisis he had experienced in his illness, and for a considerable time the conflict went on within him. One day he gave a banquet to his friends, and after it they sallied forth with torches, singing through the streets, Francis being crowned with garlands as the king of the revellers; after a time they missed him, and on retracing their steps they found him in a trance or reverie, a permanently altered man. He devoted himself to solitude, prayer and the service of the poor, and before long went on a pilgrimage to Rome. Finding the usual crowd of beggars before St Peter's, he exchanged his clothes with one of them, and experienced an overpowering joy in spending the day begging among the rest. The determining episode of his life followed soon after his return to Assisi; as he was riding he met a leper who begged an alms; Francis had always had a special horror of lepers, and turning his face he rode on; but immediately an heroic act of self-conquest was wrought in him; returning he alighted, gave the leper all the money he had about him, and kissed his hand. From that day he gave himself up to the service of the lepers and the hospitals. To the confusion of his father and brothers he went about dressed in rags, so that his old companions pelted him with mud.

Things soon came to a climax with his father: in consequence of his profuse alms to the poor and to the restoration of the ruined church of St Damian, his father feared his property would be dissipated, so he took Francis before the bishop of Assisi to have him legally disinherited; but without waiting for the documents to be drawn up, Francis cast off his clothes and gave them back to his father, declaring that now he had better reason to say "Our Father which art in heaven," and having received a cloak from the bishop, he went off into the woods of Mount Subasio singing a French song; some brigands accosted him and he told them he was the herald of the great king (1206).

The next three years he spent in the neighbourhood of Assisi in abject poverty and want, ministering to the lepers and the outcasts of society. It was now that he began to frequent the ruined little chapel of St Mary of the Angels, known as the Portiuncula, where much of his time was passed in prayer. One day while Mass was being said therein, the words of the Gospel came to Francis as a call: "Everywhere on your road preach and say—The kingdom of God is at hand. Cure the sick, raise the dead, cleanse the lepers, drive out devils. Freely have you received, freely give. Carry neither gold nor silver nor money in your girdles, nor bag, nor two coats, nor sandals, nor staff, for the workman is worthy of his hire" (Matt. x. 7-10). He at once felt that this was his vocation, and the next day, layman as he was, he went up to Assisi and began to preach to the poor (1209). Disciples joined him, and when they were twelve in number Francis said: "Let us go to our Mother, the holy Roman Church, and tell the pope what the Lord has begun to do through us, and carry it out with his sanction." They obtained the sanction of Innocent III., and returning to Assisi they gave themselves up to their life of apostolic preaching and work among the poor.

The character and development of the order are traced in the article FRANCISCANS; here the story of Francis's own life and the portrayal of his personality will be attempted. To delineate in a few words the character of the Poverello of Assisi is indeed a difficult task. There is such a many-sided richness, such a tenderness, such a poetry, such an originality, such a distinction revealed by the innumerable anecdotes in the memoirs of his disciples, that his personality is brought home to us as one of the most lovable and one of the strongest of men. It is probably true to say that no one has ever set himself so seriously to imitate the life of Christ and to carry out so literally Christ's work in Christ's own way. This was the secret of his love of poverty as manifested in the following beautiful prayer which he addressed to our Lord: "Poverty was in the crib and like a faithful squire she kept herself armed in the great combat Thou didst wage for our redemption. During Thy passion she alone did not forsake Thee. Mary Thy Mother stopped at the foot of the Cross, but poverty mounted it with Thee and clasped Thee in her embrace unto the end; and when Thou wast dying of thirst, as a watchful spouse she prepared for Thee the gall. Thou didst expire in the ardour of her embraces, nor did she leave Thee when dead, O Lord Jesus, for she allowed not Thy body to rest elsewhere than in a borrowed grave. O poorest Jesus, the grace I beg of Thee is to bestow on me the treasure of the highest poverty. Grant that the distinctive mark of our Order may be never to possess anything as its own under the sun for the glory of Thy name, and to have no other patrimony than begging" (in the *Legenda 3 Soc.*). This enthusiastic love of poverty is certainly the keynote of St Francis's spirit; and so one of his disciples in an allegorical poem (translated into English as *The Lady of Poverty* by Montgomery Carmichael, 1901), and Giotto in one of the frescoes at Assisi, celebrated the "holy nuptials of Francis with Lady Poverty."

Another striking feature of Francis's character was his constant joyousness; it was a precept in his rule, and one that he enforced strictly, that his friars should be always rejoicing in the Lord. He retained through life his early love of song, and during his last illness he passed much of his time in singing. His love of nature, animate and inanimate, was very keen and manifested itself in ways that appear somewhat naïve. His preaching to

the birds is a favourite representation of St. Francis in art. All creatures he called his "brothers" or "sisters"—the chief example is the poem of the "Praises of the Creatures," wherein "brother Sun," "sister Moon," "brother Wind," and "sister Water" are called on to praise God. In his last illness he was cauterized, and on seeing the burning iron he addressed "brother Fire," reminding him how he had always loved him and asking him to deal kindly with him. It would be an anachronism to think of Francis as a philanthropist or a "social worker" or a revivalist preacher, though he fulfilled the best functions of all these. Before everything he was an ascetic and a mystic—an ascetic who, though gentle to others, wore out his body by self-denial, so much so that when he came to die he begged pardon of "brother Ass the body" for having unduly ill-treated it: a mystic irradiated with the love of God, endowed in an extraordinary degree with the spirit of prayer, and pouring forth his heart by the hour in the tenderest affections to God and our Lord. St. Francis was a deacon but not a priest.

From the return of Francis and his eleven companions from Rome to Assisi in 1209 or 1210, their work prospered in a wonderful manner. The effect of their preaching, and their example and their work among the poor, made itself felt throughout Umbria and brought about a great religious revival. Great numbers came to join the new order which responded so admirably to the needs of the time. In 1212 Francis invested St. Clara (*q.v.*) with the Franciscan habit, and so instituted the "Second Order," that of the nuns. As the friars became more and more numerous their missionary labours extended wider and wider, spreading first over Italy, and then to other countries. Francis himself set out, probably in 1212, for the Holy Land to preach the Gospel to the Saracens, but he was shipwrecked and had to return. A year or two later he went into Spain to preach to the Moors, but had again to return without accomplishing his object (1215 probably). After another period of preaching in Italy and watching over the development of the order, Francis once again set out for the East (1219). This time he was successful; he made his way to Egypt, where the crusaders were besieging Damietta, got himself taken prisoner and was led before the sultan, to whom he openly preached the Gospel. The sultan sent him back to the Christian camp, and he passed on to the Holy Land. Here he remained until September 1220. During his absence were manifested the beginnings of the troubles in the order that were to attain to such magnitude after his death. The circumstances under which, at an extraordinary general chapter convoked by him shortly after his return, he resigned the office of minister-general (September 1220) are explained in the article FRANCISCANS: here, as illustrating the spirit of the man, it is in place to cite the words in which his abdication was couched: "Lord, I give Thee back this family which Thou didst entrust to me. Thou knowest, most sweet Jesus, that I have no more the power and the qualities to continue to take care of it. I entrust it, therefore, to the ministers. Let them be responsible before Thee at the Day of Judgment, if any brother by their negligence, or their bad example, or by a too severe punishment, shall go astray." These words seem to contain the mere truth: Francis's peculiar religious genius was probably not adapted for the government of an enormous society spread over the world, as the Friars Minor had now become.

The chief works of the next years were the revision and final redaction of the Rule and the formation or organization of the "Third Order" or "Brothers and Sisters of Penance," a vast confraternity of lay men and women who tried to carry out, without withdrawing from the world, the fundamental principles of Franciscan life (see TERTIARIES).

If for no other reason than the prominent place they hold in art, it would not be right to pass by the Stigmata without a special mention. The story is well known; two years before his death Francis went up Mount Alverno in the Apennines with some of his disciples, and after forty days of fasting and prayer and contemplation, on the morning of the 14th of September 1224 (to use Sabatier's words), "he had a vision: in the warm rays of the rising sun he discerned suddenly a strange

figure. A seraph with wings extended flew towards him from the horizon and inundated him with pleasure unutterable. At the centre of the vision appeared a cross, and the seraph was nailed to it. When the vision disappeared Francis felt sharp pains mingling with the delights of the first moment. Disturbed to the centre of his being he anxiously sought the meaning of it all, and then he saw on his body the Stigmata of the Crucified." The early authorities represent the Stigmata not as bleeding wounds, the holes as it were of the nails, but as fleshy excrescences resembling in form and colour the nails, the head on the palm of the hand, and on the back as it were a nail hammered down. In the first edition of the *Vie*, Sabatier rejected the Stigmata; but he changed his mind, and in the later editions he accepts their objective reality as an historically established fact; in an appendix he collects the evidence: there exists what is according to all probability an autograph of Br. Leo, the saint's favourite disciple and companion on Mount Alverno at the time, which describes the circumstances of the stigmatization; Elias of Cortona (*q.v.*), the acting superior, wrote on the day after his death a circular letter wherein he uses language clearly implying that he had himself seen the Stigmata, and there is a considerable amount of contemporary authentic second hand evidence. On the strength of this body of evidence Sabatier rejects all theories of fraud or hallucination, whatever may be the explanation of the phenomena.

Francis was so exhausted by the sojourn on Mount Alverno that he had to be carried back to Assisi. The remaining months of his life were passed in great bodily weakness and suffering, and he became almost blind. However, he worked on with his wonted cheerfulness and joyousness. At last, on the 3rd of October 1226, he died in the Portiuncula at the age of forty-five. Two years later he was canonized by Gregory IX., whom, as Cardinal Hugolino of Ostia, he had chosen to be the protector of his order.

The works of St Francis consist of the Rule (in two redactions), the Testament, spiritual admonitions, canticles and a few letters. They were first edited by Wadding in 1623. Two critical editions were published in 1904, one by the Franciscans of Quaracchi near Florence, the other (in a longer and a shorter form) by Professor H. Boehmer of Bonn. Sabatier and Goetz (see below) have investigated the authenticity of the several works; and the four lists, while exhibiting slight variations, are in substantial accord. Besides the works, properly so called, there is a considerable amount of traditional matter— anecdotes, sayings, sermons—preserved in the biographies and in the *Fiorelli*;¹ a great deal of this matter is no doubt substantially authentic, but it is not possible to subject it to any critical sifting.

Note on Sources.—The sources for the life of St Francis and early Franciscan history are very numerous, and an immense literature has grown up around them. Any attempt to indicate even a selection of this literature would here be impossible and also futile; for the discovery of new documents has by no means ceased, and the criticism of the materials is still in full progress, nor can it be said that final results have yet emerged from the discussion. Students will find the chief materials in the following collections: *Archiv für Literatur und Kirchengeschichte des Mittelalters* (ed. by Ehrle and Denifle, 1885, &c.); publications of the Franciscans of Quaracchi (list to be obtained from Herder, Freiburg im Breisgau); and the two series edited by Paul Sabatier, *Collection d'études et de documents sur l'histoire religieuse et littéraire du moyen âge* (5 vols. published up to 1906) and *Opuscules de critique historique* (12 fascicules): the easiest and most consecutive way of following the controversy is by the aid of the "Bulletin Hagiographique" in *Analecta Bollandiana*. Relatively popular accounts of the most important sources are supplied in the introductory chapters of Sabatier's *Vie de S. François* and *Speculum perfectionis*, and Lempp's *Frère Elie de Cortone*.

Concerning the life of St Francis and the beginnings of the order, the chief documents that come under discussion are: the two *Lives* by Thomas of Celano (1228 and 1248 respectively; Eng. trans. with introduction by A. G. Ferrers Howell, 1908), of which the only critical edition is that of Friar Ed. d'Alençon (1906); the so-called *Legenda trium sociorum*; the *Speculum perfectionis*, discovered by Paul Sabatier and edited in 1898 (Eng. trans. by Sebastian Evans,

Mirror of Perfection, 1899). Sabatier's theory as to the nature of these documents was, in brief, that the *Speculum perfectionis* was the first of all the *Lives* of the saint, written in 1227 by Br. Leo, his favourite and most intimate disciple, and that the *Legenda 3 Soc.* is what it claims to be—the handiwork of Leo and the two other most intimate companions of Francis, compiled in 1246; these are the most authentic and the only true accounts, Thomas of Celano's *Lives* being written precisely in opposition to them, in the interests of the majority of the order that favoured mitigations of the Rule especially in regard to poverty. For ten years the domain of Franciscan origins was explored and discussed by a number of scholars; and then the whole ground was reviewed by Professor W. Goetz of Munich in a study entitled *Die Quellen zur Geschichte des hl. Franz von Assisi* (1904). His conclusions are substantially the same as those of Père van Ortroy, the Bollandist, and Friar Lemmens, an Observant Franciscan, and are the direct contrary of Sabatier's: the *Legenda 3 Soc.* is a forgery; the *Speculum perfectionis* is a compilation made in the 14th century, also in large measure a forgery, but containing an element (not to be precisely determined) derived from Br. Leo; on the other hand, Thomas of Celano's two *Lives* are free from the "tendencies" ascribed to them by Sabatier, and that of 1248 was written with the collaboration of Leo and the other companions; thus the best sources of information are those portions of the *Speculum* that can with certainty be carried back to Br. Leo, and the *Lives* by Thomas of Celano, especially the second *Life*. Goetz's criticism of the documents is characterized by exceeding carefulness and sobriety. Of course he does not suppose that his conclusions are in all respects final; but his investigations show that the time has not yet come when a biography of St Francis could be produced answering to the demands of modern historical criticism. The official life of St Francis is St Bonaventura's *Legenda*, published in a convenient form by the Franciscans of Quaracchi (1898); Goetz's estimate of it (*op. cit.*) is much more favourable than Sabatier's.

Paul Sabatier's fascinating and in many ways sympathetic *Vie de S. François* (1894; 33rd ed., 1906; Eng. trans. by L. S. Houghton, 1901) will probably for a long time to come be accepted by the ordinary reader as a substantially correct portrait of St Francis; and yet Goetz declares that the most competent and independent critics have without any exception pronounced that Sabatier has depicted St Francis a great deal too much from the standpoint of modern religiosity, and has exaggerated his attitude in face of the church (*op. cit.* p. 5). In articles in the *Hist. Vierteljahrsschrift* (1902, 1903) Goetz has shown that Sabatier's presentation of St Francis's relations with the ecclesiastical authority in general, and with Cardinal Hugolino (Gregory IX.) in particular, is largely based on misconception; that the development of the order was not forced on Francis against his will; and that the differences in the order did not during Francis's lifetime attain to such a magnitude as to cause him during his last years the suffering depicted by Sabatier. This from a Protestant historian like Goetz is most valuable criticism. In truth Sabatier's St Francis is an anachronism—a man at heart, a modern pietistic French Protestant of the most liberal type, with a veneer of 13th century Catholicism.

Of lives of St Francis in English may be mentioned those by Mrs Oliphant (2nd ed., 1871) and by Canon Knox Little (1897). For general information and references to the literature of the subject, see Otto Zöckler, *Askese und Mönchtum* (1897), ii. 470-493, and his article in Herzog's *Realencyklopädie* (ed. 3), "Franz von Assisi" (1899); also Max Heimbucher, *Orden und Kongregationen* (1896), i. § 38. The chapter on St Francis in Emile Gebhart's *Italie mystique* (ed. 3, 1899) is very remarkable; indeed, though this writer is as little ecclesiastically-minded as Sabatier himself, his general picture of the state of religion in Italy at the time is far truer; here also Sabatier has given way to the usual temptation of biographers to exalt their hero by depreciating everybody else. (E. C. B.)

† FRANCIS OF MAYRONE [FRANCISCUS DE MAYRONIS] (d. 1325), scholastic philosopher, was born at Mayrone in Provence. He entered the Franciscan order and subsequently went to Paris, where he was a pupil of Duns Scotus. At the Sorbonne he acquired a great reputation for ability in discussion, and was known as the *Doctor Illuminatus* and *Magister Acutus*. He became a professor of philosophy, and took part in the discussions on the nature of Universals. Following Duns Scotus, he adopted the Platonic theory of ideas, and denied that Aristotle had made any contribution to metaphysical speculation. It is a curious commentary on the theories of Duns Scotus that one pupil, Francis, should have taken this course, while another pupil, Occam, should have used his arguments in a diametrically opposite direction and ended in extreme Nominalism.

His works were collected and published at Venice in 1520 under the title *Praeclarissima ac multum subtilia scripta Illuminati Doctoris Francisci de Mayronis, &c.*

FRANCIS OF PAOLA (or PAULA), ST, founder of the Minims, a religious order in the Catholic Church, was born of humble

¹ *The Little Flowers of St Francis.*

parentage at Paola in Calabria in 1416, or according to the Bollandists 1438. As a boy he entered a Franciscan friary, but left it and went to live as a hermit in a cave on the seashore near Paola. Soon disciples joined him, and with the bishop's approval he built a church and monastery. At first they called themselves "Hermits of St Francis"; but the object they proposed to themselves was to go beyond even the strict Franciscans in fasts and bodily austerities of all kinds, in poverty and in humility; and therefore, as the Franciscans were the Minors (*minores*, less), the new order took the name of Minims (*minimi*, least). By 1474 a number of houses had been established in southern Italy and Sicily, and the order was recognized and approved by the pope. In 1482 Louis XI. of France, being on his deathbed and hearing the reports of the holiness of Francis, sent to ask him to come and attend him, and at the pope's command he travelled to Paris. On this occasion Philip de Comines in his *Memoirs* says: "I never saw any man living so holly, nor out of whose mouth the Holy Ghost did more manifestly speak." He remained with Louis till his death, and Louis' successor, Charles VIII., held him in such high esteem that he kept him in Paris, and enabled him to found various houses of his order in France; in Spain and Germany, too, houses were founded during Francis's lifetime. He never left France, and died in 1507 in the monastery of his order at Plessis-Tours.

The Rule was so strict, that the popes long hesitated to confirm it in its entirety; not until 1506 was it finally sanctioned. The most special feature is an additional vow to keep a perpetual Lent of the strictest kind, not only flesh meat but fish and all animal products—eggs, milk, butter, cheese, dripping—being forbidden, so that the diet was confined to bread, vegetables, fruit and oil, and water was the only drink. Thus in matter of diet the Minims surpassed in austerity all orders in the West, and probably all permanently organized orders in the East. The strongly ascetical spirit of the Minims manifested itself in the title borne by the superiors of the houses—not abbot (father), or prior, or guardian, or minister, or rector, but corrector; and the general superior is the corrector general. Notwithstanding its extreme severity the order prospered. At the death of the founder it had five provinces—Italy, France, Tours, Germany, Spain. Later there were as many as 450 monasteries, and some missions in India. There never was a Minim house in England or Ireland. It ranks as one of the Mendicant orders. In 1909 there were some twenty monasteries, mostly in Sicily, but one in Rome (S. Andrea delle Fratte), and one in Naples, in Marseilles and in Cracow. There have been Minim nuns (only one convent has survived, till recently at Marseilles) and Minim Tertiaries, in imitation of the Franciscan Tertiaries. The habit of the Minims is black.

See Helyot, *Hist. des ordres religieux* (1714), vii. c. 56; Max Heimbucher, *Orden und Kongregationen* (1896), i. § 52; the article "Franz von Paula" in Wetzler and Welte, *Kirchenlexicon* (ed. 2), and in Herzog, *Realencyklopädie* (ed. 3); Catholic *Dictionary*, art. "Minims." (E. C. B.)

FRANCIS (FRANÇOIS) OF SALES, ST (1567–1622), bishop of Geneva and doctor of the Church (1877), was born at the castle of Sales, near Annecy, Savoy. His father, also François, comte de Sales, but better known as M. de Boisy, a nobleman and soldier, had been employed in various affairs of state, but in 1560, at the age of thirty-eight, settled down on his ancestral estates and married Françoise de Sionnay, a Savoyard like himself, and an heiress. St Francis, the first child of this union, was born in August 1567 when his mother was in her fifteenth year. M. de Boisy was renowned for his experience and sound judgment, and both parents were distinguished by piety, love of peace, charity to the poor, qualities which early showed themselves in their eldest son.

He received his education first at La Roche, in the Arve valley, then at the college of Annecy, founded by Eustace Chappuis, ambassador in England of Charles V., in 1549. At the age of thirteen or fourteen he went to the Jesuit College of Clermont at Paris, where he stayed till the summer of 1588, and where he

laid the foundations of his profound knowledge, while perfecting himself in the exercises of a young nobleman and practising a life of exemplary virtue. At this time also he developed an ardent love of France, a country which was politically in antagonism with his own, though so closely linked to it geographically, socially and by language. At the end of 1588 he went to Padua, to take his degree in canon and civil law, a necessary prelude in Savoy at that time to distinction in a civil career. His heart, however, especially from the date of his receiving the tonsure (1578), was already turned towards the Church, and he gave his attention even more to theology, under the great masters Antonio Possevino, S.J., and Gesualdo, afterwards general of the Friars Minor, than to his legal course. "At Padua," he said to a friend, "I studied law to please my father, and theology to please myself." In that licentious university Francis found the greatest difficulty in resisting attacks on his virtue, and once at least had to draw his sword to defend his personal safety against a band of ruffians. The gentleness for which he was already renowned was not that of a weak, but of a strong character. He returned to Savoy in 1592, and, while seeking the occasion to overcome his father's resistance to his resolution of embracing the ecclesiastical profession, took the diploma of advocate to the senate. Meantime, without his knowledge, his friends procured for him the post of provost of the chapter of Geneva, an honour which reconciled M. de Boisy to the sacrifice of more ambitious hopes. After a year of zealous work as preacher and director he was sent by the bishop, Claude de Granier, to try and win back the province of Chablais, which had embraced Calvinism when usurped by Bern in 1535, and had retained it even after its restitution to Savoy in 1564. At first the people refused to listen to him, for he was represented to them as an instrument of Satan, and all who had dealings with him were threatened with the vengeance of the consistory. He therefore wrote out his message on sheets which were passed from hand to hand, and these, with the spectacle of his virtues and disinterestedness, soon produced a strong effect. The sheets just spoken of still exist in the Chigi library at Rome, and were published, though with many alterations, in 1672, under the title of *Les Controverses*. This must be considered the first work of St Francis.

The re-erection of a wayside cross in Annemasse, at the gates of Geneva, amid an enormous concourse of converts, an event which closed the three years of his apostolate, led to the composition of the *Défense . . . de la Croix*, published in 1600. An illness brought on by toil and privation forced him to leave his work to others for nearly a year, but in August 1598 he returned to his field of labour, and in October of that year practically the whole country was Catholic again. Up to that time preaching and conference had been the only weapons employed. The stories of the use of soldiers to produce simulated conversions are incorrect.¹ Possibly the lamentable events of the campaigns of 1589 in Gex and Chablais have been applied to the

¹This, at least, is the account given by Catholic authorities. Less favourable is the view taken by non-Catholic historians, which seems in some measure to be confirmed by St Francis himself. According to this, Duke Charles Emmanuel of Savoy, who succeeded his more tolerant father in 1580, was determined to reduce the Chablais to the Catholic religion, by peaceful means if possible, by force if necessary. After two years of preaching Francis wrote to the duke (*Œuvres compl.* ii. p. 551): "During 27 months I have scattered the seed of the Word of God in this miserable land; shall I say among thorns or on stony ground? Certainly, save for the conversion of the seigneur d'Avully and the advocate Poncet, I have little to boast of." In the winter of 1596–1597 Francis was at Turin, and at his suggestion the duke decided on a regular plan for the coercion of the refractory Protestants. This plan anticipated that employed later by Louis XIV. against the Huguenots in France. The Calvinist ministers were expelled; Protestant books were confiscated and destroyed; the acts of Protestant lawyers and officials were declared invalid. The country was flooded with Jesuits and friars, whose arguments were reinforced by quartering troops, veterans of the Indian wars in Mexico, on the refractory inhabitants. Those whose stubborn persistence in error survived all these inducements to repent were sent into exile. See the article "Franz von Sales" by J. Ehni in Herzog-Hauck, *Realencyklopädie* (3rd ed., Leipzig, 1899). (W. A. P.)

period 1594-1598. In October of this last year, however, the duke of Savoy, who came then to assist in person at the great religious feasts which celebrated the return of the country to unity of faith, expatriated such of the leading men as obstinately refused even to listen to the Catholic arguments. He also forbade Calvinist ministers to reside in the Chablais, and substituted Catholic for Huguenot officials. St Francis concurred in these measures, and, three years later, even requested that those who, as he said, "follow their heresy, rather as a party than a religion," should be ordered either to conform or to leave their country, with leave to sell their goods. His conduct, judged not by a modern standard, but by the ideas of his age, will be found compatible with the highest Christian charity, as that of the duke with sound political prudence. At this time he was nominated to the pope as coadjutor of Geneva,¹ and after a visit to Rome he assisted Bishop de Granier in the administration of the newly converted countries and of the diocese at large.

In 1602 he made his second visit to the French capital, when his transcendent qualities brought him into the closest relations with the court of Henry IV., and made him the spiritual father of that circle of select souls who centred round Madame Acarie. Among the celebrated personages who became his life friends from this time were Pierre de Bérulle, founder of the French Oratorians, Guillaume Duval, the scholar, and the duc de Bellegarde, the latter a special favourite of the king, who begged to be allowed to share the Saint's friendship. At this time also his gift as a preacher became fully recognized, and de Sanzéa, afterwards bishop of Bethlehem, records that Duval exhorted all his students of the Sorbonne to listen to him and to imitate this, "the true and excellent method of preaching." His principles are expressed in the admirable letter to André Frémyot of October 1604.

De Granier died in September 1602, and the new bishop entered on the administration of his vast diocese, which, as a contemporary says, "he found brick and left marble." His first efforts were directed to securing a virtuous and well-instructed clergy, with its consequence of a people worthy of their pastors. All his time was spent in preaching, confessing, visiting the sick, relieving the poor. His zeal was not confined to his diocese. In concert with Jeanne Françoise Frémyot (1572-1641), widow of the baron de Chantal, whose acquaintance he made while preaching through Lent at Dijon in 1604, he founded the order of the Visitation, in favour of "strong souls with weak bodies," as he said, deterred from entering the orders already existing, by their inability to undertake severe corporal austerities. The institution rapidly spread, counting twenty houses before his death and eighty before that of St Jeanne. The care of his diocese and of his new foundation were not enough for his ardent charity, and in 1609 he published his famous *Introduction to a Devout Life*, a work which was at once translated into the chief European languages and of which he himself published five editions. In 1616 appeared his *Treatise on the Love of God*, which teaches that perfection of the spiritual life to which the former work is meant to be the "Introduction."

The important Lents of 1617 and 1618 at Grenoble were a prelude to a still more important apostolate in Paris, "the theatre of the world," as St Vincent de Paul calls it. This third visit to the great city lasted from the autumn of 1618 to that of 1619; the direct object of it was to assist in negotiating the marriage of the prince of Piedmont with Chrétienne of France, but nearly all his time was spent in preaching and works of mercy, spiritual or corporal. He was regarded as a living saint. St Vincent scarcely left him, and has given the most extraordinary testimonies (as yet unpublished) of his heroic virtues. Mère Angélique Arnaud, who at this time put herself under his direction and wished to join the Order of the Visitation, attracted by its humility and sweetness, may be named as the most interesting of his innumerable penitents of this period. He returned to Savoy, and after three years more of unwearying labour died at Lyons on the 28th of December 1622. A universal outburst of veneration followed; indeed his cult had already begun, and after

¹ With the title of Nicopolis *in partibus*.—ED.

an episcopal inquiry the pontifical commission in view of his beatification was instituted by decree of the 21st of July 1626, a celerity unique in the annals of the Congregation of Rites. The depositions of witnesses were returned to Rome in 1632, but meantime the forms of the Roman chancery had been changed by Urban VIII., and the advocates could not at once continue their work. Eventually a new commission was issued in 1656, and on its report, into which were inserted nineteen of the former depositions, the "servant of God" was beatified in 1661. The canonization took place in 1665.

Besides the works which we have named, there were published posthumously his *Entretiens*, i.e. a selection of the lectures given to the Visitation, reported by the sisters who heard them, some of his sermons, a large number of his letters, various short treatises of devotion. The first edition of his united or so-called "Complete" works was published at Toulouse in 1637. Others followed in 1641, 1647, 1652, 1663, 1669, 1685. The *Lettres* and *Opuscules* were republished in 1768.

The only modern editions of the complete works which it is worth while to name are those of Blaise (1821), Virès (1856-1858), Migne (1861), and the critical edition published by the Visitation of Annecy, of which the 14th volume appeared in 1905.

The biography of St Francis de Sales was written immediately after his death by the celebrated P. de La Rivière and Dom John de St François (Goulu), as well as by two other authors of less importance. The saint's nephew and successor, Charles Auguste de Sales, brought out a more extended life, Latin and French, in 1635. The lives of Giarda (1650), Maupas du Tour (1657) and Cotelendi (1687) add little to Charles Auguste. Marsollier's longer life, in two volumes (1700), is quite untrustworthy; still more so that by Loyau d'Amboise (1833), which is rather a romance than a biography. The lives by Hamon (1856) and Pérennès (1860), without adding much to preceding biographies, are serious and edifying. A complete life, founded on the lately discovered process of 1626 and the new letters, was being prepared by the author of the present article at the time of his death. With the Lives must be mentioned the *Esprit du B. F. de Sales* by Camus, bishop of Belley, who, amid innumerable errors, gives various interesting traits and sayings of his saintly friend. Among the very numerous modern studies may be named an essay by Leigh Hunt entitled "The Gentleman Saint" (*The Seer*, pt. ii. No. 41); a remarkable *causerie* by Sainte-Beuve (*Lundis*, 3rd Jan. 1853); *Le Réveil du sentiment religieux en France au XVII^e siècle*, by Strowski (Paris, 1898); *Four Essays on S. F. de S.* and *Three Essays on S. F. de S. as Preacher*, by Canon H. B. Mackey. (H. B. M.)

FRANCIS, SIR PHILIP (1740-1818), English politician and pamphleteer, the supposed author of the *Letters of Junius*, and the chief antagonist of Warren Hastings, was born in Dublin on the 22nd of October 1740. He was the only son of Dr Philip Francis (c. 1708-1773), a man of some literary celebrity in his time, known by his translations of Horace, Aeschines and Demosthenes. He received the rudiments of an excellent education at a free school in Dublin, and afterwards spent a year or two (1751-1752) under his father's roof at Skeyton rectory, Norfolk, and elsewhere, and for a short time he had Gibbon as a fellow-pupil. In March 1753 he entered St Paul's school, London, where he remained for three years and a half, becoming a proficient classical scholar. In 1756, immediately on his leaving school, he was appointed to a junior clerkship in the secretary of state's office by Henry Fox (afterwards Lord Holland), with whose family Dr Francis was at that time on intimate terms; and this post he retained under the succeeding administration. In 1758 he was employed as secretary to General Bligh in the expedition against Cherbourg; and in the same capacity he accompanied the earl of Kinnoul on his special embassy to the court of Portugal in 1760.

In 1761 he became personally known to Pitt, who, recognizing his ability and discretion, once and again made use of his services as private amanuensis. In 1762 he was appointed to a principal clerkship in the war office, where he formed an intimate friendship with Christopher D'Oyly, the secretary of state's deputy, whose dismissal from office in 1772 was hotly resented by "Junius"; and in the same year he married Miss Macrabie, the daughter of a retired London merchant. His official duties brought him into direct relations with many who were well versed in the politics of the time. In 1763 the great constitutional questions arising out of the arrest of Wilkes began to be sharply canvassed. It was natural that Francis, who from a very early age had been in the habit of writing occasionally to the newspapers,

should be eager to take an active part in the discussion, though his position as a government official made it necessary that his intervention should be carefully disguised. He is known to have written to the *Public Ledger* and *Public Advertiser*, as an advocate of the popular cause, on many occasions about and after the year 1763; he frequently attended debates in both Houses of Parliament, especially when American questions were being discussed; and between 1769 and 1771 he is also known to have been favourable to the scheme for the overthrow of the Grafton government and afterwards of that of Lord North, and for persuading or forcing Lord Chatham into power. In January 1769 the first of the *Letters of Junius* appeared, and the series was continued till January 21, 1772. They had been preceded by others under various signatures such as "Candor," "Father of Candor," "Anti-Sejanus," "Lucius," "Nemesis," which have all been attributed, some of them certainly in error, to one and the same hand. The authorship of the *Letters of Junius* has been assigned to Francis on a variety of grounds (see JUNIUS).

In March 1772 Francis finally left the war office, and in July of the same year he left England for a tour through France, Germany and Italy, which lasted until the following December. On his return he was contemplating emigration to New England, when in June 1773 Lord North, on the recommendation of Lord Barrington, appointed him a member of the newly constituted supreme council of Bengal at a salary of £10,000 per annum. Along with his colleagues Monson and Clavering he reached Calcutta in October 1774, and a long struggle with Warren Hastings, the governor-general, immediately began. These three, actuated probably by petty personal motives, combined to form a majority of the council in harassing opposition to the governor-general's policy; and they even accused him of corruption, mainly on the evidence of Nuncomar. The death of Monson in 1776, and of Clavering in the following year, made Hastings again supreme in the council. But a dispute with Francis, more than usually embittered, led in August 1780 to a minute being delivered to the council board by Hastings, in which he stated that "he judged of the public conduct of Mr Francis by his experience of his private, which he had found to be void of truth and honour." A duel was the consequence, in which Francis received a dangerous wound (see HASTINGS, WARREN). Though his recovery was rapid and complete, he did not choose to prolong his stay abroad. He arrived in England in October 1781, and was received with little favour.

Little is known of the nature of his occupations during the next two years, except that he was untiring in his efforts to procure first the recall, and afterwards the impeachment of his hitherto triumphant adversary. In 1783 Fox produced his India Bill, which led to the overthrow of the coalition government. In 1784 Francis was returned by the borough of Yarmouth, Isle of Wight; and although he took an opportunity to disclaim every feeling of personal animosity towards Hastings, this did not prevent him, on the return of the latter in 1785, from doing all in his power to bring forward and support the charges which ultimately led to the impeachment resolutions of 1787. Although excluded by a majority of the House from the list of the managers of that impeachment, Francis was none the less its most energetic promoter, supplying his friends Burke and Sheridan with all the materials for their eloquent orations and burning invectives. At the general election of 1790 he was returned member for Blethingley. He sympathized warmly and actively with the French revolutionary doctrines, expostulating with Burke on his vehement denunciation of the same. In 1793 he supported Grey's motion for a return to the old constitutional system of representation, and so earned the title to be regarded as one of the earliest promoters of the cause of parliamentary reform; and he was one of the founders of the "Society of the Friends of the People." The acquittal of Hastings in April 1795 disappointed Francis of the governor-generalship, and in 1798 he had to submit to the additional mortification of a defeat in the general election. He was once more successful, however, in 1802, when he sat for Appleby, and it seemed as if the great

ambitions of his life were about to be realized when the Whig party came into power in 1806. His disappointment was great when the governor-generalship was, owing to party exigencies, conferred on Sir Gilbert Elliot (Lord Minto); he declined, it is said, soon afterwards the government of the Cape, but accepted a K.C.B. Though re-elected for Appleby in 1806, he failed to secure a seat in the following year; and the remainder of his life was spent in comparative privacy.

Among the later productions of his pen were, besides the *Plan of a Reform in the Election of the House of Commons*, pamphlets entitled *Proceedings in the House of Commons on the Slave Trade* (1796), *Reflections on the Abundance of Paper in Circulation and the Scarcity of Specie* (1810), *Historical Questions Exhibited* (1818), and a *Letter to Earl Grey on the Policy of Great Britain and the Allies towards Norway* (1814). His first wife, by whom he had six children, died in 1806, and in 1814 he married his second wife, Emma Watkins, who long survived him, and who left voluminous manuscripts relating to his biography. Francis died on the 23rd of December 1818. In his domestic relations he was exemplary, and he lived on terms of mutual affection with a wide circle of friends. He was, however, full of vindictiveness, dissimulation and treachery, and there can be little doubt that in his historic conflict with Warren Hastings unworthy personal motives played a leading part.

BIBLIOGRAPHY.—For the evidence identifying Francis with Junius see the article JUNIUS, and the authorities there cited. Biog.* vol. xx.

FRANCIS JOSEPH I. (1830—), emperor of Austria, king of Bohemia, and apostolic king of Hungary, was the eldest son of the archduke Francis Charles, second son of the reigning emperor Francis I., being born on the 18th of August 1830. His mother, the archduchess Sophia, was daughter of Maximilian I., king of Bavaria. She was a woman of great ability and strong character, and during the years which followed the death of the emperor Francis was probably the most influential personage at the Austrian court; for the emperor Ferdinand, who succeeded in 1835, was physically and mentally incapable of performing the duties of his office; as he was childless, Francis Joseph was in the direct line of succession. During the disturbances of 1848, Francis Joseph spent some time in Italy, where, under Radetzky, at the battle of St Lucia, he had his first experience of warfare. At the end of that year, after the rising of Vienna and capture of the city by Windischgrätz, it was clearly desirable that there should be a more vigorous ruler at the head of the empire, and Ferdinand, now that the young archduke was of age, was able to carry out the abdication which he and his wife had long desired. All the preparations were made with the utmost secrecy; on the 2nd of December 1848, in the archiepiscopal palace at Olmütz, whither the court had fled from Vienna, the emperor abdicated. His brother resigned his rights of succession to his son, and Francis Joseph was proclaimed emperor. Ferdinand retired to Prague, where he died in 1875.

The history of the Dual Monarchy during his reign is told under the heading of AUSTRIA-HUNGARY, and here it is only necessary to deal with its personal aspects. The young emperor was during the first years of his reign completely in the hands of Prince Felix Schwarzenberg, to whom, with Windischgrätz and Kadetzky, he owed it that Austria had emerged from the revolution apparently stronger than it had been before. The first task was to reduce Hungary to obedience, for the Magyars refused to acknowledge the validity of the abdication in so far as it concerned Hungary, on the ground that such an act would only be valid with the consent of the Hungarian parliament. A further motive for their attitude was that Francis Joseph, unlike his predecessor, had not taken the oath to observe the Hungarian constitution, which it was the avowed object of Schwarzenberg

to overthrow. In the war which followed the emperor himself took part, but it was not brought to a successful conclusion till the help of the Russians had been called in. Hungary, deprived of her ancient constitution, became an integral part of the Austrian empire. The new reign began, therefore, under sinister omens, with the suppression of liberty in Italy, Hungary and Germany. In 1853 a Hungarian named Lebenyi attempted to assassinate the emperor, and succeeded in inflicting a serious wound with a knife. With the death of Schwarzenberg in 1852 the personal government of the emperor really began, and with it that long series of experiments of which Austria has been the subject. Generally it may be said that throughout his long reign Francis Joseph remained the real ruler of his dominions; he not only kept in his hands the appointment and dismissal of his ministers, but himself directed their policy, and owing to the great knowledge of affairs, the unremitting diligence and clearness of apprehension, to which all who transacted business with him have borne testimony, he was able to keep a very real control even of the details of government.

The recognition of the separate status of Hungary, and the restoration of the Magyar constitution in 1866, necessarily made some change in his position, and so far as concerns Hungary he fully accepted the doctrine that ministers are responsible to parliament. In the other half of the monarchy (the so-called Cisleithan) this was not possible, and the authority and influence of the emperor were even increased by the contrast with the weaknesses and failures of the parliamentary system. The most noticeable features in his reign were the repeated and sudden changes of policy, which, while they arose from the extreme difficulty of finding any system by which the Habsburg monarchy could be governed, were due also to the personal idiosyncrasies of the emperor. First we have the attempt at the autocratic centralization of the whole monarchy under Bach; the personal influence of the emperor is seen in the conclusion of the Concordat with Rome, by which in 1855 the work of Joseph II. was undone and the power of the papacy for a while restored. The foreign policy of this period brought about the complete isolation of Austria, and the "ingratitude" towards Russia, as shown during the period of the Crimean War, which has become proverbial, caused a permanent estrangement between the two great Eastern empires and the imperial families. The system led inevitably to bankruptcy and ruin; the war of 1859, by bringing it to an end, saved the monarchy. After the first defeat Francis Joseph hastened to Italy; he commanded in person at Solferino, and by a meeting with Napoleon arranged the terms of the peace of Villafranca. The next six years, both in home and foreign policy, were marked by great vacillation. In order to meet the universal discontent and the financial difficulties constitutional government was introduced; a parliament was established in which all races of the empire were represented, and in place of centralized despotism was established Liberal centralization under Schmerling and the German Liberals. But the Magyars refused to send representatives to the central parliament; the Slavs, resenting the Germanizing policy of the government, withdrew; and the emperor had really withdrawn his confidence from Schmerling long before the constitution was suspended in 1865 as a first step to a reconciliation with Hungary. In the complicated German affairs the emperor in vain sought for a minister on whose knowledge and advice he could depend. He was guided in turn by the inconsistent advice of Schmerling, Rechberg, Mensdorff, not to mention more obscure counsellors, and it is not surprising that Austria was repeatedly outmatched and outwitted by Prussia. In 1863, at the *Fürstentag* in Frankfort, the emperor made an attempt by his personal influence to solve the German question. He invited all the German sovereigns to meet him in conference, and laid before them a plan for the reconstruction of the confederation. The momentary effect was immense; for some of the halo of the Holy Empire still clung round the head of the house of Habsburg, and Francis Joseph was welcomed to the ancient free city with enthusiasm. In spite of this, however, and of the skill with which he presided over the debates, the

conference came to nothing owing to the refusal of the king of Prussia to attend.

The German question was settled definitively by the battle of Königgrätz in 1866; and the emperor Francis Joseph, with characteristic Habsburg opportunism, was quick to accommodate himself to the new circumstances. Above all, he recognized the necessity for reconciling the Magyars to the monarchy; for it was their discontent that had mainly contributed to the collapse of the Austrian power. He had already, in 1859, as the result of a visit to Budapest, made certain modifications in the Bach system by way of concession to Magyar sentiment, and in 1861 he had had an interview with Deák, during which, though unconvinced by that statesman's arguments, he had at least assured himself of his loyalty. He now made Beust, Bismarck's Saxon antagonist, the head of his government, as the result of whose negotiations with Deák the Austro-Hungarian Compromise of 1867 was agreed upon. A law was passed by the Hungarian diet regularizing the abdication of Ferdinand; at the beginning of June Francis Joseph signed the inaugural diploma and took the oath in Magyar to observe the constitution; on the 8th he was solemnly crowned king of Hungary. The traditional coronation gift of 100,000 florins he assigned to the widows and orphans of those who had fallen in the war against Austria in 1849.

Once having accepted the principle of constitutional government, the emperor-king adhered to it loyally, in spite of the discouragement caused by party struggles embittered by racial antagonisms. If in the Cisleithan half of the monarchy parliamentary government broke down, this was through no fault of the emperor, who worked hard to find a *modus vivendi* between the factions, and did not shrink from introducing manhood suffrage in the attempt to establish a stable parliamentary system. This expedient, indeed, probably also conveyed a veiled threat to the Magyar chauvinists, who, discontented with the restrictions placed upon Hungarian independence under the Compromise, were agitating for the complete separation of Austria and Hungary under a personal union only; for universal suffrage in Hungary would mean the subordination of the Magyar minority to the hitherto subject races. For nearly forty years after the acceptance of the Compromise the attitude of the emperor-king towards the Magyar constitution had been scrupulously correct. The agitation for the completely separate organization of the Hungarian army, and for the substitution of Magyar for German in words of command in Hungarian regiments, broke down the patience of the emperor, tenacious of his prerogative as supreme "war lord" of the common army. A Hungarian deputation which came to Vienna in September 1905 to urge the Magyar claims was received ungraciously by the emperor, who did not offer his hand to the members, addressed them in German, and referred them brusquely to the chancellor, Count Goluchowski. This incident caused a considerable sensation, and was the prelude to a long crisis in Hungarian affairs, during which the emperor-king, while quick to repair the unfortunate impression produced by his momentary pique, held inflexibly to his resolve in the matter of the common army.

In his relations with the Slavs the emperor displayed the same conciliatory disposition as in the case of the Magyars; but though he more than once held out hopes that he would be crowned at Prague as king of Bohemia, the project was always abandoned. In this, indeed, as in other cases, it may be said that the emperor was guided less by any abstract principles than by a common-sense appreciation of the needs and possibilities of the moment. Whatever his natural prejudices or natural resentments, he never allowed these to influence his policy. The German empire and the Italian kingdom had been built up out of the ruins of immemorial Habsburg ambitions; yet he refused to be drawn into an alliance with France in 1869 and 1870, and became the mainstay of the Triple Alliance of Austria-Hungary, Germany and Italy. His reputation as a consistent moderating influence in European policy and one of the chief guarantors of European peace was indeed rudely shaken in October 1908, the year in which he celebrated his

sixty years' jubilee as emperor, by the issue of the imperial rescript annexing Bosnia and Herzegovina to the Habsburg dominions, in violation of the terms of the treaty of Berlin. But his opportunism was again justified by the result. Europe lost an ideal; but Austria gained two provinces.

In his private life the emperor was the victim of terrible catastrophes—his wife, his brother and his only son having been destroyed by sudden and violent deaths. He married in 1854 Elizabeth, daughter of Maximilian Joseph, duke of Bavaria, who belonged to the younger and non-royal branch of the house of Wittelsbach. The empress, who shared the remarkable beauty common to all her family, took little part in the public life of Austria. After the first years of married life she was seldom seen in Vienna, and spent much of her time in travelling. She built a castle of great beauty and magnificence, called the Achilleion, in the island of Corfu, where she often resided. In 1867 she accompanied the emperor to Budapest, and took much interest in the reconciliation with the Magyars. She became a good Hungarian scholar, and spent much time in Hungary. An admirable horsewoman, in later years she repeatedly visited England and Ireland for the hunting season. In 1897 she was assassinated at Geneva by an Italian anarchist; previous attempts had been made on her and on her husband during a visit to Trieste.

There was one son of the marriage, the crown prince Rudolph (1857-1889). A man of much ability and promise, he was a good linguist, and showed great interest in natural history. He published two works, *Fifteen Days on the Danube* and *A Journey in the East*, and also promoted the publication of an important illustrated work giving a full description of the whole Austro-Hungarian monarchy; he personally shared the labours of the editorial work. In 1881 he married Stéphanie, daughter of the king of the Belgians. On 30th January 1889 he committed suicide at Mayerling, a country house near Vienna. He left one daughter, Elizabeth, who was betrothed to Count Alfred Windischgrätz in 1901. In 1900 his widow, the crown princess Stéphanie, married Count Lonyay; by this she sacrificed her rank and position within the Austrian monarchy. Besides the crown prince the empress gave birth to three daughters, of whom two survive: Gisela (born 1857), who married a son of the prince regent of Bavaria; and Marie Valerie (born 1868), who married the archduke Franz Salvator of Tuscany.
